FPL (1,3,5)	no	
Ron Gunderson; NPPD (1) MISO (1,6)	yes	Some workshops and templates or examples of what meets the standard would be useful.
Response: The SPT SDT will consider conducting a workshop.		
John Bussman:AECI (1,5,6)	yes	However, I don't think this standard is necessary.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		

Question 16		
Commenter		**Comment**
John Kerr; GRDA	yes	Any new training standard should be field tested before implementation without penalty.
Response: Most stakeholders indicated agreement with the SPT SDT that field testing is not needed for this standard.		
Mark Bennett; Gainesville Regional Utilities (5)	yes	Not only does it not need to be field tested It need to be forgotten about. It is already covered.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
William J. Smith; Allegheny Power (1)	yes	We agree that field testing is not necessary. However seminars and/or training material to throughly explain this standard and examples of a compliant training program are required before this standard can be implemented.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT will consider conducting a workshop.		
Duke Energy (G1) (1)	yes	Yes, but for a different reason -- the decision on a field test should be made on a more mature draft of the standard. The comments presented here anticipate a significant change in the next draft of this standard.
Response: The SPT SDT has significantly revised the standard based on industry feedback. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Robert Coish; MEHB (1, 3, 5, 6)	yes	
Ed Davis; Entergy Services (1)	yes	
Marion Lucas; Alcoa Power Generating, Inc (1)	yes	
CJ Ingersoll; CECD (3)	yes	
Dale Wadding; Dairyland Power Cooperative (5)	yes	
Will Franklin; Entergy (6)	yes	
SPP OTWG (1,2)	yes

Pepco Holdings (1)	yes	
Michael Scott; APS (1,5)	yes	
Michael Clime; Ameren	yes	

17. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement, or agreement please identify the conflict here.

Summary Consideration:

The overall consensus from commenters is that there are no known conflicts with the purposed standard PER-005. The one sited item is the NERC Continuing Education Program. The NERC CE program and the required hours to maintain Operator certification are independent of the proposed standard PER-005. Proposed Standard PER-005 does not prevent the inclusion or the exclusion of any training that meets the needs of an organization's training program under proposed standard PER-005 and meets the CEH hour requirements to maintain Operator certification. The proposed standard PER-005 is being developed to replace PER-002 and parts of PER-004.

Question 17	
Commenter	**Comment**
NPCC CP9 (1, 2)	Conflicts with sections of PER-002.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT plans to recommend retiring PER-002.	
Alan Adamson; NYSRC (2)	Conflicts with sections of PER-002.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT plans to recommend retiring PER-002.

18. Do you agree with the implementation plan that phases in compliance with the requirements over two years?

Summary Consideration:

This question appears to be redundant with question #15 of the Comment Form. The SDPSDT has revised the implementation plan such that the implementation timeline has been lengthened to three years and the dates were removed. Several commenters expressed the need for public discussion, workshops, etc. The SPT SDT agrees these forums are valuable and useful and will consider hosting such forum.

Question 18		
Commenter		**Comment**
WECC OTS (1,2)		The implementation plan was not posted with the Standard but was posted afterwards. While OTS has not had time to evaluate and make recommendations on the implementation plan, we do recommend all specific dates be removed. The plan notes the dates slide with the approval date of the Standard but OTS believes the approximate dates will do more to confusion the issue than to help.
Response: The SPT SDT has reviewed the comment that the implementation timeline should be extended and has revised the implementation plan to reflect an implementation timeline of up to 3 years and removed all specific dates.		
Richard Krajewski; Public Service Co of NM (1)		PNM recommend all specific dates be removed. The plan notes the dates slide with the approval date of the Standard but PNM believes the approximate dates will do more to confusion the issue than to help.
Response: The SPT SDT has reviewed the comment that the implementation timeline should be extended and has revised the implementation plan to reflect an implementation timeline up to 3 years and removed all specific dates.		
Marion Lucas; Alcoa Power Generating, Inc (1)	no	Should not be implemented at all
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Richard Appel; Sunflower Electric Power Co (1,3,5)	no	I don't feel that it should be implemented at all.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.		
Will Franklin; Entergy (6)	no	See comment in question # 15
Response: Based on stakeholder feedback, the Implementation plan has been lengthened to three years and the dates were removed.		
SRP (1)	no	See comments on # 15.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Santee Cooper (G2)	no	Refer to response on 15.

Question 18		
Commenter		**Comment**
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
William J. Smith; Allegheny Power (1)	no	See answer to question 15.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Pepco Holdings (1)	no	See comments to Question 15
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Jason Shaver; ATC (1)	no	See refer to ATC's response to question 15.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Kathleen Goodman; ISO-NE (2)	no	The proposed standard requires more public discussion before discussing implementation plans.
Response: The Standard Drafting team must utilize the NERC Standard Drafting process for obtaining comments on the proposed Standard for any posted drafts. There will be an opportunity for a second comment period for Draft 2 of this proposed standard. The SPT SDT will consider conducting a workshop.		
FPL (1,3,5)	no	The standard needs additional drafting prior to evaluating the implementation plan.
Response: The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT recognizes modifications to the proposed standard may have an impact on the implementation plan.		
NPCC CP9 (1, 2)	no	NPCC Participating members cannot comment or agree to the implementation plan until a final draft of the standard is available.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
PJM (2)	no	The proposed standard requires more public discussion before discussing implementation plans.
Response: The SPT SDT must utilize the NERC Standard Drafting process for obtaining comments on the proposed Standard for any posted drafts. There will be an opportunity for a second comment period for Draft 2 of this proposed standard. The SPT SDT will consider conducting a workshop.		
ISO/RTO Council (2)	no	The proposed standard requires more public discussion before discussing implementation plans.
Response: The SPT SDT must utilize the NERC Standard Drafting process for obtaining comments on the proposed Standard for any posted drafts. There will be an opportunity for a second comment period for Draft 2 of this proposed standard. The SPT SDT will consider conducting a workshop.		

Question 18		
Commenter		**Comment**
FRCC SO Subcommittee (1,2,5)	no	The standard needs additional drafting prior to evaluating the implementation plan.
Response: The SPT SDT must utilize the NERC Standard Drafting process for obtaining comments on the proposed Standard for any posted drafts. There will be an opportunity for a second comment period for Draft 2 of this proposed standard. The SPT SDT will consider conducting a workshop.		
Ron Falsetti; IESO (2)	no	We cannot assess this until after the implementation plan is revised according to the changes made to the standard.
Response: The SPT SDT agrees with your comment. The SPT SDT has significantly revised the standard based on industry feedback.		
Gerald LaRose; NYPA (1)	no	The proposed Standard is complex in nature and contains many Requirements and will be potentially costly to many Entities. The Responsible Entities will require time and resources to perform the depth and breadth of work mandated. An Implementation Schedule over four years rather than two better complements the five-phases of the systematic approach to training and will significantly increase the probability that this effort be accomplished in a complete and thorough manner with the costs spread over a realistic time frame.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Michael Clime; Ameren	no	Should be longer.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Jim Sorrels; AEP (1)	no	This appears to be a repeat of question 15 above. AEP would like to see this changed to phase-in time period of 3 years.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
SPP OTWG (1,2)	no	Realistically implementation may take more than two years. Refer to question #15.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
MRO (1,2)	no	The MRO recommends that compliance measurement and enforcement wait until after the two-year phase-in period. There is concern that measuring compliance on only a portion of the standard will lead to a disjointed standard where compliance is not measured uniformly.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
MISO (1,6)	no	More time will be needed if the standard is too prescriptive.

Question 18		
Commenter		**Comment**
		Most entities will have to put material together for hundreds of tasks and training activities.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Michael Gammon; KCP&L (1)	no	I think two years is too aggressive for companies that do not have and cannot afford to have a dedicated training staff and do not need a dedicated training staff. Although, the standard espouses appropriate training elements, I think companies that do not have a dedicated staff will need three years to meet this standard.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
SCE&G ERO WG (1, 3, 5)	no	Twelve months is not enough time unless a standard list of " reliability related task" and agreement of the industry of minimun requirments as associated with these tasks as it applies to R1.1 through R1.7 can be provided.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. In response to your request for examples of reliability-related tasks, the SPT SDT has provided a Generic Task List in the revised standard.		
Ed Davis; Entergy Services (1)	no	We suggest the Phased Implementation Period be over 3 years rather than the 2 years indicated.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Matthew Santos; SDE&G		It needs to be extended, unless you are saying the standard goes into effect and then in 2 years later we start with compliance?
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Allen Klassen; Westar (1)	no	Not giving enough time to meet the new requirements (lots of development and creating excessive documentation will have to be done) and should not make ANY requirement effective mid-year. Suggest effective dates of 1/1/2009 for R1 - R7 and 1/1/2010 for R8 - R10 at the earliest.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. Any proposed standard is dependent upon jurisdictional regulatory approval and it unlikely that all regulatory approvals will be achieved in the same time frame.		
Hydro One Networks (1)	no	The phase in period should be conmensurate with the entity size. Larger entities may take longer to comply with this standard. Please see our response to question 15.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		

Question 18		
Commenter		**Comment**
Edward J. Carmen; Baltimore Gas & Electric (1)	no	Longer time will be required to comply with this standard. Many organizations are currently not properly staffed to accommodate this increased workload.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Dale Wadding; Dairyland Power Cooperative (5)	no	Depending upon the level of detailed requirements in the final Standard, more than 24 months may be required to implement all components.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Duke Energy (G1) (1)	no	In the current draft, the implementation plan is too short. If the requirements are re-written to be less prescriptive and detailed, a two year plan may be workable.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Brian Thumm; ITC (1)	no	As described in question 15, the two-year implementation plan is too short to develop the comprehensive documentation required by the proposed standard. Requirement R7 will be the most demanding, and at a minimum, it should be moved into Phase 3 in order to allow for a few extra months to complete it.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. R7 has been removed from the standard.		
Brian Tuck; BPA (1)	no	The implementation plan will need to be assessed once changes to the requirements requested by BPA and other commenters are included in the next revision of the standard. BPA agrees with the concept of phased implementation. That said, to implement the training program described by this standard, in a manner that reflects the quality and effectiveness expected by industry participants, will require longer than two years.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Roger McBeth; Northeast Utilities (1)	no	Organizations will not have the inhouse resources to comply with this standard and will result in a considerable expense to complete a company specific JTA using a vendor.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The drafting team is posting a list of references that may assist entities in applying the SAT process.		

Question 18		
Commenter		**Comment**
Ron Gunderson; NPPD (1)	no	More time will be needed if the standard is too prescriptive. Most entities will have to put material together for hundreds of tasks and training activities.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Mark Bennett; Gainesville Regional Utilities (5)	no	
Allan George; Sunflower (1)	no	
CJ Ingersoll; CECD (3)	no	
Dan Kay; South Mississippi EPA (4)	no	
Robert Coish; MEHB (1, 3, 5, 6)	Yes/no	However, more will be needed if the standard is too prescriptive. Most entities will have to put material together for hundreds of tasks and training activities.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
John Bussman: AECI (1,5,6)	yes	If the requirements in R1 can be generic to allow the companies to prepare a traing program.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.		
John Kerr; GRDA	yes	After some serious adjustments, this could be inplementated in two years. No as it is now however.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed.		
Gordon Rawlings; BCTC (1)	yes	The plan says in part that PER-004-1 will be replaced with this Standard. The existing Standard is PER-004-0. Did the document mean to say PER-004-0 or is there a new PER-004-1 in progress that BCTC is not aware of or was this a typo?
Response: The SPT SDT will correct all incorrect references to the proposed standard PER-005.		
TVA (1)	yes	
Michael Scott; APS (1,5)	yes	
Southern Co (1,3,5,6)	yes	
Alan Adamson; NYSRC (2)	yes	

Question 18		
Commenter		**Comment**
FirstEnergy (1,3,5,6)	yes	
Howard Rulf; WeEnergies (3,4,5)	yes	
James Hinson; ERCOT (2)	yes	

19. Please provide any other comments you have on this standard that you haven't already provided above.

Several commenters have identified reasons why compliance with a new training standard may be challenging and while the drafting team is sympathetic to these commenters, the drafting team would also remind those stakeholders that the 2003 blackout occurred when there was voluntary compliance to an Operating Policy that asked entities to provide operator training – and the investigation concluded that not every system operator who was on duty on that day was prepared to recognize and respond to the conditions present on the bulk electric system. From an 'outsider's perspective' a system operator holds a position that is critical to infrastructure. System operator training needs to be viewed in the same light as a pilot's training – you wouldn't want to be a passenger in a plane with a pilot whose skills had not been verified. While the existing certification standard does require that system operators acquire a NERC credential, the content of the exam for that NERC credential is not company-specific and does not cover all the procedures, processes and tools that are available to an individual system operator at a specific work location. The intent of this standard is to ensure that system operators are as prepared as the pilot who has been trained to fly the plane he is in – and is prepared to address not only normal but a variety of abnormal conditions. Nothing less will meet the needs of the entities that rely electricity for their safety, comfort and livelihoods. Almost every infrastructure critical to our national security relies upon electricity. While providing training does take resources, it is necessary. The drafting team has modified the standard to retain its critical components while eliminating the elements of the standard that explained 'how' to achieve the desired results.

Several stakeholders have commented that the NERC Continuing Education (CE) program should be a substitute for the new training standard. The drafting team disagrees with this position. The CE program does not provide assurance that the system operator sitting at the console has the capability to perform of the reliability-related tasks associated with the system operator position. Who would want to be a passenger on a plane that had a pilot who had been trained to take off and land but had never been through training to maneuver through thunderstorms? We need to reach a point where we have assurance that system operators are capable of performing all the reliability-related tasks assigned to their position.

Question 19	
Commenter	**Comment**
Allan George; Sunflower (1)	I do not believe this extensive standard is necessary with the current CEH program that requires operating personnel to become and remain certified and CEH's must be maintained.Currently training and training requirements and registration of CEH's seems to detail that all Certified operators are being adequately reained in all areas. Is that not the intent os EOPS, simulator and class room training? Each Entity designs their training program to train oparators based on tasks they percieve as critical to its system. This Standard for compliance seems too aggressive for all companies to comply, most don't have budget or personnel to maintain this extensive standard.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.	
WECC RCCWG (1,2)	This standard will require more Staff to meet requirements thereby increasing the cost of providing power to our customers with little benefit for these customers.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.	

Question 19	
Commenter	**Comment**
Dan Kay; South Mississippi EPA (4)	There is no need for this standard. The NERC System Operator Certification Program with the required continiuing education for re-certification that is allready in place is more than sufficient to ensure an adequate level of training is accomplished for System Operators to know and to abide by NERC standards. The Employer of the System Operator is alleady held accountable via the 100 or so present standards, each with multiple requirments, should the System Opertator not be sufficintly trained and cause a violation of these standards.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.	
Tim Hattaway; Alabama Electric Coop (5)	These training requirments are reminecent of kudzu (a fast growing vine with deep roots planted years ago to help stop soil erosion). Just like the unstoppable vines that have taken over and smothered other plants, climbed trees and taken over crops, these proposed training requirements reflect kudzu in that they keep growing. Rules, regulations and documentation overkill are strangling the efforts to operate a reliable power system.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.	
Mark Bennett; Gainesville Regional Utilities (5)	My opinion is this standard is not necessary at this time. What seems to be taking place is somewhat backwards. In the past all entities wer required to develop[a training plan to ensure that there was competent personnel manning Control Centers. Each entity developed their individual programs based on the tasks that they percieved as " high risk, or important". This got accomplished. Now I see a SAR dictating exactly how a training program should look and what sort of back up documentation is required. What kind of measurements and possible fines for not having a program as narrated in the SAR. The schedule for Compliance is too aggressive for some companies that don't have " dedicated, qualified trainers.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost.	
Santee Cooper (G2)	The NERC CE Program is a good program for the industry. It is requiring additional training for the system operators in a well structured manner. Interpretations of this standard that do not permit flexibility for companies to apply judgement to the overall implementation of their training programs and associated analyses would result in this standard being overly prescriptive
Response: During the development of the SAR for this standard, most stakeholders agreed that there	

Question 19	
Commenter	**Comment**
is a reliability-related need for a new training standard. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.	
Richard Krajewski; Public Service Co of NM (1)	The drafting team should provide detailed responses to the comments expressed in this form and in accordance with the spirit of the standard drafting process. Finally, PNM thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for System Operators.
Response: Thank you for your support. The SPT SDT has reviewed each comment and provided responses, as well as modified the requirements based on stakeholder feedback.	
Matthew Santos; SDE&G	A lot of these requirements need adjustment so that they are not burdensome. You can come up with all the requirements you think fit and will work but the bottom line is can it physicallly be done in the short amount of time you have allotted not to mention money but mostly personnel to carry it out. There are a lot of trainers that are overworked, overloaded and burning out and it is very hard to find qualified folks to be trainers, the industry is in short supply. The only viable option is to have a vender do it, this also takes time. We are 2 years in the running in building our training program with a vender. Why is it taking so long, manangement has to buy into it, chossing a vender, working with the vender to get what you want, vender time to complete based on their other clients, completeing JTA for all positions, production, add your companies materials (Procedures, referances, etc) revise, review, deliver, revise. All this takes time not to mention that existing training is still going on with everything else. Real time issues take presendance over anything else. We still in the process with the vender to complete our training program.
Response: The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. Phase 1 is 18 months; Phase 2 is 30 months; and Phase 3 is 36 months.	
Duke Energy (G1) (1)	The purpose of this standard is to ensure system operators are competent; however, the standard fails to ensure or measure competency. NERC certification, continuing education requirements, recommended training topics, and training activities approved by NERC is sufficient direction for an effective training program. The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH],

Question 19	
Commenter	**Comment**
	record and assess progress, adjust the program annually).
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.	
Jason Shaver; ATC (1)	In general, the requirements of this standard are overly prescriptive and unduly burdensome on the industry as they ignore the existing continuing education requirements already in place under the NERC CE Program. In addition, this standard needs to be flexible enough such that it allows entities to meet either a portion or all of its organizational training requirements via external NERC approved CE training vendors, under the existing CE Program, without requiring the entity to re-document and justify training courses previously approved by NERC.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.	
MISO (1,6)	The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually). It would be simpler if this standard were measured globally (3 of the 4 requirements with no deficiencies is passing, minor deficiencies in 2 requirements is level 1, etc.). We agree that training is very important, but importance is not the same as the risk. Depending on how this standard is read, there appear to be 40 different things for which non-compliance can be assessed (and almost all of them are rated at medium or high risk). Deviating from a template training design does not put the Interconnections at risk of cascading. The standard as a whole should be evaluated at a lower risk. This standard should absorb the 32 hours of emergency training. Alternatively, this standard could lay out a way to evaluate "certified training providers".
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. A requirement has been added to the standard to address the 32 hours of emergency training.	
Robert Coish; MEHB (1, 3, 5, 6)	The System Personnel Training Standard lays out guidelines for a well thought out training program. However, there are other ways to have an

Question 19	
Commenter	**Comment**
	effective training program and each organization's needs are not the same. The primary issues relate to the administrative complexity and the compliance elements in the standard. There are a significant number of items for which non-compliance can be assessed. The team proposes that many of these are high and medium risk requirements. High risk requirements are events/items that can directly lead to cascading. Varying the design of a training program cannot directly lead to cascading outages. Also, the team has not proposed what tasks are considered reliability related tasks, leaving it to each company to determine. By not defining a minimum suite of reliability related tasks for Reliability Coordinator, Balancing Authority and Transmission Operator, who will determine if the company identified reliability tasks cover even a reasonable subset of tasks performed by the system operator. If no minimum set of reliability tasks are identified, the standard will not ensure that all companies are doing the right thing and the training of system operators will not be improved. The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually). It would be simpler if this standard were measured globally (3 of the 4 requirements with no deficiencies is passing, minor deficieiencies in 2 requirements is level 1, etc.). This standard should absorb the 32 hours of emergency training.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. A requirement has been added to the standard to address the 32 hours of emergency training. The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. The SPT SDT has provided a Generic Task List in the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore, each entity must complete a company-specific analysis to determine the required training.	
Ron Gunderson; NPPD (1)	The standard should be boiled down to the core training requirements (develop a program, deliver training [including and consistent with CEH], record and assess progress, adjust the program annually). It would be simpler if this standard were measured globally (3 of the 4 requirements with no deficiencies is passing, minor deficieiencies in 2 requirements is level 1, etc.). We agree that training is very important, but importance is not the same as the risk. Depending on how this standard is read, there appear to be 40 different things for which non-compliance can be assessed (and almost all of them are rated at medium or high risk). This standard should absorb the 32 hours of emergency training.

Question 19	
Commenter	**Comment**
	Alternatively, this standard could lay out a way to evaluate "certified training providers".
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. A requirement is included in the standard to address the 32 hours of emergency training.	
SPP OTWG (1,2)	We would prefer to see some examples of quality JTAs. We believe it's necessary to have some benchmark standards that can be used across the industry. This standard would require an unrealistic amount of record keeping, considering current staffing. Few entities have the resources, staff, and time to meet the demands of this standard.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has provided a Generic Task List in the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore, each entity must complete a company-specific analysis to determine the required training. revised standard with SAT process.	
SCE&G ERO WG (1, 3, 5)	A standard list of reliability related tasks with corresponding minimum requirements should be developed for R1.1 through R1.7 to allow the applicable parties to prevent unnecessary expenditures and poor use of resources and time. This would benefit all parties involved. It also should allow smaller organization to contract with third parties to write plans for them if necessary using a standard approach. It should allow all of us to take the guess work out of what is intended by the requirements.
Response: The SPT SDT has provided a Generic Task List in the revised standard. A generic analysis will not address all the reliability related tasks that a System Operator at a specific entity may perform. Therefore, each entity must complete a company-specific analysis to determine the required training. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.	
PJM (2) ISO/RTO Council (2) ISO-NE (2)	PJM (IRC) (ISO-NE) recognizes and supports the need for and the value of developing system operator Training plans, and of maintaining and implementing those plans. PJM (IRC) (ISO-NE) also recognizes that owing to the diverse system characteristics, varying operating systems and multitude of operating procedures used by the subject responsible entities, that the Training

Question 19	
Commenter	**Comment**
	Programs used to effect those Training plans are not and cannot be standardized. Violations Risk Factors PJM (IRC) (ISO-NE) does not agree that the SDT correctly interpreted the definitions of the Violation Risk Factors; and does not agree with the factors proposed. Training Program Accreditation Rather than attempting to proscribe what must be included in every program, PJM (IRC) (ISO-NE) suggests that the SDT consider creating a System Operator Training Accreditation Program. PJM (IRC) (ISO-NE) suggests the SDT consider revising the Standard to simplifiy the standard to mandate: - Responsible entities have a System Operator Training Plan - Responsible entities use accredited Training Programs to implement those plans PJM (IRC) (ISO-NE) further suggests that the details proposed in the current standard be drafted into a Technical Reference Guide that could serve as the basis for the Accreditation program.
Response: The SPT SDT agrees with the comment that the requirement should not be considered a High risk factor and has revised the risk factor to Medium. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The SPT SDT has significantly revised the standard based on industry feedback. The drafting team is posting a document that lists references entities can use to help understand and apply the SAT process.	
Southern Co (1,3,5,6)	Southern Company does not believe this Standard is necessary since PER-002 could be revised to include certain components of this proposed standard. However, if the development of this standard continues, we make the following comments: Requirement 4 is essentially a duplicate of PER-002, Requirement 2. Requirements 4.1-4.4 are essentially duplicates of PER-002, Requirements 3.1-3.4. Requirement 5.1 and 5.2 are very close to PER-002, Requirement 3.4. If you remove these duplications, the SDT may not be left with enough substance to build a standard around. Under Requirement 1, recommend changing the name of System Operator job task analysis to System Operator Job Description. Job Performance Appraisals should be an acceptable method for meeting Requirement 8.1. Does the 32 hours of emergency operations training specified in Requirement 6.5.1 count toward the 5 days of training required for PER-002, Requirement 4?

Question 19	
Commenter	**Comment**
	The primary emphasis of this standard seems to rely on the process and not about measuring whether or not operators are properly training. R5 - The term "systematic approach" is used but no direction or expectation is provided in the standard on what is acceptable. R6.5.2 - The requirement expressed here is too prescriptive and in some cases probably not practical. If this requirement is ultimately considered appropriate, it should be done as part of EOP-005 R6 and not inserted here as part of a general training standard. The same argument could be made for R6.5.1 as well.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. A requirement has been added to the standard to address the 32 hours of emergency training.	
Richard Appel; Sunflower Electric Power Co (1,3,5)	This standard will require additional staff and many man hours to implement. Most utilities don't have the man power to inplement this. Where are these people coming from.This is not needed at this time.As we have PER-002.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard.	
SRP (1)	This standard will require more Staff to meet requirements thereby increasing the cost of providing power to our customers with little benefit for these customers. Requirement 1 - "maintain" may be a better choice that "conduct" a System Operator JTA… Requirement 5.1 and 5.2 are truly just headings (not requirements) and should be eliminated. The others in this section (R5.1.1, R5.1.2, and R5.2.1) could be renumbered to R5.1-R5.3. It may be beneficial to define some terms associated with this standard. What is meant by "critical task", "training plan", and other intermediate levels of tasks? This standard was reviewed by a Transmission Operations Manager, Generation Operations Manager, Training Supervisor, and 2 Training Analysts. While some effort was made to arrive at consensus, some variety was left in tact for the drafting team to consider. It may be more beneficial to obtain a variety of perspectives without too many edits for the sake of maintaining a unified voice from one company. The drafting team needs to see the variety of perceptions as individuals read through this standard.
Response: During the development of the SAR for this standard, most stakeholders agreed that there	

Question 19	
Commenter	**Comment**
is a reliability-related need for a new training standard. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPSDT agrees with your comment on criticality and has removed the references to criticality from the requirement. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions.	
Edward J. Carmen; Baltimore Gas & Electric (1)	R6.5.2 requires all real-time operating positions to participate in at least one multi-entity exercise per year. BGE is a member of PJM. PJM currently conducts 2 Restoration drills per year. BGE includes as many operating personnel as possible in these drills, however, it is not feasible to include all operating positions. BGE recommends revising this requirement to read: "involving as many real-time operting positions as possible…….and, ensure that all operating positions participate in these drills at least once every 5 years".
Response: The SPT SDT has removed this requirement.	
Ed Davis; Entergy Services (1)	Entergy Transmission agrees with the SAR requirements for developing this standard. The SAR requires a systematic approach be used to identify training needs and to conduct the training. The SAR also requires responsible entities have evidence that each of its real-time system operators is competent to perform each assigned task. Entergy's suggested changes contained herein are intended to make this draft standard better conform to the SAR requirements. We believe this draft standard is overly prescriptive in its detailed requirements for how the responsible entities implement a systematic approach to training. We also believe this draft standard is overly prescriptive in the detailed process, information and documentation entities must follow to meet the requriements of this draft standard. We also request that, in all locations in the standard, the criteria for being QUALIFIED TO PERFORM A TASK should be specified in the draft standard, replacing - criteria for SUCCESSFUL PERFORMANCE. The authors of this questionairre did not ask any questions, nor did they provide a place to comment on R6 which requires the implementation of the training program. We suggest R6.1 though R6.4 are overly proscriptive and should be deleted. Also, R6.5.2 requiring at least one exercise each year involving all real-time operating positions should be deleted as being too high a risk factor for the continued real-time reliability of the BES and would involve significant time and effort for the expected gain in operational experience. We are concerned about the broadbrush requirements placed on the responsible entities concerning the training of System Operators under contract or under delegation agreement. This draft standard implies that the responsible entities are responsible for conducting a training needs assessment (R3), implementing its training program (R6), and tracking

Question 19	
Commenter	**Comment**
	the progress of each of the operators (R8) for each of the operators under contract or under delegation agreement. We suggest the responsibility for training be assigned to either the contractor or the responsible entity, depending on the content of the training required (training about general power systems, or training concerning the responsible entity's specific system) and which entity is performing a specific task. First, the contractor under delegation agreement (not the responsible entity) should be responsible for training its employees about general power systems and tasks associated with the the specific system knowledge for the responsible entity; the responsible entity should not be measured nor held in compliance for delegated tasks. Second, the contractor employing system operators (not the responsible entity) should be responsible for training the contractor employees about general power systems, while the responsible entity should be responsible for training the contract system operator about the specific system knowledge for the responsible entity. We suggest the draft standard be revised to reflect these training responsibility concepts. We will agree with the Applicability statement in the Implementation Plan concerning contract employees and delegation agreement employees given the changes are satisfactorily made in the standard.
Response: The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. Based on stakeholder feedback the standard has been reworded such that the successful performance is determined using the systematic approach to training by the entity.	
FPL (1,3,5)	Requirement R6.5.2 needs to be deleted. Joint training exercises can be beneficial, but to mandate these at this time is not justifiable. The requirement is inappropriate since it would put an entity's compliance with the requirement, subject to cooperation by another entity. Language requiring a training needs assessment of System Operators performing task identified in R1 under delegations agreements is extremely burdensome. As an example, a neighboring company may be performing the regulating function of an entity, since some form of regulation will be identified in the JTA - the entity will be forced to perform a training needs assessment on that company performing regulation service to determine if their operators can successfully perform the tasks identified in the JTA - even if those operators are being trained by there own company. We therefore, disagree with the use of the parenthetical expression (including any contract System Operator or System Operator performing tasks identified in R1. under delegation agreements). The use of this caveat throughout the standard creates confusion and ambiguity in that it makes the requirements difficult to read and dilutes clarity.
Response: Requirement 6.5.2 has been removed from the revised standard. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that	

Question 19	
Commenter	**Comment**
the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.	
Julie Tate; Progress Energy (1,3,5)	Overall, Progress Energy agrees that the Initial and continuing training plans should be tailored to the System Operator job function as identified from the job task analysis. However, it appears the inidividual GAP analysis requirements of the proposed standard are beyond the INPO training model for nuclear reactor operators. Progress Energy recommends that during initial and continuing training, gaps in performance versus the system operator job function expectations can be identified, especially in simulator exercises. From this identificaiton of gaps in performance expectations identified in continuing training, remedial training (refresher training) can take place immediately in the training session to ensure learning takes place, individual performace meets the job funtion requirments, and most importantly the gap is addressed immediately. To be consistant with the INPO training model, there is no need for a formal individual gap analysis to be conducted annually outside of the continuing training process. Also, if a gap is identified in this proposed standard's required annual assessment, the standard does not require the operating entity which has identified the gap to provide any immediate remedial action and thus the operating entity is creating a litigation issue.
Response: The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases.	
John Bussman:AECI (1,5,6)	This procedure is to restrictive. If a company can show that there are procedures in place that show how operators are trained to maintain the BES than we shouldn't have to prepare a Job Task Analysis and maintain it. There is more than one way to ensure operators are trained. I was not a Nuclear operator, however, I don't recall that job task analysis's are prepared. The operators are trained on a simulator over a 6 month period and then follow procedures when in the field. I do not believe there are JTAs. I think preparing what this standard states would overburden a company that has a process in place to ensure an operator is properly trained to maintain the BES under all conditions. A second comment is that PER-002 request that the RRO and NERC define a set of training program ojectives. Is SERC also going to have a set of stanards the entities must follow. Again this stanard is very restrictive.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.	

Question 19	
Commenter	**Comment**
The SPT SDT has significantly revised the standard based on industry feedback. The regional requirements are outside the scope of this standard.	
John Kerr; GRDA	Examples, explanations and studies should be conducted first. Most of this standard would put a burden on all entities.
Response: During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT will consider conducting a workshop.	
Jim Sorrels; AEP (1)	The Standard Drafting Team needs to be careful to not include verbiage in the Requirements and Measures that could lead to entities having to provide an individual's job performance evaluation as part of the documentation for training. These are private and confidential personnel records that should not become part of public record. This proposed standard needs additional work. AEP continues to agree conceptually with the purpose of the proposed standard and the need for such a standard. We would suggest that the drafting team take another hard look at what should be considered requirements and what are just good guidelines. The standard needs to focus on requirements. Presently, we believe it contains a significant amount of detail that should be considered guidelines, not requirements.
Response: The SPT SDT has revised the requirement to focus on positions, as opposed to individual or team performance. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases.	
Gerald LaRose; NYPA (1)	The phraseology "including any contract System Operator or System Operator performing tasks identified in R1 under delegation agreements" (R3, R6, R8) has in some instances been interpreted as applying to System Operators in a Local Control Center and in other instances to field personnel who perform SCADA-controlled or manual switching functions. The NERC Functional Model, as best as I know, contains no such reference. If the Drafting team is proposing that these Requirements extend beyond the what is in the Functional Model, e.g., RC and TOP, it should succinctly state such in a manner that will cause no confusion when the balloting commences.
Response: The “including any contract System Operator or System Operator …” has been removed from the requirement. The standard is applicable to the three functional entities, TOP, BA, RC and those personnel performing reliability-related tasks on behalf of those entities. The SPT SDT has revised section 4.2 (under Applicability) concerning the responsibilities.	
NPCC CP9 (1, 2)	NPCC Participating members believe this Standard is focused on the training program and not on the purpose of training. It is not important that an entity has a training program, rather it is vital that the entity has an effective training program, and one that is measurable by NERC. The Proposed Standard defines actions the entity must take but it does not define a performance measure that is tied to improving System Operator competency. For instance, if a gap is identified and training is

Question 19	
Commenter	**Comment**
	provided, then the entity has met the proposed Standard's requirements. But there is no assessment of successful training or poor training. Whether a gap is closed or remains after training does not matter to this Standard. This Standard should be limited to a requirement for the entity to identify and document required skills, a requirement to define an acceptable time period to acquire the skill, a method of documenting the Operator's skill, a method to reassess the Operator's skill if a gap was measured, and removal from Operation if a gap persists. The proposed NERC Standard is too keen on documentation of lesson plans, and not sharp enough on defining valuable objectives. Specific comments are: 1. R1. What is a Job Task Analysis? Needs to be defined. There is a difference between a list of tasks the Operator performs and a step by step instruction of performing the tasks. 2. R1.1 Needs to be more specific. What is meant by conditions? R1.2 This needs to be defined for the level of specificity required. R1.4. I think all real-time reliability related tasks are equally critical. The SDT should otherwise define levels of criticality criteria. R1.5 What is the SDT looking for in frequency definition? How is it defined? R1.6 Knowledge, skill and experience levels are not needed for JTA. All system operators, regardless of experience levels, should be able to perform reliability tasks. 3. R4 This does not belong in a Standard. The details are the responsibility of the entity. 4. R 6.2 How many hours of continuing training is required. R6.3 The word "Requirement" should not be spelled out. R6.4 Is not needed. Seems a repeat of R6.3 R6.5.1 Is the PER-002 R4 requirement going to be deleted? 5. R7. Training , the hours of training, the method of delivery, and objectives do not need to be documented to have a successful training program. Suggest eliminating this requirement. 6. R8. Training should be performed until an Operator is competent in a task. 7. R10- Not needed in a Standard.
Response: The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised R1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. R4 has been removed.	

Question 19	
Commenter	**Comment**
R6 has been removed. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT plans to recommend retiring PER-002. R7 has been removed. With respect to R8 has been removed. With respect to your comment on R10, the SPT SDT agrees and has removed the requirement.	
Roger McBeth; Northeast Utilities (1)	This standard will require a huge investment for creating a formal Job Task Analysis Database/Document to meet requirement R1.1 - R1.7 and there will still be the cost of developing the training materials. To manage such a JTA Database will require purchasing a costly Learning Management System. Most organizations are not currently staffed to manage such an undertaking and there is not a large source of system operators with the training experience to complete all aspects of this standard. From my own personal experience in the nuclear industry, I was part of a 3 person training staff prior to implementing the Systematic Approach to Training at a commercial nuclear power plant in 1984. There was a steep learning curve and a significant increase in staffing to support the administrative requirements. INPO provided a generic task list and job task analysis. We were required to perform a company specific Job Analysis/Job Task Analysis and develop training material using the results of the Job Task Analysis. This effort took close to a year using a 20 person contractor staff and we ultimately hired an additional 11 full time instructors to support the operator training program. We stopped all formal training programs during the performance of the JA/JTA and placed a significant demand on operator's time to serve as subject matter experts to support the JA/JTA and provide technical reviews for training material.
Response: The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised R1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. In response to your request for examples of reliability-related tasks, the SPT SDT has provided a Generic Task List in the revised standard.	
Ron Falsetti; IESO (2)	The IESO appreciates the opportunity to comment, and commends the drafting team for its breath of consideration in coming up with this draft standard. However, we feel that the standard can better focus on the key requirements for training. (1) We feel that the standard should focus on the following 4 key requirements to hold each of the three operating entities (RC, BA and TOP) responsible for: a. Developing a training program which lists the tasks (specifically for the RC, BA and TOP as listed in the Functional Model) to be performed and the competency level required to perform the tasks;

Question 19	
Commenter	**Comment**
	b. Delivering the training program; c. Recording, tracking and assessing progress of the persons receiving training; d. Planning, providing resource, reviewing and adjusting (as necessary) the training program annually. (2) Individual organizations may require the operators to perform other tasks but such tasks and the corresponding training requirements are outside of the scope of an industry-wide NERC standard from the viewpoint of the tasks assigned to the three functional entities. The training requirements to perform these other tasks should not be included in this standard. (3) Some of the items listed in R1.1 to R1.7 support the job/task description. They can be put as attachment template requirements that the training program shall include, and to aid assessment of compliance. Similarly. some of the items listed in R7 can be put into a template as requirements to prove delivery of the trainiing program. 4. Based on the above philosophy, we recommend the SDT to consider revising the draft standard as follows: (i) Keep R1 (for Key Requirement 1a above) and revise it as appropriate to require each of the 3 entities to develop a training program for their operating staff to perform the task associated with the entity's registered function; put some of R1.1 to R1.7 to a template attachment; (ii) Combine R2, R3, R4, R9 and R10 (for Key Requirement 1d above) to become a requirement for an annual planning, review, and maintenance exercise for the training program. (iii) Keep R6 (for Key Requirement 1b above), and put some of the items in R7 in a template attachment for proof of training delivery. (iv) Keep R8 (for Key Requirement 1c above), and revise it as appropriate. (v) Remove R5
Response: The SPT SDT agrees that the element identified is important and are encompassed in the revised standard. The SPT SDT has significantly revised the standard based on industry feedback. The standards addresses the core SAT phases. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform the analysis phase of systematic approach to training is not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. The SPT SDT has combined R2 and R3 and removed R4, R5, R6, R7, R8, R9, and R10 from the revised standard.	
Gordon Rawlings; BCTC (1)	There was no question directly associated with R6 to allow comments. Requirements R4 and R6 address similar training areas with the primary difference being R4 is for the "annual training plan" and R6 is the "implementation" of the training plan. It is difficult to write NERC

Question 19	
Commenter	**Comment**
	standards but some of the Standards repeat the same words just in a different context. Can the drafting team look at combining R4 and R6 into a single requirement addressing the separate issues of an annual training plan and the associated implementation of the plan? Separate Measures could be written to address these two areas even though they are contained within a single Requirement. BCTC supports a requirement for development, delivery, and evaluation of system operator training using a "systematic approach to training" as required in this Standard. Even though a specific principle of a systematic approach to training makes it more effective, that doesn't mean that principle should be part of a mandatory reliability standard. A reference document describing many of the "how" to do a quality job of using the systematic approach would be helpful. Some of our comments to remove parts of the Standard may fit well within a reference document that is not used to judge compliance. This standard may be the single most expensive standard to come from NERC for the electrical industry. It is important to ensure the words are clear and we know what is expected and not open to interpretation. We believe it also important to test this standard in industry to ensure it will work for its intended purpose. BCTC would request NERC to take the time to ensure the administrative requirements are gradually introduced and they do not take away time from training efforts already ongoing. The industry has been working through Certification and Continuing Education requirements that have been refined over the past 3 years and these requirements have been good to ensure training efforts and requirements get better within our industry. We hope that you will come back with a standard that is simple to understand not burdonsome on us to follow on top of the training requirements for CE and all the other efforts ongoing.
Response: The SPT SDT has removed R4 and R6 The SPT SDT has significantly revised the standard based on industry feedback. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for system operators that meets minimum standards may incur additional cost. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. Based on stakeholder feedback, the implementation plan has been lengthened to three years and the dates were removed. Phase 1 is 18 months; Phase 2 is 30 months; and Phase 3 is 36 months.	
Hydro One Networks (1)	In general, it is a good idea to be more prescriptive in training requirements but this standard is too prescriptive. -Greater understanding of the required detail pertaining to the JTA requirement in R1 is needed. Normally there are 3 requirement associated with learning objectives; action, conditions, and standard… not the 7 items listed R1.1 through R1.7. -R6.5.2 may be impossible to implement for every operator annually. -A clearer understanding of "reliability-related" and R1.4 "Criticality of the task with respect to reliability" is needed as this is open to subjective interpretation. -The activities listed in R7 may not all be applicable for each activity

Question 19	
Commenter	**Comment**
	used to support reliability-related training.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The drafting team has revised the requirements to reflect the outcomes of the analysis, rather than prescribing the methodology. The SPT SDT has revised the standard and Requirement 6.5.2 has been removed. The SPSDT agrees with your comment on criticality and has removed the references to criticality from the requirement. The SPT SDT has removed R7. The SPT SDT has added a paragraph in the Introduction section of the standard to clarify the meaning of reliability-related training.	
FirstEnergy (1,3,5,6)	FE would like to request NERC consider providing industry wide web based software support for the the job task analysis requirement. Software is available and used by the nuclear industry that would be useful and benefical to completing the job task analysis requirement of this standard.
Response: The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.	
Alan Adamson; NYSRC (2)	This Standard is overly broad and vague. This Standard is focused on the training program and not on the purpose of training. It is not important that an entity has a training program. Rather, it is vital that the entity has an effective training program, and one that is measurable by NERC. The Proposed Standard defines actions the entity must take, but it does not define a performance measure that is tied to improving System Operator competency. For instance, if a gap is identified and training is provided, then the entity has met the proposed Standard's requirements. But there is no assessment of successful training or poor training. Whether a gap is closed or remains after training does not matter to this Standard. This Standard should be limited to a requirement for the entity to identify and document required skills, a requirement to define an acceptable time period to acquire the skill, a method of documenting the Operator's skill, a method to reassess the Operator's skill if a gap was measured, and removal from Operation if a gap persists. The proposed NERC Standard is too keen on documentation of lesson plans, and not sharp enough on defining valuable objectives. Specific comments are: 1. R1. What is a Job Task Analysis? Needs to be defined. There is a difference between a list of tasks the Operator performs and a step by step instruction of performing the tasks. 2. R1.1 Needs to be more specific. What is meant by conditions?

Question 19	
Commenter	**Comment**
	R1.2 This needs to be defined for the level of specificity required. R1.4. I think all real-time reliability related tasks are equally critical. The SDT should otherwise define levels of criticality criteria. R1.5 What is the SDT looking for in frequency definition? How is it defined? R1.6 Knowledge, skill and experience levels are not needed for JTA. All system operators, regardless of experience levels, should be able to perform reliability tasks. 3. R4 This does not belong in a Standard. The details are the responsibility of the entity. 4. R 6.2 How many hours of continuing training is required. R6.3 The word "Requirement" should not be spelled out. R6.4 Is not needed. Seems a repeat of R6.3 R6.5.1 Is the PER-002 R4 requirement going to be deleted? 5. R7. Training, the hours of training, the method of delivery, and objectives do not need to be documented to have a successful training program. Suggest eliminating this requirement. 6. R8. Training should be performed until an Operator is competent in a task. 7. R10- Not needed in a Standard.
Response: The SPT SDT has significantly revised the standard based on industry feedback. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. R4 has been removed. R 6 has been removed. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The SPT SDT plans to recommend retiring PER-002. R7, R8, and R10 have been removed from the revised standard.	
Brian Thumm; ITC (1)	It appears that this standard will result in the need for more personnel being assigned and trained in how to be a Operations Trainer. Therefore the Implementation plan may need to be as long as five years to allow for this build-up of experience and knowledge in the training areas of companies. Finally, the standard's stated purpose is to ensure that system operators are competent to perform their real-time, reliability-related tasks. The standard focuses almost entirely on the documentation requirements for program elements, but offers little to no assurance that real-time operators remain competent in their duties. The standard requires the training program to be well documented, but the standard falls short on performance-based metrics for a successful training program.
Response: Based on stakeholder feedback, the implementation plan has been lengthened to three	

Question 19	
Commenter	**Comment**
years and the dates were removed. Phase 1 is 18 months; Phase 2 is 30 months; and Phase 3 is 36 months. The SPT SDT agrees with the comment that only specific tasks that are considered critical to reliability should be considered and has revised the requirement to include analysis that considers only reliability-related tasks by System Operator positions. The SPT SDT has added a requirement to the standard necessitating that each entity provide evidence that each of its real-time System Operators is competent to perform each assigned task that is on the list of reliability-related tasks. The SPT SDT has added a paragraph in the Introduction section of the standard to clarify the meaning of reliability-related training.	
Brian Tuck; BPA (1)	Requirements R4 and R6 address comparable training areas with the primary difference being that R4 is the "annual training plan" and R6 is the "implementation" of the annual training plan. BPA suggests the drafting team combine R4 and R6 into a single requirement addressing the separate issues of an annual training plan and its associated implementation. Separate Measures could be written to address these two areas even though they are contained within a single Requirement. BPA agrees with the requirement for annual refresher training on high reliability tasks (R6.5), and the inclusion of the 32 hour emergency operations requirement (R6.5.1) in this standard. While acknowledging the benefit of participation in regional exercises, BPA believes the requirement that all system operators participate in a regional exercise "involving all real-time operating positions likely to be involved in the actual event, with each person performing their assigned duties." (R6.5.2) is excessive and does not provide benefit commensurate with the development cost on an annual basis. BPA suggests removing requirement R6.5.2. BPA supports a Standard requiring development, delivery, and evaluation of system operator training using a "systematic approach". However, a mandatory reliability standard with economic sanctions should address the essental elements needed to comply with the Standard and not become too prescriptive in the implementation of the requirements. BPA applauds the restraint the drafting team has shown by making the effort to include only the essential elements of a systematic training program. Finally, BPA thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for system operators.
Response: The SPT SDT has removed R4 and R6 from the revised standard. The SPT SDT has significantly revised the standard based on industry feedback. The standards addresses the core SAT phases. A requirement has been added to the revised standard to address the 32 hours of emergency training.	
MRO (1,2)	The MRO believes that as long as this standard is not in conflict with other standards that require hours of emergency training (i.e. PER-003), then it is fine; however care needs to be taken to prevent these conflicts from arising in the future.
Response: PER005 will replace PER002 and portions of PER004. Please see the implementation plan.	

Question 19	
Commenter	**Comment**
Will Franklin; Entergy (6)	R6 seems to exist only to state that one must 'implement' the plan developed in R4. This unecessarily clutters the standard. It would be more concise to state in R4 that one must 'develop and implement' an annual training plan. Thanks for the opportunity to provide input on the development of the standard. In general, we support the principle of developing more structured guidelines for operator training.
Response: The SPT SDT has revised the standard and R4 and R6 have been removed.	
Allen Klassen; Westar (1)	R6.5 needs to be revised. Why maintain the 32 hour requirement which was arbitrarily "pulled from the air" as a reaction to the blackout, if the training program is developed and evaluated as required, arbitrary specified hours should not be required. R6.5.2 requires coordination and development of exercises that can not be completed by an individual entity (how can they be held to compliance if their neighbor fails to particpate, etc?). To complete this requirement annually for every operator at every entitity you better schedule an exercise every week, much too excessive, try every three years for each operator or maybe this is already covered by Continuing Education for Certification.
Response: While the Training Standard Drafting Team agrees with the logic of the argument, the 32 EOP hour requirements was maintained due to lack of evidence that it is unreasonable. The CE Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes this standard's requirements do not conflict with the CE Program's requirements.	
Michael Gammon; KCP&L (1)	Do not agree with all the requirements in R6 as stated below: **R6.** Each Reliability Coordinator, Balancing Authority and Transmission Operator shall implement its System Operator training program by providing training to all of its System Operator (including any contract System Operator or System Operator performing tasks identified in R1 under delegation agreements) as follows: [Risk Factor: High] **R6.1.** Entry-level training to provide System Operator with the knowledge and skill identified in R2 to meet the associated criteria for successful performance identified in R1.7. **R6.2.** Continuing training to reinforce knowledge and skills of incumbent System Operators as identified in the JTA (Requirement 1) that ~~were not covered in Requirement 4.2~~ meet requirements R4.2 to R4.4. (Everything the incumbent Operator needs is identified by R3 and specified in R4. There should not be anything that is not covered by this standard.) **R6.3.** Refresher training to eliminate performance gaps identified by the training needs assessments in by the JTA (Requirement 1) and ~~Requirement 2, and~~ Requirement 4.2 ~~3~~. **R6.4.** Continuing training to acquire the knowledge and skills necessary for new or modified tasks and tools

Question 19	
Commenter	**Comment**
	identified in R1 and R2 ~~and R3~~. **R6.5.** Annual refresher training for incumbent System Operator that includes the use of drills and simulations on tasks that have high reliability-related criticality (as identified in R1.4) and low frequency of occurrence (as identified in R1.5) to meet the associated criteria for successful performance identified in R1.7. This refresher training shall include: (This requirement is already in Reliability Standard PER-002, R4 and is not necessary to be repeated in this proposed standard.) R6.5.2. If sub regional, regional or interconnection-wide system exercises are available, at ~~At~~ least one exercise each year shall involve other entities on a sub-regional, regional or interconnection-wide basis, involving ~~all~~ the appropriate real-time operating positions likely to be involved in the actual event, with each person performing their assigned duties. (It is inappropriate to require an organization to do something that is entirely out of their control. What if no there are no sub regional or regional activities available? It should be left up to the companies involved to determine the extent of an exercise.)
Response: The SPT SDT has R6 from the revised standard PER005 will replace PER002, as described in the Implementation Plan.	
WECC OTS (1,2)	There was no question directly associated with R6 to allow comments. Requirements R4 and R6 address comparable training areas with the primary difference being R4 is for the "annual training plan" and R6 is the "implementation" of the annual training plan. Too many NERC and regional standards seem to say the same thing over and over with the only material difference being context. OTS suggests the drafting team combine R4 and R6 into a single requirment addressing the separate issues of an annual training plan and the associated implementation of the plan. Separate Measures could be written to address these two areas even though they are contained within a single Requirement. The OTS is the principle group in the Western Interconnection to support the WECC training program and providing support to the trainers in the West. OTS believes that quality training can and should result in quality System Operators and improved system reliability. Quality training doesn't just happen, it requires analysis and process. OTS supports a requirement for development, delivery, and evaluation of system operator training using a "systematic approach to training" as required in this Standard and as endorsed by the FERC. However, a mandatory reliability standard with economic sanctions should address the essental elements and not become too prescriptive in its requirements. The drafting team has shown restraint since early versions of the SAR and removed many requirements. Even though a specific principle of a systematic approach to training makes it more effective, that doesn't mean that principle should be part of a mandatory reliability standard. A reference document describing many of the "how" to do a quality job of using the systematic approach would be helpful. Some of the OTS comments to remove parts of the Standard would fit

Question 19	
Commenter	**Comment**
	well within a reference document that is not used to judge compliance. OTS requests the drafting team provide detailed responses to the comments expressed in this form and in accordance with the spirit of the standard drafting process. Finally, OTS thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for system operators.
Response: The SPT SDT has revised the standard and R4 and R6 have been removed. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training. During the development of the SAR for this standard, most stakeholders agreed that there is a reliability-related need for a new training standard. The standards addresses the core SAT phases. Improvements in industry training are warranted based on findings from the '03 Blackout Report and subsequent determination from FERC (Order 693). Developing and maintaining training for System Operators that meets minimum standards may incur additional cost. The drafting team is posting a document that identifies references that may assist entities in understanding and applying the SAT process.	
FRCC SO Subcommittee (1,2,5)	Requirement R6.5.2 needs to be deleted. Joint training exercises can be beneficial, but to mandate these at this time is not justifiable. The requirement is inappropriate since it would put an entity's compliance with the requirement, subject to cooperation by another entity. Language requiring a training needs assessment of System Operators performing task identified in R1 under delegations agreements is extremely burdensome. As an example, a neighboring company may be performing the regulating function of an entity, since some form of regulation will be identified in the JTA - the entity will be forced to perform a training needs assessment on that company performing regulation service to determine if their operators can successfully perform the tasks identified in the JTA - even if those operators are being trained by there own company. We therfore, disagree with the use of the parenthetical expression (including any contract System Operator or System Operator performing tasks identified in R1. under delegation agreements). The use of this caveat throughout the standard creates confusion and ambiguity in that it makes the requirements dificult to read and dilutes clarity. If the DT has a concern they should address it explicitely through a proposed definition or adding a caveat to the applicability section. Conceptually does the caveat imply that an entity will be responsible for tracking the training activities of another entity that it may have delegated a tasks to? If this is the intention, it will lead to significant confusion from a compliance measurement standpoint as far as an entity demonstrating compliance to the requirement by having to audit another entity's training records / program and demonstrate compliance on behalf of multiple entities.

Question 19	
Commenter	**Comment**
Response: The SPT SDT has revised the standard such that R 6.5.2 has been deleted. The SPT SDT agrees with the comment that the methodology used to perform the analysis phase of systematic approach to training should not be dictated. The SPT SDT revised the requirement such that the methodology used to perform and the information collected during the analysis phase of systematic approach to training are not prescribed in the revised Requirement 1. Rather, the requirement identifies the phases of the SAT process that must be included in the development of the training.	

Maureen E. Long
Standards Process Manager

August 15, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement: Comment Periods Open

The Standards Committee (SC) announces the following standards actions:

EOP-005-2 — System Restoration and Blackstart – Operations and EOP-006-2 — System Restoration and Blackstart — Coordination Standards Posted for 45-day Comment Period

The first drafts of the revisions to the set of System Restoration and Blackstart Standards (Project 2006-03) have been posted for a 45-day comment period from August 15, 2007 through September 28, 2007.

The proposed revisions update and move requirements from four standards into two standards as shown below:

Existing Approved Standards	Proposed Revised Standards
EOP-005-1 — System Restoration Plans	EOP-005-2 — System Restoration and Blackstart - Operations
EOP-006-1 — Reliability Coordination — System Restoration	EOP-006-2 — System Restoration and Blackstart — Coordination
EOP-007-0 — Establish, Maintain, and Document a Regional Blackstart Capability Plan	(merged into EOP-005-2 and EOP-006-2)
EOP-009-0 — Documentation of Blackstart Generating Unit Test Results	(merged into EOP-005-2 and EOP-006-2)

The proposed revised standards include many significant changes, including re-assignment of requirements that had been assigned to the Regional Reliability Organization, identification of the specific elements that must be contained in a system restoration plan, and the introduction of a new term "blackstart resource" along with a recommendation to retire the term "blackstart capability plan." Please use this comment form to submit comments on EOP-005-2 and EOP-006-2.

PER-005-1 — System Personnel Training Standard and Implementation Plan Posted for 45-day Comment Period

The second draft of PER-005-1 — System Personnel Training (Project 2006-01) has been posted along with its implementation plan, and references to aid in implementing the standard. The drafting team has made significant changes to the standard in response to stakeholder comments. The revised requirements focus more specifically on the reliability objective of the standard which is to ensure that

system operators performing real-time, reliability-related tasks on the North American bulk electric system are competent to perform those reliability related tasks.

Please use this comment form to submit comments on the second draft of PER-005-1.

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standard drafting team appointed by the Standards Authorization Committee on June 21, 2006.
2. Standards drafting team posted draft standard for comment on September 27, 2006.
3. Standards drafting team responded to comments and posted the revised standard on August 15, 2007.

Proposed Action Plan and Description of Current Draft:

This is the second posting of the proposed standard and its associated implementation plan for a 45-day comment period, from August 15, 2007 to September 28, 2007.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the second draft of the proposed standard.	November 1, 2007
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	November 15, 2007
3. Post the standard and implementation plan for a 30-day pre-ballot review.	December 1–January 1, 2008
4. Conduct an initial ballot for 10 days.	January 2–January 11, 2008
5. Respond to comments submitted with the initial ballot.	February 15, 2008
6. Conduct a recirculation ballot for 10 days.	February 15–February 25, 2008
7. Post for a 30-day preview for board.	March 1–March 31, 2008
8. Board adoption.	April 15, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System are competent to perform those reliability related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

4.2. This standard applies to System Operator positions of the entities listed in 4.1 and their delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric System.

5. Proposed Effective Dates:

5.1. Requirement 3 in the standard shall become effective on the first day of first quarter after applicable regulatory approval (or the Reliability Standard otherwise becomes effective on the first day of first quarter after Board of Trustee adoption in jurisdictions where regulatory approval is not required).

5.2. Requirement 2 in the standard shall become effective 18 months after the first day of the first quarter following regulatory approval (or the Reliability Standard otherwise becomes effective 18 months after the first day of the first quarter after Board of Trustee adoption in those jurisdictions where regulatory approval is not required).

5.3. Requirement 1 and Requirement 4 shall become effective 36 months after the first day of the first quarter following regulatory approval (or the Reliability Standard otherwise becomes effective 36 months after the first day of the first quarter after Board of Trustee adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall complete the five phases of a systematic approach to training (SAT) (which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training program(s) that addresses Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators. [Risk Factor: Medium] [Time Horizon: Long-term Planning]

R1.1. To create a company-specific list of BES reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Owner shall select all tasks performed by its System Operator positions from the Generic Task List (provided in Attachment A) and add other BES reliability-related tasks performed by its System Operator positions.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall assess at least annually the training needs of each System Operator position to determine the mis-match

between acceptable and actual performance capability. [Risk Factor: Medium] [Time Horizon: Long-term Planning]

R2.1. The assessment shall include identification of mis-matches between acceptable and actual performance capability that need to be addressed through future training.

R2.2. The assessment shall include identification of training required to perform new or revised tasks from the company-specific reliability related tasks.

R3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours annually of emergency operations and system restoration training. [Risk Factor: Medium] [Time Horizon: Long-term Planning]

R3.1. The emergency operations and system restoration training shall include the principles and procedures needed for recognizing and responding to emergencies, using drills, exercises or simulations of system conditions in subject areas from the Emergency Operations Topics (provided in Attachment B).

R3.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall add or remove topics from the Emergency Operations Topics to reflect emergency operations and system restoration topics that apply to its organization.

R4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify the capabilities of each of its real-time System Operators to perform each assigned task on its list of company-specific BES reliability-related tasks. [Risk Factor: Medium] [Time Horizon: Long-term Planning]

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of a SAT-developed BES System Operator training program with evidence of the following SAT-related outcomes:

M1.1. Analysis that results in a list of company-specific BES reliability-related tasks and measurable or observable criteria for desired performance for each task

M1.2. Design and development of training materials that result in learning objectives and content that is derived from results of training analysis

M1.3. Implementation of the training program, as identified in the training analysis

M1.4. Evaluations and assessments of training delivered to determine if learning objectives are met

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection the results of its latest assessment for each position, as specified in R2.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide evidence that each System Operator has obtained 32 hours of emergency operations or system restoration training, as specified in R3.

M4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection verification of the capabilities for each real-time System Operator, as specified in R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Enforcement Authority (CEA)

1.2. Compliance Monitoring Period and Reset

The performance reset period for all requirements is one month.

1.3. Data Retention

For all requirements and measures, each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain evidence of compliance for four years or since its most recent on-site compliance audit, whichever is greater. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain all data used to show evidence it is following or followed any mitigation plan associated with this standard.

The Compliance Monitor shall retain data, including self-certifications, since its last on-site audit and all documentation from other compliance monitoring methods used since the last on-site compliance audit. The Compliance Monitor shall retain any data used in mitigation plans associated with this standard.

1.4. Additional Compliance Information

Each Reliability Coordinator, Transmission Operator and Balancing Authority shall demonstrate compliance through self-certification submitted to its Compliance Enforcement Authority annually.

The Compliance Enforcement Authority shall conduct a scheduled on-site review once every three years, and may conduct spot checks and investigations to assess performance.

2. Violation Severity Levels

2.1. Lower: There shall be a lower violation for each subsection in which one or more of the following conditions exist:

2.1.1 None

2.1.2 None

2.1.3 The responsible entity did not add or remove topics from the Emergency Operations Topics that apply to their organization.

2.1.4 None

2.2. Moderate: There shall be a moderate violation for each subsection in which one or more of the following conditions exist:

2.2.1 The responsible entity has completed a list of company-specific reliability-related tasks from the Generic Task List (Provided in attachment A), and has started creating a list identifying all other reliability-related task that the company performs, but the list is not complete.

NOTE: If the entity violates R1.1, the entity is also in violation of R1, (failure to perform the Analysis phase of the SAT process).

2.2.2 The responsible entity has determined training required based on the mis-match between acceptable and actual performance capability but has not included the training identified in its current schedule.

2.2.3 The responsible entity provided at least 32 hours of training on emergency operations or system restoration, annually, but did not include training in subject areas listed in Attachment B.

2.2.4 None

2.3. High: There shall be a high violation for each subsection in which one or more of the following conditions exist: The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements.

2.3.1 The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of one of the five phases of a SAT process listed below when establishing new system operator training: (R1)

- Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives
- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

OR

The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of one of the five phases of a SAT process listed below when making modifications to an existing system operator training program:

- Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives
- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

OR

The responsible entity does not have a system operator training program based on the SAT process for one of its system operator positions (as identified in Section 4.2).

2.3.1.1 The responsible entity has started creating a list or has a partial list identifying its company specific list of reliability related tasks from the generic task list (in Attachment A), but the list is not complete

NOTE: If the entity violates R1.2, the entity is also in violation of R1, (failure to perform the implementation phase of the SAT process).

2.3.2 The responsible entity has not performed an assessment which includes identification of measurable or observable criteria for desired performance to each task for the determination of the training needs for one of its system operating position.

2.3.2.1 The responsible entity has not identified training required based on the mis-match between acceptable and actual performance capability.

2.3.3 The responsible entity provided to its system operators at least, 32 hours of emergency operations or system restoration training, annually, but not all its System Operators has completed or evidence shows will not have completed the required annual training.

2.3.3.1 The responsible entity provided at least 32 hours of training on emergency operations or system restoration, but the training did not include training in principles and procedures needed for effectively recognizing and responding to emergencies **OR**

The emergency operations or system restoration training delivery method did not include drills, exercises, or simulations of system conditions,

2.3.4 The responsible entity has performed an assessment of its System Operator's capabilities to perform each identified task that is on its company-specific reliability-related task, but not for each of its System Operators.

2.4. Severe: There shall be a severe violation for each subsection in which one or more of the following conditions exist. The responsible entity has failed to meet the reliability objective of the requirement.

2.4.1 The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of two of the five phases of a SAT process listed below when establishing new system operator training:

- Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives
- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

OR

The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of two of the five phases of a SAT processes listed below when making modifications to an existing system operator training program. :

- Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives

- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

OR

The responsible entity does not have a SAT program for its system operators.

2.4.1.1 The responsible entity failed to create a company specific list of reliability related tasks from the generic task list. (in attachment A) **OR**

The responsible entity failed to create a list of all other reliability-related task the company performs.

2.4.2 The responsible entity has not performed an assessment which includes identification of measurable or observable criteria for desired performance to each task for the determination of the training needs for two of its system operating position **OR**

The responsible entity has not performed an annual assessment as required by R2.

2.4.3 The responsible entity did not provide to its system operators at least 32 hours of emergency operations or system restoration training **OR**

The responsible entity has provided 32 hours of emergency operations and system restoration training but the training has not provided annually.

2.4.4 The responsible entity has not performed an assessment on its System Operator's capabilities to perform each identified task that is on its company-specific reliability-related task list

E. Regional Variances

None.

Attachment A: Generic Task List

Attachment A presents a generic list of tasks to assist with the creation of a company-specific list of reliability-related tasks. Entities shall add or remove from the list to create a list of reliability-related tasks applicable to their organization.

General Control Center Operations Tasks:

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
1	Communication	Provide real-time system information to the Reliability Coordinator.
2	Communication	Coordinate reliability processes and actions with and among other Reliability Coordinators.
3	Communication	Issue reliability alerts to Generator Operators, Load-Serving Entities, Transmission Operators, Transmission Service Providers, Balancing Authorities, Regional Councils, and NERC
4	Communication	Produce and publish system status information (e.g., OASIS, IRN, and RCIS)
5	Communication	Prepare and provide data to reliability coordinator for later inclusion in NERC reports
6	Communication	Ensure all balancing authorities or transmission operators are aware of solar magnetic disturbances (SMD) forecast information
7	Communication	Communicate the status of system conditions with appropriate reliability coordination offices
8	Communication	Communicate the status of system conditions with appropriate balancing authorities and/or transmission operators
9	Communication	Report disturbances to NERC following the guidelines within the U.S. Department of Energy's most recent Power System Emergency Reporting Procedures
10	Communication	Communicate with interconnected systems during normal and emergency conditions using established procedures
11	Communication	Coordinate operations between the host balancing authority or transmission operator and any transmission operating entities that exist within the host balancing authority and/or transmission operator's boundaries to ensure transmission reliability
12	Communication	Report to the regional council staff within 24 hours after a disturbance affecting your system has occurred
13	Communication	Report any disturbances or unusual occurrences, suspected or determined to be caused by sabotage to the appropriate systems, governmental agencies, and regulatory bodies
14	Communication	Coordinate reliability processes and actions with and among other reliability coordinators

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
15	Communication	Utilize the voice and data telecommunication systems as required while adhering to Interconnection and regional operating procedures
16	Monitor	Monitor real-time operational information from balancing authorities and transmission operators.
17	Monitor	Interpret SCADA-generated alarms and information, and then take appropriate actions to maintain system reliability
18	Monitor	Check data and verify accuracy of each metering point used by Supervisory Control and Data Acquisition (SCADA)
19	Monitor	Monitor performance of power system equipment and call out system personnel when appropriate
20	Monitor	Monitor system load and generation
21	Monitor	Ensure all special protection systems and special design features are in service as needed
22	Monitor	Monitor real-time market prices for accuracy
23	Monitor	Monitor and respond to alarms from status of special protective schemes
24	Monitor	Verify data used in operation
25	Monitor	Monitor the RCIS and respond to any information provided
26	Monitor	Monitor all reliability-related system parameters, such as MW, MVAR, voltage, and amps to determine system conditions
27	Monitor	Monitor and control access to the control center to prevent sabotage
28	Monitor	Monitor all reliability-related data within a reliability coordinator area
29	Monitor	Monitor and periodically test normal and emergency telecommunication systems that link with interconnected systems to ensure communications are adequate and continuous
30	Monitor	Monitor and respond to telecommunication alarms or failures and notify the appropriate personnel
31	Monitor	Monitor and maintain defined voltage profiles to ensure system reliability
32	Monitor	Monitor and validate telemetry data for accuracy
33	Monitor	Monitor control center systems and support equipment and call out appropriate assistance as needed
34	Operating	Analyze operations log, and oral information from system operator leaving shift
35	Operating	Maintain records of special protection system, special design feature, and transmission protection system mis-operations
36	Operating	Evaluate impact of current weather conditions on system operations

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
37	Operating	Evaluate system conditions and apply operating guides when applicable
38	Operating	Evaluate the extent of an outage or disturbance and develop a plan of restoration
39	Operating	Identify operating problems and deficiencies, and recommend corrective measures
40	Operating	Respond to performance survey requests
41	Operating	Provide input to ensure that the operations computer database is up to date
42	Operating	Prepare daily reports and logs generated to meet company and regulatory requirements
43	Operating	Adjust control systems to compensate for any equipment errors or failures
44	Operating	Perform same-day reliability analysis of the electric system
45	Operating	Perform next-day reliability analysis of the electric system
46	Operating	Analyze and authorize requests for equipment outages
47	Operating	Enforce operational reliability requirements
48	Operating	Compile regional system data reports
49	Operating	Operate primary and backup telecommunications systems as required
50	Operating	Schedule system telecommunications, telemetering, protection, and control equipment outages to ensure system reliability
51	Operating	Maintain current knowledge of power system modifications and additions
52	Operating	Ensure that every effort is made to remain connected to the Interconnection
53	Operating	Take action as necessary to protect the system if it becomes endangered by remaining interconnected
54	Operating	Apply guidelines, including lists of utility contact personnel, for reporting disturbances due to sabotage events
55	Operating	Direct to the appropriate entities those options necessary to relieve reliability threats and violations in a reliability coordinator area
56	Operating	Ensure the accuracy of current system status by updating necessary operating procedures, diagrams, and map board
57	Operating	Provide input to system planners to help maintain accuracy in system models used for reliability assessments
58	Operating	Evaluate, test, and/or confirm the accuracy of reliability assessment tools
59	Operating	Utilize interconnected operation services as needed to maintain system reliability

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
60	Operating	Utilize reactive resources from transmission and generator owners to maintain acceptable voltage profiles
61	Operating	Enforce compliance of operating reliability limits
62	Operating	Arm or verify that special protection systems are armed to meet system conditions (contingencies) as needed
63	Operating	Test, evaluate, and operate backup control center facilities/systems as needed
64	Operating	Implement procedures for the recognition of sabotage events on your facilities and multi-site sabotage affecting larger portions of the Interconnection
65	Operating	Implement specified procedural actions in the event of a FERC Standards of Conduct violation
66	Procedure	Complies with reliability requirements specified by Reliability Coordinator.
67	Procedure	Evaluate current operating practices and make recommendations for improvement to meet NERC reliability standards' requirements
68	Procedure	Implement system restoration procedures
69	Procedure	Maintain a working knowledge of regional, NERC, FERC, and company specific guides, policies, and standards

Transmission Tasks:

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
1	Limits	Monitor and operate or direct the operations of the transmission system within equipment and facility ratings.
2	Operating	Notify Generator Operators of transmission system problems in compliance with NERC requirements.
3	Outage	Adjust transmission configuration to implement proposed transmission system outage plan
4	Outage	Build contingency case for scheduled outages for next day
5	Outage	Coordinate planned and unplanned transmission outages with all impacted systems to ensure transmission system reliability
6	Outage	Direct transmission operators to revise maintenance plans as required, and as permitted by agreements
7	Outage	Implement transmission outages to ensure system reliability
8	Outage	Initiate the cancellation of scheduled transmission work when system conditions require
9	Outage	Interpret relay targets, oscillograph readings, breaker operations, and field observations to determine proper restoration methods during forced outages
10	Outage	Notify others of any planned transmission changes that may impact the operation of their facilities
11	Outage	Perform reliability analysis to determine impact of both scheduled and forced transmission outages
12	Outage	Receive and review transmission maintenance plans from transmission operators for reliability assessment
13	Outage	Report transmission outages to the reliability coordinators and other affected utilities
14	Limits	Coordinate with impacted systems, and monitor actual and/or expected operating reliability limit violations and respond as required
15	Limits	Develop or calculate system operating limits
16	Limits	Direct transmission operators to take actions to mitigate interconnection reliability operating limits
17	Limits	Ensure all tie-line limits are not exceeded
18	Limits	Ensure that transmission contract paths are not exceeded
19	Limits	Identify, communicate, and direct actions to relieve reliability threats and limit violations in the reliability coordinator area
20	Limits	Initiate control actions resulting from thermal limit violations, considering the responsiveness of the system
21	Limits	Monitor and respond to transmission system equipment rating violations
22	Limits	Monitor bulk transmission elements to determine constraints and operating limit violations
23	Limits	Monitor major transmission lines, flow gates, and scheduling paths

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
24	Limits	Coordinate with transmission operators and transmission service providers on real-time transmission system limitations.
25	Limits	Monitor interconnection reliability operating limits .
26	Limits	Recalculate interconnection reliability operating limits based on current or future conditions, and according to transmission and generator owners' specified equipment ratings
27	Limits	Develop interconnected operating reliability limits
28	Operating	Analyze/research any bulk system disturbances affecting your system
29	Operating	Respond to disturbance conditions
30	Operating	Monitor and operate transmission system within its designed capabilities
31	Operating	Monitor radio system for calls requiring response
32	Operating	Monitor system frequency and initiate a hotline conference call when frequency error exceeds specified limits
33	Operating	Monitor the condition of the transmission system and respond as required (including shedding firm load) to avoid voltage collapse and/or Interconnection separation
34	Operating	Monitor the voltages, and coordinate the reactive dispatch of transmission facilities, and the interconnections with neighboring systems
35	Operating	Develop special operating procedures to allow continued operation of the transmission system based on the results of a reliability analysis
36	Operating	Direct and/or control all energization and/or modification of new or existing facilities
37	Operating	Direct and/or control phase shifting transformer taps
38	Operating	Direct and/or control transmission switching
39	Operating	Direct and/or regulate the operation of the transmission system
40	Operating	Ensure adequate transmission facilities are available to meet external and internal requirements (real-time or hourly)
41	Operating	Implement corrective actions from transmission problems resulting from an underlying sub-transmission or distribution event (local reliability issues)
42	Operating	Maintain constant awareness of neighboring transmission system conditions
43	Operating	Maintain safe operating conditions for all persons and property within the transmission system
44	Operating	Operate control equipment to continuously and accurately meet its system and Interconnection control obligation and measure its performance
45	Operating	Perform reliability analysis (actual and contingency) for the reliability coordinator area
46	Operating	Provide oversight of transmission operational plans, direct revisions as required, and as permitted by agreements
47	Operating	Respond to solar magnetic disturbance (SMD) warnings as required by system

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
		operating procedures
48	Operating	Specify interconnected operation services requirements for transmission reliability (e.g., reactive requirements, location of operating reserves)
49	Operating	Supervise and coordinate all activity at switching stations, generating stations, and transmission switchyards
50	Operating	Utilize load flow modeling tools to determine power flow changes and optimum system configurations during normal and emergency conditions
51	Voltage	Deploy reactive resources to maintain acceptable voltage profiles.
52	Voltage	Coordinate voltage reduction as requested by the balancing authority or as directed by the reliability coordinator.
53	Voltage	Direct voltage reduction
54	Voltage	Approve system voltage regulating equipment outages to ensure adequate system voltage and system reliability is maintained
55	Voltage	Coordinate operation of voltage control equipment with interconnected utilities
56	Voltage	Direct transmission operators to reduce voltage or shed load if needed to ensure balance in real-time
57	Voltage	Identify and respond to conditions likely to lead to voltage collapse
58	Voltage	Implement voltage reductions as directed by a transmission operator
59	Voltage	Minimize system voltage decay and prevent cascading outages
60	Voltage	Schedule system voltage regulating equipment outages to ensure adequate system voltage and system reliability is maintained
61	Voltage	Utilize HVDC systems' reactive power control capabilities as a voltage control tool when appropriate
62	Voltage	Utilize transmission line removal as a voltage control tool only if system studies indicate that system reliability will not be degraded below acceptable levels
63	Limits	Request reliability coordinator to mitigate equipment overloads.
64	Congestion	Identify special operating procedures that may be necessary to maintain acceptable transmission loading
65	Congestion	Initiate line loading relief procedures upon request of members of the Interconnection using appropriate priority levels
66	Congestion	Initiate transmission loading relief procedures to relieve potential or actual loading on a constrained facility
67	Congestion	Manage transmission loading by directing the redispatch of generators or reconfiguring the transmission system to mitigate impact, including the load curtailment process
68	Congestion	Notify all affected areas that line loading relief has been requested, and that corrective actions are required
69	Congestion	Request the reliability coordinator to mitigate equipment overloads
70	Congestion	Run day-ahead congestion management market

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
71	Congestion	Run hour-ahead congestion management market to allocate available transmission capacities
72	Congestion	Use the results from an available transfer capability (ATC) calculator to determine the impact of an interchange transaction on the transmission system
73	Congestion	Utilize the Interchange Distribution Calculator to determine transaction curtailments for transmission load relief
74	Congestion	Calculate and post changes in available transmission capacity
75	Congestion	Implement terms of interruption for transmission services according to contractual provisions
76		Direct load shedding
77	Load	Coordinate load shedding as requested by the balancing authority or as directed by the reliability coordinator.
78	Load	Issue corrective actions (e.g., curtailments or load shedding) to transmission operators, transmission service providers
79	Load	Adjust both short-term and future forecasts using actual load data and correction factors
80	Load	Call for interruptible loads to be shed when required
81	Load	Collect individual load profiles and forecasts of end-users energy requirements, and develop overall load profiles
82	Load	Compile load forecasts from load-serving entities within a balancing area
83	Load	Coordinate load shedding, and load restoration with, or as directed by the reliability coordinator
84	Load	Coordinate or direct use of controllable loads that have been bid as interconnected operations services
85	Load	Develop both short-term and future forecasts using actual load data and correction factors
86	Load	Monitor an area’s estimated and actual loads
87	Load	Respond to light load conditions

Generation Tasks:

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
1	Balancing	Direct resources (generator operators and load-serving entities) to take action to ensure balance in real time
2	Balancing	Ensure adequate generation capacity is available to meet external and internal requirements (real-time, or hourly)
3	Balancing	Respond to manual time error correction requests by regional time error monitor
4	Balancing	Allocate generation resources to meet system requirements
5	Balancing	Allocate load resources to meet system requirements
6	Balancing	Monitor AGC to ensure compliance with NERC CPS1 and CPS2 standards
7	Balancing	Perform system configuration evaluation for dispatching of imbalance energy based on real-time conditions
8	Balancing	Minimize inadvertent flows, losses, and CPS1 and CPS2 criteria violations
9	Balancing	Monitor AGC performance to diagnose and identify telemetry problems
10	Balancing	Compare actual generator output with anticipated schedules, and take action to account for the difference
11	Balancing	Dispatch generation resources economically while maintaining system reliability
12	Balancing	Monitor time error and initiate corrections
13	Balancing	Manually calculate ACE as necessary
14	Balancing	Publish next-day market results
15	Balancing	Monitor ramping capability for requested interchange schedules
16	Balancing	Ensure that the balancing authority is satisfying its Interconnection frequency regulation obligation
17	Balancing	Ensure that the balancing authority's frequency bias value is continually set at the proper value
18	Balancing	Monitor ACE to determine if the calculation is correct
19	Balancing	Inform the appropriate balancing authority of the status of its overlap regulation service
20	Balancing	Verify that the regulating capacity is distributed equitably over as many units as possible
21	Balancing	Manage generation biasing to avoid reliability limit violations
22	Balancing	Monitor response of units to the AGC signals
23	Balancing	Operate the AGC system in tie-line bias control mode unless such operation is adverse to system or Interconnection reliability
24	Balancing	Obtain replacement energy upon a loss of any major generating or interchange resource
25	Balancing	Respond to generation losses, recognizing reliability restrictions to effectively maintain tie-line flows
26	Balancing	Apply the principles of economic dispatch to generating units

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
27	Balancing	Respond to generation losses, recognizing economic and reliability restrictions
28	Balancing	Publish hour-ahead market results
29	Balancing	Publish day-ahead market results
30	Balancing	Declare an Energy Emergency Alert (EEA) when generation resources and reserves are inadequate to meet demand
31	Balancing	Consult with other impacted balancing authorities, adjust the AGC algorithm for the proper time periods (on-peak and off-peak) to account for known tie-line metering errors
32	Balancing	Review generation commitments, dispatch, and load forecasts
33	Balancing	Receive and review generation operations plans and commitments from balancing authorities for reliability assessment
34	Balancing	Control or direct generation biasing to provide overlap regulation service to other balancing authorities in accordance with contractual obligations
35	Balancing	Ensure adequate energy resources are available to meet external and internal requirements (real-time or hourly)
36	Congestion	Direct the reduction or shedding of load if needed to ensure balance within its balancing authority area.
37	Congestion	Direct generator operators to implement redispatch for congestion management.
38	Congestion	Issue corrective actions (e.g., curtailments or load shedding) to balancing authorities.
39	Congestion	Procure alternate sources of energy when reliability coordinator curtails transactions or calls for generation re-dispatch
40	Congestion	Issue generation dispatch adjustments to mitigate transmission congestion
41	Congestion	Direct balancing authorities to take actions to mitigate interconnection reliability operating limits
42	Congestion	Control, direct, or manage generation dispatch to avoid transmission reliability limit violations
43	Operating	Monitor output of units ensuring that MW output is within operating limits
44	Operating	Monitor output of units ensuring that MVAr output is within operating limits
45	Operating	Operate generation to minimize inadvertent power flow
46	Operating	Operate the SCADA and analog systems to control generation and monitor telemetered information
47	Operating	Select proper mode of automatic generation control for system conditions
48	Operating	Suspend automatic generation control as required
49	Operating	Monitor system fuel reserves
50	Operating	Communicate with generating station regarding work for anticipated increases or decreases that may cause limit changes
51	Operating	Monitor generation production data for correctness and ensure that records are developed and maintained as required

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
52	Operating	Monitor output of units ensuring that MW output is operating according to schedules
53	Operating	Monitor output of units ensuring that MVAr output is operating according to schedules
54	Operating	Supervise and coordinate all activity at generating stations
55	Operating	Monitor hydro generation and pond levels
56	Operating	Monitor generating unit governors to verify their operational status
57	Operating	Initiate manual control of generation, and maintain scheduled interchange following an AGC system component failure
58	Operating	Operate power facilities in compliance with environmental standards (e.g., air quality, wildlife)
59	Operating	Ensure that the AGC and other vital control performance equipment are functioning properly when using the backup power supply following the loss of the primary power supply
60	Operating	Verify the accuracy of the AGC tie-line metering by comparing hourly MWh meter totals to the totals derived from tie-line meter registers
61	Operating	Monitor the status and availability of generator voltage regulators and/or power system stabilizers, and respond as required to deficiencies that may impact system reliability
62	Operating	Test/verify the reactive capability of generating units
63	Operating	Administer generator start-up and shutdown schedules
64	Operating	Report the status of generator automatic voltage regulators and/or power system stabilizers to transmission operators
65	Operating	Provide oversight of generation operational plans, direct revisions as required, and as permitted by agreements
66	Operating	Validate adequacy of resource plans (in near real time)
67	Operating	Procure interconnected operations services from generator owners to ensure voltage support from generating resources is adequate
68	Operating	Notify generator operators of voltage limitations, or equipment overloads that may impact, or are impacting generator operations
69	Outage	Inform the reliability coordinator and impacted balancing authorities of interchange schedule interruptions due to generation or load interruptions within its balancing authority area.
70	Outage	Plan next-day generation required to implement a proposed outage
71	Outage	Implement terms of interruption for generation services according to contractual provisions
72	Outage	Implement or delay generation outages to ensure system reliability
73	Outage	Coordinate ramp down of unit going on planned outage
74	Outage	Adjust generation levels to implement proposed transmission system outage plan
75	Outage	Perform reliability analysis to determine impact of both scheduled and forced

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
		generation outages
76	Outage	Separate or shut down generators that are unsafe to operate during or after an area disturbance
77	Outage	Direct generation operators to revise maintenance plans as required, and as permitted by agreements
78	Reserves	Apply operating reserves when needed
79	Reserves	Respond to reserve sharing group requests for emergencies
80	Reserves	Perform day-ahead ancillary services auction
81	Reserves	Produce list of resources to meet additional energy requirements (from ancillary service market) to purchase in real time
82	Reserves	Monitor and analyze regional reactive reserve availability
83	Reserves	Perform instantaneous reserve checks
84	Reserves	Dispatch operating reserves to alleviate system emergency conditions
85	Reserves	Perform hour-ahead ancillary services auction
86	Reserves	Monitor and analyze regional operating reserves availability
87	Reserves	Reestablish required operating reserve levels as soon as possible following a contingency that results in operating reserve usage
88	Reserves	Administer performance tests for generating resources providing ancillary services (e.g., spinning, regulation, unit ramp rates)
89	Reserves	Determine required quantities of ancillary services
90	Reserves	Determine reserves needed for the next hour
91	Reserves	Determine reserves needed for the next day
92	Reserves	Determine reserves needed for future days (long term)
93	Reserves	Monitor reactive reserve levels to ensure adequate reactive reserves exist and are properly located to provide for adequate voltage levels under normal and emergency conditions
94	Reserves	Restore reactive reserves to acceptable levels as soon as possible after use
95	Reserves	Ensure adequate spinning and operating reserves are on line
96	Reserves	Ensure adequate spinning and/or operating reserves are dispersed throughout the system
97	Reserves	Monitor available operating reserves and take corrective actions to correct deficiencies

Interchange Tasks:

ITEM#	TYPE OF ACTIVITY	INTERCHANGE TASKS
1	Communication	Communicate with real-time scheduler regarding the purchase of resources
2	Communication	Notify source balancing authority and transmission service providers, or transmission operators when an interchange transaction must be modified or terminated
3	Communication	Notify intermediate balancing authorities when an interchange transaction must be modified or terminated
4	Communication	Notify participants of transaction curtailments or adjustments observing NERC communication protocols
5	Communication	Notify sink balancing authority or transmission service provider when an interchange transaction needs to be modified or terminated
6	Communication	Notify the interchange authority when interchange transactions are cancelled or terminated
7	Congestion	Curtail, terminate, or modify interchange transaction requests that aggravate operating limits
8	Congestion	Curtail transactions as directed across interfaces
9	Congestion	Ensure that the maximum net scheduled interchange with other balancing authorities does not exceed the available transfer capability
10	Congestion	Ensure that all curtailments are properly applied per reliability coordinators instructions
11	Congestion	Analyze the impact of proposed requests for transmission service and interchange schedules on the bulk power system
12	Congestion	Reestablish curtailed interchange transactions with affected balancing authorities or transmission operators
13	Congestion	Coordinate reallocation and reloading of interchange transactions during transmission loading relief procedures
14	Monitor	Monitor status of NERC interchange transaction tags to ensure timely approval and implementation
15	Operating	Arrange transactions for energy to serve projected demand
16	Operating	Determine proper use of dynamic schedules of remote generating units as to their contribution to operating reserves
17	Operating	Manually calculate net interchange when needed
18	Operating	Determine energy excess after meeting load, reserves, and contract obligations
19	Operating	Verify the accuracy of time error monitoring equipment
20	Operating	Maintain the confidentiality of interchange transactions
21	Operating	Protect the confidentiality of all interchange transaction information
22	Operating	Check inadvertent interchange accounts with other balancing authorities at the end of each day

ITEM#	TYPE OF ACTIVITY	INTERCHANGE TASKS
23	Operating	Ensure that all appropriate transmission rights are assigned to all energy schedules (e.g., OASIS reservations) prior to their implementation
24	Operating	Agree upon daily schedule totals and energy imbalance totals with balancing authorities or transmission operators and other schedulers as needed
25	Operating	Assess, approve, or deny interchange transaction requests based on reliability analysis from the ATC calculator
26	Operating	Create NERC interchange transaction tag with all required information
27	Operating	Implement or terminate interchange transactions when needed
28	Operating	Adjust interchange transactions
29	Operating	Monitor the electronic (interchange) tagging system for accuracy of information (e-tagging)
30	Operating	Ensure all import and export schedule totals are checked for accuracy and correctness with each utility at the end of the day
31	Operating	Ensure interchange transactions are conducted in accordance with regional and NERC standards
32	Operating	Implement inadvertent interchange payback schedules with other entities
33	Operating	Submit a request to obtain the necessary transmission reservations to implement transactions
34	Operating	Manually calculate ACE as necessary
35	Operating	Adjust transfers across interfaces to maintain system reliability
36	Operating	Submit NERC interchange transaction tag to transmission providers and balancing authority or transmission operators on the scheduling path within proper timeframe
37	Operating	Secure appropriate transmission rights in response to system emergencies
38	Operating	Enter interchange transactions into the control area's scheduled interchange
39	Operating	Coordinate with any controlled interface operators (e.g., DC ties) that are part of an interchange transaction-scheduling path
40	Operating	Participate in system planning studies to determine transfer capabilities and operating limits
41	Operating	Check and validate hourly tie-line data
42	Operating	Monitor inadvertent accumulations in both the on-peak and off-peak accounts
43	Operating	Maintain knowledge of existing and proposed Interconnection agreements and contracts
44	Operating	Maintain accurate settlement records for bulk power sales and purchases
45	Operating	Apply tariffs associated with rates and services uniformly to all parties
46	Operating	Evaluate and respond to customer requests for transmission and ancillary services via the OASIS
47	Operating	Ensure that the ramp rate, start and end times, energy profile, and losses are communicated to all parties in the transaction

ITEM#	TYPE OF ACTIVITY	INTERCHANGE TASKS
48	Operating	Identify potential parallel flow impacts on pending interchange
49	Operating	Approve interchange transactions based upon a reliability perspective
50	Operating	Monitor dynamic energy schedules for the appropriate use of transmission rights
51	Operating	Administer interchange scheduling and recordkeeping requirements with interconnected balancing authorities or transmission operators or other utilities
52	Operating	Implement interchange schedules
53	Operating	Approve or deny bilateral schedules from the reliability perspective
54	Operating	Confirm and approve interchange transactions from ramping ability perspective
55	Operating	Enter interchange transaction information into reliability assessment tools
56	Operating	Determine and post available transfer capability values
57	Operating	Secure energy and transmission services to serve end-use customers
58	Operating	Perform after-the-hour checkout of actual and scheduled interchange with adjacent balancing authorities
59	Operating	Approve or deny transmission service requests in accordance with any tariff requirements (OASIS)
60	Operating	Ensure transmission reliability margins, total transfer capabilities and available transfer capabilities are correctly posted

Emergency Operations Tasks:

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
1	Capacity	Request emergency energy upon loss of a resource
2	Capacity	Respond to capacity deficiency
3	Capacity	Respond to loss of energy resources within allowable regional or pool timeframe
4	Capacity	Prepare for a capacity emergency by bringing on all available generation
5	Capacity	Prepare for a capacity emergency by postponing equipment maintenance
6	Capacity	Prepare for a capacity emergency by scheduling emergency energy purchases
7	Capacity	Prepare for a capacity emergency by reducing load
8	Capacity	Prepare for a capacity emergency by initiating voltage reductions
9	Capacity	Prepare for a capacity emergency by requesting emergency assistance from other systems
10	Capacity	Schedule available emergency assistance with as much advance notice as possible given a capacity emergency
11	Capacity	Utilize the assistance provided by the Interconnection's frequency bias (in a capacity emergency) only for the time period necessary to utilize operating reserves
12	Capacity	Utilize the assistance provided by the Interconnection's frequency bias (in a capacity emergency) only for the time period necessary to analyze ability to recover using own resources
13	Capacity	Utilize the assistance provided by the Interconnection's frequency bias (in a capacity emergency) only for the time period necessary to schedule emergency assistance from others
14	Freq	Direct corrective actions to correct abnormal frequency
15	Load Shed	Manually shed load to alleviate system emergency conditions
16	Load Shed	Following the activation of automatic load shedding schemes, restore system load as appropriate for current system conditions and in coordination with adjacent systems
17	Load Shed	Following the activation of automatic load shedding schemes, shed additional load manually if there is insufficient generation to support the connected load
18	Load Shed	Following the activation of automatic load shedding schemes, monitor system voltage levels to ensure high voltage conditions do not develop
19	Load Shed	Following the activation of automatic load shedding schemes, monitor system frequency to ensure high frequency conditions do not develop
20	Load Shed	Following the activation of automatic load shedding schemes, monitor the performance of any automatic load restoration relays
21	Load Shed	Following the activation of automatic load shedding schemes, resynchronize transmission at preplanned locations if possible
22	Load Shed	Following the activation of automatic load shedding schemes, disable automatic underfrequency relays if system conditions warrant
23	Load Shed	Direct distribution providers to shed load when required for system reliability

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
24	Load Shed	Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads or to prevent voltage collapse
25	Procedure	Implement emergency procedures.
26	Procedure	Notify the reliability coordinator of the implementation of its own emergency procedures.
27	Procedure	Comply with reliability coordinators' instructions during emergency conditions
28	Procedure	Direct implementation of emergency procedures
29	Procedure	Maintain knowledge of existing and proposed emergency assistance agreements and contracts
30	Procedure	Mandate the sale or purchase of energy to optimize reliability
31	Procedure	Respond to system emergencies and frequency deviations to meet local, regional, and NERC DCS requirements
32	Procedure	Notify appropriate personnel or departments in event of an emergency
33	Procedure	Perform or direct actions such as starting generation, canceling pre-scheduled maintenance, schedule interchange, or shed load to return the system to a secure state
34	Procedure	Perform regular testing of emergency procedures to determine preparedness and alertness of shift personnel
35	Procedure	Provide emergency services coordination for field personnel
36	Procedure	Respond to generation losses, recognizing economic and reliability restrictions to effectively maintain tie-line flows
37	Procedure	Respond to requests for emergency assistance from neighboring systems
38	Procedure	Declare system emergencies
39	Procedure	Develop and/or implement contingency plans when facilities/equipment are forced out of service
40	Procedure	Formulate a plan to implement corrective actions when equipment ratings are exceeded or anticipated to be exceeded
41	Procedure	Use sub-regional, regional, and NERC hotline to coordinate actions during emergency conditions
42	Procedure	Schedule emergency energy when needed and create interchange transaction tags within one hour
43	Procedure	Coordinate response to system emergencies
44	Procedure	Request emergency assistance from neighboring systems
45	Procedure	Assume sole control of designated telecommunication systems for use during an emergency
46	Procedure	Implement emergency procedures related to generating resources within a balancing area as directed by the reliability coordinator
47	Restoration	Direct the restoration of the transmission system following a major system outage, load shedding, islanding, or blackout

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
48	Restoration	Ensure adequate protective relaying exists during all phases of the system restoration sequence
49	Restoration	Test or simulate system restoration procedures to validate restoration plans
50	Restoration	Following a partial or total system shutdown, implement the appropriate provisions and procedures of the system's restoration plan in a coordinated manner with adjacent systems
51	Restoration	Following a partial or total system shutdown, arrange for start-up and/or emergency power for generation units as required
52	Restoration	Following a partial or total system shutdown, arrange for and utilize emergency (backup) telecommunications facilities as required
53	Restoration	Following a partial or total system shutdown, restore the integrity of the Interconnection as soon as possible
54	Transmission	Formulate a plan to implement corrective actions when an operating reliability limit violation is anticipated
55	Transmission	Determine the cause and extent of transmission system disturbances and interruptions and the impact on other facilities
56	Transmission	Apply relief measures as necessary to permit re-synchronizing and reconnecting to the Interconnection when separated from the Interconnection
57	Transmission	Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads, or to prevent voltage collapse
58	Transmission	Implement load shedding as directed by a transmission operator
59	Transmission	Identify and take appropriate actions when partial or full system islanding occurs
60	Voltage	Implement voltage reductions to alleviate system emergency conditions
61	Voltage	Identify and take appropriate actions when a partial or full system voltage collapse occurs

Attachment B: Emergency Operations Topics

These topics are identified as meeting the topic criteria for Emergency Operations training per Requirement 3 of this standard.

A. Recognition and Response to System Emergencies

1. Emergency drills and responses
2. Communication tools, protocols, coordination
3. Operating from backup control centers
4. System operations during unstudied situations
5. System Protection
6. Geomagnetic disturbances weather impacts on system operations
7. System Monitoring – voltage, equipment loading
8. Real-time contingency analysis
9. Offline system analysis tools
10. Monitoring backup plans
11. Sabotage, physical, and cyber threats and responses

B. Operating Policies Related to Emergency Operations

1. NERC standards that identify emergency operations practices (e.g. EOP Standards)
2. Regional reliability operating policies
3. Sub-regional policies and procedures
4. ISO/RTO policies and procedures

C. Power System Restoration Philosophy and Practices

1. Black start
2. Interconnection of islands – building islands
3. Load shedding – automatic (under-frequency and under-voltage) and manual
4. Load restoration philosophies

D. Interconnected Power System Operations

1. Operations coordination
2. Special protections systems
3. Special operating guides
4. Voltage and reactive control, including responding to eminent voltage collapse
5. Understanding the concepts of Interconnection Reliability Operating Limits versus System Operating Limits
6. DC tie operations and procedures during system emergencies
7. Thermal and dynamic limits
8. Unscheduled flow mitigation − congestion management
9. Local and regional line loading procedures
10. Radial load and generation operations and procedures
11. Tie line operations
12. E-tagging and Interchange Scheduling
13. Generating unit operating characteristics and limits, especially regarding reactive capabilities and the relationship between real and reactive output

E. Technologies and Tools

1. Forecasting tools
2. Power system study tools
3. Interchange Distribution Calculator (IDC)

F. Market Operations as They Relate to Emergency Operations

1. Market rules
2. Locational Marginal Pricing **(**LMP)
3. Transmission rights
4. OASIS
5. Tariffs
6. Fuel management
7. Real-time, hour-ahead and day-ahead tools

A. Introduction

1. Title: **Reliability Coordination — Staffing**

2. Number: PER-004-2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability:

4.1. Reliability Coordinators.

5. Proposed Effective Date:

- Requirements 2 and 5 retired when PER-005-1 Requirement 3 becomes effective.
- Requirements 3 and 4 retired when PER-005-1 Requirements 1 and 4 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an

extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator

To be developed

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4:

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

A. Introduction

1. **Title:** **Reliability Coordination — Staffing**

2. **Number:** PER-004-~~1~~2

3. **Purpose:**

   Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. **Applicability:**

   4.1. Reliability Coordinators.

5. **Proposed Effective Date:** ~~January 1, 2007~~

   - Requirements 2 and 5 retired when PER-005-1 Requirement 3 becomes effective.
   - Requirements 3 and 4 retired when PER-005-1 Requirements 1 and 4 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

~~**R2.**All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.~~

~~**R3.**Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.~~

~~**R4.**Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.~~

~~**R5.**~~**R2.** Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None.

~~**M1.**The Reliability Coordinator shall have and provide upon request training records that confirm that each of its operating personnel has completed a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel, as specified in Requirement 2.~~

M2.Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to, a documented training program and individual training records for each of its operating personnel or other equivalent evidence that will be used to confirm that it meets Requirements 3 and 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator

To be developed

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: ~~There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**2.4.1**One or more of its shift operating personnel did not complete a minimum of five days per year of training and drills using realistic simulations of system emergencies in the past year. (R2)~~

~~**2.4.2**No evidence operating personnel have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. (R3)~~

~~**2.4.3**No evidence operating personnel have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area. (R4)~~

E. Regional Differences

~~1.~~None identified.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 — System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirement 2 should be retired when PER-005-1 Requirement 3 becomes effective.

PER-004-1 Requirements 3 and 4 should be retired when PER-005-1 Requirements 1 and 4 become effective.

The following tables summaries the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 and other Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. Each Reliability Coordinator, Balancing Authority and Transmission Operator entity shall provide each applicable System Operator with at least 32 hours annually of emergency operations and system restoration training. PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be removed. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall complete the five phases of a systematic approach to training (SAT) (which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training program(s) that addresses all Bulk Electric System company-specific reliability-related tasks. R4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify the capabilities of each real-time System Operator to perform each assigned task on its list of company-specific reliability-related tasks. [Risk Factor: Medium] [Time Horizon: Long-term Planning] The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R3 and therefore PER-004-1 R3 should be removed.
R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff,	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall complete the five phases of a systematic approach to training (SAT) (which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training

PER-004-1 Requirement	PER-005-1 and other Requirements
operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.	program(s) that addresses all Bulk Electric System company-specific reliability-related tasks. R4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify the capabilities of each real-time System Operator to perform each assigned task on its list of company-specific reliability-related tasks. [Risk Factor: Medium] [Time Horizon: Long-term Planning] The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R4 and therefore PER-004-1 R4 should be removed.

A redline version of PER-004-1 is posted with this Implementation Plan.

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators,
- Balancing Authorities,
- Transmission Operators, and
- Reliability Coordinator, Balancing Authority and Transmission Operator delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric System.

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement 3 in the standard shall become effective on the first day of first quarter after applicable regulatory approval (or the Reliability Standard otherwise becomes effective on the first day of first quarter after Board of Trustee adoption in jurisdictions where regulatory approval is not required).
- Requirement 2 in the standard shall become effective 18 months after the first day of the first quarter following regulatory approval (or the Reliability Standard otherwise becomes effective 18 months after the first day of the first quarter after Board of Trustees adoption in those jurisdictions where regulatory approval is not required).
- Requirement 1 and Requirement 4 shall become effective 36 months after the first day of the first quarter following regulatory approval (or the Reliability Standard otherwise becomes effective 36 months after the first day of the first quarter after Board of Trustees adoption in those jurisdictions where regulatory approval is not required).

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PER-005 System Operator Training
Reference Document

Reference #1: Determining Task Performance Requirements

The purpose of this reference is to provide guidance in writing a performance standard that describes the desired outcome of a task. A standard for acceptable performance should be in either measurable or observable terms.

Clear standards of performance are necessary for an individual to know when he or she has completed the task and to ensure agreement between employees and their supervisors on the objective of a task. Performance standards answer the following questions:

- How timely must the task be performed?
  Or
- How accurately must the task be performed?
  Or
- With what quality must it be performed?
  Or
- What response or outcome must be achieved?

When a performance standard is quantifiable, successful performance is more easily demonstrated. For example, in the following task statement, the criteria for successful performance is to return system loading to within normal operating limits, which is a number that can be easily verified.

> Given a System Operating Limit violation on the transmission system, implement the correct procedure for the circumstances to mitigate loading to within normal operating limits.

Even when the outcome of a task cannot be measured as a number, it may still be observable. The next example contains performance criteria that is qualitative in nature, that is, it can be verified as either correct or not, but does not involve a numerical result.

> Given a tag submitted for scheduling, ensure that all transmission rights are assigned to the tag per the company Tariff and in compliance with NERC and NAESB standards.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments:

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☐ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments:

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Yes, although as proposed it is unclear how that objective will be determined.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: Remove from SR&B include only in Training

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Yes an assessment is important. No, the standard as written is not defined with time parameters and is unachievable.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: While qualified trained operators are important and thus traiining might appear to imply a greater VRF, the mechanics of training should be considered LOWER.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

☒ No

Comments: The required documentation needed for these measures is not well defined. Is a journal sufficient?, or a certificate?

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Once again the time period is not well defined.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Training should not be Severe or HIgh, those should be reserved for direct links to reliability.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: There are a number of concerns with assessing the training needs of each system operator position in this standard. First, the function of assessing the performance of system operators should be covered by a separate Standard. Combining Training Requirements with Performance Standards causes confusion and creates a very voluminous standard. The purpose of three of the four requirements is assessment rather than training. Second, althought doing an annual assessment of each operators performance is a desirable goal, doing a measurement of each operators performance with each company specific BES reliablity-related task is over-burdensome if even possible.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32 hours of emergency operations and system restoratio training should be located in the System Personnel Training Standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: As stated in the comments provided to question 1, this is a desirable goal. However, there are several issues that make the described assessment problematic. Many of the company-specific reliability-related tasks are very difficult to measure and some are not measureable. The time and manpower required to conduct the measurement of all assigned tasks is overly burdensome and unreasonable.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The implementation schedule is too aggressive with regards to Requirement 2. Requirements 1 and 4 should be implemented completely before Requirement 2. A more reasonable implementation schedule is 18 months for Requirement 1 followed by 18 months for Requirement 4 and then an additional 18 months for Requirement 2.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: R2.1 - Yes, as long as the interpretation and intent is truly "capability", but not for actual performance of every reliability task for which the position is responsible. Out of the possible 374 reliability tasks (Attachment A to the standard), some tasks may be rarely done, or may be done only during emergency or emergency training, such as annual restoration/black-start drills and simulation excersises. Some emergency tasks can be actually performed to gage performance, whereas other emergency tasks are more of a table-top simulation without actually performing the task. Operator performance may be based on satisfactorily completing the annual training to gain knowledge to know how, where and when to perform the task(s), foster acceptable "capability", but, not actually require performing the task(s) to achieve actual results. Based on this criteria, the standard's measurment and audit for R2.1 must allow for the "training and knowledge base for task performance", to be the measure or assessment of the "performance capability" of such emergency tasks.

   R2.1 could possibly be reworded as follows or in some other fashion to help ensure auditing procedures follow the intent (intent explained in the "Background Information" preceding these comment questions):
   ---- The assessment shall include identification of mismatches between acceptable and actual performance capability, and/or the identification of mismatches between the acceptable and actual knowledge base for performance capability, that need to be addressed for future training. -----

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: This requirement definitely should only be in one standard. It is presently in the PER-002 standard as a 5-day training requirement, and therefore should be in the PER-005, since PER-002 is being retired. It would also help in audits of the standard, to have the training record auditing done with the PER training standard records rather than the EOP standards.

   The new EOP-005-2 standard draft 1 does not directly refer to the 32 hours or 5 days of emergency training. R9 of this EOP-005-2 draft does refer to the emergency operating topics, but does not specify annual training or the 5 day (32 hour) requirement, as does the present PER-002-0 standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

☒ Yes

☒ No

Comments: Yes, with the requirement focus on "capabilities" to perform, and with the objective being to qualify the operator for the journey operating level of their operating position during their initial/progression training. (See the comments in Question 1 above)

Yes, but the revision to existing training curriculums/resourses, development of new resourses, development of performance evaluation methods/tools, and on-going training assessment of new operators, will be essential for most transmission operating entities to comply with this requirement. This standard will therefore require a significant increase in training & development staff to comply, thus placing greater financial burdon on the entities.

However, we feel that how the assessment of each individual operator is conducted should be left up to the operating entity. As a part of an annual review system operators are felt to be qualified then and that should be sufficient to determine capabilities of an operator. If a new job task is implemented during that year then it is felt that the necessary training for that task should be given based on whatever method the specific entity feels meets that requirement.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: R1. - No. This should be a "low" risk factor". An entity could do very good training without using the SAT, still identify reliability tasks, and not be at risk. Not providing a training program or avenue of training could be a "medium" risk factor, but not using SAT (ADDIE) is a "low" risk factor. SAT (ADDIE) is a great guide, but it doesn't warrant being a part of the standard requirement.

The true requirement of R1 should be the requirement of entities to have a training program with training objectives to support the identified reliability tasks.

If the only requirement of R1 was the requirement to identify Reliability Tasks (R1.1), a "Medium" risk factor might be appropriate.

Renumbering of R1.1 and making it R2, thus separating this requirement from the SAT requirement, would be an improvement, and would allow two different risk factors. (Also see comments of Question 6 and Question 11 for R1)

R2. - Yes. "Medium" risk is OK.

R3. - Yes. "Medium" risk factor is OK.

R4. - Yes. "Medium" risk is OK.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: M1 - This measurement should require evidence of a training program that supports training and identification of reliability tasks, but the approach to training should be the choice of the operating entity. (R1 - SAT should be a guide given as a reference document, but should not be a requirement and measurement of the standard; see additional comment in Question 11).

   M2 - OK

   M3 - OK

   M4 - OK.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: D1.3. - We do not see the benefit of increasing the data retention from 3 years to 4 years. NERC Readiness evaluations and Regional Compliance audits are based on 3 years. PER-002-0 present data retention compliance is 3 years. Holding data since last audit (3 years) should be adequate.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: 2.2.1 - Renumbering of R1.1 and making it R2, thus separating the reliability task identification requirement from the SAT requirement, would be an improvement, and would allow two different violation security levels.

   2.3.1 & 2.4.1 - Violation of SAT should be "lower", not "high" or "severe". An entity may produce adequate training with proper performance results without using SAT. Many entities produce qualified operators today without SAT. SAT (ADDIE) should be a guide attached to the standard or as a reference document, but should not be the standard. The violation should be on "not performing training for identified tasks", rather than how you created the training. If training produces the desired results, how you did it should not be the measure, but rather, the measure should be satisfactory operator performance capability to perform.

   2.3.1.1 - the "Note" refers to R1.2, but there is no R1.2.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

☒ No

Comments: R2 – We agree with the 36 months but recommend the implementation time for R2 be changed from 18 to 36 months as R2.2 is conflicting with R1 implementation time.

R2.2 - This part of the standard requires the assessment to include analysis of new or revised tasks for the specific company/entity and job position, which is specified for task identification in requirement R1.1. This is conflicting since the implementation plan time for R2 is 18 months, and the implementation time for R1, to have the task list identified with comparison to the reliability tasks of Attachment A, is 36 months.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: R1 - We believe R1 should not mandate the approach to training, but should only mandate identification of reliability tasks and a training program that has objectives that support the reliability tasks. R1 attempts to eliminate informal and impromptu type training for initial and continuing training. Good, informal training should still be allowed in any training program, as the approach can still be proper and reap proper results, without having extensive documentation of a systematic process. Over the years, there have been many hours of informal training that has reaped satisfactory and above satisfactory results in performance and progression of system operators. Though SAT can be an improvement in some cases, it is not an improvement in all cases.

SAT requirements should be a guide given as a reference document, but should not be a requirement and measurement of the standard.

R1.1. - Typographical error. Transmission "Owner" should be Transmission "Operator".

R3 – We believe requirement R3 should be for “NERC Certified System Operators” and offer those operators hired mid-year or who have hardships causing extended absences that prevent accumulating the required 32 hours, relief from the requirement. We suggest re-wording as follows or in some other fashion to offer relief for special circumstances as mentioned above:
----“Each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each NERC Certified System Operator with at least 32 hours annually of emergency operations and system restoration training. NERC Certified System Operators with only 6-9 months of on-shift operating time due to mid-year hiring or hardships shall be required 16 hours annually of emergency operations and system restoration training. NERC Certified System Operators who have less than 6 months operating time due to mid-year hiring or hardships shall be exempt from the annual emergency operations training requirement.”----
2.3.3 - Violation Severity Levels – Reword in accordance with the suggested rewording of R3 requirement above to reflect NERC Certified System Operators and reduced hour requirements for special circumstances such as mid-year hiring or hardships.

R3.1. – The wording of requirement R3.3 in parenthesis "(provided in Attachment B)" infers all topics of the attachment must be included in the 32 hours annual emergency training, and does not take into account the requirement of R3.1.1. We believe the intent should be "selected topics" from Attachment B. We believe R3.1 should be re-worded as follows:
----"The emergency operations and system restoration training shall include the principles and procedures needed for recognizing and responding to emergencies, using drills, exercises or simulations of system conditions in subject areas selected from the responsible entity's applicable Emergency Operations Topics listing developed from Attachment B and according to the requirement of R3.1.1."-------

2.2.3 – Violation Severity Levels – Re-word to correspond to R3.1 rewording as follows:
-----"The responsible entity provided the minimum 32 hours of training on emergency operations or system restoration, annually for all system operators, but some hours provided included topics not listed in the responsible entity's list required by R3.1.1.-----

2.3.4. – Violation Severity Levels – Reword as follows for clarity of intent:
----"The responsible entity has performed an assessment of its System Operator's Capabilities to perform each identified task that is on its company-specific reliability-related task list, for some but not all of its System Operators.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: ATC believes that the annual analysis should be on the position of system operators not for each system operator.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: It's our position that all training related requirements should be in PER standards. The SDT should review all NERC standards and move other training specific requirements into this standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

☐ No

Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: ATC does not agree with the assignment of High (Violation Severity Level) for a failure to use one of the five phases of a SAT. In practice if an entity does not use one of the five phases of a SAT in one training program then it will be assessed a high violation severity level. ATC believe that this designation is too great for the violation. NERC needs to look at the number of training programs and to the extent of the failure. Did every training program fail to include one of the five phases or was this only in a small minority of the programs.

   We would ask that the SDT develop more reasonable violations severity levels for this standard.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: The Standard requires applicable entities to develop a task list using Appendix A as a starting point. The standard allows entities to add and delete from the task list (Appendix A) as they determined necessary. So, would Applicability section (4.2) only apply if a TOP, BA or RC identifies a task and then delegates that task to a System Operator not covered under the Applicability 4.1? In other words, if a RC identifies a task in their list and then states that the task is performed by a non-RC System Operator, that delegate would then have to follow this standard.

If this is the case, who will be audited by the Regional Entities to confirm that the delegated System Operator is complying with the standard? Would the delegated System Operator have to be registered with NERC as a user, owner or operator of the BPS?

The topic of delegation of requirements has come up in other standards and it's our position that NERC should develop a solution to the issue instead of looking to the individual SDT to come up with individual solutions. In this case the Applicable Entities are allowed to develop their own list using Appendix A because of this ATC believes that no entities will fall under 4.2 of the Applicability section.

ATC request that 4.2 of the Applicability section be deleted from this standard.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The task list for each position should be reviewed annually for updates, and suggestions for training must be solicited from Leads and Supervisors in order to improve operator performance and keep the program current. But that's not what you said in this statement.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The System Personnel Training Standard only.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Experienced NERC-certified personnel may be hired as operators, and some NERC-certified incumbents have 25-30 years experience. It would certainly be a waste of resources to assess these personnel's knowledge, skill, and attitude and then send these personnel through weeks of Initial Training and the myriad of exams involved. There should be a "grand-fathering" provision for experienced personnel, such as a exemption based on observation of job performance.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Since an approved training program based on SAT may not be ready for 36 months per 5.3, the assessment of training mismatch cannot be done until then. So, Requirement 2 should also become effective 36 months after the standard's approval.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

☐ No

Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: M1.4. The "E" in ADDIE means evaluations and assessments of training effectiveness. It does not directly refer to student evaluation, of whether "learning objectives are met" (i.e. exams, which are administered during Implementation). "E"valuation more often refers to Feedback, Exam Performance, Post-Training Evaluation, and Return on Investment studies.

M4. (See Item 3 above) This "Measure" can never be consistently applied. Regarding this requirement, the Background Information on Page 3 of this document says "the standard does not specify how entities will measure this capability", leaving nothing but a future of debates during Audit Week.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Based on your definitions, the problem descriptions written for each of the four severity levels will ALL constitute "Severe" violations.

For example, Item 2.1.3 lists topics from the EO list that were not added/removed when applicable, which constitutes a failure of the Analysis process and a failure of the Evaluation process too, because you didn't detect the problem and fix it. Since two phases of SAT were not done, this condition automatically meets the definition of 2.4 as "Severe". The same with item 2.2.1 and 2.3.1.

This area needs work.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: See Item 4 above.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments:
    We question the Applicability of this standard to "delegates" referenced in 4.2. Depending on how this requirement is interpreted, the scope of the training project we're undertaking could grow exponentially.

    The R.1.1 requirement seems to demand that entities use the Generic Task List during their analysis phase. If another commercially available list is currently being used, is it invalidated by this standard?

    The details provided in R2.1 and R2.2 could be easily included in the verbiage of R2 for simplicity.

    The details provided in R3.1 and R3.1.1 could be easily included in the verbiage of R3 for simplicity.

    Draft 2 of PER-005-1 is a big improvement over Draft 1.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: A yearly evaluation for each system operator is a very large burden for any organization. Initial training for system operators should address the required job skill knowledge and tasks required for acceptable performance capability. New job tasks are trained for and implimented as new systems, tools and job functions become necessary. The routine functions of the system operator position are not the issue and EOPS training and evaluation should take care of the rest.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The trend seems to be to place some kind of training requirement in everything (FERC NOPRS, NERC Standards and Regional Standards.) My opinion is that training requirements should all be in one place and I would prefer that to be PER-005.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Again, a huge burden on every organization. It is not the routine operating tasks that cause system outages. System Operators need to be evaluated on their knowledge of tasks that are required when the BES is operating with little or no margins, either voltage, reactive or thermal. System operators also need to be tested to determine if they can recognize when their system is at it's operating limits, not the periods when adaquate reserves more than compensate for sloppy operating!

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Foor instance R2.3.1 is a Violation Risk Factor of High. SAT is not necessary; adaquate training programs exist currently without the benefit of SAT; therefore, a Violation Risk Factor of Low is more reasonable.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: M1- Removal of the term "job task analysis" but still requiring one is not much of a change from the previous draft. Again requiring every entity to have a SAT based training program is unnecessary.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Disagree based on SAT requirement.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Requirement 1 in this draft of the standard requires a full blown job task analysis be completed for each company and to maintain the JTA. We cannot support this requirement at this time. The requirement also requires all training outside of NERC CE training to follow the SAT. We cannot support this beyond the NERC CE requirements at this time or to develop it over the next 36 months. We do not have the staff to complete this beyond NERC CE requirements at this time and believe we should be focussing on NERC CE requirements until we can comfortably follow the SAT for CE first.

   Requirement 2: We cannot support R2 if the assessment of the System Operator position goes beyond the NERC CE program requirements to meet and maintain NERC Certification.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: All Reliability related training required in a standard should be listed in the PER Standards. There should only be one place to see where Reliability required training to meet standards are listed.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We cannot support R4 if the System Operator performance evaluation goes beyond the NERC CE program requirements to meet and maintain NERC Certification.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: The requirement time horizon as Long Term Planning is okay.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: These requirements changes are generally administrative issues and should be risk factor Low.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: From the comments we have provided we are suggesting the changes to the requirements are overall not acceptable, therefore the measures would have to be changed to reflect the changes to the requirements that are acceptable.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: 1.2. We are not clear what a performance reset period is but we are okay with it; 1.3 and 1.4 okay

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The way the Violation Severity Levels are written are too complicated to follow and many are open to interpretation. As an example the words for the High level say in part "…..is missing one or more significant elements". what does the word significant mean to the person who is reading this……significant to whom, the audit team; too vague?
   We do not agree with any of the words written for the severity levels; the standard and requirements are short on words and severity levels have explicit severity levels that are not detailed in the requirements. We again want to say that this will be a huge onerous task to place on any entity based on the implementation plan and we cannot support it.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: While we appreciate the time frames for implementation of some requirements at 18 months and 36 months would be helpful to allow implementation of these requirements we do not support the requirements as they are written as they are too onerous and not achievable in the time frames without hiring many more staff and applying lots of money to the make it happen. So if we do not agree with the Requirements, we cannot agree to the time phases.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: NERC CE and Certification of System Operators as a requirement was a huge step in dealing with issues that came from the Blackout recommendations. Meeting that requirement was also a good step in requiring training for SO's that meets a SAT process. And the continued training for SO's that support Certification went a long way to meet the Blackout recommendations regarding restoration, simulation and situational awareness. NERC would be better served by working with companies and training providers to make NERC Continuing Education fit the SAT and make sure all are comfortable with using it all the time when dealing with CE to maintain Certification. When that is accomplished moving forward on all training requirements starting with a proper JTA and all other training using the complete SAT could be looked at. We believe we are many years away from that.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The CAISO agrees that an operator needs-assessment be done at least annually, the IRC supports continuous assessment of operator training needs. That said, the CAISO does not agree that a prescriptive standardized process is desirable or feasible. Performance evaluation is a corporate responsibility not a NERC standard. The CAISO would propose that this standard be refocused from a standard that requires a set annual needs-assessment, to a standard mandating a given number of hours of continuous training through NERC-accredited Training programs.

   Please refer to our comments in response to Question 11.

   Discussion:
   An operator training needs-assessment is not a requirement that can be developed easily. Having an industry-wide competency level lends itself to debates, possibly without an agreement, particularly given there is already an operator certification examination. A standard that leaves definition of competency to be developed by the individual responsible entities would subject to requirement to a "fill-in-the-blank" category, which FERC has stated must be eliminated.

   A fixed annual needs-assessment may devalue a continuous needs-assessment program. A fixed annual program by definition focuses on a one-time evaluation. With such fixed programs, organizations and operators may be more focused on performing and passing a given evaluation, then focusing on a comprehensive evaluation of individual needs - an evaluation that involves subjective analysis such as interpersonal skills under stress evaluation.

   A fixed annual needs-assessment may be useful from an auditor perspective, but it does not reflect the varied undefined times that training occurs.

   To identify a 'need" an auditable test evaluation would require a standardized scoring system. Does a score of X% indicate a need for training? Indeed, how would a test identify in which area the training need exists? Requirement 2 imposes a subjective obligation of "acceptable" capability. R2.1 mandates that "mismatches" be identified. However, the draft standard does not identify a mismatch.

   Today, training is provided for all changes that a corporate entity believes needs training. Similarly, corporate entities may not even provide training on new tasks that are self-explanatory. R2.2 mandates the compliance entity identify which tasks fall in which category. That subjectivity is reasonable but it is not what one would consider an industry standard.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication

of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

Comments: The CAISO would prefer that all training comments are contained within the training standards.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

☐ Yes

☒ No

Comments: If there were a possibility of developing and quantifying a viable level of competency, then the CAISO would support such a requirement. However, the CAISO believes that the determination of this competency level and assessment of the mismatch would be troublesome and likely not measurable.

The idea of entity-identified task lists is the antithesis of the word standard. The question of training is paramount to everyone. The issue raised here is whether or not it is sensible to write an Industry Training standard. Assessing the capabilities of a given System Operator is an art not a science. To mandate such a art can (and likely will) result in entities being tied up in labor hearings for a long period of time debating whether or not the operator's 'capability level' is effectively measured by the NERC standard. Requirement 4 does not provide any quantifiable measure for identifying an operator's capabilities. Picking and choosing from a list makes this requirement even more subjective then a NERC-wide standard should be.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC will have final say on these elements in any case; therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements.

However, given the question being posed:

The CAISO believes that assigning long-term planning to all the requirements is inappropriate, if not over-simplistic. For example, the annual assessment of the training need and the subsequent development-of/revision-to a training program, as the requirement implies, occurs once every 12 months. This is normally regarded as an operations planning time frame if violation of this requirement is to be mitigated.

Training in each of the requirements can cross over time horizons.
Requirement 1 (which has not been vetted) states the entity must use the SAT 5 phases for all reliability-related tasks. If a new task that requires training is created for implementation tomorrow, how would that training program fall under long-term planning?

Requirement 4 - when a new task arises, (assuming one accepts the premise of the requirement itself) then shouldn't the assessment take place as soon as possible?

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC and FERC will have final say on these VRFs, therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Measure 1 is not quantifiable. What evidence will demonstrate 'desired performance', if the desired performance is not defined in the standard itself?

   Because Requirement 2 is subjective, Measurement 2 is meaningless in the context of a NERC reliability standard.

   Measurement 3 is proof of attendance and not a true indicator of reliability impacts.

   Measurement 4 requires that the subjective verification of the "capabilities" be documented. Even if such a measurement could be standardized, as written, this measurement requires nothing more that documentation of ineptness.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to.

   We note the following:
   1. The entity "Compliance Enforcement Authority" is a new term. It is not found in the Functional Model.

   2. The compliance elements should not impose requirements that are not in the standard itself. To require a responsible entity to maintain records on whether it is following or followed any mitigation plan associated with the standard is outside the standard itself. The standard does not address mitigation plans anywhere. This also applies to the requirement on the Compliance Monitor to retain any data used in mitigation plans associated with this standard, particularly since the Compliance Monitor does not appear on the Applicability List at the beginning of the standard.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

☒ No

Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to.

We note that a SEVERE VSL is applied for missing evidence of using two phases of the SAT; as well as applying a SEVERE VSL for not having a program at all. This would result in an organization that inadvertently is missing evidence being held to the same VSL level as an organization that consciously has no program at all.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to.

We do not support this standard as written, and therefore do not agree with the implementation schedule at this time.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☒ Yes

☐ No

Comments: The lack of objectivity in these requirements will conflict with labor union contracts. In addition the draft standard does not meet NERC or FERC requirements regarding clarity and measurability; nor does the draft meet the FERC objection to fill-in-the-blank standards.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments:
It appears that the intent of this Standard is to standardize and clarify what is and is not appropriate training materials for acceptance into the NERC Continuing Education Program. This is not well understood by the industry. If this is indeed the case, the CAISO supports such an effort. The way the existing draft is being interpretted by the industry, however, is that this will be an additional requirement, over and above (and possibly in conflict with) the NERC Certification maintenance requirements currently contained in the NERC Continuing Education Program.

The CAISO agrees that:
- Training is a critical function for our industry.

- NERC should mandate training time (i.e. minimum number of Continuing Education hours - limited to predefined critical functions) be required to ensure operators are provided experience with critical tools and procedures necessary to meet NERC's reliability standards. This could be coupled to maintaining NERC Operator certification. That would innocent operators to take the training or risk losing their personal certification, and would incent the organizations to ensure the training or risk not complying with the standard to use only-NERC certified operators.

- General in-house training programs must be permitted to be structured to the varied ad hoc needs of the given organizations, their tools and their environment, and not subject to NERC standards.

- Critical training be provided by accredited programs, and that NERC may desire to accredit programs used to provide CEH on those critical topics (e.g. Emergency Operations; Blackstart).

- the result of a Training standard should be an operator that is prepared to handle that operators system; the result should NOT be the production and storage of paperwork.

TheCAISO does not agree that:

- It is necessary that every organization has its own accredited program. As written, R1 requires that responsible entities complete the five phases of a systematic approach to training (SAT), which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training program. We do not agree that this should be a requirement.

The requirement should be for the responsible entity receive training to help system operation personnel to acquire the competency to perform the applicable tasks pertaining to the RC, TOP and BA functions that the entity is responsible for or assigned. The IRC neither endorses nor disapproves the SAT process as a good approach>

However, how any training program is arrived at (i.e. what approach it takes) is not important and should not be a standard. If so inclined, NERC itself could offer an SAT-based Training program. How could one make an argument that using other approaches to arrive at a training program that (a) list the tasks and competency level required to perform the task, (b) include the minimum requirements stipulated in this standard such as the 32 hours emergency training, (c) has provision for a training schedule, review process, etc. is not an acceptable approach?

Performance and capability are subjective ideas. Given all of the tests and training, no one can predict how a human will act. To state that the person is 'incapable' is a very strong statement and can only be made on a case-by-case basis - which by definition precludes a NERC standard.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: R2 is confusing. Assessing the training requirements of a system operator position is different than assessing the training needs of an individual system operator. This requirement should be reworded to clarify what asssement is being required. A definition of the term "system operator position" should be added to the Glossary of Terms.

   Identification of company-specific system operator position tasks may be reasonable on an annual basis or whenever tasks are added or deleted; however, assessment of individual system operator training needs should be over a three year period to align with existing NERC System Operator Certification and Continuing Education Programs.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The requirement should be in the System Personnel Training Standard. Further, any training requirements should be grouped into training standards. When necessary, other standards should reference the appropriate training standard for any specific requirements.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   R4 is duplicative because the NERC System Operator Certification Program already certifies the competency of system operators. A revised generic task list (Attachment A) could be used to develop specific courses to form the curriculum for emergency operations and reliability related topics within existing NERC training programs. The Continuing Education Program already assesses the courses before it grants Continuing Education Hours used for recertification. Likewise, a revised generic task list could could be used for the Continuing Education Program's curriculum.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

☐ No

Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: CenterPoint Energy agrees with the implementation plan for R3; however, we disagree with the implementation plan for R1, R2, and R4. If PER-005 is modified to align itself with the other NERC training programs that certify system operator competency, we would agree with a three year implementation period.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments:
Instead of establishing a new collection of competency measurements that are already defined by the NERC System Operator Certification Program and the NERC Continuing Education Program, PER-005 should align itself with these existing programs. The standard would have a greater benefit to the industry if it established the curriculum for these existing programs. PER-005 could provide the training topics necessary for advanced learning of reliability-related tasks.

The NERC Continuing Education Program uses Individual Learning Activity applications to determine if the course meets its criteria. Such review of applications presently includes whether the SAT process was utlilized. This is another reason why PER-005 should form the curriculum to be used in the NERC Continuing Education Program. Then, the Continuing Education Program would review each course application for compliance through the use of the NERC Continuing Education Review Panel.

Per R1.1, specific tasks must be selected from the proposed generic task list (Attachment A) if the task is performed by the entity's system operator positions. The generic task list includes tasks that are NOT reliability-related. For example Item 22 states "monitor real-time market proces for accuracy." The generic task list should be reviewed and edited to include ONLY reliability-related tasks.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   R2.1 does not appear "clear and unambiguous". How can a position have a mis-match between acceptable and actual performance?
   Is the intent to identify each operators deficiencies for each task every year?
   Or to identify new tasks (covered in R2.2)?

   If the answer is "to annually identify the mis-match between acceptable and actual performance a specific assesment must be done on every task that remains on the Attachment A (after modification per R1.1.)", then it is overly burdensome and is not required in the verbiage to R4, which only requires a one-time verification.

   However, it is reasonable to verify that the modified (per R1.1) Generic Task List remains current at least annually.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: Not only should this requirement should be in the System personnel Training Standard, a checklist should be made so that ALL training requirements are included in this standard. One example is the annual training on Cyber Security (CIP).

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The verification of satisfactory performance of "each assigned task" is overly burdensome. Although, since this is a one-time verification only per R4, I can live with it. If I have to verify each task for each operator every year, it is way overboard.

   Who determines if my verification is adequate? Is this my call, the RA team or the Compliance Audit? If I only have to satisfy myself, it is okay.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

☐ No

Comments: Each requirement has a "Long-term Planning" horizon.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: These are not real time requirements. Any potential impact to the BES will be adequately captured in other approved standards and violation severities. These should all be Lower!

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:
M1. This measure has no allowance for the use of outside vendors in a training plan. If a NERC Certified Provider is utilized, the entity should not be required to retain the providers documentation as required in M1.2 and M1.4. the retention of "evaluations and assessments" may include the use of end-of-course examinations which would violate exam security for the vendor if the entity has to retain them. The fact that CEH's were awarded should be sufficient for M1.2 and M1.4 in the case where a CEH provider (even if it was the parent entity) is utilized.

The industry has spent a lot of time, money and effort into getting the CEH program up and running. It has become the only way to maintain NERC Certification. Lets use it to it's fullest potential. If it is good enough for Credential maintenance, it should be good enough for the training program compliance. Violators of the CEH provider rules already have a method to be scrutinized.

M2. This relates to Question 1. Is the intent to retain documentation for the Operator position or the Operator that mans the position and sits at the desk?

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:
D1.2 - What is the compliance Monitoring Period? Should the Reset period be one month when these are apparently annual requirements?

D1.3 - Why is data retention four years? What is the benefit of an additional year of records past the last compliance audit which is required every 3 years per D1.4?
- Is the retention of "any data used in mitigation plans associarted with this standard" intended to be an indefenite retention? This is not clear. Is the "mitigation plan" intended to be mitigation for the entity to get in compliance with the standard, or for the individual operator to achieve the desired performance level per the entity's training plan?

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: No VSL should be high or severe for a requirement that is not a real time requirement.

   D2.4.1.1 - What if the entity reviewed Attachemnt A and did not identify anything else that was performed? What if they did identify several other items, but missed only one. These should not be violations. If the entity made a good faith effort, it should be compliant. The selection of a task from the list, or adding it to the list, is subjective for the entity. As such, how can a compliance team come in and apply another subjective criteria to the list?

   D2.4.3 - Grammatically incorect. Second paragraph should end " training has not BEEN provided annually."

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments:
    A4.2 - "producing a real-time response from the Bulk Electric System" is not clear and unambiguous. Turning on a light switch (to power the runway landing lights for the highly trained pilots) produces "a real-time response".

    R3 - How is a "new" employee handled? If I hire an operator and he gets NERC Certified in November (or later) I feel I should not have to complete all 32 hours of emergency training.

    Attachment A - The removal or addition of any item(s) is subjective. While I understand it is only a starting point, whose subjectivity will be used when determining compliance to this standard. Many of these items are poorly worded if they are intended to be a measurable task. I will be paring the list down substantially to remove redundant requirements, and clarify the remaining.

Attachment B - Intro paragraph is not entirely true. This list must be modified per R3.1.1 and will then contain the "company specific" topics for Emergency operations.

Although training, or the lack of, played a part in the August 14, 2003 blackout, it was not the only thing found to need improvement. This standard places the burden of improvement of operations of the BES on the training system for the system operator. This is unfair to the majority of entities and operators who have adequate training in place and are not afraid to shed load when needed. This has placed the emphasis on proper documentation instead of performance. It will be expensive and turn into a paperwork nightmare to implement and to audit.

A Systematic Approach to Training is not required to have a good training program. It IS required to be a CEH provider for NERC Credential Maintenance. But NERC has maintained a very pointed separation of the Training Standard and the CEH program and Credential Maintenance. This standard is trying to apply the CEH provider requirements to ALL entity training programs. It should not be the default system for every entity.

Implementation of this standard as written will be a nightmare to implement and audit. It will result in lots of money spent for very little return on investment. It will dilute the effectiveness of many good programs out there and I doubt will force any of the mediocre ones into being good ones.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments:

   Our response depends on who, what, where, when, and how the authors mean with the statement - "assess the training needs for each system operator position".

   We agree that each employer should evaluate the performance and training needs of each employee, probably on an annual basis. If that is what the authors meant then we agree and we request the authors make that intent more clear in the standard itself.

   In addition, we are concerned about who evaluates and determines "acceptable performance" and "actual performance". We suggest the authors make it clear the employer makes that evaluation and determination, not some third party.

   Throughout this draft standard the authors use the term "System Operator position" to mean a job category and a physical person with no distinction between the two applications. Please make it obvious in each application whether the requirement applies to a job category or a physical person.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments:

   We suggest the training requirement R3 be in the training standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments:

In addition, we are concerned about who evaluates and determines "acceptable performance" and "actual performance". We suggest the authors make it clear the employer makes that evaluation and determination, not some third party.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

   Please add Time Horizon values to R1.1, R2.1, R2.2 and R3.1 and R3.1.1. It is not obvious the Time Horizon assigned to the Requirement also applies to the sub-requirement.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

   Please add VRFs to R1.1, R2.1, R2.2 and R3.1 and R3.1.1. It is not obvious the VRFs assigned to the Requirement also applies to the sub-requirement.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:

   As written, M1 is intended to measure the "process" used to derive the result of each step of the SAT. We disagree with that measure. We suggest the Measure for R1 be a review of the "results" of each step of the SAT, not measure the process for development of those results.

   Given the specific wording of these requirements and measures, we are not sure what is being measured in M2. What is being measured in M2? Please be more specific in the words. For instance, is the "latest assessment for each position" and assessment of the job category, or an assessment of the individual employees performing in that position? Please make this measure significantly more clear and specific.

   M3 should be deleted and moved to EOP-005.

   We have similar issues with M4 as for M2, and a similar interpretation of the issues identified above for M2. What constitutes verification of the capabilities? Is this verification of a person's performance appraisal? Is this a verification of the basic

training requirements of a person to fill a position, like having a BSEE from an accredited university? Please make this measure significantly more clear and specific.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:

   VSL 2.2.1 contains the statement that if the entity violates R1.1, the entity is also in violation of R1. We believe this is being penalized twice for the same infraction and should be deleted.

   Item 2.2.3 states "but did not include training in the subject areas listed in Attachment B". The Requirement R3.1 is that Attachment B is modified by the BA, TOP or RC. Therefore, this VSL should be changed to "… listed in R3.1.1".

   Due to the formating of the VSL documentation it is difficult to be sure what are the intended VSLs of section 2.3.1, 2.3.2, 2.3.3, and 2.4.1.1. For instance, VSL is High in 2.3.2 for not performing an assessment. Is the VSL also High for section 2.3.2.1 which states the "entity has not identified training required"? Or, is 2.3.2.1 instead of 2.3.2?

   Again, the Severe VSL identified for 2.4.1 has three parts identified as "OR". However, there is an additional reference 2.4.1.1 which is part of 2.4.1. Should there be an "AND", or an "OR" infront of 2.4.1.1?

   We suggest VSLs for the 32 hour training in R3, and the VSLs for R4 are OK.

   We also suggest the VSL criteria be redistributed for each of the Requirements R1 and R2. We think 2.4.2, R2, an entity who has "not performed an assessment which includes … to each task …" should have a much lower VSL applied to it than an entity that does " not have a SAT program" at all. Both of these criteria are considered Severe in the draft standard.

   Starting with Severe, we agree Severe should be assigned to having NO SAT program, 2.4.1 for R1, and the criteria that the entity has not performed an assessment of operator capabilities, 2.4.4 for R4. These are the only two actions that rise to the level of Severe.

   We suggest all the criteria for R1 and R2 be moved down one level, from Severe to High, from High to Moderate, and Moderate to Lower, except the criteria as noted above.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:

   R3, 32 hours of training, may be effective the first day of the first quarter but compliance with that requirement will take up 10 weeks to train all the system operators due to shift rotations and training schedules. Please make this change for compliance.

   The timing for implementation of the other requirements seems out of order. First the SAT needs to be performed, R1. Then, the capabilities of the operators need to be verified R4 before a mis-match can be performed R2, from which training needs are identified and implemented. We suggest it will take 18 months to complete R1, followed by 18 months to complete R4, and finally a third 18 months to complete R2.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments:

    The draft standard extends the requirements to an undefined phrase: "delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric System". We do not understand the meaning, scope or extent of who or what constitutes "delegates" that might fall under this standard. We request this phrase be deleted from this and all similar standards. We also request the authors not include any other phrases like "delegates" or any other similar attempts to extend job functions of other RC, BA or TOP positions into the definition of System Operator.

    R1.1 requires the creation of a company specific list of BES reliability-related tasks, the creation of which could be considered part of R1 itself and does not need to be a separate requirement. In addition, an entity will be penalized twice for not developing this list, once for R1.1 and penalized again for violating R1. Therefore, R1.1 should be deleted and considered part of R1, performing the Analysis phase of the SAT process. SHOULD WE SUGGEST R1.1 BE DELETED, OR SHOULD IT BE A SEPARATE REQUIREMENT? LEAVING R1.1 AS IT IS COULD BE CONFUSING.

    The intent and meaning of the wording "acceptable" and "actual" performance capability used in R2 as they are applied to a System Operator Position is not clear . Please clarify the intent and meaning of R2. A position can have tasks assigned to it with acceptable or defined, performance criteria. A position can not have "actual" performance capability; a person performing that task can have "actual" performance capability. If the intent of R2 is to determine the mis-match between a persons actual performance capability of a task and the acceptable performance criteria for that task then please so state that one

part applies to a person and one part to the position. If it is not the intent, then please clarify the meaning of this section.

PER-004-2, as revised, contains two requirements: one to maintain staffing 24/7, and the other to place attention on SOLs, IROLs and inter-tie facility limits, and to ensure protocols are in place. There are no measures for these three requirements. Please add measures for these three requirements.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: It is unclear as to whether this is referring to the job category or each individual. This needs to be clarified. One can only infer that this is meant to design the training program for the job category and evaluate it annually for necessary changes. Consider adding a sub-requirement or within this requirement to indicate that measurable and observable criteria must also be developed along with each task identified (since "measureable and observable criteria" is a Measure of this Requirement).

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: We recommend that the requirement remain in the training standard and be removed from the Blackstart Standard project. The training standard is the appropriate place for consolidating and delineating any training requirements.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Is this meant to be a one time assessment? If so, then we agree since attempting to do this every year would be unreasonable. If it is mean to be recurring, then consider adding the requirement of a periodic assessment of a sample of tasks on an ongoing basis within the entity's own training program.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

☒ No

Comments: We believe these items to be in the LOWER risk factor category.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: M1, as currently written, is a review of an entity's entire training program from inception. This may be too broad of a Measure.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: In general, the VSLs are extremely complex and take up more of the standard than the actual requirements, measures and compliance sections. Condense and simplify.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: PER-005-1 Proposed effective dates: R1 & R2 should be implemented simultaneously, since R2.2 cannot be performed until R1.1 is completed. However, 36 months to have a training program implemented is reasonable.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments:
PER-005-1 Applicability 4.2 : is this meaning that an operator performing a function per an approved procedure or under orders from an RC/BA/TO have training and be under a training program as outlined? This may be excessive application of the training

standard. One could speculate that each power plant operator could fall under this because they operate a unit with MW and MVAR output, which creates a real time response from the BES.

PER-005-1 R3, 3.1, 3.1.1 : the words "and system restoration" should be removed unless the system restoration topics in Attachment B are required. As written, R3 and sub requirements imply that some of the 32 hours must come from system restoration training. If that is correct then state the number of hours. Note that the title of Attachment B contains the term "Emergency Operations Topics" only, even though system restoration topics are covered under Section C.

PER-005-1 Attachment A
General Control Center Operations Tasks, Item 22: Monitoring of real-time prices for accuracy should not be listed as a reliability-related task. Reliability and pricing are distinctly different. Is the intent to monitor the impact to reliability that real-time pricing is having?
Generation Tasks Item 14: Publishing next-day market results should not be a reliability-related task.

PER-004-2 Proposed Effective Dates: the bullets are extremely confusing and refer to requirements that aren't even listed. If approval of these standards deletes a pre-existing requirement immediately, there is no need to even mention it in this section (assuming that these standards are balloted together). Otherwise, list ALL of the requirements in the Requirements section and then the list of when they would no longer be in effect in the effective date section.

PER-004-2 Compliance Monitoring Responsibility : Should this be the Compliance Enforcement Authority (as stated in PER-005-1)?

PER-004-2 Compliance Monitoring: There is only a need to list the self certification. All requirements in the standards can be subject to monitoring under the other methods (spot check, periodic audit, triggered) and there is no need to list them here.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Should read "mismatch between the previoulsy developed task list and current and/or new task". "Performance capabilities" relates more to personnel that it does to positions.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: 1) Should go in PER-005. 2) However, it is recommend that the 32 hour requirement be remove completely because the CEH program captures the intent of this requirement. Furthermore, the 32 hours of emergency training is tracked on a different schedule than CEH requirments and creates an additional and confusing set of record keeping processes. Record keeping can be simplified without reducing the level and quality of training with the additional benefit of removing the audit liablitiy created by the need to track each operator's records on a different schedule.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: It should be more specific in that there should be a task list for each position and not one list that covers multiple positions. Example: Companies with specialize positions should have a task list for each position. Auditors will apply a broad based task list to specialized positions and create findings stating that each position should be able to perform all task on the general list.

   Also, the Standard should clearly state that this is a one-time assessment for each system operator and their respecitive position. It should take into account prior work history, training, qualifications and certifications from previous employers when assessments are made.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

Comments: See comments on #9.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This has not been properly vetted through the industry. Furthermore, this is an administrative standard and medium to high risk should not apply unless the training program is grossly inadequate.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Should state "applicable SAT-related outcomes" rather than "SAT related outcomes". The current wording will create unnecessary work. For example, an Analysis may show that the simplicity and frequency of a task does not need to move beyond the Analysis phase. This can be an audit liability when taken literally.

   M.4 Should state "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection verification of the qualifications for each real-time System Operator and their assigned positions, as specified in R4.".

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The requirments for self-certification should be identified. Without reasonable guidelines, a Regional Entity will have free reign to set whatever self-reporting standards it deems fit. With the current wording, annual self-certification has the potential to become very stringent.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This part of the standard is not clean and simple. Plus, it's an administrative standard and should not carry moderate to high violation levels. Also, lack of documentation should be a low violation. High and Severe violations should be reserved for entities who do not have training programs, or their programs are not maintained with adequate staff.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

Comments: R1, R2 & R4's timeline should have an additional time, at least another year, added to allow for budget cycles, hiring & traininig trainers. Additional personel will be required in many cases and these positions will need to be budgeted before they can be filled. Once filled, then the work to develop a training program begins. Depending on the approval date, a company's budget cycle may be well underway and beyond the point of change and thus delay their ability to succeed within the current timelines.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: ***VERY IMPORTANT***Implementation of this Standard without a guiding document for a training program similar to what is provided by the Department of Energy or the U.S. Military who routinely apply SAT or Instructional System Design (ISD) processes leave too much open to the inerpretation of auditors.

VERY IMPORTANT: 4.2 needs to be re-worded so it is clear that the RC/BA/TO is not responsible for training personnel in other organizations to which it has delegated tasks. After 4.2, "delegates" is not mentioned in conjunction with RC/BA/TO as being responisble to implement this standard.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: FE believes it is appropriate to have this requirement reside within the PER-005 standard and that the requirement be removed from the proposed standards that are being developed within the Project 2006-03 work effort. It is our position that all requirements related to personnel training should reside within the PER suite of standards.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: We agree that there should be some assessment of the effectiveness related to knowledge and skills learned during training being transferred to work place performance. However, upon reviewing R4, the measures associated with R4, and the VSL aimed at R4, it is unclear what the standard's expectations are related to this requirement.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Many of the measures provide no additional information beyond the information contained in the requirement except to say "provide the evidence". In addition, where they do provide additional information, the measurement value is not contained in the requirement. As an example, measure M1.1. states that, "Analysis that results in a list of company-specific BES reliability-related tasks and measurable or observable criteria for desired performance for each task." However, there is nothing in R1 or the sub-requirements that states measurable or observable criteria for desired performance must be developed. All requirements should be clearly stated in the requirements section of the standard and the measures section should not impose new or additional requirements.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The compliance monitoring and reset period is a vague concept that may be of little or no value in the mandatory compliance regime. Under the mandatory compliance regime, non-compliance is followed by a mitigation plan that contains the date by which compliance will be achieved and thus reset the compliance clock. This reduces or eliminates the value of the monitoring and reset period.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The process for establishing VSLs is presently being vetted through the industry for the 83 FERC approved standards. We believe it is prudent to let that process take its course so that SDTs presently working on revised or new standards can reference the new format in establishing VSLs.

   The violation severity levels as written are interlaced making it difficult to determine the violation severity level that pertains to each requirement. The violation severity levels should be listed by requirement. In addition the following revisions to the wording are suggested:

   Item 2.2.2 should be revised to state, "The responsible entity has determined training required based on the mis-match between acceptable and actual performance capability but has not included this training in its current schedule."

   Item 2.2.3 should be revised to state, "The responsible entity annually provided at least 32 hours of training on emergency operations or system restoration but the training did not include the subject areas listed in Attachment B."

   Item 2.3.3 should be revised to state, "The responsible entity provided to its system operators at least, 32 hours of emergency operations or system restoration training,

annually, but not all its System Operators have completed or evidence shows all of its System Operators will not have completed the required annual training."

Item 2.4.1 should be revised from, "The responsible entity does not have a SAT program for its system operators" to "The responsible entity has not used the SAT process to develop its training program."

Item 2.4.2 states, "The responsible entity has not performed an assessment which includes identification of measurable or observable criteria for desired performance to each task for the determination of the training needs for two of its system operating position." Looking past the fact that there is no requirement to identify measurable and observable criteria for desired performance, the severity level as written appears to state that I cannot get a severe violation severity raking if I only have one operator position. This should be revised to state, "… training needs for all of its system operating positions."

Item 2.4.3 paragraph 2 should be revised to state, "The responsible entity has provided 32 hours of emergency operations and system restoration training but the training has not been provided annually."

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☒ Yes

    ☐ No

    Comments: FERC 693 (par. 1359) directive to include the Generator Operator has not been addressed by this standard.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: FE has the following additional comments:

    1. This standard requires the use of the SAT process, yet it contains no requirement for trainers to be trained in this process. This train-the-trainer requirement is necessary to ensure an effective implementation process throughout the industry. This should be remedied prior to this standard becoming effective.

    2. In R3, the phrase "…at least 32 hours annually of emergency operations and system restoration training" is written incorrectly and does not coordinate with its measure, M3. We suggest changes to the phrase in both R3 and M3 to read "…at least 32 hours annually of emergency operations training which includes system restoration training".

    3. In R1, the last part of the statement should say "…System Operator positions." and not "…System Operators." This would then be consistent with the rest of the standard.

4. In Attachment A, Items #2 and #4 are duplicative. This should be corrected.

5. It is not clear how R4 would be acceptable from a compliance standpoint. The SDT should add verbiage to clarify this requirement. The measure for this requirement (M4) doesn't add any value.

6. Measures should not add requirements. We believe that M1.2 is dictating more requirements than R1 intends when it states "Design and development of training materials that result in learning objectives and content that is derived from results of training analysis". The SDT should remove this from the measures and re-evaluate the need for this statement in the standard.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: I agree that it is reasonable to annually assess the training needs for each operator position (R-2) in relationship to the defined company-specific reliability-related tasks (R-1.1).

   However, the assessment requirement (R-2.1) based on a mis-match between acceptable and actual performance capability seems ambigious and leaves the measurement (M-2) of this requirement subjective and open to interpretation. What is an acceptable means of preforming this assessment? What can we expect from a compliance audit on how they will assess each entity? An acceptable criteria (i.e., Auditors Guide) for evaluating this mis-match needs to be provided.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: I would like to see this requirement be removed from the System Restoration and Blackstart standards and to be placed only in the Personnel training standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The standard as written, does not define a time frame for the assessment (R-4). I feel that this assessment is not achievable and is unrealistic due to the time burden involved. Clarification needs to be given as to the time frame when this evaluation is to be given.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occurring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: M 1.4 - What would be required documentation for training delivered by an outside vendor? Would certificates be sufficient? M-2 - see comment on number 1 above. M-4 - see comment on number 3 above.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: D1.2 - What is the compliance Monitoring Period? Should the Reset period be one month when these are apparently annual requirements?

   D1.3 - Why is data retention four years? What is the benefit of an additional year of records past the last compliance audit which is required every 3 years per D1.4?
   - Is the retention of "any data used in mitigation plans associated with this standard" intended to be an indefenite retention? This is not clear. Is the "mitigation plan" intended to be mitigation for the entity to get in compliance with the standard, or for the individual operator to achieve the desired performance level per the entity's training plan?

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: I do not feel that any VSL should be severe or high in relation to a training program.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: Overall,I am in support of the development of a training standard to ensure personnel responsible for the real time operation of the BES to meet minimum knowledge and competency levels. However, I would recommend that any training requirements noted in NERC Standards should be identified only in the System Personnel Training Standard.

    This standard should apply to System Operating Positions only - not by individual system operators.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: FRCC agrees that it is reasonable to annually assess the training needs for each operator position (R-2) in relationship to the defined company-specific reliability-related tasks (R-1.1).

   However, the assessment requirement (R-2.1) based on a mis-match between acceptable and actual performance capability seems ambigious and leaves the measurement (M-2) of this requirement subjective and open to interpretation. What is an acceptable means of preforming this assessment? What can we expect from a compliance audit on how they will assess each entity? An acceptable criteria (i.e., Auditors Guide) for evaluating this mis-match needs to be provided. FRCC agrees it is reasonable for this assessment to include identification of training to preform new or revised tasks from the company-specific reliability related task list. (R-2.2)

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: FRCC recommends this requirement be removed from the System Restoration and Blackstart standard and be placed only in the Personnel training standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The standard as written, does not define a time frame for the assessment (R-4). The FRCC feels that this assessment is not achievable and is unrealistic due to the time burden involved. Clarification needs to be given as to the time frame when this evaluation is to be given.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occurring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: M 1.4 - What would be required documentation for training delivered by an outside vendor? Would certificates be sufficient? M-2 - see comment on number 1 above. M-4 - see comment on number 3 above.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   D1.2 - What is the compliance Monitoring Period? Should the Reset period be one month when these are apparently annual requirements?

   D1.3 - Why is data retention four years? What is the benefit of an additional year of records past the last compliance audit which is required every 3 years per D1.4?
   - Is the retention of "any data used in mitigation plans associated with this standard" intended to be an indefenite retention? This is not clear. Is the "mitigation plan" intended to be mitigation for the entity to get in compliance with the standard, or for the individual operator to achieve the desired performance level per the entity's training plan?

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: FRCC does not feel that any VSL should be severe or high in relation to a training program.
   D2.4.3 - Grammatically incorect. Second paragraph should end " training has not BEEN provided annually."

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: Overall, FRCC is supportive of the development of a training standard to ensure personnel responsible for the real time operation of the BES to meet minimum knowledge and competency levels. However, the FRCC recommends that any training requirements noted in NERC Standards should be identified only in the System Personnel Training Standard.

    How is a "new" employee handled? If I hire an operator and he gets NERC Certified in November (or later) I feel I should not have to complete all 32 hours of emergency training.

    This standard should be by position only - not by system operators.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: I believe that the training of system operators needs to be assessed, but Garland Power & Light is a small utility that has a training staff of one personnel that has many other duties as well to perform. The requirement is completely out of scope for resaonability. This would place a huge budget burden on small utilities that are managed by City Councils.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: It should be contained in the System Restoration and Blackstart standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: See #1 above. It is too large of a burden on small utilities. The requirements should be modified for practicality and still accomplish the goal.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Do not agree with the annual time line in R2. Long Term planning should be defined.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: I think the Violation risk factor for training requirements should be lower than a medium.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Again, small utilities can not manage a large training program with unreal expectations for training requirements. This would be great if you had unlimited resources or was only in the training business and not having to manage real time operations at the same time on a daily basis.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: I do not agree with the requirements in the standard, so the Compliance Process can not be addressed until the requirements are agreed upon.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Same answer #7.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It is an unreal expectation that a small utility will have the resources to comply with the requirements stated in R2 and R4.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: As stated in question #9 above, small utilities do not have unlimited resources to budget only to training. This standard would place an undue burden on training departments to meet compliance criteria that would result in additional staff needed that small entities can not meet.
    R4 -How are we supposed verify the capabilities of the each real time operator? How will someone with a NERC certification that is not working a real time desk position, (i.e. training, other administrative rolls, switching coordinator) be assessed?

How will operators be assessed annually under R2?
Why would any entity want to add to the task list when you can not meet the requirements already stated?
There are many items in the task list that are not currently done in ERCOT by Transmission and Generation Operators on a utility level, but rather done on the ERCOT regional level so how can one be assessed on that requirement.
I wouls see that entities will be excluding task from the list rather than adding them.
A systematic approach to training is the way to approach training needs, but this approach seems to be a bit to aggressive without consideration for the small utilities.
NERC should take the lead in developing training programs that can be administered be regional entities that are appropriate for the region.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Please define how to constitute acceptable and actual performance cabability and clarify the requirement. How will industry identify "mismatch". Is this requalification of system operators. The requirement doesn't seem measurable and crisp to audit for compliance. This requirement has a "fill in the blank" characteristic.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32 hour emergency training requirement belongs in the Personnel Training Standard. Please provide the basis fot the 32 hour requirement.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: We agree with the principle. However, please specify how you propose to to execute and measure this requirement.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It must be clear that no personal information or assessments that may be confidential are part of M2. The information should strictly be related to the System Operator's skills. Also see Q8 below regarding R1 and M1.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: D1.2, the reset period seems unrealistic and short. The assessment is due annually.

   D1.3 delete onsite. Also who is the Compliance Monitor intended to be.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Requiring a training program subject to following 5 Systematic Approach to Training (SAT) principles seems overly perscriptive and why would it be a severe violation severity level not to follow these or subset thereof. NPCC Participating members can accept 5 training principles but the entire SAT seems unnecessary. If NERC intends to adopt the SAT, in its entirety, it needs to clarify and educate the industry before incorporating it into a standard.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☒ Yes

    ☐ No

    Comments: The lack of objectivity in these requirements may conflict with labor union contracts i.e. confidentiality issues of review.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: R1.1 should refer to Transmission Operator instead of Transmission Owner. The proposed standard is not applicable to the Transmission Owner.

Attachment B should have the same preamble as Attachment A.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: We agree with the annual assessment of the training need. However, we feel the standard needs to have a requirement on the competency level (defined industry-wide or by individual responsible entities) in order to identify the mismatch between acceptable and actual performance capability.

   That said, this is not a requirement that can be developed easily. Having an industry-wide competency level lends itself to debates, possibly without an agreement, and given there is already a certification examination. Leaving it to be developed by the individual responsible entities would subject the requirement to a "fill-in-the-blank" category, which is to be eliminated.

   A simpler approach would be to require responsible entities to assess training needs on an annual basis, without specifying how, and develop an effective training program with an aim to enable operating personnel achieve the required skillset. In this case, the requirement will focus on the process (annually assessment) and the what (the training program), not the how (measuring the mismatch).

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: Training requirements should always be covered by one standard. This avoids duplication of requirements and lends clarity to the scope of the standard under consideration. On this basis, we feel that the 32 hours emergency training requirement should be covered in this standard since this standard deals with all aspects of training. Further, the standard on System Restoration and Blackstart has a narrower scope as compared to PER-005 - Restoration and Blackstart scenarios only - and may not cover all the emergency scenarios.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: The key attribute here is "assessment of the capabilities". As noted in our comments to Q1, above, while we do not disagree with developing a requirement for establishing the competency level for system personnel to perform the assigned tasks,

the determination of this competency level and assessment of the mismatch would be troublesome and likely not measurable.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: We do not agree with some of the requirements in the standard (see our comments under Q11) hence we have difficulties commenting on the time horizons. Given what's written, however, our general comment is that assigning long-term planning to all the requirements is inappropriate, if not over-simplistic. For example, the annual assessment of the training need and development of/revision to a training program, as the requirement implies, occurs once every 12 months. This is normally regarded as an operations planning time frame if violation of this requirement is to be mitigated.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Given what's written, but we do not agree with some of the requirements (see Q11, below).

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Yes, given what's written, but we do not agree with some of the requirements (see Q11, below). In addition, we think M3 should be expanded to cover the sub-requirements in R3. One item of particular concern is an entity is assigned a Low violation if it is found that it did not add or remove topics from the Emergency Operations Topics. This is not covered in M3, which only covers the 32 hour training duration requirement.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We have difficulties with the following elements:

   1. The entity "Compliance Enforcement Authority" is a new term and should be replaced with the equivalent Functional Model entity.

   2. The compliance elements should deal with assessing whether or not, or the extent to which, responsible entities meet the requirements according to the measures. To require a responsible entity to maintain records on whether it is following or followed any mitigation plan associated with the standard appears to be a follow-up process after the entity has been assessed non-compliant. This seems to be outside the scope of a standard. Similar comment on the requirement for the Compliance Monitor to retain any

data used in mitigation plans associated with this standard, and the Compliance Monitor is not on the applicability list.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:

   (1) 2.1.3 See our comment under Q6 that is related to this violation severity level.

   (2) We are unable to offer comments on the VSLs associated with not following or missing any steps in the SAT program. We not do see adopting and following a SAT approach to develop a training program should be a requirement. Please see our comments under Q11.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We have a major difficulty with the standard as written. We are therefore unable to agree on the implementation plan.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: The IESO appreciates the opportunity to comment, and commends the drafting team for responding positively to our comments on the previous draft standard and SAR.

    However, we have a major difficulty with this standard:

    1. R1 require that responsible entities complete the five phases of a systematic approach to training (SAT), which includes analysis, design, development, implementation, and evaluation - ADDIE) to establish a new or modify an existing training program. We do not agree that this should be a requirement.

    The requirement should be for the responsible entity to develop an effective training program to help system operation personnel to acquire the competency to perform the applicable tasks pertaining to the RC, TOP and BA functions that the entity is responsible for or assigned. We neither endorse nor disagree that the SAT process is a good approach, but how the training program is arrived at (i.e. what approach it takes) is not important and should not be a standard.

The 2003 Blackout report emphasized a need to train system operators to perform all tasks assigned to their positions. This can be met by requiring responsible entities to develop programs that cover training on all the tasks assigned to the operators, within the scope of the RC, TOP and BA functions, provide the resource for delivering the training. To achieve this, let us reiterate our previous suggestions:

a. Developing a training program which lists the tasks (specifically for the RC, BA and TOP as listed in the Functional Model) to be performed and the competency level required to perform the tasks;
b. Delivering the training program;
c. Recording, tracking and assessing progress of the persons receiving training;
d. Planning, providing resource, reviewing and adjusting (as necessary) the training program annually.

(2) We realize that system operators may perform other tasks over and above those identified for the RC, BA and TOP functions. However, these other tasks are outside of the scope of the envisaged certification requirements and hence outside of the scope of this standard. The term "company-specific reliability related task" lends itself to interpretation that other reliability tasks (such as those performed by GOP, DP, etc.) must also be included in the training program. We suggest this term be revised, or more words be used to clearly stipulate that only the tasks assigned to the above 3 functions need to be included, depending on the structure and the registered function(s) of the organization.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Please define how to constitute acceptable and actual performance cabability and clarify the requirement. How will industry identify "mismatch". Is this requalification of system operators? The requirement doesn't seem measurable and crisp to audit for compliance.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32 hour emergency training requirement belongs in the personnel training standard. Please provide the basis for the 32 hour requirement. Is this in addition to the NERC Certification requirements? How does this Standard fit into the existing NERC Certification requirements?

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: We agree with this principle however please clarify how you propose to execute and measure this requirement.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It must be clear that no personal information or assessments that may be confidential are part of M2. The information should strictly be related to the System Operator's skills. Also see number 8 below regarding R1 and M1.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: D1.2, the reset period seems unrealistic and short. The assessment is due annually.

   D1.3 delete "onsite." Also who is the Compliance Monitor intended to be.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Requiring a training program subject to following 5 Systematic Approach to Training (SAT) principles seems overly perscriptive and why would it be a severe violation severity level not to follow these or subset thereof. ISO-NE can accept 5 training principles but to require only SAT seems unnecessary. This goes against the principle pf telling the industry WHAT to do, not HOW to do it.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☒ Yes

    ☐ No

    Comments: The lack of objectivity in these requirements may conflict with labor union contracts (i.e. confidentiality issues of performance reviews).

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: R1.1 should refer to Transmission Operator instead of Transmission Owner. The proposed standard is not applicable to the Transmission Owner.

Attachment B should have the same preamble as Attachment A.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: You are simply asking too much of a large segment of this industry-those utilities that have a small, or nonexistent, training staff. Your goals are lofty, but NERC is completely out of touch with reality if it believes that the huge requirements of this standard can be effectively managed by utlities such as mine that employ a training staff of one.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: It should be contained in the Continuing Education Program.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: See #1 above. It is simply too much for smaller entities to handle. Has anyone in the group that developed this standard polled the industry to see what kind of resources are available to support it? If not, then you have no idea of whether or not it is feasible.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: If I do not agree with the requirments in the first place, then I can hardly agree with any time line.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: See #4.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Again, it is an unreal expectation to believe that smaller utlities can manage what amounts to an entirley new massive program.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: see #4.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: see #4

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: If I started on this today, it would take me longer than that to create all these new requirements. In order to meet this requirements, I would have to drop all other responsibilities.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: To recap, the creaters of this standard have done a good job. My problem is not so much with the standard itself, as it is with the completely unreal expectation that the resources, money, and time exist to do all of this.
    Some further points:
    R.2- How are we supposed to accomplish this? Test each operator on each task anually? I spent 9 years in nuclear power operations and I did not get tested on each critical task the entire nine years. I was responsible for all critical tasks, but annually I was tested on a few randomly selected ones. That is a much better way to manage such a program.

From the generic task list for Transmission:

#5: Not performed by Transmisison System Operators, this is done by support staff
#18: Not performed by Transmisison System Operators in ERCOT
#27: Not performed by Transmisison System Operators
#45: Not performed by Transmisison System Operators in ERCOT, this is done by support staff
#61: What if your utility has no HVDC?
#67: In ERCOT, Transmission System Operators do not redispatch generation. This function is performed solely by the QSE. The only case where this would not hold true would be a blackstart.
#70, #71, #72, #73, #79, #81: Since ERCOT is a deregulated market none of these functions are performed by Transmisison System Operators at LCRA.

The standard mentions that a given organization is responsible for these generic tasks as well as any other self-identified ones. Use your common sense, if you give people the option of adding to their work load by adding elements to the list, basic human nature will lead people to not do so. Why would they want to create work for themsleves when this standard would already be making their jobs incredibley burdensome? Conversekly, if entities are allowed to drop some of the genric items off the list what you will see is individual utilities paring this last down to something manageable.

What we have here is a proposal to implement a standard without, in my opinion anyways, a thorough assesment of its impact. The basic idea is sound-a mandate for a systematic approach to training. The devil is in the details. I believe there is no concept of the time and resources that exist in this industry on the part of those who created this standard. You can mandate it, but it does not meant that those of us in the positions of responsibility will get the money/resources it would take to implement such a massive undertaking. The smaller utilities would need real help in making this happen. If NERC is bent on pushing this standard through then it should step up to the plate with regional training, templates, standardized forms, etc-all the things that will be needed to make this happen. This new standard would amount to an unfunded mandate making compliance a very difficult proposition for those of us at the end of the pointy stick. In fact, I would personally consider moving into some other area out of training in order to not be liable.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It is unclear what "acceptable" is and what measurements can apply to it when it has not been defined. It is unclear whether this means for each job title or for each person that holds the system operator certificate. If it is for each job title (position), this is reasonable, however if it is each person, then it becomes overly cumbersome. If for each person, this is the responsibility of the registered entity to council and supervise its' operators. Or does it simpley mean that the System Operator position (tasks) in question has been reviewed and they meet the currect position responsibilities? How can this be measureable if there is no change in job tasks from year to year? Perhaps it should read "System Operator job task for each position shall be reviewed upon addition or removal of system operator job tasks".

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments:
   a) This requirement needs to be in "Personnel Performance, Training, and Qualifications" standard. In NERC's Reliability Standards Development Plan dated Nov 30, 2006, the Work Plan objective to support its Goal is to "Reorganize the standards more logically based on topic and remove redundancies". All NERC Training Requirements need to be within the Personnel Performance, Training, and Qualifications Standard's section.

   b) All required training that a NERC Standard directs any entity to do should be placed in its own NERC (training) Standard. The NERC Standard category "Personnel Performance, Training, and Qualifications" is established for this purpose. As stated in FERC Order 693, para. 1335, training requirements would not be in one "all inclusive standard". A better fit is to have many individual standards (that specify training requirements listed in Personnel Performance, Training, and Qualifications section of the NERC Standards) under the heading of "Personnel Performance, Training, and Qualifications". If a training requirement is imbedded in a non-"Personnel Performance, Training, and Qualifications" standard, it will lead to possible shortfalls from an entity.

   c) This requirement should be in the Personnel Performance, Training, and Qualifications Standard, because it applies to training not specifically related to System Restoration or Blackstart (e.g. loss of primary control center, energy emergencies, etc.).

   d) In R3, it is stated "… 32 hours annually of emergency AND system restoration training." Does this mean 32 hours of both or a total of 32 hours? Since system restoration is a subset of Emergency Opertions Topics (attachment B), then the SDT should delete system restoration from R3. Either way the SDT needs to state what the proposed requirement will be.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   a) It is unclear whether this means for each job title or for each person that holds the system operator certificate. If it is for each job title (position), this is reasonable, however if it is each person, then it becomes overly cumbersome. Routine tasks are currently monitored by the System Operator's Supervisor as part of the Supervisor's on-going evaluation of the System Operator's job performance. Job performance evaluation is a normal part of supervision and is utilized to determine compensation levels, retain quality personnel and administer the promotion process. Requiring a formal test or evaluation of tasks performed on a routine basis will trivialize the assessment process and encourage rubber-stamp approval to sign off on each task. System Operators should only be required to formally demonstate competance in performing non-routine tasks which are performed on an infrequent basis. Or does it simpley mean that the System Operator position (tasks) in question has been reviewed and they meet the currect position responsibilities?

   b) As a measurable requirement, this becomes too cumbersome (if for each system operator). As a business practice, it is good, but some of the tasks (i.e. communication with the RC) are performed regularly and to have to document each task for each operator would be overly burdensome.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   a) Entities have established training programs per Regulatory Approved Standards. Proposed Effective Date, 5.1 is the only parlell, carry over requirement from a Regulatory Approved Standard (PER-002-0, R4) to this proposed standard. This time frame is workable.

   b) Proposed Effective Date, 5.2 is unclear (see comments of 2.a, above), so an effective date can not be proposed yet.

   c) Proposed Effective Date, 5.3 for the proposed SAR contains over 370 tasks for operators and the time line is too aggressive. Registered Entities will need to be trained in the Systematic Approach to Training process, set up their own processes, convert established training to the SAT process, create new training and start to give training to System Operators. Budgets will need to be forecasted, personnel will need to be tasked with the training process (most companies have a small training department), this will take an extream amount of time and cost are unknown at this time.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

☒ No

Comments: Since Violation Severity Levels have not been vetted through the electrical industry, levels of severity can not be applied to the proposed standard.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: M1.2, Unclear what the difference is between "design" and "development", and these are in fact lumped into one measure even though they are considered 2 separate steps for the SAT process.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:
a) It is unclear what the one month period is meant to be in Compliance 1.2. If it is meant to mean that the requirements need to be met monthly, then the requirements are too in-depth to be met on a monthly basis. A full evaluation of each operator on a monthly basis in particular would be impractical. R3 already mentions it is an annual requirement, and this time period seems reasonable for all of the requirements.

b) Data Retention, 1.3, Do not understand the 4 year retention period, since Registered Entities (RC, TO, BA) will be audited every three years..

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:
a) In 2.1.3, under VSL, it is possible that the list of Emergency Operations Topics exactly fits an entity, and such entity should not be penalized for that. In 2.2.3, this implies that ALL of the subject areas must be met annually. If this is not the intent, it should be clarified. If this is the intent, this appears to be too demanding for each operator to meet all 42 subject areas in 32 hours.

b) VSL's need to be vetted through the electric industry or drop them all together. Since a training violation does happen during realtime, the VSL should be low.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: a) Entities have established training programs per Regulatory Approved Standards. Proposed Effective Date, 5.1 is the only parlell, carry over requirement from a Regulatory Approved Standard (PER-002-0, R4) to this proposed standard. This time frame is workable.

b) Proposed Effective Date, 5.2 is unclear (see comments of 2.a, above), so an effective date can not be proposed yet.

c) Proposed Effective Date, 5.3 for the proposed SAR contains over 370 tasks for operators and the time line is too aggressive. Registered Entities will need to be trained in the Systematic Approach to Training process, set up their own processes, convert established training to the SAT process, create new training and start to give training to System Operators. Budgets will need to be forecasted, personnel will need to be tasked with the training process (most companies have a small training department), this will take an extream amount of time and cost are unknown at this time.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:
a) In NERC's Reliability Standards Development Plan dated Nov 30, 2006 (pg 3 of 21), (pertaining to FERC Order 672) states "the Commission states that a proposed reliability standard must be designed to achieve a specific reliability goal and be clear and unambiguous regarding what is required and WHO is required to comply". The STD will need to rewrite Applicability 4.2, (use of the words "and their delegates") do to the ambiguous personnel requiring training other than certified system operators.

b) R4.2 states the standard applies to System Operator positions listed under R4.1 and "their delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric Systyem". In NERC's Personnel Certification and Governance Committee (PCGC) Charter (approved May 2, 2007), Section 2, 1.a. includes that the PCGC sets the "requirements for personnel certification, maintaining certification, and recertification". The PER-005-1 SDT does not have the authority to require non NERC Certified personnel to be trained under a NERC Standard. The PCGC establishes who must be NERC Certified.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: Attachment A:
Concerning General Control Center Operations Tasks,
#22 (Monitor real-time market prices) should be removed, reliability is not based on economics.
#58 (evaluate, test, and/or confirm the accuracy of reliability assessment tools) should be removed, this is not an operator task.

Concerning Generation Tasks,
#14 (publish next-day market results) it is redundant with #29.
#48 (suspend automatic generation control as required) should be removed, it is part of #47.
#58 (operate power facilities in compliance with environmental standards) should be removed, it is not a part of reliability.

Attachment B:

A.6, needs to be split into two topics, 1) Geomagnetic Disturbances on system operations and 2) Weather impacts on system conditions.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: Not clear on what system operator position means. In theory I agree but from a practical purpose this is not an easy task, especially for non-routine or emergency tasks without the aid of a simulator. While reference is made to the 737 pilot, simulators for the aircraft industry are far more developed than those for electrical systems. Walking through restoration plans and emergency procedures is one thing but it is quite another thing to put into practice. Is it being suggested that a comparison of acceptable to actual perfomance be made from the task on the BES task list.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: Should be part of the system personnel training standard. Anything related to training should be found in these standards.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: In theory I agree but from a practical purpose this is not easy. My real concern is who would be doing the evaluation. Besides being a burden on many utilities, as some utilities will maintain a a narrow list of BES tasks so that they could comply. I am unsure whether or not each utility would treat the evaluation consistently. In some companies, supervisors work along side the system operators and may just give the evaluation a cursory effort. This would do nothing to improve training.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Do not understand what this means.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

☒ Yes

☒ No

Comments: It is hard to believe that we are still mixing risk with importance. Yes training is an important component but it is a stretch to say that missing some item or document is going to place the system at risk.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: On quick review it looks like additonal requirements are being placed in the measures. The measures are complex and may not be understood.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Violation Security Levels are too complex to follow.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Violation Security Levels are too complex to follow.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☒ Yes

☒ No

Comments: I think the plan is okay but if it has a medium risk factor then is that being understated and should we not be starting immediately.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☒ Yes

☐ No

Comments: There may be issues with some unions and its agreements.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: I still have a concern with whether or not this would be fairly applied by all utilities. Most utilities will try and keep a minimum set of tasks and the assessment process will be treated inconsistently across the utilies.. This has been a better attempt

at providing the miniimum tasks for each type of system operator but again, there will be no way the NERC or an audit team will be able to determine if the task should be there or not. Some way of tying the metrics being developed by the TADS might be away for determining training needs.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We agree that it should be a requirement to annually assess and update a training plan for each system operator position and design training around these assessments. However, the choice of words is poor and we can't support a requirement that implies it is acceptable for a System Operator to fill a position in which he does not meet an acceptable performance level.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: We don't think it matters which standard as long as it is in only one. It should be removed from the standard that is further behind in the process to minimize any schedule impacts. In relation to this annual training requirement, we recommend striking the second paragraph under section 2.4.3 of the Severe violation level. The first paragraph should cover all situations since 32 hours of training were provided or they weren't. If the 32 hours have not been met, the annual requirement has not been met.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Each operator should have an annual plan that includes a combination of training based on job tasks, simulation, and classroom knowledge-based training. There may be hundreds of tasks in an entities JTA. It is unnecessary and administratively burdensome to require an assessment each year against each task.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: As a general rule, we do not agree to any assignments of time horizons because time horizons were never vetted through the industry. The definitions also are not posted on the NERC web site in a prominent location. There were no time horizons assigned for R1 and R2 in PER-004-2.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: As a general rule, we do not agree with the assignment of any Violation Risk Factors to any requirements since the Violation Risk Factor definitions have not been vetted through the industry. One could make a case that the lack of a training program could be a medium risk violation, however there should be no medium or high risk requirements in an administrative standard. We appear to be confusing importance with the probability of cascading.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Measure 1 is confusing due to the sub-measures. Is this trying to say the training program shall have these four critieria? If so, it needs to be worded better. For example, we suggest simply replacing M1.1 with:

   A list of company specific BES reliability-related tasks with measurable criteria for each task.

   This is much simply and clearer.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We have the following issues and concerns:

   1. Doesn't the Compliance Monitoring Period and Reset of one-month make the annual training requirement ineffective? Since it is reset every month, can you ever really measure if 32 hours have provided? It seems that it should not be reset each month.

   2. What is the justification for retaining documentation more than 3 years. Three years is generally the longest a standard requires for data retention unless there is a violation. There should be strong justification for this. We can't fathom what it is.

   3. Section 1.4 should be completely removed. It is written in a way that would require the regional entity to include this standard in their annual Compliance Monitoring and Enforcement Program every year and dictates to the region how compliance will be monitored. Isn't this up to the region? It also duplicates the requirement for a compliance audit every three years. It does not need to be repeated here.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

Comments: In general, we do not support the application of any violation severity levels because the VSL guideline has not been vetted through the industry.

We do have the following specific issues and concerns as well.

1. The VSLs try to cover so many scenarios that they are confusing. We had enough trouble understanding them that we are concerned we have not identified every specific issue with them.

2. In the Moderate Violation Severity Level, section 2.2.2 creates a de-facto requirement on the training schedule because the training based on the mis-match in performance is required to be in the current schedule. What if a responible entity's schedule is updated every quarter and only goes out 3-6 months? They could still train on this in months 7-12 but this compliance element would find them in violation because it was not in their "current schedule".

3. We do not agree that a lack of documentation should be considered a high violation as described in section 2.3.1 of the High VSL. Lack of documentation should be a lower violation.

4. Sections 2.3.1.1, 2.4.1.1 and 2.2.1 duplicate one another but are in different VSL.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: If the standard were simplified, it could be phased in more quickly.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: The scope of the Certifying System Operators SAR indicates that they will determine who needs to be certified. Yet, this standard in section 4.2 of Applicability section specifies who should be certified. This should be coordinated with the CSO SDT.

Requirement R1 in PER-004-2 will be redundant with standards created by the CSO SDT. We recommend eliminating it. Requirement 2 is also poorly defined and not measurable. How does one place particular attention on SOLs and IROLs? This a relative statement that leaves the requirement open to significant future challenges during enforcement.

The standard appears to have only 4 requirements, yet is 27 pages long. It is too complex. All registered entities should have a training program. It does not have to be a SAT program.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: There is a potential ambiguity that "each system operator position" could be interpreted as meaning "each person who performs each operator position". This is because of the use of the words "actual performance capability" which seems to refer to a person not a position. The MRO assumes what is meant is each position not each person. Please confirm. Perhaps wording could be clarified by inserting "(not person)" after the word "position". Suggest replacing "acceptable and actual performance capability" in R2 with "required and existing performance capability". The MRO agrees with R2 in concept but in practice this is not an easy task, especially for non-routine or emergency tasks which may be very difficult to simulate in training. While reference is made to the 737 pilot, simulators for the aircraft industry are far more developed than those for electrical systems. Walking through restoration plans and emergency procedures is one thing but it is quite another thing to in practice.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: Should be part of the system personnel training standard. Anything related to training should be found in these standards. Might be helpful to have a reference in the blackstart standard like "see personnel training standard for specific training requirements".

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: In R4 it isn't clear how often the Operator's capabilities must be assessed. There is a mismatch between Question 3 and R4. Question 3 uses the words "perform an assessment" whereas R4 uses the word "varify". An assessment is an estimate whereas to varify is to actually test. Perhaps R4 should use "assess" rather than "varify". In theory MRO agrees with R4 but from a practical point of view this is significant overkill. MRO Operators are already required obtain NERC certification. There is also the NERC Reliability Readiness Evaluation and Improvement Program. In addition, compliance to many other real time standards test the capabilities of the positions every day. How can the standard ensure that the assessment is being done consistently from company to company depending on who actually does the assessment and how complete or accurate each companie's specific BES task list is? For example, some utilities may maintain a

narrow list of BES tasks so that they could more easily comply. Would each utility treat the evaluation consistently? In some companies, supervisors work along side the system operators and may just give the evaluation a cursory effort. This would do nothing to improve training. Do all tasks have to be assessed annually? Wording seems to be flawed in that every operator has to be varified on every task before they can operate. This does not seem to recognize that operators require actual operating experience to aquire capability in all tasks. In general R4 adds an excessive and and burdensome level of bureaucracy.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: There is varied opinion on this. Perhaps the majority opinion is: It is hard to believe that we are still mixing risk with importance. Yes training is an important component but it is a stretch to say that missing some item or document is going to place the system at immediate risk. MRO suggest these be assigned as LOW but does agree that training is important. Others agree with assigning Medium.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: On quick review it looks like additonal requirements are being placed in the measures. For example, M1.1, seems to add an additional requirement of having measurable or observable criteria for desired performance for each task which is not stated in R1. The measures are complex and may not be understood. For example, in M4, it is not clear how "varification of the capabilities for each real-time operator" can actually be achieved and then varified to an auditor. In may also be inpractical to varify capability to perform some tasks if the individual operator has never actually been in a situation to demonstrate capability - follow the correct procedures to initiate loadshed in an emergency, for example.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments: The term Compliance Enforcement Authority (CEA) needs to be defined as it seems this is a previously undefined entity. Why not just say Regional Entity?

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Too complex. Don't need to list five phases again and again

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: If there is really a MEDIUM risk to the system perhaps the implementation plan should be accelerated. On the other hand, the implementation schedule may be overly aggressive if significant modifications to the Job Tasks are required.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☐ No

    Comments: (It seems the last sentence of this question is incorrectly phrased. Shouldn't "not" be replaced with "yes"?) There may be issues with existing union agreements.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: Please explain how the performance reset period of one month would work when the training program is being assessed annually per R2.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Monitoring the mismatch between acceptable and actual performance is a continual process. If there is a mismatch in the expectation and performance of reliability-based tasks, such mismatches are addressed immediately based on reliability requirements. Failure to do so is to risk non-compliance with reliability standards.

   To mandate an annual performance evaluations solely for the purposes of training, when continual reliability-based performance evaluations must be conducted to maintain compliance with operational standards, would be redundant.

   R2 should be deleted as unnecessary, given R1 and the compliance requirements with all other NERC standards. R1 addresses training for existing and "new or revised tasks"

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: This requirement that has no basis in a systematic approach to training, it should be removed from both locations. Thirty two hours is an indefensible, arbitrary, and capricious number.

   Please explain the justification for selecting 32 hours rather than 64, or 16?

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Orientation training is provided in a systematic approach to assume the task. Reinforcement training of the key reliability tasks is an ongoing aspect of a systematic approach to training. Addressing gaps between expectations and actual performance is driven by reliability requirements, not training program structure.

   Annual testing of all staff, on all possible tasks, is a waste of training effort and operator time.

   R4 should be deleted as unnecessary, given R1 and the compliance requirements with all other NERC standards.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Medium is an excessively high risk factor.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: M4 is unmeasureable. Replace the wording "verification of the capabilities" with "training records".

   R4 is not measurable. Please replace the following:

   Each Reliability Coordinator, Balancing Authority and Transmission Operator shall maintain training records of each of its real-time System Operators. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall maintain records of training programs provided to address the tasks on its list of company-specific BES reliability-related tasks.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: There is no requirement that requires data retention. There should be. See the proposed rewording of R4 above.

   Mitigation plans are addressed nowhere in the standard except in data retention. It is an undefined term.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   The risk factor should be LOW for R2. There is no risk to reliability if the mismatch does not result in reliability impacts in real-time operation. Real time reliability standards are

addressed in other documents. If there are tasks that fall below expectations that do not effect system reliability as measured by NERC standards, then their impact on reliability is low.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: R3 is in effect now under PER-004. There is no need for a phase in. On the other hand R3 has no place in a systematic approach to training and should be deleted.

If, and only if, R1, R2, R4, Appendix A and Appendix B are rewritten along the lines suggested in this comment form, the effective dates would be viable.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments:

Requirement R1.2 should be deleted in its entirety. It mandates through "shall" that "all" the tasks in Attachment A be included in the company specific task list. Attachment A includes meaningless, redundant and poorly worded task definitions. If NERC wishes to create a separate document to aid entities in developing a company-list, that would be OK. But Attachment A, as written, is worthless and misleading definitions of tasks.

The Attachment A has no place in a standards document unless each and every item on those lists is mandatory.

Both Attachments A should be deleted or completely reworded. As written, it will never stand up in court as valid task definitions.

Here are examples of poorly worded tasks from the

NERC Generic Task Lists: Emergency Operations,

which I will be mandated to include in my company specific task list

Consider items 1-10 on that list.

1 Request emergency energy upon loss of a resource
2 Respond to capacity deficiency
3 Respond to loss of energy resources within allowable regional or pool timeframe

4 Prepare for a capacity emergency by bringing on all available generation
5 Prepare for a capacity emergency by postponing equipment maintenance
6 Prepare for a capacity emergency by scheduling emergency energy purchases
7 Prepare for a capacity emergency by reducing load
8 Prepare for a capacity emergency by initiating voltage reductions
9 Prepare for a capacity emergency by requesting emergency assistance from other systems
10 Schedule available emergency assistance with as much advance notice as possible given a capacity emergency

The true tasks in these items have nothing to do with the causal event. Cutting out the phrase about "capacity emergency" will clarify those task statements 3-10 exceedingly.

Cutting out the causal trigger for action, i.e. "Capacity deficiency", the measurable task #2 becomes "Respond to". Please provide an example of how one measures competency for the task "Respond to".

In items 4-8, the competency task has nothing to do with the trigger to initiate the task. Dropping "Prepare for a capacity emergency by….", is not a task definition. "Bringing on all generation", "postponing equipment maintenance", "scheduling emergency energy purchases", reducing load, initiating voltage reductions" (which is really a subtask of reducing load), "requesting emergency assistance from other systems", can be executed to resolve any number of issues besides capacity emergencies. The same tasks can apply to (1) preparing for and (2) resolving - all the subsets of SOL and IROLs.

How is the task "request emergency energy" in item 1 different from "scheduling emergency energy" in item 6, or "schedule available emergency assistance" in item 10"? Please explain.

The same exercise can be applied to items 15-24 on that list.

15 - Manually shed load to alleviate system emergency conditions
16 - Following the activation of automatic load shedding schemes, restore system load as appropriate for current system conditions and in coordination with adjacent systems
17 - Following the activation of automatic load shedding schemes, shed additional load manually if there is insufficient generation to support the connected load
18 - Following the activation of automatic load shedding schemes, monitor system voltage levels to ensure high voltage conditions do not develop
19 - Following the activation of automatic load shedding schemes, monitor system frequency to ensure high frequency conditions do not develop
20 - Following the activation of automatic load shedding schemes, monitor the performance of any automatic load restoration relays
21 - Following the activation of automatic load shedding schemes, resynchronize transmission at preplanned locations if possible
22 - Following the activation of automatic load shedding schemes, disable automatic under frequency relays if system conditions warrant
23 - Direct distribution providers to shed load when required for system reliability
24 - Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads or to prevent voltage collapse

"Following the activation of automatic load shedding schemes" has no place in an outcome oriented, measurable task definition. It makes no difference to the operators' task how the load was shed.

Is the manual load shed task in 15 any different from the manual load shed task in 24? Are transmission overloads and voltage collapse in task 24 not included in task 15 "emergency conditions"? Please explain.

Does restoring system load task in 16 have any connection to how the load was lost? Is restoring load lost by UFLS, different from restoring load for manual load shed, or load trip, or restoration? Please explain.

Do you only monitor voltage levels following a UFLS event? Do I need different tasks to monitor voltage for load pick-up, load drop-off, line switching, line tripping, generation tripping, capacitor switching, reactor switching, phase shifter operations, HVDC operations, and interchange schedule changes? For each of these tasks, will I need a procedure for the auditors to verify? Please explain.

Do we only resynchronize transmission at pre-planned locations after UFLS events? Do I need to define different tasks for resynchronize transmission at pre-planned locations after a maintenance separation, during a system restoration, etc.? Please explain

Attachment B is severely flawed and redundant

The list in Attachment B has no place in a standards document unless each and every item on those lists is mandatory.

Attachment B should be deleted or seriously reworded. It will never stand up in court.

A1) "Emergency Drills and Responses" will capture:
- All of section B "Operating Policies relative to Emergency Operations"
- D4) responding to imminent voltage collapse
- D5) SOL: and IROL
- D6) DC operations during system emergencies

All of section B, D4, D5 and D6 should be removed in this standard that addresses a systematic approach.

D8 & D9. There is no distinction between "congestion management" and "line loading procedures" Remove D8 as redundant in this standard that addresses a systematic approach.

What is the difference between "congestion management" and "line loading procedures"? Please explain.

D11: Assuming that "tie line operations" means CPS control state that. If you intend it to mean another form of line loading control, delete it.

If you mean these to be different items, please clarify.

A5 & D2; There is no distinction between A5 and D2. Remove D2.
- A5: System protection
- D2: Special protections systems

What are "special protections systems" if not an instance of "system protection"? Please explain.

A4 & D3: There is no distinction between A4 and D3. Remove D3

A4: operations during unstudied conditions
d3: special operating guides

What is if the function of "special operating guides" if not to address "operations during unstudied conditions"? Please explain.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The caveat here is that before the assessment takes place, the requirements of each specific operator need to be developed. This process commences with the job tasks for each position being identified and the standards being developed from the task lists. It is difficult to determine the mis-match between acceptable and actual performance when the standard does not exist. The only standards that we currently have are that the operators must complete their NERC certification, and each operator is required to obtain 32 EOP hours of annaul training and obtain up to 200 hours of CEH to maintain their certification. Once we have completed the initial qualification of all the system operators, it would make more sense to tie the assessment to NERC recertification so that the assessment is done every three years.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32 hour requirement is not currently included in Project 2006-03. This information should be included in the training document. The System Restoration and Blackstart standard should reference the training document when talking about frequency of training and content, that way the training document would contain all pertinent training data including frequency of testing and testing requirements.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: This assessment should be part of the initial qualification effort, before the individual fills the position of system operator. The assessment should then take place every three years in conjunction with NERC re-certification. An annual assessment of each assigned task would be administratively arduous.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

Comments: The annual assessment is scheduled to begin before the baseline criteria for the evaluation is developed. It would be more beneficial to develop the standards upon which the evaluation will be based first so that the operators know what is expected from them.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Compliance monitoring period and reset lists the performance reset period for all requirements at one month, which would make the annual training requirements ineffective.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Since the training program with not be completed until the end of the three year period, assessments of personnel could not begin until after the completion of this development.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: We need clarification in A.4.2 as to whom this standard is applicable and who will be the initially qualified personnel to sign off operators.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Please define how to constitute acceptable and actual performance cabability and clarify the requirement. How will industry identify "mismatch". Is this requalification of system operators. The requirement doesn't seem measurable and crisp to audit for compliance. This requirement has a "fill in the blank" characteristic.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32 hour emergency training requirement belongs in the personnel training standard. Please provide the basis for the 32 hour requirement.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: We agree with this principle however please clarify how you propose to execute and measure this requirement.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It must be clear that no personal information or assessments that may be confidential are part of M2. The information should strictly be related to the System Operator's skills. Also see number 8 below regarding R1 and M1.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: D1.2, the reset period seems unrealistic and short. The assessment is due annually.

   D1.3 delete onsite. Also who is the Compliance Monitor intended to be.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Requiring a training program subject to following 5 Systematic Approach to Training (SAT) principles seems overly perscriptive and why would it be a severe violation severity level not to follow these or subset thereof. NPCC Participating members can accept 5 training principles but the entire SAT seems unnecessary. If NERC intends to adopt the SAT, in its entirety, it needs to clarify and educate the industry before incorporating it into a standard.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☒ Yes

    ☐ No

    Comments: The lack of objectivity in these requirements may conflict with labor union contracts. ie confidentiality issues of performance reviews.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: R1.1 should refer to Transmission Operator instead of Transmission Owner. The proposed standard is not applicable to the Transmission Owner.

Attachment B should have the same preamble as Attachment A.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: How can the training needs of a position be determined based on performance capability of that position? A position has infinite capability while an individual does not have infinite capability. The requirement be revised to determine mis-match of acceptable and actual performance and leave the word capability out of the requirement.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The training requirements for system operators should all be in the same standard, namely the System Personnel Training Standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: This requirement is not necessary for several reasons. The ability to only perform individual tasks does not give a good indication of an operator's performance to manage and execute reliable operation of the Bulk Electric System during critical times when multiple tasks must be performed in rapid succession…working under pressure. The performance of an operator in a pressure situation would provide a better measure of an operator's performance rather than assessing capabilities to execute individual tasks. With only assessing individual tasks, the big picture of an operator's performance to reliably operate the Bulk Electric System is not adequately determined.

   Also, the performance of individual system operators is already evaluated through a performance review process and training evaluations are a part of that process. In order to demonstrate compliance with this requirement, would these performance reviews need to be made availabe to compliance auditors? Allowing auditors to view the performance reviews would seem to violate privacy and confidentiality laws and would necessitate the involvement of the human resources department in the compliance process. If the human resources department were not involved in the process then a separate process would need to be duplicated in a "sanitized" manner for inspection by the compliance auditors. This duplication would be redundant and inefficient.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The Risk Factor for each requirement should be low. Each of the requirements appear to be more administrative in nature and do not warrant a Medium risk factor as is currently assigned.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The M1 sub-measures are written more like requirements than measures. The submeasures should be deleted. Revise M1 to read, "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evdience of a SAT developed BES System Operator training program as stated in R1." This wording clearly measures all that is stated in requirement R1.

   In M2 it is unclear why the word "position" was included.

   For M3, delete the words "or system restoration training." Sytem restoration is considered a part of emergency operations.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: In Section D, 1.4 the annual self-certification submittal should not be included in the standard but left to NERC's discretion to either include or exclude monitoring in the annual compliance and enforcement program. The impact on the system from this standard is minimal if it is not monitored for compliance on a yearly basis.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Generally, the whole violation severity level section is far too cumbersome and verbose to understand and implement. Specifically, for Section 2.1.3 what if the entity did not find it necessary to add or remove any topics from the list? Why is that a violation? The section seems to indicate that the list has to have items constantly

removed or added to have no violation occur. For section 2.2.2 what is meant by the addition of the word "capability?" For section 2.2.3, if the 32 hours of training is not included in Attachment B then either Attachment B needs revised or deleted or the continuing education hours program also used to identify emergency operations courses needs revised. Suggest remove 2.2.3 entirely or remove the words, "or sytem restoration", and "but did not include training in subject areas listed in Attachment B." Section 2.3, the bulleted items seem to read as requirements rather than as measures. Section 2.3.2.1, again, what is meant by the addtion of the word "capability?" Section 2.3.3.1, this section reads as a requirement rather than as a measure.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The implementation plan should be simplified to allow for clearer understanding and easier tracking. Suggest that R3 become effective immediately upon regulatory approval since the 32 hours of annual emergency operations training is currently required in PER-002, R4. Suggest that R2 become effective January 1 in the first year following regulatory approval because an effective date that would allow for less than a full calendar year of implementation does not give an entity time to thoroughly assess annually the training needs of each System Operator position. Suggest that R1 and R4 become effective January 1 the second year following regulatory approval. The suggested times balance the timely implementation of the standard to maintain and enhance reliability, while allowing entities ample time to achieve compliance with the requirements, and is a simpler and more straight forward implementation plan that is easier to understand and track.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: The statement in Applicability Section 4.2 is too broad. It could be interpreted to include switchmen performing switching because switchmen can "impact reliability by producing a real-time response form the Bulk Electric System." This interpretation will not achieve industry consensus for the standard. The statement should be revised to repeat requirements R2 and R2.1 of PER-002 which states that "Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in: Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System." This statement has the correct narrow focus, is easily understood, and is currently implemented by the entities.

    It is confusing in R2 why the word "position" was used rather than the word "person" and why was the word "capability" used at the end of the sentence. As currently worded, it is not clear what R2 is trying to require. The requirement seems to be asking an entity to "determine mismatch between acceptable and actual performance capability

for a position." What does that mean? The implementation of that interpretation does not seem feasible for the "capability of a position." It would seem the intent should be to determine the mismatch between acceptable and actual performance for an individual operator which R4 of the standard basically states. Suggest deleting R2, R2.1 and R2.2 and adding specificity to R4 described below.

R4 does not indicate how often an entity should verify capabilites of its Sytem Operators. Do entities only need to verifty capability of an Operator one time for each task? What if the task is rarely performed, how often should verification take place? What if the task is performed daily, how often should verification take place? The lack of a specified frequency to verify capability creates a requirement that provides no improvement to the reliability of the Bulk Electric System.

In R3 delete "and system restoration training" because this type of training would be considered emergency operations already. Delete R3.1 and Attachment B because the added specificity will not improve the type or scope of emergency training. Delete R3.1.1 because by just having a list will not improve emergency training or improve the reliability of the Bulk Electric System.

This proposed standard and several other standards appear to be an overreaction to the August 14 blackout. It seems to fall back to the specious argument that is if something happens, someone must have been responsible for the problem . Why are we unable to place the blame on the system for the problem, even if the system was the problem?

There has been no assessment or evaluation of the effectiveness existing training programs required by PER-002, R3 that has been in affect for over two years. Why create a standard to mandate a new training program when no assessment has been made of the effectiveness of existing training programs? The work to create a new training standard is not a judicious use of resources in order to strengthen the reliability of the bulk electric system. The argument that FERC has mandated SAT-based training programs in its order does not preclude the possibility that the FERC conclusion is wrong and unneccesary.

This standard goes beyond requiring a new training program. The standard seems to dictate the material on which operators are to be trained and how they are to be trained. The NERC operator certification program already determines that operators possess the minimal requirements to reliably operate the bulk electric system. Why should a training program duplicate the certification process? Currently there is ample incentive to have operators trained on company-specific tasks. An operator who is not capable of performing company specific task will not remain an operator at that company.

Many of the tasks listed in Appendix A do not seem to be reliability related and some would seem to be beyond the scope of a system operator position. For example, Item 18, says "Ensure that transmission contract paths are not exceeded." This item is more of a regulatory or business requirement than a reliability concern. Item 42, "Prepare daily reports and logs generated to meet company and regulatory requirements." This item may be important, but it is not important for reliability. Item 65, "Implement specified procedural actions in the event of a FERC Standards of Conduct violation." How is this item reliability related? Item 9, "Interpret relay targets, during forced outages." This item would be the responsibility of a system protection engineer who would provide guidance to the system operator and would not be the sole responsibility of the system operator.

In rebuttal to the "Background Information" provided above, work on this proposed training standard should cease and the standard should not be implemented for the following reasons:

1. Training is currently being provided to NERC Certified System Operators as a part of the NERC conitinuing education requirements for system operators and as also required in PER-002, R3.
2. Emergency Operations training is currently required in PER-002, R4.
3. Entities are currently allowed to determine and develop training based on individual training needs to support operation of the Bulk Electric System.
4. The language of the standard is too prescriptive especially, but not limited to, the inclusion of Attachment A and Attachment B.
5. Entities do not need a common starting point for training because of the extreme operational differences between entities.
6. Entites currently implement successful training programs as required by PER-002, R3.
7. The conclusion and assumption from the August , 2003 blackout investigation that Sytem Operators were not prepared to react in a manner that preserves the reliability of the interconnection is not correct. The operators were indeed prepared and were reacting to the events before the August, 2003 blackout in a manner to preserve the reliability of the interconnection by using the best data and information available to them. System Operators today are trained to perform tasks assigned to their position.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments: The intent of this section is acceptable, however, the wording assumes a level of performance that may not be present. An assessment is made to identify gaps between the knowledge or skill level of the worker and the requirements of the job. The requirements of the job are identified as the past requirements and new requirements.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: If the number of hours of training are going to be in either standard, it should be in PER-005 only; however, the training areas is what should be specified and the number of hours left to the responsible party.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☐ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: Paragraph 4.2 adds confusion to the standard. We recommend deleting this paragraph. The standard does not address requirements for delegates and it is therefore left to the reader to interpret what, if any, would be applicable. Delegates could be interpreted down to the crews, and we are sure that this interpretation is not intended.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It is unclear as to whether the assessment is for the position or each operator in the position. The Standard should reflect the training needs, in relation to the defined company specific reliability related tasks, for each position and would then be updated as needed. If there were no changes to that position in regards to the defined company specific reliability related tasks in the previous year, the position would be reviewed and updated every three years.
   It is also unclear in R.2.1 as to the identification of mis-matches between acceptable and actual performance capability. What is acceptable to one company may not be to another and therefore is left open to interpretation in the measurement, M.2. How would this be assessed in either the readiness evaluation or a compliance audit?

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The NERC System Personnel Training Standards as the repository for all training identified in the standards and therefore recommends this requirement not be duplicated in the System Restoration and Blackstart standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The standard in its current language does not define how each task is to be assessed and documented. For instance would a check off sheet with the identified company-specific reliability related tasks be adequate? If a checkoff sheet were utilized, would this assessment be considered an annual process or is a one time verification acceptable? What is the benefit to the operator in assessing each task? Do the tasks identify whether they will be performed as a team or individually and under normal or emergency conditions? Capabilities of an operator are a subjective interpretation by each company and measure (M.4) is left open to a wide interpretation by the evaluators and auditors. How would this be assessed in either the readiness evaluation or a compliance audit? If companies are following the standard to provide annual training, then the assessments for each task would at times be duplication of the annual and on going training and therefore create additional work for a trainer.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: However, we would like a definition for long term planning?

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The purpose of the Violation Risk Factors is for use when determining a penalty or sanction. In reviewing the measures all requirements are administrative in terms of providing documentation that the requirement has been met. Training generally occurs outside of the real-time operations which have little impact on the BES and therefore a "Lower" risk factor versus the "Medium/High" risk factors would be appropriate.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: If the requirements change, then the measures should be changed to reflect the revised requirement.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   D.1.2 What is the compliance monitoring period and when does the reset period begin if training is an annual requirement?
   D.1.3 is referencing data retention; a question arises over "mitigation plans". Who does it apply to, the entities program or the operator?
   We also question the four year data retention, what is the purpose since it is counter to D.1.4 requirement of a Compliance Audit every three years.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The violation severity levels are to complicated. The violation severity levels are extremely defined in comparison the requirements. To comply with the violation severity levels would be a huge onerous task on any entity based on the implementation plan.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☒ Yes

☒ No

Comments: The implementation plan would be acceptable if
NERC can develop the Standard so that they are clear and specific.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: This standard, along with the approved NERC Continuing Education training, records would be duplicated by the continuing education provider, now that operators must maintain their certification through continuing education.
The standard should be job task specific and not operator specific.
Specific training requirements should be found in one standard, not throughout eighty or more.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Comment 1. PHI is not sure what is meant by this requirement. The language is confusing. We understand assessing the training needs of individuals and setting or identifying training requirements for positions but not training needs for positions. Could the drafting team clarify what it meant by this statement? Our concern extends to sub requirement 2.1 as well, because it uses the same confusing language. R2.2 which refers to new tasks or changes to existing tasks for each position is easier to understand. When the tasks for the position change, we should be aware of this and provide a mechanism for ensuring this new content is incorporated into the tasks or responsibilities of the position. Isn't this all that is really needed? Comment 2. Because we are not quite sure what the assessment involves we do not agree that an annual assessment is reasonable.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The requirement to provide 32 hours of EOP training annually belongs in the Personnel Training Standard because as listed in Attachment B, it encompasses a slightly broader set of topics than Restoration and Blackstart. Other standards, in addition to the Blackstart standard (i.e. Cyber Security and BUCC) have also identified training requirements. PHI believes any required or mandated training deriving from another standard should be specifically identified in the Personnel Training Standard with a cross reference to the applicable standard for the details of the requirement. (i.e. personnel, topics, length, frequency of the training etc.) and whether it may be included in an individual's required 32 hours of EOP or would be in addition to that.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: The requirement does not specify a time period. As stated, this would be a one-time check to determine that each operator can perform the assigned tasks and PHI would expect that we could complete that assessment over a period of time. If that is the case PHI agrees.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Except where we would like some clarification of Requirement 2 so that we would be clear about what is being assessed. See our comment to Q1

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: PHI feels the wording of the Violation Severity Levels is confusing. Lower does not seem reasonable - If an entity has reviewed the list, agrees with it completely and has nothing to add, they would appear to be in violation. Similarly Moderate seems to be saying that if an entity has started creating a list of all reliability related tasks but hasn't finished it, has identified training but hasn't scheduled it or has given so called EOP training but not from topics on Attachment B and done nothing else--they warrant a Moderate violation. But, if they have done almost everything but not quite met the requirement, they warrant a High violation. We are sure this is not the way these are meant to be understood. Perhaps starting with the Severe Violations and working down to moderate would be a better way to delineate what a moderate and lower violation would look like.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: PJM not only agrees that an operator needs-assessment be done at least annually, PJM supports continuous assessment of operator training needs. That said, PJM does not agree that a prescriptive standardized process is desirable or feasible. Performance evaluation is a corporate responsibility not a NERC standard. PJM proposes that this standard be refocused from a standard that requires a set annual needs-assessment, to a standard mandating a given number of hours of continuous training through NERC-accredited Training programs.

   Please refer to our comments in response to Question 11.

   Discussion:
   An operator training needs-assessment is not a requirement that can be developed easily. Having an industry-wide competency level lends itself to debates, possibly without an agreement, particularly given there is already an operator certification examination. A standard that leaves definition of competency to be developed by the individual responsible entities would subject to requirement to a "fill-in-the-blank" category, which FERC has stated must be eliminated.

   A fixed annual needs-assessment may devalue a continuous needs-assessment program. A fixed annual program by definition focuses on a one-time evaluation. With such fixed programs, organizations and operators may be more focused on performing and passing a given evaluation, then focusing on a comprehensive evaluation of individual needs - an evaluation that involves subjective analysis such as interpersonal skills under stress evaluation.

   A fixed annual needs-assessment may be useful from an auditor perspective, but it does not reflect the varied undefined times that training occurs.

   To identify a 'need" an auditable test evaluation would require a standardized scoring system. Does a score of X% indicate a need for training? Indeed how would a test identify in which area is the training need exists? Requirement 2 imposes a subjective obligation of "acceptable" capability. R2.1 mandates that "mismatches" be identified. However, the draft standard does not identify a mismatch.

   Today, training is provided for all changes that a corporate entity believes needs training. Similarly, corporate entities may not even provide training on new tasks that are self-explanatory. R2.2 mandates the compliance entity identify which tasks fall in which category. That subjectivity is reasonable but it is not what one would consider an industry standard.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication

of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

Comments: It is not important which standard includes the subject requirement. Either way, the same entities will be mandated to comply. What is important is that one or the other be removed. If required to choose, PJM would suggest including all requirements in the Training standards.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

☐ Yes

☒ No

Comments: If there were a possibility of developing and quantifying a viable level of competency, then PJM would support such a requirement. However, PJM believes that the determination of this competency level and assessment of the mismatch would be troublesome and likely not measurable.

The idea of entity-identified task lists is the antithesis of the word standard. The question of training is paramount to everyone. The issue raised here is whether or not it is sensible to write an Industry Training standard. Assessing the capabilities of a given System Operator is an art not a science. To mandate such a art can (and likely will) result in entities being tied up in labor hearings for a long period of time debating whether or not the operator's 'capability level' is effectively measured by the NERC standard. Requirement 4 does not provide any quantifiable measure for identifying an operator's capabilities. Picking and choosing from a list makes this requirement even more subjective then a NERC-wide standard should be.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC will have final say on these elements in any case; therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements.

However, given the question being posed:

PJM believes that assigning long-term planning to all the requirements is inappropriate, if not over-simplistic. For example, the annual assessment of the training need and the subsequent development-of/revision-to a training program, as the requirement implies, occurs once every 12 months. This is normally regarded as an operations planning time frame if violation of this requirement is to be mitigated.

Training in each of the requirements can cross over time horizons.
Requirement 1 (which has not been vetted) states the entity must use the SAT 5 phases for all reliability-related tasks. If a new task that requires training is created for implementation tomorrow, how would that training program fall under long-term planning?

Requirement 4 - when a new task arises, (assuming one accepts the premise of the requirement itself) then shouldn't the assessment take place as soon as possible?

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC and FERC will have final say on these VRFs, therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Measure 1 is not quantifiable. What evidence will demonstrate 'desired performance', if the desired performance is not defined in the standard itself?

   Because Requirement 2 is subjective, Measurement 2 is meaningless in the context of a NERC reliability standard.

   Measurement 3 is proof of attendance and not a true indicator of reliability impacts.

   Measurement 4 requires that the subjective verification of the "capabilities" be documented. Even if such a measurement could be standardized, as written this measurement requires nothing more that documentation of ineptness.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to.

   PJM would note the following:
   1. The entity "Compliance Enforcement Authority" is a new term. It is not found in the Functional Model.

   2. The compliance elements should not impose requirements that are not in the standard itself. To require a responsible entity to maintain records on whether it is following or followed any mitigation plan associated with the standard is outside the standard itself. The standard does not address mitigation plans anywhere. This also applies to the requirement on the Compliance Monitor to retain any data used in mitigation plans associated with this standard, particularly since the Compliance Monitor does not appear on the Applicability List at the beginning of the standard.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to.

PJM would note that a SEVERE VSL is applied for missing evidence of using two phases of the SAT; as well as applying a SEVERE VSL for not having a program at all. This would result in an organization that inadvertently is missing evidence is held to the same VSL level as an organization that consciously has no program at all.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The Compliance elements of this standard should be postponed until the requirements are agreed to.

PJM does not support this standard as written, and therefore cannot agree to any implementation schedule at this time.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☒ Yes

☐ No

Comments: The lack of objectivity in these requirements will conflict with labor union contracts. In addition the draft standard does not meet NERC or FERC requirements regarding clarity and measurability; nor does the draft meet the FERC objection to fill-in-the-blank standards.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments:
Several representatives of the ISO/RTO Council, in conjunction with discussions with Drafting Team members, have been informed that the intent of this Standard is to standardize and clarify what is and is not appropriate training materials for acceptance into the NERC Continuing Education Program. This is not well understood by the industry and, if this is indeed the case, PJM supports such an effort. The way the existing draft is being interpretted by the industry, however, is that this will be an additional requirement, over and above (and possibly in conflict with) the NERC Certification maintenance requirements currently contained in the NERC Continuing Education Program.

PJM agrees that:
- Training is a critical function for our industry, and would note that NERC already ties Continuing Education Hours to the maintence of NERC Certification.

- General in-house training programs must be permitted to be structured to the varied ad hoc needs of the given organizations, their tools and their environment, and not subject to NERC standards.

- Critical training be provided by accredited programs, and that NERC may desire to accredit programs used to provide CEH on those critical topics (e.g. Emergency Operations; Blackstart).

- the result of a Training standard should be an operator that is prepared to handle that operators system; the result should NOT be the production and storage of paperwork.

PJM does not agree that:

- It is necessary that every organization has its own accredited program. As written, R1 requires that responsible entities complete the five phases of a systematic approach to training (SAT), which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training program. We do not agree that this should be a requirement.

The requirement should be for the responsible entity receive training to help system operation personnel to acquire the competency to perform the applicable tasks pertaining to the RC, TOP and BA functions that the entity is responsible for or assigned. PJM neither endorses nor disapproves the SAT process as a good approach>

However, how any training program is arrived at (i.e. what approach it takes) is not important and should not be a standard. If so inclined, NERC itself could offer an SAT-based Training program. How could one make an argument that using other approaches to arrive at a training program that (a) list the tasks and competency level required to perform the task, (b) include the minimum requirements stipulated in this standard such as the 32 hours emergency training, (c) has provision for a training schedule, review process, etc. is not an acceptable approach?

Performance and capability are subjective ideas. Given all of the tests and training, no one can predict how a human will act. To state that the person is 'incapable' is a very strong statement and can only be made on a case-by-case basis - which by definition precludes a NERC standard.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments:

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

   ☐ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments: See detailed comments below relating to Violation Level 2.2.1 requiring use of the Generic Task List provided as an attchment to the Standard.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☐ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments:
    This comment relates to Requirement R1.1 that each Reliability Coordinator, Balancing Authority and Transmission Owner should use the generic task list in the Attachment to the draft standard as the basis for their own JTA.

    The task list contains important information and would certainly be useful as a guide for entities starting out on the JTA process, but we do not believe that the list is sufficiently well developed to be a required starting point. Quality Training Systems has developed and refined its generic task list for system operators over several years, making extensive use of NERC source documents and with advisement by Industry Experts. We recognize the difficulty in developing a coherent, well-categorized task list at a consistent level of detail, but we are nonetheless concerned at offering an industry standard that still offers considerable room for improvement.

    1. Classification System
    The categorization scheme is difficult to follow in places as evidenced by the fact that closely similar tasks are listed in different Sections of the task list and - within a given

section - under different Types of Activity. Consider, for example, the following tasks relating to voltage control:
"Monitor and maintain defined voltage profiles to ensure system reliability." (Gen CC Ops 31 under Monitor)

"Utilize reactive resources from transmission and generator owners to maintain acceptable voltage profiles." (Gen CC Ops 60 under Operating)

"Monitor the voltages, and coordinate the reactive dispatch of transmission facilities, and the interconnections with neighboring systems." (Trans. Ops 34 under Operating)

"Deploy reactive resources to maintain acceptable voltage profiles." (Trans. Ops 51 under Voltage)

"Coordinate operation of voltage control equipment with interconnected utilities." (Trans. Ops 55 under Voltage)

2. Consistency
There is a lack of consistency in the level of detail of the task statements. Some tasks are extremely general, and would be difficult to train in the stated form. For example:

"Direct and/or regulate the operation of the transmission system" (Trans 15)

"Enforce operational reliability requirements" (Gen CC Ops 47)

Other tasks are very specific and might be considered as steps in a larger task. For example:

"Notify all affected areas that line loading relief has been requested, and that corrective actions are required" (Trans. 68)

"Manually calculate net interchange when needed" (Int. 17)

3. Repetition
Many tasks are repeated with closely similar wording or wording such that the more general statement includes the other more specific task(s). For example, compare :the following two tasks taken from different Sections of the Task list:

"Implement system restoration procedures" (Gen. CC Ops 68):

"Following a partial or total system shutdown, implement the appropriate provisions and procedures of the system's restoration plan in a coordinated manner with adjacent systems" (Emer. Ops 50)"

4. Clarity
A few of the task statements are unclear or poorly worded. Consider, for example; the following task, the intent of whiich seems to be captured in better-stated items elsewhere in the list:

"Direct to the appropriate entities those options necessary to relieve reliability threats and violations in a reliability authority area" (Gen. CC Ops 55)

    ☐ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: The RCSDT has a conflict between teams for ownership of the scope for PER-004 and feel that it belongs with Project 2006-1 which has PER-004 posted with PER-005 for comment. Project 2006-1 removed three of the PER-004 requirements and left in two. During the RCSDT review, we removed the same three requirements but also suggested removing the other two because they are redundant with other standards as follows:

    PER-004 R.1 is redundant with PER-003
    PER-004 R.5 is redundant with COM-001 and IRO-002

    The RCSDT request that ownership of PER-004 be scoped within Project 2006-1. The RCSDT is willing to assist Project 2006-1 in completing the review task.

    Respectfully,

    William M. Hardy
    RCSDT - Chair

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32 hour training requirement should be in the System Restoration plan. PER-005 is really focused on what should be in a training program.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It may be appropriate to perform an assessment, but the standard is getting over-prescriptive to require giving an assessment on a line by line basis. The assessment should be more global in nature regarding the general level of competency of the operator to perform the job functions.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: It is unclear what is the meaing of the time horizons.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The requirement for emergency training is in multiple standards (e.g. PER-002-0 R4. This then leads to the potential for multiple violations for the same deficiency. This training requirement should only be in one standard.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The implementation for R3 should allow an organization time to put any new training requirement into its regular training plan. Put that it needs to be included in the next years annual training program.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☐ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments:

    Applicability 4.2 is unclear. Who do you define as delegates? Are you looking to expand the applicability to personnel that are outside the control center real time operating postions? Also it refers to applying to those that "impact reliability"? This should be for something that has a signficant negative impact, not just any impact, no matter how diminimus. There needs to be more clarity as to whom the System Operator training standards apply.

    Attachment A: Are you implying that anyone that does any of these function is in a System Operator position? In some cases, this work is done by back office staff or

engineering. I do not believe all of these tasks need to be done by a System Operator with the level of training set up for them that you have designed. For example, Item 45, Perform next day reliability analysis of the electric system. This may be done by engineering staff, rather than a System Operator. Are you now saying they are System Operators? Or are you still limiting System Operators to the real-time operating positions that control the system?

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: However, it is not clear from the Requirement or Measure what is necessary to have an acceptable assessment.

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: All training requirements should be listed in this standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Yes, assuming this is a one-time verification until the reliability related tasks change.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

☒ No

Comments: M2, M3, and M4 appear to be appropriate measures. M1 and R1 should not be included in a Reliability Standard. The Standard should address training that is required and not dictate how a company should implement their training.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: Most NERC Standards require three years or less for documentation to be maintained.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

☐ Yes

☒ No

Comments: The standard should not dictate how a training program should be implemented as implied by 2.3.1.

Severe Level for the 32 hours of EOPs would be that no training was provided to any of the operators, High would be that some training was provided but not all 32 hours or several operators did not complete all 32 hours. Moderate would be that 32 hours were provided but one operator did not complete or the training did not include drills, exercises, or simulations. If one operator does not complete 32 hours of EOPs training as written in 2.3.3, it should be a Moderate Violation Severity Level rather than a High Violation Severity Level.

The violation severity levels associated with the other requirements aren't appropriately graduated either.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: The System Personnel Training Standard should address training that is required for reliable operation of the BES. It should not dictate how a company must implement its actual training program.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   Assessment should be every two years

   Need to clarify what is being assessed. Is this referring to the Job Task and Analysis or System Operator Training?

   What tasks should be reviewed? Every task associated with each operating position? BES company specific reliability issues?

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments:

   System Personnel Training Standard Only.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: We assume this is a one time evaluation of operating personnel on each assigned task that is on its list of company-specific reliability-related tasks. Subsequent evaluations should be at the discretion of the system operator's management.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Please define Long Term Planning.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: All entities' risk factors should be assessed based on their possible impact to the BES.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Please define Compliance - 1.2 Monitoring Period Reset.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: 2.2.2 What tasks should be reviewed? Every task associated with each operating position or BES company specific reliability issues?

   2.2.3 Regarding attachment "B" – Does this require all tasks listed or only selected topics?

   2.3.2 Should this be limited to BES company specific reliability tasks.

   2.1.3 Should read "The responsible entity did not add or remove topics from the Emergency Operations Topics as provided in attachment "B" that apply to their organization."

   Severity levels may be too excessive.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

☐ Yes

☒ No

Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: All training requirements per standard should be cross referenced and included in a PER attachment or could even be excluded from the individual standards.

    On the cover letter, SMUD disagrees that the verification of qualifications for people developing / delivering training should be eliminated. Also, SMUD disagrees on the elimination of the requirement addressing maintenance of the system operator training program. SMUD believes the methodology used to perform the analysis phase of a systematic approach to training (SAT)should be required in the standard not just the phases of the SAT process.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: This requirement should be in a PER standard. Ideally any requirement for training should be in a PER standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: R4 is OK as written. It appears to allow for various methods of verfication of capabilities such as observed actual performance, observed performance using simulation tools, and testing. This should work given the various task frequency and various levels of criticality.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The severity levels are too extreme. Section 2.3.1 states a HIGH severity for missing one out of five phases of the SAT process. An entity that is using four of the five, which is an 80% use rate, should not be penalized with a HIGH severity violation. The severity for this ocurrence should be reduced to at least a MODERATE.
   Section Section 2.4.1 states a SEVERE severity for missing two out of five phases of the SAT process. An entity that is using three of the five which is an 60% use rate should not be penalized with a SEVERE severity violation. The severity for this ocurrence should be reduced to a HIGH severity.
   The SEVERE severity should be used for missing three of the five SAT phases.
   In summary:
   Moderate Severity: Missing one of the five SAT phases.
   High Severity: Missing two of the five SAT phases.
   Severe Severity: Missing three of the five SAT phases.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Comments: The standard describes a specific “Systematic Approach to Training (SAT)”. This includes specific “phases” that must be included with various violation severity levels associated with the use/non use of these phases. The Standard as written is exceedingly restrictive in not allowing other training options to be considered for RC’s, BA’s and TO’s. An entity should have the option to select a training philosophy and program that meets their individual needs. This “one size fits all” for the entire industry is entirely too restrictive.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: From a organizational perspective, it would be best to include emergency and restoration training in the System Personnel Training standard. This way, all training is in a central location and would prevent system operator trainers from searching throughout the approximately 117 standards to find the particular standards related to training.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Long-term planning is the appropriate time horizon.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Medium risk factor is appropriate for all.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

☒ Yes

☐ No

Comments:

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Under D2.2 and D2.3.1.1 it states in the Note for each of the subsections that if R1.1 or R1.2 is violated, the entity is also in violation of R1. This is double jeopardy and does not seem correct, especially where the subsection only provides more detail about what is being required in the above section and does not represent a new requirement.

   R1 says you must complete the five phases of a SAT to establish a new or modify an existing company specific training program.

   R1.1 provides some specific details about what the analysis phase of the SAT training program should consist of. If you do not complete R1.1 adequately then there should be only one violation and not two violations.

   Under Data Retention, a minimum of four years of data retention is not appropriate. It should be restated to say a maximum of 3 years of data should be retained or since the last compliance audit has been performed. However, if the entity had been found to be non-compliant for a particular requirement in the most recent compliance audit, then additional data should be retained for longer than the previous compliance audit but no longer than 3 years.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Under Violation Severity Levels, it is not obviously apparent that missing two of the five phases of a SAT should have the same severity as not having a SAT program at all. There should be some differences in violation severity between the two.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

☒ No

Comments: The question should have stated: If yes, please explain in the comment area.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: There was much confusion within our group as to whether this requirement is directed toward the position of System Operator or to the individual operator. Although we struggled with finding words to clarify the point, could the SDT take this back to the drawing board and attempt to make the distinction clearer?

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: The 32-hour annual training requirement for emergency operations and system restoration belongs in PER-005-2. All training requirements should be consolidated within the System Personnel standards.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: We can concur with this requirement providing the assessment process does not become burdensome on the entity providing the assessment. A one-time assessment, while not burdensome of itself, may be inadequate to ensure continued operator performance. On the other hand, annual assessments would require an excessive amount of administrative time. A possible solution could be to allow company-specific assessment criteria such as being proposed for performance criteria.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: It is our understanding that the Time Horizon of Long-term Planning allows a mitigation period of one year or more.

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: We can concur with maintaining the VSL of Medium on Requirement 1 but would recommend dropping the VSL to Low for R2, R3 and R4 since these requirements tend to be administrative.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Although we can not offer any suggestions for making it more focused, Measurement 1 is very broad. We are concerned about how we would be able to demonstrate that we have satisfied the requirements the way it is currently written.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: There is an inconsistency between the data retention requirement in D1.3 and the on-site review requirement in D1.4. We would suggest deleting the phrases '…for four years, or…' and '…, whichever is greater.' in the first sentence of D1.3. Both time period requirements would then be based on the last on-site audit.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: The proposed severity levels are too complicated and need to be simplified.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Requirement 1 should be effective 18 months after the first day of the first quarter following regulatory approval and Requirements 2 and 4 should be effective 36 months after the first day of the first quarter following regulatory approval.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☒ Yes

    ☐ No

Comments: Has the SDT taken into consideration dealing with bargaining units when conducting the assessments on individual System Operators. In some bargaining units, individual performance assessments have been eliminated.

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: While we don't have an issue with requiring a training program, we do take exception to having to maintain all the documentation that will be required as the standard is currently proposed.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: Training requirements should only be in training standards.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: Yes as long as this will not be an annual requirement. There will be tasks that need to be assessed very infrequently.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments:

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

Comments: Wording of M1 and sub measures should be simplified/clarified. Wording of M1.2 should not preclude using training material from a vendor.

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: 1.3 Data Retention - how long must evidence that a mitigation plan was followed be kept?

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments:
   Many of the violation severity level statements need to be simplified/clarified (similar to M1).
   2.2.3 - R3.1 requires the training be from topics in Attachment B, so there would be no emergency training if the training was not from Attachment B topics.
   2.3.3.1 The current wording of R3.1 does not allow training in principles, only drills, exercises, or simulations. See question #11.
   2.4.3 The statement after OR is unnecessary. If 32 hours were not provided annually then the first statement applies.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: Implementation of R2.2 at the 18 month point requires that R1.1 (implemented in 36 months) be completed first.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: PER-002-0 R4 allows "five days per year of training and drills using realistic simulations of system emergencies". PER-005-1 R3.1 allows only "using drills, exercises, or simulations". Removal of the word "training" forces the 32 hours to be only drills, exercises, or simulations. Classroom type training could not be counted toward the 32 hours.

Background Information

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric System.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The drafting team made significant changes to the standard based on stakeholder comments. The drafting team removed the prescriptive language from the standard and produced a document that identifies references that can be used to assist entities in understanding and applying the "Systematic Approach to Training" (SAT).

The drafting team also revised the standard to require that entities review the reliability-related Bulk Electric System task list (posted with the standard) and identify the tasks that are assigned to its System Operators. The task list includes tasks to support reliability standards with requirements assigned to the Reliability Coordinator, Transmission Operator and Balancing Authority. By requiring the use of this task list, the standard will help ensure that every Reliability Coordinator, Transmission Operator and Balancing Authority has a common starting point for developing its System Operator training.

The drafting team also revised the standard to require that entities verify that its system operators are capable of performing assigned reliability-related tasks. This would be the end result of a successful training program. The standard does not specify 'how' entities will measure this capability — it can be measured by end of training exams, by on-the-job evaluations, by results of simulation exercises, or by other means. This is a critical requirement in the standard, as this is the verification that the System Operator is prepared to perform the tasks assigned to the position.

- When passengers board a 737 jet airplane they expect that someone has verified that the pilot has the capability of flying that plane.
- End users of electricity have a right to demand that a System Operator at the controls of the interconnection is qualified to meet the rigors of the tasks assigned to the position.

The August, 2003 blackout investigation concluded that when System Operators are not trained to perform all tasks assigned to their positions, they aren't prepared to react in a manner that preserves the reliability of the interconnection.

Please review the second draft of the proposed standard, along with the task list and the list of references to assist in using the SAT process to develop training. Then answer the questions on the following pages.

Accordingly, we request that you include your comments and e-mail to sarcomm@nerc.net with the subject "System Operator Training Standard" by **September 28, 2007**.

You do not have to answer all questions.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: WECC OTS is unclear as to whether the assessment is for the position or each operator in the position. The Standard should reflect the training needs, in relation to the defined company specific reliability related tasks, for each position and would then be updated as needed. If there were no changes to that position in regards to the defined company specific reliability related tasks in the previous year, the position would be reviewed and updated every three years.
   It is also unclear in R.2.1 as to the identification of mis-matches between acceptable and actual performance capability. What is acceptable to one company may not be to another and therefore is left open to interpretation in the measurement, M.2. How would this be assessed in either the readiness evaluation or a compliance audit?

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

   Comments: WECC OTS views the NERC System Personnel Training Standards as the repository for all training identified in the standards and therefore recommends this requirement not be duplicated in the System Restoration and Blackstart standard.

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: WECC OTS feels the standard in its current language does not define how each task is to be assessed and documented. For instance would a check off sheet with the identified company-specific reliability related tasks be adequate? If a checkoff sheet were utilized, would this assessment be considered an annual process or is a one time verification acceptable? What is the benefit to the operator in assessing each task? Do the tasks identify whether they will be performed as a team or individually and under normal or emergency conditions? Capabilities of an operator are a subjective interpretation by each company and measure (M.4) is left open to a wide interpretation by the evaluators and auditors. How would this be assessed in either the readiness evaluation or a compliance audit? If companies are following the standard to provide annual training, then the assessments for each task would at times be duplication of the annual and on going training and therefore create additional work for a trainer. The OTS supports assessing the capabilities of the operators, however, we suggest it be more in line with the system operator certification, i.e. every three years.

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

   ☒ Yes

   ☐ No

   Comments: However, we would like a definition for long term planning?

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: OTS recommends the violation risk factors be set to 'Lower'.
   The purpose of the Violation Risk Factors is for use when determining a penalty or sanction. In reviewing the measures all requirements are administrative in terms of providing documentation that the requirement has been met. Training generally occurs outside of the real-time operations which have little impact on the BES and therefore a "Lower" risk factor versus the "Medium/High" risk factors would be appropriate.

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: OTS is suggesting in its comments changes to the requirements, therefore the measures would be changed to reflect the changes to these requirements. It also does not address training provided by third parties or vendors. What requirements would companies be under if this type of training were provided?

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: OTS does not agree with the Compliance Monitoring Process in the revised standard and has several questions.
   D.1.2 What is the compliance monitoring period and when does the reset period begin if training is an annual requirement?
   D.1.3 is referencing data retention; a question arises over "mitigation plans". Who does it apply to, the entities program or the operator?
   We also question the four year data retention, what is the purpose since it is counter to D.1.4 requirement of a Compliance Audit every three years.

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes

   ☒ No

   Comments: WECC OTS feels the violation severity levels are to complicated. The violation severity levels are extremely defined in comparison the requirements. To

comply with the violation severity levels would be a huge onerous task on any entity based on the implementation plan.

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

   ☒ Yes

   ☒ No

   Comments: The WECC OTS questions the implementation plan, when they do not agree with the current requirements. However, the implementation plan would be acceptable if NERC can develop the Standard so that they are clear and specific.

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

    ☐ Yes

    ☒ No

    Comments:

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

    Comments: The WECC OTS is the principle group in the Western Interconnection to support the WECC training program and providing support to the trainers in the West. It is the OTS belief that quality training can and should result in quality System Operators and improved system reliability and therefore, we are supportive of the effort by the drafting team for their efforts to ensure the system operator responsible for the BES meets a minimum competency and knowledge levels. Quality training requires analysis and process and the OTS supports a requirement for development, delivery, and evaluation of system operator training using a "systematic approach to training" as required in this Standard and endorsed by the FERC.
    However, the OTS feels that this standard, along with the approved NERC Continuing Education training, records would be duplicated by the continuing education provider, now that operators must maintain their certification through continuing education. Therefore, the WECC OTS recommends this standard be job task specific and not operator specific.
    The OTS has also identified several training specific needs in other NERC Standards and would like to recommend that all training requirements in the current NERC Standards and future Standards only be identified in the NERC System Personnel Training Standard. While it is necessary to mention in the various standards, training needs per that standard, specific training requirements should be found in one standard, not amongst eighty or more. This allows the training staff responsible for the training compliance measures to coordinate and provide training for all future and current training needs.
    OTS suggests this Standard focus on Certified System Operators only at this time. The training for CE to support Certified System Operators using the SAT process should be covered at this time.

Consideration of Comments on 2nd Draft of System Personnel Training Standard

The System Personnel Training Standard Drafting Team (SPT SDT) thanks all commenters who submitted comments on the second draft of the standard. This standard was posted for a 45-day public comment period from August 15, 2007 through September 28, 2007. The drafting team asked stakeholders to provide feedback on the standard through a special Standard Comment Form. There were more than 43 sets of comments, including comments from 130 different people from more than 70 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

In this document, the SPT SDT's consideration of comments is provided in blue text immediately following each comment submitted for each question. A summary response to each question is highlighted in yellow following each question. The following conforming changes were made to the standard:

- Extended the Proposed Effective Date for Requirement 3 from effective immediately to 36 months after regulatory approval to allow entities sufficient time to include the use of a simulator in their emergency operations training.
- Combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks.
- Clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.
- Clarified the language in R3, explaining the emergency operations training includes system restoration training.
- Added a clause to R3 that requires each entity to provide hands-on training using simulators for emergency operations training, per FERC Order 693 directives for this standard. (Note that the requirement does not address who 'owns' the simulator, just that a simulator be used.)
- Revised each of the measures to include examples of evidence that could be used to show compliance.
- Revised all of the VSLs, using the Draft VSL Development Guidelines Criteria and feedback from the industry.
- Removed Attachment A (Generic Task List) and converted Attachment B (Emergency Opeations Topics) to a Reference Document for this standard.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/System-Personnel-Training.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards,

Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

Index to Questions, Comments, and Responses

1. Do you agree that it is reasonable to at least annually, assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability? [R2]? If not, please explain in the comment area.

Summary Consideration:

The majority of the commenters did not agree that it is reasonable to at least annually assess the training needs for each system operator position by determining any mis-match between acceptable and actual performance capability. Several commenters that did not support the requirement explained that the requirement as written is ambiguous, subjective, and not measureable. Several commenters requested clarification on whether the assessment was being conducted for each position or each individual system operator, explaining that it was reasonable to assess positions annually but not individual system operators. Several commenters also suggested that the assessment periodicity should be changed from annually to every two or three years.

The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT also revised R4 (now R2) to clearly state the capability assessment is verified for each System Operator at least once – and within 6 months of any new or modified task on the company-specific reliability-related task list.

Question #1			
Commenter	**Yes**	**No**	**Comment**
Ameren	☑		Yes, although as proposed it is unclear how that objective will be determined.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The revised standard (R2) requires verification of each System Operator's capability at least once, and within six months of any new or revised company-specific reliability-related task.			
Florida Power & Light	☑		I agree that it is reasonable to annually assess the training needs for each operator position (R-2) in relationship to the defined company-specific reliability-related tasks (R-1.1). However, the assessment requirement (R-2.1) based on a mis-match between acceptable and actual performance capability seems ambigious and leaves the measurement (M-2) of this requirement subjective and open to interpretation. What is an acceptable means of preforming this assessment? What can we expect from a compliance audit on how they will assess each entity? An acceptable criteria (i.e., Auditors Guide) for evaluating this mis-match needs to be provided.
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least			

Question #1			
Commenter	**Yes**	**No**	**Comment**
annually and then develop the necessary training to address the updated or new tasks. The SPT SDT updated M1 to support the revised R1, including deleting M2. The SPT SDT also included examples of evidence in the revised Measure. The development of the Auditors Guide is outside the scope of this standard.			
FRCC	☑	☑	FRCC agrees that it is reasonable to annually assess the training needs for each operator position (R-2) in relationship to the defined company-specific reliability-related tasks (R-1.1). However, the assessment requirement (R-2.1) based on a mis-match between acceptable and actual performance capability seems ambiguous and leaves the measurement (M-2) of this requirement subjective and open to interpretation. What is an acceptable means of performing this assessment? What can we expect from a compliance audit on how they will assess each entity? An acceptable criteria (i.e., Auditors Guide) for evaluating this mis-match needs to be provided. FRCC agrees it is reasonable for this assessment to include identification of training to perform new or revised tasks from the company-specific reliability related task list. (R-2.2.)
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT updated M1 to support the revised R1, including deleting M2. The SPT SDT also included examples of evidence in the revised Measure. The development of the Auditors Guide is outside the scope of this standard.			
LCRA		☑	You are simply asking too much of a large segment of this industry-those utilities that have a small, or nonexistent, training staff. Your goals are lofty, but NERC is completely out of touch with reality if it believes that the huge requirements of this standard can be effectively managed by utlities such as mine that employ a training staff of one.
Response: Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each Requirement.			
NYISO		☑	Monitoring the mismatch between acceptable and actual performance is a continual process. If there is a mismatch in the expectation and performance of reliability-based tasks, such mismatches are addressed immediately based on reliability requirements. Failure to do so is to risk non-compliance with reliability standards.

Question #1			
Commenter	**Yes**	**No**	**Comment**
			To mandate an annual performance evaluations solely for the purposes of training, when continual reliability-based performance evaluations must be conducted to maintain compliance with operational standards, would be redundant. R2 should be deleted as unnecessary, given R1 and the compliance requirements with all other NERC standards. R1 addresses training for existing and "new or revised tasks."
Response: The SPT SDT agrees with your suggestion to delete R2. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The requirement does not preclude more frequent updates. The SPT SDT revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once – and the revised R2 requires this assessment to be updated within six months of any new or revised company-specific reliability-related task.			
OVEC		☑	How can the training needs of a position be determined based on performance capability of that position? A position has infinite capability while an individual does not have infinite capability. The requirement be revised to determine mis-match of acceptable and actual performance and leave the word capability out of the requirement.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT revised R4(now R2) to clearly state the capability assessment, is verified for each System Operator. As revised, the word “capability” is appropriate and has been retained.			
PHI		☑	Comment 1. PHI is not sure what is meant by this requirement. The language is confusing. We understand assessing the training needs of individuals and setting or identifying training requirements for positions but not training needs for positions. Could the drafting team clarify what it meant by this statement? Our concern extends to sub requirement 2.1 as well, because it uses the same confusing language. R2.2 which refers to new tasks or changes to existing tasks for each position is easier to understand. When the tasks for the position change, we should be aware of this and provide a mechanism for ensuring this new content is incorporated into the tasks or responsibilities of the position. Isn't this all that is really needed? Comment 2. Because we are not quite sure what the assessment involves we do not agree that an annual assessment is reasonable.
Response: The SPT SDT agrees with your comment. The SPT SDT combined R1 and R2 to clarify the requirement. R1 requires each entity to update at least annually their BES company-specific reliability-related task list and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4) (now R2) to clearly state that the			

Question #1			
Commenter	**Yes**	**No**	**Comment**
capability assessment, is verified for each System Operator at least once and within six months of a new or modified reliability-related task.			
SMUD		☑	Assessment should be every two years Need to clarify what is being assessed. Is this referring to the Job Task and Analysis or System Operator Training? What tasks should be reviewed? Every task associated with each operating position? BES company specific reliability issues?
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and within six months of a new or modified reliability-related task.			
APS		☑	The task list for each position should be reviewed annually for updates, and suggestions for training must be solicited from Leads and Supervisors in order to improve operator performance and keep the program current. But that's not what you said in this statement.
Response: The SPT SDT agrees with your statement. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its task list at least annually and then develop the necessary training to address the updated or new tasks. The requirement does not prescribe the methodology that must be used to perform the updates.			
Santee Cooper	☑		However, it is not clear from the Requirement or Measure what is necessary to have an acceptable assessment.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its task list at least annually and then develop the necessary training to address the updated or new tasks. The requirement does not prescribe the methodology that must be used to perform the assessment. The assessment methodology is determined by the entity, with evidence available for audit purposes. The SPT SDT revised the measures to include examples of evidence.			
Avista		☑	A yearly evaluation for each system operator is a very large burden for any organization. Initial training for system operators should address the required job skill knowledge and tasks required for acceptable performance capability. New job tasks are trained for and implimented as new systems, tools and job functions become necessary. The routine functions of the system operator position are not the issue and EOPS training and evaluation should take care of the rest.

Question #1			
Commenter	**Yes**	**No**	**Comment**
Response: In the revised standard, the responsible entity must assess the capability of each System Operator to perform each assigned reliability-related task at least once – and within six months of any new or revised reliability-related task. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. More frequent updates are acceptable.			
FirstEnergy	☑		
Entergy (1)	☑	☑	Our response depends on who, what, where, when, and how the authors mean with the statement - "assess the training needs for each system operator position". We agree that each employer should evaluate the performance and training needs of each employee, probably on an annual basis. If that is what the authors meant then we agree and we request the authors make that intent more clear in the standard itself. In addition, we are concerned about who evaluates and determines "acceptable performance" and "actual performance". We suggest the authors make it clear the employer makes that evaluation and determination, not some third party. Throughout this draft standard the authors use the term "System Operator position" to mean a job category and a physical person with no distinction between the two applications. Please make it obvious in each application whether the requirement applies to a job category or a physical person.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The assessment is performed by the entity based on its BES company-specific reliability-related task list. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. The SPT SDT removed the term, “System Operator position” from the revised standard.			
Quality Training Systems			No comment.
TAL		☑	R2.1 does not appear "clear and unambiguous". How can a position have a mis-match between acceptable and actual performance? Is the intent to identify each operators deficiencies for each task every year? Or to identify new tasks (covered in R2.2)?

Question #1			
Commenter	**Yes**	**No**	**Comment**
			If the answer is "to annually identify the mis-match between acceptable and actual performance a specific assesment must be done on every task that remains on the Attachment A (after modification per R1.1.)", then it is overly burdensome and is not required in the verbiage to R4, which only requires a one-time verification. However, it is reasonable to verify that the modified (per R1.1) Generic Task List remains current at least annually.
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.			
Madison G&E		☑	It is unclear what "acceptable" is and what measurements can apply to it when it has not been defined. It is unclear whether this means for each job title or for each person that holds the system operator certificate. If it is for each job title (position), this is reasonable, however if it is each person, then it becomes overly cumbersome. If for each person, this is the responsibility of the registered entity to council and supervise its' operators. Or does it simpley mean that the System Operator position (tasks) in question has been reviewed and they meet the currect position responsibilities? How can this be measureable if there is no change in job tasks from year to year? Perhaps it should read "System Operator job task for each position shall be reviewed upon addition or removal of system operator job tasks".
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state the capability assessment is verified for each System Operator. The revised requirment now requires that the capability be verified at least once, and within six months of any new or revised company-specific reliability-related task.			
Entergy (2)	☑		It is unclear as to whether this is referring to the job category or each individual. This needs to be clarified. One can only infer that this is meant to design the training program for the job category and evaluate it annually for necessary changes. Consider adding a sub-requirement or within this requirement to indicate that measurable and observable criteria must also be developed along with each task identified (since "measureable and observable criteria" is a Measure of this Requirement).
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPT SDT combined R1 and R2 to clarify the			

Question #1			
Commenter	**Yes**	**No**	**Comment**
requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised the R1 and R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. The SPT SDT revised the measures to include examples of evidence.			
ERCOT	☑	☑	Should read "mismatch between the previoulsy developed task list and current and/or new task". "Performance capabilities" relates more to personnel that it does to positions.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 to clearly state that the capability assessment is verified for each System Operator.			
Southern	☑		
Allegheny Power		☑	There are a number of concerns with assessing the training needs of each system operator position in this standard. First, the function of assessing the performance of system operators should be covered by a separate Standard. Combining Training Requirements with Performance Standards causes confusion and creates a very voluminous standard. The purpose of three of the four requirements is assessment rather than training. Second, althought doing an annual assessment of each operators performance is a desirable goal, doing a measurement of each operators performance with each company specific BES reliablity-related task is over-burdensome if even possible.
Response: The function of assessing the performance of system operators was included in the approved SAR for this standard. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each applicable requirement. The assessment can be performed during training or in real-time. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator.			
AEP	☑		R2.1 - Yes, as long as the interpretation and intent is truly “capability”, but not for actual performance of every reliability task for which the position is responsible. Out of the possible 374 reliability tasks (Attachment A to the standard), some tasks may be rarely done, or may be done only during emergency or emergency training, such as annual restoration/black-start drills and simulation excersises. Some emergency tasks can be actually performed to gage performance, whereas other emergency tasks are more of a table-top simulation without actually performing the task. Operator performance may be based on satisfactorily completing the annual training to gain knowledge to know how, where and when to perform the task(s), foster acceptable “capability”, but, not actually require performing the task(s) to achieve actual results. Based on this criteria, the standard’s measurment and audit for R2.1 must allow for the “training and knowledge

Question #1			
Commenter	**Yes**	**No**	**Comment**
			base for task performance", to be the measure or assessment of the "performance capability" of such emergency tasks. R2.1 could possibly be reworded as follows or in some other fashion to help ensure auditing procedures follow the intent (intent explained in the "Background Information" preceding these comment questions): ---- The assessment shall include identification of mismatches between acceptable and actual performance capability, and/or the identification of mismatches between the acceptable and actual knowledge base for performance capability, that need to be addressed for future training. -----
Response: The SPT SDT agrees that it is "capability" not actual performance. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. R2 (previously R4) allows for the training and knowledge base for task performance. The SPT SDT agrees that you can demonstrate the capability to perform the tasks in a training environment or during real-time operations.			
ATC		☑	ATC believes that the annual analysis should be on the position of system operators not for each system operator.
Response: The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. R2 (previously R4) allows for the training and knowledge base for task performance.			
BCTC		☑	Requirement 1 in this draft of the standard requires a full blown job task analysis be completed for each company and to maintain the JTA. We cannot support this requirement at this time. The requirement also requires all training outside of NERC CE training to follow the SAT. We cannot support this beyond the NERC CE requirements at this time or to develop it over the next 36 months. We do not have the staff to complete this beyond NERC CE requirements at this time and believe we should be focusing on NERC CE requirements until we can comfortably follow the SAT for CE first. Requirement 2: We cannot support R2 if the assessment of the System Operator position goes beyond the NERC CE program requirements to meet and maintain NERC Certification.
Response: Requirement 1 does not require a full blown job task analysis. It also does does not require the use of SAT for all training outside of NERC CE training. In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs".			

Question #1			
Commenter	**Yes**	**No**	**Comment**
The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each applicable requirement. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The standard does not limit the use of nor does it require an entity use the NERC Continuing Education (CE) Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.			
CAISO		☑	The CAISO agrees that an operator needs-assessment be done at least annually, the IRC supports continuous assessment of operator training needs. That said, the CAISO does not agree that a prescriptive standardized process is desirable or feasible. Performance evaluation is a corporate responsibility not a NERC standard. The CAISO would propose that this standard be refocused from a standard that requires a set annual needs-assessment, to a standard mandating a given number of hours of continuous training through NERC-accredited Training programs. Please refer to our comments in response to Question 11. Discussion: An operator training needs-assessment is not a requirement that can be developed easily. Having an industry-wide competency level lends itself to debates, possibly without an agreement, particularly given there is already an operator certification examination. A standard that leaves definition of competency to be developed by the individual responsible entities would subject to requirement to a "fill-in-the-blank" category, which FERC has stated must be eliminated. A fixed annual needs-assessment may devalue a continuous needs-assessment program. A fixed annual program by definition focuses on a one-time evaluation. With such fixed programs, organizations and operators may be more focused on performing and passing a given evaluation, then focusing on a comprehensive evaluation of individual needs - an evaluation that involves subjective analysis such as interpersonal skills under stress evaluation.

Question #1			
Commenter	**Yes**	**No**	**Comment**
			A fixed annual needs-assessment may be useful from an auditor perspective, but it does not reflect the varied undefined times that training occurs. To identify a 'need" an auditable test evaluation would require a standardized scoring system. Does a score of X% indicate a need for training? Indeed, how would a test identify in which area the training need exists? Requirement 2 imposes a subjective obligation of "acceptable" capability. R2.1 mandates that "mismatches" be identified. However, the draft standard does not identify a mismatch. Today, training is provided for all changes that a corporate entity believes needs training. Similarly, corporate entities may not even provide training on new tasks that are self-explanatory. R2.2 mandates the compliance entity identify which tasks fall in which category. That subjectivity is reasonable but it is not what one would consider an industry standard.

Response: The function of assessing the performance of system operators was included in the approved SAR for this standard. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each applicable requirement. The assessment can be performed during training or in real-time. The SPT SDT does not believe the suggested “refocus” is within the scope of the approved SAR.

The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.

The SPT SDT does not agree that the standard should include training time requirements for training on the BES reliailbity-related tasks. NERC’s response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours.

In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that “uses the Systematic Approach to Training (SAT) methodology in its development of new training programs”. The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks.

The SPT SDT has prepared a Reference Document for this standard that provides several SAT resources. The Implementation Plan uses a phased-in approach to allow sufficient time to aquire training on using a systematic approach to developing

Question #1			
Commenter	**Yes**	**No**	**Comment**
training. The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks.			
CenterPoint		☑	R2 is confusing. Assessing the training requirements of a system operator position is different than assessing the training needs of an individual system operator. This requirement should be reworded to clarify what assessment is being required. A definition of the term "system operator position" should be added to the Glossary of Terms. Identification of company-specific system operator position tasks may be reasonable on an annual basis or whenever tasks are added or deleted; however, assessment of individual system operator training needs should be over a three year period to align with existing NERC System Operator Certification and Continuing Education Programs.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. The standard does not limit the use of nor does it require an entity use the NERC Continuing Education (CE) Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.			
NIPSCO		☑	The caveat here is that before the assessment takes place, the requirements of each specific operator need to be developed. This process commences with the job tasks for each position being identified and the standards being developed from the task lists. It is difficult to determine the mis-match between acceptable and actual performance when the standard does not exist. The only standards that we currently have are that the operators must complete their NERC certification, and each operator is required to obtain 32 EOP hours of annaul training and obtain up to 200 hours of CEH to maintain their certification. Once we have completed the initial qualification of all the system operators, it would make more sense to tie the assessment to NERC recertification so that the assessment is done every three years.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the			

Question #1			
Commenter	**Yes**	**No**	**Comment**
updated or new tasks. The standard does not limit the use of nor does it require an entity use the NERC Continuing Education (CE) Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.			
NPCC RCS		☑	Please define how to constitute acceptable and actual performance cabability and clarify the requirement. How will industry identify "mismatch". Is this requalification of system operators. The requirement doesn't seem measurable and crisp to audit for compliance. This requirement has a "fill in the blank" characteristic.
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT revised the Measures to include examples of evidence.			
PG&E (1)			The intent of this section is acceptable, however, the wording assumes a level of performance that may not be present. An assessment is made to identify gaps between the knowledge or skill level of the worker and the requirements of the job. The requirements of the job are identified as the past requirements and new requirements.
Response: The SPT SDT agrees that R2 is ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks.			
PG&E (2)		☑	It is unclear as to whether the assessment is for the position or each operator in the position. The Standard should reflect the training needs, in relation to the defined company specific reliability related tasks, for each position and would then be updated as needed. If there were no changes to that position in regards to the defined company specific reliability related tasks in the previous year, the position would be reviewed and updated every three years. It is also unclear in R.2.1 as to the identification of mis-matches between acceptable and actual performance capability. What is acceptable to one company may not be to another and therefore is left open to interpretation in the measurement, M.2. How would this be assessed in either the readiness evaluation or a compliance audit?
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT believes an annual review of the task list is reasonable.			

Question #1			
Commenter	**Yes**	**No**	**Comment**
The SPT SDT revised the Measures to include examples of evidence.			
PJM		☑	PJM not only agrees that an operator needs-assessment be done at least annually, PJM supports continuous assessment of operator training needs. That said, PJM does not agree that a prescriptive standardized process is desirable or feasible. Performance evaluation is a corporate responsibility not a NERC standard. PJM proposes that this standard be refocused from a standard that requires a set annual needs-assessment, to a standard mandating a given number of hours of continuous training through NERC-accredited Training programs. Please refer to our comments in response to Question 11. Discussion: An operator training needs-assessment is not a requirement that can be developed easily. Having an industry-wide competency level lends itself to debates, possibly without an agreement, particularly given there is already an operator certification examination. A standard that leaves definition of competency to be developed by the individual responsible entities would subject to requirement to a "fill-in-the-blank" category, which FERC has stated must be eliminated. A fixed annual needs-assessment may devalue a continuous needs-assessment program. A fixed annual program by definition focuses on a one-time evaluation. With such fixed programs, organizations and operators may be more focused on performing and passing a given evaluation, then focusing on a comprehensive evaluation of individual needs - an evaluation that involves subjective analysis such as interpersonal skills under stress evaluation. A fixed annual needs-assessment may be useful from an auditor perspective, but it does not reflect the varied undefined times that training occurs. To identify a 'need" an auditable test evaluation would require a standardized scoring system. Does a score of X% indicate a need for training? Garland		☑	I believe that the training of system operators needs to be assessed, but Garland Power

Question #1			
Commenter	**Yes**	**No**	**Comment**
			& Light is a small utility that has a training staff of one personnel that has many other duties as well to perform. The requirement is completely out of scope for resaonability. This would place a huge budget burden on small utilities that are managed by City Councils.
Response: The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least one time and within six months of any new or revised task. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.			
HQT		☑	Please define how to constitute acceptable and actual performance cabability and clarify the requirement. How will industry identify "mismatch". Is this requalification of system operators. The requirement doesn't seem measurable and crisp to audit for compliance. This requirement has a "fill in the blank" characteristic.
Response: The SPT SDT agrees that R2 is ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least one time and within six months of any new or revised task.			
IESO	☑	☑	We agree with the annual assessment of the training need. However, we feel the standard needs to have a requirement on the competency level (defined industry-wide or by individual responsible entities) in order to identify the mismatch between acceptable and actual performance capability. That said, this is not a requirement that can be developed easily. Having an industry-wide competency level lends itself to debates, possibly without an agreement, and given there is already a certification examination. Leaving it to be developed by the individual responsible entities would subject the requirement to a "fill-in-the-blank" category, which is to be eliminated. A simpler approach would be to require responsible entities to assess training needs on an annual basis, without specifying how, and develop an effective training program with an aim to enable operating personnel achieve the required skillset. In this case, the requirement will focus on the process (annually assessment) and the what (the training program), not the how (measuring the mismatch).
Response: The SPT SDT believes the suggested requirement on the competency level is outside the scope of the approved			

Question #1			
Commenter	**Yes**	**No**	**Comment**
SAR. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The revised standard (R2) requires verification of each System Operator's capability at least once, and within six months of any new or revised company-specific reliability-related task.			
ISO New England		☑	Please define how to constitute acceptable and actual performance cabability and clarify the requirement. How will industry identify "mismatch". Is this requalification of system operators? The requirement doesn't seem measurable and crisp to audit for compliance.
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The revised standard (R2) requires verification of each System Operator's capability at least once, and within six months of any new or revised company-specific reliability-related task. The SPT SDT revised the measures to include examples of evidence.			
Manitoba Hydro	☑	☑	Not clear on what system operator position means. In theory I agree but from a practical purpose this is not an easy task, especially for non-routine or emergency tasks without the aid of a simulator. While reference is made to the 737 pilot, simulators for the aircraft industry are far more developed than those for electrical systems. Walking through restoration plans and emergency procedures is one thing but it is quite another thing to put into practice. Is it being suggested that a comparison of acceptable to actual performance be made from the task on the BES task list.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT revised the measures to include examples of evidence.			
MISO Stakeholders		☑	We agree that it should be a requirement to annually assess and update a training plan for each system operator position and design training around these assessments. However, the choice of words is poor and we can't support a requirement that implies it is acceptable for a System Operator to fill a position in which he does not meet an acceptable performance level.

Question #1			
Commenter	**Yes**	**No**	**Comment**
Response: The SPT SDT agrees that R2 was ambiguous. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The revised standard (R2) requires verification of each System Operator's capability at least once, and within six months of any new or revised company-specific reliability-related task.			
MRO	☑	☑	There is a potential ambiguity that "each system operator position" could be interpreted as meaning "each person who performs each operator position". This is because of the use of the words "actual performance capability" which seems to refer to a person not a position. The MRO assumes what is meant is each position not each person. Please confirm. Perhaps wording could be clarified by inserting "(not person)" after the word "position". Suggest replacing "acceptable and actual performance capability" in R2 with "required and existing performance capability". The MRO agrees with R2 in concept but in practice this is not an easy task, especially for non-routine or emergency tasks which may be very difficult to simulate in training. While reference is made to the 737 pilot, simulators for the aircraft industry are far more developed than those for electrical systems. Walking through restoration plans and emergency procedures is one thing but it is quite another thing to in practice.
Response: The SPT SDT agrees that R2 was ambiguous and subjective. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator.			
SPP ORWG	☑		There was much confusion within our group as to whether this requirement is directed toward the position of System Operator or to the individual operator. Although we struggled with finding words to clarify the point, could the SDT take this back to the drawing board and attempt to make the distinction clearer?
Response: The SPT SDT agrees that R2 was ambiguous. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator.			
WECC OTS		☑	WECC OTS is unclear as to whether the assessment is for the position or each operator in the position. The Standard should reflect the training needs, in relation to the defined company specific reliability related tasks, for each position and would then be updated as needed. If there were no changes to that position in regards to the defined company

Question #1			
Commenter	**Yes**	**No**	**Comment**
			specific reliability related tasks in the previous year, the position would be reviewed and updated every three years. It is also unclear in R.2.1 as to the identification of mis-matches between acceptable and actual performance capability. What is acceptable to one company may not be to another and therefore is left open to interpretation in the measurement, M.2. How would this be assessed in either the readiness evaluation or a compliance audit?
Response: The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT believes an annual review of the task list is reasonable. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is performed for each System Operator. The SPT SDT revised the Measures to include examples of evidence.			

2. Requirement 3 requires entities to provide at least 32 hours annually of emergency operations and system restoration training. This requirement is also included in the System Restoration and Blackstart standard (Project 2006-03). To eliminate duplication of requirements, please comment on whether the requirement should be in the System Personnel Training Standard or in the System Restoration and Blackstart standard.

Summary Consideration:

Most commenters supported including this requirement in the System Personnel Training standard and eliminating any duplication of training requirements in the System Restoration and Blackstart Standard. Some commenters suggested that all training requirements should be removed from other standards and included in the System Personnel Training standard. One commenter suggested removing the requirement from both standards.

The SPT SDT has and will continue to work with the System Restoration and Blackstart SDT to eliminate any duplication of the training requirements in the two standards. The SPT SDT will also suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.

Question #2	
Commenter	**Comment**
Ameren	Remove from SR&B include only in Training
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Florida Power & Light	I would like to see this requirement be removed from the System Restoration and Blackstart standards and to be placed only in the Personnel training standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
FRCC	FRCC recommends this requirement be removed from the System Restoration and Blackstart standard and be placed only in the Personnel training standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
LCRA	It should be contained in the Continuing Education Program.
Response: The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all	

Question #2	
Commenter	**Comment**
reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.	
NYISO	This requirement that has no basis in a systematic approach to training, it should be removed from both locations. Thirty two hours is an indefensible, arbitrary, and capricious number. Please explain the justification for selecting 32 hours rather than 64, or 16?
Response: NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours.	
OVEC	The training requirements for system operators should all be in the same standard, namely the System Personnel Training Standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
PHI	The requirement to provide 32 hours of EOP training annually belongs in the Personnel Training Standard because as listed in Attachment B, it encompasses a slightly broader set of topics than Restoration and Blackstart. Other standards, in addition to the Blackstart standard (i.e. Cyber Security and BUCC) have also identified training requirements. PHI believes any required or mandated training deriving from another standard should be specifically identified in the Personnel Training Standard with a cross reference to the applicable standard for the details of the requirement. (i.e. personnel, topics, length, frequency of the training etc.) and whether it may be included in an individual's required 32 hours of EOP or would be in addition to that.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
SMUD	System Personnel Training Standard Only
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	

Question #2	
Commenter	**Comment**
APS	The System Personnel Training Standard only.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Santee Cooper	All training requirements should be listed in this standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Avista	The trend seems to be to place some kind of training requirement in everything (FERC NOPRS, NERC Standards and Regional Standards.) My opinion is that training requirements should all be in one place and I would prefer that to be PER-005.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Entergy (1)	We suggest the training requirement R3 be in the training standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
FirstEnergy	FE believes it is appropriate to have this requirement reside within the PER-005 standard and that the requirement be removed from the proposed standards that are being developed within the Project 2006-03 work effort. It is our position that all requirements related to personnel training should reside within the PER suite of standards.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Quality Training Systems	No comment.
TAL	Not only should this requirement should be in the System personnel Training Standard, a checklist should be made so that ALL training requirements are included in this standard. One example is the annual training on Cyber Security (CIP).

Question #2	
Commenter	**Comment**
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Madison G&E	a) This requirement needs to be in "Personnel Performance, Training, and Qualifications" standard. In NERC's Reliability Standards Development Plan dated Nov 30, 2006, the Work Plan objective to support its Goal is to "Reorganize the standards more logically based on topic and remove redundancies". All NERC Training Requirements need to be within the Personnel Performance, Training, and Qualifications Standard's section. b) All required training that a NERC Standard directs any entity to do should be placed in its own NERC (training) Standard. The NERC Standard category "Personnel Performance, Training, and Qualifications" is established for this purpose. As stated in FERC Order 693, para. 1335, training requirements would not be in one "all inclusive standard". A better fit is to have many individual standards (that specify training requirements listed in Personnel Performance, Training, and Qualifications section of the NERC Standards) under the heading of "Personnel Performance, Training, and Qualifications". If a training requirement is imbedded in a non-"Personnel Performance, Training, and Qualifications" standard, it will lead to possible shortfalls from an entity. c) This requirement should be in the Personnel Performance, Training, and Qualifications Standard, because it applies to training not specifically related to System Restoration or Blackstart (e.g. loss of primary control center, energy emergencies, etc.). d) In R3, it is stated "... 32 hours annually of emergency AND system restoration training." Does this mean 32 hours of both or a total of 32 hours? Since system restoration is a subset of Emergency Opertions Topics (attachment B), then the SDT should delete system restoration from R3. Either way the SDT needs to state what the proposed requirement will be.
Response: a, b, c) The NERC Reliability Standards Development Work Plan does not include any Personnel Performance Training and Qualification Standard and there is no reference to such a document. Please clarify the source of this reference. d) The SPT SDT clarified the language in R3, explaining the emergency operations training includes system restoration training.	
Entergy (2)	We recommend that the requirement remain in the training standard and be removed from the Blackstart Standard project. The training standard is the appropriate place for consolidating and delineating any training requirements.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to	

Question #2	
Commenter	**Comment**
eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
ERCOT	1) Should go in PER-005. 2) However, it is recommended that the 32 hour requirement be remove completely because the CEH program captures the intent of this requirement. Furthermore, the 32 hours of emergency training is tracked on a different schedule than CEH requirements and creates an additional and confusing set of record keeping processes. Record keeping can be simplified without reducing the level and quality of training with the additional benefit of removing the audit liability created by the need to track each operator's records on a different schedule.
Response: 1) The SPT SDT will work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards.. 2) The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.	
Southern	From a organizational perspective, it would be best to include emergency and restoration training in the System Personnel Training standard. This way, all training is in a central location and would prevent system operator trainers from searching throughout the approximately 117 standards to find the particular standards related to training.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Allegheny Power	The 32 hours of emergency operations and system restoratio training should be located in the System Personnel Training Standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
AEP	This requirement definitely should only be in one standard. It is presently in the PER-002 standard as a 5-day training requirement, and therefore should be in the PER-005, since PER-002 is being retired. It would also help in audits of the standard, to have the training record auditing done with the PER training standard records rather than the EOP standards.

Question #2	
Commenter	**Comment**
	The new EOP-005-2 standard draft 1 does not directly refer to the 32 hours or 5 days of emergency training. R9 of this EOP-005-2 draft does refer to the emergency operating topics, but does not specify annual training or the 5 day (32 hour) requirement, as does the present PER-002-0 standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
ATC	It's our position that all training related requirements should be in PER standards. The SDT should review all NERC standards and move other training specific requirements into this standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
BCTC	All Reliability related training required in a standard should be listed in the PER Standards. There should only be one place to see where Reliability required training to meet standards are listed.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
CAISO	The CAISO would prefer that all training comments are contained within the training standards.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
CenterPoint	The requirement should be in the System Personnel Training Standard. Further, any training requirements should be grouped into training standards. When necessary, other standards should reference the appropriate training standard for any specific requirements.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
NIPSCO	The 32 hour requirement is not currently included in Project 2006-03. This information should be included in the training document. The System Restoration and Blackstart standard should reference the training document when talking about frequency of training and content, that way the training

Question #2	
Commenter	**Comment**
	document would contain all pertinent training data including frequency of testing and testing requirements.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
NPCC RCS	The 32 hour emergency training requirement belongs in the personnel training standard. Please provide the basis for the 32 hour requirement.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards. NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours.	
PG&E (1)	If the number of hours of training are going to be in either standard, it should be in PER-005 only; however, the training areas is what should be specified and the number of hours left to the responsible party.
Response: The SPT SDT will work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours.	
PG&E (2)	The NERC System Personnel Training Standards as the repository for all training identified in the standards and therefore recommends this requirement not be duplicated in the System Restoration and Blackstart standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
PJM	It is not important which standard includes the subject requirement. Either way, the same entities will be mandated to comply. What is important is that one or the other be removed. If required to choose, PJM would suggest including all requirements in the Training standards.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements	

Question #2	
Commenter	**Comment**
into the PER standards.	
SRP	This requirement should be in a PER standard. Ideally any requirement for training should be in a PER standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
SDG&E	The 32 hour training requirement should be in the System Restoration plan. PER-005 is really focused on what should be in a training program.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
We Energies	Training requirements should only be in training standards.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
Garland	It should be contained in the System Restoration and Blackstart standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
HQT	The 32 hour emergency training requirement belongs in the Personnel Training Standard. Please provide the basis for the 32 hour requirement.
Response: The SPT SDT will work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours.	
IESO	Training requirements should always be covered by one standard. This avoids duplication of requirements and lends clarity to the scope of the standard under consideration. On this basis, we feel that the 32 hours emergency training requirement should be covered in this standard since this standard deals with all aspects of training. Further, the standard on System Restoration and Blackstart has a narrower scope as compared to PER-005 - Restoration and Blackstart scenarios only - and may not cover all the emergency scenarios.

Question #2	
Commenter	**Comment**
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
ISO New England	The 32 hour emergency training requirement belongs in the personnel training standard. Please provide the basis for the 32 hour requirement. Is this in addition to the NERC Certification requirements? How does this Standard fit into the existing NERC Certification requirements?
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards. NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours. There is no NERC re-certification requirement for emergency training. If the 32 hours meet the requirements of the CE program, the hours can meet both requirements. The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.	
Manitoba Hydro	Should be part of the system personnel training standard. Anything related to training should be found in these standards.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
MISO Stakeholders	We don't think it matters which standard as long as it is in only one. It should be removed from the standard that is further behind in the process to minimize any schedule impacts. In relation to this annual training requirement, we recommend striking the second paragraph under section 2.4.3 of the Severe violation level. The first paragraph should cover all situations since 32 hours of training were provided or they weren't. If the 32 hours have not been met, the annual requirement has not been met.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to	

Question #2	
Commenter	**Comment**
eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards. The SPT SDT agrees with your statement on the VSLs and has revised R3 VSLs consistent with your suggestion.	
MRO	Should be part of the system personnel training standard. Anything related to training should be found in these standards. Might be helpful to have a reference in the blackstart standard like "see personnel training standard for specific training requirements".
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
SPP ORWG	The 32-hour annual training requirement for emergency operations and system restoration belongs in PER-005-2. All training requirements should be consolidated within the System Personnel standards.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	
WECC OTS	WECC OTS views the NERC System Personnel Training Standards as the repository for all training identified in the standards and therefore recommends this requirement not be duplicated in the System Restoration and Blackstart standard.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008 – 2010 that consolidates all training-related requirements into the PER standards.	

3. As stated in the approved SAR for this standard, do you agree that there should be a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned task that is on its list of company-specific reliability-related tasks? [R4] If not, please explain in the comment area.

Summary Consideration:

Most commenters did not agree that there should a requirement to perform an assessment of the capabilities of each real-time System Operator to perform each assigned tasks that is on its list of BES company-specific reliability-related tasks. Several commenters that did not support the requirement indicated it would be burdensome to perform this assessment annually, which is not the intent of the requirement. Several commenters requested confirmation that the verification is a one-time assessment to determine if the operator can perform each assigned task and the verification can be performed over time. Several commenters suggested that the standard should include a methodology to execute and measure the requirement.

The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.

Question #3			
Commenter	**Yes**	**No**	**Comment**
Ameren	☑	☑	Yes an assessment is important. No, the standard as written is not defined with time parameters and is unachievable.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.			
Florida Power & Light		☑	The standard as written, does not define a time frame for the assessment (R-4). I feel that this assessment is not achievable and is unrealistic due to the time burden involved. Clarification needs to be given as to the time frame when this evaluation is to be given.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.			
FRCC		☑	The standard as written, does not define a time frame for the assessment (R-4). The FRCC feels that this assessment is not achievable and is unrealistic due to the time burden involved. Clarification needs to be given as to the time frame when this evaluation is to be given.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.			
LCRA		☑	See #1 above. It is simply too much for smaller entities to handle. Has anyone in the

Question #3			
Commenter	**Yes**	**No**	**Comment**
			group that developed this standard polled the industry to see what kind of resources are available to support it? If not, then you have no idea of whether or not it is feasible.
Response: Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The request for comments on the SAR, which was approved, and draft versions of the standard are intended to collect stakeholder's ability to support the standard.			
NYISO		☑	Orientation training is provided in a systematic approach to assume the task. Reinforcement training of the key reliability tasks is an ongoing aspect of a systematic approach to training. Addressing gaps between expectations and actual performance is driven by reliability requirements, not training program structure. Annual testing of all staff, on all possible tasks, is a waste of training effort and operator time. R4 should be deleted as unnecessary, given R1 and the compliance requirements with all other NERC standards.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.			
OVEC		☑	This requirement is not necessary for several reasons. The ability to only perform individual tasks does not give a good indication of an operator's performance to manage and execute reliable operation of the Bulk Electric System during critical times when multiple tasks must be performed in rapid succession…working under pressure. The performance of an operator in a pressure situation would provide a better measure of an operator's performance rather than assessing capabilities to execute individual tasks. With only assessing individual tasks, the big picture of an operator's performance to reliably operate the Bulk Electric System is not adequately determined. Also, the performance of individual system operators is already evaluated through a performance review process and training evaluations are a part of that process. In order to demonstrate compliance with this requirement, would these performance reviews need to be made availabe to compliance auditors? Allowing auditors to view the performance reviews would seem to violate privacy and confidentiality laws and would necessitate the involvement of the human resources department in the compliance process. If the human resources department were not involved in the process then a

Question #3			
Commenter	**Yes**	**No**	**Comment**
			separate process would need to be duplicated in a "sanitized" manner for inspection by the compliance auditors. This duplication would be redundant and inefficient.
Response: The requirement of assessing the performance of system operators was included in the approved SAR for this standard. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The assessment can be performed during training or in real-time. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified. The SPT SDT revised the Measure for this Requirement to include the types of evidence that could be used to meet the Requirement. Performance reviews are not included.			
PHI	☑		The requirement does not specify a time period. As stated, this would be a one-time check to determine that each operator can perform the assigned tasks and PHI would expect that we could complete that assessment over a period of time. If that is the case PHI agrees.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
SMUD	☑		We assume this is a one time evaluation of operating personnel on each assigned task that is on its list of company-specific reliability-related tasks. Subsequent evaluations should be at the discretion of the system operator's management.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
APS		☑	Experienced NERC-certified personnel may be hired as operators, and some NERC-certified incumbents have 25-30 years experience. It would certainly be a waste of resources to assess these personnel's knowledge, skill, and attitude and then send these personnel through weeks of Initial Training and the myriad of exams involved. There should be a "grand-fathering" provision for experienced personnel, such as a exemption based on observation of job performance.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			

Question #3			
Commenter	**Yes**	**No**	**Comment**
The SPT SDT does not agree that there should be a grandfathering provision for experienced personnel. Each System Operator needs to demonstate they can perform each company-specific reliaiblity-related task. NERC Certification and years of experience do not necessarily ensure the System Operator is capable of performing company-specific reliability-related tasks.			
Santee Cooper	☑		Yes, assuming this is a one-time verification until the reliability related tasks change.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
Avista		☑	Again, a huge burden on every organization. It is not the routine operating tasks that cause system outages. System Operators need to be evaluated on their knowledge of tasks that are required when the BES is operating with little or no margins, either voltage, reactive or thermal. System operators also need to be tested to determine if they can recognize when their system is at it's operating limits, not the periods when adaquate reserves more than compensate for sloppy operating!
Response: Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. Note that the SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.			
FirstEnergy	☑		We agree that there should be some assessment of the effectiveness related to knowledge and skills learned during training being transferred to work place performance. However, upon reviewing R4, the measures associated with R4, and the VSL aimed at R4, it is unclear what the standard's expectations are related to this requirement.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The SPT SDT also revised the measure for this requirement to include examples of evidence. The SPT SDT has revised the Measures to include examples of the evidence that can be used. The SPT SDT has also revised the VSLs for this requirement.			
Entergy (1)	☑	☑	Our response depend on who, what, where, when, and how the authors mean with the statement - "assess the training needs for each system operator position". We agree that each employer should evaluate the performance and training needs of each employee, probably on an annual basis. If that is what the authors meant then we

Question #3			
Commenter	**Yes**	**No**	**Comment**
			agree and we request the authors make that intent more clear in the standard itself. In addition, we are concerned about who evaluates and determines "acceptable performance" and "actual performance". We suggest the authors make it clear the employer makes that evaluation and determination, not some third party.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The responsible entity performs the assessment.			
Quality Training Systems			No comment.
TAL		☑	The verification of satisfactory performance of "each assigned task" is overly burdensome. Although, since this is a one-time verification only per R4, I can live with it. If I have to verify each task for each operator every year, it is way overboard. Who determines if my verification is adequate? Is this my call, the RA team or the Compliance Audit? If I only have to satisfy myself, it is okay.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The responsible entity performs the assessment.			
Madison G&E		☑	a) It is unclear whether this means for each job title or for each person that holds the system operator certificate. If it is for each job title (position), this is reasonable, however if it is each person, then it becomes overly cumbersome. Routine tasks are currently monitored by the System Operator's Supervisor as part of the Supervisor's on-going evaluation of the System Operator's job performance. Job performance evaluation is a normal part of supervision and is utilized to determine compensation levels, retain quality personnel and administer the promotion process. Requiring a formal test or evaluation of tasks performed on a routine basis will trivialize the assessment process and encourage rubber-stamp approval to sign off on each task. System Operators should only be required to formally demonstrate competence in performing non-routine tasks which are performed on an infrequent basis. Or does it simply mean that the System Operator position (tasks) in question has been reviewed and they meet the correct position responsibilities? b) As a measurable requirement, this becomes too cumbersome (if for each system

Question #3			
Commenter	**Yes**	**No**	**Comment**
			operator). As a business practice, it is good, but some of the tasks (i.e. communication with the RC) are performed regularly and to have to document each task for each operator would be overly burdensome.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The SPT SDT also revised the measure for this requirement to include examples of evidence.			
Entergy (2)	☑		Is this meant to be a one time assessment? If so, then we agree since attempting to do this every year would be unreasonable. If it is mean to be recurring, then consider adding the requirement of a periodic assessment of a sample of tasks on an ongoing basis within the entity's own training program.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
ERCOT	☑	☑	It should be more specific in that there should be a task list for each position and not one list that covers multiple positions. Example: Companies with specialize positions should have a task list for each position. Auditors will apply a broad based task list to specialized positions and create findings stating that each position should be able to perform all tasks on the general list. Also, the Standard should clearly state that this is a one-time assessment for each system operator and their respective position. It should take into account prior work history, training, qualifications and certifications from previous employers when assessments are made.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The responsible entity shall determine the assessment methodology. The SPT SDT does not agree that there should be a grandfathering provision for experienced personnel. Each System Operator needs to demonstate they can perform each company-specific reliaiblity-related task. NERC Certification and years of experience do not necessarily ensure the System Operator is capable of performing BES company-specific reliability-related tasks.			
Southern	☑		

Question #3			
Commenter	**Yes**	**No**	**Comment**
Allegheny Power		☑	As stated in the comments provided to question 1, this is a desirable goal. However, there are several issues that make the described assessment problematic. Many of the company-specific reliability-related tasks are very difficult to measure and some are not measureable. The time and manpower required to conduct the measurement of all assigned tasks is overly burdensome and unreasonable.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The SPT SDT also revised the measure for this requirement to include examples of evidence.			
AEP	☑	☑	Yes, with the requirement focus on "capabilities" to perform, and with the objective being to qualify the operator for the journey operating level of their operating position during their initial/progression training. (See the comments in Question 1 above) Yes, but the revision to existing training curriculums/resources, development of new resources, development of performance evaluation methods/tools, and on-going training assessment of new operators, will be essential for most transmission operating entities to comply with this requirement. This standard will therefore require a significant increase in training & development staff to comply, thus placing greater financial burden on the entities. However, we feel that how the assessment of each individual operator is conducted should be left up to the operating entity. As a part of an annual review system operators are felt to be qualified then and that should be sufficient to determine capabilities of an operator. If a new job task is implemented during that year then it is felt that the necessary training for that task should be given based on whatever method the specific entity feels meets that requirement.
Response: The SPT SDT agrees that it is "capability" not actual performance. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing their BES company-specific reliability-related task list, as described in R1. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. R2 (previously R4) allows for the training and knowledge base for task performance. The SPT SDT agrees that you can demonstrate the capability to perform the tasks in a training environment or during real-time operations. The responsible entity determines the assessment methodology and performs the assessment.			

Question #3			
Commenter	**Yes**	**No**	**Comment**
ATC	☑		
BCTC		☑	We cannot support R4 if the System Operator performance evaluation goes beyond the NERC CE program requirements to meet and maintain NERC Certification.
Response: NERC certification is irrelevant to on the job performance of required tasks. The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPT SDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.			
CAISO		☑	If there were a possibility of developing and quantifying a viable level of competency, then the CAISO would support such a requirement. However, the CAISO believes that the determination of this competency level and assessment of the mismatch would be troublesome and likely not measurable. The idea of entity-identified task lists is the antithesis of the word standard. The question of training is paramount to everyone. The issue raised here is whether or not it is sensible to write an Industry Training standard. Assessing the capabilities of a given System Operator is an art not a science. To mandate such a art can (and likely will) result in entities being tied up in labor hearings for a long period of time debating whether or not the operator's 'capability level' is effectively measured by the NERC standard. Requirement 4 does not provide any quantifiable measure for identifying an operator's capabilities. Picking and choosing from a list makes this requirement even more subjective then a NERC-wide standard should be.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The requirement does not dictate the methodology that must be used by the responsible entity to perform the assessment. The SPT SDT believes that competency is measurable. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
CenterPoint		☑	R4 is duplicative because the NERC System Operator Certification Program already certifies the competency of system operators. A revised generic task list (Attachment A) could be used to develop specific courses to form the curriculum for emergency operations and reliability related topics within existing NERC training programs. The Continuing Education Program already assesses the courses before it grants Continuing Education Hours used for recertification. Likewise, a revised generic task list could could

Question #3			
Commenter	**Yes**	**No**	**Comment**
			be used for the Continuing Education Program's curriculum.
Response: The SPT SDT disagrees. NERC certification is irrelevant to on the job performance of required tasks. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its task list, as described in R1.			
NIPSCO	☑		This assessment should be part of the initial qualification effort, before the individual fills the position of system operator. The assessment should then take place every three years in conjunction with NERC re-certification. An annual assessment of each assigned task would be administratively arduous.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. NERC certification is irrelevant to on the job performance of required tasks.			
NPCC RCS	☑	☑	We agree with this principle however please clarify how you propose to execute and measure this requirement.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
PG&E (1)	☑		
PG&E (2)		☑	The standard in its current language does not define how each task is to be assessed and documented. For instance would a check off sheet with the identified company-specific reliability related tasks be adequate? If a check off sheet were utilized, would this assessment be considered an annual process or is a one-time verification acceptable? What is the benefit to the operator in assessing each task? Do the tasks identify whether they will be performed as a team or individually and under normal or emergency conditions? Capabilities of an operator are a subjective interpretation by each company and measure (M.4) is left open to a wide interpretation by the evaluators and auditors. How would this be assessed in either the readiness evaluation or a compliance audit? If companies are following the standard to provide annual training, then the assessments for each task would at times be duplication of the annual and on going training and therefore create additional work for a trainer.
Response: The SPT SDT revised M2 (previously M4) to include some evidence examples.			
PJM		☑	If there were a possibility of developing and quantifying a viable level of competency, then PJM would support such a requirement. However, PJM believes that the determination of this competency level and assessment of the mismatch would be troublesome and likely not measurable.

Question #3			
Commenter	**Yes**	**No**	**Comment**
			The idea of entity-identified task lists is the antithesis of the word standard. The question of training is paramount to everyone. The issue raised here is whether or not it is sensible to write an Industry Training standard. Assessing the capabilities of a given System Operator is an art not a science. To mandate such a art can (and likely will) result in entities being tied up in labor hearings for a long period of time debating whether or not the operator's 'capability level' is effectively measured by the NERC standard. Requirement 4 does not provide any quantifiable measure for identifying an operator's capabilities. Picking and choosing from a list makes this requirement even more subjective then a NERC-wide standard should be.
Response: The requirement does not dictate the methodology that must be used to perform the assessment. The entity is responsible for performing the assessment. The SPT SDT believes that competency is measurable. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
SRP	☑		R4 is OK as written. It appears to allow for various methods of verification of capabilities such as observed actual performance, observed performance using simulation tools, and testing. This should work given the various task frequency and various levels of criticality.
Response: The SPT SDT agrees and revised M2 (previously M4) to include some evidence examples.			
SDG&E		☑	It may be appropriate to perform an assessment, but the standard is getting over-prescriptive to require giving an assessment on a line by line basis. The assessment should be more global in nature regarding the general level of competency of the operator to perform the job functions.
Response: The approved SAR requires that each entity have evidence that each System Operator is competent to perform each assigned task. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
We Energies	☑		Yes as long as this will not be an annual requirement. There will be tasks that need to be assessed very infrequently.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified.			
Garland		☑	See #1 above. It is too large of a burden on small utilities. The requirements should be modified for practicality and still accomplish the goal.
Response: Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for			

Question #3			
Commenter	**Yes**	**No**	**Comment**
its compliance with each requirement. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
HQT	☑	☑	We agree with the principle. However, please specify how you propose to to execute and measure this requirement.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
IESO	☑	☑	The key attribute here is "assessment of the capabilities". As noted in our comments to Q1, above, while we do not disagree with developing a requirement for establishing the competency level for system personnel to perform the assigned tasks, the determination of this competency level and assessment of the mismatch would be troublesome and likely not measurable.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
ISO New England	☑	☑	We agree with this principle however please clarify how you propose to execute and measure this requirement.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
Manitoba Hydro	☑	☑	In theory I agree but from a practical purpose this is not easy. My real concern is who would be doing the evaluation. Besides being a burden on many utilities, as some utilities will maintain a narrow list of BES tasks so that they could comply. I am unsure whether or not each utility would treat the evaluation consistently. In some companies, supervisors work along side the system operators and may just give the evaluation a cursory effort. This would do nothing to improve training.
Response: The responsible entity determines the evaluation methodology and performs the evaluation. The SPT SDT also revised M2 (previously M4) to include some evidence examples.			

Question #3			
Commenter	**Yes**	**No**	**Comment**
Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.			
MISO Stakeholders		☑	Each operator should have an annual plan that includes a combination of training based on job tasks, simulation, and classroom knowledge-based training. There may be hundreds of tasks in an entities JTA. It is unnecessary and administratively burdensome to require an assessment each year against each task.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
MRO	☑	☑	In R4 it isn't clear how often the Operator's capabilities must be assessed. There is a mismatch between Question 3 and R4. Question 3 uses the words "perform an assessment" whereas R4 uses the word "verify". An assessment is an estimate whereas to verify is to actually test. Perhaps R4 should use "assess" rather than "verify". In theory MRO agrees with R4 but from a practical point of view this is significant overkill. MRO Operators are already required obtain NERC certification. There is also the NERC Reliability Readiness Evaluation and Improvement Program. In addition, compliance to many other real time standards test the capabilities of the positions every day. How can the standard ensure that the assessment is being done consistently from company to company depending on who actually does the assessment and how complete or accurate each company's specific BES task list is? For example, some utilities may maintain a narrow list of BES tasks so that they could more easily comply. Would each utility treat the evaluation consistently? In some companies, supervisors work along side the system operators and may just give the evaluation a cursory effort. This would do nothing to improve training. Do all tasks have to be assessed annually? Wording seems to be flawed in that every operator has to be varified on every task before they can operate. This does not seem to recognize that operators require actual operating experience to aquire capability in all tasks. In general R4 adds an excessive and and burdensome level of bureaucracy.
Response: The SPT SDT believes "verify" is a more appropriate term to ensure the System Operator is capable of performing the reliability-related tasks. The responsible entity determines the evaluation methodology and performs the evaluation. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional verifications must be performed as the System Operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some			

Question #3			
Commenter	**Yes**	**No**	**Comment**
evidence examples.			
SPP ORWG	☑		We can concur with this requirement providing the assessment process does not become burdensome on the entity providing the assessment. A one-time assessment, while not burdensome of itself, may be inadequate to ensure continued operator performance. On the other hand, annual assessments would require an excessive amount of administrative time. A possible solution could be to allow company-specific assessment criteria such as being proposed for performance criteria.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional verifications must be performed as the System Operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.			
WECC OTS		☑	WECC OTS feels the standard in its current language does not define how each task is to be assessed and documented. For instance would a check off sheet with the identified company-specific reliability related tasks be adequate? If a check-off sheet were utilized, would this assessment be considered an annual process or is a one time verification acceptable? What is the benefit to the operator in assessing each task? Do the tasks identify whether they will be performed as a team or individually and under normal or emergency conditions? Capabilities of an operator are a subjective interpretation by each company and measure (M.4) is left open to a wide interpretation by the evaluators and auditors. How would this be assessed in either the readiness evaluation or a compliance audit? If companies are following the standard to provide annual training, then the assessments for each task would at times be duplication of the annual and on going training and therefore create additional work for a trainer. The OTS supports assessing the capabilities of the operators, however, we suggest it be more in line with the system operator certification, i.e. every three years.
Response: The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional verifications must be performed as the operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples. The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.			

4. Do you agree with the Time Horizon for each requirement in the revised standard? If not, please explain in the comment area.

Summary Consideration:

Most commenters agreed with the Time Horizons. Several commenters requested a definition of long-term planning and appeared to be interchanging time horizons, effective date, and impact to implementation plan. The SPT SDT did not change the time horizons for the revised requirements.

Question #4			
Commenter	**Yes**	**No**	**Comment**
Ameren	☑		No comment.
Florida Power & Light	☑		No comment.
FRCC	☑		No comment.
LCRA		☑	If I do not agree with the requirments in the first place, then I can hardly agree with any time line.
Response: The SPT SDT revised the requirements based on industry comments.			
NYISO	☑		No comment.
OVEC	☑		No comment.
PHI	☑		No comment.
SMUD	☑		Please define Long Term Planning.
Response: Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf.			
APS		☑	Since an approved training program based on SAT may not be ready for 36 months per 5.3, the assessment of training mismatch cannot be done until then. So, Requirement 2 should also become effective 36 months after the standard's approval.
Response: The SPT SDT believes there is some confusion between Time Horizons and the Implementation Plan. Time Horizons are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term			

Question #4			
Commenter	**Yes**	**No**	**Comment**
Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its task list at least annually and then develop the necessary training to address the updated or new tasks. Section 5.2 has been removed from the revised standard.			
Santee Cooper	☑		No comment.
Avista	☑		No comment.
Entergy (1)	☑		Please add Time Horizon values to R1.1, R2.1, R2.2 and R3.1 and R3.1.1. It is not obvious the Time Horizon assigned to the Requirement also applies to the sub-requirement.
Response: Per the NERC Drafting Standard guidelines it is not necessary to add Time Horizons for each of the sub-requirements if the Time Horizons for the subrequirements is the same as the Time Horizon for the requirement.			
FirstEnergy	☑		
Quality Training Systems			No comment.
TAL	☑		Each requirement has a "Long-term Planning" horizon.
Response: The SPT SDT thanks you for your comment.			
Madison G&E		☑	a) Entities have established training programs per Regulatory Approved Standards. Proposed Effective Date, 5.1 is the only parallel, carry over requirement from a Regulatory Approved Standard (PER-002-0, R4) to this proposed standard. This time frame is workable. b) Proposed Effective Date, 5.2 is unclear (see comments of 2.a, above), so an effective date cannot be proposed yet. c) Proposed Effective Date, 5.3 for the proposed SAR contains over 370 tasks for operators and the time line is too aggressive. Registered Entities will need to be trained in the Systematic Approach to Training process, set up their own processes, convert established training to the SAT process, create new training and start to give training to System Operators. Budgets will need to be forecasted, personnel will need to be tasked with the training process (most companies have a small training department), this will take an extreme amount of time and cost are unknown at this time.
Response: The SPT SDT believes there is some confusion between Time Horizons and the Implementation Plan. Time			

Question #4			
Commenter	**Yes**	**No**	**Comment**
Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. Section 5.2 has been removed from the revised standard. The SPT SDT believes your comments are in response to the Implementation Plan. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
Entergy (2)	☑		
ERCOT		☑	See comments on #9.
Response: The SPT SDT has considered stakeholder comments on version 1 and Version 2 of the standard and believes the existing Implementation Plan reflects stakeholder consensus.			
Southern	☑		Long-term planning is the appropriate time horizon.
Response: The SPT SDT thanks you for your comment.			
Allegheny Power			
AEP	☑		
ATC	☑		
BCTC	☑		The requirement time horizon as Long Term Planning is okay.
Response: The SPT SDT thanks you for your comment.			
CAISO		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC will have final say on these elements in any case; therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements. However, given the question being posed: The CAISO believes that assigning long-term planning to all the requirements is inappropriate, if not over-simplistic. For example, the annual assessment of the training

Question #4			
Commenter	**Yes**	**No**	**Comment**
			need and the subsequent development-of/revision-to a training program, as the requirement implies, occurs once every 12 months. This is normally regarded as an operations planning time frame if violation of this requirement is to be mitigated. Training in each of the requirements can cross over time horizons. Requirement 1 (which has not been vetted) states the entity must use the SAT 5 phases for all reliability-related tasks. If a new task that requires training is created for implementation tomorrow, how would that training program fall under long-term planning? Requirement 4 - when a new task arises, (assuming one accepts the premise of the requirement itself) then shouldn't the assessment take place as soon as possible?
Response: Time Horizons are prepared by the Standard Drafting Team, not the CCC. Please see the NERC Drafting Team Guidelines for a complete description of the elements that are prepared by each (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf). The SPT SDT revised the requirements and believes that based on the definitions included in the Drafting Team Guidelines the assignment of long-term planning is appropriate. The SPT SDT believes there is some confusion between Time Horizons and the amount of time it takes to perform the requirement. Time Horizons are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time.			
CenterPoint	☑		
NIPSCO		☑	The annual assessment is scheduled to begin before the baseline criteria for the evaluation is developed. It would be more beneficial to develop the standards upon which the evaluation will be based first so that the operators know what is expected from them.
Response: The SPT SDT agrees with your comment and combined these two requirements (R1 and R2).			
NPCC RCS	☑		
PG&E (1)			
PG&E (2)	☑		However, we would like a definition for long term planning?
Response: Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be

Commenter	**Yes**	**No**	**Comment**
for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf.			
PJM		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC will have final say on these elements in any case; therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements. However, given the question being posed: PJM believes that assigning long-term planning to all the requirements is inappropriate, if not over-simplistic. For example, the annual assessment of the training need and the subsequent development-of/revision-to a training program, as the requirement implies, occurs once every 12 months. This is normally regarded as an operations planning time frame if violation of this requirement is to be mitigated. Training in each of the requirements can cross over time horizons. Requirement 1 (which has not been vetted) states the entity must use the SAT 5 phases for all reliability-related tasks. If a new task that requires training is created for implementation tomorrow, how would that training program fall under long-term planning? Requirement 4 - when a new task arises, (assuming one accepts the premise of the requirement itself) then shouldn't the assessment take place as soon as possible?
Response: Time Horizons are prepared by the Standard Drafting Team, not the CCC. Please see the NERC Drafting Team Guidelines for a complete description of the elements that are prepared by each (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf). The SPT SDT revised the requirements and believes that based on the definitions included in the Drafting Team Guidelines the assignment of long-term planning is appropriate. The SPT SDT believes there is some confusion between Time Horizons and the amount of time it takes to perform the requirement. Time Horizons are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time.			
SRP	☑		

Question #4			
Commenter	**Yes**	**No**	**Comment**
SDG&E		☑	It is unclear what is the meaing of the time horizons.
Response: Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf.			
We Energies	☑		
Garland		☑	Do not agree with the annual time line in R2. Long Term planning should be defined.
Response: Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf. The SPT SDT believes your comment is in reference to R2, not the Time Horizon for R2. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their task list at least annually and then develop the necessary training to address the updated or new tasks.			
HQT	☑		
IESO	☑	☑	We do not agree with some of the requirements in the standard (see our comments under Q11) hence we have difficulties commenting on the time horizons. Given what's written, however, our general comment is that assigning long-term planning to all the requirements is inappropriate, if not over-simplistic. For example, the annual assessment of the training need and development of/revision to a training program, as the requirement implies, occurs once every 12 months. This is normally regarded as an operations planning time frame if violation of this requirement is to be mitigated.
Response: (1) In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. (2) The standard is addressing reliability-related tasks performed by the three applicable entities.			

Question #4			
Commenter	**Yes**	**No**	**Comment**
Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf.			
ISO New England	☑		
Manitoba Hydro		☑	Do not understand what this means.
Response: Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf.			
MISO Stakeholders		☑	As a general rule, we do not agree to any assignments of time horizons because time horizons were never vetted through the industry. The definitions also are not posted on the NERC web site in a prominent location. There were no time horizons assigned for R1 and R2 in PER-004-2.
Response: Time Horizons were not vetted through the stakeholder process. They were published in the ERO Sanctions Guidelines. The industry is being asked to provide feedback through the request for comments on the standards. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf. The assignment of Time Horizons to the requirements that remain in the approved PER-004-2 is outside the scope of this standard.			
MRO	☑		
SPP ORWG	☑		It is our understanding that the Time Horizon of Long-term Planning allows a mitigation period of one year or more.
Response: The SPT SDT agrees with your understanding.			
WECC OTS	☑		However, we would like a definition for long term planning?
Response: Long Term Planning is a planning horizon of one year or more. It is one of the five Time Horizons that are used in determining the size of the sanction. If an entity violates a requirement and there is no time to mitigate the violation because the requirement takes place in real-time, then the sanction associated with the violation is higher than it would be

Commenter	Yes	No	Comment
for violation of a requirement that could be mitigated over a longer period of time. The definition of Long Term Planning, as well as other Time Horizons can be found in the NERC Drafting Team Guidelines which can be found at ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf.			

5. Do you agree with the Violation Risk Factor for each requirement in the revised standard? If not, please explain in the comment area.

Summary Consideration:

Most commenters did not agree with the Violation Risk Factors (VRFs) for each requirement, suggesting the all training requirements should have Lower VRF. The SPT SDT did not revise the VRFs for any of the requirements. The SPT SDT believes that based on the existing definitions of the VRFs, the VRFs should not be changed from Medium to Lower. The analysis of the August 2003 Blackout showed that training, or the lack of training, was a significant factor that contributed to the blackout.

Question #5			
Commenter	**Yes**	**No**	**Comment**
Ameren		☑	While qualified trained operators are important and thus traiining might appear to imply a greater VRF, the mechanics of training should be considered LOWER.
Response: The SPT SDT believes that based on the existing definitions of the VRFs, the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
Florida Power & Light		☑	The risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occurring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
FRCC		☑	The risk factors associated with the training standards should be "Lower" risk factors. These training activities will be occurring outside of the "real-time" operating arena and therefore violations of these requirements cannot in and of themselves cause impacts as defined by "Medium" risk factors. An entity would be required to violate several core operating requirements prior to the violation of a training requirement having any material impact on a system. At that, the linkage of an event to a training activity would be extremely subjective.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. Question #5			
Commenter	**Yes**	**No**	**Comment**
Standards Development Procedure Manual.			
LCRA		☑	See #4.
Response: The SPT SDT revised the requirements based on industry comments.			
NYISO		☑	Medium is an excessively high risk factor.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
OVEC		☑	The Risk Factor for each requirement should be low. Each of the requirements appear to be more administrative in nature and do not warrant a Medium risk factor as is currently assigned.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
PHI	☑		
SMUD		☑	All entities' risk factors should be assessed based on their possible impact to the BES.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
APS			No comment.
Santee Cooper	☑		No comment.
Avista		☑	For instance R2.3.1 is a Violation Risk Factor of High. SAT is not necessary; adaquate training programs exist currently without the benefit of SAT; therefore, a Violation Risk Factor of Low is more reasonable.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
Entergy (1)	☑		Please add VRFs to R1.1, R2.1, R2.2 and R3.1 and R3.1.1. It is not obvious the VRFs assigned to the Requirement also applies to the sub-requirement.
Response: Each requirement must have an associated Violation Risk Factor (VRF). To avoid being penalized more than once			

Question #5			
Commenter	**Yes**	**No**	**Comment**
for violating the same requirement, NERC is avoiding the assignment of VRF to sub-requirements.			
FirstEnergy	☑		
Quality Training Systems			No comment.
TAL		☑	These are not real time requirements. Any potential impact to the BES will be adequately captured in other approved standards and violation severities. These should all be Lower!
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
Madison G&E		☑	Since Violation Severity Levels have not been vetted through the electrical industry, levels of severity can not be applied to the proposed standard.
Response: Violation Severity Levels are currently being vetted through the stakeholder process. They were also published in the ERO Sanctions Guidelines. The industry is being asked to provide feedback through the request for comments on the standards. The Violation Severity Levels for this standard are being vetted through the industry as part of the standard development effort.			
Entergy (2)		☑	We believe these items to be in the LOWER risk factor category.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
ERCOT		☑	This has not been properly vetted through the industry. Furthermore, this is an administrative standard and medium to high risk should not apply unless the training program is grossly inadequate.
Response: Violation Risk Factors were not vetted through the stakeholder process. They were published in the ERO Sanctions Guidelines. The industry is being asked to provide feedback through the request for comments on the standards. The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
Southern	☑		Medium risk factor is appropriate for all.

Question #5			
Commenter	**Yes**	**No**	**Comment**
Response: The SPT SDT thanks you for your comment.			
Allegheny Power			
AEP		☑	R1. - No. This should be a "low" risk factor". An entity could do very good training without using the SAT, still identify reliability tasks, and not be at risk. Not providing a training program or avenue of training could be a "medium" risk factor, but not using SAT (ADDIE) is a "low" risk factor. SAT (ADDIE) is a great guide, but it doesn't warrant being a part of the standard requirement. The true requirement of R1 should be the requirement of entities to have a training program with training objectives to support the identified reliability tasks. If the only requirement of R1 was the requirement to identify Reliability Tasks (R1.1), a "Medium" risk factor might be appropriate. Renumbering of R1.1 and making it R2, thus separating this requirement from the SAT requirement, would be an improvement, and would allow two different risk factors. (Also see comments of Question 6 and Question 11 for R1) R2. - Yes. "Medium" risk is OK. R3. - Yes. "Medium" risk factor is OK. R4. - Yes. "Medium" risk is OK.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
ATC	☑		
BCTC		☑	These requirements changes are generally administrative issues and should be risk factor Low.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
CAISO		☑	The Compliance elements of this standard should be postponed until the requirements

Question #5			
Commenter	**Yes**	**No**	**Comment**
			are agreed to. The CCC and FERC will have final say on these VRFs, therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements.
Response: Violation Risk Factors are prepared by the Standard Drafting Team, not the CCC. Please see the NERC Drafting Team Guidelines for a complete description of the elements that are prepared by each (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
CenterPoint			
NIPSCO	☑		
NPCC RCS	☑		
PG&E (1)			
PG&E (2)		☑	The purpose of the Violation Risk Factors is for use when determining a penalty or sanction. In reviewing the measures all requirements are administrative in terms of providing documentation that the requirement has been met. Training generally occurs outside of the real-time operations which have little impact on the BES and therefore a "Lower" risk factor versus the "Medium/High" risk factors would be appropriate.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
PJM		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to. The CCC and FERC will have final say on these VRFs, therefore the SDT would save itself some effort by focusing on the primary elements before weighing in on the compliance elements.
Response: Violation Risk Factors are prepared by the Standard Drafting Team, not the CCC. Please see the NERC Drafting Team Guidelines for a complete description of the elements. (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual. .			
SRP	☑		
SDG&E			
We Energies	☑		
Garland		☑	I think the Violation risk factor for training requirements should be lower than a medium.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from			

Question #5			
Commenter	**Yes**	**No**	**Comment**
medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
HQT	☑		
IESO	☑		Given what's written, but we do not agree with some of the requirements (see Q11, below).
Response: (1) In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. (2) The standard is addressing reliability-related tasks performed by the three applicable entities.			
ISO New England	☑		
Manitoba Hydro	☑	☑	It is hard to believe that we are still mixing risk with importance. Yes training is an important component but it is a stretch to say that missing some item or document is going to place the system at risk.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
MISO Stakeholders		☑	As a general rule, we do not agree with the assignment of any Violation Risk Factors to any requirements since the Violation Risk Factor definitions have not been vetted through the industry. One could make a case that the lack of a training program could be a medium risk violation, however there should be no medium or high risk requirements in an administrative standard. We appear to be confusing importance with the probability of cascading.
Response: The Violation Risk Factors for this standard are being vetted through the industry as part of the standard development effort. The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
MRO	☑	☑	There is varied opinion on this. Perhaps the majority opinion is: It is hard to believe that we are still mixing risk with importance. Yes training is an important component but it is

Question #5			
Commenter	**Yes**	**No**	**Comment**
			a stretch to say that missing some item or document is going to place the system at immediate risk. MRO suggest these be assigned as LOW but does agree that training is important. Others agree with assigning Medium.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
SPP ORWG		☑	We can concur with maintaining the VSL of Medium on Requirement 1 but would recommend dropping the VSL to Low for R2, R3 and R4 since these requirements tend to be administrative.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			
WECC OTS		☑	OTS recommends the violation risk factors be set to 'Lower'. The purpose of the Violation Risk Factors is for use when determining a penalty or sanction. In reviewing the measures all requirements are administrative in terms of providing documentation that the requirement has been met. Training generally occurs outside of the real-time operations which have little impact on the BES and therefore a "Lower" risk factor versus the "Medium/High" risk factors would be appropriate.
Response: The SPT SDT believes that based on the existing definitions of the VRFs the VRFs should not be changed from medium to lower. The NERC Drafting Team Guidelines present the VRF definitions (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as the Reliability Standards Development Procedure Manual.			

6. Do you agree with the Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

Summary Consideration:

Most commenters did not agree with the Measures identified fro each requirement. Several commenters expressed concern that the required documentation was not well-defined, including the documentation from outside vendors that are used to meet the requirement. Several commenters provided comments on Measure 1, expressing concern that it was imposing new requirements and was too broad and confusing.

The SPT SDT revised each of the Measures to include examples of evidence. For example, here is the revised measure for the requirement to verify the capabilities of system operators:

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence (for example training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments) to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1, as specified in R2.

Question #6			
Commenter	**Yes**	**No**	**Comment**
Ameren		☑	The required documentation needed for these measures is not well defined. Is a journal sufficient?, or a certificate?
Response: The SPT SDT revised each of the Measures to include examples of evidence. Please see the Summary Consideration for an example of one of the revised measures.			
Florida Power & Light		☑	M 1.4 - What would be required documentation for training delivered by an outside vendor? Would certificates be sufficient? M-2 - see comment on number 1 above. M-4 - see comment on number 3 above.
Response: The SPT SDT revised each of the Requirements, as well as the Measures. The Measures now include include examples of evidence, which do not exclude the use of vendors. The revised Measure for training delivery (M1.3) requires responsible entities to have System Operator training records showing the names of the people trained, the title of the training delivered, and the dates of delivery. The SPT SDT agrees that R2 was ambiguous and subjective. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT updated M1 to support the revised R1 and deleted M2. The SPT SDT also included examples of evidence in the			

Question #6			
Commenter	**Yes**	**No**	**Comment**
revised measure. The development of the Auditors Guide is outside the scope of this standard. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
FRCC	☑	☑	M 1.4 - What would be required documentation for training delivered by an outside vendor? Would certificates be sufficient? M-2 - see comment on number 1 above. M-4 - see comment on number 3 above.
Response: The SPT SDT revised each of the Requirements, as well as the Measures. The Measures now include include examples of evidence, which do not exclude the use of vendors. The revised Measure for training delivery (M1.3) requires responsible entities to have System Operator training records showing the names of the people trained, the title of the training delivered, and the dates of delivery. The SPT SDT agrees that R2 was ambiguous and subjective. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT updated M1 to support the revised R1 and deleted M2. The SPT SDT also included examples of evidence in the revised Measure. The development of the Auditors Guide is outside the scope of this standard. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each System Operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the System Operator's assigned task list is modified.			
LCRA		☑	Again, it is an unreal expectation to believe that smaller utlities can manage what amounts to an entirley new massive program.
Response: The SPT SDT revised each of the Measures to include examples of evidence.			
NYISO		☑	M4 is unmeasureable. Replace the wording "verification of the capabilities" with "training records". R4 is not measurable. Please replace the following: Each Reliability Coordinator, Balancing Authority and Transmission Operator shall maintain training records of each of its real-time System Operators. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall maintain records of

Question #6			
Commenter	**Yes**	**No**	**Comment**
			training programs provided to address the tasks on its list of company-specific BES reliability-related tasks.
Response: The SPT SDT revised each of the Measures to include examples of evidence such as training records.			
OVEC		☑	The M1 sub-measures are written more like requirements than measures. The submeasures should be deleted. Revise M1 to read, "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evdience of a SAT developed BES System Operator training program as stated in R1." This wording clearly measures all that is stated in requirement R1. In M2 it is unclear why the word "position" was included. For M3, delete the words "or system restoration training." Sytem restoration is considered a part of emergency operations.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2). The SPT SDT agrees with your suggestion to delete “or system restoration training” and has revised R3 and M3.			
PHI	☑		Except where we would like some clarification of Requirement 2 so that we would be clear about what is being assessed. See our comment to Q1.
Response: The SPT SDT agrees with your comment. The SPT SDT combined R1 and R2 to clarify the requirement. R1 requires each entity to update at least annually the BES company-specific reliability-related task list and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and and within six months of any new or revised task.			
SMUD	☑		
APS		☑	M1.4. The "E" in ADDIE means evaluations and assessments of training effectiveness. It does not directly refer to student evaluation, of whether "learning objectives are met" (i.e. exams, which are administered during Implementation). "E"valuation more often refers to Feedback, Exam Performance, Post-Training Evaluation, and Return on Investment studies. M4. (See Item 3 above) This "Measure" can never be consistently applied. Regarding this requirement, the Background Information on Page 3 of this document says "the standard does not specify how entities will measure this capability", leaving nothing but a future of debates during Audit Week.
Response: The SPT SDT has modified the Requirement and the Measure to clarify the type of evaluation that can be			

Question #6			
Commenter	**Yes**	**No**	**Comment**
performed. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and within six months of any new or revised task.			
Santee Cooper		☑	M2, M3, and M4 appear to be appropriate measures. M1 and R1 should not be included in a Reliability Standard. The Standard should address training that is required and not dictate how a company should implement their training.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.			
Avista		☑	M1- Removal of the term "job task analysis" but still requiring one is not much of a change from the previous draft. Again requiring every entity to have a SAT based training program is unnecessary.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised R1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each Requirement.			
Entergy (1)		☑	As written, M1 is intended to measure the "process" used to derive the result of each step of the SAT. We disagree with that measure. We suggest the Measure for R1 be a review of the "results" of each step of the SAT, not measure the process for development of those results. Given the specific wording of these requirements and measures, we are not sure what is being measured in M2. What is being measured in M2? Please be more specific in the words. For instance, is the "latest assessment for each position" and assessment of the job category, or an assessment of the individual employees performing in that position? Please make this measure significantly more clear and specific. M3 should be deleted and moved to EOP-005. We have similar issues with M4 as for M2, and a similar interpretation of the issues identified above for M2. What constitutes verification of the capabilities? Is this

Question #6			
Commenter	**Yes**	**No**	**Comment**
			verification of a person's performance appraisal? Is this a verification of the basic training requirements of a person to fill a position, like having a BSEE from an accredited university? Please make this measure significantly more clear and specific.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2). The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to its Reliability Standards Work Plan 2008-2010 that consolidates all training-related requirements into the PER standards. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and within six months of any new or revised task. The SPT SDT revised M4 (now M2) to include examples of evidence.			
FirstEnergy	☑		Many of the measures provide no additional information beyond the information contained in the requirement except to say "provide the evidence". In addition, where they do provide additional information, the measurement value is not contained in the requirement. As an example, measure M1.1. states that, "Analysis that results in a list of company-specific BES reliability-related tasks and measurable or observable criteria for desired performance for each task." However, there is nothing in R1 or the sub-requirements that states measurable or observable criteria for desired performance must be developed. All requirements should be clearly stated in the requirements section of the standard and the measures section should not impose new or additional requirements.
Response: The SPT SDT revised each of the Measures to include examples of evidence. Please see the Summary Consideration for an example of the way the SDT revised the measures. The SPT SDT agrees with your statement about R1 and M1 and has revised R1 and M1, combining R1 and R2 (and M1 and M2).			
Quality Training Systems			No comment.
TAL		☑	M1. This measure has no allowance for the use of outside vendors in a training plan. If a NERC Certified Provider is utilized, the entity should not be required to retain the providers documentation as required in M1.2 and M1.4. the retention of "evaluations and assessments" may include the use of end-of-course examinations which would violate exam security for the vendor if the entity has to retain them. The fact that CEH's were awarded should be sufficient for M1.2 and M1.4 in the case where a CEH provider

Question #6			
Commenter	**Yes**	**No**	**Comment**
			(even if it was the parent entity) is utilized. The industry has spent a lot of time, money and effort into getting the CEH program up and running. It has become the only way to maintain NERC Certification. Lets use it to it's fullest potential. If it is good enough for Credential maintenance, it should be good enough for the training program compliance. Violators of the CEH provider rules already have a method to be scrutinized. M2. This relates to Question 1. Is the intent to retain documentation for the Operator position or the Operator that mans the position and sits at the desk?
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2). The revised Measure for training delivery (M1.3) requires responsible entities to have System Operator training records showing the names of the people trained, the title of the training delivered, and the dates of delivery. The NERC CE program and the required hours to maintain System Operator certification are independent of the proposed standard PER-005. The proposed Standard PER-005 does not prevent the inclusion or the exclusion of any training that meets the needs of an organization's training program under the proposed standard PER-005 and meets the CEH hour requirements to maintain System Operator certification.			
Madison G&E		☑	M1.2, Unclear what the difference is between "design" and "development", and these are in fact lumped into one measure even though they are considered 2 separate steps for the SAT process.
Response: The SPT SDT revised R1 and the associated Measures for each subrequirement. The measures include examples of evidence that can be used to show compliance. The SPT SDT posted a reference that includes resources with additional information on the SAT process.			
Entergy (2)		☑	M1, as currently written, is a review of an entity's entire training program from inception. This may be too broad of a Measure.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2).			
ERCOT		☑	Should state "applicable SAT-related outcomes" rather than "SAT related outcomes". The current wording will create unnecessary work. For example, an Analysis may show that the simplicity and frequency of a task does not need to move beyond the Analysis phase. This can be an audit liability when taken literally. M.4 Should state "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection verification of the qualifications for each real-time System Operator and their assigned positions, as specified in R4."
Response: The SPT SDT revised R1 and M1, combining R1 and R2 (and M1 and M2).			

Question #6			
Commenter	**Yes**	**No**	**Comment**
The SPT SDT revised each of the Measures to include examples of evidence. The intent of the proposed revision to M4 was adopted. The revised measure (now M2) allows a range of evidence such as training records showing successful completion of tasks with the employee name and date,supervisor check sheets showing the employee name, date, and task completed or the results of learning assessments.			
Southern	☑		
Allegheny Power			
AEP		☑	M1 - This measurement should require evidence of a training program that supports training and identification of reliability tasks, but the approach to training should be the choice of the operating entity. (R1 - SAT should be a guide given as a reference document, but should not be a requirement and measurement of the standard; see additional comment in Question 11). M2 - OK M3 - OK M4 - OK.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2). In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised R1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.			
ATC	☑		
BCTC		☑	From the comments we have provided we are suggesting the changes to the requirements are overall not acceptable, therefore the measures would have to be changed to reflect the changes to the requirements that are acceptable.
Response: The SPT SDT has revised the Requirements and the Measures.			
CAISO		☑	Measure 1 is not quantifiable. What evidence will demonstrate 'desired performance', if the desired performance is not defined in the standard itself? Because Requirement 2 is subjective, Measurement 2 is meaningless in the context of a NERC reliability standard. Measurement 3 is proof of attendance and not a true indicator of reliability impacts.

Question #6			
Commenter	**Yes**	**No**	**Comment**
			Measurement 4 requires that the subjective verification of the "capabilities" be documented. Even if such a measurement could be standardized, as written, this measurement requires nothing more that documentation of ineptness.
Response: The SPT SDT revised each of the Measures to include examples of evidence.			
CenterPoint			
NIPSCO	☑		
NPCC RCS		☑	It must be clear that no personal information or assessments that may be confidential are part of M2. The information should strictly be related to the System Operator's skills. Also see number 8 below regarding R1 and M1.
Response: The SPT SDT has clarified M1, such that the sources of evidence are clearer. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and within six months of any new or revised task. The SPT SDT also revised M4 (now M2) to include examples of evidence such as training records showing successful completion of tasks with the employee name and date,supervisor check sheets showing the employee name, date, and task completed or the results of learning assessments. In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.			
PG&E (1)			
PG&E (2)		☑	If the requirements change, then the measures should be changed to reflect the revised requirement.
Response: The SPT SDT revised the Requirements and the Measures.			
PJM		☑	Measure 1 is not quantifiable. What evidence will demonstrate 'desired performance', if the desired performance is not defined in the standard itself? Because Requirement 2 is subjective, Measurement 2 is meaningless in the context of a NERC reliability standard. Measurement 3 is proof of attendance and not a true indicator of reliability impacts. Measurement 4 requires that the subjective verification of the "capabilities" be

Question #6			
Commenter	**Yes**	**No**	**Comment**
			documented. Even if such a measurement could be standardized, as written this measurement requires nothing more that documentation of ineptness.
Response: The SPT SDT has clarified M1, such that the sources of evidence are clearer. The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2). The SPT SDT agrees with your statement on M3. The requirement and measure are aimed at ensuring that training is provided. The SPT SDT agrees with your statement on M4 and has revised M2 (previously M4).			
SRP	☑		
SDG&E			
We Energies		☑	Wording of M1 and sub measures should be simplified/clarified. Wording of M1.2 should not preclude using training material from a vendor.
Response: The SPT SDT has clarified M1, such that the sources of evidence are clearer. The revised Measure for training delivery (M1.3) requires responsible entities to have System Operator training records showing the names of the people trained, the title of the training delivered, and the dates of delivery. The use of training material from a vendor is not precluded.			
Garland		☑	Again, small utilities can not manage a large training program with unreal expectations for training requirements. This would be great if you had unlimited resources or was only in the training business and not having to manage real time operations at the same time on a daily basis.
Response: The SPT SDT thanks you for your comment. The intent of the standard is to ensure that all system operators who work for a Reliability Coordinator, Balancing Authority and Transmission Operator have the capabilities to perform their reliability-related tasks. The size of an entity does not preclude that entity's system operators from having an impact on BES reliability.			
HQT		☑	It must be clear that no personal information or assessments that may be confidential are part of M2. The information should strictly be related to the System Operator's skills. Also see Q8 below regarding R1 and M1.
Response: The SPT SDT has clarified M1, such that the sources of evidence are clearer. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and within six months of any new or revised task. The SPT SDT also revised M4 (now M2) to include examples of evidence such as training records showing successful completion of tasks with the employee name and date,supervisor check sheets showing the employee name, date, and task completed or the results of learning assessments.			

Question #6			
Commenter	**Yes**	**No**	**Comment**
IESO	☑	☑	Yes, given what's written, but we do not agree with some of the requirements (see Q11, below). In addition, we think M3 should be expanded to cover the sub-requirements in R3. One item of particular concern is an entity is assigned a Low violation if it is found that it did not add or remove topics from the Emergency Operations Topics. This is not covered in M3, which only covers the 32 hour training duration requirement.
Response: (1) In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement. (2) The standard is addressing BES company-specific reliability-related tasks performed by the three applicable entities. The SPT SDT has revised the requirements and the associated measures. The SPT SDT revised R3 such that the sub-requirements were eliminated.			
ISO New England		☑	It must be clear that no personal information or assessments that may be confidential are part of M2. The information should strictly be related to the System Operator's skills. Also see number 8 below regarding R1 and M1.
Response: The SPT SDT has clarified M1, such that the sources of evidence are clearer. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator at least once and within six months of any new or revised task. The SPT SDT also revised M4 (now M2) to include examples of evidence such as training records showing successful completion of tasks with the employee name and date,supervisor check sheets showing the employee name, date, and task completed or the results of learning assessments. In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.			
Manitoba Hydro		☑	On quick review it looks like additional requirements are being placed in the measures. The measures are complex and may not be understood.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2).			
MISO Stakeholders		☑	Measure 1 is confusing due to the sub-measures. Is this trying to say the training program shall have these four critieria? If so, it needs to be worded better. For example, we suggest simply replacing M1.1 with:

Question #6			
Commenter	**Yes**	**No**	**Comment**
			A list of company specific BES reliability-related tasks with measurable criteria for each task. This is much simply and clearer.
Response: The SPT SDT revised R1 and M1, combining R1 and R2 (and M1 and M2).			
MRO		☑	On quick review it looks like additonal requirements are being placed in the measures. For example, M1.1, seems to add an additional requirement of having measurable or observable criteria for desired performance for each task which is not stated in R1. The measures are complex and may not be understood. For example, in M4, it is not clear how "varification of the capabilities for each real-time operator" can actually be achieved and then varified to an auditor. In may also be inpractical to varify capability to perform some tasks if the individual operator has never actually been in a situation to demonstrate capability - follow the correct procedures to initiate loadshed in an emergency, for example.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2). The SPT SDT revised M4 to include examples of evidence such as training records showing successful completion of tasks with the employee name and date,supervisor check sheets showing the employee name, date, and task completed or the results of learning assessments.			
SPP ORWG	☑		Although we can not offer any suggestions for making it more focused, Measurement 1 is very broad. We are concerned about how we would be able to demonstrate that we have satisfied the requirements the way it is currently written.
Response: The SPT SDT agrees and has revised R1 and M1, combining R1 and R2 (and M1 and M2).			
WECC OTS		☑	OTS is suggesting in its comments changes to the requirements, therefore the measures would be changed to reflect the changes to these requirements. It also does not address training provided by third parties or vendors. What requirements would companies be under if this type of training were provided?
Response: The SPT SDT revised the Requirements and the Measures, including identifying examples of evidence. The revised Measure for training delivery (M1.3) requires responsible entities to have System Operator training records showing the names of the people trained, the title of the training delivered, and the dates of delivery. The use of training material from a vendor is not precluded.			

7. Do you agree with the Compliance Monitoring Process section (D1) in the revised standard? If not, please explain in the comment area.

Summary Consideration:

Most commenters did not agree with the Compliance Monitoring section (D1) in the revised standard. Most comments requested clarification or definition of compliance monitoring terms, such as time period, Compliance Monitoring Period, Reset, and mitigation plans. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. The term, "Compliance Monitoring Period and Reset" is not used in the revised standard.

The data retention period was modified. The revised standard requires retaining the current task list and evidence of compliance since the last audit. Since the Reliability Coordinator, Transmission Operator and Balancing Authority are all on a "once every three years" audit cycle, this means that the retention period would not be longer than three years.

Question #7			
Commenter	**Yes**	**No**	**Comment**
Ameren		☑	Once again the time period is not well defined.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC had determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
Florida Power & Light		☑	D1.2 - What is the compliance Monitoring Period? Should the Reset period be one month when these are apparently annual requirements? D1.3 - Why is data retention four years? What is the benefit of an additional year of records past the last compliance audit which is required every 3 years per D1.4? - Is the retention of "any data used in mitigation plans associated with this standard" intended to be an indefenite retention? This is not clear. Is the "mitigation plan" intended to be mitigation for the entity to get in compliance with the standard, or for the individual operator to achieve the desired performance level per the entity's training plan?
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before			

Question #7			
Commenter	**Yes**	**No**	**Comment**
performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC had determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. The data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years. The definition of a Mitigation Plan is: An action plan developed by a Registered entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. A Mitigation Plan is required whenever a Registered entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, Settlement Agreement, or otherwise. This is defined in the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". FERC has approved the CMEP. Mitigations plans address compliance violations, whether self reported, during an on-site audit, etc. Once an alleged violation is confirmed by the regional entity (RE), the registered entity will submit a mitigation plan to it's RE. The RE will approve or disapprove the mitigation plan. The RE submits the mitigation plan to NERC for approval. Once NERC approves, the plans are reported to FERC. The RE will track the status of all mitigation plans with the registered entity.			
FRCC		☑	D1.2 - What is the compliance Monitoring Period? Should the Reset period be one month when these are apparently annual requirements? D1.3 - Why is data retention four years? What is the benefit of an additional year of records past the last compliance audit which is required every 3 years per D1.4? - Is the retention of "any data used in mitigation plans associated with this standard" intended to be an indefenite retention? This is not clear. Is the "mitigation plan" intended to be mitigation for the entity to get in compliance with the standard, or for the individual operator to achieve the desired performance level per the entity's training plan?
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a			

Question #7			
Commenter	**Yes**	**No**	**Comment**
minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC had determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years. The definition of a Mitigation Plan is: An action plan developed by a Registered Entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. A Mitigation Plan is required whenever a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, Settlement Agreement, or otherwise. This is defined in the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". FERC has approved the CMEP. Mitigations plans address compliance violations, whether self reported, during an on-site audit, etc. Once an alleged violation is confirmed by the regional entity (RE), the registered entity will submit a mitigation plan to it's RE. The RE will approve or disapprove the mitigation plan. The RE submits the mitigation plan to NERC for approval. Once NERC approves, the plans are reported to FERC. The RE will track the status of all mitigation plans with the registered entity. The data retention section of the standard was revised and no longer references "mitigation plans" – in the revised standard, if the responsible entity is found to be noncompliant, that entity must keep evidence related to the noncompliance until found compliant. Thus, in the revised standard, it is clear that the responsible entity does not have to keep evidence for an indefinite period of time.			
LCRA		☑	See #4.
Response: The SPT SDT revised the requirements based on industry comments.			
NYISO		☑	There is no requirement that requires data retention. There should be. See the proposed rewording of R4 above. Mitigation plans are addressed nowhere in the standard except in data retention. It is an undefined term.
Response: All data retention requirements fall under Section D1, which includes Data Retention. The SPT SDT revised the			

Question #7			
Commenter	**Yes**	**No**	**Comment**
Compliance Monitoring section to be consistent with the revised content and format. The definition of a Mitigation Plan is: An action plan developed by a Registered Entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. A Mitigation Plan is required whenever a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, Settlement Agreement, or otherwise. This is defined in the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". FERC has approved the CMEP. Mitigations plans address compliance violations, whether self reported, during an on-site audit, etc. Once an alleged violation is confirmed by the regional entity (RE), the registered entity will submit a mitigation plan to it's RE. The RE will approve or disapprove the mitigation plan. The RE submits the mitigation plan to NERC for approval. Once NERC approves, the plans are reported to FERC. The RE will track the status of all mitigation plans with the registered entity. The data retention section of the standard was revised and no longer references "mitigation plans" – in the revised standard, if the responsible entity is found to be noncompliant, that entity must keep evidence related to the noncompliance until found compliant. Thus, in the revised standard, it is clear that the responsible entity does not have to keep evidence for an indefinite period of time.			
OVEC		☑	In Section D, 1.4 the annual self-certification submittal should not be included in the standard but left to NERC's discretion to either include or exclude monitoring in the annual compliance and enforcement program. The impact on the system from this standard is minimal if it is not monitored for compliance on a yearly basis.
Response: The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard to which it is subject. More information concerning this can be found on the NERC website, under Compliance, open the "Uniform CMEP document". (ftp://www.nerc.com/pub/sys/all_updl/rop/Appendix4C-Uniform-CMEP-eff-041907.pdf) The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
PHI	☑		
SMUD	☑		Please define Compliance - 1.2 Monitoring Period Reset.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The			

Question #7			
Commenter	**Yes**	**No**	**Comment**
FERC had determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
APS			No comment.
Santee Cooper		☑	Most NERC Standards require three years or less for documentation to be maintained.
Response: This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
Avista		☑	
Entergy (1)	☑		
FirstEnergy		☑	The compliance monitoring and reset period is a vague concept that may be of little or no value in the mandatory compliance regime. Under the mandatory compliance regime, non-compliance is followed by a mitigation plan that contains the date by which compliance will be achieved and thus reset the compliance clock. This reduces or eliminates the value of the monitoring and reset period.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC had determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
Quality Training Systems			No comment.
TAL		☑	D1.2 - What is the compliance Monitoring Period? Should the Reset period be one month when these are apparently annual requirements? D1.3 - Why is data retention four years? What is the benefit of an additional year of records past the last compliance audit which is required every 3 years per D1.4?

Question #7			
Commenter	**Yes**	**No**	**Comment**
			- Is the retention of "any data used in mitigation plans associarted with this standard" intended to be an indefenite retention? This is not clear. Is the "mitigation plan" intended to be mitigation for the entity to get in compliance with the standard, or for the individual operator to achieve the desired performance level per the entity's training plan?
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC had determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years. The definition of a Mitigation Plan is: An action plan developed by a Registered Entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. A Mitigation Plan is required whenever a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, Settlement Agreement, or otherwise. This is defined in the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". FERC has approved the CMEP. Mitigations plans address compliance violations, whether self reported, during an on-site audit, etc. Once an alleged violation is confirmed by the regional entity (RE), the registered entity will submit a mitigation plan to it's RE. The RE will approve or disapprove the mitigation plan. The RE submits the mitigation plan to NERC for approval. Once NERC approves, the plans are reported to FERC. The RE will track the status of all mitigation plans with the registered entity. The data retention section of the standard was revised and no longer references "mitigation plans" – in the revised standard, if the responsible entity is found to be noncompliant, that entity must keep evidence related to the noncompliance until found compliant. Thus, in the revised standard, it is clear that the responsible entity does not have to keep evidence for an indefinite period of time.			
Madison G&E		☑	a) It is unclear what the one month period is meant to be in Compliance 1.2. If it is

Question #7			
Commenter	**Yes**	**No**	**Comment**
			meant to mean that the requirements need to be met monthly, then the requirements are too in-depth to be met on a monthly basis. A full evaluation of each operator on a monthly basis in particular would be impractical. R3 already mentions it is an annual requirement, and this time period seems reasonable for all of the requirements. b) Data Retention, 1.3, Do not understand the 4 year retention period, since Registered Entities (RC, TO, BA) will be audited every three years.
Response: a) The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC has determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. b) This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years.			
Entergy (2)	☑		
ERCOT		☑	The requirments for self-certification should be identified. Without reasonable guidelines, a Regional Entity will have free reign to set whatever self-reporting standards it deems fit. With the current wording, annual self-certification has the potential to become very stringent.
Response: The NERC Compliance Monitoring and Enforcement Program (CMEP), approved by FERC, addresses each method listed for determining compliance. Per the delegation agreements, the regional entities must include each of these methods in its compliance program. Inclusion of these methods provides the registered entity information on various methods used to determine compliance with this standard to which it is subject. More information concerning this can be found on the NERC website, under Compliance, open the "Uniform CMEP document". (ftp://www.nerc.com/pub/sys/all_updl/rop/Appendix4C-Uniform-CMEP-eff-041907.pdf) The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
Southern		☑	Under D2.2 and D2.3.1.1 it states in the Note for each of the subsections that if R1.1 or

Question #7			
Commenter	**Yes**	**No**	**Comment**
			R1.2 is violated, the entity is also in violation of R1. This is double jeopardy and does not seem correct, especially where the subsection only provides more detail about what is being required in the above section and does not represent a new requirement. R1 says you must complete the five phases of a SAT to establish a new or modify an existing company specific training program. R1.1 provides some specific details about what the analysis phase of the SAT training program should consist of. If you do not complete R1.1 adequately then there should be only one violation and not two violations. Under Data Retention, a minimum of four years of data retention is not appropriate. It should be restated to say a maximum of 3 years of data should be retained or since the last compliance audit has been performed. However, if the entity had been found to be non-compliant for a particular requirement in the most recent compliance audit, then additional data should be retained for longer than the previous compliance audit but no longer than 3 years.
Response: The SPT SDT agrees with your statement about double jeopardy and has removed 2.3.1.1. This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
Allegheny Power			
AEP		☑	D1.3. - We do not see the benefit of increasing the data retention from 3 years to 4 years. NERC Readiness evaluations and Regional Compliance audits are based on 3 years. PER-002-0 present data retention compliance is 3 years. Holding data since last audit (3 years) should be adequate.
Response: This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once

Commenter	**Yes**	**No**	**Comment**
every six years, the compliance enforcement authority must keep that audit data for at least six years.			
ATC	☑		
BCTC	☑		1.2. We are not clear what a performance reset period is but we are okay with it; 1.3 and 1.4 okay.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC has determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
CAISO		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to. We note the following: 1. The entity "Compliance Enforcement Authority" is a new term. It is not found in the Functional Model. 2. The compliance elements should not impose requirements that are not in the standard itself. To require a responsible entity to maintain records on whether it is following or followed any mitigation plan associated with the standard is outside the standard itself. The standard does not address mitigation plans anywhere. This also applies to the requirement on the Compliance Monitor to retain any data used in mitigation plans associated with this standard, particularly since the Compliance Monitor does not appear on the Applicability List at the beginning of the standard.
Response: 1. The use of the term Compliance Enforcement Authority (CEA) relates to the "Compliance Monitor" referred to in the functional model. The definition of CEA is: NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards, as defined the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. NERC as the ERO is the Compliance Enforcement Authority as designated by FERC. NERC has delegation agreements with the regional entities, which defines their role as a compliance enforcement authority. Both NERC and the regional entity are			

Question #7			
Commenter	**Yes**	**No**	**Comment**
responsible for monitoring compliance. 2. The SPT SDT revised the requirements. The definition of a Mitigation Plan is: An action plan developed by a Registered entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. A Mitigation Plan is required whenever a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, Settlement Agreement, or otherwise. This is defined in the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". FERC has approved the CMEP. Mitigations plans address compliance violations, whether self reported, during an on-site audit, etc. Once an alleged violation is confirmed by the regional entity (RE), the registered entity will submit a mitigation plan to it's RE. The RE will approve or disapprove the mitigation plan. The RE submits the mitigation plan to NERC for approval. Once NERC approves, the plans are reported to FERC. The RE will track the status of all mitigation plans with the registered entity. The requirements in the standard identify the performance or outcome needed for BES reliability. The compliance elements in the standard identify how compliance will be monitored and assessed. Maintaining records to provide evidence of compliance does not have a direct impact on reliability – the records are solely retained for compliance, not for reliability – and as such, they belong in the compliance section of the standard.			
CenterPoint			
NIPSCO		☑	Compliance monitoring period and reset lists the performance reset period for all requirements at one month, which would make the annual training requirements ineffective.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated and then reset. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
NPCC RCS		☑	D1.2, the reset period seems unrealistic and short. The assessment is due annually. D1.3 delete onsite. Also who is the Compliance Monitor intended to be.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. Commenter	**Yes**	**No**	**Comment**
in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. There are other forms of audits, for example “table-top” audits. The term “on-site” audit refers to the audit cycle. Some registered entities are on a 6-year audit cycle and others are on a three-year audit cycle. FERC has specified an “on-site” audit be performed on either a 3 or 6 year audit cycle depending on the registration of the entity. RC, BA and TOP will be audited at a minimum of 3 years. The use of the term Compliance Enforcement Authority (CEA) relates to the “Compliance Monitor” referred to in the functional model. The definition of CEA is: NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards, as defined the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the “Uniform CMEP document”. NERC as the ERO is the Compliance Enforcement Authority as designated by FERC. NERC has delegation agreements with the regional entities, which defines their role as a compliance enforcement authority. Both NERC and the regional entity are responsible for monitoring compliance.			
PG&E (1)			
PG&E (2)		☑	D.1.2 What is the compliance monitoring period and when does the reset period begin if training is an annual requirement? D.1.3 is referencing data retention; a question arises over "mitigation plans". Who does it apply to, the entities program or the operator? We also question the four year data retention, what is the purpose since it is counter to D.1.4 requirement of a Compliance Audit every three years.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the ‘zero’ infractions level for the purpose of determining an appropriate sanction. The FERC has determined that a ‘reset’ time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. The definition of a Mitigation Plan is: An action plan developed by a Registered Entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. Manitoba Hydro		☑	The Violation Security Levels are too complex to follow.
Response: The Violation Severity Levels were revised to reflect the revised requirements and the revised format.			
MISO Stakeholders		☑	We have the following issues and concerns: 1. Doesn't the Compliance Monitoring Period and Reset of one-month make the annual training requirement ineffective? Since it is reset every month, can you ever really measure if 32 hours have provided? It seems that it should not be reset each month. 2. What is the justification for retaining documentation more than 3 years. Three years is generally the longest a standard requires for data retention unless there is a violation. There should be strong justification for this. We can't fathom what it is. 3. Section 1.4 should be completely removed. It is written in a way that would require the regional entity to include this standard in their annual Compliance Monitoring and Enforcement Program every year and dictates to the region how compliance will be monitored. Isn't this up to the region? It also duplicates the requirement for a compliance audit every three years. It does not need to be repeated here.
Response: 1. The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before			

Question #7			
Commenter	**Yes**	**No**	**Comment**
performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC has determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format. 2. This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years. 3. Additional Compliance Information (D1.4), identifies the method or methods the compliance enforcement authority will use to assess compliance. All methods of compliance monitoring are listed in this section of the standard. This is outlined in the "Standards Drafting Team Guideline" on the NERC Website. Now that NERC is the ERO and there are delegation agreements in place between NERC and the Regions, the Regions are aiding NERC in implementing the NERC Compliance Monitoring and Enforcement Program.			
MRO			The term Compliance Enforcement Authority (CEA) needs to be defined as it seems this is a previously undefined entity. Why not just say Regional Entity?
Response: The use of the term Compliance Enforcement Authority (CEA) relates to the "Compliance Monitor" referred to in the functional model. The definition of CEA is: NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards, as defined the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". NERC as the ERO is the Compliance Enforcement Authority as designated by FERC. NERC has delegation agreements with the regional entities, which defines their role as a compliance enforcement authority. Both NERC and the regional entity are responsible for monitoring compliance. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
SPP ORWG		☑	There is an inconsistency between the data retention requirement in D1.3 and the on-site review requirement in D1.4. We would suggest deleting the phrases '…for four years, or…' and '…, whichever is greater.' in the first sentence of D1.3. Both time period requirements would then be based on the last on-site audit.
Response: Agree. D1.3 will be changed to reflect the compliance monitoring period. The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.			
WECC OTS		☑	OTS does not agree with the Compliance Monitoring Process in the revised standard and has several questions.

Question #7			
Commenter	**Yes**	**No**	**Comment**
			D.1.2 What is the compliance monitoring period and when does the reset period begin if training is an annual requirement? D.1.3 is referencing data retention; a question arises over "mitigation plans". Who does it apply to, the entities program or the operator? We also question the four year data retention, what is the purpose since it is counter to D.1.4 requirement of a Compliance Audit every three years.

Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now entities are on at a minimum, a 6-year audit cycle and others are on a three-year audit cycle. The reset time frame is the time frame before performance is assumed to be at the 'zero' infractions level for the purpose of determining an appropriate sanction. The FERC has determined that a 'reset' time frame cannot be any longer than a month. The compliance monitoring period and reset timeframe were linked to an older version of the sanctions table, and have no relevance to the sanctions table currently in use.

The SPT SDT revised the Compliance Monitoring section to be consistent with the revised content and format.

The definition of a Mitigation Plan is: An action plan developed by a Registered Entity to (i) correct a violation of a Reliability Standard and (ii) prevent re-occurrence of the violation. A Mitigation Plan is required whenever a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, Settlement Agreement, or otherwise. This is defined in the Compliance Monitoring and Enforcement Program. The Compliance Monitoring and Enforcement Program (CMEP) can be found on the NERC website, under Compliance, open the "Uniform CMEP document". FERC has approved the CMEP. Mitigations plans address compliance violations, whether self reported, during an on-site audit, etc. Once an alleged violation is confirmed by the regional entity (RE), the registered entity will submit a mitigation plan to it's RE. The RE will approve or disapprove the mitigation plan. The RE submits the mitigation plan to NERC for approval. Once NERC approves, the plans are reported to FERC. The RE will track the status of all mitigation plans with the registered entity.

The data retention section of the standard was revised and no longer references "mitigation plans" – in the revised standard, if the responsible entity is found to be noncompliant, that entity must keep evidence related to the noncompliance until found compliant.

This data retention time frame was changed to reflect the compliance audit cycles. The registered entity must keep data available since the last audit for the compliance monitor to review. Additionally, the compliance enforcement authority is

Question #7			
Commenter	**Yes**	**No**	**Comment**
responsible to retain its audit data for one audit cycle – so that if the compliance enforcement authority is auditing an entity that is subject to audit every three years, the compliance enforcement authority must keep that audit data for at least three years – similarly if a compliance enforcement authority is auditing an entity that is subject to audit once every six years, the compliance enforcement authority must keep that audit data for at least six years.			

8. Do you agree with the Violation Severity Levels for each requirement in the revised standard? If not, please explain in the comment area.

Summary Consideration:

Most commenters did not agree with the Violation Severity Levels for each requirement in the revised standard, expressing concern that they were too excessive and too cumbersome to understand and implement. The SPT SDT revised all of the VSLs based on the VSL Development Guidelines Criteria, the revised requirements, and industry feedback.

Question #8			
Commenter	**Yes**	**No**	**Comment**
Ameren		☑	Training should not be Severe or HIgh, those should be reserved for direct links to reliability.
Response: The VSLs are used to identify 'how badly' an entity missed complying with a requirement. An entity that does not make any attempt to meet the specified performance of a requirement has a 'severe' violation severity level and an entity that tries to comply with a requirement and comes very close to being fully compliant has a 'lower' violation severity level. Violation Risk Factors (VRFs) are used to assess the impact to reliability of violating a requirement.			
Florida Power & Light		☑	I do not feel that any VSL should be severe or high in relation to a training program.
Response: The VSLs are used to identify 'how badly' an entity missed complying with a requirement. An entity that does not make any attempt to meet the specified performance of a requirement has a 'severe' violation severity level and an entity that tries to comply with a requirement and comes very close to being fully compliant has a 'lower' violation severity The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
FRCC		☑	FRCC does not feel that any VSL should be severe or high in relation to a training program. D2.4.3 - Grammatically incorect. Second paragraph should end " training has not BEEN provided annually."
Response: The VSLs are used to identify 'how badly' an entity missed complying with a requirement. An entity that does not make any attempt to meet the specified performance of a requirement has a 'severe' violation severity level and an entity that tries to comply with a requirement and comes very close to being fully compliant has a 'lower' violation severity The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The format of the VSL Section has been revised, as well as D2.4.3.			
LCRA		☑	See #4.
Response: The SPT SDT revised the requirements based on industry comments.			

Question #8			
Commenter	**Yes**	**No**	**Comment**
NYISO		☑	The risk factor should be LOW for R2. There is no risk to reliability if the mismatch does not result in reliability impacts in real-time operation. Real time reliability standards are addressed in other documents. If there are tasks that fall below expectations that do not effect system reliability as measured by NERC standards, then their impact on reliability is low.
Response: The VSLs are used to identify 'how badly' an entity missed complying with a requirement. An entity that does not make any attempt to meet the specified performance of a requirement has a 'severe' violation severity level and an entity that tries to comply with a requirement and comes very close to being fully compliant has a 'lower' violation severity. Violation Risk Factors (VRFs) are used to assess the impact to reliability of violating a requirement. The SPT SDT believes that the VRFs for this standard are consistent with the VRF definitions. The BES company-specific reliability-related task list that must be developed in Requirement 1 is for all reliability-related tasks so it does not include BES tasks that are not reliability-related.			
OVEC		☑	Generally, the whole violation severity level section is far too cumbersome and verbose to understand and implement. Specifically, for Section 2.1.3 what if the entity did not find it necessary to add or remove any topics from the list? Why is that a violation? The section seems to indicate that the list has to have items constantly removed or added to have no violation occur. For section 2.2.2 what is meant by the addition of the word "capability?" For section 2.2.3, if the 32 hours of training is not included in Attachment B then either Attachment B needs revised or deleted or the continuing education hours program also used to identify emergency operations courses needs revised. Suggest remove 2.2.3 entirely or remove the words, "or sytem restoration", and "but did not include training in subject areas listed in Attachment B." Section 2.3, the bulleted items seem to read as requirements rather than as measures. Section 2.3.2.1, again, what is meant by the addtion of the word "capability?" Section 2.3.3.1, this section reads as a requirement rather than as a measure.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. Requirement 3 has been revised and the language for adding and removing topics has been deleted. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.			
PHI		☑	PHI feels the wording of the Violation Severity Levels is confusing. Lower does not seem reasonable - If an entity has reviewed the list, agrees with it completely and has nothing to add, they would appear to be in violation. Similarly Moderate seems to be saying that if an entity has started creating a list of all reliability related tasks but hasn't finished it, has identified training but hasn't scheduled it or has given so called EOP training but not from topics on Attachment B and done nothing else--they warrant a Moderate violation. But, if they have done almost everything but not quite met the requirement, they

Question #8			
Commenter	**Yes**	**No**	**Comment**
			warrant a High violation. We are sure this is not the way these are meant to be understood. Perhaps starting with the Severe Violations and working down to moderate would be a better way to delineate what a moderate and lower violation would look like.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. Requirement 3 has been revised and the language for adding and removing topics has been deleted. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.			
SMUD	☑		2.2.2 What tasks should be reviewed? Every task associated with each operating position or BES company specific reliability issues? 2.2.3 Regarding attachment "B" – Does this require all tasks listed or only selected topics? 2.3.2 Should this be limited to BES company specific reliability tasks. 2.1.3 Should read "The responsible entity did not add or remove topics from the Emergency Operations Topics as provided in attachment "B" that apply to their organization." Severity levels may be too excessive.
Response: In response to your comments on 2.2.2 and 2.3.2, the SPTSDT combined R1 and R2 to clarify the requirement. The SPT SDT deleted the VSLs this requirement. The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. Requirement 3 has been revised and the language for adding and removing topics has been deleted. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.			
APS		☑	Based on your definitions, the problem descriptions written for each of the four severity levels will ALL constitute "Severe" violations. For example, Item 2.1.3 lists topics from the EO list that were not added/removed when applicable, which constitutes a failure of the Analysis process and a failure of the Evaluation process too, because you didn't detect the problem and fix it. Since two phases of SAT were not done, this condition automatically meets the definition of 2.4 as "Severe". The same with item 2.2.1 and 2.3.1. This area needs work.

Question #8			
Commenter	**Yes**	**No**	**Comment**
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The SPT SDT removed Attachment A and revised the VSLs for Requirement 1.			
Santee Cooper		☑	The standard should not dictate how a training program should be implemented as implied by 2.3.1. Severe Level for the 32 hours of EOPs would be that no training was provided to any of the operators, High would be that some training was provided but not all 32 hours or several operators did not complete all 32 hours. Moderate would be that 32 hours were provided but one operator did not complete or the training did not include drills, exercises, or simulations. If one operator does not complete 32 hours of EOPs training as written in 2.3.3, it should be a Moderate Violation Severity Level rather than a High Violation Severity Level. The violation severity levels associated with the other requirements aren't appropriately graduated either.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The SPT SDT modified the VSLs for Requirement 3 such that they are based on the percentage of System Operators that completed 32 hours of emergency operations training.			
Avista		☑	Disagree based on SAT requirement.
Response: In FERC Order 693 "the Commission (FERC) directs that NERC submit a modification to PER-002-0 that uses the SAT methodology in its development of new training programs" . Requirement 1 identifies the phases of an SAT process that must be included in the development of the training. The SPT SDT revised the VSLs for Requirement 1.			
Entergy (1)		☑	VSL 2.2.1 contains the statement that if the entity violates R1.1, the entity is also in violation of R1. We believe this is being penalized twice for the same infraction and should be deleted. Item 2.2.3 states "but did not include training in the subject areas listed in Attachment B". The Requirement R3.1 is that Attachment B is modified by the BA, TOP or RC. Therefore, this VSL should be changed to "... listed in R3.1.1". Due to the formating of the VSL documentation it is difficult to be sure what are the intended VSLs of section 2.3.1, 2.3.2, 2.3.3, and 2.4.1.1. For instance, VSL is High in 2.3.2 for not performing an assessment. Is the VSL also High for section 2.3.2.1 which

Question #8			
Commenter	**Yes**	**No**	**Comment**
			states the "entity has not identified training required"? Or, is 2.3.2.1 instead of 2.3.2? Again, the Severe VSL identified for 2.4.1 has three parts identified as "OR". However, there is an additional reference 2.4.1.1 which is part of 2.4.1. Should there be an "AND", or an "OR" infront of 2.4.1.1? We suggest VSLs for the 32 hour training in R3, and the VSLs for R4 are OK. We also suggest the VSL criteria be redistributed for each of the Requirements R1 and R2. We think 2.4.2, R2, an entity who has "not performed an assessment which includes … to each task …" should have a much lower VSL applied to it than an entity that does " not have a SAT program" at all. Both of these criteria are considered Severe in the draft standard. Starting with Severe, we agree Severe should be assigned to having NO SAT program, 2.4.1 for R1, and the criteria that the entity has not performed an assessment of operator capabilities, 2.4.4 for R4. These are the only two actions that rise to the level of Severe. We suggest all the criteria for R1 and R2 be moved down one level, from Severe to High, from High to Moderate, and Moderate to Lower, except the criteria as noted above.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. Requirement 3 has been revised and the language for adding and removing topics has been deleted. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.			
FirstEnergy		☑	The process for establishing VSLs is presently being vetted through the industry for the 83 FERC approved standards. We believe it is prudent to let that process take its course so that SDTs presently working on revised or new standards can reference the new format in establishing VSLs. The violation severity levels as written are interlaced making it difficult to determine the violation severity level that pertains to each requirement. The violation severity levels should be listed by requirement. In addition the following revisions to the wording are suggested: Item 2.2.2 should be revised to state, "The responsible entity has determined training

Question #8			
Commenter	**Yes**	**No**	**Comment**
			required based on the mis-match between acceptable and actual performance capability but has not included this training in its current schedule." Item 2.2.3 should be revised to state, "The responsible entity annually provided at least 32 hours of training on emergency operations or system restoration but the training did not include the subject areas listed in Attachment B." Item 2.3.3 should be revised to state, "The responsible entity provided to its system operators at least, 32 hours of emergency operations or system restoration training, annually, but not all its System Operators have completed or evidence shows all of its System Operators will not have completed the required annual training." Item 2.4.1 should be revised from, "The responsible entity does not have a SAT program for its system operators" to "The responsible entity has not used the SAT process to develop its training program." Item 2.4.2 states, "The responsible entity has not performed an assessment which includes identification of measurable or observable criteria for desired performance to each task for the determination of the training needs for two of its system operating position." Looking past the fact that there is no requirement to identify measurable and observable criteria for desired performance, the severity level as written appears to state that I cannot get a severe violation severity raking if I only have one operator position. This should be revised to state, "… training needs for all of its system operating positions." Item 2.4.3 paragraph 2 should be revised to state, "The responsible entity has provided 32 hours of emergency operations and system restoration training but the training has not been provided annually."
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The VSLs for each requirement are presented in a table format. Requirement 3 has been revised and the VSLs for this requirement.			
Quality Training Systems	☑		See detailed comments below relating to Violation Level 2.2.1 requiring use of the Generic Task List provided as an attchment to the Standard.
Response: The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing their task list,			

Question #8			
Commenter	**Yes**	**No**	**Comment**
as described in R1. The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
TAL		☑	No VSL should be high or severe for a requirement that is not a real time requirement. D2.4.1.1 - What if the entity reviewed Attachemnt A and did not identify anything else that was performed? What if they did identify several other items, but missed only one. These should not be violations. If the entity made a good faith effort, it should be compliant. The selection of a task from the list, or adding it to the list, is subjective for the entity. As such, how can a compliance team come in and apply another subjective criteria to the list? D2.4.3 - Grammatically incorect. Second paragraph should end " training has not BEEN provided annually."
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing their task list, as described in R1. The SPT SDT revised the VSLs for Requirement 3.			
Madison G&E		☑	a) In 2.1.3, under VSL, it is possible that the list of Emergency Operations Topics exactly fits an entity, and such entity should not be penalized for that. In 2.2.3, this implies that ALL of the subject areas must be met annually. If this is not the intent, it should be clarified. If this is the intent, this appears to be too demanding for each operator to meet all 42 subject areas in 32 hours. b) VSL's need to be vetted through the electric industry or drop them all together. Since a training violation does happen during realtime, the VSL should be low.
Response: a) The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. Requirement 3 has been revised and the language for adding and removing topics has been deleted. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference document for this standard. VSLs are currently being vetted through the stakeholder process. They were published in the ERO Sanctions Guidelines. The industry is being asked to provide feedback through the request for comments on the standards. The VSLs are used to identify 'how badly' an entity missed complying with a requirement. An entity that does not make any attempt to meet the specified performance of a requirement has a 'severe' violation severity level and an entity that tries to comply with a			

Question #8			
Commenter	**Yes**	**No**	**Comment**
requirement and comes very close to being fully compliant has a 'lower' violation severity level. Violation Risk Factors (VRFs) are used to assess the impact to reliability of violating a requirement.			
Entergy (2)		☑	In general, the VSLs are extremely complex and take up more of the standard than the actual requirements, measures and compliance sections. Condense and simplify.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
ERCOT		☑	This part of the standard is not clean and simple. Plus, it's an administrative standard and should not carry moderate to high violation levels. Also, lack of documentation should be a low violation. High and Severe violations should be reserved for entities who do not have training programs, or their programs are not maintained with adequate staff.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
Southern		☑	Under Violation Severity Levels, it is not obviously apparent that missing two of the five phases of a SAT should have the same severity as not having a SAT program at all. There should be some differences in violation severity between the two.
Response: The SPT SDT agrees with your statement and has revised the VSLs for Requirement 1.			
Allegheny Power			
AEP		☑	2.2.1 - Renumbering of R1.1 and making it R2, thus separating the reliability task identification requirement from the SAT requirement, would be an improvement, and would allow two different violation security levels. 2.3.1 & 2.4.1 - Violation of SAT should be "lower", not "high" or "severe". An entity may produce adequate training with proper performance results without using SAT. Many entities produce qualified operators today without SAT. SAT (ADDIE) should be a guide attached to the standard or as a reference document, but should not be the standard. The violation should be on "not performing training for identified tasks", rather than how you created the training. If training produces the desired results, how you did it should not be the measure, but rather, the measure should be satisfactory operator performance capability to perform. 2.3.1.1 - the "Note" refers to R1.2, but there is no R1.2.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related			

Question #8			
Commenter	**Yes**	**No**	**Comment**
tasks. Each applicable Entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The SPT SDT revised requirement 1 such that entities must use a Systematic Approach to Training and not necessarily a specific. The revised Requirement 1 identies the key components that must be included in any systematic approach to developing training. The VSLs are used to identify 'how badly' an entity missed complying with a requirement. An entity that does not make any attempt to meet the specified performance of a requirement has a 'severe' violation severity level and an entity that tries to comply with a requirement and comes very close to being fully compliant has a 'lower' violation severity The SPT SDT has revised the VSLs for all of the requirements.			
ATC		☑	ATC does not agree with the assignment of High (Violation Severity Level) for a failure to use one of the five phases of a SAT. In practice if an entity does not use one of the five phases of a SAT in one training program then it will be assessed a high violation severity level. ATC believe that this designation is too great for the violation. NERC needs to look at the number of training programs and to the extent of the failure. Did every training program fail to include one of the five phases or was this only in a small minority of the programs. We would ask that the SDT develop more reasonable violations severity levels for this standard.
Response: The SPT SDT agrees with your statement. The SPT SDT revised the VSLs for Requirement 1 such that each VSL specifically identifies the components of an SAT process. Requirement 1 includes all training programs that addresses the entity's reliabilty-related task list. Each entity determines the number of training programs that it uses to provide training to their system operators.			
BCTC		☑	The way the Violation Severity Levels are written are too complicated to follow and many are open to interpretation. As an example the words for the High level say in part "…..is missing one or more significant elements". what does the word significant mean to the person who is reading this……significant to whom, the audit team; too vague? We do not agree with any of the words written for the severity levels; the standard and requirements are short on words and severity levels have explicit severity levels that are not detailed in the requirements. We again want to say that this will be a huge onerous task to place on any entity based on the implementation plan and we cannot support it.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
CAISO		☑	The Compliance elements of this standard should be postponed until the requirements

Question #8			
Commenter	**Yes**	**No**	**Comment**
			are agreed to. We note that a SEVERE VSL is applied for missing evidence of using two phases of the SAT; as well as applying a SEVERE VSL for not having a program at all. This would result in an organization that inadvertently is missing evidence being held to the same VSL level as an organization that consciously has no program at all.
Response: The SPT SDT revised the requirements and the VSLs and is seeking industry feedback. The Drafting Team Guidelines describe the process the team uses to develop the standard, which includes developing requriements and VSLs at the same time and then posting the standard for industry feedback. The SPT SDT agrees with your statement about the R1's VSLs and has revised them based on the revised requirement.			
CenterPoint			
NIPSCO	☑		
NPCC RCS		☑	Requiring a training program subject to following 5 Systematic Approach to Training (SAT) principles seems overly perscriptive and why would it be a severe violation severity level not to follow these or subset thereof. NPCC Participating members can accept 5 training principles but the entire SAT seems unnecessary. If NERC intends to adopt the SAT, in its entirety, it needs to clarify and educate the industry before incorporating it into a standard.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The SPT SDT has prepared a reference document that provides several SAT resources. The Implementation Plan uses a phased-in approach to allow sufficient time to aquire training on using a systematic approach to developing training.			
PG&E (1)			
PG&E (2)		☑	The violation severity levels are to complicated. The violation severity levels are extremely defined in comparison the requirements. To comply with the violation severity levels would be a huge onerous task on any entity based on the implementation plan.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The Implementation Plan allows sufficient time (3 years+) to become compliant with the standard.			
PJM		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to.

Question #8			
Commenter	**Yes**	**No**	**Comment**
			PJM would note that a SEVERE VSL is applied for missing evidence of using two phases of the SAT; as well as applying a SEVERE VSL for not having a program at all. This would result in an organization that inadvertently is missing evidence is held to the same VSL level as an organization that consciously has no program at all.
Response: The SPT SDT revised the requirements and the VSLs and is seeking industry feedback. The Drafting Team Guidelines describe the process the team uses to develop the standard, which includes developing requriements and VSLs at the same time and then posting the standard for industry feedback. The SPT SDT agrees with your statement about R1's VSLs and has revised them based on the revised requirement.			
SRP		☑	The severity levels are too extreme. Section 2.3.1 states a HIGH severity for missing one out of five phases of the SAT process. An entity that is using four of the five, which is an 80% use rate, should not be penalized with a HIGH severity violation. The severity for this ocurrence should be reduced to at least a MODERATE. Section Section 2.4.1 states a SEVERE severity for missing two out of five phases of the SAT process. An entity that is using three of the five which is an 60% use rate should not be penalized with a SEVERE severity violation. The severity for this ocurrence should be reduced to a HIGH severity. The SEVERE severity should be used for missing three of the five SAT phases. In summary: Moderate Severity: Missing one of the five SAT phases. High Severity: Missing two of the five SAT phases. Severe Severity: Missing three of the five SAT phases.
Response: The SPT SDT agrees with your statement about R1's VSLs and has revised them based on the revised requirement.			
SDG&E		☑	The requirement for emergency training is in multiple standards (e.g. PER-002-0 R4. This then leads to the potential for multiple violations for the same deficiency. This training requirement should only be in one standard.
Response: Upon regulatory approval, PER-005 replaces PER-002. The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to the Reliability Standards Work Plan 2008-2010 that consolidates all training-related requirements into the PER standards.			

Question #8			
Commenter	**Yes**	**No**	**Comment**
We Energies		☑	Many of the violation severity level statements need to be simplified/clarified (similar to M1). 2.2.3 - R3.1 requires the training be from topics in Attachment B, so there would be no emergency training if the training was not from Attachment B topics. 2.3.3.1 The current wording of R3.1 does not allow training in principles, only drills, exercises, or simulations. See question #11. 2.4.3 The statement after OR is unnecessary. If 32 hours were not provided annually then the first statement applies.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The SPT SDT has moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard and revised R3 and the requriements VSLs.			
Garland		☑	Same answer #7.
Response: The SPT SDT revised the requirements based on industry feedback.			
HQT		☑	Requiring a training program subject to following 5 Systematic Approach to Training (SAT) principles seems overly perscriptive and why would it be a severe violation severity level not to follow these or subset thereof. NPCC Participating members can accept 5 training principles but the entire SAT seems unnecessary. If NERC intends to adopt the SAT, in its entirety, it needs to clarify and educate the industry before incorporating it into a standard.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The SPT SDT has prepared a reference document that provides several SAT resources. The Implementation Plan uses a phased-in approach to allow sufficient time to aquire training on using a systematic approach to developing training.			
IESO		☑	(1) 2.1.3 See our comment under Q6 that is related to this violation severity level. (2) We are unable to offer comments on the VSLs associated with not following or missing any steps in the SAT program. We not do see adopting and following a SAT approach to develop a training program should be a requirement. Please see our

Question #8			
Commenter	**Yes**	**No**	**Comment**
			comments under Q11.
Response: (1) and (2) In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable Entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The standard is addressing reliability-related tasks performed by the three applicable entities. The SPT SDT has revised the requirements and the associated measures. The SPT SDT revised R3 such that the subrequirements were eliminated.			
ISO New England		☑	Requiring a training program subject to following 5 Systematic Approach to Training (SAT) principles seems overly perscriptive and why would it be a severe violation severity level not to follow these or subset thereof. ISO-NE can accept 5 training principles but to require only SAT seems unnecessary. This goes against the principle pf telling the industry WHAT to do, not HOW to do it.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement.			
Manitoba Hydro		☑	The Violation Security Levels are too complex to follow.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
MISO Stakeholders		☑	In general, we do not support the application of any violation severity levels because the VSL guideline has not been vetted through the industry. We do have the following specific issues and concerns as well. 1. The VSLs try to cover so many scenarios that they are confusing. We had enough trouble understanding them that we are concerned we have not identified every specific issue with them. 2. In the Moderate Violation Severity Level, section 2.2.2 creates a de-facto requirement on the training schedule because the training based on the mis-match in performance is required to be in the current schedule. What if a responible entity's schedule is updated every quarter and only goes out 3-6 months? They could still train on this in months 7-

Question #8			
Commenter	**Yes**	**No**	**Comment**
			12 but this compliance element would find them in violation because it was not in their "current schedule". 3. We do not agree that a lack of documentation should be considered a high violation as described in section 2.3.1 of the High VSL. Lack of documentation should be a lower violation. 4. Sections 2.3.1.1, 2.4.1.1 and 2.2.1 duplicate one another but are in different VSL.
Response: The VSLs for this standard are being vetted through the industry through the standard development process. 1. The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. 2. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their task list at least annually and then develop the necessary training to address the updated or new tasks. 3. The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. 4. The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
MRO		☑	Too complex. Don't need to list five phases again and again.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The SPT SDT agrees with your statement and has revised the VSLs for Requirement 1.			
SPP ORWG		☑	The proposed severity levels are too complicated and need to be simplified.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement.			
WECC OTS		☑	WECC OTS feels the violation severity levels are to complicated. The violation severity levels are extremely defined in comparison the requirements. To comply with the violation severity levels would be a huge onerous task on any entity based on the implementation plan.
Response: The SPT SDT has considered industry feedback and the definitions for each of the VSL levels and has revised the VSLs for each requirement. The Implementation Plan uses a phased-in approach to allow sufficient time to become compliant with the standard.			

9. Do you agree with the Implementation Plan that phases in compliance with the Requirements over a three year period? If not, please explain in the comment area.

Summary Consideration:

Some commenters did not support the Implementation Plan. Some commenters suggested the implementation plan should be shortened, while others suggested it should be lengthened. The SPT SDT considered stakeholder comments on Version 1 and Version 2 of the standard and believes the Implementation Plan posted with the second draft of the standard reflected stakeholder consensus. However, the SPT SDT revised the Implementation Plan to allow additional time for entities to comply with the revised Requirement R3 which now requires that emergency operations training include the use of a simulator.

The revised implementation plan includes the following proposed effective dates:

> Requirement R1, Requirement R2, and Requirement R3 shall become effective 36 months after the first day of the first quarter following applicable regulatory approval or, in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes become effective 36 months after the first day of the first quarter after Board of Trustee adoption.

Question #9			
Commenter	**Yes**	**No**	**Comment**
Ameren	☑		
Florida Power & Light	☑		
FRCC	☑		
LCRA		☑	If I started on this today, it would take me longer than that to create all these new requirements. In order to meet this requirement, I would have to drop all other responsibilities.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
NYISO		☑	R3 is in effect now under PER-004. There is no need for a phase in. On the other hand R3 has no place in a systematic approach to training and should be deleted. If, and only if, R1, R2, R4, Appendix A and Appendix B are rewritten along the lines suggested in this comment form, the effective dates would be viable.
Response: The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			

Question #9			
Commenter	**Yes**	**No**	**Comment**
NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours. The SPT SDT revised the requirements, deleted Attachment A, and moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.			
OVEC		☑	The implementation plan should be simplified to allow for clearer understanding and easier tracking. Suggest that R3 become effective immediately upon regulatory approval since the 32 hours of annual emergency operations training is currently required in PER-002, R4. Suggest that R2 become effective January 1 in the first year following regulatory approval because an effective date that would allow for less than a full calendar year of implementation does not give an entity time to thoroughly assess annually the training needs of each System Operator position. Suggest that R1 and R4 become effective January 1 the second year following regulatory approval. The suggested times balance the timely implementation of the standard to maintain and enhance reliability, while allowing entities ample time to achieve compliance with the requirements, and is a simpler and more straight forward implementation plan that is easier to understand and track.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
PHI	☑		
SMUD	☑		
APS		☑	See Item 4 above.
Response: The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their task list at least annually and then develop the necessary training to address the updated or new tasks. Section 5.2 has been removed from the revised standard.			
Santee Cooper	☑		
Avista	☑		
Entergy (1)		☑	R3, 32 hours of training, may be effective the first day of the first quarter but compliance with that requirement will take up 10 weeks to train all the system operators due to shift rotations and training schedules. Please make this change for compliance. The timing for implementation of the other requirements seems out of order. First the

Question #9			
Commenter	**Yes**	**No**	**Comment**
			SAT needs to be performed, R1. Then, the capabilities of the operators need to be verified R4 before a mis-match can be performed R2, from which training needs are identified and implemented. We suggest it will take 18 months to complete R1, followed by 18 months to complete R4, and finally a third 18 months to complete R2.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
FirstEnergy		☑	
Quality Training Systems	☑		
TAL	☑		
Madison G&E		☑	a) Entities have established training programs per Regulatory Approved Standards. Proposed Effective Date, 5.1 is the only parlell, carry over requirement from a Regulatory Approved Standard (PER-002-0, R4) to this proposed standard. This time frame is workable. b) Proposed Effective Date, 5.2 is unclear (see comments of 2.a, above), so an effective date can not be proposed yet. c) Proposed Effective Date, 5.3 for the proposed SAR contains over 370 tasks for operators and the time line is too aggressive. Registered Entities will need to be trained in the Systematic Approach to Training process, set up their own processes, convert established training to the SAT process, create new training and start to give training to System Operators. Budgets will need to be forecasted, personnel will need to be tasked with the training process (most companies have a small training department), this will take an extream amount of time and cost are unknown at this time.
Response: The SPTSDT combined R1 and R2 to clarify the requirement, therefore Section 5.2 has been deleted. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
Entergy (2)		☑	PER-005-1 Proposed effective dates: R1 & R2 should be implemented simultaneously, since R2.2 cannot be performed until R1.1 is completed. However, 36 months to have a

Question #9			
Commenter	**Yes**	**No**	**Comment**
			training program implemented is reasonable.
Response: The SPTSDT combined R1 and R2 to clarify the requirement, therefore Section 5.2 has been deleted.			
ERCOT		☑	R1, R2 & R4's timeline should have an additional time, at least another year, added to allow for budget cycles, hiring & traininig trainers. Additional personel will be required in many cases and these positions will need to be budgeted before they can be filled. Once filled, then the work to develop a training program begins. Depending on the approval date, a company's budget cycle may be well underway and beyond the point of change and thus delay their ability to succeed within the current timelines.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
Southern	☑		
Allegheny Power		☑	The implementation schedule is too aggressive with regards to Requirement 2. Requirements 1 and 4 should be implemented completely before Requirement 2. A more reasonable implementation schedule is 18 months for Requirement 1 followed by 18 months for Requirement 4 and then an additional 18 months for Requirement 2.
Response: The SPT SDT combined R1 and R2 to clarify the requirement, therefore Section 5.2 has been deleted. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
AEP		☑	R2 – We agree with the 36 months but recommend the implementation time for R2 be changed from 18 to 36 months as R2.2 is conflicting with R1 implementation time. R2.2 - This part of the standard requires the assessment to include analysis of new or revised tasks for the specific company/entity and job position, which is specified for task identification in requirement R1.1. This is conflicting since the implementation plan time for R2 is 18 months, and the implementation time for R1, to have the task list identified with comparison to the reliability tasks of Attachment A, is 36 months.
Response: The SPTSDT combined R1 and R2 to clarify the requirement, therefore Section 5.2 has been deleted.			
ATC	☑		
BCTC		☑	While we appreciate the time frames for implementation of some requirements at 18 months and 36 months would be helpful to allow implementation of these requirements we do not support the requirements as they are written as they are too onerous and not

Question #9			
Commenter	**Yes**	**No**	**Comment**
			achievable in the time frames without hiring many more staff and applying lots of money to the make it happen. So if we do not agree with the Requirements, we cannot agree to the time phases.
Response: The SPT SDT has revised the requirements.			
CAISO		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to. We do not support this standard as written, and therefore do not agree with the implementation schedule at this time.
Response: The SPT SDT has revised the requirements. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
CenterPoint		☑	CenterPoint Energy agrees with the implementation plan for R3; however, we disagree with the implementation plan for R1, R2, and R4. If PER-005 is modified to align itself with the other NERC training programs that certify system operator competency, we would agree with a three year implementation period.
Response: The implementation Plan reflects a 36 (or 3 year) month implementation. The SPT SDT is not aware of any NERC Training Program and that the NERC CE Program is not linked to a NERC standard, nor does it define system operator competency.			
NIPSCO		☑	Since the training program with not be completed until the end of the three year period, assessments of personnel could not begin until after the completion of this development.
Response: The SPT SDT has revised the requirements, including removing R2. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
NPCC RCS	☑		
PG&E (1)			
PG&E (2)	☑	☑	The implementation plan would be acceptable if NERC can develop the Standard so that they are clear and specific.
Response: The SPT SDT has revised the requirements. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			

Question #9			
Commenter	**Yes**	**No**	**Comment**
PJM		☑	The Compliance elements of this standard should be postponed until the requirements are agreed to. PJM does not support this standard as written, and therefore cannot agree to any implementation schedule at this time.
Response: The SPT SDT has revised the requirements. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
SRP	☑		
SDG&E		☑	The implementation for R3 should allow an organization time to put any new training requirement into its regular training plan. Put that it needs to be included in the next years annual training program.
Response: The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
We Energies		☑	Implementation of R2.2 at the 18 month point requires that R1.1 (implemented in 36 months) be completed first.
Response: The SPTSDT combined R1 and R2 to clarify the requirement, therefore Section 5.2 has been deleted.			
Garland		☑	It is an unreal expectation that a small utility will have the resources to comply with the requirements stated in R2 and R4.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
HQT	☑		
IESO		☑	We have a major difficulty with the standard as written. We are therefore unable to agree on the implementation plan.
Response: The SPT SDT has revised the requirements. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
ISO New England	☑		
Manitoba Hydro	☑	☑	I think the plan is okay but if it has a medium risk factor then is that being understated and should we not be starting immediately.

Question #9			
Commenter	**Yes**	**No**	**Comment**
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
MISO Stakeholders		☑	If the standard were simplified, it could be phased in more quickly.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
MRO	☑	☑	If there is really a MEDIUM risk to the system perhaps the implementation plan should be accelerated. On the other hand, the implementation schedule may be overly aggressive if significant modifications to the Job Tasks are required.
Response: The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
SPP ORWG		☑	Requirement 1 should be effective 18 months after the first day of the first quarter following regulatory approval and Requirements 2 and 4 should be effective 36 months after the first day of the first quarter following regulatory approval.
Response: The SPT SDT combined R1 and R2 to clarify the requirement, therefore 5.2 has been deleted. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			
WECC OTS	☑	☑	The WECC OTS questions the implementation plan, when they do not agree with the current requirements. However, the implementation plan would be acceptable if NERC can develop the Standard so that they are clear and specific.
Response: The SPT SDT has revised the requirements. The SPT SDT has considered stakeholder comments on draft version 1 and Version 2 of the standard and believes the existing Implementation Plan for R1 and R2, as captured in Section 5 of the standard, reflects stakeholder consensus. The SPT SDT modified the effective date for R3 to allow entities time to comply with the requirement to use simulators in the emergency operations training, per FERC Order 693.			

10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement, or agreement? If not, please explain in the comment area.

Summary Consideration:

Several commenters identify conflict between the proposed standard and labor contracts due to lack of objectivity in the standard. The SPT SDT revised the requirements and the measures such that are objective, clear, and measureable. The SPT SDT cannot address labor union contract issues.

FirstEnergy			FERC 693 (par. 1359) directive to include the Generator Operator has not been addressed by this standard.
Response: NERC Work Plan Project 2010-01, Support Personnel Training, is intended to determine the training needs of generator operators and operations and support staff with a direct impact on reliable operations of the bulk power system. A high-level description of the project can be found in the NERC Reliaibity Standards Development Plan: 2008-2010 (ftp://www.nerc.com/pub/sys/all_updl/standards/sar/FERC_Filing_Volumes_I_II_III_Reliability_Standards_Development_Plan_2008_2010.pdf).			
Quality Training Systems			No comment.

Question #10			
Commenter	**Yes**	**No**	**Comment**
TAL		☑	
Madison G&E	☑		a) In NERC's Reliability Standards Development Plan dated Nov 30, 2006 (pg 3 of 21), (pertaining to FERC Order 672) states "the Commission states that a proposed reliability standard must be designed to achieve a specific reliability goal and be clear and unambiguous regarding what is required and WHO is required to comply". The STD will need to rewrite Applicability 4.2, (use of the words "and their delegates") do to the ambiguous personnel requiring training other than certified system operators. b) R4.2 states the standard applies to System Operator positions listed under R4.1 and "their delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric Systyem". In NERC's Personnel Certification and Governance Committee (PCGC) Charter (approved May 2, 2007), Section 2, 1.a. includes that the PCGC sets the "requirements for personnel certification, maintaining certification, and recertification". The PER-005-1 SDT does not have the authority to require non NERC Certified personnel to be trained under a NERC Standard. The PCGC establishes who must be NERC Certified.
Response: a) The SPT SDT removed Section 4.2 from the revised standard. b) The SPT SDT disagrees with your statement. The approved SAR for this standard established the scope of this standard, not the PCGC.			
Entergy (2)		☑

Commenter	**Yes**	**No**	**Comment**
Manitoba Hydro	☑		There may be issues with some unions and its agreements.
Response: The SPT SDT has revised the requirements and the measures such that they are objective, clear, and measureable. The SPT SDT cannot address performance reviews or labor union contract issues.			
MISO Stakeholders		☑	
MRO			(It seems the last sentence of this question is incorrectly phrased. Shouldn't "not" be replaced with "yes"?) There may be issues with existing union agreements.
Response: The SPT SDT has revised the requirements and the measures such that they are objective, clear, and measureable. The SPT SDT cannot address performance reviews or labor union contract issues.			
SPP ORWG	☑		Has the SDT taken into consideration dealing with bargaining units when conducting the assessments on individual System Operators. In some bargaining units, individual performance assessments have been eliminated.
Response: The SPT SDT has revised the requirements and the measures such that they are objective, clear, and measureable. The SPT SDT cannot address performance reviews or labor union contract issues.			
WECC OTS		☑	

11. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Question #11	
Commenter	**Comment**
Ameren	No comment.
Florida Power & Light	Overall,I am in support of the development of a training standard to ensure personnel responsible for the real time operation of the BES to meet minimum knowledge and competency levels. However, I would recommend that any training requirements noted in NERC Standards should be identified only in the System Personnel Training Standard. This standard should apply to System Operating Positions only - not by individual system operators.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to the Reliability Standards Work Plan 2008-2010 that consolidates all training-related requirements into the PER standards. The standard is consistent with the approved SAR, applicable to System Operators, not System Operating positions.	
FRCC	Overall, FRCC is supportive of the development of a training standard to ensure personnel responsible for the real time operation of the BES to meet minimum knowledge and competency levels. However, the FRCC recommends that any training requirements noted in NERC Standards should be identified only in the System Personnel Training Standard. How is a "new" employee handled? If I hire an operator and he gets NERC Certified in November (or later) I feel I should not have to complete all 32 hours of emergency training. This standard should be by position only - not by system operators.
Response: The SPT SDT has and will continue to work collaboratively with the System Restoration and Blackstart SDT to eliminate any duplication of training requirements in the two standards. The SPT SDT will suggest that NERC consider adding a new standard project to the Reliability Standards Work Plan 2008-2010 that consolidates all training-related requirements into the PER standards. The SPT SDT revised the condition for Requirement 3 from annually to every 12 months to allow for the situation of new hires late in the calendar year.	
LCRA	To recap, the creaters of this standard have done a good job. My problem is not so much with the standard itself, as it is with the completely unreal expectation that the resources, money, and time exist to do all of this.

Question #11	
Commenter	**Comment**
	Some further points: R.2- How are we supposed to accomplish this? Test each operator on each task anually? I spent 9 years in nuclear power operations and I did not get tested on each critical task the entire nine years. I was responsible for all critical tasks, but annually I was tested on a few randomly selected ones. That is a much better way to manage such a program. From the generic task list for Transmission: #5: Not performed by Transmission System Operators, this is done by support staff #18: Not performed by Transmission System Operators in ERCOT #27: Not performed by Transmission System Operators #45: Not performed by Transmission System Operators in ERCOT, this is done by support staff #61: What if your utility has no HVDC? #67: In ERCOT, Transmission System Operators do not redispatch generation. This function is performed solely by the QSE. The only case where this would not hold true would be a blackstart. #70, #71, #72, #73, #79, #81: Since ERCOT is a deregulated market none of these functions are performed by Transmission System Operators at LCRA. The standard mentions that a given organization is responsible for these generic tasks as well as any other self-identified ones. Use your common sense, if you give people the option of adding to their work load by adding elements to the list, basic human nature will lead people to not do so. Why would they want to create work for themselves when this standard would already be making their jobs incredibly burdensome? Conversely, if entities are allowed to drop some of the generic items off the list what you will see is individual utilities paring this last down to something manageable. What we have here is a proposal to implement a standard without, in my opinion anyways, a thorough assessment of its impact. The basic idea is sound-a mandate for a systematic approach to training. The devil is in the details. I believe there is no concept of the time and resources that exist in this industry on the part of those who created this standard. You can mandate it, but it does not meant that those of us in the positions of responsibility will get the money/resources it would take to implement such a massive undertaking. The smaller utilities would need real help in making this happen. If NERC is bent on pushing this standard through then it should step up to the plate with regional training, templates, standardized forms, etc-all the things that will be needed to make this happen. This new standard would amount to an unfunded mandate making compliance a very difficult proposition for those of us at the end of the pointy stick. In fact, I would personally consider moving into some other area out of training in order to not be liable.

Question #11	
Commenter	**Comment**
Response: The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2). to clearly state that thecapability assessment is verified for each System Operator. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.	
NYISO	Requirement R1.2 should be deleted in its entirety. It mandates through "shall" that "all" the tasks in Attachment A be included in the company specific task list. Attachment A includes meaningless, redundant and poorly worded task definitions. If NERC wishes to create a separate document to aid entities in developing a company-list, that would be OK. But Attachment A, as written, is worthless and misleading definitions of tasks. The Attachment A has no place in a standards document unless each and every item on those lists is mandatory. Both Attachments A should be deleted or completely reworded. As written, it will never stand up in court as valid task definitions. Here are examples of poorly worded tasks from the NERC Generic Task Lists: Emergency Operations, which I will be mandated to include in my company specific task list Consider items 1-10 on that list. 1 Request emergency energy upon loss of a resource 2 Respond to capacity deficiency 3 Respond to loss of energy resources within allowable regional or pool timeframe 4 Prepare for a capacity emergency by bringing on all available generation 5 Prepare for a capacity emergency by postponing equipment maintenance 6 Prepare for a capacity emergency by scheduling emergency energy purchases 7 Prepare for a capacity emergency by reducing load 8 Prepare for a capacity emergency by initiating voltage reductions 9 Prepare for a capacity emergency by requesting emergency assistance from other systems

Question #11	
Commenter	**Comment**
	10 Schedule available emergency assistance with as much advance notice as possible given a capacity emergency The true tasks in these items have nothing to do with the causal event. Cutting out the phrase about "capacity emergency" will clarify those task statements 3-10 exceedingly. Cutting out the causal trigger for action, i.e. "Capacity deficiency", the measurable task #2 becomes "Respond to". Please provide an example of how one measures competency for the task "Respond to". In items 4-8, the competency task has nothing to do with the trigger to initiate the task. Dropping "Prepare for a capacity emergency by….", is not a task definition. "Bringing on all generation", "postponing equipment maintenance", "scheduling emergency energy purchases", reducing load, initiating voltage reductions" (which is really a subtask of reducing load), "requesting emergency assistance from other systems", can be executed to resolve any number of issues besides capacity emergencies. The same tasks can apply to (1) preparing for and (2) resolving - all the subsets of SOL and IROLs. How is the task "request emergency energy" in item 1 different from "scheduling emergency energy" in item 6, or "schedule available emergency assistance" in item 10"? Please explain. The same exercise can be applied to items 15-24 on that list. 15 - Manually shed load to alleviate system emergency conditions 16 - Following the activation of automatic load shedding schemes, restore system load as appropriate for current system conditions and in coordination with adjacent systems 17 - Following the activation of automatic load shedding schemes, shed additional load manually if there is insufficient generation to support the connected load 18 - Following the activation of automatic load shedding schemes, monitor system voltage levels to ensure high voltage conditions do not develop 19 - Following the activation of automatic load shedding schemes, monitor system frequency to ensure high frequency conditions do not develop 20 - Following the activation of automatic load shedding schemes, monitor the performance of any automatic load restoration relays 21 - Following the activation of automatic load shedding schemes, resynchronize transmission at

Question #11	
Commenter	**Comment**
	preplanned locations if possible 22 - Following the activation of automatic load shedding schemes, disable automatic under frequency relays if system conditions warrant 23 - Direct distribution providers to shed load when required for system reliability 24 - Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads or to prevent voltage collapse "Following the activation of automatic load shedding schemes" has no place in an outcome oriented, measurable task definition. It makes no difference to the operators' task how the load was shed. Is the manual load shed task in 15 any different from the manual load shed task in 24? Are transmission overloads and voltage collapse in task 24 not included in task 15 "emergency conditions"? Please explain. Does restoring system load task in 16 have any connection to how the load was lost? Is restoring load lost by UFLS, different from restoring load for manual load shed, or load trip, or restoration? Please explain. Do you only monitor voltage levels following a UFLS event? Do I need different tasks to monitor voltage for load pick-up, load drop-off, line switching, line tripping, generation tripping, capacitor switching, reactor switching, phase shifter operations, HVDC operations, and interchange schedule changes? For each of these tasks, will I need a procedure for the auditors to verify? Please explain. Do we only resynchronize transmission at pre-planned locations after UFLS events? Do I need to define different tasks for resynchronize transmission at pre-planned locations after a maintenance separation, during a system restoration, etc.? Please explain Attachment B is severely flawed and redundant The list in Attachment B has no place in a standards document unless each and every item on those lists is mandatory. Attachment B should be deleted or seriously reworded. It will never stand up in court. A1) "Emergency Drills and Responses" will capture: All of section B "Operating Policies relative to Emergency Operations"

Question #11	
Commenter	**Comment**
	D4) responding to imminent voltage collapse D5) SOL: and IROL D6) DC operations during system emergencies All of section B, D4, D5 and D6 should be removed in this standard that addresses a systematic approach. D8 & D9. There is no distinction between "congestion management" and "line loading procedures" Remove D8 as redundant in this standard that addresses a systematic approach. What is the difference between "congestion management" and "line loading procedures"? Please explain. D11: Assuming that "tie line operations" means CPS control state that. If you intend it to mean another form of line loading control, delete it. If you mean these to be different items, please clarify. A5 & D2; There is no distinction between A5 and D2. Remove D2. A5: System protection D2: Special protections systems What are "special protections systems" if not an instance of "system protection"? Please explain. A4 & D3: There is no distinction between A4 and D3. Remove D3 A4: operations during unstudied conditions d3: special operating guides What is if the function of "special operating guides" if not to address "operations during unstudied conditions"? Please explain.
Response: The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference document for this standard.	
OVEC	The statement in Applicability Section 4.2 is too broad. It could be interpreted to include switchmen

Question #11	
Commenter	**Comment**
	performing switching because switchmen can "impact reliability by producing a real-time response form the Bulk Electric System." This interpretation will not achieve industry consensus for the standard. The statement should be revised to repeat requirements R2 and R2.1 of PER-002 which states that "Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in: Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System." This statement has the correct narrow focus, is easily understood, and is currently implemented by the entities. It is confusing in R2 why the word "position" was used rather than the word "person" and why was the word "capability" used at the end of the sentence. As currently worded, it is not clear what R2 is trying to require. The requirement seems to be asking an entity to "determine mismatch between acceptable and actual performance capability for a position." What does that mean? The implementation of that interpretation does not seem feasible for the "capability of a position." It would seem the intent should be to determine the mismatch between acceptable and actual performance for an individual operator which R4 of the standard basically states. Suggest deleting R2, R2.1 and R2.2 and adding specificity to R4 described below. R4 does not indicate how often an entity should verify capabilites of its Sytem Operators. Do entities only need to verifty capability of an Operator one time for each task? What if the task is rarely performed, how often should verification take place? What if the task is performed daily, how often should verification take place? The lack of a specified frequency to verify capability creates a requirement that provides no improvement to the reliability of the Bulk Electric System. In R3 delete "and system restoration training" because this type of training would be considered emergency operations already. Delete R3.1 and Attachment B because the added specificity will not improve the type or scope of emergency training. Delete R3.1.1 because by just having a list will not improve emergency training or improve the reliability of the Bulk Electric System. This proposed standard and several other standards appear to be an overreaction to the August 14 blackout. It seems to fall back to the specious argument that is if something happens, someone must have been responsible for the problem . Why are we unable to place the blame on the system for the problem, even if the system was the problem? There has been no assessment or evaluation of the effectiveness existing training programs required by PER-002, R3 that has been in affect for over two years. Why create a standard to mandate a new

Question #11	
Commenter	**Comment**
	training program when no assessment has been made of the effectiveness of existing training programs? The work to create a new training standard is not a judicious use of resources in order to strengthen the reliability of the bulk electric system. The argument that FERC has mandated SAT-based training programs in its order does not preclude the possibility that the FERC conclusion is wrong and unneccesary. This standard goes beyond requiring a new training program. The standard seems to dictate the material on which operators are to be trained and how they are to be trained. The NERC operator certification program already determines that operators possess the minimal requirements to reliably operate the bulk electric system. Why should a training program duplicate the certification process? Currently there is ample incentive to have operators trained on company-specific tasks. An operator who is not capable of performing company specific task will not remain an operator at that company. Many of the tasks listed in Appendix A do not seem to be reliability related and some would seem to be beyond the scope of a system operator position. For example, Item 18, says "Ensure that transmission contract paths are not exceeded." This item is more of a regulatory or business requirement than a reliability concern. Item 42, "Prepare daily reports and logs generated to meet company and regulatory requirements." This item may be important, but it is not important for reliability. Item 65, "Implement specified procedural actions in the event of a FERC Standards of Conduct violation." How is this item reliability related? Item 9, "Interpret relay targets, during forced outages." This item would be the responsibility of a system protection engineer who would provide guidance to the system operator and would not be the sole responsibility of the system operator. In rebuttal to the "Background Information" provided above, work on this proposed training standard should cease and the standard should not be implemented for the following reasons: 1. Training is currently being provided to NERC Certified System Operators as a part of the NERC conitinuing education requirements for system operators and as also required in PER-002, R3. 2. Emergency Operations training is currently required in PER-002, R4. 3. Entities are currently allowed to determine and develop training based on individual training needs to support operation of the Bulk Electric System. 4. The language of the standard is too prescriptive especially, but not limited to, the inclusion of Attachment A and Attachment B. 5. Entities do not need a common starting point for training because of the extreme operational differences between entities. 6. Entites currently implement successful training programs as required by PER-002, R3. 7. The conclusion and assumption from the August , 2003 blackout investigation that Sytem

Question #11	
Commenter	**Comment**
	Operators were not prepared to react in a manner that preserves the reliability of the interconnection is not correct. The operators were indeed prepared and were reacting to the events before the August, 2003 blackout in a manner to preserve the reliability of the interconnection by using the best data and information available to them. System Operators today are trained to perform tasks assigned to their position.
Response: The SPT SDT removed Section 4.2. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include examples of evidence. The SPT SDT clarified the language in R3, explaining the emergency operations training includes system restoration training. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.	
PHI	No comment.
SMUD	All training requirements per standard should be cross referenced and included in a PER attachment or could even be excluded from the individual standards. On the cover letter, SMUD disagrees that the verification of qualifications for people developing / delivering training should be eliminated. Also, SMUD disagrees on the elimination of the requirement addressing maintenance of the system operator training program. SMUD believes the methodology used to perform the analysis phase of a systematic approach to training (SAT)should be required in the standard not just the phases of the SAT process.
Response: The SPT SDT will suggest that NERC consider adding a new standard project to the Reliability Standards Work Plan 2008-2010 that consolidates all training-related requirements into the PER standards. The qualifications for people developing/delivering training and the maintenance of the training program are outside the scope of the approved SAR. In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its comliance	

Question #11	
Commenter	**Comment**
with each requirement.	
APS	We question the Applicability of this standard to "delegates" referenced in 4.2. Depending on how this requirement is interpreted, the scope of the training project we're undertaking could grow exponentially. The R.1.1 requirement seems to demand that entities use the Generic Task List during their analysis phase. If another commercially available list is currently being used, is it invalidated by this standard? The details provided in R2.1 and R2.2 could be easily included in the verbiage of R2 for simplicity. The details provided in R3.1 and R3.1.1 could be easily included in the verbiage of R3 for simplicity. Draft 2 of PER-005-1 is a big improvement over Draft 1.
Response: The SPT SDT removed Section 4.2. The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update their BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. The SPT SDT revised R3, as suggested.	
Santee Cooper	The System Personnel Training Standard should address training that is required for reliable operation of the BES. It should not dictate how a company must implement its actual training program.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that “uses the Systematic Approach to Training (SAT) methodology in its development of new training programs”. The revised R1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement.	
Avista	No comment.
Entergy (1)	The draft standard extends the requirements to an undefined phrase: "delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric System". We do not understand the meaning, scope or extent of who or what constitutes "delegates" that might fall under this standard. We request this phrase be deleted from this and all similar

Question #11	
Commenter	**Comment**
	standards. We also request the authors not include any other phrases like "delegates" or any other similar attempts to extend job functions of other RC, BA or TOP positions into the definition of System Operator. R1.1 requires the creation of a company specific list of BES reliability-related tasks, the creation of which could be considered part of R1 itself and does not need to be a separate requirement. In addition, an entity will be penalized twice for not developing this list, once for R1.1 and penalized again for violating R1. Therefore, R1.1 should be deleted and considered part of R1, performing the Analysis phase of the SAT process. SHOULD WE SUGGEST R1.1 BE DELETED, OR SHOULD IT BE A SEPARATE REQUIREMENT? LEAVING R1.1 AS IT IS COULD BE CONFUSING. The intent and meaning of the wording "acceptable" and "actual" performance capability used in R2 as they are applied to a System Operator Position is not clear . Please clarify the intent and meaning of R2. A position can have tasks assigned to it with acceptable or defined, performance criteria. A position can not have "actual" performance capability; a person performing that task can have "actual" performance capability. If the intent of R2 is to determine the mis-match between a persons actual performance capability of a task and the acceptable performance criteria for that task then please so state that one part applies to a person and one part to the position. If it is not the intent, then please clarify the meaning of this section. PER-004-2, as revised, contains two requirements: one to maintain staffing 24/7, and the other to place attention on SOLs, IROLs and inter-tie facility limits, and to ensure protocols are in place. There are no measures for these three requirements. Please add measures for these three requirements.
Response: The SPT SDT removed Section 4.2 The SPTSDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised the R4 (now R2) to clearly state that the capability assessment is verified for each System Operator. Your suggested changes to the remaining requirements in the approved PER-004-2 are outside the scope of this effort.	
FirstEnergy	FE has the following additional comments: 1. This standard requires the use of the SAT process, yet it contains no requirement for trainers to be trained in this process. This train-the-trainer requirement is necessary to ensure an effective implementation process throughout the industry. This should be remedied prior to this standard becoming effective.

Question #11	
Commenter	**Comment**
	2. In R3, the phrase "…at least 32 hours annually of emergency operations and system restoration training" is written incorrectly and does not coordinate with its measure, M3. We suggest changes to the phrase in both R3 and M3 to read "…at least 32 hours annually of emergency operations training which includes system restoration training". 3. In R1, the last part of the statement should say "…System Operator positions." and not "…System Operators." This would then be consistent with the rest of the standard. 4. In Attachment A, Items #2 and #4 are duplicative. This should be corrected. 5. It is not clear how R4 would be acceptable from a compliance standpoint. The SDT should add verbiage to clarify this requirement. The measure for this requirement (M4) doesn't add any value. 6. Measures should not add requirements. We believe that M1.2 is dictating more requirements than R1 intends when it states "Design and development of training materials that result in learning objectives and content that is derived from results of training analysis". The SDT should remove this from the measures and re-evaluate the need for this statement in the standard.

Response: 1. The qualifications for people developing/delivering training and the maintenance of the training program are outside the scope of the approved SAR.

2. The SPT SDT has revised R3 to clarify the condition under which the requirement must be performed is every twelve months.

3. The SPT SDT combined R1 and R2 to clarify the requirement. The revised R1 requires each entity to update its BES company-specific reliability-related task list at least annually and then develop the necessary training to address the updated or new tasks. The SPT SDT has revised R4 (now R2) to clearly state that the capability assessment is verified for each System Operator.

4. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.

5. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples.

6. The SPT SDT agrees with your comment and has revised R1 and M1.

Question #11	
Commenter	**Comment**
Quality Training Systems	This comment relates to Requirement R1.1 that each Reliability Coordinator, Balancing Authority and Transmission Owner should use the generic task list in the Attachment to the draft standard as the basis for their own JTA. The task list contains important information and would certainly be useful as a guide for entities starting out on the JTA process, but we do not believe that the list is sufficiently well developed to be a required starting point. Quality Training Systems has developed and refined its generic task list for system operators over several years, making extensive use of NERC source documents and with advisement by Industry Experts. We recognize the difficulty in developing a coherent, well-categorized task list at a consistent level of detail, but we are nonetheless concerned at offering an industry standard that still offers considerable room for improvement. 1. Classification System The categorization scheme is difficult to follow in places as evidenced by the fact that closely similar tasks are listed in different Sections of the task list and - within a given section - under different Types of Activity. Consider, for example, the following tasks relating to voltage control: “Monitor and maintain defined voltage profiles to ensure system reliability.” (Gen CC Ops 31 under Monitor) “Utilize reactive resources from transmission and generator owners to maintain acceptable voltage profiles.” (Gen CC Ops 60 under Operating) “Monitor the voltages, and coordinate the reactive dispatch of transmission facilities, and the interconnections with neighboring systems.” (Trans. Ops 34 under Operating) “Deploy reactive resources to maintain acceptable voltage profiles.” (Trans. Ops 51 under Voltage) “Coordinate operation of voltage control equipment with interconnected utilities.” (Trans. Ops 55 under Voltage) 2. Consistency There is a lack of consistency in the level of detail of the task statements. Some tasks are extremely general, and would be difficult to train in the stated form. For example: "Direct and/or regulate the operation of the transmission system" (Trans 15)

Question #11	
Commenter	**Comment**
	"Enforce operational reliability requirements" (Gen CC Ops 47) Other tasks are very specific and might be considered as steps in a larger task. For example: "Notify all affected areas that line loading relief has been requested, and that corrective actions are required" (Trans. 68) "Manually calculate net interchange when needed" (Int. 17) 3. Repetition Many tasks are repeated with closely similar wording or wording such that the more general statement includes the other more specific task(s). For example, compare :the following two tasks taken from different Sections of the Task list: “Implement system restoration procedures” (Gen. CC Ops 68): “Following a partial or total system shutdown, implement the appropriate provisions and procedures of the system’s restoration plan in a coordinated manner with adjacent systems" (Emer. Ops 50)” 4. Clarity A few of the task statements are unclear or poorly worded. Consider, for example; the following task, the intent of whiich seems to be captured in better-stated items elsewhere in the list: "Direct to the appropriate entities those options necessary to relieve reliability threats and violations in a reliability authority area” (Gen. CC Ops 55)
Response: The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.	
TAL	A4.2 - "producing a real-time response from the Bulk Electric System" is not clear and unambiguous. Turning on a light switch (to power the runway landing lights for the highly trained pilots) produces "a real-time response". R3 - How is a "new" employee handled? If I hire an operator and he gets NERC Certified in November (or later) I feel I should not have to complete all 32 hours of emergency training. Attachment A - The removal or addition of any item(s) is subjective. While I understand it is only a starting point, whose subjectivity will be used when determining compliance to this standard. Many

Question #11	
Commenter	**Comment**
	of these items are poorly worded if they are intended to be a measurable task. I will be paring the list down substantially to remove redundant requirements, and clarify the remaining. Attachment B - Intro paragraph is not entirely true. This list must be modified per R3.1.1 and will then contain the "company specific" topics for Emergency operations. Although training, or the lack of, played a part in the August 14, 2003 blackout, it was not the only thing found to need improvement. This standard places the burden of improvement of operations of the BES on the training system for the system operator. This is unfair to the majority of entities and operators who have adequate training in place and are not afraid to shed load when needed. This has placed the emphasis on proper documentation instead of performance. It will be expensive and turn into a paperwork nightmare to implement and to audit. A Systematic Approach to Training is not required to have a good training program. It IS required to be a CEH provider for NERC Credential Maintenance. But NERC has maintained a very pointed separation of the Training Standard and the CEH program and Credential Maintenance. This standard is trying to apply the CEH provider requirements to ALL entity training programs. It should not be the default system for every entity. Implementation of this standard as written will be a nightmare to implement and audit. It will result in lots of money spent for very little return on investment. It will dilute the effectiveness of many good programs out there and I doubt will force any of the mediocre ones into being good ones.

Response: The SPT SDT removed Section 4.2.

The SPT SDT has revised R3 to clarify that the condition under which the requirement must be performed is every twelve months.

The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.

The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.

In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that “uses the Systematic Approach to Training (SAT) methodology in its development of new training programs”. The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is

Question #11	
Commenter	**Comment**
responsible for its compliance with each requirement.	
Madison G&E	Attachment A: Concerning General Control Center Operations Tasks, #22 (Monitor real-time market prices) should be removed, reliability is not based on economics. #58 (evaluate, test, and/or confirm the accuracy of reliability assessment tools) should be removed, this is not an operator task. Concerning Generation Tasks, #14 (publish next-day market results) it is redundant with #29. #48 (suspend automatic generation control as required) should be removed, it is part of #47. #58 (operate power facilities in compliance with environmental standards) should be removed, it is not a part of reliability. Attachment B: A.6, needs to be split into two topics, 1) Geomagnetic Disturbances on system operations and 2) Weather impacts on system conditions.
Response: The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.	
Entergy (2)	PER-005-1 Applicability 4.2 : is this meaning that an operator performing a function per an approved procedure or under orders from an RC/BA/TO have training and be under a training program as outlined? This may be excessive application of the training standard. One could speculate that each power plant operator could fall under this because they operate a unit with MW and MVAR output, which creates a real time response from the BES. PER-005-1 R3, 3.1, 3.1.1 : the words "and system restoration" should be removed unless the system restoration topics in Attachment B are required. As written, R3 and sub requirements imply that some of the 32 hours must come from system restoration training. If that is correct then state the number of hours. Note that the title of Attachment B contains the term "Emergency Operations Topics" only, even though system restoration topics are covered under Section C. PER-005-1 Attachment A General Control Center Operations Tasks, Item 22: Monitoring of real-time prices for accuracy should

Question #11	
Commenter	**Comment**
	not be listed as a reliability-related task. Reliability and pricing are distinctly different. Is the intent to monitor the impact to reliability that real-time pricing is having? Generation Tasks Item 14: Publishing next-day market results should not be a reliability-related task. PER-004-2 Proposed Effective Dates: the bullets are extremely confusing and refer to requirements that aren't even listed. If approval of these standards deletes a pre-existing requirement immediately, there is no need to even mention it in this section (assuming that these standards are balloted together). Otherwise, list ALL of the requirements in the Requirements section and then the list of when they would no longer be in effect in the effective date section. PER-004-2 Compliance Monitoring Responsibility : Should this be the Compliance Enforcement Authority (as stated in PER-005-1)? PER-004-2 Compliance Monitoring: There is only a need to list the self certification. All requirements in the standards can be subject to monitoring under the other methods (spot check, periodic audit, triggered) and there is no need to list them here.
Response: The SPT SDT removed Section 4.2. The SPT SDT clarified the language in R3, explaining the emergency operations training includes system restoration training. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. Your suggestions to the remaining requirement in the approved PER-004-2 are outide the scope of this effort.	
ERCOT	***VERY IMPORTANT***Implementation of this Standard without a guiding document for a training program similar to what is provided by the Department of Energy or the U.S. Military who routinely apply SAT or Instructional System Design (ISD) processes leave too much open to the inerpretation of auditors. ***VERY IMPORTANT***: 4.2 needs to be re-worded so it is clear that the RC/BA/TO is not responsible for training personnel in other organizations to which it has delegated tasks. After 4.2, "delegates" is not mentioned in conjunction with RC/BA/TO as being responisble to implement this standard.
Response: The SPT SDT prepared a Reference Document for this standard that includes sources of additional information about the SAT process The SPT SDT has removed Section 4.2 from the revised standard.	

Question #11	
Commenter	**Comment**
Southern	No comment.
Allegheny Power	No comment.
AEP	R1 - We believe R1 should not mandate the approach to training, but should only mandate identification of reliability tasks and a training program that has objectives that support the reliability tasks. R1 attempts to eliminate informal and impromptu type training for initial and continuing training. Good, informal training should still be allowed in any training program, as the approach can still be proper and reap proper results, without having extensive documentation of a systematic process. Over the years, there have been many hours of informal training that has reaped satisfactory and above satisfactory results in performance and progression of system operators. Though SAT can be an improvement in some cases, it is not an improvement in all cases. SAT requirements should be a guide given as a reference document, but should not be a requirement and measurement of the standard. R1.1. - Typographical error. Transmission "Owner" should be Transmission "Operator". R3 – We believe requirement R3 should be for “NERC Certified System Operators” and offer those operators hired mid-year or who have hardships causing extended absences that prevent accumulating the required 32 hours, relief from the requirement. We suggest re-wording as follows or in some other fashion to offer relief for special circumstances as mentioned above: ----“Each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each NERC Certified System Operator with at least 32 hours annually of emergency operations and system restoration training. NERC Certified System Operators with only 6-9 months of on-shift operating time due to mid-year hiring or hardships shall be required 16 hours annually of emergency operations and system restoration training. NERC Certified System Operators who have less than 6 months operating time due to mid-year hiring or hardships shall be exempt from the annual emergency operations training requirement.”---- 2.3.3 - Violation Severity Levels – Reword in accordance with the suggested rewording of R3 requirement above to reflect NERC Certified System Operators and reduced hour requirements for special circumstances such as mid-year hiring or hardships. R3.1. – The wording of requirement R3.3 in parenthesis “(provided in Attachment B)” infers all topics of the attachment must be included in the 32 hours annual emergency training, and does not take into account the requirement of R3.1.1. We believe the intent should be “selected topics” from Attachment B. We believe R3.1 should be re-worded as follows: ----“The emergency operations and system restoration training shall include the principles and

Question #11	
Commenter	**Comment**
	procedures needed for recognizing and responding to emergencies, using drills, exercises or simulations of system conditions in subject areas selected from the responsible entity's applicable Emergency Operations Topics listing developed from Attachment B and according to the requirement of R3.1.1."------- 2.2.3 – Violation Severity Levels – Re-word to correspond to R3.1 rewording as follows: -----"The responsible entity provided the minimum 32 hours of training on emergency operations or system restoration, annually for all system operators, but some hours provided included topics not listed in the responsible entity's list required by R3.1.1.----- 2.3.4. – Violation Severity Levels – Reword as follows for clarity of intent: ----"The responsible entity has performed an assessment of its System Operator's Capabilities to perform each identified task that is on its company-specific reliability-related task list, for some but not all of its System Operators.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised R1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement. The SPT SDT corrected the entity in R1.1 from "Transmission Owner" to "Transmission Operator." The SPT SDT revised the condition for R3 from "annually" to "every 12-months." There is no NERC re-certification requirement for emergency training. If the 32 hours meet the requirements of the CE program, the hours can meet both requirements. The SPT SDT revised all of the VSLs based on the revised requirements. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard. The SPT SDT revised R3 such that the sub-requirements were removed.	
ATC	The Standard requires applicable entities to develop a task list using Appendix A as a starting point. The standard allows entities to add and delete from the task list (Appendix A) as they determined necessary. So, would Applicability section (4.2) only apply if a TOP, BA or RC identifies a task and then delegates that task to a System Operator not covered under the Applicability 4.1? In other words, if a RC identifies a task in their list and then states that the task is performed by a non-RC System Operator, that delegate would then have to follow this standard.

Question #11	
Commenter	**Comment**
	If this is the case, who will be audited by the Regional Entities to confirm that the delegated System Operator is complying with the standard? Would the delegated System Operator have to be registered with NERC as a user, owner or operator of the BPS? The topic of delegation of requirements has come up in other standards and it's our position that NERC should develop a solution to the issue instead of looking to the individual SDT to come up with individual solutions. In this case the Applicable Entities are allowed to develop their own list using Appendix A because of this ATC believes that no entities will fall under 4.2 of the Applicability section. ATC request that 4.2 of the Applicability section be deleted from this standard.
Response: The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. The SPT SDT agrees and has removed Section 4.2.	
BCTC	NERC CE and Certification of System Operators as a requirement was a huge step in dealing with issues that came from the Blackout recommendations. Meeting that requirement was also a good step in requiring training for SO's that meets a SAT process. And the continued training for SOs that support Certification went a long way to meet the Blackout recommendations regarding restoration, simulation and situational awareness. NERC would be better served by working with companies and training providers to make NERC Continuing Education fit the SAT and make sure all are comfortable with using it all the time when dealing with CE to maintain Certification. When that is accomplished moving forward on all training requirements starting with a proper JTA and all other training using the complete SAT could be looked at. We believe we are many years away from that.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.	
CAISO	It appears that the intent of this Standard is to standardize and clarify what is and is not appropriate training materials for acceptance into the NERC Continuing Education Program. This is not well understood by the industry. If this is indeed the case, the CAISO supports such an effort. The way the existing draft is being interpreted by the industry, however, is that this will be an additional requirement, over and above (and possibly in conflict with) the NERC Certification maintenance requirements currently contained in the NERC Continuing Education Program.

Question #11	
Commenter	**Comment**
	The CAISO agrees that: - Training is a critical function for our industry. - NERC should mandate training time (i.e. minimum number of Continuing Education hours - limited to predefined critical functions) be required to ensure operators are provided experience with critical tools and procedures necessary to meet NERC's reliability standards. This could be coupled to maintaining NERC Operator certification. That would innocent operators to take the training or risk losing their personal certification, and would incent the organizations to ensure the training or risk not complying with the standard to use only-NERC certified operators. - General in-house training programs must be permitted to be structured to the varied ad hoc needs of the given organizations, their tools and their environment, and not subject to NERC standards. - Critical training be provided by accredited programs, and that NERC may desire to accredit programs used to provide CEH on those critical topics (e.g. Emergency Operations; Blackstart). - the result of a Training standard should be an operator that is prepared to handle that operators system; the result should NOT be the production and storage of paperwork. The CAISO does not agree that: - It is necessary that every organization has its own accredited program. As written, R1 requires that responsible entities complete the five phases of a systematic approach to training (SAT), which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training program. We do not agree that this should be a requirement. The requirement should be for the responsible entity receive training to help system operation personnel to acquire the competency to perform the applicable tasks pertaining to the RC, TOP and BA functions that the entity is responsible for or assigned. The IRC neither endorses nor disapproves the SAT process as a good approach> However, how any training program is arrived at (i.e. what approach it takes) is not important and should not be a standard. If so inclined, NERC itself could offer an SAT-based Training program. How could one make an argument that using other approaches to arrive at a training program that (a) list the tasks and competency level required to perform the task, (b) include the minimum requirements

Question #11	
Commenter	**Comment**
	stipulated in this standard such as the 32 hours emergency training, (c) has provision for a training schedule, review process, etc. is not an acceptable approach? Performance and capability are subjective ideas. Given all of the tests and training, no one can predict how a human will act. To state that the person is 'incapable' is a very strong statement and can only be made on a case-by-case basis - which by definition precludes a NERC standard.
Response: The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of, nor does it require an entity to use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH. The SPT SDT does not agree that the standard should include training time requirements for training on the BES reliailbity-related tasks. NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours. In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The SPT SDT has prepared a Reference Document that provides several SAT resources. The Implementation Plan uses a phased-in approach to allow sufficient time to aquire training on using a systematic approach to developing training.	
CenterPoint	Instead of establishing a new collection of competency measurements that are already defined by the NERC System Operator Certification Program and the NERC Continuing Education Program, PER-005 should align itself with these existing programs. The standard would have a greater benefit to the industry if it established the curriculum for these existing programs. PER-005 could provide the training topics necessary for advanced learning of reliability-related tasks. The NERC Continuing Education Program uses Individual Learning Activity applications to determine if the course meets its criteria. Such review of applications presently includes whether the SAT process was utlilized. This is another reason why PER-005 should form the curriculum to be used in the NERC Continuing Education Program. Then, the Continuing Education Program would review each course application for compliance through the use of the NERC Continuing Education Review Panel.

Question #11	
Commenter	**Comment**
	Per R1.1, specific tasks must be selected from the proposed generic task list (Attachment A) if the task is performed by the entity's system operator positions. The generic task list includes tasks that are NOT reliability-related. For example Item 22 states "monitor real-time market proces for accuracy." The generic task list should be reviewed and edited to include ONLY reliability-related tasks.
Response: The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing their BES company-specific reliability-related task list, as described in R1.	
NIPSCO	We need clarification in A.4.2 as to whom this standard is applicable and who will be the initially qualified personnel to sign off operators.
Response: The SPT SDT has removed Section 4.2	
NPCC RCS	R1.1 should refer to Transmission Operator instead of Transmission Owner. The proposed standard is not applicable to the Transmission Owner. Attachment B should have the same preamble as Attachment A.
Response: The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1. The SPT SDT moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.	
PG&E (1)	Paragraph 4.2 adds confusion to the standard. We recommend deleting this paragraph. The standard does not address requirements for delegates and it is therefore left to the reader to interpret what, if any, would be applicable. Delegates could be interpreted down to the crews, and we are sure that this interpretation is not intended.
Response: The SPT SDT has removed Section 4.2.	
PG&E (2)	This standard, along with the approved NERC Continuing Education training, records would be duplicated by the continuing education provider, now that operators must maintain their certification through continuing education.

Question #11	
Commenter	**Comment**
	The standard should be job task specific and not operator specific. Specific training requirements should be found in one standard, not throughout eighty or more.
Response: The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH. The verification of each System Operator's capability to perform each assigned BES company-specific reliability-related task is included in the approved SAR for this standard. The SPT SDT will suggest that NERC consider adding a new standard project to the Reliability Standards Work Plan 2008-2010 that consolidates all training-related requirements into the PER standards.	
PJM	Several representatives of the ISO/RTO Council, in conjunction with discussions with Drafting Team members, have been informed that the intent of this Standard is to standardize and clarify what is and is not appropriate training materials for acceptance into the NERC Continuing Education Program. This is not well understood by the industry and, if this is indeed the case, PJM supports such an effort. The way the existing draft is being interpreted by the industry, however, is that this will be an additional requirement, over and above (and possibly in conflict with) the NERC Certification maintenance requirements currently contained in the NERC Continuing Education Program. PJM agrees that: - Training is a critical function for our industry, and would note that NERC already ties Continuing Education Hours to the maintenance of NERC Certification. - General in-house training programs must be permitted to be structured to the varied ad hoc needs of the given organizations, their tools and their environment, and not subject to NERC standards. - Critical training be provided by accredited programs, and that NERC may desire to accredit programs used to provide CEH on those critical topics (e.g. Emergency Operations; Blackstart). - the result of a Training standard should be an operator that is prepared to handle that operators system; the result should NOT be the production and storage of paperwork.

Question #11	
Commenter	**Comment**
	PJM does not agree that: - It is necessary that every organization has its own accredited program. As written, R1 requires that responsible entities complete the five phases of a systematic approach to training (SAT), which includes analysis, design, development, implementation, and evaluation) to establish a new or modify an existing training program. We do not agree that this should be a requirement. The requirement should be for the responsible entity receive training to help system operation personnel to acquire the competency to perform the applicable tasks pertaining to the RC, TOP and BA functions that the entity is responsible for or assigned. PJM neither endorses nor disapproves the SAT process as a good approach> However, how any training program is arrived at (i.e. what approach it takes) is not important and should not be a standard. If so inclined, NERC itself could offer an SAT-based Training program. How could one make an argument that using other approaches to arrive at a training program that (a) list the tasks and competency level required to perform the task, (b) include the minimum requirements stipulated in this standard such as the 32 hours emergency training, (c) has provision for a training schedule, review process, etc. is not an acceptable approach? Performance and capability are subjective ideas. Given all of the tests and training, no one can predict how a human will act. To state that the person is 'incapable' is a very strong statement and can only be made on a case-by-case basis - which by definition precludes a NERC standard.

Response: The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH.

The SPT SDT does not agree that the standard should include training time requirements for training on the BES reliailbity-related tasks. NERC's response to Blackout Recommendation 6A recommended 5 days of emergency operations training, which was subsequently clarified to mean 32-hours. The SPT SDT is not aware of the justification that was used for selecting 32 hours.

In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance

Question #11	
Commenter	**Comment**
with each requirement. The SPT SDT has prepared a reference document that provides several SAT resources. The Implementation Plan uses a phased-in approach to allow sufficient time to aquire training on using a systematic approach to developing training.	
RCSDT	The RCSDT has a conflict between teams for ownership of the scope for PER-004 and feel that it belongs with Project 2006-1 which has PER-004 posted with PER-005 for comment. Project 2006-1 removed three of the PER-004 requirements and left in two. During the RCSDT review, we removed the same three requirements but also suggested removing the other two because they are redundant with other standards as follows: PER-004 R.1 is redundant with PER-003 PER-004 R.5 is redundant with COM-001 and IRO-002 The RCSDT request that ownership of PER-004 be scoped within Project 2006-1. The RCSDT is willing to assist Project 2006-1 in completing the review task. Respectfully, William M. Hardy RCSDT - Chair
Response: The two remaining PER-004 requirements are outside the scope of this Project and will be addressed by other NERC standard development projects, such as Project 2007-05 Certifying System Operators.	
SRP	The standard describes a specific “Systematic Approach to Training (SAT)”. This includes specific “phases” that must be included with various violation severity levels associated with the use/non use of these phases. The Standard as written is exceedingly restrictive in not allowing other training options to be considered for RC’s, BA’s and TO’s. An entity should have the option to select a training philosophy and program that meets their individual needs. This “one size fits all” for the entire industry is entirely too restrictive.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that “uses the Systematic Approach to Training (SAT) methodology in its development of new training programs”. The revised R1 requires that a systematic approach must be used to create new or revise existing training programs for BES company-specific reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement.	
SDG&E	Applicability 4.2 is unclear. Who do you define as delegates? Are you looking to expand the applicability to personnel that are outside the control center real time operating postions? Also it refers to applying to those that "impact reliability"? This should be for something that has a signficant

Question #11	
Commenter	**Comment**
	negative impact, not just any impact, no matter how diminimus. There needs to be more clarity as to whom the System Operator training standards apply. Attachment A: Are you implying that anyone that does any of these function is in a System Operator position? In some cases, this work is done by back office staff or engineering. I do not believe all of these tasks need to be done by a System Operator with the level of training set up for them that you have designed. For example, Item 45, Perform next day reliability analysis of the electric system. This may be done by engineering staff, rather than a System Operator. Are you now saying they are System Operators? Or are you still limiting System Operators to the real-time operating positions that control the system?
Response: The SPT SDT has removed Section 4.2 from the revised standard. The SPT SDT removed Attachment A from the standard. Each entity is responsible for developing its BES company-specific reliability-related task list, as described in R1.	
We Energies	PER-002-0 R4 allows "five days per year of training and drills using realistic simulations of system emergencies". PER-005-1 R3.1 allows only "using drills, exercises, or simulations". Removal of the word "training" forces the 32 hours to be only drills, exercises, or simulations. Classroom type training could not be counted toward the 32 hours.
Response: The SPT SDT revised the language to include “training”.	
Garland	As stated in question #9 above, small utilities do not have unlimited resources to budget only to training. This standard would place an undue burden on training departments to meet compliance criteria that would result in additional staff needed that small entities can not meet. R4 -How are we supposed verify the capabilities of the each real time operator? How will someone with a NERC certification that is not working a real time desk position, (i.e. training, other administrative rolls, switching coordinator) be assessed? How will operators be assessed annually under R2? Why would any entity want to add to the task list when you can not meet the requirements already stated? There are many items in the task list that are not currently done in ERCOT by Transmission and Generation Operators on a utility level, but rather done on the ERCOT regional level so how can one be assessed on that requirement.

Question #11	
Commenter	**Comment**
	I would see that entities will be excluding task from the list rather than adding them. A systematic approach to training is the way to approach training needs, but this approach seems to be a bit to aggressive without consideration for the small utilities. NERC should take the lead in developing training programs that can be administered be regional entities that are appropriate for the region.
Response: The SPT SDT has considered stakeholder comments on Version 1 and Version 2 of the standard and believes the existing Implementation Plan reflects stakeholder consensus. The SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified. The SPT SDT revised M2 (previously M4) to include some evidence examples such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments. This standard applies to System Operators, which by definition is a real-time position. The SPT SDT will forward your comment on training program development to NERC.	
HQT	R1.1 should refer to Transmission Operator instead of Transmission Owner. The proposed standard is not applicable to the Transmission Owner. Attachment B should have the same preamble as Attachment A.
Response: The SPT SDT corrected the entity in R1.1 from Transmission Owner to Transmission Operator. The SPT SDT has moved Attachment B so that it is no longer part of a requirement but is a Reference Document for this standard.	
IESO	The IESO appreciates the opportunity to comment, and commends the drafting team for responding positively to our comments on the previous draft standard and SAR. However, we have a major difficulty with this standard: 1. R1 require that responsible entities complete the five phases of a systematic approach to training (SAT), which includes analysis, design, development, implementation, and evaluation - ADDIE) to establish a new or modify an existing training program. We do not agree that this should be a requirement. The requirement should be for the responsible entity to develop an effective training program to help

Question #11	
Commenter	**Comment**
	system operation personnel to acquire the competency to perform the applicable tasks pertaining to the RC, TOP and BA functions that the entity is responsible for or assigned. We neither endorse nor disagree that the SAT process is a good approach, but how the training program is arrived at (i.e. what approach it takes) is not important and should not be a standard. The 2003 Blackout report emphasized a need to train system operators to perform all tasks assigned to their positions. This can be met by requiring responsible entities to develop programs that cover training on all the tasks assigned to the operators, within the scope of the RC, TOP and BA functions, provide the resource for delivering the training. To achieve this, let us reiterate our previous suggestions: a. Developing a training program which lists the tasks (specifically for the RC, BA and TOP as listed in the Functional Model) to be performed and the competency level required to perform the tasks; b. Delivering the training program; c. Recording, tracking and assessing progress of the persons receiving training; d. Planning, providing resource, reviewing and adjusting (as necessary) the training program annually. (2) We realize that system operators may perform other tasks over and above those identified for the RC, BA and TOP functions. However, these other tasks are outside of the scope of the envisaged certification requirements and hence outside of the scope of this standard. The term "company-specific reliability related task" lends itself to interpretation that other reliability tasks (such as those performed by GOP, DP, etc.) must also be included in the training program. We suggest this term be revised, or more words be used to clearly stipulate that only the tasks assigned to the above 3 functions need to be included, depending on the structure and the registered function(s) of the organization.
Response: (1) In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that “uses the Systematic Approach to Training (SAT) methodology in its development of new training programs”. The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement. (2) The standard is addressing BES company-specific reliability-related tasks performed by the three applicable entities.	
ISO New England	R1.1 should refer to Transmission Operator instead of Transmission Owner. The proposed standard is not applicable to the Transmission Owner.

Question #11	
Commenter	**Comment**
	Attachment B should have the same preamble as Attachment A.
Response: The SPT SDT corrected the entity in R1.1 from Transmission Owner to Transmission Operator. The SPT SDT has moved Attachment B so that it is no longer part of a requirement but is a Reference Document and removed Attachment A.	
Manitoba Hydro	I still have a concern with whether or not this would be fairly applied by all utilities. Most utilities will try and keep a minimum set of tasks and the assessment process will be treated inconsistently across the utilies.. This has been a better attempt at providing the miniimum tasks for each type of system operator but again, there will be no way the NERC or an audit team will be able to determine if the task should be there or not. Some way of tying the metrics being developed by the TADS might be away for determining training needs.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for their response to each requirement. The ERO's Sanctions Guidelines allow the compliance enforcement authority to increase the size of a fine when an entity is not truthful in completing its self-certification. This should incent entities to be truthful in complying with the requirements of the standard.	
MISO Stakeholders	The scope of the Certifying System Operators SAR indicates that they will determine who needs to be certified. Yet, this standard in section 4.2 of Applicability section specifies who should be certified. This should be coordinated with the CSO SDT. Requirement R1 in PER-004-2 will be redundant with standards created by the CSO SDT. We recommend eliminating it. Requirement 2 is also poorly defined and not measurable. How does one place particular attention on SOLs and IROLs? This a relative statement that leaves the requirement open to significant future challenges during enforcement. The standard appears to have only 4 requirements, yet is 27 pages long. It is too complex. All registered entities should have a training program. It does not have to be a SAT program.
Response: The SPT SDT removed section 4.2. PER-004-2 changes beyond those identified in the Implementation Plan are outside the scope of this standard. In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The revised Requirement 1 requires	

Question #11	
Commenter	**Comment**
that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. Each applicable entity (Reliability Coordinator, Balancing Authority, and Transmission Operator) is responsible for its compliance with each requirement. The two remaining PER-004 requirements are outside the scope of this Project and will be addressed by other NERC standard development projects, such as Project 2007-05 Certifying System Operators.	
MRO	Please explain how the performance reset period of one month would work when the training program is being assessed annually per R2.
Response: The compliance monitoring period is the time period in which performance or outcomes are measured and evaluated and then reset. In the past, most requirements were measured annually through self-certification and then once every three years with a periodic audit and reset at the end of the audit period. This process has changed, and now some entities are on a 6-year audit cycle and others are on a three-year audit cycle. The revised standard does not include a "Performance reset period."	
SPP ORWG	While we don't have an issue with requiring a training program, we do take exception to having to maintain all the documentation that will be required as the standard is currently proposed.
Response: The responsible entity needs to maintain sufficient evidence to demonstrate compliance to the requirements. Note that the data retention in the revised standard is shorter than in the second draft of the standard.	
WECC OTS	The WECC OTS is the principle group in the Western Interconnection to support the WECC training program and providing support to the trainers in the West. It is the OTS belief that quality training can and should result in quality System Operators and improved system reliability and therefore, we are supportive of the effort by the drafting team for their efforts to ensure the system operator responsible for the BES meets a minimum competency and knowledge levels. Quality training requires analysis and process and the OTS supports a requirement for development, delivery, and evaluation of system operator training using a "systematic approach to training" as required in this Standard and endorsed by the FERC. However, the OTS feels that this standard, along with the approved NERC Continuing Education training, records would be duplicated by the continuing education provider, now that operators must maintain their certification through continuing education. Therefore, the WECC OTS recommends this standard be job task specific and not operator specific. The OTS has also identified several training specific needs in other NERC Standards and would like to recommend that all training requirements in the current NERC Standards and future Standards only be identified in the NERC System Personnel Training Standard. While it is necessary to mention in the

Question #11	
Commenter	**Comment**
	various standards, training needs per that standard, specific training requirements should be found in one standard, not amongst eighty or more. This allows the training staff responsible for the training compliance measures to coordinate and provide training for all future and current training needs. OTS suggests this Standard focus on Certified System Operators only at this time. The training for CE to support Certified System Operators using the SAT process should be covered at this time.
Response: : The NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. The SPTSDT believes there is nothing in this standard that conflicts with the CE Program requirements. The standard does not limit the use of nor does it require an entity use the NERC CE Program. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific related-related tasks). The CE training can be also used for NERC re-certification. Most training in this standard could meet CEH. The verification of each System Operator's capability to perform each assigned BES company-specific reliability-related task is included in the approved SAR for this standard.	

Maureen E. Long
Standards Process Manager

August 15, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement: Nomination Periods Open for Three Drafting Teams

The Standards Committee announces the following standards actions:

Nominations for Project 2006-01 System Personnel Training Standard Drafting Team (August 15–29, 2007)

The Standards Committee is seeking additional industry experts to serve on the System Personnel Training Standard Drafting Team. The new members will join the already-formed drafting team in developing the following standard:

- PER-005 — System Personnel Training

If you are interested in serving on this standard drafting team, please complete this nomination form and return it to sarcomm@nerc.net by August 29, 2007 with "System Personnel Training SDT" in the subject line. For questions, please contact Linda Clarke at 610-310-7210 or linclrke@msn.com.

Nominations for Project 2007-06 System Protection Coordination Standard Drafting Team (August 15–29, 2007)

The Standards Committee is seeking industry experts to serve on the System Protection Coordination Standard Drafting Team. The drafting team will work on modifications to the following standard:

- PRC-001 — System Protection Coordination

If you are interested in serving on this standard drafting team, please complete this nomination form and return it to sarcomm@nerc.net by August 29, 2007 with "System Protection Coordination SDT" in the subject line. For questions, please contact Al Calafiore at 678-524-1188 or at al.calafiore@nerc.net.

Nominations for Project 2007-17 Protection System Maintenance and Testing Standard Drafting Team (August 15–29, 2007)

The Standards Committee is seeking industry experts to serve on the Protection System Maintenance and Testing Standard Drafting Team. If you are interested in serving on this team, please complete this nomination form and return it to sarcomm@nerc.net with "Protection System Maintenance SDT" in the subject line by August 29, 2007. For questions, please contact Al Calafiore at 678-524-1188 or at al.calafiore@nerc.net.

The drafting team will work on revising the following standards:

- PRC-005-1 — Transmission and Generation Protection System Maintenance and Testing
- PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs
- PRC-011-0 — UVLS System Maintenance and Testing
- PRC-017-0 — Special Protection System Maintenance and Testing

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Nomination Form for System Personnel Training Standard Drafting Team (Project 2006-01)

Please return this form to sarcomm@nerc.net by August 29, 2007 with the words "System Personnel Training SDT" in the subject line. If you have questions please Linda Clarke at linclrke@msn.com or by telephone at 610-310-7210.

All candidates should be prepared to participate actively at these meetings.

Name: Organization: Address: Office Telephone: E-mail:
Please briefly describe your experience and qualifications to serve on the System Personnel Training Standard Drafting Team. Candidates should have experience in managing real-time operators working for Reliability Coordinators, Transmission Operators and/or Balancing Authorities. Previous experience working on or applying NERC or IEEE standards is beneficial, but not a requirement.

I represent the following NERC Reliability Region(s) (check all that apply)**:**	**I represent the following Industry Segment (check one):**	
☐ ERCOT ☐ FRCC ☐ MRO ☐ NPCC ☐ RFC ☐ SERC ☐ SPP ☐ WECC ☐ NA – Not Applicable	☐	1 — Transmission Owners
	☐	2 — RTOs, ISOs
	☐	3 — Load-serving Entities
	☐	4 — Transmission-dependent Utilities
	☐	5 — Electric Generators
	☐	6 — Electricity Brokers, Aggregators, and Marketers
	☐	7 — Large Electricity End Users
	☐	8 — Small Electricity End Users
	☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
	☐	10 — Regional Reliability Organizations and Regional Entities

Which of the following Function(s)[1] do you have expertise or responsibilities:

☐ Balancing Authority	☐ Planning Coordinator
☐ Compliance Monitor	☐ Transmission Operator
☐ Distribution Provider	☐ Transmission Owner
☐ Generator Operator	☐ Transmission Planner
☐ Generator Owner	☐ Transmission Service Provider
☐ Interchange Authority	☐ Purchasing-selling Entity
☐ Load-serving Entity	☐ Resource Planner
☐ Market Operator	☐ Reliability Coordinator

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group.

Standards Announcement

Comment Period Opens
February 25–April 9, 2008

Now available at: http://www.nerc.com/~filez/standards/System-Personnel-Training

Comment Period for Project 2006-01 — System Personnel Training Standard Opens February 25, 2008

The System Personnel Training Standard Drafting Team has posted its third draft of PER-005-1 — System Personnel Training (Project 2006-01) along with an implementation plan, and a reference to aid in implementing the standard.

The purpose of the standard is to ensure that that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System are competent to perform those reliability related tasks. The proposed standard is applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators.

Please use this electronic comment form to submit comments on the third draft of PER-005-1 by **April 9, 2008**.

Standards Development Process

The NERC posting and balloting procedures are described in the *Reliability Standards Development Procedure Manual*, which contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Please send questions to Maureen Long at maureen.long@nerc.net, or call 813-468-5998.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.

Proposed Action Plan and Description of Current Draft:

This is the third posting of the proposed standard and its associated implementation plan for a 45-day comment period, from February 25, 2008 to April 9, 2008.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the third draft of the proposed standard.	May 15, 2008
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	June 15, 2008
3. Post the standard and implementation plan for a 30-day pre-ballot review.	July 1–July 31, 2008
4. Conduct an initial ballot for ten days.	August 1–August 10, 2008
5. Respond to comments submitted with the initial ballot.	September 1, 2008
6. Conduct a recirculation ballot for ten days.	September 1–September 10, 2008
7. Post for a 30-day preview for board.	October 1–October 31, 2008

8. BOT adoption.	November 15, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date:

Effective 36 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, the Reliability Standard becomes effective 36 months after the first day of the first calendar quarter after Board of Trustee adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use a systematic approach to training to establish a new or modify an existing training program(s) for the BES company-specific reliability-related tasks performed by its System Operators. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation of the training program established in R1, to identify any needed changes to the training program.

R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each or its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority, and Transmission Operator

shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration) using training, drills, exercises, and hands on training using simulators. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

C. Measures

M1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish a new or modify an existing training program(s), as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific task list, with the date of the last revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee feedback. supervisor feedback, course evaluations, learning assessments, or audit results) that it performed a training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

1.4.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain its current company-specific task list and any supporting learning objectives and course outlines, training records, and evaluation records since its last compliance audit for Requirement 1, Measure 1.

1.4.2 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain training records for each of its System Operators since the last compliance audit for Requirement 2, Measure 2.

1.4.3 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain training records for each of its System Operators since the last compliance audit for Requirement 3, Measure 3.

1.4.4 If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Medium VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence of evaluating its training program effectiveness to identify needed changes to its training program(s).	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related task list (when developing a new	When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related task list

R#	Lower VSL	Medium VSL	High VSL	Severe VSL
			or modifying an existing training program).	OR When developing a new or modifying an existing training, the responsible entity failed to deliver training based on the BES company specific reliability related task list.
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks.	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks OR The responsible entity failed to verify its system operators' capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability related task list.	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks.
R3	None	The responsible entity provided at least 32 hours of emergency operations	The responsible entity provided at least 32 hours of emergency	The responsible entity provided 32 hours of emergency

R#	Lower VSL	Medium VSL	High VSL	Severe VSL
		training to at least 90% but less than 100% of its System Operators.	operations training to at least 70% but less than 90% of its System Operators.	operations training to less than 70% of its System Operators OR The responsible entity did not include in its emergency training, the use of drills, exercises, and hands on training using simulators.

E. Regional Variances

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Authorization Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards drafting team posted draft standard for comment on September 27, 2006.
8. Standards drafting team responded to comments and posted the revised standard on August 15, 2007.

Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.

Proposed Action Plan and Description of Current Draft:

This is the third posting of the proposed standard and its associated implementation plan for a 45-day comment period, from February 25, 2008 to April 9, 2008.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the third draft of the proposed standard.	May 15, 2008
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	June 15, 2008
3. Post the standard and implementation plan for a 30-day pre-ballot review.	July 1–July 31, 2008
4. Conduct an initial ballot for 10 days.	August 1–August 10, 2008
5. Respond to comments submitted with the initial ballot.	September 1, 2008
6. Conduct a recirculation ballot for 10 days.	September 1–September 10, 2008
7. Post for a 30-day preview for board.	October 1–October 31, 2008

8. Board adoption.	November 15, 2008

A. Introduction

1. **Title:** **System Personnel Training**

2. **Number:** PER-005-1

3. **Purpose:** To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Reliability Coordinator.

   4.1.2 Balancing Authority.

   4.1.3 Transmission Operator.

   ~~**4.2.** This standard applies to System Operator positions of the entities listed in 4.1 and their delegates who can directly, or through communications, impact reliability by producing a real-time response from the Bulk Electric System.~~

5. **Proposed Effective ~~Date for Regulatory Approvals:~~ Dates:**

   Effective 36 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, the Reliability Standard becomes effective 36 months after the first day of the first calendar quarter after Board of Trustee adoption.

   ~~**5.1.**Requirement 3 in the standard shall become effective on the first day of first quarter after applicable regulatory approval (or the Reliability Standard otherwise becomes effective on the first day of first quarter after Board of Trustee adoption in jurisdictions where regulatory approval is not required).~~

   ~~**5.2.**Requirement 2 in the standard shall become effective 18 months after the first day of the first quarter following regulatory approval (or the Reliability Standard otherwise becomes effective 18 months after the first day of the first quarter after Board of Trustee adoption in those jurisdictions where regulatory approval is not required).~~

   ~~**5.3.**Requirement 1 and Requirement 4 shall become effective 36 months after the first day of the first quarter following regulatory approval (or the Reliability Standard otherwise becomes effective 36 months after the first day of the first quarter after Board of Trustee adoption in those jurisdictions where regulatory approval is not required).~~

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use ~~complete the five phases of~~ a systematic approach to training ~~(SAT) (which includes analysis, design, development, implementation, and evaluation)~~ to establish a new or modify an existing training program(s) for the BES company-specific reliability-related tasks performed by its~~that addresses Bulk Electric~~ System Operators. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

~~R2.~~R1.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall create a list of ~~(~~BES~~)~~ company-specific reliability-related tasks performed by its System Operators. ~~[Risk Factor: Medium] [Time Horizon: Long-term Planning]~~

~~R2.1.~~R1.1.1. Each ~~To create a company-specific list of BES reliability-related tasks, each~~ Reliability Coordinator, Balancing Authority, and Transmission ~~Owner shall select all tasks performed by its System~~ Operator shall update its list of BES company-specific ~~positions from the Generic Task List (provided in Attachment A) and add other BES~~ reliability-related tasks performed by its System Operators at least annually to identify new or modified tasks for inclusion in training~~Operator positions~~.

R1.2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver ~~assess at least annually~~ the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority, and Transmission~~needs of each System~~ Operator shall conduct an evaluation of ~~position to determine~~ the training program established in R1, to identify any needed changes to the training program.

~~R3.~~R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each or its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time.~~mis-match between acceptable and actual performance capability.~~ [Risk Factor: *High*~~Medium~~] [Time Horizon: Long-term Planning]

~~R2.1.~~ Within six months of a modification~~The assessment shall include identification of mis-matches between acceptable and actual performance capability that need to be addressed through future training.~~

~~R2.2.~~ ~~The assessment shall include identification~~ of ~~training required to perform new or revised tasks from~~ the BES company-specific reliability ~~-~~related tasks, each.~~.~~

R2.1. ~~Each~~ Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators ~~Operator~~ with at least 32 hours ~~annually~~ of emergency operations training applicable to its organization that reflects emergency operations topics (which includes ~~and~~ system restoration) using training, drills, exercises, and hands on training using simulators. [Risk Factor: Medium] [Time Horizon: Long-term Planning]

~~R3.1.~~ ~~The emergency operations and system restoration training shall include the principles and procedures needed for recognizing and responding to emergencies, using drills, exercises or simulations of system conditions in subject areas from the Emergency Operations Topics (provided in Attachment B).~~

~~R3.1.1.~~ ~~Each Reliability Coordinator, Balancing Authority and Transmission Operator shall add or remove topics from the Emergency Operations Topics to reflect emergency operations and system restoration topics that apply to its organization.~~

~~R4.~~ ~~Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify the capabilities of each of its real-time System Operators to perform each assigned task on its list of company-specific BES reliability-related tasks. [Risk Factor: Medium] [Time Horizon: Long-term Planning]~~

C. Measures

M1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish a new or modify an existing training program(s), as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific task list, with the date of the last revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection ~~SAT-developed BES~~ System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection ~~program with~~ evidence (such as instructor observations, trainee feedback. supervisor feedback, course evaluations, learning assessments, or audit results) that it performed a training program evaluation, as specified in R1.4~~of the following SAT-related outcomes:~~

~~M1.1. Analysis that results in a list of company-specific BES reliability-related tasks and measurable or observable criteria for desired performance for each task~~

~~M1.2. Design and development of training materials that result in learning objectives and content that is derived from results of training analysis~~

~~M1.3. Implementation of the training program, as identified in the training analysis~~

~~M1.4. Evaluations and assessments of training delivered to determine if learning objectives are met~~

M2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1~~the results of its latest assessment for each position~~, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

~~M3.~~ Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations ~~or system restoration~~ training, as specified in R3.

M3. ~~Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection verification of the capabilities for each real-time System Operator, as specified in R4.~~

D. Compliance

1. Compliance Monitoring Process

~~**1.1. Compliance Monitoring Responsibility**~~

Compliance Enforcement Authority ~~(CEA)~~

For Reliability Coordinators and other functional entities that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.1. Compliance Monitoring Period and Reset

Not Applicable.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

~~The performance reset period for all requirements is one month.~~

1.3. Data Retention

Each~~For all requirements and measures, each~~ Reliability Coordinator, Balancing Authority, and Transmission Operator shall keep data or ~~retain~~ evidence to show ~~of~~ compliance, as identified below, unless directed by ~~for four years or since~~ its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

1.4.1 ~~most recent on-site compliance audit, whichever is greater.~~ Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall retain its current company-specific task list and~~all data used to show evidence it is following or followed~~ any supporting learning objectives and course outlines, training records, and evaluation records since its last compliance audit for Requirement 1, Measure 1~~mitigation plan associated with this standard~~.

1.4.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall retain training records for each of its System Operators since the last compliance audit for Requirement 2, Measure 2.

1.4.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall retain training records for each of its System Operators since the last compliance audit for Requirement 3, Measure 3.

1.4.4 If a Reliability Coordinator, Balancing Authority, and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

~~The Compliance Monitor shall retain data, including self-certifications, since its last on-site audit and all documentation from other compliance monitoring methods used since the last on-site compliance audit. The Compliance Monitor shall retain any data used in mitigation plans associated with this standard.~~

1.4. Additional Compliance Information

NoneEach Reliability Coordinator, Transmission Operator and Balancing Authority shall demonstrate compliance through self-certification submitted to its Compliance Enforcement Authority annually.

The Compliance Enforcement Authority shall conduct a scheduled on-site review once every three years, and may conduct spot checks and investigations to assess performance.

2. Violation Severity Levels

R#	Lower VSL	Medium VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence of evaluating its training program effectiveness to identify needed changes to its training program(s).	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related task list (when developing a new or modifying an existing training program).	When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related task list OR When developing a new or modifying an existing training, the responsible entity failed to deliver training based on the BES company specific reliability related task list.
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks.	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks OR	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks.

R#	Lower VSL	Medium VSL	High VSL	Severe VSL
			The responsible entity failed to verify its system operators' capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability related task list.	
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of its System Operators.	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators.	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators OR The responsible entity did not include in its emergency training, the use of drills, exercises, and hands on training using simulators.

~~**2.1. Lower: There shall be a lower violation for each subsection in which one or more of the following conditions exist:**~~

~~**2.1.1 None**~~

~~**2.1.2 None**~~

~~**2.1.3** The responsible entity did not add or remove topics from the Emergency Operations Topics that apply to their organization.~~

~~**2.1.4 None**~~

~~**2.2. Moderate: There shall be a moderate violation for each subsection in which one or more of the following conditions exist:**~~

2.2.1 The responsible entity has completed a list of company-specific reliability-related tasks from the Generic Task List (Provided in attachment A), and has started creating a list identifying all other reliability-related task that the company performs, but the list is not complete.

NOTE: If the entity violates R1.1, the entity is also in violation of R1, (failure to perform the Analysis phase of the SAT process).

2.2.2 The responsible entity has determined training required based on the mis-match between acceptable and actual performance capability but has not included the training identified in its current schedule.

2.2.3 The responsible entity provided at least 32 hours of training on emergency operations or system restoration, annually, but did not include training in subject areas listed in Attachment B.

2.2.4 None

2.3. High: There shall be a high violation for each subsection in which one or more of the following conditions exist: The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements.

2.3.1 The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of one of the five phases of a SAT process listed below when establishing new system operator training: (R1)

- Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives
- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

OR

The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of one of the five phases of a SAT process listed below when making modifications to an existing system operator training program:

- Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives
- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

OR

The responsible entity does not have a system operator training program based on the SAT process for one of its system operator positions (as identified in Section 4.2).

2.3.1.1 The responsible entity has started creating a list or has a partial list identifying its company specific list of reliability related tasks from the generic task list (in Attachment A), but the list is not complete

NOTE: If the entity violates R1.2, the entity is also in violation of R1, (failure to perform the implementation phase of the SAT process).

2.3.2 The responsible entity has not performed an assessment which includes identification of measurable or observable criteria for desired performance to each task for the determination of the training needs for one of its system operating position.

2.3.2.1 The responsible entity has not identified training required based on the mis-match between acceptable and actual performance capability.

2.3.3 The responsible entity provided to its system operators at least, 32 hours of emergency operations or system restoration training, annually, but not all its System Operators has completed or evidence shows will not have completed the required annual training.

2.3.3.1 The responsible entity provided at least 32 hours of training on emergency operations or system restoration, but the training did not include training in principles and procedures needed for effectively recognizing and responding to emergencies **OR**

The emergency operations or system restoration training delivery method did not include drills, exercises, or simulations of system conditions,

2.3.4 The responsible entity has performed an assessment of its System Operator's capabilities to perform each identified task that is on its company specific reliability related task, but not for each of its System Operators.

2.4. Severe: There shall be a severe violation for each subsection in which one or more of the following conditions exist. The responsible entity has failed to meet the reliability objective of the requirement.

2.4.1 The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of two of the five phases of a SAT process listed below when establishing new system operator training:

- Analysis that results in a list of company specific reliability related tasks and measurable or observable criteria for desired performance for each task
- Design that results in learning objectives
- Develop training content that is derived from results of training analysis and learning objectives.
- Implementation of the training program, as identified in the training analysis
- Evaluations and assessments of training delivered to determine if learning objectives are met

~~**OR**~~

~~The responsible entity has a system operator training program for all its system operator positions (identified in Section 4.2) but the entity did not use or provide evidence of use of two of the five phases of a SAT processes listed below when making modifications to an existing system operator training program. :~~

- ~~Analysis that results in a list of company-specific reliability-related tasks and measurable or observable criteria for desired performance for each task~~
- ~~Design that results in learning objectives~~
- ~~Develop training content that is derived from results of training analysis and learning objectives.~~
- ~~Implementation of the training program, as identified in the training analysis~~
- ~~Evaluations and assessments of training delivered to determine if learning objectives are met~~

~~**OR**~~

~~The responsible entity does not have a SAT program for its system operators.~~

~~**2.4.1.1** The responsible entity failed to create a company specific list of reliability related tasks from the generic task list. (in attachment A) **OR**~~

~~The responsible entity failed to create a list of all other reliability-related task the company performs.~~

~~**2.4.2** The responsible entity has not performed an assessment which includes identification of measurable or observable criteria for desired performance to each task for the determination of the training needs for two of its system operating position **OR**~~

~~The responsible entity has not performed an annual assessment as required by R2.~~

~~**2.4.3** The responsible entity did not provide to its system operators at least 32 hours of emergency operations or system restoration training **OR**~~

~~The responsible entity has provided 32 hours of emergency operations and system restoration training but the training has not provided annually.~~

~~**2.4.4** The responsible entity has not performed an assessment on its System Operator's capabilities to perform each identified task that is on its company-specific reliability-related task list~~

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking

Attachment A: Generic Task List

Attachment A presents a generic list of tasks to assist with the creation of a company-specific list of reliability-related tasks. Entities shall add or remove from the list to create a list of reliability-related tasks applicable to their organization.

General Control Center Operations Tasks:

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
1	Communication	Provide real-time system information to the Reliability Coordinator.
2	Communication	Coordinate reliability processes and actions with and among other Reliability Coordinators.
3	Communication	Issue reliability alerts to Generator Operators, Load-Serving Entities, Transmission Operators, Transmission Service Providers, Balancing Authorities, Regional Councils, and NERC
4	Communication	Produce and publish system status information (e.g., OASIS, IRN, and RCIS)
5	Communication	Prepare and provide data to reliability coordinator for later inclusion in NERC reports
6	Communication	Ensure all balancing authorities or transmission operators are aware of solar magnetic disturbances (SMD) forecast information
7	Communication	Communicate the status of system conditions with appropriate reliability coordination offices
8	Communication	Communicate the status of system conditions with appropriate balancing authorities and/or transmission operators
9	Communication	Report disturbances to NERC following the guidelines within the U.S. Department of Energy's most recent Power System Emergency Reporting Procedures
10	Communication	Communicate with interconnected systems during normal and emergency conditions using established procedures
11	Communication	Coordinate operations between the host balancing authority or transmission operator and any transmission operating entities that exist within the host balancing authority and/or transmission operator's boundaries to ensure transmission reliability
12	Communication	Report to the regional council staff within 24 hours after a disturbance affecting your system has occurred
13	Communication	Report any disturbances or unusual occurrences, suspected or determined to be caused by sabotage to the appropriate systems, governmental agencies, and regulatory bodies
14	Communication	Coordinate reliability processes and actions with and among other reliability coordinators

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
15	Communication	Utilize the voice and data telecommunication systems as required while adhering to Interconnection and regional operating procedures
16	Monitor	Monitor real-time operational information from balancing authorities and transmission operators.
17	Monitor	Interpret SCADA-generated alarms and information, and then take appropriate actions to maintain system reliability
18	Monitor	Check data and verify accuracy of each metering point used by Supervisory Control and Data Acquisition (SCADA)
19	Monitor	Monitor performance of power system equipment and call out system personnel when appropriate
20	Monitor	Monitor system load and generation
21	Monitor	Ensure all special protection systems and special design features are in service as needed
22	Monitor	Monitor real-time market prices for accuracy
23	Monitor	Monitor and respond to alarms from status of special protective schemes
24	Monitor	Verify data used in operation
25	Monitor	Monitor the RCIS and respond to any information provided
26	Monitor	Monitor all reliability related system parameters, such as MW, MVAR, voltage, and amps to determine system conditions
27	Monitor	Monitor and control access to the control center to prevent sabotage
28	Monitor	Monitor all reliability related data within a reliability coordinator area
29	Monitor	Monitor and periodically test normal and emergency telecommunication systems that link with interconnected systems to ensure communications are adequate and continuous
30	Monitor	Monitor and respond to telecommunication alarms or failures and notify the appropriate personnel
31	Monitor	Monitor and maintain defined voltage profiles to ensure system reliability
32	Monitor	Monitor and validate telemetry data for accuracy
33	Monitor	Monitor control center systems and support equipment and call out appropriate assistance as needed
34	Operating	Analyze operations log, and oral information from system operator leaving shift
35	Operating	Maintain records of special protection system, special design feature, and transmission protection system mis-operations
36	Operating	Evaluate impact of current weather conditions on system operations

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
37	Operating	Evaluate system conditions and apply operating guides when applicable
38	Operating	Evaluate the extent of an outage or disturbance and develop a plan of restoration
39	Operating	Identify operating problems and deficiencies, and recommend corrective measures
40	Operating	Respond to performance survey requests
41	Operating	Provide input to ensure that the operations computer database is up to date
42	Operating	Prepare daily reports and logs generated to meet company and regulatory requirements
43	Operating	Adjust control systems to compensate for any equipment errors or failures
44	Operating	Perform same-day reliability analysis of the electric system
45	Operating	Perform next-day reliability analysis of the electric system
46	Operating	Analyze and authorize requests for equipment outages
47	Operating	Enforce operational reliability requirements
48	Operating	Compile regional system data reports
49	Operating	Operate primary and backup telecommunications systems as required
50	Operating	Schedule system telecommunications, telemetering, protection, and control equipment outages to ensure system reliability
51	Operating	Maintain current knowledge of power system modifications and additions
52	Operating	Ensure that every effort is made to remain connected to the Interconnection
53	Operating	Take action as necessary to protect the system if it becomes endangered by remaining interconnected
54	Operating	Apply guidelines, including lists of utility contact personnel, for reporting disturbances due to sabotage events
55	Operating	Direct to the appropriate entities those options necessary to relieve reliability threats and violations in a reliability coordinator area
56	Operating	Ensure the accuracy of current system status by updating necessary operating procedures, diagrams, and map board
57	Operating	Provide input to system planners to help maintain accuracy in system models used for reliability assessments
58	Operating	Evaluate, test, and/or confirm the accuracy of reliability assessment tools
59	Operating	Utilize interconnected operation services as needed to maintain system reliability

ITEM#	TYPE OF ACTIVITY	GENERAL CONTROL CENTER OPERATIONS TASKS
60	Operating	Utilize reactive resources from transmission and generator owners to maintain acceptable voltage profiles
61	Operating	Enforce compliance of operating reliability limits
62	Operating	Arm or verify that special protection systems are armed to meet system conditions (contingencies) as needed
63	Operating	Test, evaluate, and operate backup control center facilities/systems as needed
64	Operating	Implement procedures for the recognition of sabotage events on your facilities and multi-site sabotage affecting larger portions of the Interconnection
65	Operating	Implement specified procedural actions in the event of a FERC Standards of Conduct violation
66	Procedure	Complies with reliability requirements specified by Reliability Coordinator.
67	Procedure	Evaluate current operating practices and make recommendations for improvement to meet NERC reliability standards' requirements
68	Procedure	Implement system restoration procedures
69	Procedure	Maintain a working knowledge of regional, NERC, FERC, and company specific guides, policies, and standards

Transmission Tasks:

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
1	Limits	Monitor and operate or direct the operations of the transmission system within equipment and facility ratings.
2	Operating	Notify Generator Operators of transmission system problems in compliance with NERC requirements.
3	Outage	Adjust transmission configuration to implement proposed transmission system outage plan
4	Outage	Build contingency case for scheduled outages for next day
5	Outage	Coordinate planned and unplanned transmission outages with all impacted systems to ensure transmission system reliability
6	Outage	Direct transmission operators to revise maintenance plans as required, and as permitted by agreements
7	Outage	Implement transmission outages to ensure system reliability
8	Outage	Initiate the cancellation of scheduled transmission work when system conditions require
9	Outage	Interpret relay targets, oscillograph readings, breaker operations, and field observations to determine proper restoration methods during forced outages
10	Outage	Notify others of any planned transmission changes that may impact the operation of their facilities
11	Outage	Perform reliability analysis to determine impact of both scheduled and forced transmission outages
12	Outage	Receive and review transmission maintenance plans from transmission operators for reliability assessment
13	Outage	Report transmission outages to the reliability coordinators and other affected utilities
14	Limits	Coordinate with impacted systems, and monitor actual and/or expected operating reliability limit violations and respond as required
15	Limits	Develop or calculate system operating limits
16	Limits	Direct transmission operators to take actions to mitigate interconnection reliability operating limits
17	Limits	Ensure all tie-line limits are not exceeded
18	Limits	Ensure that transmission contract paths are not exceeded
19	Limits	Identify, communicate, and direct actions to relieve reliability threats and limit violations in the reliability coordinator area
20	Limits	Initiate control actions resulting from thermal limit violations, considering the responsiveness of the system
21	Limits	Monitor and respond to transmission system equipment rating violations
22	Limits	Monitor bulk transmission elements to determine constraints and operating limit violations
23	Limits	Monitor major transmission lines, flow gates, and scheduling paths

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
24	Limits	Coordinate with transmission operators and transmission service providers on real-time transmission system limitations.
25	Limits	Monitor interconnection reliability operating limits .
26	Limits	Recalculate interconnection reliability operating limits based on current or future conditions, and according to transmission and generator owners' specified equipment ratings
27	Limits	Develop interconnected operating reliability limits
28	Operating	Analyze/research any bulk system disturbances affecting your system
29	Operating	Respond to disturbance conditions
30	Operating	Monitor and operate transmission system within its designed capabilities
31	Operating	Monitor radio system for calls requiring response
32	Operating	Monitor system frequency and initiate a hotline conference call when frequency error exceeds specified limits
33	Operating	Monitor the condition of the transmission system and respond as required (including shedding firm load) to avoid voltage collapse and/or Interconnection separation
34	Operating	Monitor the voltages, and coordinate the reactive dispatch of transmission facilities, and the interconnections with neighboring systems
35	Operating	Develop special operating procedures to allow continued operation of the transmission system based on the results of a reliability analysis
36	Operating	Direct and/or control all energization and/or modification of new or existing facilities
37	Operating	Direct and/or control phase shifting transformer taps
38	Operating	Direct and/or control transmission switching
39	Operating	Direct and/or regulate the operation of the transmission system
40	Operating	Ensure adequate transmission facilities are available to meet external and internal requirements (real-time or hourly)
41	Operating	Implement corrective actions from transmission problems resulting from an underlying sub-transmission or distribution event (local reliability issues)
42	Operating	Maintain constant awareness of neighboring transmission system conditions
43	Operating	Maintain safe operating conditions for all persons and property within the transmission system
44	Operating	Operate control equipment to continuously and accurately meet its system and Interconnection control obligation and measure its performance
45	Operating	Perform reliability analysis (actual and contingency) for the reliability coordinator area
46	Operating	Provide oversight of transmission operational plans, direct revisions as required, and as permitted by agreements
47	Operating	Respond to solar magnetic disturbance (SMD) warnings as required by system

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
		operating procedures
48	Operating	Specify interconnected operation services requirements for transmission reliability (e.g., reactive requirements, location of operating reserves)
49	Operating	Supervise and coordinate all activity at switching stations, generating stations, and transmission switchyards
50	Operating	Utilize load flow modeling tools to determine power flow changes and optimum system configurations during normal and emergency conditions
51	Voltage	Deploy reactive resources to maintain acceptable voltage profiles.
52	Voltage	Coordinate voltage reduction as requested by the balancing authority or as directed by the reliability coordinator.
53	Voltage	Direct voltage reduction
54	Voltage	Approve system voltage regulating equipment outages to ensure adequate system voltage and system reliability is maintained
55	Voltage	Coordinate operation of voltage control equipment with interconnected utilities
56	Voltage	Direct transmission operators to reduce voltage or shed load if needed to ensure balance in real-time
57	Voltage	Identify and respond to conditions likely to lead to voltage collapse
58	Voltage	Implement voltage reductions as directed by a transmission operator
59	Voltage	Minimize system voltage decay and prevent cascading outages
60	Voltage	Schedule system voltage regulating equipment outages to ensure adequate system voltage and system reliability is maintained
61	Voltage	Utilize HVDC systems' reactive power control capabilities as a voltage control tool when appropriate
62	Voltage	Utilize transmission line removal as a voltage control tool only if system studies indicate that system reliability will not be degraded below acceptable levels
63	Limits	Request reliability coordinator to mitigate equipment overloads.
64	Congestion	Identify special operating procedures that may be necessary to maintain acceptable transmission loading
65	Congestion	Initiate line loading relief procedures upon request of members of the Interconnection using appropriate priority levels
66	Congestion	Initiate transmission loading relief procedures to relieve potential or actual loading on a constrained facility
67	Congestion	Manage transmission loading by directing the redispatch of generators or reconfiguring the transmission system to mitigate impact, including the load curtailment process
68	Congestion	Notify all affected areas that line loading relief has been requested, and that corrective actions are required
69	Congestion	Request the reliability coordinator to mitigate equipment overloads
70	Congestion	Run day-ahead congestion management market

ITEM#	TYPE OF ACTIVITY	TRANSMISSION TASKS
71	Congestion	Run hour-ahead congestion management market to allocate available transmission capacities
72	Congestion	Use the results from an available transfer capability (ATC) calculator to determine the impact of an interchange transaction on the transmission system
73	Congestion	Utilize the Interchange Distribution Calculator to determine transaction curtailments for transmission load relief
74	Congestion	Calculate and post changes in available transmission capacity
75	Congestion	Implement terms of interruption for transmission services according to contractual provisions
76		Direct load shedding
77	Load	Coordinate load shedding as requested by the balancing authority or as directed by the reliability coordinator.
78	Load	Issue corrective actions (e.g., curtailments or load shedding) to transmission operators, transmission service providers
79	Load	Adjust both short-term and future forecasts using actual load data and correction factors
80	Load	Call for interruptible loads to be shed when required
81	Load	Collect individual load profiles and forecasts of end-users energy requirements, and develop overall load profiles
82	Load	Compile load forecasts from load-serving entities within a balancing area
83	Load	Coordinate load shedding, and load restoration with, or as directed by the reliability coordinator
84	Load	Coordinate or direct use of controllable loads that have been bid as interconnected operations services
85	Load	Develop both short-term and future forecasts using actual load data and correction factors
86	Load	Monitor an area's estimated and actual loads
87	Load	Respond to light load conditions

Generation Tasks:

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
1	Balancing	Direct resources (generator operators and load-serving entities) to take action to ensure balance in real time
2	Balancing	Ensure adequate generation capacity is available to meet external and internal requirements (real-time, or hourly)
3	Balancing	Respond to manual time error correction requests by regional time error monitor
4	Balancing	Allocate generation resources to meet system requirements
5	Balancing	Allocate load resources to meet system requirements
6	Balancing	Monitor AGC to ensure compliance with NERC CPS1 and CPS2 standards
7	Balancing	Perform system configuration evaluation for dispatching of imbalance energy based on real-time conditions
8	Balancing	Minimize inadvertent flows, losses, and CPS1 and CPS2 criteria violations
9	Balancing	Monitor AGC performance to diagnose and identify telemetry problems
10	Balancing	Compare actual generator output with anticipated schedules, and take action to account for the difference
11	Balancing	Dispatch generation resources economically while maintaining system reliability
12	Balancing	Monitor time error and initiate corrections
13	Balancing	Manually calculate ACE as necessary
14	Balancing	Publish next-day market results
15	Balancing	Monitor ramping capability for requested interchange schedules
16	Balancing	Ensure that the balancing authority is satisfying its Interconnection frequency regulation obligation
17	Balancing	Ensure that the balancing authority's frequency bias value is continually set at the proper value
18	Balancing	Monitor ACE to determine if the calculation is correct
19	Balancing	Inform the appropriate balancing authority of the status of its overlap regulation service
20	Balancing	Verify that the regulating capacity is distributed equitably over as many units as possible
21	Balancing	Manage generation biasing to avoid reliability limit violations
22	Balancing	Monitor response of units to the AGC signals
23	Balancing	Operate the AGC system in tie-line bias control mode unless such operation is adverse to system or Interconnection reliability
24	Balancing	Obtain replacement energy upon a loss of any major generating or interchange resource
25	Balancing	Respond to generation losses, recognizing reliability restrictions to effectively maintain tie-line flows
26	Balancing	Apply the principles of economic dispatch to generating units

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
27	Balancing	Respond to generation losses, recognizing economic and reliability restrictions
28	Balancing	Publish hour-ahead market results
29	Balancing	Publish day-ahead market results
30	Balancing	Declare an Energy Emergency Alert (EEA) when generation resources and reserves are inadequate to meet demand
31	Balancing	Consult with other impacted balancing authorities, adjust the AGC algorithm for the proper time periods (on-peak and off-peak) to account for known tie-line metering errors
32	Balancing	Review generation commitments, dispatch, and load forecasts
33	Balancing	Receive and review generation operations plans and commitments from balancing authorities for reliability assessment
34	Balancing	Control or direct generation biasing to provide overlap regulation service to other balancing authorities in accordance with contractual obligations
35	Balancing	Ensure adequate energy resources are available to meet external and internal requirements (real-time or hourly)
36	Congestion	Direct the reduction or shedding of load if needed to ensure balance within its balancing authority area.
37	Congestion	Direct generator operators to implement redispatch for congestion management.
38	Congestion	Issue corrective actions (e.g., curtailments or load shedding) to balancing authorities.
39	Congestion	Procure alternate sources of energy when reliability coordinator curtails transactions or calls for generation re-dispatch
40	Congestion	Issue generation dispatch adjustments to mitigate transmission congestion
41	Congestion	Direct balancing authorities to take actions to mitigate interconnection reliability operating limits
42	Congestion	Control, direct, or manage generation dispatch to avoid transmission reliability limit violations
43	Operating	Monitor output of units ensuring that MW output is within operating limits
44	Operating	Monitor output of units ensuring that MVAr output is within operating limits
45	Operating	Operate generation to minimize inadvertent power flow
46	Operating	Operate the SCADA and analog systems to control generation and monitor telemetered information
47	Operating	Select proper mode of automatic generation control for system conditions
48	Operating	Suspend automatic generation control as required
49	Operating	Monitor system fuel reserves
50	Operating	Communicate with generating station regarding work for anticipated increases or decreases that may cause limit changes
51	Operating	Monitor generation production data for correctness and ensure that records are developed and maintained as required

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
52	Operating	Monitor output of units ensuring that MW output is operating according to schedules
53	Operating	Monitor output of units ensuring that MVAr output is operating according to schedules
54	Operating	Supervise and coordinate all activity at generating stations
55	Operating	Monitor hydro generation and pond levels
56	Operating	Monitor generating unit governors to verify their operational status
57	Operating	Initiate manual control of generation, and maintain scheduled interchange following an AGC system component failure
58	Operating	Operate power facilities in compliance with environmental standards (e.g., air quality, wildlife)
59	Operating	Ensure that the AGC and other vital control performance equipment are functioning properly when using the backup power supply following the loss of the primary power supply
60	Operating	Verify the accuracy of the AGC tie-line metering by comparing hourly MWh meter totals to the totals derived from tie-line meter registers
61	Operating	Monitor the status and availability of generator voltage regulators and/or power system stabilizers, and respond as required to deficiencies that may impact system reliability
62	Operating	Test/verify the reactive capability of generating units
63	Operating	Administer generator start-up and shutdown schedules
64	Operating	Report the status of generator automatic voltage regulators and/or power system stabilizers to transmission operators
65	Operating	Provide oversight of generation operational plans, direct revisions as required, and as permitted by agreements
66	Operating	Validate adequacy of resource plans (in near real time)
67	Operating	Procure interconnected operations services from generator owners to ensure voltage support from generating resources is adequate
68	Operating	Notify generator operators of voltage limitations, or equipment overloads that may impact, or are impacting generator operations
69	Outage	Inform the reliability coordinator and impacted balancing authorities of interchange schedule interruptions due to generation or load interruptions within its balancing authority area.
70	Outage	Plan next-day generation required to implement a proposed outage
71	Outage	Implement terms of interruption for generation services according to contractual provisions
72	Outage	Implement or delay generation outages to ensure system reliability
73	Outage	Coordinate ramp down of unit going on planned outage
74	Outage	Adjust generation levels to implement proposed transmission system outage plan
75	Outage	Perform reliability analysis to determine impact of both scheduled and forced

ITEM#	TYPE OF ACTIVITY	GENERATION TASKS
		generation outages
76	Outage	Separate or shut down generators that are unsafe to operate during or after an area disturbance
77	Outage	Direct generation operators to revise maintenance plans as required, and as permitted by agreements
78	Reserves	Apply operating reserves when needed
79	Reserves	Respond to reserve sharing group requests for emergencies
80	Reserves	Perform day-ahead ancillary services auction
81	Reserves	Produce list of resources to meet additional energy requirements (from ancillary service market) to purchase in real time
82	Reserves	Monitor and analyze regional reactive reserve availability
83	Reserves	Perform instantaneous reserve checks
84	Reserves	Dispatch operating reserves to alleviate system emergency conditions
85	Reserves	Perform hour-ahead ancillary services auction
86	Reserves	Monitor and analyze regional operating reserves availability
87	Reserves	Reestablish required operating reserve levels as soon as possible following a contingency that results in operating reserve usage
88	Reserves	Administer performance tests for generating resources providing ancillary services (e.g., spinning, regulation, unit ramp rates)
89	Reserves	Determine required quantities of ancillary services
90	Reserves	Determine reserves needed for the next hour
91	Reserves	Determine reserves needed for the next day
92	Reserves	Determine reserves needed for future days (long term)
93	Reserves	Monitor reactive reserve levels to ensure adequate reactive reserves exist and are properly located to provide for adequate voltage levels under normal and emergency conditions
94	Reserves	Restore reactive reserves to acceptable levels as soon as possible after use
95	Reserves	Ensure adequate spinning and operating reserves are on line
96	Reserves	Ensure adequate spinning and/or operating reserves are dispersed throughout the system
97	Reserves	Monitor available operating reserves and take corrective actions to correct deficiencies

~~*Interchange Tasks:*~~

~~ITEM#~~	~~TYPE OF ACTIVITY~~	~~INTERCHANGE TASKS~~
~~1~~	~~Communication~~	~~Communicate with real-time scheduler regarding the purchase of resources~~
~~2~~	~~Communication~~	~~Notify source balancing authority and transmission service providers, or transmission operators when an interchange transaction must be modified or terminated~~
~~3~~	~~Communication~~	~~Notify intermediate balancing authorities when an interchange transaction must be modified or terminated~~
~~4~~	~~Communication~~	~~Notify participants of transaction curtailments or adjustments observing NERC communication protocols~~
~~5~~	~~Communication~~	~~Notify sink balancing authority or transmission service provider when an interchange transaction needs to be modified or terminated~~
~~6~~	~~Communication~~	~~Notify the interchange authority when interchange transactions are cancelled or terminated~~
~~7~~	~~Congestion~~	~~Curtail, terminate, or modify interchange transaction requests that aggravate operating limits~~
~~8~~	~~Congestion~~	~~Curtail transactions as directed across interfaces~~
~~9~~	~~Congestion~~	~~Ensure that the maximum net scheduled interchange with other balancing authorities does not exceed the available transfer capability~~
~~10~~	~~Congestion~~	~~Ensure that all curtailments are properly applied per reliability coordinators instructions~~
~~11~~	~~Congestion~~	~~Analyze the impact of proposed requests for transmission service and interchange schedules on the bulk power system~~
~~12~~	~~Congestion~~	~~Reestablish curtailed interchange transactions with affected balancing authorities or transmission operators~~
~~13~~	~~Congestion~~	~~Coordinate reallocation and reloading of interchange transactions during transmission loading relief procedures~~
~~14~~	~~Monitor~~	~~Monitor status of NERC interchange transaction tags to ensure timely approval and implementation~~
~~15~~	~~Operating~~	~~Arrange transactions for energy to serve projected demand~~
~~16~~	~~Operating~~	~~Determine proper use of dynamic schedules of remote generating units as to their contribution to operating reserves~~
~~17~~	~~Operating~~	~~Manually calculate net interchange when needed~~
~~18~~	~~Operating~~	~~Determine energy excess after meeting load, reserves, and contract obligations~~
~~19~~	~~Operating~~	~~Verify the accuracy of time error monitoring equipment~~
~~20~~	~~Operating~~	~~Maintain the confidentiality of interchange transactions~~
~~21~~	~~Operating~~	~~Protect the confidentiality of all interchange transaction information~~
~~22~~	~~Operating~~	~~Check inadvertent interchange accounts with other balancing authorities at the end of each day~~

ITEM#	TYPE OF ACTIVITY	INTERCHANGE TASKS
23	Operating	Ensure that all appropriate transmission rights are assigned to all energy schedules (e.g., OASIS reservations) prior to their implementation
24	Operating	Agree upon daily schedule totals and energy imbalance totals with balancing authorities or transmission operators and other schedulers as needed
25	Operating	Assess, approve, or deny interchange transaction requests based on reliability analysis from the ATC calculator
26	Operating	Create NERC interchange transaction tag with all required information
27	Operating	Implement or terminate interchange transactions when needed
28	Operating	Adjust interchange transactions
29	Operating	Monitor the electronic (interchange) tagging system for accuracy of information (e-tagging)
30	Operating	Ensure all import and export schedule totals are checked for accuracy and correctness with each utility at the end of the day
31	Operating	Ensure interchange transactions are conducted in accordance with regional and NERC standards
32	Operating	Implement inadvertent interchange payback schedules with other entities
33	Operating	Submit a request to obtain the necessary transmission reservations to implement transactions
34	Operating	Manually calculate ACE as necessary
35	Operating	Adjust transfers across interfaces to maintain system reliability
36	Operating	Submit NERC interchange transaction tag to transmission providers and balancing authority or transmission operators on the scheduling path within proper timeframe
37	Operating	Secure appropriate transmission rights in response to system emergencies
38	Operating	Enter interchange transactions into the control area's scheduled interchange
39	Operating	Coordinate with any controlled interface operators (e.g., DC ties) that are part of an interchange transaction-scheduling path
40	Operating	Participate in system planning studies to determine transfer capabilities and operating limits
41	Operating	Check and validate hourly tie-line data
42	Operating	Monitor inadvertent accumulations in both the on-peak and off-peak accounts
43	Operating	Maintain knowledge of existing and proposed Interconnection agreements and contracts
44	Operating	Maintain accurate settlement records for bulk power sales and purchases
45	Operating	Apply tariffs associated with rates and services uniformly to all parties
46	Operating	Evaluate and respond to customer requests for transmission and ancillary services via the OASIS
47	Operating	Ensure that the ramp rate, start and end times, energy profile, and losses are communicated to all parties in the transaction

ITEM#	TYPE OF ACTIVITY	INTERCHANGE TASKS
48	Operating	Identify potential parallel flow impacts on pending interchange
49	Operating	Approve interchange transactions based upon a reliability perspective
50	Operating	Monitor dynamic energy schedules for the appropriate use of transmission rights
51	Operating	Administer interchange scheduling and recordkeeping requirements with interconnected balancing authorities or transmission operators or other utilities
52	Operating	Implement interchange schedules
53	Operating	Approve or deny bilateral schedules from the reliability perspective
54	Operating	Confirm and approve interchange transactions from ramping ability perspective
55	Operating	Enter interchange transaction information into reliability assessment tools
56	Operating	Determine and post available transfer capability values
57	Operating	Secure energy and transmission services to serve end-use customers
58	Operating	Perform after-the-hour checkout of actual and scheduled interchange with adjacent balancing authorities
59	Operating	Approve or deny transmission service requests in accordance with any tariff requirements (OASIS)
60	Operating	Ensure transmission reliability margins, total transfer capabilities and available transfer capabilities are correctly posted

Emergency Operations Tasks:

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
1	Capacity	Request emergency energy upon loss of a resource
2	Capacity	Respond to capacity deficiency
3	Capacity	Respond to loss of energy resources within allowable regional or pool timeframe
4	Capacity	Prepare for a capacity emergency by bringing on all available generation
5	Capacity	Prepare for a capacity emergency by postponing equipment maintenance
6	Capacity	Prepare for a capacity emergency by scheduling emergency energy purchases
7	Capacity	Prepare for a capacity emergency by reducing load
8	Capacity	Prepare for a capacity emergency by initiating voltage reductions
9	Capacity	Prepare for a capacity emergency by requesting emergency assistance from other systems
10	Capacity	Schedule available emergency assistance with as much advance notice as possible given a capacity emergency
11	Capacity	Utilize the assistance provided by the Interconnection's frequency bias (in a capacity emergency) only for the time period necessary to utilize operating reserves
12	Capacity	Utilize the assistance provided by the Interconnection's frequency bias (in a capacity emergency) only for the time period necessary to analyze ability to recover using own resources
13	Capacity	Utilize the assistance provided by the Interconnection's frequency bias (in a capacity emergency) only for the time period necessary to schedule emergency assistance from others
14	Freq	Direct corrective actions to correct abnormal frequency
15	Load Shed	Manually shed load to alleviate system emergency conditions
16	Load Shed	Following the activation of automatic load shedding schemes, restore system load as appropriate for current system conditions and in coordination with adjacent systems
17	Load Shed	Following the activation of automatic load shedding schemes, shed additional load manually if there is insufficient generation to support the connected load
18	Load Shed	Following the activation of automatic load shedding schemes, monitor system voltage levels to ensure high voltage conditions do not develop
19	Load Shed	Following the activation of automatic load shedding schemes, monitor system frequency to ensure high frequency conditions do not develop
20	Load Shed	Following the activation of automatic load shedding schemes, monitor the performance of any automatic load restoration relays
21	Load Shed	Following the activation of automatic load shedding schemes, resynchronize transmission at preplanned locations if possible
22	Load Shed	Following the activation of automatic load shedding schemes, disable automatic underfrequency relays if system conditions warrant
23	Load Shed	Direct distribution providers to shed load when required for system reliability

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
24	Load Shed	Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads or to prevent voltage collapse
25	Procedure	Implement emergency procedures.
26	Procedure	Notify the reliability coordinator of the implementation of its own emergency procedures.
27	Procedure	Comply with reliability coordinators' instructions during emergency conditions
28	Procedure	Direct implementation of emergency procedures
29	Procedure	Maintain knowledge of existing and proposed emergency assistance agreements and contracts
30	Procedure	Mandate the sale or purchase of energy to optimize reliability
31	Procedure	Respond to system emergencies and frequency deviations to meet local, regional, and NERC DCS requirements
32	Procedure	Notify appropriate personnel or departments in event of an emergency
33	Procedure	Perform or direct actions such as starting generation, canceling pre-scheduled maintenance, schedule interchange, or shed load to return the system to a secure state
34	Procedure	Perform regular testing of emergency procedures to determine preparedness and alertness of shift personnel
35	Procedure	Provide emergency services coordination for field personnel
36	Procedure	Respond to generation losses, recognizing economic and reliability restrictions to effectively maintain tie-line flows
37	Procedure	Respond to requests for emergency assistance from neighboring systems
38	Procedure	Declare system emergencies
39	Procedure	Develop and/or implement contingency plans when facilities/equipment are forced out of service
40	Procedure	Formulate a plan to implement corrective actions when equipment ratings are exceeded or anticipated to be exceeded
41	Procedure	Use sub-regional, regional, and NERC hotline to coordinate actions during emergency conditions
42	Procedure	Schedule emergency energy when needed and create interchange transaction tags within one hour
43	Procedure	Coordinate response to system emergencies
44	Procedure	Request emergency assistance from neighboring systems
45	Procedure	Assume sole control of designated telecommunication systems for use during an emergency
46	Procedure	Implement emergency procedures related to generating resources within a balancing area as directed by the reliability coordinator
47	Restoration	Direct the restoration of the transmission system following a major system outage, load shedding, islanding, or blackout

ITEM#	TYPE OF ACTIVITY	EMERGENCY OPERATIONS TASKS
48	Restoration	Ensure adequate protective relaying exists during all phases of the system restoration sequence
49	Restoration	Test or simulate system restoration procedures to validate restoration plans
50	Restoration	Following a partial or total system shutdown, implement the appropriate provisions and procedures of the system's restoration plan in a coordinated manner with adjacent systems
51	Restoration	Following a partial or total system shutdown, arrange for start-up and/or emergency power for generation units as required
52	Restoration	Following a partial or total system shutdown, arrange for and utilize emergency (backup) telecommunications facilities as required
53	Restoration	Following a partial or total system shutdown, restore the integrity of the Interconnection as soon as possible
54	Transmission	Formulate a plan to implement corrective actions when an operating reliability limit violation is anticipated
55	Transmission	Determine the cause and extent of transmission system disturbances and interruptions and the impact on other facilities
56	Transmission	Apply relief measures as necessary to permit re-synchronizing and reconnecting to the Interconnection when separated from the Interconnection
57	Transmission	Use manual load shedding to prevent imminent separation from the Interconnection due to transmission overloads, or to prevent voltage collapse
58	Transmission	Implement load shedding as directed by a transmission operator
59	Transmission	Identify and take appropriate actions when partial or full system islanding occurs
60	Voltage	Implement voltage reductions to alleviate system emergency conditions
61	Voltage	Identify and take appropriate actions when a partial or full system voltage collapse occurs

Attachment B: Emergency Operations Topics

These topics are identified as meeting the topic criteria for Emergency Operations training per Requirement 3 of this standard.

A. Recognition and Response to System Emergencies

1. Emergency drills and responses
2. Communication tools, protocols, coordination
3. Operating from backup control centers
4. System operations during unstudied situations
5. System Protection
6. Geomagnetic disturbances weather impacts on system operations
7. System Monitoring – voltage, equipment loading
8. Real-time contingency analysis
9. Offline system analysis tools
10. Monitoring backup plans
11. Sabotage, physical, and cyber threats and responses

B. Operating Policies Related to Emergency Operations

1. NERC standards that identify emergency operations practices (e.g. EOP Standards)
2. Regional reliability operating policies
3. Sub-regional policies and procedures
4. ISO/RTO policies and procedures

C. Power System Restoration Philosophy and Practices

1. Black start
2. Interconnection of islands – building islands
3. Load shedding – automatic (under-frequency and under-voltage) and manual
4. Load restoration philosophies

D. Interconnected Power System Operations

1. Operations coordination
2. Special protections systems
3. Special operating guides
4. Voltage and reactive control, including responding to eminent voltage collapse
5. Understanding the concepts of Interconnection Reliability Operating Limits versus System Operating Limits
6. DC tie operations and procedures during system emergencies
7. Thermal and dynamic limits
8. Unscheduled flow mitigation – congestion management
9. Local and regional line loading procedures
10. Radial load and generation operations and procedures
11. Tie line operations
12. E-tagging and Interchange Scheduling
13. Generating unit operating characteristics and limits, especially regarding reactive capabilities and the relationship between real and reactive output

E. Technologies and Tools

1. Forecasting tools
2. Power system study tools
3. Interchange Distribution Calculator (IDC)

F. Market Operations as They Relate to Emergency Operations

1. Market rules
2. Locational Marginal Pricing (LMP)
3. Transmission rights
4. OASIS
5. Tariffs
6. Fuel management
7. Real-time, hour-ahead and day-ahead tools

A. Introduction

1. Title: **Reliability Coordination — Staffing**

2. Number: PER-004-2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Proposed Effective Date:

- Requirements 2, 3, 4, and 5 retired when PER-005-1 becomes effective

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

The VSL SDT developed VSLs for this standard to replace the Levels of Non-compliance

2. Levels of Non-Compliance for a Reliability Coordinator

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4:

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

A. Introduction

1. **Title:** **Reliability Coordination — Staffing**

2. **Number:** PER-004-~~1~~2

3. **Purpose:**

   Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. **Applicability**

   4.1. Reliability Coordinators.

5. **Proposed Effective Date:** ~~January 1, 2007~~

   - Requirements 2, 3, 4, and 5 retired when PER-005-1 becomes effective

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

~~**R2.**All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.~~

~~**R3.**Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.~~

~~**R4.**Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.~~

~~**R5.**~~**R2.** Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

~~**M1.**The Reliability Coordinator shall have and provide upon request training records that confirm that each of its operating personnel has completed a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel, as specified in Requirement 2.~~

~~**M2.**Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to, a documented training program and individual training records for each of its operating personnel or other equivalent evidence that will be used to confirm that it meets Requirements 3 and 4.~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

The VSL SDT developed VSLs for this standard to replace the Levels of Non-compliance

2. Levels of Non-Compliance for a Reliability Coordinator

~~To be developed~~

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: ~~There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**2.4.1**One or more of its shift operating personnel did not complete a minimum of five days per year of training and drills using realistic simulations of system emergencies in the past year. (R2)~~

~~**2.4.2**No evidence operating personnel have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. (R3)~~

~~**2.4.3**No evidence operating personnel have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area. (R4)~~

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

The SPT SDT recommends that this entire standard be retired when PER-005 becomes effective.

A. Introduction

1. **Title:** **Operating Personnel Training**

2. **Number:** PER-002-0

3. **Purpose:** Each Transmission Operator and Balancing Authority must provide their personnel with a coordinated training program that will ensure reliable system operation.

4. **Applicability**

   4.1. Balancing Authority.

   4.2. Transmission Operator.

5. **Effective Date:** April 1, 2005

B. Requirements

R1. Each Transmission Operator and Balancing Authority shall be staffed with adequately trained operating personnel.

R2. Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in:

R2.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.

R2.2. Positions directly responsible for complying with NERC standards.

R3. For personnel identified in Requirement R2, the Transmission Operator and Balancing Authority shall provide a training program meeting the following criteria:

R3.1. A set of training program objectives must be defined, based on NERC and Regional Reliability Organization standards, entity operating procedures, and applicable regulatory requirements. These objectives shall reference the knowledge and competencies needed to apply those standards, procedures, and requirements to normal, emergency, and restoration conditions for the Transmission Operator and Balancing Authority operating positions.

R3.2. The training program must include a plan for the initial and continuing training of Transmission Operator and Balancing Authority operating personnel. That plan shall address knowledge and competencies required for reliable system operations.

R3.3. The training program must include training time for all Transmission Operator and Balancing Authority operating personnel to ensure their operating proficiency.

R3.4. Training staff must be identified, and the staff must be competent in both knowledge of system operations and instructional capabilities.

R4. For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.

C. Measures

M1. The Transmission Operator and Balancing Authority operating personnel training program shall be reviewed to ensure that it is designed to promote reliable system operations.

D. Compliance

1. Compliance Monitoring Process

Periodic Review: The Regional Reliability Organization will conduct an on-site review of the Transmission Operator and Balancing Authority operating personnel training program every three years. The operating personnel training records will be reviewed and assessed compared to the program curriculum.

1.1. Compliance Monitoring Responsibility

Self-certification: The Transmission Operator and Balancing Authority will annually provide a self-certification based on Requirements R1 through R4.

1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year.

1.3. Data Retention

Three years.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

2.1. Level 1: N/A.

2.2. Level 2: The Transmission Operator or Balancing Authority operating personnel training program does not address all elements of Requirement R3.

2.3. Level 3: The Transmission Operator or Balancing Authority operating personnel training program does not address Requirement R4.

2.4. Level 4: A Transmission Operator or Balancing Authority has not provided a training program for its operating personnel.

E. Regional Differences

None identified.

0	April 1, 2005	Effective Date	New
0	August 8, 2005	Proposed Effective Date	Errata

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours months of emergency operations training applicable to its organization that reflect emergency operations topics (which includes system restoration) using training, drills, exercises and hands on training using simulators. PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be retired. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall complete a systematic approach to training to establish a new or modify an existing training program(s) for the Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each System Operator's capability to perform each task identified in R1.1 at least one time. The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R2) duplicate PER-004-1 R3 and therefore PER-004-1 R3 should be retired.
R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall complete a systematic approach to training to establish a new or modify an existing training program(s) for the Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each System Operator's capability to perform each task identified in R1.1 at least

PER-004-1 Requirement	PER-005-1 Requirements
	one time. The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R4 and therefore PER-004-1 R4 should be removed.

Red-line versions of PER-002-0 and PER-004-1 are posted with this Implementation Plan.

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators
- Balancing Authorities
- Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement 1, Requirement 2, and Requirement 3 shall become effective 36 months after the first day of the first quarter following regulatory approval or, in those jurisdictions where regulatory approval is not required, the Reliability Standard otherwise becomes effective 36 months after the first day of the first quarter after Board of Trustee adoption.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PER-005 System Operator Training
Reference Document

Reference #1: Determining Task Performance Requirements

The purpose of this reference is to provide guidance in writing a performance standard that describes the desired outcome of a task. A standard for acceptable performance should be in either measurable or observable terms.

Clear standards of performance are necessary for an individual to know when he or she has completed the task and to ensure agreement between employees and their supervisors on the objective of a task. Performance standards answer the following questions:

- How timely must the task be performed?
  Or
- How accurately must the task be performed?
  Or
- With what quality must it be performed?
  Or
- What response or outcome must be achieved?

When a performance standard is quantifiable, successful performance is more easily demonstrated. For example, in the following task statement, the criteria for successful performance is to return system loading to within normal operating limits, which is a number that can be easily verified.

> Given a System Operating Limit violation on the transmission system, implement the correct procedure for the circumstances to mitigate loading to within normal operating limits.

Even when the outcome of a task cannot be measured as a number, it may still be observable. The next example contains performance criteria that is qualitative in nature, that is, it can be verified as either correct or not, but does not involve a numerical result.

> Given a tag submitted for scheduling, ensure that all transmission rights are assigned to the tag per the company Tariff and in compliance with NERC and NAESB standards.

This is a copy of the questions found on the electronic comment form used to collect feedback on Draft 3 of PER-005-1 — System Personnel Training. This list of questions has been provided to make it easier for groups to draft their comments before submitting them electronically and should not be used to submit comments.

When you are ready to submit your comments, please transfer the comments to the electronic form and submit by April 9, 2008. If you experience problems using the electronic comment form, please contact Barbara Bogenrief at 609-452-8060.

1. FERC Order 693 directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The SPT SDT revised R1 to identify the essential components of a systematic approach to training. Do you agree that this requirement now clearly describes the minimal components that must be included in a systematic approach to training? If not, please explain in the comment area.

   ☐ Yes
   ☐ No
   Comments:

2. The SPT SDT revised R3 for emergency operations training. The drafting team believes that each company's list of reliability-related tasks (from R1.1) will include tasks related to emergency operations such that the task list developed to meet R1 can be used to identify the training needed to meet R3. If you disagree, please explain in the comment area.

   ☐ Yes
   ☐ No
   Comments:

3. Do you agree with the revised Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes
   ☐ No
   Comments:

4. Do you agree with the revised Violation Severity Levels for each of requirement in the revised standard? If not, please explain in the comment area.

   ☐ Yes
   ☐ No
   Comments:

5. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

   ☐ Yes
   ☐ No
   Comments:

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

The System Personnel Training Standard Drafting Team (SPT SDT) thanks all commenters who submitted comments on the third draft of the standard. This standard was posted for a 45-day public comment period from February 25, 2007 through April 9, 2007.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

1. FERC Order 693 directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The SPT SDT revised R1 to identify the essential components of a systematic approach to training. Do you agree that this requirement now clearly describes the minimal components that must be included in a systematic approach to training? If not, please explain in the comment area.

Organization	Question 1:	Question 1 Comments:
FRCC	No	Although FERC required the SAT methodology in Order 693, it was not defined. The previous version of the standard did include, (analysis, design, development, implementation and evaluation) components of what at SAT should include. These have been removed and now it seems that "systematic approach" is an ambiguous term. The requirement states that the RC, BA and TOP shall "use" a systematic approach. Are the requirements 1.1, 1.1.1, 1.2, 1.3 and 1.4 the components of such an approach? If so, why not delete the term and just have the requirements which cover each of the components?
California ISO	No	Stating that the FERC mandated SAT methodology must be used is sufficient. The SAT methodology already includes the components listed in the sub-requirements. We suggest eliminating all the sub-requirements to R1.With R1 modified to eliminate the sub-requirements, we recommend re-writing R2 as shown below.R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform reliability-related tasks at least one time. [Risk Factor: High] [Time Horizon: Long-term Planning]We suggest that R2.1 be modified to allow extra time for employees who were absent from work and were unable to be trained within the six month time frame.R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks. The six-month time frame is applicable only to those employees who were not absent from work and who were able to attend the formal training sessions. An additional six months for evaluating System Operator's capabilities shall be granted for employees who were unable to attend formal training due to absence from work.
Ohio Valley Electric Corporation	No	R1.2 & R1.3 could be interpreted to exclude the use of contractors for designing and developing learning objectives and training materials. R1.2 & R1.3 should be revised so as not to imply that outside contractors could not be used. The evaluation of training stated in R1.4 is a good statement and good training practice. However, there has been no assessment or evaluation of the effectiveness existing training programs required by PER-002, R3 that has been in affect for over three years. Why create a standard to mandate a new training program when no assessment has been made of the effectiveness of existing training programs? The work to create a new training standard is not a judicious use of resources in order to strengthen the reliability of the bulk electric system. FERC, with its Order, is trying to direct the outcome of the stakeholder process without participating in the same process that the stakeholders must use. The standards development process loses its integrity if the outcome is directed or predetermined and stakeholder input is not considered.
firstenergy	Yes	
Bonneville Power Administration	Yes	
tampa electric company	No	The previous version of the standard did include, (analysis, design, development, implementation and evaluation) which are components of what at SAT should include. These have been removed and now it seems that "systematic approach" is an ambiguous term, unless creating the task list is what the SDT considers a systematic approach to training.
Operating Reliability Working Group (ORWG)	Yes	
LCRA	No	The requirement requires transmission operators to create a list of company specific reliability related tasks. What are they exactly? That's a very subjective term. Who decides? If the transmission operator training staff decides what will be critical, and thus what they will be audited on, then it behooves them to keep that list as short as possible. The fewer tasks on the list, the less one is responsible for. I do agree that the systematic approach is the best way to go, but not when you are attempting to tie it to a task list that is completely subjective. That makes no sense whatsoever.
Sacramento Municipal Utility District	Yes	
Northeast Utilities	Yes	R1 describes the SAT process (Analysis, Design, Develop, Implement, and Evaluate) well. What guidance determines "BES company-specific reliability-related tasks"?

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 1:	Question 1 Comments:
Response:		
CAISO	No	This is a general comment regarding PER-005. The following statement from R2 has a typo error. I believe the word "or" should have been "of". Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each or its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time.
NPCC Regional Standards Committee	No	NPCC participating members wish to thank the drafting team for accepting our comment related to the SAT from the last posting--"We continue to disagree that using a Systematic Approach to Training to develop a training program is a reliability requirement. Reliability standards need to address the "what", not the how, despite the FERC Order." The lower case acronym that now appears in the standard seems to have alleviated some of the concern with some of the NPCC RSC members. However we request the drafting team further clarify the standard to ensure that the requirement to use a "systematic approach to training" does not dictate a specific type of training program, such as the 5 principles in the SAT, as long as requirements in R1.1 to R1.4 are fully met. In fact, R1 should simply be stipulated as: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall establish a new or modify an existing training program(s) for the BES company-specific reliability-related tasks performed by its System Operators."
Manitoba Hydro	Yes	Manitoba Hydro agrees that a Systematic Approach to training be used in developing new training programs.
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	We agree that R1 does identify the essential components of a Systematic Approach to Training (SAT). However, we found the statement that SAT must be used "to establish a new or modify an existing training program(s)" to be ambiguous. Clearly, if a company creates a new course or undertakes a modification to an existing course, then SAT must be followed. But does this statement require that ALL existing training programs (whether modifications are planned or not) be adjusted to be consistent with SAT? R1 needs to be reworded to eliminate this ambiguity. Furthermore, the development of reliability-related system operator tasks is a crucial starting point for the SAT process. R1 requires that these tasks be company-specific and related to the Bulk Electric System (BES). However, BES still has not been adequately defined to a level that would provide direction to companies for developing their own reliability-related tasks.
MidAmerican Energy Company	Yes	
Grant County PUD	Yes	The revised Requirement R1 does identify a minimum subset of the components of the Systematic Approach to Training with out actually naming them. Analysis, Design, Development, Implementation and Evaluation. These elements are very well understood in other industries such as nuclear power and have been in use for many years. It's not clear why you would choose not to simply use the existing model and not try to reinvent the wheel? It's also notable that the previous version had reference to a "Generic Task List" which could prove very useful and informative for those who are struggling with the analysis phase of SAT. This reference to the GTL was struck out in the new redline of the standard. This is unfortunate because entities with little expertise in SAT will have to start from scratch with their job/task analysis instead of having a point of departure for design and development. This is not to encourage wholesale use of a generic task list but perhaps the availability of a generic task list and guidance to customize it for use on an entity specific basis would provide a smoother transition to the Systematic Approach.
Cowlitz County PUD No. 1	Yes	
Arizona Public Service Company	Yes	
The Detroit Edison Company	Yes	
E.ON U.S.	No	E.ON U.S. generally supports the intent of the PER-005 standard, but it does not believe that following the Systematic Approach to Training as defined in the DOE document is appropriate in all instances. The DOE reference document is geared for training programs that relate to nuclear power operators which require a virtually fail safe redundancy. While E.ON U.S. acknowledges that formal operator training is essential for the safe and reliable operation of the electricity system, it is concerned that any incremental reliability gains derived from implementing the SAT document may not be worth the substantial cost for companies and their customers. E.ON U.S. believes that utilities should have the ability to outline and tailor their training programs to reflect the unique characteristics of their systems and the unique circumstances that each operator is likely to confront in the operation of the system. Many parties already have developed and will continue to conduct extensive and highly effective training of their operations staff. Absent some demonstration of substantial incremental

Organization	Question 1:	Question 1 Comments:
		benefit, a standard requiring utilities to start from scratch with a formal SAT process will be unjustifiably burdensome, distracting, and require a complete reallocation of already limited resources, all to the potential detriment of continued safe and reliable operations. E.ON U.S., as well as many other parties, currently train their system operators through many processes. For E.ON U.S., all new hires are required to complete a structured training program that covers all areas of operations during normal and emergency system conditions. This training is in the form of structured classroom and/or NERC certified vendor training plus direct instruction from supervisory operators through the use of actual control room equipment and, where appropriate, simulators. No operator is allowed to independently work until the supervisory personnel has certified that training has been completed and the employee has satisfactorily demonstrated proficiency in all identified tasks through the successful completion of a rigorous testing program.. All existing operators that have been certified as being proficient at a journeyman level will receive annual refresher instruction and training, both through vendor and simulator training programs to, again, guarantee that operators have a mastery of all tasks required of them. E.ON U.S. believes, therefore, that its current training program, while not identical with the DOE SAT process, achieves the same goals and objectives of having well-trained and proficient system operators in place, and in maintaining a rigorous training regimen to keep those skills at the highest attainable levels. Such a program provides systematic, company specific training programs and processes that meet the requirements of PER-005. Companies should be able to demonstrate that their training programs are equal or superior to programs that are identified in the SAT process. Identification of critical tasks and training necessary to ensure that system operators possess the skills necessary to complete the task is utility specific. Employing a cookie cutter approach as identified by the SAT process seems to largely ignore utility differences. Existing training programs should not be overhauled by use of the SAT unless these programs prove to be deficient.
SERC OC Standards Review Group (Project 2006-01)	No	We agree that R1 does identify the essential components of a Systematic Approach to Training (SAT). However, we found the statement that SAT must be used "to establish a new or modify an existing training program(s)" to be ambiguous. Clearly, if a company creates a new course or undertakes a modification to an existing course, then SAT must be followed. But does this statement require that ALL existing training programs (whether modifications are planned or not) be adjusted to be consistent with SAT? R1 needs to be reworded to eliminate this ambiguity. Furthermore, the development of reliability-related system operator tasks is a crucial starting point for the SAT process. R1 requires that these tasks be company-specific and related to the Bulk Electric System (BES). However, BES still has not been adequately defined to a level that would provide direction to companies for developing their own reliability-related tasks. A major point of confusion is the discrepancy between BES (NERC terminology) and the FERC terminology (Bulk Power System? BPS) as described in the Energy Policy Act of 2005. BPS has a much broader and inclusive definition, which makes it extremely difficult for an entity to determine if its training program meets the R1 requirement. We suggest the inclusion of an Appendix in this standard that formally defines the SAT/ADDIE process. While R1.1? R1.4 does allude to the basic elements of the process; this may not be obvious to those without a background in training. The Appendix would clearly describe each step required by the systematic approach to training, and bring everyone who must comply with this standard to a basic level of understanding.
Hydro One Networks - Reliability Standards Group	No	(do not wish to specify Yes or NO for this question)R1.4 needs a time frame in which each entity must conduct an evaluation of their training program.
American Transmission Company	Yes	In general we agree with the approach described.
Gainesville Regional Utilities	No	FERC and NERC describing in detail How training is accomplished and documented seem to be taking things to an extreme that is not necessary.
Niagara Mohawk (DBA National Grid)	Yes	The lower case acronym that now appears in the standard seems to have alleviated some of our concerns. However we request the drafting team further clarify the standard to ensure that the requirement to use a "systematic approach to training" does not dictate a specific type of training program, such as the 5 principles in the SAT, as long as requirements in R1.1 to R1.4 are fully met. In fact, R1 should simply be stipulated as: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall establish a new or modify an existing training program(s) for the BES company-specific reliability-related tasks performed by its System Operators" since R1.1 thru 1.4 describe the training development "process".
WECC Reliability Coordination Comments	Yes	

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 1:	Question 1 Comments:
Work Group (RCCWG)		
PSEI	No	Since the new wording includes "BES company-specific reliability-related tasks" we have now bought into regional differences as each region is responsible to decide their definition of BES. They have done this in a FERC filing (Docket No. RM06-16-000). What if a company does not have any tasks that are BES related as defined by their region? Will an auditor accept that it does not apply and therefore the entity does not need a training program? Requiring an administrative burdensome process for all training does not help smaller companies. They lack staff. Perhaps the training standard should only apply to those companies that are CEH providers. System Operators are already required to obtain and maintain certification. Let companies decide the skill level of their operators without an administrative nightmare.
Southwest Power Pool - Operations Training Working Group	Yes	
CECD	Yes	
PJM Interconnection, LLC	No	R1 without the sub-requirements is sufficient to meet the FERC directive. The sub-requirements go outside the scope of the standard and merely describe some elements of the SAT methodology itself. The SAT methodology is a well established, widely used training standard in the industry which does not need to be described in detail in the NERC Standards.
Salt River Project	Yes	
Pacific Gas and Electric Company	Yes	
Xcel Energy	Yes	
MRO NERC Standards Review Subcommittee	No	A systematic approach to training is a clearly developed process used in many programs. Some entities may interpret this to refer to the DOE SAT methodology, which is incorrect. The MRO suggests wording to clarify R1: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use asystematic approach to training as outlined in the sub-requirements below, to establish?" R1.1.1 states "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall update its list of BES company-specific reliability-related tasks" Replace 'update' with 'review and update as necessary'
Allegheny Power	Yes	
Public Service Commission of South Carolina	Yes	
WECC Operations Training Subcommittee	Yes	
ISO New England Inc.	Yes	
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	Yes	We agree that the description for the SAT methodology clearly describes the minimal components required. We do have concern with the use of the term "company specific". Does this infer that each company has a composite listing or can each function (business unit) within a company maintain their own listing?
AEP	Yes	
ERCOT Inc.	No	R1 without the sub-requirements is sufficient to meet the FERC directive. The sub-requirements of R1 are not only unnecessary; as written they are detrimental.
We Energies	Yes	
Santee Cooper	No	R1 states "? Shall use a systematic approach to training to establish a new or modify an existing training program(s)". Does this imply that all previous training is to be modified to fit SAT? A training module should only need to be modified to fit the SAT process if it is used again after this standard is approved. All past training that is not used after this standard is approved should not have to be modified. See below for recommended wording. We agree that R1 describes the minimal components that should be included in a training program. Recommend including as an attachment to the standard the System Operator Training Reference Document. We recommend removing

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 1:	Question 1 Comments:
		the words "BES company-specific" to avoid confusion. R1 would read simpler as "Each RC, BA, and TOP shall use a systematic approach to training to establish a new training program for reliability-related tasks performed by its System Operators. Existing programs that do not follow the SAT model should ensure future training conforms to the SAT process."
BCTC	No	The concept for Systematic Approach to Training is understood but it is not clear what the BES company-specific reliability-related tasks performed by System Operators would be. This would be too open to interpretation by an audit team.
Pepco Holdings, Inc. - Affiliates	No	Change the wording in R1 to emphasize the training program before establishing the method of development. For example --Each RC, BA and TOP shall establish a new or modify an existing training program using a systematic approach etc. The change in emphasis would make it easier to state VSLs as shown in 4 below.
Baltimore Gas & Electric	Yes	
New York Independent System Operator	Yes	
FirstEnergy	No	Although we agree that the minimum training needs of personnel are identified, we have the following concerns/suggestions: 1. The standard does not require minimum training needs for the trainer. Adding a subrequirement to assure the trainer is adequately trained will support the BES reliability through the assurance that training personnel will have the knowledge and skills they need and will add to the quality of the training delivered. Even though this is considered to be outside the scope of the SAR, adding a requirement to "train the trainer" will demonstrate the importance of flexibility in NERC's standard development process that does not always exist today. While we understand that SDT's should not be given complete freedom to significantly diverge from the SAR scope, there needs to be some flexibility for teams to adjust the scope based on industry feedback. In the end, all new or revised standard requirements are voted on regardless of the exact SAR scope. We believe the SDT teams should not be rigidly bound by the SAR scope, but rather have enough flexibility to adjust based on subsequent direction from FERC on other standards projects or valid input, agreed upon by the SDT, that is received from industry during the development of the standard although not explicitly stated in the original SAR scope. Our suggested change to "train the trainer" has precedence from direction received from FERC based on its Order 706 regarding the CIP standards. Please refer to paragraph 435 of Order 706.2. We feel that R1.4 may need to be expanded. Per R1.4, an evaluation of the training program is required; however, it does not specify what to do with the results of such evaluations. We suggest revising R1.4 and adding the following subrequirements: R1.4. The Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation of the training program established in R1. R1.4.1. The Reliability Coordinator, Balancing Authority, and Transmission Operator shall annually review the evaluations of their delivered training to identify needed changes to their training program.R1.4.2. The Reliability Coordinator, Balancing Authority, and Transmission Operator shall implement the training program changes identified in R1.4.1 within 12 months of that review.
Duke Energy Corporation	No	We have significant concerns with the current draft of PER-005-1. While the concept of a systematic approach to training? Is valid, the implementation of the concept as envisioned in the current draft cannot be accomplished with the precision and clarity necessary for a mandatory reliability standard. A process-driven approach like the systematic approach to training is better handled outside of reliability standards. We need specific requirements that are clear and consistently enforceable in the standards. The critical first step of the ?systematic approach to training as stated in Requirement R1.1, is to create a list of Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators. The previous draft of PER-005-1 listed literally hundreds of tasks. The development of a company-specific list is a subjective endeavor. It is highly likely that auditors would consistently disagree with the composition of any responsibility entity's list, and hence find them in violation of a medium risk factor requirement. Ambiguous requirements have no place in a mandatory reliability standard. A better approach would be to capture in this standard the continuing education requirements and categories by type of NERC certification. Operators should be required to pass the appropriate NERC certification examination, and maintain that certification with NERC-approved continuing education training hours. For example the current requirement is 200 hours over a three-year period for Reliability Coordinators. The initial letter from Mark Fidrych stating the company requirement for the five-days of emergency operations training, established in PER-002 R4 and further defined as 32 hours currently identified in R3 of PER-005-1 should be put into the standard and counted toward the system operator certification training requirements as a third category of hours along with Simulation and Standards to maintain certification. Why have a completely separate set of training requirements not part of the continuing education process? It makes for separate record keeping and confusion. With the consolidation of

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 1:	Question 1 Comments:
		the PER-002, 003 and 004 into PER-005, it makes further sense to consolidate the emergency hour's requirement into the credential maintenance program.
Ontario IESO	No	We would ask the SDT to clarify that the requirement to use a "systematic approach to training" does not dictate a specific type of training program, as long as requirements in R1.1 to R1.4 are fully met. As we have commented in the past, we believe standards should dictate what and not how. If this clarification is made, the IESO would support the standard. However, if the "systematic approach to training" indeed dictates the use of a specific type of training program, then we would request the SDT to demonstrate how it can be determined that a training program developed using other methods is not acceptable if the subrequirements R1.1 to R1.4 are fully met.
Midwest ISO Stakeholder Collaborators	Yes	In general, we agree that R1 describes the components that must be included in a systematic approach to training. However, we do believe the requirement could be improved further by adding the following clause after the word training in the second line of R1.as outlined below

2. The SPT SDT revised R3 to identify the training requirements and the various techniques/tools that can be utilized to conduct the training. In utilizing a systematic approach to training as described in R1, would you agree that the task list developed in R1.1 would be utilized to conduct the training required in R3? If not, please explain in the comment area.

Organization	Question 2:	Question 2 Comments:
FRCC	No	The statement "using training, drills, exercises, and hands on training using simulators" is vague. What is meant by training since the items that follow it are forms of training? Does the responsible entity have to prove that all of these forms of training were used for every class, or just over the entire 32 hours. It appears that the only particular term identified for emergency operations training that is a "must" is system restoration. Is that correct? And if so, do all of the forms of training identified apply specifically to system restoration? This requirement needs to be clarified.
California ISO	No	We've recommended that the sub-requirements for R1 be eliminated. We believe R3 should be modified to allow any combination of "training, drills, exercises, and hands on training using simulators" instead of mandating that all must be used.
Ohio Valley Electric Corporation	No	Emergency operations training should not be limited to the task list developed in R1. Many emergency operations topics are related to concepts and not tasks. R1 can be used to identify some emergency operations training topics but will not cover all the topics that could qualify as emergency operations training. There is insistence by FERC that the use of simulators be explicitly required and that the requirements be applicable to local control center personnel. FERC offers no justification as to why this is necessary but it is also not immune from its requirement to engage in reasoned decision-making and provide justification. The required use of simulators creates undue hardship for many smaller entities, especially those with limited staffing. The purchase, operation, and model maintenance of a simulator is not an inexpensive proposition. Additional staffing for this purpose will be required. Likewise, there will be a considerable expenditure for training resources, either internal or external. FERC however did state that smaller entities that have no impact on the BES should not be required to have simulators, but no definition of small entity has been offered. Suggest removing the "hands on training using simulators" wording from R3.PER-002 R4 currently defines emergency operations training clearly and is well understood and successfully implemented by the entities required to provide this training. PER-005 R3 should be revised to the existing wording found in PER-002 R4.
firstenergy	No	R1.1 did not exist in draft 3 of the standard.
Bonneville Power Administration	Yes	
tampa electric company	No	I feel should be reworded to state "using training, drills, exercises, and hands on training using simulations" instead of simulators as many smaller and larger companies do not have the staff or resources to support simulators. Also, R3 does not address a new hire that starts mid year or a trainee who is released late in the year. Do these individuals have the same 32hr requirement even though they do not have a year to complete it?
Operating Reliability Working Group (ORWG)	Yes	
LCRA	No	The emergency training requirement should be removed from this standard and moved to certification/CE program. Right now CE requirements are tracked on a 36 month rolling calendar while the annual emergency training requirement is tracked on a 12 month annual calendar. You are confusing people and making it much more difficult to keep track of it all.
Sacramento Municipal Utility District	Yes	
Northeast Utilities	Yes	No specific duration associated with system restoration training. Should there be a minimum number of hours per year for system restoration training?
CAISO	No	No comment
NPCC Regional Standards Committee	Yes	
Manitoba Hydro	Yes	Manitoba Hydro agrees that a company's list of reliability related task which include tasks related to emergency operations be used to identify training needs.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 2:	Question 2 Comments:
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	As stated in the response to Question 1, we are uncomfortable with the R1 requirement to create reliability-related tasks for the operation of the Bulk Electric System. The information needed to effectively develop the subset of tasks related to emergency operations is insufficient.
MidAmerican Energy Company	Yes	
Grant County PUD	Yes	
Cowlitz County PUD No. 1	Yes	
Arizona Public Service Company	Yes	
The Detroit Edison Company	Yes	We believe the use of "simulators" is too restrictive and "simulations" should be used instead. Simulations can occur without the use of simulators.
E.ON U.S.	Yes	No comment
SERC OC Standards Review Group (Project 2006-01)	No	As stated in the response to Question 1, we are uncomfortable with the R1 requirement to create reliability-related tasks for the operation of the Bulk Electric System. The information needed to effectively develop the subset of tasks related to emergency operations is insufficient. Clarify what the twelve months - is it an annual basis or a rolling 12 month = a calendar year vs. a credential year. In addition, we feel that the phrase in R3: At least every 12 months...? Is open to different interpretations. Must each system operator be provided with 32 hours of emergency training within every calendar year or within every credential year?R3 further implies by the phrase applicable to its organization that only system-specific training can be used for the 32-hour annual emergency training requirement. This wording needs to be changed to make it clear that, while system-specific training is needed, generic training on emergency operations is also allowed in the 32 hours. We also suggest that, in R3, the phrase and hands on training using simulators be changed to and/or hands on training using simulators to clarify that use of a simulator is not required for all training, drills or exercises (for example, table-top drills are allowed as well).
Hydro One Networks - Reliability Standards Group	No	Do not assume each company's list of tasks will include emergency operations and system restoration. Perhaps include these items in brackets in R1.1, and/or in requirement 3 refer to the list tasks in R1. Join R1 and R3 in someway other than assuming an entity/company will.
American Transmission Company	Yes	TC agrees with the SDT that the task list required by R1 can be used to identify those emergency operation tasks which can be used to satisfy R3.
Gainesville Regional Utilities	No	Not necessary
Niagara Mohawk (DBA National Grid)	Yes	
WECC Reliability Coordination Comments Work Group (RCCWG)	Yes	
PSEI	No	The new wording says "applicable to its organization". This just eliminated a lot of vendor training as it is generic. Small companies that do not have training staff rely on vendors to meet the current requirement. They also do not have the time and staff to specifically link a vendor's course to specific tasks. Emergency training can be and is valuable without burdening companies by requiring all to be company specific.
Southwest Power Pool - Operations Training Working Group	Yes	We believe this is true, but there are certain tasks that may be required as emergency training which falls under the general list of emergency training as indicated by Mark Fiddich's letter of March 2nd, 2004 that is not expressed by Requirement 1 of company specific related tasks.
CECD	Yes	

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 2:	Question 2 Comments:
PJM Interconnection, LLC	No	No list is required, as we recommended the elimination of the sub-requirements in R1. In addition, the type of training mandated is too definitive. The standard should read, “using a combination of training, drills, exercises, or training simulators.” This allows the registered entity to structure a program based on their specific needs and resources.
Salt River Project	Yes	
Pacific Gas and Electric Company	Yes	
Xcel Energy	No	We recommend that the wording of R3 be slightly modified to clarify that entities may use any of the training methods listed, and not necessarily required to use ALL of them. Here is how we suggest it should read: R3. At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration)using any of the following methods: training, drills, exercises, and hands on training using simulators.
MRO NERC Standards Review Subcommittee	Yes	The MRO understands the SDT to be saying that the emergency operations tasks identified in R1.1 can be used in R3. If that is correct the MRO agrees. If this is not the intent of the SDT, please clarify.
Allegheny Power	Yes	
Public Service Commission of South Carolina	Yes	
WECC Operations Training Subcommittee	No	Training applicable to the organization should be removed, due to lack of clarity which may lead to multiple interpretations and multiple definitions of "applicable"
ISO New England Inc.	Yes	
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	Yes	We agree that the list of reliability related tasks previously identified by the entity can be used to identify the training to meet R3. We have a concern with the description of the training methods, especially that it includes the apparent requirement to use hands on training simulators. The way this is written it indicates that the use of simulators is required. If that is the intent then we disagree with the requirement. If it is not the intent then strike the use of example entirely or clarify that the training "may include methods such as." Additionally, must all of the 32 hours be comprised of drills, exercises and hands on training using simulators?
AEP	Yes	We believe this is true but it should not harbor the intent that all emergency training should only be in conjunction with reliability tasks. Some tasks relate to emergency training which are indirect subsets of the reliability tasks. All emergency training done for the 5 days of emergency training should be considered satisfactory training whether directly or indirectly related to a reliability task. The present guidelines for emergency training topics identified by the Personnel Sub-committee in Mark Fydrich’s letter of March 2, 2004 on recommended training topics should remain the guidelines for emergency training topics.
ERCOT Inc.	Yes	The 32 hour requirement should be removed. The 32 hour requirement was an interim fix to address the absence of a SAT process in many organizations, and for political expediency. With the implementation of SAT, arbitrary mandates are no longer needed. If the 32 hour requirement remains, then the equivalent of the Fidrych letter of 2004 needs to be provided.
We Energies	Yes	The company's task list will not identify all of the allowed emergency operations training topics.
Santee Cooper	No	R3 reads" using training, drills, exercises, and hands on training using simulators". Santee Cooper agrees with R3 if the "and" is changed to "or". As it is currently written it could be misconstrued to mean that simulators have to be used for all 32 hours. In addition, Santee Cooper is concerned that a company's interpretation of what is considered emergency operations training could be questioned by an auditor without some further clarification of topics that can be included in emergency operations training (Fidrych letter). We also ask the SDT to clarify "at least every 12 months". Is this on an annual basis as currently defined in PER002? It could be rewritten to read "On a per year basis each RC, BA, and TOP shall provide?”
BCTC	No	The Standard now states that at least 32 hours annually of emergency operations training applicable to its organization. The way this is written suggests that emergency operations training is now limited to only company specific issues and that would disqualify much of the Emergency Operations training done with other organizations or contractors / vendors. If this interpretation is correct this would be very limiting and it would be difficult to get 32 hours accomplished. We suggest the original wording in PER-004 is sufficient and just change 5

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 2:	Question 2 Comments:
		days to 32 hours. It is not clear when a 12 month interval starts and stops for each System Operator as written in the Standard. Is this meant to allow each System Operator to have a different 12 month window so the measure could be tied to a Certification yearly window?
Pepco Holdings, Inc. - Affiliates	Yes	Requirement 3 should specifically state that the tasks related to emergency operations should be taken from the list developed for Requirement 1 In addition R3 should be revised to say "using any of the following: training classes, drills, exercises or hands on training using simulations" rather than training, drills, exercises and hands on training using simulators. This allows for training classes which can still be a valuable type of emergency ops training and other types of simulation experiences as well.
Baltimore Gas & Electric	Yes	
New York Independent System Operator	Yes	
FirstEnergy	Yes	
Duke Energy Corporation	No	See response to question #1 above. Also on R3, the phrase "using training, drills, exercises and hands-on training using simulators" should be changed to "using training, drills, table-top exercises or hands-on training using simulators". This change recognizes that training may be accomplished using one or more of these methods, and that hands-on training using simulators is not required for all entities (FERC Order No. 693, paragraphs 1390 - 1393).
Ontario IESO	Yes	
Midwest ISO Stakeholder Collaborators	No	We agree that the company's list of reliability-related tasks from R1.1 will include tasks related to emergency operations which will certainly facilitate identifying the training required for R3. As R3 is currently written, however, R3 creates the potential for small registered entities to expend significantly more funds for emergency operations training than they will realize in actual value. This is directly due to the requirement to include hands on training using simulators. In Order 693, FERC even recognized that smaller registered entities that have little impact on the BES should not be required to have a simulator or simulator training. FERC stated that the requirement to have a simulator or simulator training should consider the entities role and size. If the word simulator was changed to simulations or the word or was used instead of and in the list, the requirement would satisfy the consideration FERC gave these small entities in Order 693.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

3. Do you agree with the revised Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

Organization	Question 3:	Question 3 Comments:
FRCC	Yes	However, It appears that the measure after M1.3 that is identified by M1. should really be M1.4 And, if the requirements change based on industry comments the measurements will need to be reevaluated and modified.
California ISO	No	We recommend the following:M1: Delete all M1 sub-measures, since we believe all R1 sub-requirements should be eliminated.M2: Delete references to R1.1
Ohio Valley Electric Corporation	No	The emphasis on documentation in this standard does not seem conducive to improved reliability, as a previous commenter from Draft 1 of this standard observed. The measures may provide an incentive to create documents, but are there mechanisms in the compliance process to distinguish between an entity that is providing the appropriate training and documenting it versus an entity that is merely creating documents? Similarly, an entity may be taking all of the right steps, providing the necessary training, but lacks having all of the mandated documentation (perhaps because of a lack of resources to maintain the documentation). Between the paper-creating entity and the proper training entity, which is in compliance and more importantly which is more reliable? Some may comment that without documentation there is no way to measure compliance. While compliance auditors will certainly look at documentation they make no attempt to compare the contents of the documentation with actual practices. If the documentation contains the right words, the entity is deemed to be in compliance, regardless of whether the words in the documents were put into practice. Thus, if compliance can be verified by observing the actual practices, then why is the documentation even needed?
firstenergy	Yes	
Bonneville Power Administration	Yes	
tampa electric company	Yes	
Operating Reliability Working Group (ORWG)	Yes	
LCRA	No	If I do not agree with the task list in the first place, it only follows that I would not agree with the measures. The measures themselves create an administrative nightmare for smaller utilities with respect to record keeping. There seems to be a disconnect on NERC's part as to how much the "one man shops" can handle. Not every utility in NERC has a large, complex training staff. In fact, many have one trainer, or even none. What is proposed by this standard will make training unmanageable.
Sacramento Municipal Utility District	Yes	
Northeast Utilities	Yes	
CAISO	No	No comment
NPCC Regional Standards Committee	Yes	
Manitoba Hydro	Yes	Manitoba Hydro agrees with the measures.
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	Section C of this standard indicates that responsible entities will be measured on specific items of evidence that demonstrate use of the SAT. However, many of these items are not explicitly stated in the standard requirements themselves. For instance, Measure M1.4 lists evidence such as instructor observations and learning assessments that were not previously identified in R1.4. In addition, some items of evidence for measuring entity performance are not part of the SAT process at all - for example, audit results and supervisor feedback. The requirements section of this standard needs to be reworded to better define what specific items of evidence are required.
MidAmerican Energy Company	No	Some training materials will be the property of third party providers of learning activities. Not all training materials will be developed by entity that developed the task list as suggested in M1.2. M1.2 should modified to "...have available for inspection its learning objectives and any training material self-supplied as specified in R2.2Based on what I have heard, the records kept in the NERC data base can not be accessed by anyone other than the system operator. M1.3 should be modified to read, "... showing the names of the people trained, the title of the training received and dates received to show that its operators received the training specified in R1.3 (2.3)
Grant County PUD	No	I note that there is a new requirement R2 which appeared suddenly with this version. You don't seem to be taking comments directly on

Organization	Question 3:	Question 3 Comments:
		this new addition though. Is this in accordance with the ANSI process for standards development? The proposed new R2 and its associated measure require a new verification of operator capability to perform the tasks identified in R1 at least one time. This verification is very different from the previous requirement to perform a training needs analysis based on performance mis-matches. What is the time period allowed to do the initial verification. Since the proposed effective date is 36 months after date of approval, should one assume that entities must be in compliance at that time with the requirement to do the initial one time verification? Please explain the point of doing this verification of capabilities only once? This seems to miss the boat on the benefit of refresher training. The only requirement will be to train when a new task is identified or an existing one is modified. Thus, an entity would be absolved from providing any refresher for operators on tasks that have not changed but which may be very difficult, highly important to be done correctly and performed only infrequently? This doesn't seem to meet the needs of system operators who are an essential element in maintaining bulk electric system reliability. Does this one time verification remove the 3 year certificate renewal cycle? If not, how does the one time verification fit into the overall systematic approach to training? What's the difference between the one time verification and initial certification? If you still have to renew your certificate every 3 years, doing this verification (at least one time) makes no sense because a systematic approach to training would revisit training on tasks based on the results of the Difficulty, Importance, and Frequency (DIF) analysis.
Cowlitz County PUD No. 1	Yes	
Arizona Public Service Company	Yes	M2 is unclear to me. The way I read it, within 36 months of the standard's approval, each operator must be evaluated on each assigned task, even if they are experienced incumbents. This may be done in one of three "methods": Training records, Supervisor check sheets, or Learning assessments. These "methods" are open to interpretation. To me, they mean the following: Training records = training on the task is provided and evaluated and the attendance sheet and grade is archived Supervisor checklist = floor supervisor sees operator perform task satisfactorily and marks it complete on a tracking sheet. Learning assessment = an operator successfully answers questions about a given task. Somebody may interpret those methods entirely differently. We need to understand the expectations, or the audit will be needlessly painful.
The Detroit Edison Company	No	We believe M1.2 should read: Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and a representative sample of training materials with all training materials available at the business location, with the date of the last revision, as specified in R1.2.
E.ON U.S.	Yes	
SERC OC Standards Review Group (Project 2006-01)	No	Section C of this standard indicates that responsible entities will be measured on specific items of evidence that demonstrate use of the SAT. However, many of these items are not explicitly stated in the standard requirements themselves. For instance, Measure M1.4 lists evidence such as instructor observations and learning assessments that were not previously identified in R1.4. In addition, some items of evidence for measuring entity performance are not part of the SAT process at all - for example, audit results and supervisor feedback. The requirements section of this standard needs to be reworded to better define what specific items of evidence are required.
Hydro One Networks - Reliability Standards Group	Yes	
American Transmission Company	Yes	
Gainesville Regional Utilities	No	
Niagara Mohawk (DBA National Grid)	Yes	
WECC Reliability Coordination Comments Work Group (RCCWG)	Yes	The WECC RCCWG agrees with the revised Measures, assuming that there would be a 12 month requirement for emergency training for new hires. Please clarify this is a correct assumption.
PSEI	No	This process should only apply to those entities that are NERC approved providers awarding CEHs.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 3:	Question 3 Comments:
Southwest Power Pool - Operations Training Working Group	Yes	
CECD	Yes	
PJM Interconnection, LLC	No	Due to the changes recommended above, all measures and sub-measures should be eliminated except for M1 and M3.
Salt River Project	Yes	
Pacific Gas and Electric Company	Yes	
Xcel Energy	Yes	
MRO NERC Standards Review Subcommittee	No	The MRO believes that the requirement in M1.2 to provide training materials could create an undo burden on the applicable entity if the audit was not conducted at the entity's site. The MRO recommends that this measure should be altered to reflect that concern.
Allegheny Power	Yes	
Public Service Commission of South Carolina	Yes	
WECC Operations Training Subcommittee	Yes	
ISO New England Inc.	Yes	
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	Yes	See the comment regarding "company specific" in question 1.
AEP	Yes	
ERCOT Inc.	No	M1 is fine, but as noted above M1.1 through M1.4 should be deleted along with R1.1 through R1.4. If R3 is changed, then M3 must be changed.
We Energies	Yes	
Santee Cooper	No	Santee Cooper feels that some of the items of evidence defined in the measures are not part of the SAT process (audit results, supervisor feedback). The SDT may have been trying to give some examples here but during an audit a company may be held to provide all the listed items as evidence. Including some words such as "shall have and provide upon request evidence that could include, but is not limited to" would help clarify that the list is examples only and that all items do not have to be provided during an audit.
BCTC	Yes	
Pepco Holdings, Inc. - Affiliates	Yes	Revise M1 to reflect the revised wording in R1 above. For example: Each RC, TA and TOP shall have available for inspection evidence of establishing a new or modifying an existing training program developed using a systematic approach to training. A 4th Requirement and a 4th Measure should be added - see our comments in 5 below
Baltimore Gas & Electric	Yes	
New York Independent System Operator	Yes	
FirstEnergy	No	M1.4 - The parenthetical examples are good to help with the compliance of R1.4, but entities may be tied down to these specific methods. Just to assure that other effective methods can be used, we suggest a rewording of M1.4 as follows: "The Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence that it performed a training program evaluation, as specified in R1.4 (evidence may include, but not limited to, instructor observations, trainee feedback, course evaluations, etc.)
Duke Energy Corporation	No	See response to question #1 above. All the requirements of this standard need to be revised and the measures should be developed to fit

Organization	Question 3:	Question 3 Comments:
		the revised requirements.
Ontario IESO	Yes	
Midwest ISO Stakeholder Collaborators	No	We are concerned that M1.2 could be burdensome. Specifically, what does have available for inspection mean? Training materials are often quite voluminous and can actually include systems such as simulators. We do not believe that the registered entity should be required to make these materials available for inspection off-site. We recommend modifying the measure to make it clear that inspection must occur at the location of the materials and systems to avoid this burden.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

4. Do you agree with the revised Violation Severity Levels for each of requirement in the revised standard? If not, please explain in the comment area.

Organization	Question 4:	Question 4 Comments:
FRCC	No	For R1, the Medium VSL states "…..evaluating its training program efectiveness to…" The word effectiveness is not in the requirement and is vague. What does effectiveness mean and how would it be evaluated. We would recommend removing the word effectiveness and sticking to what the requirement states. For the High and Severe VSLs, the phrase "when developing a new or modifying an existing training program" is used. These words are not in the requirements and we are unclear as to how they should be evaluated. There is not a requirement to modify the training program, only to conduct an evaluation of the training program to identify changes. This phrase added into the VSL descriptions seems to imply more than the requirements actually state. Either remove this phrase or modify the requirements to be more clear. For the Severe VSL do the words "…failed to deliver training based on the BES company specific reliability related task list." mean that every task must be trined on, or only tasks from the list, or you only have to include some of the list to get the check off? For R2, the first part of the requirement only requires that verification of the operators capabilities be done at least one time. There is no time period specified. Then later in the requirement it speaks to verification within 6 months of a modification of the tasks. It looks like having the VSL be high when the responsible entity fails to verify capabilities within 6 months of a change is in conflict with having 90-100% verification be a medium since its quite possible that more than 90% would be verified, even without verifying the changed capabilities.
California ISO	No	Since we recommended deleting all R1 sub-requirements, all references to the "task list" should be changed to "BES company-specific reliability-related tasks"
Ohio Valley Electric Corporation	No	The Violation Severity Levels are all skewed towards the severe level. The Violation Severity levels should be skewed towards the lower level.
firstenergy	Yes	
Bonneville Power Administration	Yes	
tampa electric company	No	I do not agree that any part of a training program should have high or severe VRFs.
Operating Reliability Working Group (ORWG)	No	Why is missing one new or modified task just as severe as missing 30% of the existing tasks in R2?
LCRA	No	
Sacramento Municipal Utility District	Yes	The VSL should be either eliminated or at a minimum moved to lowest VSL. The verbiage seems ambiguous and it is debatable that a BES risk exists.
Northeast Utilities	Yes	For R2, VSL states "At least 90% but less than 100% of its system operator's capability to perform each assigned task." Is the measure for number of system operators or number of assigned tasks?
CAISO	No	No comment
NPCC Regional Standards Committee	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Manitoba Hydro	Yes	Manitoba Hydro agrees with the revised VSL for each requirement.
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	All requirements of this standard need to be adequately defined before violation severity levels can be identified and applied.
MidAmerican Energy Company	Yes	
Grant County PUD	Yes	

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 4:	Question 4 Comments:
Cowlitz County PUD No. 1	Yes	
Arizona Public Service Company	Yes	
The Detroit Edison Company	No	Don and Mike to address.
E.ON U.S.	Yes	
SERC OC Standards Review Group (Project 2006-01)	No	All requirements of this standard need to be adequately defined before violation severity levels can be identified and applied.
Hydro One Networks - Reliability Standards Group	No	Where is the VSL for R1.1.1 (annual update to list of tasks)? As well, the VSL for R1.4 needs a time frame (see comment for question 1). Also, the VSL for R3 should be re-written based on number of hours of training completed or incomplete rather than % of operators trained. Having any operator untrained (less than xx hours/12 months) should be lumped into the Severe VSL.
American Transmission Company	Yes	R1 High VSL Suggested modification: Delete everything after "task list" Proposed language: The responsible entity failed to design and develop learning objectives and training materials based on the BES company-specific reliability related task list. The additional language in the draft does not appear in Requirement 1.2 and makes the VSL confusing. R1 Severe VSL. Suggested new language: The responsible entity does not have a task list in their systematic approach to training or The responsible entity failed to deliver the training as specified in their systematic approach to trainingR2 VSLATC would suggest that the SDT allow for the number of task to be a weight in the calculation of the percentages. Examples: Company a has ten operators and 100 tasks on their task list. Example: The responsible entity was unable to verify that two of its operator's were capable of performing 1 out of the 100 tasks listed in their SAT. (2 * 1) / (10 * 100) = .2% .2% - 100% = 99.8% The violation would fall in the Medium VSL. The way the current VSL is written it seem that the compliance auditor would use the following formula. 2 / 10 = 20%20% - 100% = 80% The violation would fall in the High VSLATC is requesting that both the number of operators and the size of the task list are included in the calculation for a VSL. R3 VSL ATC believe that both the number of operators and the amount of 32 hours not satisfied should be included in the calculation of the percentage. Examples: Company a has ten operators and each is required to have 32 hours of emergency operations training Example: The responsible entity verified that two of its operator's only completed 30 hours of emergency training. The remaining eight completed all the required hours. (2 * 2) / (10 * 32) = 1.25% 1.25% - 100% = 98.75% The violation would fall in the Medium VSL. The way the current VSL is written it seem that the compliance auditor would use the following formula. 2 / 10 = 20%20% - 100% = 80% The violation would fall in the High VSLR3 Severe VSL It is our interpretation that the list, specified in R3, are only examples of the types of training. (drills, exercises, and hands on training using, simulators) The language used in the Severe VSL for R3 seems to contradict our interpretation. If the SDT's intent of the list is to provide examples then we believe that the following language should be deleted. "The responsible entity did not include in its emergency training, the use of drills, exercises, and hands on training using simulators." Measure M3 seems to support our interpretation that it is only a list of examples.
Gainesville Regional Utilities	No	
Niagara Mohawk (DBA National Grid)	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
WECC Reliability Coordination Comments Work Group (RCCWG)	No	The WECC RCCWG believes that the Severe VSL for R3 should be worded as follows: "... The responsible entity did not include in its emergency training, the use of drills, exercises, OR (emphasis added) hands on training using simulators. The WECC RCCWG does not believe that all three types of training must be covered. Additionally, simulation can be accomplished without the use of a simulator.
PSEI	No	Administrative type violations should not result in High or Severe VSLs. Especially for the omission of a single task or piece of "evidence".
Southwest Power Pool - Operations Training Working Group	No	Most operators base their training schedules on a twelve month calendar instead of the six month limit as noted in the proposed standard on R2 High VSL. R3 High VSL makes no provision for hardships or mid-year hires.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 4:	Question 4 Comments:
CECD	Yes	
PJM Interconnection, LLC	No	The R1 VSL should be based on the overall number of training components or modules that an entity is non-compliant with in comparison to the size of its overall training program. For example, if an entity does not use the SAT methodology in two of its 50 training modules, the VSL would be lower than if its total number of courses was only 20.The R2 VSL should be eliminated, as recommended above. The R3 VSL statement? OR The responsible entity did not?? Should be eliminated.
Salt River Project	Yes	
Pacific Gas and Electric Company	No	Much of this standard reflects documentation of an individual and their training program. Documentation of training is not a guarantee that operational errors won't occur, merely that training did or did not occur. In reviewing the VSLs we question why there is not a category of "Lower" added to the VSLs and why there is a category of "Severe". Is it to be assumed that lack of documentation is a possible precursor to an operator having an operational error on the BES? The VSLs need to reflect the affect on the BES from the lack of performing a requirement and lack of documentation for training on a dynamic system does not warrant a "Severe" level.
Xcel Energy	Yes	
MRO NERC Standards Review Subcommittee	No	Violation Severity Levels: R1, This requirement is based on using the SAT process (creating an Operator Task list and updating that Task list is part of the SAT process). The Lower VSL should read "The entity used at least 75%, but less than 100% of the SAT processes in its training program. The Medium VSL should read “The entity used at least 50% but less than 75% of the SAT processes in its training program. The High VSL should read " The entity used at least 25% but less than 50% SAT processes in its training program. The Severe VSL should read " The entity used less than 25% of the SAT process in its training program.R2, This requirement is based on the entity verifying that a System Operator can perform the task (list) identified in R1.1.The Lower VSL should read "The entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” The Medium VSL should read "The entity verified at least 80% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” The High VSL should read "The entity verified at least 70% but less than 80% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” The Severe VSL should read "The entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks."R3, This requirement is based on System Operators shall have 32 hours of emergency training per year. The written VSL for R3 is based on the number of System Operators not the hourly amount of training per System Operator. So, if we had 10 System Operators all with 31 hours of emergency training, we would be in the Severe VSL column. But if we had 10 System Operators, 9 with 32 hours, 1 with 0 hours of emergency training, we would be in the Medium VSL column. R3's VSLs need to be rewritten. The LOWER VSL should read "At least 1 System Operator had less than 32 hours of emergency training but greater than 30 hours. The Medium VSL should read "At least 1 System Operator had less than 30 hours of emergency training but greater than 28 hours. The High VSL should read "At least 1 System Operator had less than 28 hours of emergency training but greater than 26 hours. The Severe VSL should read "At least 1 System Operator had less than 26 hours of emergency training.
Allegheny Power	Yes	
Public Service Commission of South Carolina	Yes	
WECC Operations Training Subcommittee	No	By the definition of the VSL the administrative functions of non-compliance does not put the BES at risk, thus all the current VSL should include a lower VSL.
ISO New England Inc.	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	No	The VSLs should be as simple as possible. In general, complicated VSLs add unnecessary confusion to addressing compliance. The proposed VSLs for R1 weight each specific sub requirement in one of the VSL categories rather than taking the approach of how much of the SAT process is performed. We recommend a volumetric approach such as SEVERE = "the entity demonstrated less than 2 of the required elements of a SAT training program as identified in R1 through R 1.4".The proposed VSL for R2 is not consistent in its approach to the modified company-specific reliability task list. It should have a graduated scale just as the "original" task list. The proposed VSL for

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 4:	Question 4 Comments:
		R3 drops the "use of drills, exercises," into the Severe category. Eliminate this as this is defined in the requirement it self. If VSL will dependent upon how much training is accomplished using "drills, exercises," then the VSLs must be graduated as well. E.g. Severe = less than 18 hours of emergency training included drills, exercises, and hands on simulators".
AEP	No	R1 Medium VSL - Should be changed to read: "The responsible entity failed to utilize training materials designed and developed with learning objectives based on the BES company specific reliability related task list (when developing a new or modifying an existing training program)." R2 High VSL - The second part of the VSL after "OR" should be changed to read 12 months rather than 6 months as follows: "The responsible entity failed to verify its system operators? capabilities to perform each new or modified task within Twelve months of making a modification to its BES company-specific reliability related task list".R3 VSLs do not allow for hardships, mid-year hire of certified operators or mid-year certification of new operators. This means that just one operator not receiving the 32 hours of emergency training for any reason would constitute a Medium VSL. We believe each VSL should have the following statement (or similar clarification/exemption) added for R3: "Emergency Hours for system operators who have worked in real-time operations 10 months or less in the year due to hardship, military duty, or other reasons, will be exempt from the 32 hour requirement as follows: less than 10 but more than 8 months - 24 hours of emergency operations training is required; less than 8 months but more than 6 months - 16 hours of emergency operations training is required; less tan 6 months but more than 4 months - 8 hours of emergency operations training is required; less than 4 months - totally exempt".
ERCOT Inc.	No	When the sub-requirements of R1 are removed, the VSLs need to be completely revised. As written, the VSL for R1 is inconsistent with the requirement. The requirement is to use a systematic approach to training; nowhere does it mention "program effectiveness". This VSL would seem to be imposing a new requirement.
We Energies	No	R3 Severe VSL: The phrase "....the use of drills, exercises, and hands on training using simulators." is reasonably interpreted as "the use of drills and exercises and hands on training using simulators." This phrase should be reworded.
Santee Cooper	No	The Severe VSL for all requirements should be the responsible entity did not have a training program. Shift the medium VSL to the lower, the high VSL to the medium, etc. for all the requirements. It appears that an entity that has implemented a reasonable training program could be punished severely.
BCTC	No	Any violation of an administrative nature should not put the BES at risk, thus all the current Requirements that are of an administrative nature should have a lower VSL. Many of the Requirements are administrative issues. For example, if the administration is not done but training has been completed then the risk to the Power System is quite different than if training is not being done.
Pepco Holdings, Inc. - Affiliates	No	R1 the Medium VSL contains the word "effectiveness" this word should be removed, effectiveness is not mentioned as a part of Requirement 1. Revise the High VSL. Proposed wording: The responsible entity failed to show evidence of developing a new training program or modifying an existing program based on a systematic approach to training in that it did not develop new (or modify existing) learning objectives or design new (or modify existing) training materials based on its company specific reliability related task list Revise the Severe VSLs - examples: The responsible entity failed to show evidence of delivering training to its operators. OR it failed to show evidence of using a systematic approach to training in that it failed to create a list of company specific reliability related tasks upon which to develop a new training program or modify an existing one The High VSL for R2 concerning "verifying operators capabilities to perform new or modified tasks within 6 months" should be moved to Medium. As currently stated a company that failed to verify operators for one new or modified task but verified 100% of its operators on existing tasks would have a Violation Severity Level higher than a company that only verified 90% of its operators on existing tasks. The Severe VSL for R3 on use of drills, exercises etc. should be moved to Medium which would better reflect the suggested revised R3 and indicate that drills, exercises and hands on training simulations are of higher value than training classes alone for emergency operations training Additional VSLs should be developed to address the 4th Requirement proposed in 5 below. Example: R4 High. The responsible entity failed to show evidence that it used a systematic approach to training to develop a training program for its delegated tasks.R4 Severe The responsible entity failed to develop a training program for the entities to whom it has delegated tasks
Baltimore Gas & Electric	Yes	
New York Independent System Operator	No	Remove the relative term "effectiveness" from the medium VSL on R1. It is not a measurable quantity.
FirstEnergy	Yes	

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 4:	Question 4 Comments:
Duke Energy Corporation	No	See response to question #1 above. All the requirements of this standard need to be revised and the VSLs should be developed to fit the revised requirements.
Ontario IESO	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Midwest ISO Stakeholder Collaborators	Yes	Violation Severity Levels: R1, This requirement is based on using a SAT process (creating an Operator Task list and updating that Task list is part of the SAT process). After reviewing the Violation Severity Levels Development Guidelines Criteria developed by the VSL Drafting Team, we believe this requirement could easily be classified as numerical performance. The numerical performance would be calculated based on the number of SAT processes used. The Lower VSL should read "The entity used at least 75%, but less than 100% of the SAT processes in its training program. The Medium VSL should read “The entity used at least 50% but less than 75% processes in its training program. The High VSL should read " The entity used at least 25% but less than 50% SAT processes in its training program. The Severe VSL should read “The entity used less than 25% of the SAT process in its training program. As an alternative, R1 could be classified as multi-component. After reviewing the Violation Severity Levels Development Guidelines Criteria developed by the VSL Drafting Team, we believe R2 can be classified as a numerical performance requirement as well. This requirement is based on the entity verifying that a System Operator can perform the task (list) identified in R1.1.The Lower VSL should read "The entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” The Medium VSL should read "The entity verified at least 80% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” The High VSL should read "The entity verified at least 70% but less than 80% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” The Severe VSL should read "The entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” After reviewing the Violation Severity Levels Development Guidelines Criteria developed by the VSL Drafting Team, we believe R3 can be classified as a numerical performance requirement as well. This requirement is based on System Operators shall have 32 hours of emergency training per year. The written VSL for R3 is based on the number of System Operators not the hourly amount of training per System Operator. So, if we had ten System Operators all with 31 hours of emergency training, we would be in the Severe VSL column. But if we had 10 System Operators, nine with 32 hours, one with zero hours of emergency training, we would be in the Medium VSL column. Thus, even though more total hours of training did not occur the latter example results in a lower severity. The VSLs need to consider the aggregate total of hours of training for all system operators. As one example, R3's VSLs could be rewritten. The LOWER VSL could read "At least one System Operator had less than 32 hours of emergency training but greater than 30 hours. The Medium VSL could read "At least one System Operator had less than 30 hours of emergency training but greater than 28 hours. The High VSL could read "At least one System Operator had less than 28 hours of emergency training but greater than 26 hours. The Severe VSL could read "At least one System Operator had less than 26 hours of emergency training. For another example, one could sum all of the system operators training hours and use a numerical performance VSL. For example, 10 system operators require a total of 320 hours of training. If a total of 240 hours of training is delivered to the 10 system operators, a violation has occurred with only 75% of the training occurring. For these VSLs to be effective, any hours over the minimum 32 hours required would have to be ignored and not considered in the calculation. VSLs for could be written as: The LOWER VSL could read "More than 75% of required training hours were delivered.” The Medium VSL could read "More than 50% but 75% or less of the required training hours were delivered.” The High VSL could read "More than 25% but 50% or less of the required training hours were delivered.” The Severe VSL could read "25% or less of the required training hours were delivered."

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

5. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Organization	Question 5 Comments:
FRCC	The proposed effective date of 36 months after the first day of the first calendar quarter following regulatory approval is unnecessarily long. What is the rationale for 36 months? In R1, we would suggest to revise "…..shall update its list of BES company-specific…." to say "…shall review and update if needed it's list of BES company-specific…." In R1.4 it is silent to how often an evaluation of the training program must be conducted but it also appears partially redundant with the annual requirement in R1.1. They should agree or a time requirement should be in only one place. If the intent was to establish a continuous improvement mechanism, the drafting team should consider directing the responsible entity to establish a monitoring and improvement program that includes an annual review of the task list and then implement it. That may be more clear. R1.3 is really ambiguous. Does it mean that training will have to be provided annually for every single task on the list? Does it mean every topic, every year? If so, does that make sense? If it is just one time, then it is redundant with R2. Is a long range plan that includes all elements over several years acceptable? Also, if it is training for a new operator, it might not be needed again because it is then performed routinely. This needs clarification. In R2, there is a typo, it should say "each of" instead of "each or". In section 1.1 Compliance Monitoring Period and Reset, what does Not Applicable mean? In section 1.3 Data Retention, the subparagraphs should be numbered 1.3.1, 1.3.2 etc rather than 1.4.1, 1.4.2 etc. In these paragraphs it refers only to compliance audits as the time period for keeping records, we assume this means an on-site compliance audit. Since audit periods can vary, ie 3 - 6 years, plus they can happen at other times depending on conditions, it would be more clear to state the retention time in years. We would suggest 3 years to be an appropriate time frame since on-site compliance audits of the RC, BA and TOP are to be at least every 3 years. Also, in the first paragraph of the section "investigation" should be changed to "compliance violation investigation" to avoid confusion with other types of investigations such as disturbance events analysis etc. And, in the last paragraph the Compliance Enforcement Authority should keep records according to the NERC Rules of Procedure. There is no need to spell it out here since it is already covered in the NERC Rules of Procedure. There is not a comment form for PER-004, however a redline is posted as part of the changes in the project. We do have a comment on R2 of PER-004. The last sentence states "The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times." There is no consideration to cost in this requirement. "...best available information at all times." is very broad and wide open. Data overload can be a reality, as can a diminishing return on investments to meet a requirement that will have a very small impact on reliability.
California ISO	No comment.
Ohio Valley Electric Corporation	With the lack of assessment or evaluation of the effectiveness of existing training programs required by PER-002 R3, why work to create a new training standard? With the lack of such an assessment, the work to develop a new training standard is not a judicious use of limited resources in order to strengthen the reliability of the bulk electric system. The NERC operation certification program already determines that operators possess the minimal requirements to reliably operate the bulk electric system. Why should a training program duplicate the certification process? Currently there is ample incentive to have operators trained on company-specific tasks. An operator who is not capable of performing company specific task will not remain an operator at that company.
firstenergy	The standard refers back to requirements R1.1 and R1.2 in several places. I did not see these in the draft 3 version of the standard that I was viewing.
Bonneville Power Administration	While agreeing with the proposed Violation Severity Levels, BPA considers the Violation Risk Factor assigned to requirement R1 to be too high. R1 is essentially administrative in nature, and this should be reflected in a VRF rating of Low. There is a tremendous workload

Organization	Question 5 Comments:
	involved in developing the training program described by the standard. The 3 year implementation plan proposed by the drafting team is adequate for this task. That said, to implement the training program as described, in a manner that reflects the quality and effectiveness expected by industry participants will require the full 3 years that has been allotted. The implementation time should not be shortened any Further, BPA agrees with the 6 month window for certifying competency in performing a task once a new task has been identified (R2.1). The standard does not provide a window for certifying competency in performing job tasks when a System Operator assumes a new position. BPA suggests providing a 1 year window for System Operators to complete the job task competency verification (R2) once they have assumed a new position. BPA supports a Standard requiring development, delivery, and evaluation of system operator training using a "systematic approach", and applauds the restraint the drafting team has shown by including only the essential elements of a systematic training program. BPA thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for System Operators.
tampa electric company	No comment.
Operating Reliability Working Group (ORWG)	R2 should be corrected to read '...verify each of its System Operator's...'.We feel the VRF for R2 is too high. It should be no higher than medium. As written R3 could be interpreted to require 32 hours of emergency operations training on a simulator. We appreciate the effort by the SDT to incorporate all the suggestions provided by the industry following the last posting. The current standard reflects considerable rewrite and we feel that this proposal is a significant improvement.
LCRA	To review, requiring a list of critical tasks, with no explanation as to what those tasks may be, only ensures that there will be a wide variance across the industry. It is not reasonable to expect that each utility will police itself. Common human nature dictates that individual utilities will pare the list down to whatever they can manage, not an all inclusive list. Were this standard to go into effect as currently written, I suspect utilities with large training staffs would have a large list, while small utilities will create a small list that they can manage. Whether or not an operator can perform the duties associated with his position is already handled by company specific procedures like performance reviews. If an operator is NERC certified has not that process already determined that the operator has a basic level of understanding? What happens if an operator fails one of these critical task evaluations? On the one hand he is NERC certified, yet he cannot perform a critical task. Would that then indicate that the certification process is flawed? What exactly is a critical task? What may seem critical and complex to a newly certified operator is old hat to one with 20 years of experience. Reliability related? Taking that term to its extreme limits, the ability to get in a car and drive to work could be construed as reliability related since if the operator cannot get to work reliability is compromised. Nearly everything a transmission operator does is reliability related. Other than eating lunch I cannot think of one single transmission operator task that is not reliability related in some way or another. Voltage control, switching, EECP, blackstart, etc, etc, etc. The list would simply be unmanageable. If NERC cannot effectively define a critical task in this standard, how can anyone else be expected to do so? What happens on an audit if the auditor shows up and decides the list is not comprehensive? Ultimately there is no definition of a critical task, thus this standard cannot be enforced. What about QSEs, generator operators, and field personnel such as relay technicians? They all have multiple tasks that impact reliability, yet I see no requirements for them. What good is a critical task analysis that only focuses on one group when multiple groups have impacts? What this standard would do is create an administrative monster that only the large training staffs could manage. Smaller utilities, such as my own, would be forced to strip the critical task list down as short as possible. Otherwise it could not be effectively managed. The net result would be something that can be managed for audits, not necessarily something that would do training any good. In fact, coupled with the already burdensome demands of the CE program, this requirement would move many trainers away from contact time to sitting at a computer and administering a critical task list. It comes down to this; What does NERC want me to do with my time? Train operators, or fill out paperwork?
Sacramento Municipal Utility District	R# Severe VSL column last row stating: "OR The responsible entity did not include in its emergency training, the use of drills, exercises, and hands on training using simulators." NERC should clarify what is meant by "training using simulators." Is this mandating the use of an OTS? Applicability of this standard should apply to all NERC registration types that impact the BESR2. This requirement should state " shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 annually." Minimum competencies should be maintained by the system operator and certified by the registered entitiy. This standard should mandate the system operator passing an exam/evaluation. R3. This standard should mandate the system operator to pass a written and/or simulation exam to be credited the 32 hours of training
Northeast Utilities	Is it correct that this standard does not apply to NERC-certified individuals in non-System Operator roles? (reference PER-003 R1.) e.g. - a

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 5 Comments:
	System Operator's supervisor.R1.1.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall REVIEW its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to identify new or modified tasks for inclusion in training. One should REVIEW the task list to determine if there is a need to UPDATE - whenever there is a change to the system, procedures, operator tools, etc. TYPO in R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each OF (not "or") its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time.
CAISO	No comment.
NPCC Regional Standards Committee	NPCC members appreciate the efforts of the SDT in creating this latest version. We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. However, we do realize that there are REs that are requested by membership in a region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly. In R3 suggest changing drills, exercises and hands on training using simulators to drills, exercises and hands on training using simulators (if available).
Manitoba Hydro	No comment.
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	Our group supports the use of a Systematic Approach to Training in the design, development and delivery of effective personnel training programs. However, the lack of clarity in the requirement statements is a cause for some concern. Each requirement in this standard should be re-examined to assure clarity of evidence required, adequate definition of terms, and consistency with the associated measures and violation severity levels.
MidAmerican Energy Company	The Requirement numbers are not consistent with the wording in other sections. For example the R2.2 references R1.1 but should reference 2.1. This made commenting very difficult.
Grant County PUD	No comment.
Cowlitz County PUD No. 1	Typographical error in Requirement 2: "...shall verify each or its System Operators capability..." should read "...shall verify each of its System Operators capability..."
Arizona Public Service Company	No comment.
The Detroit Edison Company	We do not agree with complaints being included in section 1.3 Compliance Monitoring and Enforcement Processes. Compliance audits, Self-Certifications, Spot Checking, Compliance Violation Investigations, and Self-Reporting is adequate to ensure entity compliance. We believe Attachment A: Generic Task List is valuable information and should be included in the PER-005 System Operator Training Reference Document as Reference #3.
E.ON U.S.	No comment.
SERC OC Standards Review Group (Project 2006-01)	Our group supports the use of a Systematic Approach to Training in the design, development and delivery of effective personnel training programs. However, the lack of clarity in the requirement statements is a cause for some concern. Each requirement in this standard should be re-examined to assure clarity of evidence required, adequate definition of terms, and consistency with the associated measures and violation severity levels. Requirements R1.1 through R1.4 of PER-005 can be interpreted as requiring each entity to develop and deliver its total training program in-house and not allow the use of vendors in developing and implementing its training requirements. For example, R1.3 states, ?Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver the training established in R1.2.?. We suggest that replacing the word ?deliver? with ?make available? or ?ensure delivery of? would clarify this misconception. Finally, in R2 there is a typo: the word ?or? should be changed to ?of?.
Hydro One Networks - Reliability Standards Group	No comment.
American Transmission Company	Requirement 1: ? ? The following language should be removed from the requirement 1. ? ? "?to establish a new or modify an existing training program(s)?" ? ? It's our position that the language does not provide any additional clarity but adds confusion to the requirement. ATC believes that the language makes sense for the short term, (FERC approval followed by implementation period) but in the long term

Organization	Question 5 Comments:
	this information is unnecessary. Once an entity has a SAT the language in question would require an entity to modify or develop a new program even if neither is required. ? ? Proposed change:? ? "Each RC, BA and TOP shall use a systematic approach to training for the Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators."? ? ATC believes that our suggested modification accomplishes the intent of the SDT and addresses our concern with the long-term implementation of this standard.? R1.1? ? The word "create" should be replaced with "document".? ? This change does not alter the intent of the Requirement but simple states what the entities needs to have. ? ? Proposed change: ? ? Each RC, BA and TOP shall document a list of BES company-specific reliability-related tasks performed by its System Operators. ? ? Once the initial list is developed you will no longer create a list, but the proposed language would have entities re-create the list annually. ? ? R1.1.1? ? The requirement should be modified to only require annual reviews. Updates to the list are dependant on the company and are not a NERC issue. ? ? Proposed change: ? ? Each RC, BA and TOP shall annually review its list of BES company-specific reliability-related tasks performed by its System Operators.? ? New Requirement 1.1.2? ? Each RC, BA and TOP shall identify new or modified tasks during the annual review. ? ? R3: ? ? The "12 months" should be replaced with "annual". If the SDT does not agree with the change then they need to confirm how the 12 months is going to be determined. Ultimately ATC is concerned that the 12 months could be interpreted to mean a rolling 12-month period which would make compliance with this standard extremely difficult as it would essentially require a company to ensure that each of its Scots completed 32 hours of emergency training within any 12-month sliding window during the year; i.e. at an average rate of 2.67 hours per month. Typically, this is not how the emergency hour training is completed. Rather, it is completed in ?lumps.? ATC understands that the 12-month concept was introduced to account for new operating personnel. With that in mind, ATC proposes that the Standard call out the provision to pro-rate training specifically as detailed below. ? ? Proposed language: ? ? On an annual basis, each RC, BA and TOP shall provide each of its System Operators with 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration). For each new System Operator, the required number of hours of emergency operations training shall be prorated to the nearest whole number of hours based upon the number of full months worked during that calendar year. (Examples of training: drills, exercises, and hands on training using simulators)? ? The additional changes are to:? Clarify the prorated training requirement; i.e. an operator beginning work on Dec. 31st would have an emergency hour training requirement of 0 hours, an operator beginning work on June 15th would have an emergency hour training requirement of 16 hours and an operator beginning work on Jan. 15th would have an emergency hour training requirement of 30 hours for that calendar year.? 2. Clearly identify the list as examples that can be used but not methods that must be used.
Gainesville Regional Utilities	No comment.
Niagara Mohawk (DBA National Grid)	We propose the following minor edits for clerification.R1.1.1 change to "...shall review and update as necessary its list of BES company specific reliability related tasks...". The task should be reviewed annually and then updated as necessary. In some cases an update may not be needed.R3 Replace "...using training, drills, exercises, and hands on training using simulators" with "using various methods of training such as drills, exercises, classroom presentations, or hands on training using simulators". This reads better since drills, etc. are all forms of training. In addition these need to be examples of training methods not required training methods since some entities do not have training simulators, thus the addition of "or". In addition, we do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. However, we do realize that there are REs that are requested by membership in a region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.
WECC Reliability Coordination Comments Work Group (RCCWG)	The WECC RCCWG believes that R2 in PER-004-2 is mis-placed and does not belong in a standard that covers staffing. Specific requirements for SOLs, IROLs, and inter-tie facility limits belong in IRO standards, not in a PER standard.
PSEI	I appears that the ideas going into this standard are designed such that it can only be achieved by large organizations with not only a trainer, but training staff and lots of resources. Putting requirements in place that demand all organizations meet the same expectations as

Organization	Question 5 Comments:
	the larger ones is unfair, unrealistic and removes any flexibility small utilities have. If there is such a need for the SAT to be in place, use it in conjunction with the System Operator Certification program. There is already a detailed process in place for this and allows smaller utilities to have options other than hiring more staff or requiring the purchase of simulators.
Southwest Power Pool - Operations Training Working Group	R1.2 - The wording of R1.2 should refer to "utilizing designed training materials" with learning objectives based on the task list, rather than "designing training materials" with learning objectives based on the task list. Some training is purchased from vendors to satisfy training need rather than designing the training in-house. We suggest the wording be modified as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize training materials designed and developed with learning objectives that are based on the task list created in R1.1." R2 Risk Factor - The "Risk Factor" should be "Medium" in-line with the risk factor of R1. The risk factor to verify performance of the reliability tasks (R2) should not be higher than the risk factor for identifying the reliability tasks (R1). R3 - This requirement requires all entities large or small to have a simulator or buy hands on simulator exercises from a vendor "that applies to their system". We believe the word simulator should be changed to "simulation" as follows: "??.using training, drills, exercises, and hands on training using simulations". The related VSLs would need the word changed also. If the intent of the standard is for the individual entity to purchase a computerized simulator package, it could be quite burdensome on the company.R3.1 - To assure R3.1 is in aligned with our comments on R1.2, based on the fact that some training may be purchased training delivered by a vendor, we suggest rewording of R3.1. Change the word "deliver" to the word "utilize" as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize the training established in R1.2." A suggested Reliability Task List should be included in the reference material to the standard as a base guideline for entities to build their task list. Purpose: We feel the words "competent" and "competency" in the purpose statement should be changed to "capable" and "capability" to reflect the wording in M2. We appreciate the effort by the SDT to incorporate all the suggestions provided by the industry following the last posting. The current standard reflects considerable rewrite and we feel that this proposal is a significant improvement.
CECD	It is not appropriate to require all BAs and TOPs to have hands on simulator training. FERC's directives indicated that "the ERO needed to develop a requirement for the use of simulators dependent on the entity's role and size" and that it would be appropriate to limit such a requirement to RCs, TOPs, and BAs that have operational control over a significant portion of load and generation." There is an error in R2, second line "each or its System Operator's". Delete "or its". R3. The phrase "that reflects emergency operations topics" should be modified to state "on emergency operation topics" or "that reflects emergency operating conditions."
PJM Interconnection, LLC	Since one of the elements of the SAT methodology is to "Evaluate not only worker performance of the objectives, but also the ability of the curriculum to meet the stated objectives", R2 is unnecessary, as R1 already requires the use of the SAT methodology. This requirement should be deleted.
Salt River Project	No comment.
Pacific Gas and Electric Company	In reviewing the purpose statement the words "competent" and "competency" do not align with wording in the requirements or the measures. We believe competency of an individual is directly reflected in their performance and therefore performance is governed by their supervisor or manager. In many instances trainers provide training to individuals on a limited basis throughout the year, of which, during that time the individual's performance in assessed for his capability to perform a task. We suggest changing the purpose statement to the following: "To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are capable to perform those reliability-related tasks." "The capability of the System Operators is critical to the reliability of the North American Bulk Electric System."
Xcel Energy	No comment.
MRO NERC Standards Review Subcommittee	In R2, the current language could be read that the System Operator needs to be capable of performing the task at least one time, but the intent is to perform the verification at least one time. This can be clarified by rearranging the sentence to be "?shall verify at least one time that each of its System Operator's are capable of performing each task identified in R1.1."R3, There seems to be some confusion in the industry about what would be classified as a simulator per this requirement. The definition of the term simulator can range from a simulator attached to the EMS, a custom built simulator to represent one's utility structure, a generic simulator similar to the one that EPRI had offered for no cost in the past, table top simulations or even computer class simulations that qualify as simulation hours in the NERC CEH program. In paragraph 1391 of FERC order 693, FERC recognizes the fact that it would be impractical for small entities to develop and maintain full-scale simulators and suggests that the small entities use generic simulators or realistic table top exercises in there place.

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 5 Comments:
	FERC goes on in paragraph 1391 to direct the ERO "to develop a requirement for the use of simulators dependent on the entity's role and size". The MRO requests that the SDT define what it means by 'simulator' and "who should use this simulator" and revise the requirement as appropriate to meet the FERC 693 directives. R3, The Requirement states '.....32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration) using training, drills, exercises, and hands on training using simulators.' Is this requirement setup to require each operator to have at least some simulator training every 12 months, or is the requirement only providing a list of training options? The MRO requests clarification on this requirement. Data Retention: Does 1.4.4 say that if someone is found non-compliant they only have to keep records until they are found to be compliant? This goes against the previous three paragraphs. This could be corrected if "or since the last compliance audit, which ever is greater." is added to the end of the sentence.? Risk Factors: ? ? R1, should be changed to "Lower Risk Factor", since it is administrative in nature, per NERC Reliability Standards Development Procedure. If an entity had the first four steps to the SAT process but an incomplete Evaluation, this would not "affect the electrical state or capability of the bulk power system".
Allegheny Power	No Additional comments
Public Service Commission of South Carolina	On Page 1 of 2 of Implementation Plan for PER-005-1 - System Personnel Training, strike the word "months" under PER-005-1 Requirements in the box for R3.
WECC Operations Training Subcommittee	The definition of Bulk Power vs. Bulk Electric System needs to be clearly defined in order to be utilized as a basis for the standards with respect to systems that the RRO has defined as not affecting the BES.
ISO New England Inc.	We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. In R3 suggest changing drills, exercises and hands on training using simulators to drills, exercises and hands on training using simulators (if available).
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	It appears that only the Requirement (R1, R2, R3) have VRFs and VSLs. Do the VRFs and VSLs apply to the sub-requirements and can an entity be penalized for the requirement and the sub-requirement? (e.g. if an entity does not create the list required in R1.1 will they receive a penalty for R1 and R1.1?)Regarding PER-004-2 R2 - the requirement does not belong in a RC "staffing" standard. This general statement requirement is adequately covered in the IRO-005 standard and should be deleted as part of this revision or a future revision/review of IRO-005.
AEP	R1.2 - The wording of R1.2 should refer to "utilizing designed training materials" with learning objectives based on the task list, rather than "designing training materials" with learning objectives based on the task list. Some training is purchased from vendors to satisfy training need rather than designing the training in-house. We suggest the wording be modified as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize training materials designed and developed with learning objectives that are based on the task list created in R1.1."R2 Risk Factor - The "Risk Factor" should be "Medium" in-line with the risk factor of R1. The risk factor to verify performance of the reliability tasks (R2) should not be higher than the risk factor for identifying the reliability tasks (R1). R2.1 - We believe this requirement should specify 12months (rather than 6 months) for performance verification following identification of new or modified tasks. Often, tasks change or are modified gradually do to operator adaptation of influencing parameters. Therefore operators often adapt to the task modification without formal training, and well before the task is updated in the list. Annual review of the task list (specified in R1.1.1) will likely set the stage for the needed annual training on the tasks, whether modified, new, or existing tasks just needing improvement in operator performance. The continuing education training plan is typically scheduled annually targeting operator training needs including certification maintenance training and emergency training. Consequently it would be best to schedule new and modified task training along with the operator's annually scheduled CE training. Specifically R2.1 should read: "Within twelve months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks".R3 - This requirement could be interpreted to require all entities large or small to have a simulator or buy hands on simulator exercises from a vendor "that applies to their system". We believe the word simulator should be changed to "simulation" as follows: "??.using training, drills, exercises, and hands on training using simulations". The related VSLs would need the word changed also.R3.1 - To assure R3.1 is in aligned with our comments on R1.2, based on the fact that some training may be purchased training delivered by a vendor, we suggest rewording of R3.1 change the

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 5 Comments:
	word "deliver" to the word "utilize" as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize the training established in R1.2."Purpose - In item 3 of the Introduction to the Standard "Purpose", the word "competent" should be changed to "capable" to align with Measurement M2. Specifically ?. "To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are "capable" to perform those reliability related tasks. The Reliability Task List (previously attached to draft 2) should be included with the reference material that can be referenced for the standard, such as along with the references for the systematic approach to training (ADDIE, DOE references, etc.). We appreciate the effort by the SDT to incorporate all the suggestions provided by the industry following the last posting. The current standard reflects considerable rewrite and we feel that this proposal is a significant improvement.
ERCOT Inc.	The requirements say to create a task list and develop objectives and materials based on that list. This could be burdensome, and doesn't have to happen if the SAT process if followed. Objectives and materials should only required on tasks identified for training, before that training is conducted, not every task performed before any training is conducted.? ?In meeting R2, the entity may determine that their operators need no training on the tasks in their list. R1.2 (which we recommend goes away) requires development of objectives and training materials regardless of need. R1.3 (which we also recommend go away) requires they deliver training on those objectives and materials. Therefore there actually would be a justifiable argument that under almost any SAT process, R1.2 and R1.3 could be considered to be an unnecessary and unreasonable burden until an organization would have to replace an operator with an ignorant, off-the-street individual; an unlikely scenario for many.? ?Arbitrarily creating such requirements flies in the face of any SAT process.? ?Even if the entity changes something about a task(s), it is very possible that R2.1 can be accomplished with no ?formal? training.? ?On R3: If the SAT process is believed, then the 32 hour emergency training requirement is bogus. The 32 hour requirement was instigated as an interim act in the absence of an organizational SAT process for System Operators. ? ?If NERC is going to continue to specify topics and times, then don't preen and pretend to advocate the SAT process. The old guide has a list of topics, and the PSS can certainly apply their expertise to assign times; this would simplify the process for the whole industry. Of course this would be mostly for show, but then so is the 32 hour requirement.? Now let's look at the Purpose of PER-005. That should be changed. It should read: "To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent." The words "The competency of System Operators is critical to the reliability of the North American Bulk Electric System." is an observation, not a purpose.
We Energies	R2: Typographical error "...shall verify each OF its System Operator's..."R3: The phrase"...using training, drills, exercises, and hands on training using simulators." is reasonably interpreted as "...using training and drills and exercises and hands on training using simulators." This phrase needs to be reworded. Data Retention 1.4.4: 1.4.1, 1.4.2, and 1.4.3 reference a requirement and measure. Should this one also reference requirements and measures?
Santee Cooper	Clarity should be provided in the requirements that training can be provided through the use of vendors or in-house as long as the SAT process is utilized. In addition, the training standard needs to be written such that a smaller entity is able to comply with the standard without employing the use of vendors or consultants.
BCTC	The definition of Bulk Power System vs. Bulk Electric System needs to be clearly defined in order to be utilized as a basis for the standards. Until the BES vs. BPS issue is cleared up this should not be used as a basis for Standards.
Pepco Holdings, Inc. - Affiliates	We are concerned that this standard does not address the specific directions of FERC Order 693 to include local control centers that can take independent actions, in this standard. We think the standard should be revised to include a new Requirement 4:R4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator that delegates tasks for which it is responsible to another entity shall develop or modify an existing training program using a systematic approach to training for the set of tasks it has delegated to other entities.[Risk Factor: Medium] [Time Horizon: Long-term Planning]R4.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator who has developed a training program for its delegated tasks shall ensure through a monitoring program that the training program for the delegated tasks meets the equivalent requirements of R2 and R3 of this standardR4.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator who has delegated tasks for which it responsible shall maintain a list of the entities to whom tasks have been delegated and of the tasks that have been delegated and provide the list to its Regional Entity.M4. Each RC, BA, and TOP shall have available a training program for its delegated tasks developed through a systematic approach to training.M4.1 Each RC, BA and TOP shall have evidence that the training program for its delegated tasks meets the equivalent of R2 and R3.M4.2 Each RC, BA and TOP shall have

Comments on 3rd Draft of System Personnel Training Standard (Project 2006-01)

Organization	Question 5 Comments:
	evidence that it provided to its Regional Entity the list of the entities to which it has delegated tasks and the delegated tasks.
Baltimore Gas & Electric	We recommend that NERC provide industry training on the development of a training program and include detailed instructions on "a systematic approach to training", how to compile a "list of BES company-specific reliability-related tasks", explain expectable verification methods for "System Operator's capabilities to perform each assigned task", etc.
New York Independent System Operator	Regarding R3 "using training, drills, exercises and hands-on training?" can actually be just "training". "Drills, exercises and hands on" are methods of training that can be used and remove the corresponding Severe VSL. Replace six months with 30 days.
FirstEnergy	FE has the following additional comments/suggestions: R3 - The last part of this requirement, "? (which includes system restoration) using training, drills, exercises, and hands on training using simulators.", may be both confusing and not all inclusive. The following is an explanation of our concerns:(a) The phrase in parenthesis "which includes system restoration" seems to only capture one of the several important emergency operations topics. We feel that it should either be removed, or expanded to include the other important topics which include "Capacity and Energy Emergencies" and "Load shedding".(b) The phrase "using training, drills, exercises, and hands on training using simulators" may be confusing and a couple of the terms are not clearly defined. We are not sure of the meaning and differences in the terms "drills" and "exercises". At the very least, we believe these terms could be combined into one subset of the required training. Also, for better clarity, we think these subsets of the training should be bulleted under R3. We suggest rewording R3 as follows:R3. At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics using all of the following [Risk Factor: Medium] [Time Horizon: Long-term Planning]:- classroom training- drills and/or exercises- hands on training using simulators.
Duke Energy Corporation	Requirements of this standard should be revised to reflect that training may be developed and delivered by a third party under contract.
Ontario IESO	(1) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. However, we do realize that there are REs that are requested by membership in a region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.
Midwest ISO Stakeholder Collaborators	No comment.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on 3rd Draft of System Personnel Training Standard

The System Personnel Training Standard Drafting Team (SPT SDT) thanks all commenters who submitted comments on the third draft of the standard. This standard was posted for a 45-day public comment period from February 25, 2007 through April 9, 2007. The drafting team asked stakeholders to provide feedback on the standard through a special Standard Comment Form. There were more than 51 sets of comments, including comments from more than 100 different people from approximately 100 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

In this document, the SPT SDT's consideration of comments is provided in blue text immediately following each comment submitted for each question. A summary response to each question is highlighted in yellow following each question. The following conforming changes were made to the standard:

- Modified the Proposed Effective Date for Requirement 1 and Requirement 2 from 36 months after regulatory approval to 24 months after regulator approval.
- Clarified Requirement 1.4 to reflect an annual evaluation of the training program to identify any needed changes.
- Modified Requirement 3 to mandate System Restoration Training and provide clarity as to the methods of training that could be used.
- Added Requirement 3.1 to provide for emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions for certain entities.
- Clarified the Data Retention Section to reflect the required retention periods.
- Modified the Requirement 3 VSLs to provide clarity in compliance violations regarding the use of simulation/simulator training.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/System-Personnel-Training.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. **FERC Order 693 directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology in its development of new training programs". The SPT SDT revised R1 to identify the essential components of a systematic approach to training. Do you agree that this requirement now clearly describes the minimal components that must be included in a systematic approach to training? If not, please explain in the comment area.**

Summary Consideration:

The majority of the commenters agreed that the requirement describes the minimal components that must be used in a systematic approach to training. However, several of the commenters did not agree with listing some of the components of a systematic approach to training as sub-requirements stating that it was unnecessary. A few of the commenters also thought that the Standard was prescribing the use of a specific method of the systematic approach to training.

The sub-requirements in Requirement 1 are simply listing common elements that are in every systematic approach to training process. The task list should be used to identify the necessary training as stated in Requirement 1 and that a systematic approach to training is then used to develop the associated training for each task. While the SAT process may be familiar to many entities, the comments received during the development of this standard indicate that many entities have little or no familiarity with the SAT process.

The following reference documents could be used in applying a systematic approach to training - these documents are listed in the Reference Document for this Standard.

(1) DOE-HDBK-1078-94, A Systematic Approach to Training
http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf

(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910
http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html

(3) ADDIE – 1975, Florida State University
http://www.nwlink.com/~donclark/history_isd/addie.html

(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96
http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf

The Standard does not prescribe the use of a certain methodology in applying a systematic approach to training - the above mentioned references provide different examples of a systematic approach to training.

Organization	Question 1:	Question 1 Comments:
E.ON U.S.	No	E.ON U.S. generally supports the intent of the PER-005 standard, but it does not believe that following the Systematic Approach to Training as defined in the DOE document is appropriate in all instances. The DOE reference document is geared for training programs that relate to nuclear power operators which require a virtually fail safe redundancy. While E.ON U.S. acknowledges that formal operator training is essential for the safe and reliable operation of the electricity system, it is concerned that any incremental reliability gains derived from implementing the SAT document may not be worth

Organization	Question 1:	Question 1 Comments:
		the substantial cost for companies and their customers. E.ON U.S. believes that utilities should have the ability to outline and tailor their training programs to reflect the unique characteristics of their systems and the unique circumstances that each operator is likely to confront in the operation of the system. Many parties already have developed and will continue to conduct extensive and highly effective training of their operations staff. Absent some demonstration of substantial incremental benefit, a standard requiring utilities to start from scratch with a formal SAT process will be unjustifiably burdensome, distracting, and require a complete reallocation of already limited resources, all to the potential detriment of continued safe and reliable operations. E.ON U.S., as well as many other parties, currently train their system operators through many processes. For E.ON U.S., all new hires are required to complete a structured training program that covers all areas of operations during normal and emergency system conditions. This training is in the form of structured classroom and/or NERC certified vendor training plus direct instruction from supervisory operators through the use of actual control room equipment and, where appropriate, simulators. No operator is allowed to independently work until the supervisory personnel has certified that training has been completed and the employee has satisfactorily demonstrated proficiency in all identified tasks through the successful completion of a rigorous testing program.. All existing operators that have been certified as being proficient at a journeyman level will receive annual refresher instruction and training, both through vendor and simulator training programs to, again, guarantee that operators have a mastery of all tasks required of them. E.ON U.S. believes, therefore, that its current training program, while not identical with the DOE SAT process, achieves the same goals and objectives of having well-trained and proficient system operators in place, and in maintaining a rigorous training regimen to keep those skills at the highest attainable levels. Such a program provides systematic, company specific training programs and processes that meet the requirements of PER-005. Companies should be able to demonstrate that their training programs are equal or superior to programs that are identified in the SAT process. Identification of critical tasks and training necessary to ensure that system operators possess the skills necessary to complete the task is utility specific. Employing a cookie cutter approach as identified by the SAT process seems to largely ignore utility differences. Existing training programs should not be overhauled by use of the SAT unless these programs prove to be deficient.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology". Requirement 1 requires that a systematic approach must be used to create new or revise existing training programs for reliability-related tasks. There are multiple variations of a systematic approach to training. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. (1) DOE-HDBK-1078-94, A Systematic Approach to Training http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf (2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910 http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html (3) ADDIE – 1975, Florida State University http://www.nwlink.com/~donclark/history_isd/addie.html (4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96 http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training,		

Organization	Question 1:	Question 1 Comments:
not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). The majority of training in this standard could meet CEH.		
MRO NERC Standards Review Subcommittee	No	A systematic approach to training is a clearly developed process used in many programs. Some entities may interpret this to refer to the DOE SAT methodology, which is incorrect. The MRO suggests wording to clarify R1: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall use asystematic approach to training as outlined in the sub-requirements below, to establish?" R1.1.1 states "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall update its list of BES company-specific reliability-related tasks" Replace 'update' with 'review and update as necessary'
Response: The present wording for Requirement 1 is "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a new or modify an existing training program(s) for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program(s)". There are multiple variations of a systematic approach to training. The following are reference documents that can be used in applying a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf The SPT SDT believes that in order to update a task list it first must be reviewed. Therefore the SPT SDT thanks you for your response but does not feel that a change in the wording is necessary.		
tampa electric company	No	The previous version of the standard did include, (analysis, design, development, implementation and evaluation) which are components of what at SAT should include. These have been removed and now it seems that "systematic approach" is an ambiguous term, unless creating the task list is what the SDT considers a systematic approach to training.
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The task list is used to identify the necessary training as stated in R1. A systematic approach to training is used to develop the associated training for each task. The following are reference documents that can be used in applying a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC**		

Organization	Question 1:	Question 1 Comments:
6910 http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf		
ERCOT Inc.	No	R1 without the sub-requirements is sufficient to meet the FERC directive. The sub-requirements of R1 are not only unnecessary; as written they are detrimental.
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. While the SAT process may be familiar to many entities, the comments received during the development of this standard indicate that many entities have little or no familiarity with the SAT process.		
Ontario IESO	No	We would ask the SDT to clarify that the requirement to use a "systematic approach to training" does not dictate a specific type of training program, as long as requirements in R1.1 to R1.4 are fully met. As we have commented in the past, we believe standards should dictate what and not how. If this clarification is made, the IESO would support the standard. However, if the "systematic approach to training" indeed dictates the use of a specific type of training program, then we would request the SDT to demonstrate how it can be determined that a training program developed using other methods is not acceptable if the subrequirements R1.1 to R1.4 are fully met.
Response: There are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4The sub-requirements simply list common elements that are in every systematic approach to training process. The task list is used to identify the necessary training as stated in R1. A systematic approach to training is used to develop the associated training for each task. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf		
SERC OC Standards Review Group (Project 2006-01)	No	We agree that R1 does identify the essential components of a Systematic Approach to Training (SAT). However, we found the statement that SAT must be used "to establish a new or modify an existing training program(s)" to be ambiguous. Clearly, if a company creates a new course or undertakes a modification to an existing course, then SAT must be followed. But does this statement require that ALL existing training programs (whether modifications are planned or not) be adjusted

Organization	Question 1:	Question 1 Comments:
		to be consistent with SAT? R1 needs to be reworded to eliminate this ambiguity. Furthermore, the development of reliability-related system operator tasks is a crucial starting point for the SAT process. R1 requires that these tasks be company-specific and related to the Bulk Electric System (BES). However, BES still has not been adequately defined to a level that would provide direction to companies for developing their own reliability-related tasks. A major point of confusion is the discrepancy between BES (NERC terminology) and the FERC terminology (Bulk Power System? BPS) as described in the Energy Policy Act of 2005. BPS has a much broader and inclusive definition, which makes it extremely difficult for an entity to determine if its training program meets the R1 requirement. We suggest the inclusion of an Appendix in this standard that formally defines the SAT/ADDIE process. While R1.1? R1.4 does allude to the basic elements of the process; this may not be obvious to those without a background in training. The Appendix would clearly describe each step required by the systematic approach to training, and bring everyone who must comply with this standard to a basic level of understanding.
Response: The intent of the Standard is to require all entities to use a systematic approach to training for either new or existing training programs. The effective date of this standard allows time to modify existing or implement new training programs. Requirement 1 has been modified to provide clarity and now reads: R1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. The defining of the term Bulk Electric System (BES) is outside the scope of this Drafting Team. The definition is found in the NERC Glossary and is defined by each individual Region. The requirement in this standard references BES, not BPS, so there should be no confusion. There are multiple variations of a systematic approach to training. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf		
California ISO	No	Stating that the FERC mandated SAT methodology must be used is sufficient. The SAT methodology already includes the components listed in the sub-requirements. We suggest eliminating all the sub-requirements to R1.With R1 modified to eliminate the sub-requirements, we recommend re-writing R2 as shown below. R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform reliability-related tasks at least one time. [Risk Factor: High] [Time Horizon: Long-term Planning]

Organization	Question 1:	Question 1 Comments:
		We suggest that R2.1 be modified to allow extra time for employees who were absent from work and were unable to be trained within the six month time frame. R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks. The six-month time frame is applicable only to those employees who were not absent from work and who were able to attend the formal training sessions. An additional six months for evaluating System Operator's capabilities shall be granted for employees who were unable to attend formal training due to absence from work.
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. While the SAT process may be familiar to many entities, the comments received during the development of this standard indicate that many entities have little or no familiarity with the SAT process. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf The Standard Drafting Team recognizes that hardship circumstances will arise. The SDT feels that these instances will be addressed on a case- by-case basis by the Compliance Monitoring Enforcement Program (CMEP). It is not feasible that a Standard could address every possible situation.		
FRCC	No	Although FERC required the SAT methodology in Order 693, it was not defined. The previous version of the standard did include, (analysis, design, development, implementation and evaluation) components of what at SAT should include. These have been removed and now it seems that "systematic approach" is an ambiguous term. The requirement states that the RC, BA and TOP shall "use" a systematic approach. Are the requirements 1.1, 1.1.1, 1.2, 1.3 and 1.4 the components of such an approach? If so, why not delete the term and just have the requirements which cover each of the components?
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. While the SAT process may be familiar to many entities, the comments received during the development of this standard indicate that many entities have little or no familiarity with the SAT process. Keeping the reference to the SAT process in R1 provides greater clarity to the intent of the requirement, so it was retained.		

Organization	Question 1:	Question 1 Comments:

NPCC Regional Standards Committee	No	NPCC participating members wish to thank the drafting team for accepting our comment related to the SAT from the last posting--"We continue to disagree that using a Systematic Approach to Training to develop a training program is a reliability requirement. Reliability standards need to address the "what", not the how, despite the FERC Order." The lower case acronym that now appears in the standard seems to have alleviated some of the concern with some of the NPCC RSC members. However we request the drafting team further clarify the standard to ensure that the requirement to use a "systematic approach to training" does not dictate a specific type of training program, such as the 5 principles in the SAT, as long as requirements in R1.1 to R1.4 are fully met. In fact, R1 should simply be stipulated as: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall establish a new or modify an existing training program(s) for the BES company-specific reliability-related tasks performed by its System Operators."
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. Keeping the reference to the SAT process in R1 provides greater clarity to the intent of the requirement, so it was retained. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf		
PJM Interconnection, LLC	No	R1 without the sub-requirements is sufficient to meet the FERC directive. The sub-requirements go outside the scope of the standard and merely describe some elements of the SAT methodology itself. The SAT methodology is a well established, widely used training standard in the industry which does not need to be described in detail in the NERC Standards.

Organization	Question 1:	Question 1 Comments:
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The task list is used to identify the necessary training as stated in R1. A systematic approach to training is used to develop the associated training for each task. While the SAT process may be used by many entities, the comments received during the development of this standard indicate that there are many entities that have little or no familiarity with the SAT process. The drafting team added a list of references that provide guidance in applying the SAT process to the standard.		
FirstEnergy	No	Although we agree that the minimum training needs of personnel are identified, we have the following concerns/suggestions: 1. The standard does not require minimum training needs for the trainer. Adding a subrequirement to assure the trainer is adequately trained will support the BES reliability through the assurance that training personnel will have the knowledge and skills they need and will add to the quality of the training delivered. Even though this is considered to be outside the scope of the SAR, adding a requirement to "train the trainer" will demonstrate the importance of flexibility in NERC's standard development process that does not always exist today. While we understand that SDT's should not be given complete freedom to significantly diverge from the SAR scope, there needs to be some flexibility for teams to adjust the scope based on industry feedback. In the end, all new or revised standard requirements are voted on regardless of the exact SAR scope. We believe the SDT teams should not be rigidly bound by the SAR scope, but rather have enough flexibility to adjust based on subsequent direction from FERC on other standards projects or valid input, agreed upon by the SDT, that is received from industry during the development of the standard although not explicitly stated in the original SAR scope. Our suggested change to "train the trainer" has precedence from direction received from FERC based on its Order 706 regarding the CIP standards. Please refer to paragraph 435 of Order 706.2. We feel that R1.4 may need to be expanded. Per R1.4, an evaluation of the training program is required; however, it does not specify what to do with the results of such evaluations. We suggest revising R1.4 and adding the following subrequirements: R1.4. The Reliability Coordinator, Balancing Authority, and Transmission Operator shall conduct an evaluation of the training program established in R1. R1.4.1. The Reliability Coordinator, Balancing Authority, and Transmission Operator shall annually review the evaluations of their delivered training to identify needed changes to their training program.R1.4.2. The Reliability Coordinator, Balancing Authority, and Transmission Operator shall implement the training program changes identified in R1.4.1 within 12 months of that review.
Response: The majority of commenter's from previous postings did not agree that a requirement should be included in the standard that necessitates entities to verify that personnel developing or delivering training to System Operators are competent. Since this requirement was outside the scope of the SAR, the SPT SDT removed this requirement from the standard. With regards to your comment that the SDT should not "be rigidly bound by the SAR scope" is beyond the purview of the SDT process. This should be brought up to the Standards Committee for future consideration and possible modification to the standards development process. The intent of R1.4 was that when the need for a change to the training program was identified, the change would be made. The SDT added clarifying language to R1.4 which now reads "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1 to identify any needed changes to the training program and shall implement the changes identified".		
PSEI	No	Since the new wording includes "BES company-specific reliability-related tasks" we have now bought into regional differences as each region is responsible to decide their definition of BES. They have done this in a FERC filing (Docket No. RM06-16-000). What if a company does not have any tasks that are BES related as defined by their region? Will an auditor accept that it does not apply and therefore the entity does not need a training program? Requiring an administrative burdensome process for all training does not help smaller companies. They lack staff. Perhaps the training standard should only apply to those companies that are CEH providers. System Operators are already required to obtain and maintain certification. Let companies decide the skill level of their operators without an administrative nightmare.

Organization	Question 1:	Question 1 Comments:
Response: As stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). The majority of training in this standard could meet CEH.		
Duke Energy Corporation	No	We have significant concerns with the current draft of PER-005-1. While the concept of a systematic approach to training? Is valid, the implementation of the concept as envisioned in the current draft cannot be accomplished with the precision and clarity necessary for a mandatory reliability standard. A process-driven approach like the systematic approach to training is better handled outside of reliability standards. We need specific requirements that are clear and consistently enforceable in the standards. The critical first step of the ?systematic approach to training as stated in Requirement R1.1, is to create a list of Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators. The previous draft of PER-005-1 listed literally hundreds of tasks. The development of a company-specific list is a subjective endeavor. It is highly likely that auditors would consistently disagree with the composition of any responsibility entity's list, and hence find them in violation of a medium risk factor requirement. Ambiguous requirements have no place in a mandatory reliability standard. A better approach would be to capture in this standard the continuing education requirements and categories by type of NERC certification. Operators should be required to pass the appropriate NERC certification examination, and maintain that certification with NERC-approved continuing education training hours. For example the current requirement is 200 hours over a three-year period for Reliability Coordinators. The initial letter from Mark Fidrych stating the company requirement for the five-days of emergency operations training, established in PER-002 R4 and further defined as 32 hours currently identified in R3 of PER-005-1 should be put into the standard and counted toward the system operator certification training requirements as a third category of hours along with Simulation and Standards to maintain certification. Why have a completely separate set of training requirements not part of the continuing education process? It makes for separate record keeping and confusion. With the consolidation of the PER-002, 003 and 004 into PER-005, it makes further sense to consolidate the emergency hour's requirement into the credential maintenance program.
Response: The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. As stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). The majority of training in this standard could meet CEH.		
LCRA	No	The requirement requires transmission operators to create a list of company specific reliability related tasks. What are they exactly? That's a very subjective term. Who decides? If the transmission operator training staff decides what will be critical,

Organization	Question 1:	Question 1 Comments:
		and thus what they will be audited on, then it behooves them to keep that list as short as possible. The fewer tasks on the list, the less one is responsible for. I do agree that the systematic approach is the best way to go, but not when you are attempting to tie it to a task list that is completely subjective. That makes no sense whatsoever.
Response: As stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard has been revised and now details some topics that could be considered and included in a task list.		
BCTC	No	The concept for Systematic Approach to Training is understood but it is not clear what the BES company-specific reliability-related tasks performed by System Operators would be. This would be too open to interpretation by an audit team.
Response: As stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary depending upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard has been revised and now details some topics that could be considered and included in a task list. The defining of the term BES is outside the scope of this Drafting Team. The definition is found in the NERC Glossary and is defined by each individual Region.		
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	We agree that R1 does identify the essential components of a Systematic Approach to Training (SAT). However, we found the statement that SAT must be used "to establish a new or modify an existing training program(s)" to be ambiguous. Clearly, if a company creates a new course or undertakes a modification to an existing course, then SAT must be followed. But does this statement require that ALL existing training programs (whether modifications are planned or not) be adjusted to be consistent with SAT? R1 needs to be reworded to eliminate this ambiguity. Furthermore, the development of reliability-related system operator tasks is a crucial starting point for the SAT process. R1 requires that these tasks be company-specific and related to the Bulk Electric System (BES). However, BES still has not been adequately defined to a level that would provide direction to companies for developing their own reliability-related tasks.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology". The intent of the Standard is to require all entities to utilize a systematic approach to training for either new or existing training programs. The effective date of this standard allows time to modify existing or implement new training programs. Requirement 1 has been modified to provide clarity and now reads: R1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. The defining of the term Bulk Electric System (BES) is outside the scope of this Drafting Team. The definition is found in the NERC Glossary and is defined by each individual Region.		
Santee Cooper	No	R1 states "? Shall use a systematic approach to training to establish a new or modify an existing training program(s)". Does this imply that all previous training is to be modified to fit SAT? A training module should only need to be modified to fit the SAT process if it is used again after this standard is approved. All past training that is not used after this standard is approved should not have to be modified. See below for recommended wording. We agree that R1 describes the minimal components that should be included in a training program. Recommend including as an attachment to the standard the System Operator Training Reference Document. We recommend removing the words "BES company-specific" to avoid confusion. R1 would read simpler as "Each RC, BA, and TOP shall use a systematic approach to training to establish a new

Organization	Question 1:	Question 1 Comments:
		training program for reliability-related tasks performed by its System Operators. Existing programs that do not follow the SAT model should ensure future training conforms to the SAT process."
Response: The SDT agrees that this Standard only applies to active training related to the task lists as defined by R1.1. The intent of the Standard is to require all entities to use a systematic approach to training for developing new or modifying existing training programs. The effective date of this standard allows time to modify existing or implement new training programs. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR.		
Ohio Valley Electric Corporation	No	R1.2 & R1.3 could be interpreted to exclude the use of contractors for designing and developing learning objectives and training materials. R1.2 & R1.3 should be revised so as not to imply that outside contractors could not be used. The evaluation of training stated in R1.4 is a good statement and good training practice. However, there has been no assessment or evaluation of the effectiveness existing training programs required by PER-002, R3 that has been in affect for over three years. Why create a standard to mandate a new training program when no assessment has been made of the effectiveness of existing training programs? The work to create a new training standard is not a judicious use of resources in order to strengthen the reliability of the bulk electric system. FERC, with its Order, is trying to direct the outcome of the stakeholder process without participating in the same process that the stakeholders must use. The standards development process loses its integrity if the outcome is directed or predetermined and stakeholder input is not considered.
Response: - The SPT SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity that hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR.		
Gainesville Regional Utilities	No	FERC and NERC describing in detail How training is accomplished and documented seem to be taking things to an extreme that is not necessary.
Response: The philosophy used to develop this Standard is based on the industry need from the industry approved SAR.		
Hydro One Networks - Reliability Standards Group	No	(do not wish to specify Yes or NO for this question)R1.4 needs a time frame in which each entity must conduct an evaluation of their training program.
Response: The SPT SDT acknowledges your response and has added a time frame for evaluation of a training program. R1.4 now reads “Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1 to identify any needed changes to the training program and shall implement the changes identified. ”		
CAISO	No	This is a general comment regarding PER-005. The following statement from R2 has a typo error. I believe the word "or" should have been "of”. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each or its System Operator’s capabilities to perform each assigned task identified in R1.1 at least one time.
Response: The SPT SDT acknowledges your response and thanks you for your clarifying comment. The typographical error has been corrected.		
Pepco Holdings, Inc. - Affiliates	No	Change the wording in R1 to emphasize the training program before establishing the method of development. For example --Each RC, BA and TOP shall establish a new or modify an existing training program using a systematic approach etc. The change in emphasis would make it easier to state VSLs as shown in 4 below.
Response: The SDT acknowledges your response and thanks you for your comment but feels that the present wording provides for sufficient clarity.		
Niagara Mohawk (DBA National Grid)	Yes	The lower case acronym that now appears in the standard seems to have alleviated some of our concerns. However we request the drafting team further clarify the standard to ensure that the requirement to use a "systematic approach to training" does not dictate a specific type of training program, such as the 5 principles in the SAT, as long as requirements in R1.1 to R1.4 are fully met. In fact, R1 should simply be stipulated as: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall establish a new or modify an existing training program(s) for the BES company-specific

Organization	Question 1:	Question 1 Comments:
		reliability-related tasks performed by its System Operators" since R1.1 thru 1.4 describe the training development "process".
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. Keeping the reference to the SAT process in R1 provides greater clarity to the intent of the requirement, so it was retained. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf		
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	Yes	We agree that the description for the SAT methodology clearly describes the minimal components required. We do have concern with the use of the term "company specific". Does this infer that each company has a composite listing or can each function (business unit) within a company maintain their own listing?
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. The Standard is not intended to specify how an entity develops the company specific task lists. Whatever is logical and fits the organizational structure that is justifiable should be sufficient. Only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard has been revised and now details some topics that could be considered and included in a task list.		
Northeast Utilities	Yes	R1 describes the SAT process (Analysis, Design, Develop, Implement, and Evaluate) well. What guidance determines "BES company-specific reliability-related tasks"?
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. Only specific tasks that are considered critical to reliability should be considered when developing a task list. The Reference Document associated with the Standard details some topics that could be considered and included in a task list.		
Grant County PUD	Yes	The revised Requirement R1 does identify a minimum subset of the components of the Systematic Approach to Training with out actually naming them. Analysis, Design, Development, Implementation and Evaluation. These elements are very well understood in other industries such as nuclear power and have been in use for many years. It's not clear why you would choose not to simply use the existing model and not try to reinvent the wheel? It's also notable that the previous version had reference to a "Generic Task List" which could prove very useful and informative for those who are struggling with the analysis phase of SAT. This reference to the GTL was struck out in the new redline of the standard. This is unfortunate because entities with little expertise in SAT will have to start from scratch with their job/task analysis instead of having a point of departure for design and development. This is not to encourage wholesale use of a generic task list but

Organization	Question 1:	Question 1 Comments:
		perhaps the availability of a generic task list and guidance to customize it for use on an entity specific basis would provide a smoother transition to the Systematic Approach.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. Only specific tasks that are considered critical to reliability should be considered when developing a task list. The Reference Document associated with the Standard has been revised and now details some topics that could be considered and included in a task list.		
Manitoba Hydro	Yes	Manitoba Hydro agrees that a Systematic Approach to training be used in developing new training programs.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.		
American Transmission Company	Yes	In general we agree with the approach described.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.

Consideration of Comments on 3rd Draft of System Personnel Training Standard

Organization	Question 1:	Question 1 Comments:
Allegheny Power	Yes	
Public Service Commission of South Carolina	Yes	
WECC Operations Training Subcommittee	Yes	
ISO New England Inc.	Yes	
AEP	Yes	
We Energies	Yes	
Baltimore Gas & Electric	Yes	
New York Independent System Operator	Yes	
Midwest ISO Stakeholder Collaborators	Yes	In general, we agree that R1 describes the components that must be included in a systematic approach to training. However, we do believe the requirement could be improved further by adding the following clause after the word training in the second line of R1.as outlined below
Response: There was insufficient information in your comment for the SPT SDT to address.		

2. The SPT SDT revised R3 to identify the training requirements and the various techniques/tools that can be utilized to conduct the training. In utilizing a systematic approach to training as described in R1, would you agree that the task list developed in R1.1 would be utilized to conduct the training required in R3? If not, please explain in the comment area.

Summary Consideration:

The majority of the responders agreed that the task list developed in Requirement 1 could be used in the development of the training identified in Requirement 3. In those instances of disagreement, the majority questioned the use of simulators and the definition of what 12 month period was to be used. Also, there appeared to be confusion concerning the task list developed in Requirement 1 being all inclusive for the emergency operations training.

The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read:

R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.

R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from “annually” to “every 12 months” to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 4 of the Standard.

Concerning the confusion associated with the task list developed in Requirement 1 being all inclusive for the emergency operations training, the SPT SDT did not intend to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Several commenters referenced a list of emergency operations training topics issued by the Operating Committee Chair (Mr. Fidrych) in March, 2004 – the SPT SDT added this list of emergency operations training topics that could be included in the training to the revised Reference Document associated with this Standard.

Organization	Question 2:	Question 2 Comments:
SERC OC Standards Review Group (Project 2006-01)	No	As stated in the response to Question 1, we are uncomfortable with the R1 requirement to create reliability-related tasks for the operation of the Bulk Electric System. The information needed to effectively develop the subset of tasks related to emergency operations is insufficient. Clarify what the twelve months - is it an annual basis or a rolling 12 month = a calendar year vs. a credential year. In addition, we feel that the phrase in R3: At least every 12 months...? Is open to different interpretations. Must each system operator be provided with 32 hours of emergency training within every calendar year or

Organization	Question 2:	Question 2 Comments:
		within every credential year?R3 further implies by the phrase applicable to its organization that only system-specific training can be used for the 32-hour annual emergency training requirement. This wording needs to be changed to make it clear that, while system-specific training is needed, generic training on emergency operations is also allowed in the 32 hours. We also suggest that, in R3, the phrase and hands on training using simulators be changed to and/or hands on training using simulators to clarify that use of a simulator is not required for all training, drills or exercises (for example, table-top drills are allowed as well).
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard. The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from "annually" to "every 12 months" to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 3 of the Standard. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions."		
Ohio Valley Electric Corporation	No	Emergency operations training should not be limited to the task list developed in R1. Many emergency operations topics are related to concepts and not tasks. R1 can be used to identify some emergency operations training topics but will not cover all the topics that could qualify as emergency operations training. There is insistence by FERC that the use of simulators be explicitly required and that the requirements be applicable to local control center personnel. FERC offers no justification as to why this is necessary but it is also not immune from its requirement to engage in reasoned decision-making and provide justification. The required use of simulators creates undue hardship for many smaller entities, especially those with limited staffing. The purchase, operation, and model maintenance of a simulator is not an inexpensive proposition. Additional staffing for this purpose will be required. Likewise, there will be a considerable expenditure for training resources, either internal or external. FERC however did state that smaller entities that have no impact on the BES should not be required to have simulators, but no definition of small entity has been offered. Suggest removing the "hands on training using simulators" wording from R3.PER-002 R4 currently defines emergency operations training clearly and is well understood and successfully implemented by the entities required to provide this training. PER-005 R3 should be revised to the existing wording found in PER-002 R4.
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that		

Organization	Question 2:	Question 2 Comments:
the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
Gainesville Regional Utilities	No	Not necessary
Response: The 32 hours of emergency operations training is presently identified and required in NERC approved standards. The training of System Operators was a major contributor to the 2003 blackout.		
tampa electric company	No	I feel should be reworded to state "using training, drills, exercises, and hands on training using simulations" instead of simulators as many smaller and larger companies do not have the staff or resources to support simulators. Also, R3 does not address a new hire that starts mid year or a trainee who is released late in the year. Do these individuals have the same 32hr requirement even though they do not have a year to complete it?
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT revised the condition for Requirement 3 from “annually” to “every 12 months” to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 4 of the Standard.		
Santee Cooper	No	R3 reads" using training, drills, exercises, and hands on training using simulators". Santee Cooper agrees with R3 if the

Organization	Question 2:	Question 2 Comments:
		"and" is changed to "or". As it is currently written it could be misconstrued to mean that simulators have to be used for all 32 hours. In addition, Santee Cooper is concerned that a company's interpretation of what is considered emergency operations training could be questioned by an auditor without some further clarification of topics that can be included in emergency operations training (Fidrych letter). We also ask the SDT to clarify "at least every 12 months". Is this on an annual basis as currently defined in PER002? It could be rewritten to read "On a per year basis each RC, BA, and TOP shall provide?"
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from “annually” to “every 12 months” to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 4 of the Standard. The drafting team has included the topics from the Fidrych letter to the Reference Document for this standard.		
Midwest ISO Stakeholder Collaborators	No	We agree that the company's list of reliability-related tasks from R1.1 will include tasks related to emergency operations which will certainly facilitate identifying the training required for R3. As R3 is currently written, however, R3 creates the potential for small registered entities to expend significantly more funds for emergency operations training than they will realize in actual value. This is directly due to the requirement to include hands on training using simulators. In Order 693, FERC even recognized that smaller registered entities that have little impact on the BES should not be required to have a simulator or simulator training. FERC stated that the requirement to have a simulator or simulator training should consider the entities role and size. If the word simulator was changed to simulations or the word or was used instead of and in the list, the requirement would satisfy the consideration FERC gave these small entities in Order 693.
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard. All of the forms of training listed in Requirement 3 do not have to be used for every class. However, dependent on the entities system characteristics, the use of simulators must be included within the 32 hours as defined below. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement		

Organization	Question 2:	Question 2 Comments:
3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
PJM Interconnection, LLC	No	No list is required, as we recommended the elimination of the sub-requirements in R1. In addition, the type of training mandated is too definitive. The standard should read, "using a combination of training, drills, exercises, or training simulators." This allows the registered entity to structure a program based on their specific needs and resources.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 "Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
Xcel Energy	No	We recommend that the wording of R3 be slightly modified to clarify that entities may use any of the training methods listed, and not necessarily required to use ALL of them. Here is how we suggest it should read: R3. At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration)using any of the following methods: training, drills, exercises, and hands on training using simulators.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with		

Organization	Question 2:	Question 2 Comments:
established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
Duke Energy Corporation	No	See response to question #1 above. Also on R3, the phrase "using training, drills, exercises and hands-on training using simulators" should be changed to "using training, drills, table-top exercises or hands-on training using simulators". This change recognizes that training may be accomplished using one or more of these methods, and that hands-on training using simulators is not required for all entities (FERC Order No. 693, paragraphs 1390 - 1393).
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - – to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation.. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
California ISO	No	We've recommended that the sub-requirements for R1 be eliminated. We believe R3 should be modified to allow any combination of "training, drills, exercises, and hands on training using simulators" instead of mandating that all must be used.
Response: The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 “Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
BCTC	No	The Standard now states that at least 32 hours annually of emergency operations training applicable to its organization. The way this is written suggests that emergency operations training is now limited to only company specific issues and that would disqualify much of the Emergency Operations training done with other organizations or contractors / vendors. If this interpretation is correct this would be very limiting and it would be difficult to get 32 hours accomplished. We suggest the original wording in PER-004 is sufficient and just change 5 days to 32 hours. It is not clear when a 12 month interval starts and stops for each System Operator as written in the Standard. Is this meant to allow each System Operator to have a different 12 month window so the measure could be tied to a Certification yearly window?
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that		

Organization	Question 2:	Question 2 Comments:
the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard. The SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. In addition, Requirement 3 has been modified and Requirement 3.1 has been added to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 “Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). As envisioned, much of the training developed and delivered in accordance with this standard could also be used to meet CEH. The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from “annually” to “every 12 months” to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 3 of the Standard.		
PSEI	No	The new wording says "applicable to its organization". This just eliminated a lot of vendor training as it is generic. Small companies that do not have training staff rely on vendors to meet the current requirement. They also do not have the time and staff to specifically link a vendor's course to specific tasks. Emergency training can be and is valuable without burdening companies by requiring all to be company specific.
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard. The SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR In addition, Requirement 3 has been modified and Requirement 3.1 has been added to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.		

Organization	Question 2:	Question 2 Comments:
R3.1 "Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	As stated in the response to Question 1, we are uncomfortable with the R1 requirement to create reliability-related tasks for the operation of the Bulk Electric System. The information needed to effectively develop the subset of tasks related to emergency operations is insufficient.
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. The SPT SDT believes that the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard.		
FRCC	No	The statement "using training, drills, exercises, and hands on training using simulators" is vague. What is meant by training since the items that follow it are forms of training? Does the responsible entity have to prove that all of these forms of training were used for every class, or just over the entire 32 hours. It appears that the only particular term identified for emergency operations training that is a "must" is system restoration. Is that correct? And if so, do all of the forms of training identified apply specifically to system restoration? This requirement needs to be clarified.
Response: The SPT SDT believes that what is meant by training is clarified by the items that were listed in the Requirement – note that the SPT SDT modified the phrase for clarity. All of the forms of training listed in Requirement 3 do not have to be used for every class. However, dependent on the entity's system characteristics, the use of simulators must be included within the 32 hours. The SPT SDT is not targeting just system restoration in Requirement 3. There are other topics that could be used but the training must include system restoration. System restoration training could utilize one or more of the methods identified in Requirement 3. Additionally, emergency operation training topics, that could be included, are listed in the revised Reference Document associated with this Standard.		
Hydro One Networks - Reliability Standards Group	No	Do not assume each company's list of tasks will include emergency operations and system restoration. Perhaps include these items in brackets in R1.1, and/or in requirement 3 refer to the list tasks in R1. Join R1 and R3 in someway other than assuming an entity/company will.
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. However, those tasks associated with emergency operations identified in Requirement 1 should be included. The SPT SDT believes that these tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard.		
LCRA	No	The emergency training requirement should be removed from this standard and moved to certification/CE program. Right now CE requirements are tracked on a 36 month rolling calendar while the annual emergency training requirement is tracked on a 12 month annual calendar. You are confusing people and making it much more difficult to keep track of it all.
Response: The majority of the commenters in Draft 2 of this Standard supported including this requirement in the System Personnel Training standard. The SPT SDT revised the condition for Requirement 3 from "annually" to "every 12 months" to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 4 of the Standard.		

Organization	Question 2:	Question 2 Comments:
WECC Operations Training Subcommittee	No	Training applicable to the organization should be removed, due to lack of clarity which may lead to multiple interpretations and multiple definitions of "applicable"
Response: The SPT SDT disagrees with your comment. The SPT SDT believes that by using the term applicable allows the individual entity to tailor the training to their specific organizational needs.		
CAISO	No	No comment
The Detroit Edison Company	Yes	We believe the use of "simulators" is too restrictive and "simulations" should be used instead. Simulations can occur without the use of simulators.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 “Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.”		
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	Yes	We agree that the list of reliability related tasks previously identified by the entity can be used to identify the training to meet R3. We have a concern with the description of the training methods, especially that it includes the apparent requirement to use hands on training simulators. The way this is written it indicates that the use of simulators is required. If that is the intent then we disagree with the requirement. If it is not the intent then strike the use of example entirely or clarify that the training "may include methods such as." Additionally, must all of the 32 hours be comprised of drills, exercises and hands on training using simulators?
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with		

Organization	Question 2:	Question 2 Comments:
established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
Pepco Holdings, Inc. - Affiliates	Yes	Requirement 3 should specifically state that the tasks related to emergency operations should be taken from the list developed for Requirement 1 In addition R3 should be revised to say "using any of the following: training classes, drills, exercises or hands on training using simulations" rather than training, drills, exercises and hands on training using simulators. This allows for training classes which can still be a valuable type of emergency ops training and other types of simulation experiences as well.
Response: It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. However, those tasks associated with emergency operations identified in Requirement 1 should be included The SPT SDT believes that the tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.		
ERCOT Inc.	Yes	The 32 hour requirement should be removed. The 32 hour requirement was an interim fix to address the absence of a SAT process in many organizations, and for political expediency. With the implementation of SAT, arbitrary mandates are no longer needed. If the 32 hour requirement remains, then the equivalent of the Fidrych letter of 2004 needs to be provided.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. The majority of the commenter's in Draft 2 of this Standard supported including this requirement in the System Personnel Training standard. The SPT SDT has included topics that could be included in the emergency operations training in the revised Reference Document associated with this Standard – they are the topics that were included in the letter from the Operating Committee chair to the Operating Committee for clarification when the 32 hour training requirement was initiated. The drafting team has included the topics from the Fidrych letter to the Reference Document for this standard.		
MRO NERC Standards Review Subcommittee	Yes	The MRO understands the SDT to be saying that the emergency operations tasks identified in R1.1 can be used in R3. If that is correct the MRO agrees. If this is not the intent of the SDT, please clarify.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment.		

Organization	Question 2:	Question 2 Comments:
The SPT SDT agrees that those tasks associated with emergency operations identified in Requirement 1 should be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard.		
Southwest Power Pool - Operations Training Working Group	Yes	We believe this is true, but there are certain tasks that may be required as emergency training which falls under the general list of emergency training as indicated by Mark Fiddich's letter of March 2nd, 2004 that is not expressed by Requirement 1 of company specific related tasks.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. However, those tasks associated with emergency operations identified in Requirement 12 should be included. The SPT SDT believes that these tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard -– they are the topics that were included in the letter from the Operating Committee chair to the Operating Committee for clarification when the 32 hour training requirement was initiated. The drafting team has included the topics from the Fidrych letter to the Reference Document for this standard.		
AEP	Yes	We believe this is true but it should not harbor the intent that all emergency training should only be in conjunction with reliability tasks. Some tasks relate to emergency training which are indirect subsets of the reliability tasks. All emergency training done for the 5 days of emergency training should be considered satisfactory training whether directly or indirectly related to a reliability task. The present guidelines for emergency training topics identified by the Personnel Sub-committee in Mark Fydrich's letter of March 2, 2004 on recommended training topics should remain the guidelines for emergency training topics.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. However, those tasks associated with emergency operations identified in Requirement 12 should be included. The SPT SDT believes that these tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard – they are the topics that were included in the letter from the Operating Committee chair to the Operating Committee for clarification when the 32 hour training requirement was initiated..		
We Energies	Yes	The company's task list will not identify all of the allowed emergency operations training topics.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. It was not the intent of the SPT SDT to limit the emergency operations training to only tasks identified in Requirement 1. However, those tasks associated with emergency operations identified in Requirement 12 should be included. The SPT SDT believes that these tasks identified in Requirement 1 could be used as a starting point for development of the emergency operations training. Additional training topics that could be included in the training can be found in the revised Reference Document associated with this Standard.		
Northeast Utilities	Yes	No specific duration associated with system restoration training. Should there be a minimum number of hours per year for system restoration training?
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment. The SPT SDT believes that the type of system restoration training and associated length of training should be determined by the individual entity.		
Manitoba Hydro	Yes	Manitoba Hydro agrees that a company's list of reliability related task which include tasks related to emergency operations

Organization	Question 2:	Question 2 Comments:
		be used to identify training needs.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment.		
American Transmission Company	Yes	TC agrees with the SDT that the task list required by R1 can be used to identify those emergency operation tasks which can be used to satisfy R3.
Response: The SDT SPT acknowledges your affirmative response and thanks you for your clarifying comment.

Electric		
New York Independent System Operator	Yes	
FirstEnergy	Yes	
Ontario IESO	Yes	

3. Do you agree with the revised Measures identified for each requirement in the revised standard? If not, please explain in the comment area.

Summary Consideration:

The majority of those entities responding agreed with the Measures as presently defined. For those responders disagreeing with the Measures, there appeared to be significant concern with the sub-measures and keeping documentation of compliance on-site. There also appeared to be confusion surrounding the training required in this Standard and the certification process.

The SPT SDT explained the sub-measures were a means to provide consistency in measuring compliance with the sub-requirements. The SPT SDT further explained that there are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The task list is used to identify the necessary training as stated in R1. A systematic approach to training is then used to develop the associated training for each task.

With regards to the concern surrounding the requirement to provide documentation on-site the SPT SDT explained that, as with other standards, it is the entity's responsibility to provide all documentation necessary to reflect compliance.

The SPT SDT also explained that the NERC Certification Process and NERC Continuing Education (CE) Program are not a part of this standard. This standard applied to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). As envisioned, much of the training developed and delivered in accordance with this standard could be used to meet CEH.

Organization	Question 3:	Question 3 Comments:
Grant County PUD	No	I note that there is a new requirement R2 which appeared suddenly with this version. You don't seem to be taking comments directly on this new addition though. Is this in accordance with the ANSI process for standards development? The proposed new R2 and its associated measure require a new verification of operator capability to perform the tasks identified in R1 at least one time. This verification is very different from the previous requirement to perform a training needs analysis based on performance mis-matches. What is the time period allowed to do the initial verification. Since the proposed effective date is 36 months after date of approval, should one assume that entities must be in compliance at that time with the requirement to do the initial one time verification? Please explain the point of doing this verification of capabilities only once? This seems to miss the boat on the benefit of refresher training. The only requirement will be to train when a new task is identified or an existing one is modified. Thus, an entity would be absolved from providing any refresher for operators on tasks that have not changed but which may be very difficult, highly important to be done correctly and performed only infrequently? This doesn't seem to meet the needs of system operators who are an essential element in maintaining bulk electric system reliability. Does this one time verification remove the 3 year certificate renewal cycle? If not, how does the one time verification fit into the overall systematic approach to training? What's the difference between the one time verification and initial certification? If you still have to renew your certificate every 3 years, doing this verification (at least one time) makes no sense because a systematic approach to training would

Organization	Question 3:	Question 3 Comments:
		revisit training on tasks based on the results of the Difficulty, Importance, and Frequency (DIF) analysis.
Response: As stated in Draft 2 of the System Personnel Training Consideration of Comments, the SPT SDT clarified the language in R4 (now R2) to state that the assessment is a one-time verification of each system operator's capabilities. The SPT SDT also added a sub-requirement that clarifies that additional assessments must be performed as the operator's assigned task list is modified. This would not preclude an entity from verifying the capability more than once. The SPT SDT believes that with the additional training required (i.e., Emergency Operations, CEH, etc.) and the re-assessment of an operator's capabilities when the task list is modified that an initial one time training assessment is sufficient. However, this does not preclude an entity from performing training outside this Standard. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). As envisioned, much of the training developed and delivered in accordance with this standard could be used to meet CEH.		
California ISO	No	We recommend the following:M1: Delete all M1 sub-measures, since we believe all R1 sub-requirements should be eliminated.M2: Delete references to R1.1
Response: The SPT SDT believes that the sub-measures provide a necessary means of reflecting compliance with the sub-requirements. The sub-requirements simply list common elements that are in every systematic approach to training process. While the SAT process may be used by many entities, the comments received during the development of this standard indicate that there are many entities that have little or no familiarity with the SAT process.		
PJM Interconnection, LLC	No	Due to the changes recommended above, all measures and sub-measures should be eliminated except for M1 and M3.
Response: The SPT SDT believes that the measures and sub-measures provide a necessary means of reflecting compliance with the requirements and sub-requirements. The sub-requirements simply list common elements that are in every systematic approach to training process.		
ERCOT Inc.	No	M1 is fine, but as noted above M1.1 through M1.4 should be deleted along with R1.1 through R1.4. If R3 is changed, then M3 must be changed.
Response: The SPT SDT believes that the sub-measures provide a necessary means of reflecting compliance with the sub-requirements. The sub-requirements simply list common elements that are in every systematic approach to training process. There are multiple variations of a systematic approach to training. While the SAT process may be familiar to many entities, the comments received during the development of this standard indicate that many entities have little or no familiarity with the SAT process. Keeping the reference to the SAT process in R1 along with the subrequirements provides greater clarity to the intent of the requirement, so the sub-requirements were retained. R3 was modified to clarify what entities are required to use simulation technology in their emergency operations training – and M3 was modified to support the revisions to R3.		
MidAmerican Energy Company	No	Some training materials will be the property of third party providers of learning activities. Not all training materials will be developed by entity that developed the task list as suggested in M1.2. M1.2 should modified to "...have available for inspection its learning objectives and any training material self-supplied as specified in R2.2Based on what I have heard, the records kept in the NERC data base can not be accessed by anyone other than the system operator. M1.3 should be modified to read, "... showing the names of the people trained, the title of the training received and dates received to show that its operators received the training specified in R1.3 (2.3)
Response: The SPT SDT revised the measures from Draft 2 to Draft 3. As stated in the Consideration of Comments on 2nd Draft of System Personnel Training Standard the measures now include examples of evidence, which do not exclude the use of vendors.		

Organization	Question 3:	Question 3 Comments:
With reference to Measure 1.2 the SPT SDT acknowledges your comment and understands you concern. However, as with other standards it is the entity's responsibility to provide all documentation necessary to reflect compliance. The Measure for training delivery (M1.3) requires responsible entities to have System Operator training records showing the names of the people trained, the title of the training delivered and the dates the training was delivered.		
Santee Cooper	No	Santee Cooper feels that some of the items of evidence defined in the measures are not part of the SAT process (audit results, supervisor feedback). The SDT may have been trying to give some examples here but during an audit a company may be held to provide all the listed items as evidence. Including some words such as "shall have and provide upon request evidence that could include, but is not limited to" would help clarify that the list is examples only and that all items do not have to be provided during an audit.
Response: The Measures lists examples of a means to document compliance. However an entity is not limited to only the methods provided in the measure. The SPT SDT believes that it is the entity's responsibility to determine how it will show compliance unless the standard specifically requires entities to show specific evidence. The Measures have been written to allow entities latitude in using a variety of evidence for most requirements. The use of the phrase, "such as" clearly demonstrates that the items listed are examples and are not an exclusive or a mandatory list of evidence. The SPT SDT modified the measure to clarify that the audit that may be used to assess the effectiveness of the training program is an "internal" audit.		
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	Section C of this standard indicates that responsible entities will be measured on specific items of evidence that demonstrate use of the SAT. However, many of these items are not explicitly stated in the standard requirements themselves. For instance, Measure M1.4 lists evidence such as instructor observations and learning assessments that were not previously identified in R1.4. In addition, some items of evidence for measuring entity performance are not part of the SAT process at all - for example, audit results and supervisor feedback. The requirements section of this standard needs to be reworded to better define what specific items of evidence are required.
Response: The Measure M1.4 lists examples of a means to document compliance. However an entity is not limited to only the methods provided in the measure. The SPT SDT believes that it is the entity's responsibility to determine how it will show compliance. The SPT SDT modified the measure to clarify that the audit that may be used to assess the effectiveness of the training program is an "internal" audit.		
SERC OC Standards Review Group (Project 2006-01)	No	Section C of this standard indicates that responsible entities will be measured on specific items of evidence that demonstrate use of the SAT. However, many of these items are not explicitly stated in the standard requirements themselves. For instance, Measure M1.4 lists evidence such as instructor observations and learning assessments that were not previously identified in R1.4. In addition, some items of evidence for measuring entity performance are not part of the SAT process at all - for example, audit results and supervisor feedback. The requirements section of this standard needs to be reworded to better define what specific items of evidence are required.
Response: The Measure M1.4 lists examples of a means to document compliance – this is an acceptable method of establishing measures. However an entity is not limited to only the methods provided in the measure. The SPT SDT believes that it is the entity's responsibility to determine how it will show compliance unless the standard specifically requires entities to show specific evidence. The Measures have been written to allow entities latitude in using a variety of evidence for most requirements. The use of the phrase, "such as" clearly demonstrates that the items listed are examples and are not an exclusive or a mandatory list of evidence. The SPT SDT modified the measure to clarify that the audit that may be used to assess the effectiveness of the training program is an "internal" audit.		
FirstEnergy	No	M1.4 - The parenthetical examples are good to help with the compliance of R1.4, but entities may be tied down to these specific methods. Just to assure that other effective methods can be used, we suggest a rewording of M1.4 as follows: "The Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence that it performed a training program evaluation, as specified in R1.4 (evidence may include, but not limited to, instructor

Organization	Question 3:	Question 3 Comments:
		observations, trainee feedback, course evaluations, etc.)
Response: The Measure M1.4 lists examples of a means to document compliance. The use of the phrase, "such as" clearly demonstrates that the items listed are examples and are not an exclusive or a mandatory list of evidence. However an entity is not limited to only the methods provided in the measure. The SPT SDT believes that it is the entity's responsibility to determine how it will show compliance unless the standard specifically requires entities to show specific evidence. The Measures have been written to allow entities latitude in using a variety of evidence for most requirements.		
MRO NERC Standards Review Subcommittee	No	The MRO believes that the requirement in M1.2 to provide training materials could create an undo burden on the applicable entity if the audit was not conducted at the entity's site. The MRO recommends that this measure should be altered to reflect that concern.
Response: The SPT SDT acknowledges your comment and understands you concern. However, as with other standards it is the entity's responsibility to provide documentation to reflect compliance.		
Midwest ISO Stakeholder Collaborators	No	We are concerned that M1.2 could be burdensome. Specifically, what does have available for inspection mean? Training materials are often quite voluminous and can actually include systems such as simulators. We do not believe that the registered entity should be required to make these materials available for inspection off-site. We recommend modifying the measure to make it clear that inspection must occur at the location of the materials and systems to avoid this burden.
Response: The SPT SDT acknowledges your comment and understands you concern. However, as with other standards it is the entity's responsibility to provide all documentation necessary to reflect compliance.		
The Detroit Edison Company	No	We believe M1.2 should read: Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and a representative sample of training materials with all training materials available at the business location, with the date of the last revision, as specified in R1.2.
Response: The SPT SDT acknowledges your comment but respectfully disagrees. All training material needs to be available for inspection. As with other standards it is the entity's responsibility to provide documentation to reflect compliance.		
Duke Energy Corporation	No	See response to question #1 above. All the requirements of this standard need to be revised and the measures should be developed to fit the revised requirements.
Response: The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. As stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list.		
PSEI	No	This process should only apply to those entities that are NERC approved providers awarding CEHs.
Response: This Standard applies only to those NERC registered applicable entities as defined within the Standard. This includes all Reliability Coordinators, Transmission Operators and Balancing Authorities. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). As envisioned, much of the training developed and delivered in accordance with this standard could be used to meet CEH.		
Ohio Valley Electric Corporation	No	The emphasis on documentation in this standard does not seem conducive to improved reliability, as a previous commenter from Draft 1 of this standard observed. The measures may provide an incentive to create documents, but are there mechanisms in the compliance process to distinguish between an entity that is providing the appropriate training and

Organization	Question 3:	Question 3 Comments:
		documenting it versus an entity that is merely creating documents? Similarly, an entity may be taking all of the right steps, providing the necessary training, but lacks having all of the mandated documentation (perhaps because of a lack of resources to maintain the documentation). Between the paper-creating entity and the proper training entity, which is in compliance and more importantly which is more reliable? Some may comment that without documentation there is no way to measure compliance. While compliance auditors will certainly look at documentation they make no attempt to compare the contents of the documentation with actual practices. If the documentation contains the right words, the entity is deemed to be in compliance, regardless of whether the words in the documents were put into practice. Thus, if compliance can be verified by observing the actual practices, then why is the documentation even needed?
Response: The SPT SDT acknowledges your comment but respectfully disagrees. With enforceable standards, every effort needs to be made to ensure that the standards are being enforced in an objective manner – and that is difficult to do when relying upon personal observations. The SPT SDT believes that supporting documents are necessary means to reflect compliance with the Standard.		
LCRA	No	If I do not agree with the task list in the first place, it only follows that I would not agree with the measures. The measures themselves create an administrative nightmare for smaller utilities with respect to record keeping. There seems to be a disconnect on NERC's part as to how much the "one man shops" can handle. Not every utility in NERC has a large, complex training staff. In fact, many have one trainer, or even none. What is proposed by this standard will make training unmanageable.
Response: The SPT SDT acknowledges your comment but respectfully disagrees. The SPT SDT believes that supporting documents are necessary means to reflect compliance with the Standard.		
CAISO	No	No comment
Gainesville Regional Utilities	No	
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	Yes	See the comment regarding "company specific" in question 1.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. The Standard is not intended to specify how an entity develops the company specific task lists. Whatever is logical and fits the organizational structure that is justifiable should be sufficient. Only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary depending upon the operating position, responsibility of the position and the specific system for which the list is being developed. The revised Reference Document associated with the Standard details some topics that could be considered and included in a task list.		
Arizona Public Service Company	Yes	M2 is unclear to me. The way I read it, within 36 months of the standard's approval, each operator must be evaluated on each assigned task, even if they are experienced incumbents. This may be done in one of three "methods": Training records, Supervisor check sheets, or Learning assessments. These "methods" are open to interpretation. To me, they mean the following: Training records = training on the task is provided and evaluated and the attendance sheet and grade is archived Supervisor checklist = floor supervisor sees operator perform task satisfactorily and marks it complete on a tracking sheet. Learning assessment = an operator successfully answers questions about a given task. Somebody may interpret those methods entirely differently. We need to understand the expectations, or the audit will be needlessly painful.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. We agree with your interpretation of M2.		

Organization	Question 3:	Question 3 Comments:
WECC Reliability Coordination Comments Work Group (RCCWG)	Yes	The WECC RCCWG agrees with the revised Measures, assuming that there would be a 12 month requirement for emergency training for new hires. Please clarify this is a correct assumption.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. Your understanding is correct.		
Pepco Holdings, Inc. - Affiliates	Yes	Revise M1 to reflect the revised wording in R1 above. For example: Each RC, TA and TOP shall have available for inspection evidence of establishing a new or modifying an existing training program developed using a systematic approach to training. A 4th Requirement and a 4th Measure should be added - see our comments in 5 below
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment but feels that the present wording is sufficient.		
FRCC	Yes	However, It appears that the measure after M1.3 that is identified by M1. should really be M1.4 And, if the requirements change based on industry comments the measurements will need to be reevaluated and modified.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. This has been corrected.		
Manitoba Hydro	Yes	Manitoba Hydro agrees with the measures.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.

4. Do you agree with the revised Violation Severity Levels for each of requirement in the revised standard? If not, please explain in the comment area.

Summary Consideration:

The majority of responders disagreed with the Violation Security Levels (VSLs) associated with this Standard. The major concern centered on how the VSLs were developed. There was also concern that the requirement of providing 32 hours of emergency operations training was not being addressed in the VSLs. In addition there appeared to be concern that the Standard required that all of the methods of providing training identified in Requirement 3 had to be used.

The VSLs are determined in accordance with the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs and that this document was a product developed jointly by the stakeholder drafting teams and Subject Matter Experts, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.

Regarding the concern that the requirement of providing 32 hours of emergency operations training not being addressed in the VSLs - the VSLs, as presently written, address the issue of providing less than the required number of hours of emergency training. In the instance of an entity only providing 30 hours of emergency training to all of its system operators, that entity would have provided 32 hours of emergency operations training to 0% of the system operators and therefore would be deemed non-compliant.

The training methods identified in Requirement 3 are only examples of how the training could be accomplished. The SPT SDT modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read:

R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.

R3.1 “Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

The SDT is not attempting to define the method of training (with the exception of the use of simulators) but feels it was more prudent for the individual entity to determine the best method of providing the training to its System Operators dependent upon their unique system parameters.

Organization	Question 4:	Question 4 Comments:
FRCC	No	For R1, the Medium VSL states "…..evaluating its training program efectiveness to…" The word effectiveness is not in the requirement and is vague. What does effectiveness mean and how would it be evaluated. We would recommend removing the word effectiveness and sticking to what the requirement states. For the High and Severe VSLs, the phrase "when developing a new or modifying an existing training program" is used. These words are not in the requirements and we are unclear as to how they should be evaluated. There is not a

Organization	Question 4:	Question 4 Comments:
		requirement to modify the training program, only to conduct an evaluation of the training program to identify changes. This phrase added into the VSL descriptions seems to imply more than the requirements actually state. Either remove this phrase or modify the requirements to be more clear. For the Severe VSL do the words "…failed to deliver training based on the BES company specific reliability related task list." mean that every task must be trined on, or only tasks from the list, or you only have to include some of the list to get the check off? For R2, the first part of the requirement only requires that verification of the operators capabilities be done at least one time. There is no time period specified. Then later in the requirement it speaks to verification within 6 months of a modification of the tasks. It looks like having the VSL be high when the responsible entity fails to verify capabilities within 6 months of a change is in conflict with having 90-100% verification be a medium since its quite possible that more than 90% would be verified, even without verifying the changed capabilities.
Response: The SPT SDT acknowledges your response concerning the Requirement 1 VSL and is in agreement. The word "effectiveness" has been removed from the Requirement 1 VSL. In regards to your comment concerning the use of the term "developing" in the VSL, the SPT SDT believes that developing a new training program is the same as establishing a new training program. This terminology used in the standard is reflected in the VSL and the measures associated with this requirement provide examples of evaluation criteria. In addition, all tasks identified in the BES company specific related task list must have associated training. We appreciate your comments concerning Requirement 2 but do not see a conflict based on the VSLs associated with the requirements. Requirement 2 does require the verification of the operators capabilities be done at least one time (on the BES company specific reliability related task) whereas Requirement 2.1 is applying a time frame to train the system operators when any changes occur in the entity's BES company specific reliability related task list.		
Hydro One Networks - Reliability Standards Group	No	Where is the VSL for R1.1.1 (annual update to list of tasks)? As well, the VSL for R1.4 needs a time frame (see comment for question 1). Also, the VSL for R3 should be re-written based on number of hours of training completed or incomplete rather than % of operators trained. Having any operator untrained (less than xx hours/12 months) should be lumped into the Severe VSL.
Response: The SPT SDT thanks your catching this oversight. The moderate VSL has been modified to reflect compliance with R1.1.1. The SPT SDT has modified Requirement R1.4 to provide a time frame for evaluation of a training program. R1.4 now reads "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an "annual" evaluation of the training program established in R1 to identify any needed changes to the training program and shall implement the changes identified". This provides the necessary medium for evaluating compliance. With regards to your concern with Requirement 3, the determination of Violation Severity Levels (VSLs) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when developing VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.		
PSEI	No	Administrative type violations should not result in High or Severe VSLs. Especially for the omission of a single task or piece of "evidence".
Response: The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL		

Organization	Question 4:	Question 4 Comments:
Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. In addition, if a task is significant enough to warrant inclusion in the BES company specific related task list then the associated training must be provided. Failure to provide the training would imply the task was not important enough to warrant the time to provide the necessary training. This develops in to a conundrum.		
Southwest Power Pool - Operations Training Working Group	No	Most operators base their training schedules on a twelve month calendar instead of the six month limit as noted in the proposed standard on R2 High VSL. R3 High VSL makes no provision for hardships or mid-year hires.
Response: The high VSL is associated with R2.1 which applies a six month time frame to train the system operators when any changes occur in the entity's BES company specific reliability related task list. Additionally, the determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. The Standard Drafting Team recognizes that hardship circumstances will arise. The SDT feels that these instances will be addressed on a case- by-case basis by the Compliance Monitoring Enforcement Program (CMEP). It is not feasible that a Standard could address every possible situation.		
Ohio Valley Electric Corporation	No	The Violation Severity Levels are all skewed towards the severe level. The Violation Severity levels should be skewed towards the lower level.
Response: The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.		
tampa electric company	No	I do not agree that any part of a training program should have high or severe VRFs.
Response: The SPT SDT assumes that your comment concern the VSLs since the question referenced VSLs not VRFs. The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. Note that VSLs identify categories of noncompliant performance with the "Lower VSL" identifying performance that was close to being fully compliant and "Severe" VSL identifying performance that does not meet the intent of the requirement– VSLs do not identify the reliability-related risk associated with noncompliance.		
Operating Reliability Working Group (ORWG)	No	Why is missing one new or modified task just as severe as missing 30% of the existing tasks in R2?
Response: The SPT SDT acknowledges your response but feels there may be a misunderstanding of the VSL. The first portion of the VSL relates to the number of System Operators that received the necessary training identified. The second half of the VSL references a task that has been identified as a reliability related issue but training on the issue was not provided to the System Operators. In either instance the SPT SDT believes that one is as significant as the other.		
Santee Cooper	No	The Severe VSL for all requirements should be the responsible entity did not have a training program. Shift the medium VSL to the lower, the high VSL to the medium, etc. for all the requirements. It appears that an entity that has implemented a reasonable training program could be punished severely.

Organization	Question 4:	Question 4 Comments:
Response: The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. Note that VSLs identify categories of noncompliant performance with the "Lower VSL" identifying performance that was close to being fully compliant and "Severe" VSL identifying performance that does not meet the intent of the requirement– VSLs do not identify the reliability-related risk associated with noncompliance.		
WECC Operations Training Subcommittee	No	By the definition of the VSL the administrative functions of non-compliance does not put the BES at risk, thus all the current VSL should include a lower VSL.
Response: The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. Note that VSLs identify categories of noncompliant performance with the "Lower VSL" identifying performance that was close to being fully compliant and "Severe" VSL identifying performance that does not meet the intent of the requirement– VSLs do not identify the reliability-related risk associated with noncompliance.		
WECC Reliability Coordination Comments Work Group (RCCWG)	No	The WECC RCCWG believes that the Severe VSL for R3 should be worded as follows: "... The responsible entity did not include in its emergency training, the use of drills, exercises, OR (emphasis added) hands on training using simulators. The WECC RCCWG does not believe that all three types of training must be covered. Additionally, simulation can be accomplished without the use of a simulator.
Response: In FERC Order 693 the Commission (FERC) directed NERC to provide for the use of simulators as a means of training. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT did not attempt to define the method of training (with the exception of the use of simulators) but felt it was more prudent for the individual entity to determine the best method of providing the training to their System Operators dependent upon their unique system parameters.		
We Energies	No	R3 Severe VSL: The phrase "....the use of drills, exercises, and hands on training using simulators." is reasonably interpreted as "the use of drills and exercises and hands on training using simulators." This phrase should be reworded.
Response: The SPT SDT has modified Requirement 3 to provide clarity. The requirement now reads " At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.		

Organization	Question 4:	Question 4 Comments:
The SPT SDT did not attempt to define the method of training (with the exception of the use of simulators) but felt it was more prudent for the individual entity to determine the best method of providing the training to their System Operators dependent upon their unique system parameters.		
NPCC Regional Standards Committee	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Response: The SDT believes that the VSL, as presently written, addresses the issue of providing less than the required number of hours of emergency training. For instance, if an entity were to only provide 30 hours of emergency training to all of its system operators, the entity would have provided 0% of the system operators with 32 hours of emergency operations training and therefore would be deemed to be non-compliant with the requirement.		
Niagara Mohawk (DBA National Grid)	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Response: The SDT believes that the VSL, as presently written, addresses the issue of providing less than the required number of hours of emergency training. For instance, if an entity were to only provide 30 hours of emergency training to all of its system operators, the entity would have provided 0% of the system operators with 32 hours of emergency operations training and therefore would be deemed to be non-compliant with the requirement.		
ISO New England Inc.	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Response: The SDT believes that the VSL, as presently written, addresses the issue of providing less than the required number of hours of emergency training. For instance, if an entity were to only provide 30 hours of emergency training to all of its system operators, the entity would have provided 0% of the system operators with 32 hours of emergency operations training and therefore would be deemed to be non-compliant with the requirement.		
Ontario IESO	No	For R3, there should be VSLs assigned for providing less than 32 hours of training, not just on the percentage of system operators receiving the 32-hour training.
Response: The SDT believes that the VSL, as presently written, addresses the issue of providing less than the required number of hours of emergency training. For instance, if an entity were to only provide 30 hours of emergency training to all of its system operators, the entity would have provided 0% of the system operators with 32 hours of emergency operations training and therefore would be deemed to be non-compliant with the requirement.		
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	No	All requirements of this standard need to be adequately defined before violation severity levels can be identified and applied.
Response: The SPT SDT acknowledges your comment but feels that the present wording of the requirements provides for sufficient clarity.		
SERC OC Standards Review Group (Project 2006-01)	No	All requirements of this standard need to be adequately defined before violation severity levels can be identified and applied.
Response: The SPT SDT acknowledges your comment but feels that the present wording of the requirements provides for sufficient clarity.		
California ISO	No	Since we recommended deleting all R1 sub-requirements, all references to the "task list" should be changed to "BES company-specific reliability-related tasks"
Response: As we stated earlier, there are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. With regards to your comment concerning referencing a task list, the SPT SDT agrees and the term, “task list” has been replaced with “tasks”.		
PJM Interconnection, LLC	No	The R1 VSL should be based on the overall number of training components or modules that an entity is non-compliant with in comparison to the size of its overall training program. For example, if an entity does not use the SAT methodology in two

Organization	Question 4:	Question 4 Comments:
		of its 50 training modules, the VSL would be lower than if its total number of courses was only 20.The R2 VSL should be eliminated, as recommended above. The R3 VSL statement? OR The responsible entity did not?? Should be eliminated.
Response: The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. With regards to your comment concerning R1 VSLs, the SPT SDT believes that the intent of the Requirement is to use a systematic approach to training for all company-specific reliability-related tasks. Therefore, the SDT does not feel that it would sufficient to measure compliance on the percentage of processes used. The SPT SDT acknowledges your comments concerning the VSLs associated with Requirements 2 and 3. However, The SPT SDT believes that the VSLs, as written, provide the necessary means to reflect the degree of non-compliance with the standard.		
Pacific Gas and Electric Company	No	Much of this standard reflects documentation of an individual and their training program. Documentation of training is not a guarantee that operational errors won't occur, merely that training did or did not occur. In reviewing the VSLs we question why there is not a category of "Lower" added to the VSLs and why there is a category of "Severe". Is it to be assumed that lack of documentation is a possible precursor to an operator having an operational error on the BES? The VSLs need to reflect the affect on the BES from the lack of performing a requirement and lack of documentation for training on a dynamic system does not warrant a "Severe" level.
Response: We appreciate your comment and agree that documentation alone is not a guarantee of the operator's ability. The registered entity must supply evidence that it has met the requirements as specified in the reliability standard. Compliance auditing must adhere to the ERO Rules of Procedure as approved by FERC. The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.		
BCTC	No	Any violation of an administrative nature should not put the BES at risk, thus all the current Requirements that are of an administrative nature should have a lower VSL. Many of the Requirements are administrative issues. For example, if the administration is not done but training has been completed then the risk to the Power System is quite different than if training is not being done.
Response: The registered entity must supply evidence that it has met the requirements as specified in the reliability standard. Compliance auditing must adhere to the ERO Rules of Procedure as approved by FERC. Violation Severity Levels identify categories of noncompliant performance – performance that is very close to being fully compliant has a "Lower" VSL and noncompliant performance that does not meet the intent of the requirement is a "Severe" VSL. Violation Risk Factors (VRFs) assess the reliability-related impact of a violation. The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.		
MRO NERC Standards Review	No	Violation Severity Levels: R1, This requirement is based on using the SAT process (creating an Operator Task list and updating that Task list is part of the SAT process).

Organization	Question 4:	Question 4 Comments:
Subcommittee		▪ The Lower VSL should read "The entity used at least 75%, but less than 100% of the SAT processes in its training program. ▪ The Medium VSL should read “The entity used at least 50% but less than 75% of the SAT processes in its training program. ▪ The High VSL should read " The entity used at least 25% but less than 50% SAT processes in its training program. The ▪ Severe VSL should read " The entity used less than 25% of the SAT process in its training program. R2, This requirement is based on the entity verifying that a System Operator can perform the task (list) identified in R1.1. ▪ The Lower VSL should read "The entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” ▪ The Medium VSL should read "The entity verified at least 80% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” ▪ The High VSL should read "The entity verified at least 70% but less than 80% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.” ▪ The Severe VSL should read "The entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks." R3, This requirement is based on System Operators shall have 32 hours of emergency training per year. The written VSL for R3 is based on the number of System Operators not the hourly amount of training per System Operator. So, if we had 10 System Operators all with 31 hours of emergency training, we would be in the Severe VSL column. But if we had 10 System Operators, 9 with 32 hours, 1 with 0 hours of emergency training, we would be in the Medium VSL column. R3's VSLs need to be rewritten. ▪ The LOWER VSL should read "At least 1 System Operator had less than 32 hours of emergency training but greater than 30 hours. ▪ The Medium VSL should read "At least 1 System Operator had less than 30 hours of emergency training but greater than 28 hours. ▪ The High VSL should read "At least 1 System Operator had less than 28 hours of emergency training but greater than 26 hours.

Organization	Question 4:	Question 4 Comments:
		▪ The Severe VSL should read "At least 1 System Operator had less than 26 hours of emergency training.
Response With regards to your comment concerning R1 VSLs, the SPT SDT believes that the intent of the Requirement is to use a systematic approach to training for all company-specific reliability-related tasks. Therefore, the SDT does not feel that it would be sufficient to measure compliance on the percentage of the processes used. Concerning your comment related to R3 VSLs, the SPT SDT believes that the requirement is to provide 32 hours of emergency operations training and to provide less than the 32 hours of training would be insufficient to meet the requirement of the standard.		
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	No	The VSLs should be as simple as possible. In general, complicated VSLs add unnecessary confusion to addressing compliance. The proposed VSLs for R1 weight each specific sub requirement in one of the VSL categories rather than taking the approach of how much of the SAT process is performed. We recommend a volumetric approach such as SEVERE = "the entity demonstrated less than 2 of the required elements of a SAT training program as identified in R1 through R 1.4".The proposed VSL for R2 is not consistent in its approach to the modified company-specific reliability task list. It should have a graduated scale just as the "original" task list. The proposed VSL for R3 drops the "use of drills, exercises," into the Severe category. Eliminate this as this is defined in the requirement it self. If VSL will dependent upon how much training is accomplished using "drills, exercises," then the VSLs must be graduated as well. E.g. Severe = less than 18 hours of emergency training included drills, exercises, and hands on simulators".
Response: With regards to your comment concerning R1 VSLs, the SPT SDT believes that the intent of the Requirement is to use a systematic approach to training for all company-specific reliability-related tasks. Therefore, the SDT does not feel that it would sufficient to measure compliance on the percentage of processes used. The SPT SDT feels that the VSLs for R2 and R3, as currently written, provide for the use of a graduated scale for determination of compliance violation severity. Therefore, the SDT does not believe that any further revisions would provide increased clarity for determining compliance violation severity. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other forms of training, which could include simulations. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. Concerning your comment related to R3 VSLs, the SPT SDT believes that the requirement is to provide 32 hours of emergency operations training and to provide less than the 32 hours of training would be insufficient to meet the requirement of the standard.		
AEP	No	R1 Medium VSL - Should be changed to read: "The responsible entity failed to utilize training materials designed and developed with learning objectives based on the BES company specific reliability related task list (when developing a new or modifying an existing training program)." R2 High VSL - The second part of the VSL after "OR" should be changed to read 12 months rather than 6 months as

Organization	Question 4:	Question 4 Comments:
		follows: "The responsible entity failed to verify its system operators? capabilities to perform each new or modified task within Twelve months of making a modification to its BES company-specific reliability related task list". R3 VSLs do not allow for hardships, mid-year hire of certified operators or mid-year certification of new operators. This means that just one operator not receiving the 32 hours of emergency training for any reason would constitute a Medium VSL. We believe each VSL should have the following statement (or similar clarification/exemption) added for R3: "Emergency Hours for system operators who have worked in real-time operations 10 months or less in the year due to hardship, military duty, or other reasons, will be exempt from the 32 hour requirement as follows: less than 10 but more than 8 months - 24 hours of emergency operations training is required; less than 8 months but more than 6 months - 16 hours of emergency operations training is required; less tan 6 months but more than 4 months - 8 hours of emergency operations training is required; less than 4 months - totally exempt".
Response: R1: This requirement is addressing training material development criteria (R1.2). To change the VSL to include use of training materials designed and developed would not accurately reflect the requirement. The severe VSL addresses the delivery of the developed training materials (R1.3). R 2.1 states "*Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.*" The timeline for verification is 6 months as outlined in the requirement whereas R3 has a timeline of 12 months. R3 states: At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. The requirement does not address the different scenarios as stated in your response. Including such would make the requirement very complicated. The VSL does not address new hires or hardships as it's a reflection of the requirement. The regional entity has flexibility in its assessment of a penalty to take this into account. The VSL Severity levels applied to this requirement is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide apply a more consistent application when developing VSLs.		
ERCOT Inc.	No	When the sub-requirements of R1 are removed, the VSLs need to be completely revised. As written, the VSL for R1 is inconsistent with the requirement. The requirement is to use a systematic approach to training; nowhere does it mention "program effectiveness". This VSL would seem to be imposing a new requirement.
Response: The SPT SDT acknowledges your response concerning the Requirement 1 VSL and is in agreement. The word "effectiveness" has been removed from the Requirement 1 VSL.		
Pepco Holdings, Inc. - Affiliates	No	R1 the Medium VSL contains the word "effectiveness" this word should be removed, effectiveness is not mentioned as a part of Requirement 1. Revise the High VSL. Proposed wording: The responsible entity failed to show evidence of developing a new training program or modifying an existing program based on a systematic approach to training in that it did not develop new (or modify existing) learning objectives or design new (or modify existing) training materials based on its company specific reliability related task list Revise the Severe VSLs - examples: The responsible entity failed to show evidence of delivering training to its operators.

Organization	Question 4:	Question 4 Comments:
		OR it failed to show evidence of using a systematic approach to training in that it failed to create a list of company specific reliability related tasks upon which to develop a new training program or modify an existing one The High VSL for R2 concerning "verifying operators capabilities to perform new or modified tasks within 6 months" should be moved to Medium. As currently stated a company that failed to verify operators for one new or modified task but verified 100% of its operators on existing tasks would have a Violation Severity Level higher than a company that only verified 90% of its operators on existing tasks. The Severe VSL for R3 on use of drills, exercises etc. should be moved to Medium which would better reflect the suggested revised R3 and indicate that drills, exercises and hands on training simulations are of higher value than training classes alone for emergency operations training Additional VSLs should be developed to address the 4th Requirement proposed in 5 below. Example: ▪ R4 High. The responsible entity failed to show evidence that it used a systematic approach to training to develop a training program for its delegated tasks. ▪ R4 Severe The responsible entity failed to develop a training program for the entities to whom it has delegated tasks
Response: The SPT SDT acknowledges your response concerning the Requirement 1 VSL and is in agreement. The word “effectiveness” has been removed from the Requirement 1 VSL. The SPT SDT acknowledges your comment concerning revision of the VSLs associated with Requirements 1, 2 and 3, but respectfully disagrees. The SDT believes that the VSL’s, as presently written, provide for sufficient clarity as well as an effective means of categorizing the degree of non-compliance. The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.		
New York Independent System Operator	No	Remove the relative term "effectiveness" from the medium VSL on R1. It is not a measurable quantity.
Response: The SPT SDT acknowledges your response concerning the Requirement 1 VSL and is in agreement. The word “effectiveness” has been removed from the Requirement 1 VSL.		
Duke Energy Corporation	No	See response to question #1 above. All the requirements of this standard need to be revised and the VSLs should be developed to fit the revised requirements.
Response: The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.		
LCRA	No	
Gainesville Regional	No	

Organization	Question 4:	Question 4 Comments:
Utilities		
CAISO	No	No comment
The Detroit Edison Company	No	Don and Mike to address.
Sacramento Municipal Utility District	Yes	The VSL should be either eliminated or at a minimum moved to lowest VSL. The verbiage seems ambiguous and it is debatable that a BES risk exists.
Response: The SPT SDT acknowledges your positive response and thanks you for your clarifying comment. The determination of the Violation Severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. Violation Severity Levels do not assess the reliability-related risk caused by a violation of a specific requirement. Violation Risk Factors assess the reliability-related risk of a violation of a requirement. Violation Severity Levels categorize noncompliant performance such that noncompliant performance that is very close to being fully compliant is a "Lower" Violation Severity Level – and noncompliant performance that is mostly or totally misses being fully compliant is a "Severe" Violation Severity Level.		
Northeast Utilities	Yes	For R2, VSL states "At least 90% but less than 100% of its system operator's capability to perform each assigned task." Is the measure for number of system operators or number of assigned tasks?
Response: The SPT SDT acknowledges your positive response and thanks you for your clarifying comment. The VSL is based on the number of system operators.		
Manitoba Hydro	Yes	Manitoba Hydro agrees with the revised VSL for each requirement.
Response: The SPT SDT acknowledges your positive response and thanks you for your clarifying comment.		
American Transmission Company	Yes	R1 High VSL Suggested modification: Delete everything after "task list" Proposed language: The responsible entity failed to design and develop learning objectives and training materials based on the BES company-specific reliability related task list. The additional language in the draft does not appear in Requirement 1.2 and makes the VSL confusing. R1 Severe VSL. Suggested new language: The responsible entity does not have a task list in their systematic approach to training or The responsible entity failed to deliver the training as specified in their systematic approach to training R2 VSLATC would suggest that the SDT allow for the number of task to be a weight in the calculation of the percentages. Examples: Company a has ten operators and 100 tasks on their task list. Example: The responsible entity was unable to verify that two of its operator's were capable of performing 1 out of the 100 tasks listed in their SAT. (2 * 1) / (10 * 100) = .2% .2% - 100% = 99.8% The violation would fall in the Medium VSL. The way the current VSL is written it seem that the compliance auditor would use the following formula. 2 / 10 = 20%20% - 100% = 80% The violation would fall in the High VSLATC is requesting that both the number of operators and the size of the task list are included in the calculation for a VSL. R3 VSL ATC believe that both the number of operators and the amount of 32 hours not satisfied should be included in the calculation of the percentage. Examples: Company a has ten operators and each is required to have 32 hours of emergency operations training Example: The responsible entity verified that two of its operator's only completed 30 hours of emergency training. The remaining eight completed all the required hours. (2 * 2) / (10 * 32) = 1.25% 1.25% - 100% = 98.75% The

Organization	Question 4:	Question 4 Comments:
		violation would fall in the Medium VSL. The way the current VSL is written it seem that the compliance auditor would use the following formula. 2 / 10 = 20%20% - 100% = 80% The violation would fall in the High VSLR3 Severe VSL It is our interpretation that the list, specified in R3, are only examples of the types of training. (drills, exercises, and hands on training using, simulators) The language used in the Severe VSL for R3 seems to contradict our interpretation. If the SDT's intent of the list is to provide examples then we believe that the following language should be deleted. "The responsible entity did not include in its emergency training, the use of drills, exercises, and hands on training using simulators." Measure M3 seems to support our interpretation that it is only a list of examples.
Response: R1 specifies application of the SAT process to new or modifying an existing training program. R1.2 is a sub-requirement of R1 which applies to all new of modified training programs based on the BES company-specific reliability related task list. The VSL percentages applied to this requirement are based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide apply a more consistent application when developing VSLs. Concerning your comment related to R3 VSls, the SPT SDT believes that the requirement is to provide 32 hours of emergency operations training and to provide less than the 32 hours of training would be insufficient to meet the requirement of the standard. The SPT SDT acknowledges your comment concerning Measure 3 and has added Measure 3.1 to provide clarity.		
Midwest ISO Stakeholder Collaborators	Yes	Violation Severity Levels: R1, This requirement is based on using a SAT process (creating an Operator Task list and updating that Task list is part of the SAT process). After reviewing the Violation Severity Levels Development Guidelines Criteria developed by the VSL Drafting Team, we believe this requirement could easily be classified as numerical performance. The numerical performance would be calculated based on the number of SAT processes used. The Lower VSL should read "The entity used at least 75%, but less than 100% of the SAT processes in its training program. The Medium VSL should read “The entity used at least 50% but less than 75% processes in its training program. The High VSL should read " The entity used at least 25% but less than 50% SAT processes in its training program. The Severe VSL should read “The entity used less than 25% of the SAT process in its training program. As an alternative, R1 could be classified as multi-component. After reviewing the Violation Severity Levels Development Guidelines Criteria developed by the VSL Drafting Team, we believe R2 can be classified as a numerical performance requirement as well. This requirement is based on the entity verifying that a System Operator can perform the task (list) identified in R1.1. The Lower VSL should read "The entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks.”

Organization	Question 4:	Question 4 Comments:
		The Medium VSL should read "The entity verified at least 80% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks." The High VSL should read "The entity verified at least 70% but less than 80% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks." The Severe VSL should read "The entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company specific reliability related tasks." After reviewing the Violation Severity Levels Development Guidelines Criteria developed by the VSL Drafting Team, we believe R3 can be classified as a numerical performance requirement as well. This requirement is based on System Operators shall have 32 hours of emergency training per year. The written VSL for R3 is based on the number of System Operators not the hourly amount of training per System Operator. So, if we had ten System Operators all with 31 hours of emergency training, we would be in the Severe VSL column. But if we had 10 System Operators, nine with 32 hours, one with zero hours of emergency training, we would be in the Medium VSL column. Thus, even though more total hours of training did not occur the latter example results in a lower severity. The VSLs need to consider the aggregate total of hours of training for all system operators. As one example, R3's VSLs could be rewritten. The LOWER VSL could read "At least one System Operator had less than 32 hours of emergency training but greater than 30 hours. The Medium VSL could read "At least one System Operator had less than 30 hours of emergency training but greater than 28 hours. The High VSL could read "At least one System Operator had less than 28 hours of emergency training but greater than 26 hours. The Severe VSL could read "At least one System Operator had less than 26 hours of emergency training. For another example, one could sum all of the system operators training hours and use a numerical performance VSL. For example, 10 system operators require a total of 320 hours of training. If a total of 240 hours of training is delivered to the 10 system operators, a violation has occurred with only 75% of the training occurring. For these VSLs to be effective, any hours over the minimum 32 hours required would have to be ignored and not considered in the calculation. VSLs for could be written as: The LOWER VSL could read "More than 75% of required training hours were delivered." The Medium VSL could read "More than 50% but 75% or less of the required training hours were delivered." The High VSL could read "More than 25% but 50% or less of the required training hours were delivered."

Organization	Question 4:	Question 4 Comments:
		The Severe VSL could read "25% or less of the required training hours were delivered."
Response: With regards to your comment concerning R1 VSLs, the SPT SDT believes that the intent of the Requirement is to utilize a systematic approach to training for all company-specific reliability-related tasks. Therefore, the SDT does not feel that it would sufficient to measure compliance on the percentage of processes used. Concerning your comment related to R3 VSLs, the SPT SDT believes that the requirement is to provide 32 hours of emergency operations training and to provide less than the 32 hours of training would be insufficient to meet the requirement of the standard.

5. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Summary Consideration:

The majority of comments received in this section were reiterating concerns identified in earlier questions. There were a few responders with concerns as to data retention being unclear and that the Violation Risk Factors (VRFs) were set too high because the requirements were administrative in nature. Also, a couple of commenters did not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between Reliability Coordinators and other functional entities that work for the Regional Entity and those that do not work for the Regional Entities.

The SPT SDT explained that it agreed the data retention section was unclear and therefore revised it to more accurately reflect either a three year requirement or the last compliance audit, whichever time frame was the greatest and removed each of the sub-sections.

The SPT SDT also explained that based on the existing definitions of the VRFs, the VRFs should not be changed primarily based on the analysis of the August 2003 Blackout which showed that training, or the lack of training, was a significant factor that contributed to the blackout. The VRF Definitions can be found in the NERC Drafting Team Guidelines at (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as in the Reliability Standards Development Procedure Manual.

With regards to the confusion surrounding the Reliability Coordinators and other functional entities that work or are employees of a Region and those that do not work for the Regions, the SPT SDT explained that this distinction was made due to FERC's requirement of NERC to perform audits of the Reliability Coordinators and any registered entities that work for the Regional Entity. There are several regions where this is the case not only concerning the Reliability Coordinator, but other registered entities. This is the situation for example in WECC, where the Reliability Coordinators are employees of WECC and report to the WECC Director of the Reliability Coordinators. In all of these situations, FERC views this as a conflict of interest for the regional entity to perform the compliance audit and therefore NERC would perform compliance audits for these exceptions.

Organization	Question 5 Comments:
FRCC	The proposed effective date of 36 months after the first day of the first calendar quarter following regulatory approval is unnecessarily long. What is the rationale for 36 months? In R1, we would suggest to revise "…..shall update its list of BES company-specific…." to say "…shall review and update if needed it's list of BES company-specific…." In R1.4 it is silent to how often an evaluation of the training program must be conducted but it also appears partially redundant with the annual requirement in R1.1. THey should agree or a time requirement should be in only one place. If the intent was to establish a continuous improvement mechanism, the drafting team should consider directing the responsible entity to establish a monitoring and improvement program that includes an annual review of the task list and then implement it. That may be more clear. R1.3 is really ambiguous. Does it mean that training will have to be provided annually for every single task on the list? Does

Organization	Question 5 Comments:
	it mean every topic, every year? If so, does that make sense? If it is just one time, then it is redundant with R2. Is a long range plan that includes all elements over several years acceptable? Also, if it is training for a new operator, it might not be needed again because it is then performed routinely. This needs clarification. In R2, there is a typo, it should say "each of" instead of "each or". In section 1.3 Data Retention, the subparagraphs should be numbered 1.3.1, 1.3.2 etc rather than 1.4.1, 1.4.2 etc. In these paragraphs it refers only to compliance audits as the time period for keeping records, we assume this means an on-site compliance audit. Since audit periods can vary, ie 3 - 6 years, plus they can happen at other times depending on conditions, it would be more clear to state the retention time in years. We would suggest 3 years to be an appropriate time frame since on-site compliance audits of the RC, BA and TOP are to be at least every 3 years. Also, in the first paragraph of the section "investigation" should be changed to "compliance violation investigation" to avoid confusion with other types of investigations such as disturbance events analysis etc. And, in the last paragraph the Compliance Enforcement Authority should keep records according to the NERC Rules of Procedure. There is no need to spell it out here since it is already covered in the NERC Rules of Procedure. There is not a comment form for PER-004, however a redline is posted as part of the changes in the project. We do have a comment on R2 of PER-004. The last sentence states "The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times." There is no consideration to cost in this requirement. "...best available information at all times." is very broad and wide open. Data overload can be a reality, as can a diminishing return on investments to meet a requirement that will have a very small impact on reliability.
Response: The majority of the industry responding to earlier drafts of this Standard requested a longer phase in period. The SPT SDT responded to their comments and changed the phase in period from 24 months to 36 months. The SPT SDT acknowledges your comment concerning Requirement 1 but believes that the present wording provides for sufficient clarity. Requirement 1.4 has been modified to provide further clarity. Requirement 1.4 now reads “Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an “annual” evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified”. Requirement 1.3 simply states that the training developed must be provided to the System Operators. In the development of your training program each entity will determine the periodicity of when training needs to be conducted. The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected. The SPT SDT acknowledges your comment concerning data retention and has revised this section to more accurately reflect either a three year requirement or the last compliance audit, whichever time frame is the greatest and each of the sub-sections have been removed. The Data Retentions section now reads “Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance, for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation”. The SDT acknowledges your comment concerning the Compliance Enforcement Authority’s requirement to keep records according to the NERC Rules of	

Organization	Question 5 Comments:
Procedure. However, the SDT believes that the paragraph provides clarity for data retention within the standard. The SPT SDT acknowledges your comment concerning PER-004. However, revisions to requirements in other standards, unless specifically associated with this standard, are outside the scope of this Standard Drafting Team.	
Ohio Valley Electric Corporation	With the lack of assessment or evaluation of the effectiveness of existing training programs required by PER-002 R3, why work to create a new training standard? With the lack of such an assessment, the work to develop a new training standard is not a judicious use of limited resources in order to strengthen the reliability of the bulk electric system. The NERC operation certification program already determines that operators possess the minimal requirements to reliably operate the bulk electric system. Why should a training program duplicate the certification process? Currently there is ample incentive to have operators trained on company-specific tasks. An operator who is not capable of performing company specific task will not remain an operator at that company.
Response: The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). The majority of training in this standard could meet CEH. The lack of system operator training was a contributing factor in the 2003 Blackout.	
Bonneville Power Administration	While agreeing with the proposed Violation Severity Levels, BPA considers the Violation Risk Factor assigned to requirement R1 to be too high. R1 is essentially administrative in nature, and this should be reflected in a VRF rating of Low. There is a tremendous workload involved in developing the training program described by the standard. The 3 year implementation plan proposed by the drafting team is adequate for this task. That said, to implement the training program as described, in a manner that reflects the quality and effectiveness expected by industry participants will require the full 3 years that has been allotted. The implementation time should not be shortened any Further, BPA agrees with the 6 month window for certifying competency in performing a task once a new task has been identified (R2.1). The standard does not provide a window for certifying competency in performing job tasks when a System Operator assumes a new position. BPA suggests providing a 1 year window for System Operators to complete the job task competency verification (R2) once they have assumed a new position.BPA supports a Standard requiring development, delivery, and evaluation of system operator training using a "systematic approach", and applauds the restraint the drafting team has shown by including only the essential elements of a systematic training program. BPA thanks the drafting team for your dedicated concern and efforts to improve our industry by helping entities develop valuable and effective training programs for System Operators.
Response: The SPT SDT believes that based on the existing definitions of the VRFs, the VRFs should not be changed. The analysis of the August 2003 Blackout showed that training, or the lack of training, was a significant factor that contributed to the blackout. The VRF Definitions can be found in the NERC Drafting Team Guidelines at (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as in the Reliability Standards Development Procedure Manual.	
Operating Reliability Working Group (ORWG)	R2 should be corrected to read '...verify each of its System Operator's...'.We feel the VRF for R2 is too high. It should be no higher than medium. As written R3 could be interpreted to require 32 hours of emergency operations training on a simulator. We appreciate the effort by the SDT to incorporate all the suggestions provided by the industry following the last posting. The current standard reflects considerable rewrite and we feel that this proposal is a significant improvement.
Response: The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected.	

Organization	Question 5 Comments:
The SPT SDT feels that the training associated with R2 concerns reliability related tasks which if not provided could result in a significant impact on the BES. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee -– to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.	
LCRA	To review, requiring a list of critical tasks, with no explanation as to what those tasks may be, only ensures that there will be a wide variance across the industry. It is not reasonable to expect that each utility will police itself. Common human nature dictates that individual utilities will pare the list down to whatever they can manage, not an all inclusive list. Were this standard to go into effect as currently written, I suspect utilities with large training staffs would have a large list, while small utilities will create a small list that they can manage. Whether or not an operator can perform the duties associated with his position is already handled by company specific procedures like performance reviews. If an operator is NERC certified has not that process already determined that the operator has a basic level of understanding? What happens if an operator fails one of these critical task evaluations? On the one hand he is NERC certified, yet he cannot perform a critical task. Would that then indicate that the certification process is flawed? What exactly is a critical task? What may seem critical and complex to a newly certified operator is old hat to one with 20 years of experience. Reliability related? Taking that term to its extreme limits, the ability to get in a car and drive to work could be construed as reliability related since if the operator cannot get to work reliability is compromised. Nearly everything a transmission operator does is reliability related. Other than eating lunch I cannot think of one single transmission operator task that is not reliability related in some way or another. Voltage control, switching, EECP, blackstart, etc, etc, etc. The list would simply be unmanageable. If NERC cannot effectively define a critical task in this standard, how can anyone else be expected to do so? What happens on an audit if the auditor shows up and decides the list is not comprehensive? Ultimately there is no definition of a critical task, thus this standard cannot be enforced. What about QSEs, generator operators, and field personnel such as relay technicians? They all have multiple tasks that impact reliability, yet I see no requirements for them. What good is a critical task analysis that only focuses on one group when multiple groups have impacts? What this standard would do is create an administrative monster that only the large training staffs could manage. Smaller utilities, such as my own, would be forced to strip the critical task list down as short as possible. Otherwise it could not be effectively managed. The net result would be something that can be managed for audits, not necessarily something that would do training any good. In fact, coupled with the already burdensome demands of the CE program, this requirement would move many trainers away from contact time to sitting at a computer and administering a critical task list. It comes down to this; What does NERC want me to do with my time? Train operators, or fill out paperwork?
Response: As stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the	

Organization	Question 5 Comments:
position and the specific system for which the list is being developed. The revised Reference Document associated with the Standard details some topics that could be considered and included in a task list. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). As envisioned, much of the training developed and delivered in accordance with this standard could also be used to meet CEH. Note that the Reliability Standards Work Plan does include a project that will address training of others such as Generator Operators.	
Sacramento Municipal Utility District	R# Severe VSL column last row stating: "OR The responsible entity did not include in its emergency training, the use of drills, exercises, and hands on training using simulators." NERC should clarify what is meant by "training using simulators." Is this mandating the use of an OTS? Applicability of this standard should apply to all NERC registration types that impact the BES R2. This requirement should state " shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 annually." Minimum competencies should be maintained by the system operator and certified by the registered entitiy. This standard should mandate the system operator passing an exam/evaluation. R3. This standard should mandate the system operator to pass a written and/or simulation exam to be credited the 32 hours of training
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC SC. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The applicability was established during the SAR development stage of this process – and is limited to Reliability Coordinators, Transmission Operators and Balancing Authorities.	

Organization	Question 5 Comments:
The SPT SDT acknowledges your comment concerning the wording of Requirement 2 but respectfully disagrees. The SPT SDT believes that with the additional training required (i.e., Emergency Operations, CEH, etc.) and the re-assessment of an operator's capabilities when the task list is modified that an initial one time training assessment is sufficient. However, this does not preclude an entity from performing training or verifications outside this Standard. The SPT SDT believes that mandating a System Operator passing an examination for the training material provided would be too prescriptive. The SPT SDT also believes that a Standard should relate what must be done but not how.	
Northeast Utilities	Is it correct that this standard does not apply to NERC-certified individuals in non-System Operator roles? (reference PER-003 R1.) e.g. - a System Operator's supervisor.R1.1.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall REVIEW its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to identify new or modified tasks for inclusion in training. One should REVIEW the task list to determine if there is a need to UPDATE - whenever there is a change to the system, procedures, operator tools, etc. TYPO in R2. Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each OF (not "or") its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time.
Response: The purpose of this Standard is to ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. This Standard is applicable to all Reliability Coordinators, Balancing Authorities and Transmission Operators, and focuses specifically on the training of system operators. Therefore, if a supervisor is working as a real-time system operator performing reliability-related tasks then the supervisors would be covered by the training in this Standard. The SPT SDT believes that in order to update a task list it first must be reviewed. Therefore the SPT SDT thanks you for your response but does not feel that a change in the wording is necessary. The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected.	
NPCC Regional Standards Committee	NPCC members appreciate the efforts of the SDT in creating this latest version. We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. However, we do realize that there are REs that are requested by membership in a region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly. In R3 suggest changing drills, exercises and hands on training using simulators to drills, exercises and hands on training using simulators (if available).
Response: The SPT SDT acknowledges your comment concerning Reliability Coordinators and other functional entities that work or are employees of a Region and those that do not work for the Regions. This distinction was made due to FERC's requirement of NERC to perform audits of the Reliability Coordinators and any registered entities which work of the Region. In WECC, for example, the Reliability Coordinators are employees of WECC and report to the WECC Director of the Reliability Coordinators. FERC views this as a conflict of interest for the regional entity to perform the compliance audit therefore NERC will perform compliance audits for these exceptions. Having provided the above explanation, the SPT SDT realized the existing statements under Section 1.1 Compliance Enforcement Authority, does not cover all exceptions and the section has been revised to more accurately reflect these exceptions.	

Organization	Question 5 Comments:
This section now reads "The ERO or its delegate shall serve as the Compliance Enforcement Authority". The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee -– to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.	
SERC System Operator Subcommittee (SOS) of the SERC Operating Committee	Our group supports the use of a Systematic Approach to Training in the design, development and delivery of effective personnel training programs. However, the lack of clarity in the requirement statements is a cause for some concern. Each requirement in this standard should be re-examined to assure clarity of evidence required, adequate definition of terms, and consistency with the associated measures and violation severity levels.
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The task list is used to identify the necessary training as stated in R1. A systematic approach to training is used to develop the associated training for each task. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the revised Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf The SPT SDT believes that the present revised wording of the Requirements in this Standard provides for sufficient clarity and consistency.	
MidAmerican Energy Company	The Requirement numbers are not consistent with the wording in other sections. For example the R2.2 references R1.1 but should reference 2.1 This made commenting very difficult.
Response: The SPT SDT acknowledges your comment concerning the inconsistencies described above. This has been corrected.	

Organization	Question 5 Comments:
Cowlitz County PUD No. 1	Typographical error in Requirement 2: "...shall verify each or its System Operators capability..." should read "...shall verify each of its System Operators capability..."
Response: The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected.	
The Detroit Edison Company	We do not agree with complaints being included in section 1.3 Compliance Monitoring and Enforcement Processes. Compliance audits, Self-Certifications, Spot Checking, Compliance Violation Investigations, and Self-Reporting is adequate to ensure entity compliance. We believe Attachment A: Generic Task List is valuable information and should be included in the PER-005 System Operator Training Reference Document as Reference #3.
Response: The SPT SDT acknowledges your comment concerning complaints being included in the Compliance Monitoring and Enforcement Process section of the Standard but respectfully disagrees. The list of processes in the standard matches the list of processes identified in Section 3 of the Uniform Compliance Monitoring and Enforcement Program. ftp://ftp.nerc.com/pub/sys/all_updl/rop/Appendix4C_Uniform_CMEP_10162007.pdf The Reference Document associated with the Standard details some topics that could be considered and included in a task list.	
SERC OC Standards Review Group (Project 2006-01)	Our group supports the use of a Systematic Approach to Training in the design, development and delivery of effective personnel training programs. However, the lack of clarity in the requirement statements is a cause for some concern. Each requirement in this standard should be re-examined to assure clarity of evidence required, adequate definition of terms, and consistency with the associated measures and violation severity levels. Requirements R1.1 through R1.4 of PER-005 can be interpreted as requiring each entity to develop and deliver its total training program in-house and not allow the use of vendors in developing and implementing its training requirements. For example, R1.3 states, ?Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall deliver the training established in R1.2.?. We suggest that replacing the word ?deliver? with ?make available? or ?ensure delivery of? would clarify this misconception. Finally, in R2 there is a typo: the word ?or? should be changed to ?of?.
Response: There are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. The task list is used to identify the necessary training as stated in R1. A systematic approach to training is used to develop the associated training for each task. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the revised Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html	

Organization	Question 5 Comments:
(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96 http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf The SPT SDT believes that the present revised wording of the Standard provides for sufficient clarity and consistency. The SPT SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected.	
American Transmission Company	Requirement 1: ? ? The following language should be removed from the requirement 1. ? ? "?to establish a new or modify an existing training program(s)?" ? ? It's our position that the language does not provide any additional clarity but adds confusion to the requirement. ATC believes that the language makes sense for the short term, (FERC approval followed by implementation period) but in the long term this information is unnecessary. Once an entity has a SAT the language in question would require an entity to modify or develop a new program even if neither is required. ? ? Proposed change:? ? "Each RC, BA and TOP shall use a systematic approach to training for the Bulk Electric System (BES) company-specific reliability-related tasks performed by its System Operators."? ? ATC believes that our suggested modification accomplishes the intent of the SDT and addresses our concern with the long-term implementation of this standard.? R1.1? ? The word "create" should be replaced with "document".? ? This change does not alter the intent of the Requirement but simple states what the entities needs to have. ? ? Proposed change: ? ? Each RC, BA and TOP shall document a list of BES company-specific reliability-related tasks performed by its System Operators. ? ? Once the initial list is developed you will no longer create a list, but the proposed language would have entities re-create the list annually. ? ? R1.1.1? ? The requirement should be modified to only require annual reviews. Updates to the list are dependant on the company and are not a NERC issue. ? ? Proposed change: ? ? Each RC, BA and TOP shall annually review its list of BES company-specific reliability-related tasks performed by its System Operators.? ? New Requirement 1.1.2? ? Each RC, BA and TOP shall identify new or modified tasks during the annual review. ? ? R3: ? ? The "12 months" should be replaced with "annual". If the SDT does not agree with the change then they need to confirm how the 12 months is going to be determined. Ultimately ATC is concerned that the 12 months could be interpreted to mean a rolling 12-month period which would make compliance with this standard extremely difficult as it would essentially require a company to ensure that each of its Scots completed 32 hours of emergency training within any 12-month sliding window during the year; i.e. at an average rate of 2.67 hours per month. Typically, this is not how the emergency hour training is completed. Rather, it is completed in ?lumps.? ATC understands that the 12-month concept was introduced to account for new operating personnel. With that in mind, ATC proposes that the Standard call out the provision to pro-rate training specifically as detailed below. ? ? Proposed language: ? ? On an annual basis, each RC, BA and TOP shall provide each of its System Operators with 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration). For each new System Operator, the required number of hours of emergency operations training shall be prorated to the nearest whole number of hours based upon the number of full months worked during that calendar year.

Organization	Question 5 Comments:
	(Examples of training: drills, exercises, and hands on training using simulators)? ? The additional changes are to:? Clarify the prorated training requirement; i.e. an operator beginning work on Dec. 31st would have an emergency hour training requirement of 0 hours, an operator beginning work on June 15th would have an emergency hour training requirement of 16 hours and an operator beginning work on Jan. 15th would have an emergency hour training requirement of 30 hours for that calendar year.? 2. Clearly identify the list as examples that can be used but not methods that must be used.
Response: In FERC Order 693 the Commission (FERC) directed NERC to submit a modification to PER-002-0 that "uses the Systematic Approach to Training (SAT) methodology". The intent of the Standard is to require all entities to use a systematic approach to training for either new or existing training programs. The effective date of this standard allows time to modify existing or implement new training programs. The SPT SDT acknowledges your comment regarding the re-wording of Requirement 1 and has modified Requirement 1. Requirement 1 now reads: R1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. With regards to your comment concerning Requirement 1.1, there is no language in R1.1 that identifies a need to recreate the task list on an annual basis. The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from annually to every 12 months to allow for the situation of new hires late in the calendar year. This revision was incorporated into Draft 3 of the Standard. The SPT SDT has modified Requirement and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.	
Niagara Mohawk (DBA National Grid)	We propose the following minor edits for clerification.R1.1.1 change to "...shall review and update as necessary its list of BES company specific reliability related tasks...". The task should be reviewed annually and then updated as necessary. In some cases an update may not be needed. R3 Replace "...using training, drills, exercises, and hands on training using simulators" with "using various methods of training such as drills, exercises, classroom presentations, or hands on training using simulators". This reads better since drills, etc. are all forms of training. In addition these need to be examples of training methods not required training methods since some entities do not have training simulators, thus the addition of "or". In addition, we do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for

Organization	Question 5 Comments:
	the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. However, we do realize that there are REs that are requested by membership in a region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.
Response: The SPT SDT acknowledges your comment concerning Requirement 1.1.1 but respectfully disagrees. The SDT believes that the present wording provides sufficient clarity and the suggested changes would not significantly improve or alter the desired outcome of the requirement. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, ,which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT acknowledges your comment concerning Reliability Coordinators and other functional entities that work or are employees of a Region and those that do not work for the Regions. This distinction was made due to FERC's requirement of NERC to perform audits of the Reliability Coordinators and any registered entities that work for the Region. One example is WECC - where the Reliability Coordinators are employees of WECC and report to the WECC Director of the Reliability Coordinators. For all of these situations, FERC views this as a conflict of interest for the regional entity to perform the compliance audit therefore NERC will perform compliance audits for these exceptions.	
WECC Reliability Coordination Comments Work Group (RCCWG)	The WECC RCCWG believes that R2 in PER-004-2 is mis-placed and does not belong in a standard that covers staffing. Specific requirements for SOLs, IROLs, and inter-tie facility limits belong in IRO standards, not in a PER standard.
Response: The SPT SDT acknowledges your comment concerning PER-004. However, revisions to requirements in other standards, unless specifically addressed within this standard, are outside the scope of this Standard Drafting Team.	
PSEI	I appears that the ideas going into this standard are designed such that it can only be achieved by large organizations with not only a trainer, but training staff and lots of resources. Putting requirements in place that demand all organizations meet the same expectations as the larger ones is unfair, unrealistic and removes any flexibility small utilities have. If there is such a need for the SAT to be in place, use it in conjunction with the System Operator Certification program. There is already a detailed process in place for this and allows smaller utilities to have options other than hiring more staff or requiring the purchase of simulators.
Response: The SPT SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR.	

Organization	Question 5 Comments:
The NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). As envisioned, much of the training developed and delivered in accordance with this standard could also be used to meet CEH. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 “Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.	
Southwest Power Pool - Operations Training Working Group	R1.2 - The wording of R1.2 should refer to "utilizing designed training materials" with learning objectives based on the task list, rather than "designing training materials" with learning objectives based on the task list. Some training is purchased from vendors to satisfy training need rather than designing the training in-house. We suggest the wording be modified as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize training materials designed and developed with learning objectives that are based on the task list created in R1.1." R2 Risk Factor - The "Risk Factor" should be "Medium" in-line with the risk factor of R1. The risk factor to verify performance of the reliability tasks (R2) should not be higher than the risk factor for identifying the reliability tasks (R1). R3 - This requirement requires all entities large or small to have a simulator or buy hands on simulator exercises from a vendor "that applies to their system". We believe the word simulator should be changed to "simulation" as follows: "??.using training, drills, exercises, and hands on training using simulations". The related VSLs would need the word changed also. If the intent of the standard is for the individual entity to purchase a computerized simulator package, it could be quite burdensome on the company. R3.1 - To assure R3.1 is in aligned with our comments on R1.2, based on the fact that some training may be purchased training delivered by a vendor, we suggest rewording of R3.1. Change the word "deliver" to the word "utilize" as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize the training established in R1.2." A suggested Reliability Task List should be included in the reference material to the standard as a base guideline for entities to build their task list.

Organization	Question 5 Comments:
	Purpose: We feel the words "competent" and "competency" in the purpose statement should be changed to "capable" and "capability" to reflect the wording in M2. We appreciate the effort by the SDT to incorporate all the suggestions provided by the industry following the last posting. The current standard reflects considerable rewrite and we feel that this proposal is a significant improvement.
Response: The SPT SDT acknowledges your comment concerning Requirement 1.2 but respectfully disagrees. The SDT believes that the present wording provides sufficient clarity and the suggested changes would not significantly improve or alter the desired outcome of the requirement. The SDT also does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The SPT SDT believes that based on the existing definitions of the VRFs, the VRFs should not be changed. The analysis of the August 2003 Blackout showed that training, or the lack of training, was a significant factor that contributed to the blackout. The VRF Definitions can be found in the NERC Drafting Team Guidelines at (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as in the Reliability Standards Development Procedure Manual. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The revised Reference Document associated with the Standard details some topics that could be considered and included in a task list. The SPT SDT acknowledges your comment regarding the use of the terms competent and competency but does not believe that changing the words would significantly improve or alter the desired outcome of the requirement. In addition, the “Purpose” section of this standard is taken from the industry approved SAR.	
CECD	It is not appropriate to require all BAs and TOPs to have hands on simulator training. FERC’s directives indicated that "the ERO needed to develop a requirement for the use of simulators dependent on the entity's role and size" and that it would be appropriate to limit such a requirement to RCs, TOPs, and BAs that have operational control over a significant portion of load and generation.” There is an error in R2, second line "each or its System Operator's". Delete "or its".

Organization	Question 5 Comments:
	R3. The phrase "that reflects emergency operations topics" should be modified to state "on emergency operation topics" or "that reflects emergency operating conditions."
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected. The SPT SDT acknowledges your comment concerning Requirement 3 but respectfully disagrees. The SDT believes that the present wording provides sufficient clarity and the suggested changes would not significantly improve or alter the desired outcome of the requirement.	
PJM Interconnection, LLC	Since one of the elements of the SAT methodology is to "Evaluate not only worker performance of the objectives, but also the ability of the curriculum to meet the stated objectives", R2 is unnecessary, as R1 already requires the use of the SAT methodology. This requirement should be deleted.
Response: The SPT SDT agrees with you that the evaluation process addresses both elements in a systematic approach to training. However, based on previous comments from the industry, the SDT felt it was important to delineate the difference between individual performance and the evaluation of the curriculum.	
Pacific Gas and Electric Company	In reviewing the purpose statement the words "competent" and "competency" do not align with wording in the requirements or the measures. We believe competency of an individual is directly reflected in their performance and therefore performance is governed by their supervisor or manager. In many instances trainers provide training to individuals on a limited basis throughout the year, of which, during that time the individual's performance in assessed for his capability to perform a task. We suggest changing the purpose statement to the following: "To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are capable to perform those reliability-related tasks." "The capability of the System Operators is critical to the reliability of the North American Bulk Electric System."
Response: The SPT SDT acknowledges your comment regarding the use of the terms competent and competency but does not believe that changing the words would significantly improve or alter the desired outcome of the requirement. In addition, the “Purpose” section of this standard is taken from the industry approved SAR.	
MRO NERC Standards Review Subcommittee	In R2, the current language could be read that the System Operator needs to be capable of performing the task at least one time, but the intent is to perform the verification at least one time. This can be clarified by rearranging the sentence to be "?shall verify at least one time that each of its System Operator's are capable of performing each task identified in R1.1." R3, There seems to be some confusion in the industry about what would be classified as a simulator per this requirement. The

Organization	Question 5 Comments:
	definition of the term simulator can range from a simulator attached to the EMS, a custom built simulator to represent one's utility structure, a generic simulator similar to the one that EPRI had offered for no cost in the past, table top simulations or even computer class simulations that qualify as simulation hours in the NERC CEH program. In paragraph 1391 of FERC order 693, FERC recognizes the fact that it would be impractical for small entities to develop and maintain full-scale simulators and suggests that the small entities use generic simulators or realistic table top exercises in there place. FERC goes on in paragraph 1391 to direct the ERO "to develop a requirement for the use of simulators dependent on the entity's role and size". The MRO requests that the SDT define what it means by 'simulator' and "who should use this simulator" and revise the requirement as appropriate to meet the FERC 693 directives. R3, The Requirement states '.....32 hours of emergency operations training applicable to its organization that reflects emergency operations topics (which includes system restoration) using training, drills, exercises, and hands on training using simulators.' Is this requirement setup to require each operator to have at least some simulator training every 12 months, or is the requirement only providing a list of training options? The MRO requests clarification on this requirement. Data Retention: Does 1.4.4 say that if someone is found non-compliant they only have to keep records until they are found to be compliant? This goes against the previous three paragraphs. This could be corrected if "or since the last compliance audit, which ever is greater." is added to the end of the sentence.? Risk Factors: ? ? R1, should be changed to "Lower Risk Factor", since it is administrative in nature, per NERC Reliability Standards Development Procedure. If an entity had the first four steps to the SAT process but an incomplete Evaluation, this would not "affect the electrical state or capability of the bulk power system".

Response: The SPT SDT acknowledges your comment concerning Requirement 2 but respectfully disagrees. The SDT believes that the present wording provides sufficient clarity and the suggested changes would not significantly improve or alter the desired outcome of the requirement.

The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. . The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read:

> R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.
>
> > R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

The SPT SDT acknowledges your comment concerning data retention and has revised this section to more accurately reflect either a three year requirement or the last compliance audit, whichever time frame is the greatest and each of the sub-sections have been removed. The Data Retentions section now reads "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance, for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period

Organization	Question 5 Comments:
of time as part of an investigation". The SPT SDT believes that based on the existing definitions of the VRFs, the VRFs should not be changed. The analysis of the August 2003 Blackout showed that training, or the lack of training, was a significant factor that contributed to the blackout. The VRF Definitions can be found in the NERC Drafting Team Guidelines at (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as in the Reliability Standards Development Procedure Manual.	
Public Service Commission of South Carolina	On Page 1 of 2 of Implementation Plan for PER-005-1 - System Personnel Training, strike the word "months" under PER-005-1 Requirements in the box for R3.
Response: The SPT SDT acknowledges your comment and has made the necessary modifications.	
WECC Operations Training Subcommittee	The definition of Bulk Power vs. Bulk Electric System needs to be clearly defined in order to be utilized as a basis for the standards with respect to systems that the RRO has defined as not affecting the BES.
Response: The defining of the term Bulk Electric System (BES) is outside the scope of this Drafting Team. The definition is found in either the NERC Glossary or is defined by the individual Region.	
ISO New England Inc.	We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. In R3 suggest changing drills, exercises and hands on training using simulators to drills, exercises and hands on training using simulators (if available).
Response: The SPT SDT acknowledges your comment concerning Reliability Coordinators and other functional entities that work or are employees of a Region and those that do not work for the Regions. This distinction was made due to FERC's requirement of NERC to perform audits of any registered entities which work for the Region. In WECC, for example, the Reliability Coordinators are employees of WECC and report to the WECC Director of the Reliability Coordinators. For all of these situations, FERC views this as a conflict of interest for the regional entity to perform the compliance audit therefore NERC will perform compliance audits for these exceptions. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. . The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.	
Entergy Services, Inc. System Planning & Operations (Generation & Marketing)	It appears that only the Requirement (R1, R2, R3) have VRFs and VSLs. Do the VRFs and VSLs apply to the sub-requirements and can an entity be penalized for the requirement and the sub-requirement? (e.g. if an entity does not create the list required in R1.1 will they receive a penalty for R1 and R1.1?)Regarding PER-004-2 R2 - the requirement does not belong in a RC "staffing" standard. This general statement requirement is adequately covered in the IRO-005 standard and should be deleted as part of

Organization	Question 5 Comments:
	this revision or a future revision/review of IRO-005.
Response: The present methodology being used in the Standard Drafting Process requires VRFs to be associated with a Requirement. Sub-requirements will not have an associated VRF. VSLs are assigned to each Requirement and cover the sub-requirements. The Sanctions Guidelines Section 3.10 includes the following: Strictly speaking, NERC or the regional entity can determine and levy a separate penalty or sanction, or direct remedial action, upon a violator for each individual violation. However, in instances of multiple violations related to a single act or common incidence of noncompliance, NERC or the regional entity will generally determine and issue a single aggregate penalty, sanction, or remedial action directive bearing reasonable relationship to the aggregate of the related violations. The penalty, sanction, or remedial action will not be that determined individually for the least serious of the violations; it will generally be at least as large or expansive as what would be called for individually for the most serious of the violations. As stated in the Implementation Plan associated with this Standard, PER-004-2 Requirement 2 will be retired when this Standard becomes effective.	
AEP	R1.2 - The wording of R1.2 should refer to "utilizing designed training materials" with learning objectives based on the task list, rather than "designing training materials" with learning objectives based on the task list. Some training is purchased from vendors to satisfy training need rather than designing the training in-house. We suggest the wording be modified as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize training materials designed and developed with learning objectives that are based on the task list created in R1.1. "R2 Risk Factor - The "Risk Factor" should be "Medium" in-line with the risk factor of R1. The risk factor to verify performance of the reliability tasks (R2) should not be higher than the risk factor for identifying the reliability tasks (R1). R2.1 - We believe this requirement should specify 12months (rather than 6 months) for performance verification following identification of new or modified tasks. Often, tasks change or are modified gradually do to operator adaptation of influencing parameters. Therefore operators often adapt to the task modification without formal training, and well before the task is updated in the list. Annual review of the task list (specified in R1.1.1) will likely set the stage for the needed annual training on the tasks, whether modified, new, or existing tasks just needing improvement in operator performance. The continuing education training plan is typically scheduled annually targeting operator training needs including certification maintenance training and emergency training. Consequently it would be best to schedule new and modified task training along with the operator's annually scheduled CE training. Specifically R2.1 should read: "Within twelve months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority, and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks". R3 - This requirement could be interpreted to require all entities large or small to have a simulator or buy hands on simulator exercises from a vendor "that applies to their system". We believe the word simulator should be changed to "simulation" as follows: "??.using training, drills, exercises, and hands on training using simulations". The related VSLs would need the word changed also. R3.1 - To assure R3.1 is in aligned with our comments on R1.2, based on the fact that some training may be purchased training delivered by a vendor, we suggest rewording of R3.1 change the word "deliver" to the word "utilize" as follows: "Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall utilize the training established in R1.2. "Purpose - In item 3 of the Introduction to the Standard "Purpose", the word "competent" should be changed to "capable" to align with Measurement M2. Specifically ?. "To ensure that System Operators performing real-time, reliability-related tasks on the

Organization	Question 5 Comments:
	North American Bulk Electric System (BES) are "capable" to perform those reliability related tasks. The Reliability Task List (previously attached to draft 2) should be included with the reference material that can be referenced for the standard, such as along with the references for the systematic approach to training (ADDIE, DOE references, etc.). We appreciate the effort by the SDT to incorporate all the suggestions provided by the industry following the last posting. The current standard reflects considerable rewrite and we feel that this proposal is a significant improvement.

Response: The SPT SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them.

The SPT SDT believes that based on the existing definitions of the VRFs, the VRFs should not be changed. The analysis of the August 2003 Blackout showed that training, or the lack of training, was a significant factor that contributed to the blackout. The VRF Definitions can be found in the NERC Drafting Team Guidelines at (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as in the Reliability Standards Development Procedure Manual.

The SPT SDT acknowledges your comment concerning training associated with an update of the training program but respectfully disagrees. The SDT believes that an update of the training program will typically will require modifications or additions of a few items and is not as extensive as implementing a new training program. This is something that can be accomplished within a six month window. In addition, the NERC Certification Process or NERC Continuing Education (CE) Program is not a part of this standard. The standard applies to all reliability-related training, not just NERC CE approved activities. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., company specific reliability-related tasks). The majority of training in this standard could meet CEH.

The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read:

> R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.
>
> > R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

The SPT SDT acknowledges your comment regarding the use of the terms competent and competency but does not believe that changing the words would significantly improve or alter the desired outcome of the requirement. In addition, the “Purpose” section of this standard is taken from the industry approved SAR.

The revised Reference Document associated with the Standard details some topics that could be considered and included in a task list.

Organization	Question 5 Comments:
ERCOT Inc.	The requirements say to create a task list and develop objectives and materials based on that list. This could be burdensome, and doesn't have to happen if the SAT process if followed. Objectives and materials should only required on tasks identified for training, before that training is conducted, not every task performed before any training is conducted.? ?In meeting R2, the entity may determine that their operators need no training on the tasks in their list. R1.2 (which we recommend goes away) requires development of objectives and training materials regardless of need. R1.3 (which we also recommend go away) requires they deliver training on those objectives and materials. Therefore there actually would be a justifiable argument that under almost any SAT process, R1.2 and R1.3 could be considered to be an unnecessary and unreasonable burden until an organization would have to replace an operator with an ignorant, off-the-street individual; an unlikely scenario for many.? ?Arbitrarily creating such requirements flies in the face of any SAT process.? ?Even if the entity changes something about a task(s), it is very possible that R2.1 can be accomplished with no ?formal? training.? ? On R3: If the SAT process is believed, then the 32 hour emergency training requirement is bogus. The 32 hour requirement was instigated as an interim act in the absence of an organizational SAT process for System Operators. ? ?If NERC is going to continue to specify topics and times, then don't preen and pretend to advocate the SAT process. The old guide has a list of topics, and the PSS can certainly apply their expertise to assign times; this would simplify the process for the whole industry. Of course this would be mostly for show, but then so is the 32 hour requirement.? Now let's look at the Purpose of PER-005. That should be changed. It should read: "To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent." The words "The competency of System Operators is critical to the reliability of the North American Bulk Electric System." is an observation, not a purpose.
Response: The SPT SDT agrees that a systematic approach to training does not require the development of a task list. The task list is a tool that can be used to identify the necessary training as stated in R1. A systematic approach to training is then used to develop the associated training for each task. This is needed to cover new hires. It would be difficult to determine, in advance, on which tasks a new hire will need to be trained. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR. The revised Reference Document associated with the Standard details some topics that could be considered and included in a task list. The SPT SDT acknowledges your comment regarding the Purpose section of the standard. The "Purpose" section of this standard is taken from the industry approved SAR.	
We Energies	R2: Typographical error "...shall verify each OF its System Operator's... "R3: The phrase"...using training, drills, exercises, and hands on training using simulators." is reasonably interpreted as "...using training and drills and exercises and hands on training using simulators." This phrase needs to be reworded. Data Retention 1.4.4: 1.4.1, 1.4.2, and 1.4.3 reference a requirement and measure. Should this one also reference requirements and measures?
Response: The SPT SDT acknowledges your comment concerning the typographical error in Requirement 2. This has been corrected.	

Organization	Question 5 Comments:
The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel"; R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT acknowledges your comment concerning the Data Retention section of the standard. The Data Retention section has been modified to provide clarity.	
Santee Cooper	Clarity should be provided in the requirements that training can be provided through the use of vendors or in-house as long as the SAT process is utilized. In addition, the training standard needs to be written such that a smaller entity is able to comply with the standard without employing the use of vendors or consultants.
Response: The SPT SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR.	
BCTC	The definition of Bulk Power System vs. Bulk Electric System needs to be clearly defined in order to be utilized as a basis for the standards. Until the BES vs. BPS issue is cleared up this should not be used as a basis for Standards.
Response: The defining of the term Bulk Electric System (BES) is outside the scope of this Drafting Team – and since the standard only uses the term, "Bulk Electric System" there should be no confusion in this standard. The definition of BES is found in the NERC Glossary and is defined by the individual Region.	
Pepco Holdings, Inc. - Affiliates	We are concerned that this standard does not address the specific directions of FERC Order 693 to include local control centers that can take independent actions, in this standard. We think the standard should be revised to include a new Requirement 4: R4. Each Reliability Coordinator, Balancing Authority, and Transmission Operator that delegates tasks for which it is responsible to another entity shall develop or modify an existing training program using a systematic approach to training for the set of tasks it has delegated to other entities.[Risk Factor: Medium] [Time Horizon: Long-term Planning] R4.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator who has developed a training program for its delegated tasks shall ensure through a monitoring program that the training program for the delegated tasks meets the equivalent requirements of R2 and R3 of this standard R4.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator who has delegated tasks for which it responsible shall maintain a list of the entities to whom tasks have been delegated and of the tasks that have been delegated and provide the list to its Regional Entity.

Organization	Question 5 Comments:
	M4. Each RC, BA, and TOP shall have available a training program for its delegated tasks developed through a systematic approach to training. M4.1 Each RC, BA and TOP shall have evidence that the training program for its delegated tasks meets the equivalent of R2 and R3. M4.2 Each RC, BA and TOP shall have evidence that it provided to its Regional Entity the list of the entities to which it has delegated tasks and the delegated tasks.
Response: In previous drafts of this standard the industry has consistently agreed that Local Control Centers should not be applicable to this Standard until a universal definition of the term "Local Control Center" has been established. The SPT SDT has developed this Standard based on the Functional Model Version 3 and the current registration process. Additionally, the philosophy used to develop this Standard is based on the industry need from the industry approved SAR.	
Baltimore Gas & Electric	We recommend that NERC provide industry training on the development of a training program and include detailed instructions on "a systematic approach to training", how to compile a "list of BES company-specific reliability-related tasks", explain expectable verification methods for "System Operator's capabilities to perform each assigned task", etc.
Response: The SPT SDT has modified the Implementation Plan to include industry training on the use of a systematic approach to training. Additional information can be found in the revised Reference Document associated with this Standard and through the following links. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html **(3) ADDIE – 1975, Florida State University** http://www.nwlink.com/~donclark/history_isd/addie.html **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf	
New York Independent System Operator	Regarding R3 "using training, drills, exercises and hands-on training?" can actually be just "training". "Drills, exercises and hands on" are methods of training that can be used and remove the corresponding Severe VSL. Replace six months with 30 days.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read:	

Organization	Question 5 Comments:
R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. The determination of the Violation severity Level (VSL) is based on the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing VSLs to provide a more consistent application when determining VSLs. This document is a product developed jointly by the stakeholder drafting teams and SMEs, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. The SPT SDT has considered your comment, but the VSL will remain as presently written. The SPT SDT believes that reducing the six month re-verification window of Requirement 2.1 to a 30 day window would be too burdensome on an entity due to the shift schedules associated with a System Operators work environment.	
FirstEnergy	FE has the following additional comments/suggestions: R3 - The last part of this requirement, "? (which includes system restoration) using training, drills, exercises, and hands on training using simulators.", may be both confusing and not all inclusive. The following is an explanation of our concerns:(a) The phrase in parenthesis "which includes system restoration" seems to only capture one of the several important emergency operations topics. We feel that it should either be removed, or expanded to include the other important topics which include "Capacity and Energy Emergencies" and "Load shedding". (b) The phrase "using training, drills, exercises, and hands on training using simulators" may be confusing and a couple of the terms are not clearly defined. We are not sure of the meaning and differences in the terms "drills" and "exercises". At the very least, we believe these terms could be combined into one subset of the required training. Also, for better clarity, we think these subsets of the training should be bulleted under R3. We suggest rewording R3 as follows:R3. At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics using all of the following [Risk Factor: Medium] [Time Horizon: Long-term Planning]:- classroom training- drills and/or exercises- hands on training using simulators.
Response: The SPT SDT is not targeting just system restoration in Requirement 3. There are other topics that could be used but the training must include system restoration. Emergency operation training topics, that could be included, are also listed in the revised Reference Document associated with this Standard. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with	

Organization	Question 5 Comments:
established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.	
Duke Energy Corporation	Requirements of this standard should be revised to reflect that training may be developed and delivered by a third party under contract.
Response: The SPT SDT does not believe that the Standard, as written, precludes the use of contractors for training purposes. A contractor hired to perform these activities performs under the auspices of the entity who hires them. The philosophy used to develop this Standard is based on the industry need from the industry approved SAR.	
Ontario IESO	(1) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process) between RCs and other functional entities that work for the Regional Entity AND those that do not work for the REs. Please provide examples of RCs and functional entities that work for an RE, which, as a standard developer and compliance monitor per the functional model do not have any operating and planning functions that require employing RCs or any other functional entities. However, we do realize that there are REs that are requested by membership in a region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.
Response: The SPT SDT acknowledges your comment concerning Reliability Coordinators and other functional entities that work or are employees of a Region and those that do not work for the Regions. This distinction was made due to FERC's requirement of NERC to perform audits of any registered entities which work of the Region. In WECC, for example the Reliability Coordinators are employees of WECC and report to the WECC Director of the Reliability Coordinators. For all of these situations, FERC views this as a conflict of interest for the regional entity to perform the compliance audit therefore NERC will perform compliance audits for these exceptions. The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee - - to comply with one of the directives, the standard needs to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant potion of load and generation. The SPT SDT has modified Requirement 3 and added Requirement 3.1 to provide clarity. Requirement 3 and Requirement 3.1 now read: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, ,which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations shall provide each system operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

Standards Announcement

Comment Period Opens
June 18–July 17, 2008

Now available at: http://www.nerc.com/~filez/standards/System-Personnel-Training.html

Comment Period for Project 2006-01 — System Personnel Training Standard Opens June 18, 2008
The System Personnel Training Standard Drafting Team has posted its fourth draft of PER-005-1 — System Personnel Training (Project 2006-01) along with an implementation plan, and a reference to aid in implementing the standard for a 30-day comment period from June 18 through July 17, 2008.

The purpose of the standard is to help ensure that that System Operators performing real-time, reliability-related tasks on the North American bulk electric system are competent to perform those reliability-related tasks. The proposed standard is applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators.

Please use this electronic comment form to submit comments on the fourth draft of PER-005-1 by **July 17, 2008**.

If you need an off-line, unofficial copy of the questions in the comment form, there is a copy of the comment form posted at the following site:

http://www.nerc.com/~filez/standards/System-Personnel-Training.html

Please use only the electronic form to submit comments by July 17, 2008. If you experience any difficulties in using the electronic form, please contact Barbara Bogenrief at 609-452-8060.

Standards Development Process
The *Reliability Standards Development Procedure Manual* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Maureen Long, Standards Process Manager, at maureen.long@nerc.net or at (813) 468-5998.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.
10. Standards Drafting Team responded to comments and posted the revised standard for comment on June 9, 2008.

Proposed Action Plan and Description of Current Draft:

This is the fourth posting of the proposed standard and its associated implementation plan for a 30-day comment period, from June 18, 2008 to July 17, 2008.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments and post a fourth revised standard, implementation plan and reference document for a 30-day comment period.	June 18, 2008
2. Respond to comments on the fourth draft of the proposed standard.	July 21, 2008
3. Obtain the Standards Committee's approval to move the standard forward to balloting.	September 15, 2008
4. Post the standard and implementation plan for a 30-day pre-ballot review.	September 22, 2008
5. Conduct an initial ballot for ten days.	October 22, 2008
6. Respond to comments submitted with the initial ballot.	November 1, 2008

7. Conduct a recirculation ballot for ten days.	November 11, 2008
8. Post for a 30-day preview for board.	November 21, 2008
9. BOT adoption.	December 22, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. Requirement R1 and Requirement R2 become effective 24 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, these requirements becomes effective 24 months after the first day of the first calendar quarter after Board of Trustee adoption.

5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.

5.3. Requirement R3.1 becomes effective 36 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, the subrequirement becomes effective 36 months after the first day of the first calendar quarter after Board of Trustee adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4.

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the

employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator, Balancing Authority or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related tasks to identify new or modified tasks on an annual basis (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s).(R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks (when developing a new or modifying an existing training program). (R1.2)	When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related tasks (R1.1) OR When developing a new or modifying an existing training program the responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability related tasks. (R2.1)	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)
R3	None	The responsible entity provided at least 32	The responsible entity provided at	The responsible entity provided 32

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
		hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	hours of emergency operations training to less than 70% of its System Operators (R3) OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)

E. Regional Variances

None.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.
10. Standards Drafting Team responded to comments and posted the revised standard for comment on June 9, 2008.

Proposed Action Plan and Description of Current Draft:

This is the fourth posting of the proposed standard and its associated implementation plan for a 30-day comment period, from June ~~16~~18, 2008 to July ~~15~~17, 2008.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments and post a fourth revised standard, implementation plan and reference document for a 30-day comment period.	June 18, 2008
2. Respond to comments on the fourth draft of the proposed standard.	July 21, 2008
3. Obtain the Standards Committee's approval to move the standard forward to balloting.	September 15, 2008
4. Post the standard and implementation plan for a 30-day pre-ballot review.	September 22, 2008
5. Conduct an initial ballot for ten days.	October 22, 2008
6. Respond to comments submitted with the initial ballot.	November 1, 2008
7. Conduct a recirculation ballot for ten days.	November 11, 2008
8. Post for a 30-day preview for board.	November 21, 2008
9. BOT adoption.	December 22, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. Requirement R1 and Requirement R2 becomes ~~s~~ e~~E~~ffective 24~~36~~ months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, these ~~Reliability Standard~~ requirements becomes effective 24~~36~~ months after the first day of the first calendar quarter after Board of Trustee adoption.

5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.

5.3. Requirement R3.1 becomes effective 36 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, the ~~Reliability Standard~~subrequirement becomes effective 36 months after the first day of the first calendar quarter after Board of Trustee adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a ~~new or modify an existing~~ training program~~(s)~~ for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, (which includes system restoration) using training, drills, exercises or other training required to maintain qualified personnel, which could include simulationsand hands on training using simulators. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational or direct authority or control over fFacilities with established IROLs or haves established operating guides or protection systems to mitigate IROL violations shall provide each sSystem oOperator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish a and implement anew or modify an existing training program(s) and evidence of implementation, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee feedback, , supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4.

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is

capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology~~simulation training~~, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, ~~, as identified below,~~ unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.~~:~~

1.4.1 ~~Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain its current company-specific task list and any supporting learning objectives and course outlines, training records, and evaluation records since its last compliance audit for Requirement 1, Measure 1.~~

~~1.4.2 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain training records for each of its System Operators since the last compliance audit for Requirement 2, Measure 2.~~

1.4.3 ~~Each Reliability Coordinator, Balancing Authority and Transmission Operator shall retain training records for each of its System Operators since the last compliance audit for Requirement 3, Measure 3.~~

1.4.4 If a Reliability Coordinator, Balancing Authority ~~and~~ or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	~~Medium~~ Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related tasks to identify new or modified tasks on an annual basis (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program ~~effectiveness~~ to identify needed changes to its training program(s). (R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related task~~s list~~ (when developing a new or modifying an existing training program). (R1.2)	When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related task~~s list~~ (R1.1) OR When developing a new or modifying an existing training program the responsible entity failed to deliver training based on the BES company specific reliability related task~~s list~~. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2) OR The responsible	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)

R#	Lower VSL	~~Medium~~ Moderate VSL	High VSL	Severe VSL
			entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability related task~~s list~~. (R2.1)	
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3) OR The ~~required~~ responsible entity did not include simulation technology replicating the operational behavior of the BES ~~in its emergency training, the use of drills, exercises, and hands-on training using simulators~~in its emergency operations training. (R3.1)

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: **Reliability Coordination — Staffing**

2. Number: PER-004-2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Proposed Effective Date:

- Requirements 2, 3, 4, and 5 retired when PER-005-1 becomes effective

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

The VSL SDT developed VSLs for this standard to replace the Levels of Non-compliance

2. Levels of Non-Compliance for a Reliability Coordinator

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4:

E. Regional Differences

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

A. Introduction

1. **Title:** **Reliability Coordination — Staffing**

2. **Number:** PER-004-~~1~~2

3. **Purpose:**

   Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. **Applicability**

   4.1. Reliability Coordinators.

5. **Proposed Effective Date:** ~~January 1, 2007~~

   - Requirements 2, 3, 4, and 5 retired when PER-005-1 becomes effective

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

~~**R2.**All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.~~

~~**R3.**Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.~~

~~**R4.**Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.~~

~~**R5.**~~**R2.** Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

~~**M1.**The Reliability Coordinator shall have and provide upon request training records that confirm that each of its operating personnel has completed a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel, as specified in Requirement 2.~~

~~**M2.**Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to, a documented training program and individual training records for each of its operating personnel or other equivalent evidence that will be used to confirm that it meets Requirements 3 and 4.~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

The VSL SDT developed VSLs for this standard to replace the Levels of Non-compliance

2. Levels of Non-Compliance for a Reliability Coordinator

~~To be developed~~

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: ~~There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**2.4.1**One or more of its shift operating personnel did not complete a minimum of five days per year of training and drills using realistic simulations of system emergencies in the past year. (R2)~~

~~**2.4.2**No evidence operating personnel have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. (R3)~~

~~**2.4.3**No evidence operating personnel have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area. (R4)~~

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

The SPT SDT recommends that this entire standard be retired when PER-005 becomes effective.

A. Introduction

1. **Title:** **Operating Personnel Training**

2. **Number:** PER-002-0

3. **Purpose:** Each Transmission Operator and Balancing Authority must provide their personnel with a coordinated training program that will ensure reliable system operation.

4. **Applicability**

   4.1. Balancing Authority.

   4.2. Transmission Operator.

5. **Effective Date:** April 1, 2005

B. Requirements

R1. Each Transmission Operator and Balancing Authority shall be staffed with adequately trained operating personnel.

R2. Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in:

R2.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.

R2.2. Positions directly responsible for complying with NERC standards.

R3. For personnel identified in Requirement R2, the Transmission Operator and Balancing Authority shall provide a training program meeting the following criteria:

R3.1. A set of training program objectives must be defined, based on NERC and Regional Reliability Organization standards, entity operating procedures, and applicable regulatory requirements. These objectives shall reference the knowledge and competencies needed to apply those standards, procedures, and requirements to normal, emergency, and restoration conditions for the Transmission Operator and Balancing Authority operating positions.

R3.2. The training program must include a plan for the initial and continuing training of Transmission Operator and Balancing Authority operating personnel. That plan shall address knowledge and competencies required for reliable system operations.

R3.3. The training program must include training time for all Transmission Operator and Balancing Authority operating personnel to ensure their operating proficiency.

R3.4. Training staff must be identified, and the staff must be competent in both knowledge of system operations and instructional capabilities.

R4. For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.

C. Measures

M1. The Transmission Operator and Balancing Authority operating personnel training program shall be reviewed to ensure that it is designed to promote reliable system operations.

D. Compliance

1. Compliance Monitoring Process

Periodic Review: The Regional Reliability Organization will conduct an on-site review of the Transmission Operator and Balancing Authority operating personnel training program every three years. The operating personnel training records will be reviewed and assessed compared to the program curriculum.

1.1. Compliance Monitoring Responsibility

Self-certification: The Transmission Operator and Balancing Authority will annually provide a self-certification based on Requirements R1 through R4.

1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year.

1.3. Data Retention

Three years.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

2.1. Level 1: N/A.

2.2. Level 2: The Transmission Operator or Balancing Authority operating personnel training program does not address all elements of Requirement R3.

2.3. Level 3: The Transmission Operator or Balancing Authority operating personnel training program does not address Requirement R4.

2.4. Level 4: A Transmission Operator or Balancing Authority has not provided a training program for its operating personnel.

E. Regional Differences

None identified.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours of emergency operations training applicable to its organization that reflect emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. Note: PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be retired. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use e a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time.

PER-004-1 Requirement	PER-005-1 Requirements
	Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R2) duplicate PER-004-1 R3 and therefore PER-004-1 R3 should be retired.
R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time. Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R4 and therefore PER-004-1 R4 should be removed.

A red-line version of PER-004-1 is posted with this Implementation Plan.

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators
- Balancing Authorities
- Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement R1 and Requirement R2 become effective 24 months after the first day of the first quarter following regulatory approval or, in those jurisdictions where regulatory approval is not required, these requirements otherwise becomes effective 24 months after the first day of the first quarter after Board of Trustee adoption.
- Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.
- Requirement R3.1 becomes effective 36 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required; this subrequirement becomes effective 36 months after the first day of the first calendar quarter after Board of Trustee adoption.

Training

- The SPT SDT will provide training on the use of a systematic approach to training, either in conjunction with a NERC workshop or independent PER-005 training, dependent on the preference of the industry.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours ~~months~~ of emergency operations training applicable to its organization that reflect emergency operations topics ~~(~~, which includes system restoration~~)~~ using ~~training,~~ drills, exercises ~~and hands on training using simulators.~~ or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. Note: PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be retired. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators
- Balancing Authorities
- Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement ~~1, Requirement 2,~~R1 and Requirement ~~3 shall~~R2 become effective ~~36~~24 months after the first day of the first quarter following regulatory approval or, in those jurisdictions where regulatory approval is not required, ~~the Reliability Standard~~these requirements otherwise becomes effective 24 months after the first day of the first quarter after Board of Trustee adoption.
- Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.
- Requirement R3.1 becomes effective 36 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is ~~required,~~required; this subrequirement becomes effective 36 months after the first day of the first calendar quarter after Board of Trustee adoption.

Training

- The SPT SDT will provide training on the use of a systematic approach to training, either in conjunction with a NERC workshop or independent PER-005 training, dependent on the preference of the industry.

PER-005 System Personnel Training
Reference Document

Reference #1: Determining Task Performance Requirements

The purpose of this reference is to provide guidance in writing a performance standard that describes the desired outcome of a task. A standard for acceptable performance should be in either measurable or observable terms.

Clear standards of performance are necessary for an individual to know when he or she has completed the task and to ensure agreement between employees and their supervisors on the objective of a task. Performance standards answer the following questions:

How timely must the task be performed?

Or

How accurately must the task be performed?

Or

With what quality must it be performed?

Or

What response from the customer must be accomplished?

When a performance standard is quantifiable, successful performance is more easily demonstrated. For example, in the following task statement, the criteria for successful performance is to return system loading to within normal operating limits, which is a number that can be easily verified.

> Given a System Operating Limit violation on the transmission system, implement the correct procedure for the circumstances to mitigate loading to within normal operating limits.

Even when the outcome of a task cannot be measured as a number, it may still be observable. The next example contains performance criteria that is qualitative in nature, that is, it can be verified as either correct or not, but does not involve a numerical result.

> Given a tag submitted for scheduling, ensure that all transmission rights are assigned to the tag per the company Tariff and in compliance with NERC and NAESB standards.

Reference #2: Systematic Approach to Training References:

The following list of hyperlinks identifies references for the NERC Standard PER-005 to assist with the application of a systematic approach to training:

Reference #3: Normal and Emergency Operations Topics

These topics are identified as meeting the topic criteria for normal and emergency operations training per Requirement 1 and Requirement 3 of this standard.

A. Recognition and Response to System Emergencies

1. Emergency drills and responses
2. Communication tools, protocols, coordination
3. Operating from backup control centers
4. System operations during unstudied situations
5. System Protection
6. Geomagnetic disturbances weather impacts on system operations
7. System Monitoring – voltage, equipment loading
8. Real-time contingency analysis
9. Offline system analysis tools
10. Monitoring backup plans
11. Sabotage, physical, and cyber threats and responses

B. Operating Policies and Standards Related to Emergency Operations

1. NERC standards that identify emergency operations practices (e.g. EOP Standards)
2. Regional reliability operating policies
3. Sub-regional policies and procedures
4. ISO/RTO policies and procedures

C. Power System Restoration Philosophy and Practices

1. Black start
2. Interconnection of islands – building islands
3. Load shedding – automatic (under-frequency and under-voltage) and manual
4. Load restoration philosophies

D. Interconnected Power System Operations

1. Operations coordination
2. Special protections systems
3. Special operating guides
4. Voltage and reactive control, including responding to eminent voltage collapse
5. Understanding the concepts of Interconnection Reliability Operating Limits versus System Operating Limits
6. DC tie operations and procedures during system emergencies
7. Thermal and dynamic limits
8. Unscheduled flow mitigation − congestion management
9. Local and regional line loading procedures
10. Radial load and generation operations and procedures
11. Tie line operations
12. E-tagging and Interchange Scheduling
13. Generating unit operating characteristics and limits, especially regarding reactive capabilities and the relationship between real and reactive output

E. Technologies and Tools

1. Forecasting tools
2. Power system study tools
3. Interchange Distribution Calculator (IDC)

F. Market Operations as They Relate to Emergency Operations

1. Market rules
2. Locational Marginal Pricing (LMP)
3. Transmission rights
4. OASIS
5. Tariffs
6. Fuel management
7. Real-time, hour-ahead and day-ahead tools

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Comment Form for System Personnel Training Standard Draft 4

Please use this form to submit comments on the draft System Personnel Training standard. Comments must be submitted by **July 17, 2008.** If you have questions please contact **Darrel Richardson** at Darrel.Richardson@nerc.net or by telephone at 609-613-1848.

Background Information:

The System Personnel Training standard is designed to help ensure that System Operators who work for Reliability Coordinators, Balancing Authorities, and Transmission Operators are provided with training to promote the reliability and adequacy of the North American interconnections and their Bulk Electric Systems.

The proposed standard allows each Reliability Coordinator, Balancing Authority, and Transmission Operator to use a valid approach in determining its system operator's training needs and then in developing and delivering training that meets those individual training needs to support reliable bulk power system operations.

The System Personnel Training Standard Drafting Team would like to receive industry comments on this standard.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The System Personnel Training standard drafting team (SPT SDT) revised the effective dates for this Standard to provide for a shorter period for implementation of the training program while allowing for a longer implementation period for implementing the use of training simulation/simulators. Do you agree that the revised effective dates provide for sufficient time to establish a training program, as specified in R1? If not, please explain in the comment area.

☐ Yes
☐ No

Comments:

2. The SPT SDT revised R1 to provide clarity and eliminate the ambiguity concerning the training program to be established. R1 now reads:

> "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program."

Do you agree that the revised language now clearly defines the training program to be developed? If not, please explain in the comment area.

☐ Yes
☐ No

Comments:

3. The SPT SDT revised R3 and added R3.1 to provide clarity in the types of training that can be utilized and the entities that must use simulation/simulator training in their emergency operations training. Do you agree that this requirement now clearly describes the types of training that can be utilized as well as the entities that must provide simulation/simulator training in its emergency operations training? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

4. The SPT SDT modified the Data Retention section of this Standard to provide clarity:

> "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance, for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation."

Do you agree that this Standard now clearly defines the period for which compliance records must be kept? If not, please explain in the comment area.

☐ Yes

☐ No

Comments:

5. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Consideration of Comments on 4th Draft of System Personnel Training Standard — Project 2006-01

The System Personnel Training Standards Drafting Team thanks all commenters who submitted comments on revisions for the 4th draft of the System Personnel Training standard. These standards were posted for a 30-day public comment period from June 18, 2008 through July 17, 2009. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were more than 41 sets of comments, including comments from more than 140 different people from approximately 70 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/~filez/standards/System-Personnel-Training.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

1. The System Personnel Training standard drafting team (SPT SDT) revised the effective dates for this Standard to provide for a shorter period for implementation of the training program while allowing for a longer implementation period for implementing the use of training simulation/simulators. Do you agree that the revised effective dates provide for sufficient time to establish a training program, as specified in R1? If not, please explain in the comment area.

Summary Consideration:

Organization	Question 1:	Question 1 Comments:
Bonneville Power Administration	Yes	
NorthWestern Corporation	Yes	
Ameren	No	Everyone who does training now is not necessarily familiar with developing training using the systematic approach. So some trainers will have to acquire these skills. Also some companies will have to hire another person to develop and write the training lessons using the systematic approach. It might take that person more than 6 months just to become familiar with the jobs and the tasks being performed before that person could even begin to do any task listing and developing of any training. So essentially you would have less than 2 years to develop and deliver the training. Three years was a short period of time after implementation of the Standard to have all of the requirements done. Two years is un-realistic.
NPCC	Yes	
PJM Interconnection	No	This change was surprising, as the only comment made on the previous draft was to increase the implementation time. The SDT has shortened the implementation time, without providing justification for the change.
Seattle City Light	Yes	
Southern Company Transmission	No	We suggest the effective date be 36 months for both not 24 and 36. The 36 months will allow the industry the time required to develop quality training programs
Arizona Public Service Company	Yes and No	I can live with it, but I'm not sure if some smaller entities with training responsibilities being conducted by part time operators can. Three years would be better.
Manitoba Hydro	Yes	MHEB agrees with the revised dates.
Wapa (Loveland, Co)	Yes	
Pepco Holdings, Inc. - Affiliates	Yes	
Orlando Utilities Commission	Yes	

Organization	Question 1:	Question 1 Comments:
E.ON U.S. LLC	No	.ON U.S. believes that its training programs are sufficient to meet the requirements of the standard but is concerned that if NERC requires that parties undergo a formal systematic approach to training process that adequate time may not be available to complete the development, testing and administration of a training program. E.ON U.S. requests that NERC provide greater clarity as to whether a systematic approach to training process will be required in all instances and if so, better define what steps are required to implement this process. Without this guidance E.ON U.S. suggests that shortening the training period is not appropriate at this time.
WECC Reliability Coordination Comment Working Group	Yes	
SERC Standards Review Group	No	Our group supports the return of the training program effective date to 36 months after the first day of the first calendar quarter following regulatory approval. We feel that a 36-month implementation period is needed to allow responsible entities to develop quality training programs under the systematic approach required by the standard.
PowerSouth Energy Cooperative	No	Reducing the time frame from 36 to 24 months is not appropriate for the implementation of quality training. The evaluation and purchase process, lead time and cost to implement simulators as stated in R3.1 is unreasonable and does not necessarily improve reliability.
PSEI	No	The plan should go back to 3 years. There are many entities that will essentially have to re-build there programs to meet the administrative burden of an auditable SAT. I also disagree with the statement in the standard that R3 is presently in effect. The language, and therefore interpretation, of R3 differs from what is in the current approved standard. The new R3 in this standard should not go into effect until the first calendar quarter following regulatory approval of the standard.
FRCC System Operator Subcommittee	Yes	
SRP		
Hydro One Networks	Yes and No	The timelines of 2 months and 36 months are appropriate however the general wording of the Effective Date section of the Standard and the Implementation Plan should be modified. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in standards that have a clear reliability impact. In addition, it does not seem appropriate to have entities exposed to sanctions for non-compliance in some jurisdictions while not in others. We suggest: ?Requirement 1 and Requirement 2 becomes effective 2 months after the first day of the first calendar quarter following the date the standard is approved by all applicable regulatory authorities. ?"Requirement R3.1 becomes effective 36 months after the first day of the first calendar quarter

Organization	Question 1:	Question 1 Comments:
		following applicable the date the standard is approved by all applicable regulatory authorities."
Entergy - System Planning & Operation (Generation)	Yes	
CenterPoint Energy		
Ohio Valley Electric Corporation	No	A longer time period of 36 months better represents the industry project process of planning, budgeting, and construction. The scope of training as outlined in this standard would certainly be considered a project. Year 1 (months 1-12) is the planning year. Year 2 (months 13-24) is the budgeting year. Year 3 (months 25-36) is the purchase and construction year. Having a shorter implementation period would not give utilities an opportunity to appropriately address and consider each stage of the project process which could lead to significant errors in either the planning, budgeting, or construction (implementation) stage.
City Of Tallahassee (TAL)	Yes	
BCTC	No	The previous version of the standard included 36 months for implementing the re-defined training program and all the new requirements for a training program. The reduction in time from 36 months to 24 months is not acceptable. The 36 months implementation period, based on the amount of time needed to create the task lists of company-specific reliability related tasks performed by its System Operators, to conform with a systematic approach to training and the RRO's definition of the Bulk Electric System, and to provide the one time training to all system operators should be retained.
ISO/RTO Council - Standards Review Committee	No	The IRC does not agree with the SDT's proposal, particularly as it relates to training simulation/simulators (for details see comments under Q3).
WECC Operations Training Subcommittee	No	The previous version of the standard included 36 months for implementing the training program. The WECC OTS would like to see this time frame returned, based on the amount of time needed to create the task lists of company-specific reliability related tasks performed by its System Operators, utilizing a systematic approach to training, the regions definition of the Bulk Electric System and the time to provide the one time training to all system operators.
MRO NSRS	No	The original time frame of 36 months allowed entities to formulate an effective plan, ensuring compliance to the new Standard and requirements, as well as providing the training that will be needed when the MISO ancillary service market implementation scheduled for September 9, 2008. The systematic approach to training (SAT) process is a detailed process where entities are going to need to be trained in order to fulfill the requirements. There will need to be a substantial capital investment by entities who must comply with this updated Standard. By reducing the time frame to 24 months the Standard will not be as effective and may lead to possible shortcomings in the detailed training that is required for System Operators.
ONtario IESO	No	We have a comment on the use of training simulation/simulators (see comments under Q3) and are

Organization	Question 1:	Question 1 Comments:
		therefore not agreeing with that part of the implementation date.
AEP	No	The Requirements R1 and R2 implementation period should not be shortened but rather remain at the 3 year implementation requirement previously specified in Draft 3 of the standard. We believe it will take the 3 years to assure proper development of the training and objectives required to support all reliability tasks, and to verify every existing operator's capability to perform every identified reliability task as specified in R2. For some operators, the majority of their tasks may be reliability tasks.
Great River Energy	No	he original time frame of 36 months allowed entities to formulate an effective plan, ensuring compliance to the new Standard and Requirements, as well as providing the training that will be needed when the MISO ancillary service market is implemented which is scheduled for September 9, 2008. The systematic approach to training (SAT) process is a detailed process where entities are going to need to be trained in order to fulfill the requirements. There will need to be a substantial capital investment by entities that must comply with this updated Standard. By reducing the time frame to 24 months the Standard will not be as effective and may lead to possible shortcomings in the detailed training that is required for System Operators.
Transmission System Operations - Baltimore Gas & Electric		
PPL Electric Utilities	Yes	
Pacific Gas and Electric Company	No	There is an assumption that all entities utilize a systematic approach to their current training program. We would guess that is not the case, since utilizing this methodology may generate a lot of paper work and is administered by those with a background in implementing a systematic approach to training. With the passage of this new standard, reducing the implementation time frame from 36 to 24 months will in many cases create additional burdens to some entities and others will need to make improvements to their programs to meet the new standard and measures. In either case, entities will have to either rely on in house development or vendors to meet the criteria. This may be a substantial change and may require project funding, which in of itself creates a timeline of anywhere between 1-3 years and a process of planning, budgeting, and implementation. Therefore, within the first two years planning (analyzing and designing) and budgeting would have to be completed, followed by development and implementation. We feel returning the training program effective date to 36 months after the first day of the first calendar quarter following regulatory approval allows responsible entities to develop quality training programs under the systematic approach required by the standard.
Santee Cooper	No	Santee Cooper believes that 36 months is needed to implement a quality training program utilizing the systematic approach to training. Requirement 1 and Requirement 2 should both become effective 36 months after appropriate approvals.
American Transmission	Yes	As the JTA is new; but the requirement to have a training program is not, it is reasonable to conduct and

Organization	Question 1:	Question 1 Comments:
Company		implement a JTA within a two year timeframe.
Standards Interface Subcommittee/Compliance Elements Drafting Resource Pool		
Public Service Commission of South Carolina	Yes	
Duke Energy	No	While 24 months is sufficient time to implement R1, implementing R2 will take longer because verifying System Operators' capabilities is dependent upon development of the task list and training program. 36 months should be allowed for implementation of R2.
FirstEnergy	Yes	The 24-month implementation allows for sufficient time for industry to properly develop their training programs and to formulate the required evidence for compliance.
ISO New England Inc.	Yes	

2. The SPT SDT revised R1 to provide clarity and eliminate the ambiguity concerning the training program to be established. R1 now reads: "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program." Do you agree that the revised language now clearly defines the training program to be developed? If not, please explain in the comment area.?

Summary Consideration:

Organization	Question 2:	Question 2 Comments:
Bonneville Power Administration	Yes	
NorthWestern Corporation	Yes	
Ameren	Yes and No	I don't think the addition of "and shall implement the program" is necessary as R.1.3 already does this.
NPCC	Yes	
PJM Interconnection	No	It is still unclear if this addresses only new programs. R1 ignores the fact that many RCs, BAs & TOs already have excellent training programs in place. Is R1 intended to cover existing work as well? These programs are effective, however, they may not have been built "using a systematic Approach to Training" (SAT). Even if they were built with a SAT, the documentation for this would need to be created. The timely completion of this is unlikely, given the new, abbreviated, implementation time (see 1 above).
Seattle City Light	Yes	
Southern Company Transmission	No	What about the training programs that are in place now? Are they grand fathered? The industry needs clear direction on existing training programs. We support the use of the Systematic Approach-To-training (SAT). However the proposed standard seems to infer that to be consistent with SAT an entity need only develop a "company-specific reliability-related task". The SAT process is more than merely developing a list of Tasks. (Analysis, Design, Develop, Implement, and Evaluate.) Additionally as written the proposed standard provides no industry guidance in determining what constitutes "…a company-specific reliability-related task". It is purely subjective. Further, developing this subjective list does nothing to enhance reliability. An entity can make this list as long or short as they see fit. This task list should, at minimum, fully support the function type definition contained in the NERC Statement of Compliance Registry Criteria (Revision 4.0) for the Company's Compliance Registry Certification.
Arizona Public Service Company	Yes	
Manitoba Hydro	Yes	MHEB agrees that the revised language makes it clear.
Wapa (Loveland, Co)	Yes	

Organization	Question 2:	Question 2 Comments:
Pepco Holdings, Inc. - Affiliates	Yes	
Orlando Utilities Commission	Yes	
E.ON U.S. LLC	No	As outlined above, E.ON U.S. requests that NERC fully identify what steps are required to use a "systematic approach to training". As previously discussed, the use of the DOE process if required will require a substantial resource and time commitment but will not guarantee that the resulting training program is any better than the programs currently in place for training system operators. E.ON U.S. recommends that the standard be altered to allow entities to demonstrate that their current training programs and policies, while not necessarily developed through a defined systematic approach do meet the requirements of the standard.
WECC Reliability Coordination Comment Working Group	Yes	
SERC Standards Review Group	No	This group feels that the requirement to "establish a training program" using the systematic approach to training (SAT) is still ambiguous with respect to existing training materials. Can these resources be retrofit into the SAT-developed program? Are existing materials grandfathered and therefore exempt from meeting requirement R1? The industry needs clear direction on how responsible entities can incorporate their existing materials into the established "training program" and still be compliant with requirement R1. Furthermore, the development of reliability-related system operator tasks is a crucial first step for the SAT process. It would be helpful to have a suggested (not prescriptive) list of generic tasks that training personnel could use as a starting point to create the list of BES company-specific reliability-related tasks required by R1.1. This group suggests that the PER-005 System Personnel Training Reference Document be augmented to include such a generic task list. We further suggest that Appendix A: Generic Task List of Draft 2 of PER-005 be used as the suggested list of operator tasks. By moving the task list out of the Standard and into the Reference Document, training personnel will have the flexibility to modify the tasks, or add/remove tasks to suit their specific system.
PowerSouth Energy Cooperative	No	Some direction on existing training programs and how they will fit into the requirement should be inlcuded in the standard. Also, the current wording leaves a lot of interpretation to an auditor in deciding what tasks are be appropriate to included in the task list.
PSEI	No	BES company-specific, reliability-related tasks is open to interpretation by auditors. What if an auditor thinks some task should be on my task list, but my evaluation based on difficulty, frequency, and importance concludes it does not? Am I automatically in violation? The current wording is so broad that essentially all tasks could be linked to it. Perhaps re-phrasing to "critical BES company-specific reliability-related tasks ..." or "BES company-specific reliability-related tasks determined to be critical ..." would

Organization	Question 2:	Question 2 Comments:
		help trainers with refining their task list to a more manageable level.
FRCC System Operator Subcommittee	Yes	
SRP		
Hydro One Networks	Yes	
Entergy - System Planning & Operation (Generation)	No	The two sentences that make up R1 seem to convey a purpose/intent rather than an actual requirement. R1 adds nothing that is not already covered in the "sub-requirements" that are listed. There is no reason to state that a 'systematic approach to training' is required and then go on to state the specific requirements of that concept. Only the requirements are needed. It is suggested that R1 be integrated into the PURPOSE section of PER-005 as such: To ensure that System Operators performing real-time, relaibility-related tasks on the North American Bulk Electric System (BES) are competent to perform those tasks through a systematic approach to training. The Sub-requirements should be made as stand alone requirements in the standard.R1.1 - a reference document containing a possible list of reliability tasks may be useful for some entities, as long as it is not interpreted to be all encompassing nor required to be required tasks.R1.1.1 - "annually" needs better definition. Is it January through December? Or is it within 12 months of the last performance?
CenterPoint Energy		
Ohio Valley Electric Corporation	No	The wording "systematic approach" may be clearly stated, but the words will not be uniformly understood or applied in the development of a training program. Similarly, the individual company interpretations of "reliability-related tasks" will not be uniformly understood or applied. The R1 wording should be, "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall establish a training program for its System Operators and shall implement the program."
City Of Tallahassee (TAL)	Yes	
BCTC	No	"Company-specific reliability-related tasks" are not defined. These tasks may vary with different RROs and as related to the RRO's definition of the BES. Therefore, it is up to each RRO to provide clear guidance to its entities to establish these tasks and that will require additional time to develop. If the BES is not properly defined by the RRO, then it will be extremely difficult for an entity to determine if the BES company-specific reliability-related tasks in its training program meet this requirement. We are also concerned that unless there is a clear definition or examples of what "Company-specific reliability-related tasks" are then an audit team will define them as they see fit and this does not meet the spirit of removing ambiguity from the Standards.
ISO/RTO Council - Standards Review Committee	Yes	The IRC agrees that any new training program should be created using a systematic approach to training. However, the SDT should make clear that this requirement is related only to new programs and will not be imposed retroactively on training modules created prior to this standard.
WECC Operations	No	"Company-specific reliability-related tasks" are not defined and therefore it will be up to each region to

Organization	Question 2:	Question 2 Comments:
Training Subcommittee		provide this assistance. The WECC OTS believes the additional time needed for this definition from the regions needs to be provided for in the implementation phase. However, this definition will vary within the regions and some may have a broader definition, which will make it extremely difficult for an entity to determine if its training program meets this requirement.
MRO NSRS	Yes	
ONtario IESO	No	The term "systematic approaching to training" needs to be defined. Interpretations currently vary widely across the industry.
AEP	Yes	
Great River Energy	Yes	
Transmission System Operations - Baltimore Gas & Electric		
PPL Electric Utilities	Yes	
Pacific Gas and Electric Company	No	This statement; "shall use a systematic approach to training to establish a training program" based on "for the BES company-specific reliability-related tasks performed by its System Operators" will be the challenge! This leaves open for interpretation by the auditors what that means for each entity and will therefore, create inconsistency throughout the industry. The compliance audits are already creating inconsistency within the industry and this standard will further add to that inconsistency. NERC Standards should clearly state the requirement(s) and measure(s), and not create more uncertainty.
Santee Cooper	Yes	We recommend the Standard include as a reference document a suggested (not prescriptive) list of generic tasks that training personnel could use as a starting point to create the list of BES company-specific reliability-related tasks required by R1.1. It should be clear that the list is only SUGGESTED generic tasks so that if a company determines one of the tasks is not a reliability-related task performed by its System Operators that an audit team could not deem the company non-compliant if all tasks are not included.
American Transmission Company	Yes	
Standards Interface Subcommittee/Compliance Elements Drafting Resource Pool		
Public Service Commission of South Carolina	Yes	
Duke Energy	No	R1 should state that each RC, BA and TO shall define and use a systematic approach to training. Since

Organization	Question 2:	Question 2 Comments:
		the systematic approach to training is not a NERC-defined term, an auditor may not agree with an entity's selected approach. Similarly, R1.1 should state that each RC, BA and TO shall define its list of BES company-specific reliability-related tasks performed by its System Operators. Also, the R1 High and Severe VSLs need to have the word "list" added back in.
FirstEnergy	Yes	
ISO New England Inc.	Yes	

3. The SPT SDT revised R3 and added R3.1 to provide clarity in the types of training that can be utilized and the entities that must use simulation/simulator training in their emergency operations training. Do you agree that this requirement now clearly describes the types of training that can be utilized as well as the entities that must provide simulation/simulator training in its emergency operations training? If not, please explain in the comment area.

Summary Consideration:

Organization	Question 3:	Question 3 Comments:
Bonneville Power Administration	Yes	
NorthWestern Corporation	No	R3.1 specifies that the simulator training is required only for IROL situations. However, the corresponding measure (M3.1) does not stipulate the same. It is unclear if this requirement/measure applies only to IROLs or both IROLs and SOLs. Is this requirement not applicable in the Western Interconnection since there is an absence of IROLs in the West?
Ameren	No	What is "other training required to maintain qualified personnnel"? Why not just say "using drills, excercises, or other methods of training".
NPCC	No	R3.1 is overly prescriptive on how to accomplish training. The objective of this standard is to ensure that the RC, TOP, and BA develop and implement a training program for its system operators to deal with normal and emergency situations. Handling IROL violations is just one of the tasks that an RC operator must be able to perform. How to achieve this training to meet the needed competency level should be left to the responsible entity. The NERC Operator Certification exercise is the vehicle to test the operators' knowledge of handling these situations, not the prescriptive tool for training. If a simulator, virtual, or other technology that replicates the operational behavior of the bulk power system during normal and emergency conditions is required for RC, TOP, and BA to facilitate system operator training, then where justified it should be a requirement for organization certification, not for a training program.
PJM Interconnection	No	As written, there is no minimum amount of simulator training needed to satisfy R3 (eg, using a "technology that replicates the operational behavior of the BES" for five minutes would meet the requirement). NERC Certification programs currently mandate that RC, BA, & TO system operators have 30 hours of simulator training over their three year certification period. A duplication here (with no minimum requirement) seems pointlessly redundant.
Seattle City Light	Yes	
Southern Company Transmission	No	We disagree with mandating the use of a training simulator. R3. should be revised to allow an entity the flexibility of using any or all of the following training resources to meet its emergency operations requirement; drills, exercises, training classes or hands on training using simulation. This requirement is onerous. Less affluent entities that operate the BES, and also fall under NERC's purview will be hard

Organization	Question 3:	Question 3 Comments:
		pressed to afford a "simulator" that truly imitates their system. The purchase, model maintenance and operation of a simulator can be a financial burden for a smaller entity with an IROL.
Arizona Public Service Company	No	I suggest the following revisions: R3 At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization, including system restoration using drills, exercises, or other training activities.R3.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training based on the operational behavior of the BES during normal and emergency conditions. These changes maintain the intent of the requirement while allowing for flexibility in training methods.
Manitoba Hydro	Yes	MHEB agrees that the revision more clearly describes the types of training and which entities must provide simulation/simulator training.
Wapa (Loveland, Co)	Yes	
Pepco Holdings, Inc. - Affiliates	Yes	
Orlando Utilities Commission	Yes	Placing examples directly within the body of text leads to ambiguity. In this case it would appear that drills are only applicable to system restoration. I would recommend always placing examples of items within parentheses, producing:... emergency operations topics (including system restoration) using drills, exercises ...As far as using simulation, I think that the requirement is fairly clear however I hate to bring up that the requirement does not specify that the clock-time of the simulations must use actual clock time and not artificially slowed down events.
E.ON U.S. LLC	No	The standard does not define what is considered a simulation/simulator training platform. E.ON U.S. does use internal and vendor provided emergency system simulator training. In most programs the emergency conditions embedded in the training programs while not specific to E.ON U.S. operations represent conditions that can reasonably be expected to surface during times of system emergencies.. Therefore, these simulation/simulator training provide valuable framework from which to develop specific operator protocols to follow when experiencing system emergencies. Once again E.ON U.S. requests that NERC either better define what it considers a simulation/simulator training or allow each entity to demonstrate that training currently provided is sufficient to meet the standards.
WECC Reliability Coordination Comment Working Group	Yes and No	It does a better job of clarifying what entities must use simulation, but it does not specify what number of EOP hours must be simulation only. We suggest that the number of hours be determined by the entity itself utilizing the requirements in PER 005 R1.4.
SERC Standards Review Group	No	The consensus of this group is that the use of simulators for certain entities should not be mandated and that requirement R3.1 should be removed from the standard. Requirement R3 should be revised to

Organization	Question 3:	Question 3 Comments:
		allow every responsible entity the flexibility to meet its emergency operations training requirement using any or all of the following types of training: drills, exercises, training classes, or hands-on training using simulation. If Requirement 3.1 does remain in the standard, this group feels that entities mandated to use simulator training should be limited to Reliability Coordinators that have established IROLs within their coordinating footprint. In addition, the initial phrase in R3, "At least every 12 months" needs further clarification. We understand and appreciate the reason for changing the requirement for 32 hours of emergency training from every calendar year to every 12 months. This change was intended to permit an operator hired late in year to obtain his/her 32 required hours over a full 12 month period instead of just a month or two. However, this wording does not fully reflect this flexibility. The Drafting Team is requested to add some wording that clearly states that the 12-month period for this required 32 hours of training can be determined by the entity on a case-by-case basis, depending on an operator's specific circumstances.
PowerSouth Energy Cooperative	No	Section of 3.1 is poorly worded. It is unclear what "simulation technology or other technology that replicates operational behavior" implies. Flexibility in the training including hands-on exercises, table top drills, classes should be allowed.
PSEI	No	Who this applies to is still very vague and open to interpretation by auditors. Performing a Google search on "WECC IROL" will produce a "philosophy" document that states "The WECC does not have any IROLs under normal operation, but an SOL condition, depending upon the operating conditions, could become an IROL condition, which would be determined post-analysis." I am afraid of entities honestly believing that this standard does not apply to them, but suddenly finding themselves fined because an auditor believes everyone has IROLs or SOLs that could become IROLs. Perhaps the standard could ask the RRO to further define who this applies to. Of course, nothing would prevent the region from putting out an overly burdensome definition.
FRCC System Operator Subcommittee		FRCC disagrees with tying the requirement to SOL/IROL remediation. FRCC also disagrees with having to have a simulator. While they are good tools, a generic simulator (that replicates the response of the BES) is not the cure-all for a training in system response (including restoration). A good table-top on an entity's own system will provide better understanding of the operators own system and how to restore it. Many small entities are quite capable of producing quality training with a table-top. Do not pass requirements that will be overly burdensome to small utilities to fix a perceived problem in the value of training on simulators as compared to table-top exercises. We can have well trained operators without breaking the bank. The inclusion of mandatory simulators contradicts previous public responses from FERC. This requirement is beyond a minimum standard, it is a "best practice". Leave it out of the standard!
SRP	No	The Interconnection Reliability Operating Limit (IROL) should not be used to establish the applicability of this requirement, since the term itself is not well understood within the industry. Based on the obligations

Organization	Question 3:	Question 3 Comments:
		of the drafting team to clearly identify the applicability of the standard, it would be necessary for the drafting team to list all RCs, BAs and TOPs who have operational authority or control over Facilities with established IROLs.
Hydro One Networks	Yes	
Entergy - System Planning & Operation (Generation)	Yes	However the number of hours required is not clear; is there a minimum number of hours of the 32 that must meet this simulation technology requirement?.
CenterPoint Energy	No	No. CenterPoint Energy believes that additional clarity is needed. R3.1 can be interpreted to mean that for the entities identified simulation technology?. must be used for (all) 32 hours of emergency operations training. This goes far beyond the directive from FERC in Order 693, paragraphs 1390-1391. CenterPoint Energy believes from the Consideration of Comments on the 3rd Draft? the intent is for the entities identified in R3.1 to include simulation technology within the at least 32 hours? of emergency operations training provided to each System Operator, which is consistent with the directive from FERC in Order 693, paragraphs 1390-1391.In R3.1, CenterPoint Energy proposes to replace "using" with "including the use of" to clarify the intent as discussed above. R3.1 would read as follows: R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training including the use of simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.
Ohio Valley Electric Corporation	No	Emergency operations training should not be limited to the tasks "applicable to its organization." Many emergency operations topics are related to concepts and not tasks performed by System Operators. The task list developed in R1 could be used to identify some emergency operations training topics but will not cover all the topics that should qualify as emergency operations training.R3.1 is too specific/detailed to be included as a requirement in the standard. Place the details of R3.1 in a reference document or guide.PER-002 R4 currently defines emergency operations training clearly and is well understood and successfully implemented by the entities required to provide this training. PER-005 R3 should be revised to the wording in PER-002 R4.
City Of Tallahassee (TAL)	No	I disagree with tying the requirement to SOL/IROL remediation. I also disagree with having to have a simulator. While they are good tools, a generic simulator (that replicates the response of the BES) is not the cure-all for a training in system response (including restoration). A good table-top on an entities own system will provide better understanding of the operators own system and how to restore it. The cost-benefit analysis may not justify the expense of producing and maintaining a simulator for many small entities that are quite capable of producing quality training with a table-top. Cost needs to become a

Organization	Question 3:	Question 3 Comments:
		factor in what is mandated for the operation of the BES. Compliance is pushing the cost of doing business through the roof. Customers and their advocates are getting fed up with the increased costs they are paying for the same service. They do not see the additional support and tools needed to have an effective compliance program and prevent fines. Do not pass requirements that will be overly burdensome to small utilities to fix a perceived problem with poor training. We can have well trained operators without breaking the bank. The inclusion of mandatory simulators contradicts previous public responses from FERC. This requirement is beyond a minimum standard, it is a "best practice". Leave it out of the standard!
BCTC	No	Using simulation to deliver training which may be developed out of R1.4 requires a guideline or a clear number of hours for an entity to determine how many hours should be required to meet the standard. Or, if an entity has no task identified that requires simulation according to the definition in the Standard, then the Standard should reflect completion of your annual NERC certification requirements for certification renewal, i.e. a minimum 10 hours of simulation. We would support 10 hours of simulation training.
ISO/RTO Council - Standards Review Committee	No	Subrequirement 3.1 is overly prescriptive regarding how to accomplish training. The objective of this standard is to ensure the RC, TOP and BA develop and implement a training program for its system operators to deal with normal and emergency situations. Handling IROL violations is one of the tasks that an RC operator must be able to perform. How to achieve this training to meet the needed competency level should be left to the responsible entity. The NERC Operator Certification exercise is the vehicle to test the operators' knowledge of handling these situations, not the prescriptive tool for training. The following requirement 3.1 text referring to instructional applications in the current draft is excessively vague: "shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions." What does it mean to say "virtual technology, or other technology that replicates the operational behavior of the BES...." ? A clear language version of the intended text should be: "shall provide each System Operator with emergency operations training employing power flow results which replicate the operational behavior of the BES during normal and emergency conditions." If a simulator or virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions is required for RC, BA and TOP to facilitate system operator training, where justified, then it should be a requirement for organization certification, not for training program.
WECC Operations Training Subcommittee	No	The WECC OTS believes using simulation to identify training which may be developed out of R1.4 and believes a guideline is needed to determine how many hours should be required in this standard. Or, if no task is identified, then the standard should reflect completion of your annual NERC certification requirements for certification renewal, i.e. a minimum of 10 hours of simulation.
MRO NSRS	No	The SPT SDT has done a great job on R3.1 but we wonder about R3. R3 mentions other system

Organization	Question 3:	Question 3 Comments:
		specific emergency training available to maintain qualified personnel is there a way that the SDT can clarify what type of training is acceptable? Is attending any NERC workshop acceptable? Perhaps, the SDT could suggest some examples and place them in the PER-005 System Personnel Training Reference Document.
ONtario IESO	No	Subrequirement 3.1 is overly prescriptive on how to accomplish training. The objective of this standard is to ensure the RC, TOP and BA develop and implement a training program for its system operators to deal with normal and emergency situations. Handling IROL violations is one of the tasks that an RC operator must be able to perform. How to achieve this training to meet the needed competency level should be left to the responsible entity. The NERC Operator Certification exercise is the vehicle to test the operators' knowledge of handling these situations, not the prescriptive tool for training. If a simulator or virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions is required for RC, BA and TOP to facilitate system operator training, where justified, then it should be a requirement for organization certification, not for training program. Further, in order to be a measurable requirement, the functionality and use of a simulator would need to be specified.
AEP	No	R3.1 - We disagree with the requirement to utilize a simulator for annual emergency operations training. Use of a simulator for training should be an option (not a requirement) for all entities. It should not just be optional for those entities without established IROLs. Also, discriminating in the requirement to have a simulator based on having an established IROL or guides/procedures to mitigate IROL violations, could cause a political view by an entity to avoid claiming an IROL to in turn avoid purchasing a simulator.
Great River Energy	No	GRE recommends replacing the existing phrase "other training required to maintain qualified personnel" with the following text "or other system specific emergency training available to maintain qualified personnel"
Transmission System Operations - Baltimore Gas & Electric		
PPL Electric Utilities	Yes	
Pacific Gas and Electric Company	Yes and No	We recognize that utilizing a simulator for training can greatly enhance the operator's awareness of system conditions and can enable them to respond in a training environment to simulated events which will not lead to an actual cascading event or collapse of the BES. In many cases of an operator's career, this would constitute approximately 10% or less of their actual work time and what they need to know and how to respond to an emergency situation. This additional requirement for some smaller entities that operate within the BES may create financial burdens with the required purchase, model maintenance and operation of a simulator that imitates their system. We recommend R3. be revised to allow an entity

Organization	Question 3:	Question 3 Comments:
		the flexibility of using any or all of the following training resources to meet its emergency operations requirement; drills, exercises, training classes or hands on training using simulation.
Santee Cooper	No	In R3.1 the SDT has tried to define what size entity is required to provide simulation training. Santee Cooper recommends removing R3.1 and revising R3 to read "to its organization that reflects emergency operations topics (which includes system restoration) using drills, exercises, training classes, or hands on training using simulations or other training required to maintain qualified personnel." This will provide flexibility for training within the companies and meets FERC's requirement of the use of simulators. The "at least every 12 months" wording in R3 needs to have additional wording added to allow for case by case basis. This change was intended to permit an operator hired late in year to obtain his/her 32 required hours over a full 12 month period instead of just a month or two. However, this wording does not fully reflect this flexibility.
American Transmission Company	Yes	Suggestion on the 12 months: The SDT had the following statement to ATC's previous comment: "THE SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from annually to every 12 months to allow for the situations of new hires late in the calendar year."ATC understands the SPT SDT position on the 12 month period, but believes that the standard should contain this clarity. ATC suggests that the Requirement 3 contain a footnote describing the SPT SDT meaning of the 12-months.
Standards Interface Subcommittee/Compliance Elements Drafting Resource Pool		
Public Service Commission of South Carolina	Yes	
Duke Energy	No	As written, R3.1 applies only to entities that have IROLs or operating guides or protection systems to mitigate IROL violations. Paragraph 1393 of Order 693 states that simulators should be used by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The Standards Drafting Team should resolve this disconnect. R3.1 also uses undefined terms (simulation technology, virtual technology) that should be further clarified to reduce ambiguity. We also note and agree that while 36 months is allowed for implementation of R3.1, R3 is in effect now for emergency operations training.
FirstEnergy	Yes and No	We agree that the addition of R3.1 more clearly specifies when simulators, or simulation technology, is required. However, the duration of required simulator training is not specified in R3.1. We would not want an auditor to think that you would need 32 hours of simulator training since using simulation technology

Organization	Question 3:	Question 3 Comments:
		would only be a part of all the training tasks. In R3.1, we suggest the SDT specify that a duration of at least 1 hour of simulation training shall be part of the 32 hours of emergency operations training.
ISO New England Inc.	No	Subrequirement 3.1 is overly prescriptive regarding how to accomplish training. The objective of this standard is to ensure the RC, TOP and BA develop and implement a training program for its system operators to deal with normal and emergency situations. What does it mean to say, "virtual technology, or other technology that replicates the operational behavior of the BES...." ? A clearer language version of the intended text would be: "shall provide each System Operator with emergency operations training employing power flow results which replicate the operational behavior of the BES during normal and emergency conditions."

4. The SPT SDT modified the Data Retention section of this Standard to provide clarity: "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance, for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation." Do you agree that this Standard now clearly defines the period for which compliance records must be kept? If not, please explain in the comment area

Summary Consideration:

Summary Consideration:

Organization	Question 5 Comments:
Bonneville Power Administration	
NorthWestern Corporation	
Ameren	
NPCC	
PJM Interconnection	SAT, while a valid training process is not without its shortcomings, or the only acceptable method to develop training. This is especially true in the area of just-in-time training. Mandating a training development process is not conducive to a reliability standard, and would be difficult to monitor for compliance. The standard as written mandates a "How-to" approach which is not within scope of a reliability standard. This standard would divert the already scarce training resources away from training operators to the administrative work of documenting every step of the training process to ensure compliance with the standard. It could have the unintended consequence of actually reducing the number of training hours the operators receive. Ultimately, training effectiveness will be measured by compliance with existing reliability standards. That being said, the objective is to ensure qualified system operators. PJM supports the parallel implementation of hourly training requirements for continuing education as well as initial training. NERC has a Continuing Education Program that ensures high quality training, and sets forth a structure using Continuing Education Hours (CEHs) for "NERC Certified Operators". While NERC has continually stated that the CEH program is separate from the standards, little justification has been provided for this separation. Thus, redundant and possibly conflicting training requirements are being proposed. NERC has stated, in it's 2008 budget, that the CEH program ""promotes excellence" and "advances improved performance". Utilizing the CEH approach, PJM would support the increase of the training time required under R3 to at least 100 CEHs annually with category breakdown (i.e. simulation, standards, EOP) as specified in the NERC Certification program. PJM also proposes that for new operators, R2 be replaced with a fixed training hour requirement that is broken down into specific areas (such as job assignments, NERC Standards, tools, internal procedures, etc.). This initial training requirement would be analogous to the CEH program for existing operators, but focused on specific categories related to the initial requirements of the job. PJM would suggest that the SDT post this idea for industry comments.
Seattle City Light	The increase in time for the simulation was necessary. Vendors will be flooded with requests to model their system for this simulation requirement and this will take time.

Organization	Question 5 Comments:
Southern Company Transmission	We are concerned with the current draft of PER-005. It is likely that auditors will consistently disagree with the composition of an entity's reliability related task list. Ambiguous subjective requirements have no place in a mandatory reliability standard. A better approach would be to capture in this standard the continuing education requirements and categories by type of NERC certification.
Arizona Public Service Company	Simplify step R1.1.1 as follows: Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall review its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to ensure the list's adequacy.
Manitoba Hydro	
Wapa (Loveland, Co)	
Pepco Holdings, Inc. - Affiliates	For the Violation Risk Factors for R1, High and Severe, all the references to -when developing a new or modifying an existing training program- should be removed. This language is no longer a part of the Requirements. Additionally, the High and Severe VSLs should reflect that R1.1, R1.2 and R1.3 should all be at the same severity level because all are equally important to meeting the standard.
Orlando Utilities Commission	I greatly appreciate the effort that the drafting team has put in this standard and would like to say thank you (my hat comes off to you).
E.ON U.S. LLC	E .ON U.S. generally supports the intent of the PER-005 standard, but it does not believe that following the Systematic Approach to Training. While E.ON U.S. acknowledges that formal operator training is essential for the safe and reliable operation of the electricity system, it is concerned that any incremental reliability gains derived from implementing the SAT process may not be worth the substantial cost for companies and their customers. - E.ON U.S. believes that utilities should have the ability to outline and tailor their training programs to reflect the unique characteristics of their systems and the unique circumstances that each operator is likely to confront in the operation of the system. Many parties already have developed and will continue to conduct extensive and highly effective training of their operations staff. Absent some demonstration of substantial incremental benefit, a standard requiring utilities to start from scratch with a formal SAT process will be unjustifiably burdensome, distracting, and require a complete reallocation of already limited resources, all to the potential detriment of continued safe and reliable operations. - E.ON U.S., as well as many other parties, currently trains their system operators through many processes. For E.ON U.S., all new hires are required to complete a structured training program that covers all areas of operations during normal and emergency system conditions. This training is in the form of structured classroom and/or NERC certified vendor training plus direct instruction from supervisory operators through the use of actual control room equipment and, where appropriate, simulators. No operator is allowed to independently work until the supervisory personnel has

Organization	Question 5 Comments:
	certified that training has been completed and the employee has satisfactorily demonstrated proficiency in all identified tasks through the successful completion of a rigorous testing program. – All existing operators that have been certified as being proficient at a journeyman level will receive annual refresher instruction and training, both through vendor and simulator training programs to, again, guarantee that operators have a mastery of all tasks required of them. – E.ON U.S. believes, therefore, that its current training program, while not identical with the DOE SAT process, achieves the same goals and objectives of having well-trained and proficient system operators in place, and in maintaining a rigorous training regimen to keep those skills at the highest attainable levels. Such a program provides systematic, company specific training programs and processes that meet the requirements of PER-005. Companies should be able to demonstrate that their training programs are equal or superior to programs that are identified in the SAT process. – Identification of critical tasks and training necessary to ensure that system operators possess the skills necessary to complete the task is utility specific. Employing a cookie cutter approach as identified by the SAT process seems to largely ignore utility differences. Existing training programs should not be overhauled by use of the SAT unless these programs prove to be deficient.
WECC Reliability Coordination Comment Working Group	
SERC Standards Review Group	No further comments. The drafting team is to be commended for its diligent efforts on revisions to this draft standard.
PowerSouth Energy Cooperative	
PSEI	I believe there needs to be further clarification of a couple of points in R3. The change to "at least every 12 months" is a compliance nightmare. Does this mean each operator shall have 32 hours for any consecutive 12 month period? Could this mean every calendar year? Does this mean there is a compliance violation if an operator completes a course 12 months and 1 day from the last completion date? Some regional exercises are held annually for operators to complete the 32-hr emergency training. If this training is held a week later the next year, are the entities in violation? I know I will get the response that this is outside the scope of the drafting team, but entities need to know how they are expected to be compliant to the standard as it is written. The use of the term annually in this application differs from updating a document annually. Does it mean within 365 days? Also, the addition of company-specific adds another dynamic to the existing requirement. This now adds another layer of paperwork to the entities that are using vendors to meet their requirements. If an entity is strapped for bodies to create their own training courses, why burden them with linking tasks to vendor courses. This again opens the door to an auditor's opinion of what training is "company-specific" and what is adequate proof. It should remain worded as the current standard.
FRCC System Operator	FRCC does not agree that any Violation Severity Level should be higher than "Moderate" regarding

Organization	Question 5 Comments:
Subcommittee	system personnel training.
SRP	
Hydro One Networks	A measure for R1.1.1 is missing. We recommend adding the words "? and R1.1.1" to the end of Measure M1.1 and replace the word "revision" with "update and/or review". Considered adding the following to the High VSL for R3: "? OR The responsible entity provided less than 32 hours of emergency training to its System Operators (R3). Can we assume standard PER-004-2 Reliability Coordination - Staffing will eventually be updated and completed within Project 2006-01's timeframe?
Entergy - System Planning & Operation (Generation)	The second sentence of the PURPOSE section needs to be deleted as it is more of a statement which adds no value to the purpose. Suggest revising the PURPOSE to include concepts of R1 (see response to question 1 above). R2 - How would this apply to System Operators who are currently "qualified" by their entities to fulfill the on-duty position of a System Operator? i.e. - is there some sort of "grandfather" status? R2 - recommend modifying the phrase "at least one time" to "prior to independently staffing a real-time System Operator role", if the intent is to have the individual demonstrate the ability prior to being allowed to staff the on-duty System Operator position. R2 - is there any consideration to "proficiency" of a System Operator who has performed this task once? If an operator demonstrated the ability once 5 years ago, is it still ok? R2.1 - the length of time to verify System Operators abilities on new or modified tasks should not be longer that 3 months. Ideally, the System Operator would be trained prior to assuming the next watch. R3 - why 12 months instead of annually? Is there a difference? Is this intentional? R3 - the phrase "?required to maintain qualified personnel." should be deleted. "Qualified personnel" is not adequately defined or described and should not be used. M1.4 - seems to address on-going evaluations rather than a formal annual evaluation, unless a collective annual review of the items specified in M1.4 is the intent. M3 - what constitutes "training records"? Is the same as what is specified in M1.3? If so, then state as such. VSLs need to be reevaluated such that SEVERE would indicate a complete lack of a documented program. The scoring method used to rate several VSLs could be "shifted to the left" such that they fall into the Lower, Moderate, and High, instead of completely not using the Lower rating.PER-004-2R2 -

Organization	Question 5 Comments:
	consider strengthening the language of this requirement or deleting all together. The terms "particular attention" and "best available" are subjective. Regarding formatting when deleting requirements, is it proper to just shift everything up to fill in the deleted requirement or should it be annotated as "deleted" and the so that the remaining requirements still retain their original requirement number? For example, the proposed R2 was formerly R5. Changing the requirement number will create a logistical/tracking problem for many entities.
CenterPoint Energy	
Ohio Valley Electric Corporation	The Violation Severity Levels are all skewed towards the severe level. The Violation Severity levels should be skewed towards the lower level. With the lack of assessment or evaluation of the effectiveness of existing training programs required by PER-002 R3, why work to create a new training standard? With the lack of such an assessment, the work to develop a new training standard is not a judicious use of limited resources in order to strengthen the reliability of the bulk electric system. The NERC operation certification program already determines that operators possess the minimal requirements to reliably operate the bulk electric system. Why should a training program duplicate the certification process? Currently there is ample incentive to have operators trained on company-specific tasks. An operator who is not capable of performing company specific task will not remain an operator at that company.
City Of Tallahassee (TAL)	No Violation Severity Level should be higher than "Moderate" regarding system personnel training!
BCTC	The Standard drafting team stated in the implementation plan for R3 that it is presently in effect and will remain in effect, but the SDT added two significant changes to this requirement. This results in additional work by the entities to meet these changes and additional time to implement these changes. We recommend a 12 month implementation plan for the new R3 to allow entities to become compliant.? "5. Proposed Effective Date for Regulatory Approvals:" "5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard."? R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. [Risk Factor: Medium] [Time Horizon: Long-term Planning]
ISO/RTO Council - Standards Review Committee	
WECC Operations Training Subcommittee	The WECC OTS questions the following statement and believes R3 has not been approved in PER-005 and would like the implementation date effective 12 months after the first day of the first calendar quarter following applicable regulatory approval:? "5. Proposed Effective Date for Regulatory Approvals:" "5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard."? R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall

Organization	Question 5 Comments:
	provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. [Risk Factor: Medium] [Time Horizon: Long-term Planning]
MRO NSRS	R 1.4 should be deleted it is covered by R 1.1.1, by adding "and shall implement the changes identified" to R 1.1.1 will give clear direction to registered entities. M 1.2 It will be impossible to provide all training support material for off site audits. Training programs may consist of computers, energy management system, facilities (generation plants, back up control centers, etc.) these can not be "boxed up" and supplied to an off site audit. We would like to see a footnote or note that recognizes that certain training items, such as EMS systems, are excluded. M 1.3 places required items as measures that are not in R 1.3. Requirements need to match the Measurements, exactly. M 1.4 places required items as measures that are not in R 1.4. Requirements need to match the Measurements, exactly. Under Data retention, 1.4.2 and 1.4.3 need to state that they have been removed instead of deleting the statement. Is it possible to say “Not Applicable” under section 1.2 (“Compliance Monitoring Period and Reset”) of the standard PER-005-1; this standard has this phrase. On page 26 of 73, the NERC Drafting Team Guidelines dated July 1, 2007 states that the compliance monitoring period is when the performance or outcome of a requirement is measured. Is it true that this standard’s performance is not measured? The MRO doesn’t think the Compliance Enforcement Authority is going to want to have its hands tied for three years until they can assess whether the entity is on track to meeting the requirements listed in the standard. The use of the term “customer” is a little out there. In the PER-005 System Personnel Training Reference Document, the reference #1: Determining Task Performance Requirement lists a question “What response from the customer must be accomplished?” Please define what a customer is.
ONtario IESO	
AEP	
Great River Energy	R 1.4 should be deleted it is covered by R 1.1.1, by adding "and shall implement the changes identified" to R 1.1.1 will give clear direction to registered entities. M 1.4 should be moved to M1.1 with the recommended deletion of R1.4 above. GRE recommends that the percentages referenced under R2 and

Organization	Question 5 Comments:
	R3 in the VSLs be replaced with specific quantities of items missed.
Transmission System Operations - Baltimore Gas & Electric	The "Systematic Approach to Training" training should be offered as soon as possible. 24 months to complete a training program is a very aggressive schedule, so there is a need to start these activities in the near term.
PPL Electric Utilities	Shouldn't 5.3 read "Subrequirement R3.1 becomes effective..." rather than "Requirement R3.1 becomes effective..."
Pacific Gas and Electric Company	Under "5. Proposed Effective Date for Regulatory Approvals:" "5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard." Since PER-005 has not been approved, R3 "At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.", has not been approved. This is a change in the language from PER-002 R4 "For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel." We recommend the implementation date effective 12 months after the first day of the first calendar quarter following applicable regulatory approval"
Santee Cooper	
American Transmission Company	In R3, ATC suggests to move "At least every 12 months" to between "training" and "applicable". We feel that it changes the meaning of the sentence to more accurately reflect that each operator is required to have the required training within a 12 month window. ATC continues disagrees with the SPT SDT VSL's for Requirement 2 and 3. (Please see our comments during the last comment period.) Requirement 2 and 3: The VSLs continue to be based on pass/fail concept and do not represent the extent to which an entity did not comply with the requirement. Requirement 2 should include a component that represents the number of task(s) not completed. Requirement 3 should include a component that represents the number of emergency hours that not completed. PER-004-2 Proposed Effective Date: ATC believes that there is an error in the proposed effective date section based on our review of the red-line version of PER-004-2. The proposed effective date states that requirement 5 is being deleted but it seems that requirement 5 is being re-numbered as requirement 2. This inconsistency should be corrected.
Standards Interface Subcommittee/Compliance Elements Drafting Resource Pool	Standard – R1 PER-005-1 Attributes of the requirement Binary Timing X Omission X

Organization	Question 5 Comments:
	Communication Quality Other General comment - Some of the requirements listed in this requirement (R1.1.1 & R1.4) include a timing element "annually" – the CEDRP suggest that more definition be associated with the annual requirements. Annual requirements appear to accept "anytime during two consecutive calendar years" which can result in the task being performed during December of one year followed by the task being performed in January of the next year (which we suspect would not meet the SDT intent). SDT Proposed Lower VSL: None CEDRP Proposed VSL: (blank) SDT Proposed Moderate VSL: The responsible entity failed to provide evidence that it updated its company-specific reliability-related tasks to identify new or modified tasks on an annual basis (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s).(R1.4) CEDRP Proposed VSL: The entity did create a list of reliability tasks – but did the list was incomplete or was not company specific (R1.1) OR The entity performed an update of the BES company specific reliability tasks, but the update did not occur within the timing criteria specified in the requirement (R1.1.1) OR The entity conducted an evaluation of its training program, but the evaluation did not occur within the timing criteria specified in the requirement (R1.4) OR The entity conducted an annual evaluation as required in requirement 1.4, but failed to identify needed changes (R1.4) OR The entity conducted an annual evaluation as required in requirement 1.4, identified needed changes, but failed to implement changes (R1.4)

Organization	Question 5 Comments:
	SDT Proposed High VSL: The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks (when developing a new or modifying an existing training program). (R1.2) CEDRP Proposed VSL: The entity implemented/uses a systematic approach to training, but one or more elements of the systematic approach are not included in the program (R1) OR The entity failed to perform a annual update of BES company specific reliability tasks (R1.1.1) OR The responsible entity failed to design and develop learning objectives based on the BES company specific reliability related tasks (when developing a new or modifying an existing training program). (R1.2) OR The entity designed and created learning objectives but did not create associated training material (R1.2) OR The entity delivered training but training delivered did not include all learning objectives/training material as stated in requirement 1.2 (R1.3) OR The entity did not conduct an evaluation as stated in requirement 1.4 (R1.4) SDT Proposed Severe VSL: When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related tasks (R1.1) OR When developing a new or modifying an existing training program the responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3) CEDRP Proposed VSL: The entity does not use a systematic approach to training (R1) OR When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related tasks (R1.1) OR When developing a new or modifying an existing training program the responsible entity failed to

Organization	Question 5 Comments:
	deliver training based on the BES company specific reliability related tasks. (R1.3) FERC Guidance for VSLs (Analysis based on CEDRP Proposed Changes) 1. Will the VSL assignment signal entities that less compliance than has been historically achieved is condoned? No 2. Is the VSL assignment a binary requirement? No Is it truly a “binary” requirement? N/A If yes, is the VSL assignment consistent with other binary requirement assignments? N/A Is the VSL language clear & measurable (ambiguity removed)? If no, does the requirement or measure need to be revised? The CEDRP suggests that the SDT review or further define “annual” as it applies to this set of requirements. 3. Does the VSL redefine or undermine the stated requirement? No 4. Is the VSL based on a single violation of the requirement (not multiple violations)? Yes Standard – R2 PER-005-1 Attributes of the requirement Binary Timing X Omission X Communication Quality Other

Organization	Question 5 Comments:
	SDT Proposed Lower VSL: None CEDRP Proposed VSL: (blank) SDT Proposed Moderate VSL: The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2) CEDRP Proposed VSL: Entity verified capability of all operators to perform new or modified tasks, but the verification did not occur within the timing criteria specified in the requirement (R2.1) SDT Proposed High VSL: The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company specific reliability related tasks. (R2.1) CEDRP Proposed VSL: Entity verified capability of operators, but did not verify capability of all operators (R2) OR Entity verified the capability of all operators, but the verification was incomplete (based on list tasks identified in 1.1(R2) OR Entity verified capability of operators for new or modified tasks, but did not verify capability of all operators (R2.1) SDT Proposed Severe VSL: The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. Is the VSL based on a single violation of the requirement (not multiple violations)? Yes
Public Service Commission of South Carolina	The PSCSC suggests that the concept of "Systematic Approach to Training", used in PER-005-1, be defined in the standard or in the Glossary pertaining to all standards.
Duke Energy	As we read this standard, we see nothing that precludes the use of contractors to perform System Operators' tasks, or training of the System Operators. We agree that the use of contractors is one of the ways to train or fulfill system operator positions.
FirstEnergy	FE has the following additional comments:1. With regard to R1.1.1, the task list would not need to be updated if no new or modified tasks were identified. Therefore, the subrequirement could be slightly reworded as follows: "R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators at least annually when new or modified tasks for inclusion in training have been identified." Also, the Measures were written so that they align with the Requirements and their respective subrequirements. However, subrequirement R1.1.1 seems to be missing a specific measure that requires proof that the training program task list was updated annually if new or modified tasks were identified per R1.1. The SDT should consider adding a new measure M1.1.1 for R1.1.1.2. Since R3.1 is only applicable for entities that operate with IROLs, the measure for R3 should be consistently worded. We suggest changing M3.1 as follows: "Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall have available

Organization	Question 5 Comments:
	for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1."3. The reference document is a good guide for entities to use to reference industry recognized SAT processes as well as helping to determine their company-specific reliability-related operator tasks. However, this document may not be readily available to industry once the standard is enforceable since the standard does not provide a direct link to this reference material. Standards should be "all inclusive" and provide all the information needed. The SDT should consider adding a "Part F" to the standard (as allowed by NERC standard drafting guidelines) that provides a link to this reference material. This information should be transparent to industry when reviewing the standard for compliance and the SDT's work in preparing the reference document will be put to good use.
ISO New England Inc.	

Consideration of Comments on 4th Draft of System Personnel Training Standard — Project 2006-01

The System Personnel Training Standard Drafting Team (SPT SDT) thanks all commenters who submitted comments on revisions for the 4th draft of the System Personnel Training standard. This standard was posted for a 30-day public comment period from June 18, 2008 through July 17, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were 41 sets of comments, including comments from more than 140 different people from approximately 70 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

In this document, the SPT SDT's consideration of comments is provided in blue text immediately following each comment submitted for each question. A summary response to each question is highlighted following each question. The following conforming modifications were made to the standard:

- Modified the Effective Date for Requirement R3 to provide clarity in what Requirement is presently in effect.
- Modified Requirement R1.1.1 to "each calendar year" to provide clarity.
- Modified Measure M1.1 to provide for clarity in measurement of compliance for Requirements R1.1 and R1.1.1.

The drafting team was not able to resolve all suggestions for modifications to the standard. Because the standard will require some entities to change their existing practices with respect to system operator training, the drafting team does not expect that additional postings of the standard will result in significant improvements in stakeholder consensus. Some of the minority views that remain unresolved include:

- Several commenters requested modifications to the effective date to allow a longer time for compliance. The SDT explained that the need for improved system operator training was identified in the Blackout Report and in Order 693. Entities registered to perform the functions of the Reliability Coordinator, Transmission Operator and Balancing Authority should already have system operator training and programs or operator qualification programs in place to comply with PER-002-0 — Operating Personnel Training and PER-005-1 — Reliability Coordination Staffing.
- Several commenters requested that the SDT add more specificity to the standard regarding the term, "Systematic Approach to Training (SAT)." The SDT explained that there are several different terms used to describe this approach to developing training programs. The SDT felt that adding a definition would force some entities into modifying their existing practices, without any additional benefit to reliability. There are many variations to the SAT approach to training, but all include the steps identified in subrequirements R1.1 through R1.4.
- Several comments indicated that the standard should not specify the use of the SAT process. This is a training process that has been widely recognized in many different occupational fields as an effective and efficient method of linking training to specific performance on designated tasks. The SAR for this project specified that the requirements in the standard must mandate use of the SAT process – one of the directives in FERC Order 693 was to modify the existing training standard to require the use of the SAT methodology in the development of new training programs.

- Several commenters asked the drafting team to include a reference with a comprehensive reliability-related task list. The SDT did not include such a list as in previous postings, the SDT did propose a list and commenters indicated such a list was problematic as it was not written to be company-specific, and could have been interpreted as requiring training on all the tasks, whether applicable or not.

- Several commenters stated that the use of simulators should not be mandatory. Order 693 included a directive to modify the existing training standard to include the use of simulators by reliability coordinators, transmission operators, and balancing authorities that have operational control over a significant portion of load and generation. The language in the proposed standard does not require that any entity purchase a system-specific simulator. The use of simulators as effective training tools, particularly for learning how to react to events that occur infrequently, is widely accepted in other industries as an effective and efficient method of providing training and practice. Simulators are used in many industries where the ramifications of an error have far-reaching consequences to safety – including airline pilots, shipping pilots, and operators of control systems in chemical, oil and gas industries.

- Some commenters indicated that some VSLs do not provide as many options as possible for describing noncompliant performance.

In this "Consideration of Comments" document stakeholder comments have been arranged so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

http://www.nerc.com/~filez/standards/System-Personnel-Training.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. The System Personnel Training standard drafting team (SPT SDT) revised the effective dates for this Standard to provide for a shorter period for implementation of the training program while allowing for a longer implementation period for implementing the use of training simulation/simulators. Do you agree that the revised effective dates provide for sufficient time to establish a training program, as specified in R1? If not, please explain in the comment area.

Summary Consideration:

With almost an even distribution of "yes" and "no" votes of those industry participants responding, there was no clear industry consensus on this issue. Of those responding no, the majority disagreed with the shorter implementation period for implementing the training program. In the responses to comments, the SPT SDT explained that there was actually a longer period of time available to them if they utilized the period between NERC BOT approval and the requirement implementation date. The SPT SDT also explained FERC's concern that the need for the standard was initially identified in the 2003 Black-out Report and again in Order 693.

Organization	Question 1:	Question 1 Comments:
Ameren	No	Everyone who does training now is not necessarily familiar with developing training using the systematic approach. So some trainers will have to acquire these skills. Also some companies will have to hire another person to develop and write the training lessons using the systematic approach. It might take that person more than 6 months just to become familiar with the jobs and the tasks being performed before that person could even begin to do any task listing and developing of any training. So essentially you would have less than 2 years to develop and deliver the training. Three years was a short period of time after implementation of the Standard to have all of the requirements done. Two years is un-realistic.

Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada):

- **NERC filing of BOT approved standard with FERC**
- **FERC staff review for development of NOPR**
- **NOPR comment period**
- **FERC staff review of NOPR comments**

Organization	Question 1:	Question 1 Comments:
• **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
PJM Interconnection	No	This change was surprising, as the only comment made on the previous draft was to increase the implementation time. The SDT has shortened the implementation time, without providing justification for the change.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
Southern Company	No	We suggest the effective date be 36 months for both not 24 and 36. The 36 months will allow the

Organization	Question 1:	Question 1 Comments:
Transmission		industry the time required to develop quality training programs
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
SERC Standards Review Group	No	Our group supports the return of the training program effective date to 36 months after the first day of the first calendar quarter following regulatory approval. We feel that a 36-month implementation period is needed to allow responsible entities to develop quality training programs under the systematic approach required by the standard.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR**		

Organization	Question 1:	Question 1 Comments:
• **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
PowerSouth Energy Cooperative	No	Reducing the time frame from 36 to 24 months is not appropriate for the implementation of quality training. The evaluation and purchase process, lead time and cost to implement simulators as stated in R3.1 is unreasonable and does not necessarily improve reliability.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval**		

Organization	Question 1:	Question 1 Comments:
In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.		
Ohio Valley Electric Corporation	No	A longer time period of 36 months better represents the industry project process of planning, budgeting, and construction. The scope of training as outlined in this standard would certainly be considered a project. Year 1 (months 1-12) is the planning year. Year 2 (months 13-24) is the budgeting year. Year 3 (months 25-36) is the purchase and construction year. Having a shorter implementation period would not give utilities an opportunity to appropriately address and consider each stage of the project process which could lead to significant errors in either the planning, budgeting, or construction (implementation) stage.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
BCTC	No	The previous version of the standard included 36 months for implementing the re-defined training program and all the new requirements for a training program. The reduction in time from 36 months to 24 months is not acceptable. The 36 months implementation period, based on the amount of time needed to create the task lists of company-specific reliability related tasks performed by its System Operators, to

Organization	Question 1:	Question 1 Comments:
		conform with a systematic approach to training and the RRO's definition of the Bulk Electric System, and to provide the one time training to all system operators should be retained.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
WECC Operations Training Subcommittee	No	The previous version of the standard included 36 months for implementing the training program. The WECC OTS would like to see this time frame returned, based on the amount of time needed to create the task lists of company-specific reliability related tasks performed by its System Operators, utilizing a systematic approach to training, the regions definition of the Bulk Electric System and the time to provide the one time training to all system operators.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC**		

Organization	Question 1:	Question 1 Comments:
• **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
MRO NSRS	No	The original time frame of 36 months allowed entities to formulate an effective plan, ensuring compliance to the new Standard and requirements, as well as providing the training that will be needed when the MISO ancillary service market implementation scheduled for September 9, 2008. The systematic approach to training (SAT) process is a detailed process where entities are going to need to be trained in order to fulfill the requirements. There will need to be a substantial capital investment by entities who must comply with this updated Standard. By reducing the time frame to 24 months the Standard will not be as effective and may lead to possible shortcomings in the detailed training that is required for System Operators.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments**		

Organization	Question 1:	Question 1 Comments:
• **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
AEP	No	The Requirements R1 and R2 implementation period should not be shortened but rather remain at the 3 year implementation requirement previously specified in Draft 3 of the standard. We believe it will take the 3 years to assure proper development of the training and objectives required to support all reliability tasks, and to verify every existing operator's capability to perform every identified reliability task as specified in R2. For some operators, the majority of their tasks may be reliability tasks.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		

Organization	Question 1:	Question 1 Comments:
Great River Energy	No	The original time frame of 36 months allowed entities to formulate an effective plan, ensuring compliance to the new Standard and Requirements, as well as providing the training that will be needed when the MISO ancillary service market is implemented which is scheduled for September 9, 2008. The systematic approach to training (SAT) process is a detailed process where entities are going to need to be trained in order to fulfill the requirements. There will need to be a substantial capital investment by entities that must comply with this updated Standard. By reducing the time frame to 24 months the Standard will not be as effective and may lead to possible shortcomings in the detailed training that is required for System Operators.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
Pacific Gas and Electric Company	No	There is an assumption that all entities utilize a systematic approach to their current training program. We would guess that is not the case, since utilizing this methodology may generate a lot of paper work and is administered by those with a background in implementing a systematic approach to training. With the passage of this new standard, reducing the implementation time frame from 36 to 24 months will in many cases create additional burdens to some entities and others will need to make improvements to their programs to meet the new standard and measures. In either case, entities will have to either rely

Organization	Question 1:	Question 1 Comments:
		on in house development or vendors to meet the criteria. This may be a substantial change and may require project funding, which in of itself creates a timeline of anywhere between 1-3 years and a process of planning, budgeting, and implementation. Therefore, within the first two years planning (analyzing and designing) and budgeting would have to be completed, followed by development and implementation. We feel returning the training program effective date to 36 months after the first day of the first calendar quarter following regulatory approval allows responsible entities to develop quality training programs under the systematic approach required by the standard.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
Santee Cooper	No	Santee Cooper believes that 36 months is needed to implement a quality training program utilizing the systematic approach to training. Requirement 1 and Requirement 2 should both become effective 36 months after appropriate approvals.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada):		

Organization	Question 1:	Question 1 Comments:
• **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
Duke Energy	No	While 24 months is sufficient time to implement R1, implementing R2 will take longer because verifying System Operators' capabilities is dependent upon development of the task list and training program. 36 months should be allowed for implementation of R2.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule**		

Organization	Question 1:	Question 1 Comments:
• **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
E.ON U.S. LLC	No	E.ON U.S. believes that its training programs are sufficient to meet the requirements of the standard but is concerned that if NERC requires that parties undergo a formal systematic approach to training process that adequate time may not be available to complete the development, testing and administration of a training program. E.ON U.S. requests that NERC provide greater clarity as to whether a systematic approach to training process will be required in all instances and if so, better define what steps are required to implement this process. Without this guidance E.ON U.S. suggests that shortening the training period is not appropriate at this time.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		

Organization	Question 1:	Question 1 Comments:
With regards to your comment concerning clarity as to whether a systematic approach to training being required in all instances the answer is yes, the systematic approach to training process must be used for all training associated with this standard. In addition, the Reference Document attached to this standard provides information on the use and implementation of a systematic approach to training.		
PSEI	No	The plan should go back to 3 years. There are many entities that will essentially have to re-build there programs to meet the administrative burden of an auditable SAT. I also disagree with the statement in the standard that R3 is presently in effect. The language, and therefore interpretation, of R3 differs from what is in the current approved standard. The new R3 in this standard should not go into effect until the first calendar quarter following regulatory approval of the standard.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.** **The SPT SDT thanks you for your comment concerning the effective date for Requirement R3 and has modified the date. The effective date now reads "PER-002-1 Requirement R4 and PER-004-1 Requirement R2 are presently in effect and will be superseded by PER-005-1 Requirement R3 upon approval of this Standard".**		

Organization	Question 1:	Question 1 Comments:
ISO/RTO Council - Standards Review Committee	No	The IRC does not agree with the SDT's proposal, particularly as it relates to training simulation/simulators (for details see comments under Q3).
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. **Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. The requirement specifies the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that have operational authority or control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations. If an entity does not have authority or control over facilities with established IROLs or has not established operating guides or protection systems to mitigate IROL violations, then this requirement does not apply to the entity.**		
Ontario IESO	No	We have a comment on the use of training simulation/simulators (see comments under Q3) and are therefore not agreeing with that part of the implementation date.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. **Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. The requirement specifies the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that have operational authority or control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations. If an entity does not have authority or control over facilities with established IROLs or has not established operating guides or protection systems to mitigate IROL violations, then this requirement does not apply to the entity.**		
Arizona Public Service Company	Yes and No	I can live with it, but I'm not sure if some smaller entities with training responsibilities being conducted by part time operators can. Three years would be better.
Response: Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical		

Organization	Question 1:	Question 1 Comments:
process (with the exception of Canada): • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
Hydro One Networks	Yes and No	The timelines of 2 months and 36 months are appropriate however the general wording of the Effective Date section of the Standard and the Implementation Plan should be modified. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in standards that have a clear reliability impact. In addition, it does not seem appropriate to have entities exposed to sanctions for non-compliance in some jurisdictions while not in others. We suggest: - Requirement 1 and Requirement 2 becomes effective 2 months after the first day of the first calendar quarter following the date the standard is approved by all applicable regulatory authorities. - "Requirement R3.1 becomes effective 36 months after the first day of the first calendar quarter following applicable the date the standard is approved by all applicable regulatory authorities."
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. **While some standards do need to be implemented at the same time throughout an Interconnection such as standards that have requirements associated with frequency control, there is nothing in this standard that will impact real-time operations, and thus no**		

Organization	Question 1:	Question 1 Comments:
reliability-related reason to implement the standard at the same time in all jurisdictions.		
American Transmission Company	Yes	As the JTA is new; but the requirement to have a training program is not, it is reasonable to conduct and implement a JTA within a two year timeframe.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.		
FirstEnergy	Yes	The 24-month implementation allows for sufficient time for industry to properly develop their training programs and to formulate the required evidence for compliance.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.		
Manitoba Hydro	Yes	MHEB agrees with the revised dates.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.

SRP		

2. The SPT SDT revised R1 to provide clarity and eliminate the ambiguity concerning the training program to be established. R1 now reads: "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program." Do you agree that the revised language now clearly defines the training program to be developed? If not, please explain in the comment area.?

Summary Consideration:

Approximately 2/3 of the industry participants responding agreed the revised Requirement R1 provided greater and sufficient clarity. A few of those industry participants responding with a "no" vote either opposed using a systematic approach to training or felt the SPT SDT was trying to dictate a specific process. The SPT SDT explained that it was responding to FERC directives and that it was not trying to prescribe a certain methodology. The SPT SDT further explained that there were multiple variations of a systematic approach to training and that there were examples listed in the Reference Document associated with the Standard.

Some of the responders also cited concerns with developing a task list or that a task list would be different, some possibly small and some larger. The SPT SDT explained that task lists would vary from entity to entity and therefore would be impossible for a standard to define the tasks for every entity. The SPT SDT further explained that there were topics located within the Reference Document associated with this Standard that could serve as a guide for the development of an entities task list.

Organization	Question 2:	Question 2 Comments:
Entergy - System Planning & Operation (Generation)	No	The two sentences that make up R1 seem to convey a purpose/intent rather than an actual requirement. R1 adds nothing that is not already covered in the "sub-requirements" that are listed. There is no reason to state that a 'systematic approach to training' is required and then go on to state the specific requirements of that concept. Only the requirements are needed. It is suggested that R1 be integrated into the PURPOSE section of PER-005 as such: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those tasks through a systematic approach to training. The Sub-requirements should be made as stand alone requirements in the standard.R1.1 - a reference document containing a possible list of reliability tasks may be useful for some entities, as long as it is not interpreted to be all encompassing or required to be required tasks.R1.1.1 - "annually" needs better definition. Is it January through December? Or is it within 12 months of the last performance?
Response: The SPT SDT feels that, based on prior industry comments received during earlier postings, there is a need to require the use of a systematic approach to training within the Standard. Also, there are multiple variations of a systematic approach to training. The sub-requirements simply list common elements that are in every systematic approach to training process. While the SAT process may be familiar to many entities, the comments received during the development of this standard indicate that many entities have little		

Organization	Question 2:	Question 2 Comments:
or no familiarity with the SAT process. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf** **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html** **(3) ADDIE – 1975, Florida State University** **http://www.nwlink.com/~donclark/history_isd/addie.html** **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** **http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf** **The Appendix A: Generic System Operator Task List was removed based on industry comments received from previous postings, therefore only BES company-specific reliability-related tasks are required to be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list.** **The SPT SDT is specifying the term "annual" to mean a calendar year from January to December. The SPT SDT modified the Requirement to say "calendar year".**		
Ohio Valley Electric Corporation	No	The wording "systematic approach" may be clearly stated, but the words will not be uniformly understood or applied in the development of a training program. Similarly, the individual company interpretations of "reliability-related tasks" will not be uniformly understood or applied. The R1 wording should be, "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall establish a training program for its System Operators and shall implement the program."
Response: This standard was developed based on the Industry approved SAR and requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. The requirement to use a systematic approach to training is a directive from FERC Order 693. In addition, there are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard.		

Organization	Question 2:	Question 2 Comments:
(1) DOE-HDBK-1078-94, A Systematic Approach to Training http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910 http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html** **(3) ADDIE – 1975, Florida State University http://www.nwlink.com/~donclark/history_isd/addie.html** **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96 http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf** **Only BES company-specific reliability-related tasks should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list.**		
E.ON U.S. LLC	No	As outlined above, E.ON U.S. requests that NERC fully identify what steps are required to use a "systematic approach to training". As previously discussed, the use of the DOE process if required will require a substantial resource and time commitment but will not guarantee that the resulting training program is any better than the programs currently in place for training system operators. E.ON U.S. recommends that the standard be altered to allow entities to demonstrate that their current training programs and policies, while not necessarily developed through a defined systematic approach do meet the requirements of the standard.
Response: This standard requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. The requirement to use a systematic approach to training is a directive from FERC Order 693. In addition, there are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf** **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C.**		

Organization	Question 2:	Question 2 Comments:
20585 FSC 6910 **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html** **(3) ADDIE – 1975, Florida State University** **http://www.nwlink.com/~donclark/history_isd/addie.html** **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** **http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf**		
ONtario IESO	No	The term "systematic approaching to training" needs to be defined. Interpretations currently vary widely across the industry.
Response: There are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf** **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html** **(3) ADDIE – 1975, Florida State University** **http://www.nwlink.com/~donclark/history_isd/addie.html** **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** **http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf**		
Duke Energy	No	R1 should state that each RC, BA and TO shall define and use a systematic approach to training. Since the systematic approach to training is not a NERC-defined term, an auditor may not agree with an entity's selected approach. Similarly, R1.1 should state that each RC, BA and TO shall define its list of BES company-specific reliability-related tasks performed by its System Operators. Also, the R1 High and Severe VSLs need to have the word "list" added back in.
Response: There are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard.		

Organization	Question 2:	Question 2 Comments:

However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.** **The SPT SDT thanks you for your comment concerning the wording of Sub-requirement R1.1 but feels that thee term "create" is more appropriate and provides for sufficient clarity.** **With regards to your comment concerning the VSL for R1, the SPT SDT agrees and has modified the VSL to include the word "list".**		
Southern Company Transmission	No	What about the training programs that are in place now? Are they grand fathered? The industry needs clear direction on existing training programs. We support the use of the Systematic Approach-To-training (SAT). However the proposed standard seems to infer that to be consistent with SAT an entity need only develop a "company-specific reliability-related task". The SAT process is more than merely developing a list of Tasks. (Analysis, Design, Develop, Implement, and Evaluate.) Additionally as written the proposed standard provides no industry guidance in determining what constitutes "…a company-specific reliability-related task". It is purely subjective. Further, developing this subjective list does nothing to enhance reliability. An entity can make this list as long or short as they see fit. This task list should, at minimum, fully support the function type definition contained in the NERC Statement of Compliance Registry Criteria (Revision 4.0) for the Company's Compliance Registry Certification.
Response: This standard requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. **In addition, the SPT SDT is not inferring that "to be consistent with SAT an entity need only to develop a company-specific reliability-related task list". The SPT is only identifying some of the common elements that are in every systematic approach to training. Also, as**		

Organization	Question 2:	Question 2 Comments:
stated previously in our response to comments dated August 15, 2007 only specific tasks that are considered critical to reliability should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. **The NERC Functional Model and the Statement of Compliance Registry Criteria provide the current functional type definitions needed by NERC to fulfill its obligation as the Electric Reliability Organization to identify and register all entities that meet the criteria for inclusion in the compliance registry. An entity can utilize the NERC Functional Model and the Statement of Compliance Registry Criteria functional definitions to develop its list of BES company-specific reliability-related tasks. In addition, the NERC Rules of Procedure Section 500 specifies that Reliability Coordinators, Balancing Authorities and Transmission Operators included in the Compliance Registry must be certified to operate in those functional areas.**		
SERC Standards Review Group	No	This group feels that the requirement to "establish a training program" using the systematic approach to training (SAT) is still ambiguous with respect to existing training materials. Can these resources be retrofit into the SAT-developed program? Are existing materials grandfathered and therefore exempt from meeting requirement R1? The industry needs clear direction on how responsible entities can incorporate their existing materials into the established "training program" and still be compliant with requirement R1. Furthermore, the development of reliability-related system operator tasks is a crucial first step for the SAT process. It would be helpful to have a suggested (not prescriptive) list of generic tasks that training personnel could use as a starting point to create the list of BES company-specific reliability-related tasks required by R1.1. This group suggests that the PER-005 System Personnel Training Reference Document be augmented to include such a generic task list. We further suggest that Appendix A: Generic Task List of Draft 2 of PER-005 be used as the suggested list of operator tasks. By moving the task list out of the Standard and into the Reference Document, training personnel will have the flexibility to modify the tasks, or add/remove tasks to suit their specific system.
Response: This standard has been developed based on the Industry approved SAR and requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. **The Appendix A: Generic System Operator Task List was removed based on industry comments received from previous postings, therefore only BES company-specific reliability-related tasks should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list.**		
PowerSouth Energy Cooperative	No	Some direction on existing training programs and how they will fit into the requirement should be included in the standard. Also, the current wording leaves a lot of interpretation to an auditor in deciding what tasks are be appropriate to included in the task list.
Response: This standard requires that a systematic approach to training process be applied to all system operator training for		

Organization	Question 2:	Question 2 Comments:
reliability-related tasks, either new or existing. **The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. In addition, the SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.**		
BCTC	No	"Company-specific reliability-related tasks" are not defined. These tasks may vary with different RROs and as related to the RRO's definition of the BES. Therefore, it is up to each RRO to provide clear guidance to its entities to establish these tasks and that will require additional time to develop. If the BES is not properly defined by the RRO, then it will be extremely difficult for an entity to determine if the BES company-specific reliability-related tasks in its training program meet this requirement. We are also concerned that unless there is a clear definition or examples of what "Company-specific reliability-related tasks" are then an audit team will define them as they see fit and this does not meet the spirit of removing ambiguity from the Standards.
Response: Only BES company-specific reliability-related tasks should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. **The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.**		
Pacific Gas and Electric Company	No	This statement; "shall use a systematic approach to training to establish a training program" based on "for the BES company-specific reliability-related tasks performed by its System Operators" will be the challenge! This leaves open for interpretation by the auditors what that means for each entity and will therefore, create inconsistency throughout the industry. The compliance audits are already creating inconsistency within the industry and this standard will further add to that inconsistency. NERC Standards should clearly state the requirement(s) and measure(s), and not create more uncertainty.
Response: Only BES company-specific reliability-related tasks should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. **The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.**		
PJM Interconnection	No	It is still unclear if this addresses only new programs. R1 ignores the fact that many RCs, BAs & TOs

Organization	Question 2:	Question 2 Comments:
		already have excellent training programs in place. Is R1 intended to cover existing work as well? These programs are effective, however, they may not have been built "using a systematic Approach to Training" (SAT). Even if they were built with a SAT, the documentation for this would need to be created. The timely completion of this is unlikely, given the new, abbreviated, implementation time (see 1 above).
Response: This standard requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. **The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada):** • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training were identified in the 2003 Black-out Report and FERC Order 693 to establish the criteria for system operator training.** **Also, this standard has been developed based on the Industry approved SAR.**		
WECC Operations Training Subcommittee	No	"Company-specific reliability-related tasks" are not defined and therefore it will be up to each region to provide this assistance. The WECC OTS believes the additional time needed for this definition from the regions needs to be provided for in the implementation phase. However, this definition will vary within the regions and some may have a broader definition, which will make it extremely difficult for an entity to

Organization	Question 2:	Question 2 Comments:
		determine if its training program meets this requirement.
Response: Only BES company-specific reliability-related tasks should be considered when developing a task list. The number of tasks identified by each entity will vary dependent upon the operating position, responsibility of the position and the specific system for which the list is being developed. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. **Due to the lack of clear industry consensus, the SPT SDT supports a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada):** • **NERC filing of BOT approved standard with FERC** • **FERC staff review for development of NOPR** • **NOPR comment period** • **FERC staff review of NOPR comments** • **FERC issuing of final rule** • **Publish in Federal Register** • **24 months after the first day of the first calendar quarter following regulatory approval** **In addition, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training.**		
PSEI	No	BES company-specific, reliability-related tasks is open to interpretation by auditors. What if an auditor thinks some task should be on my task list, but my evaluation based on difficulty, frequency, and importance concludes it does not? Am I automatically in violation? The current wording is so broad that essentially all tasks could be linked to it. Perhaps re-phrasing to "critical BES company-specific reliability-related tasks ..." or "BES company-specific reliability-related tasks determined to be critical ..." would help trainers with refining their task list to a more manageable level.
Response: The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.		

Organization	Question 2:	Question 2 Comments:
The term "critical" was in earlier versions of this Standard but was removed based on industry comments received from previous postings.		
Ameren	Yes and No	I don't think the addition of "and shall implement the program" is necessary as R.1.3 already does this.
Response: The SPT SDT acknowledges your comment but added the phrase "and shall implement the program" to provide clarity in support of comments received during previous postings.		
ISO/RTO Council - Standards Review Committee	Yes	The IRC agrees that any new training program should be created using a systematic approach to training. However, the SDT should make clear that this requirement is related only to new programs and will not be imposed retroactively on training modules created prior to this standard.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. **This standard was developed based on the Industry approved SAR and requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. The requirement to use a systematic approach to training is a directive from FERC Order 693.**		
Santee Cooper	Yes	We recommend the Standard include as a reference document a suggested (not prescriptive) list of generic tasks that training personnel could use as a starting point to create the list of BES company-specific reliability-related tasks required by R1.1. It should be clear that the list is only SUGGESTED generic tasks so that if a company determines one of the tasks is not a reliability-related task performed by its System Operators that an audit team could not deem the company non-compliant if all tasks are not included.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. **The Reference Document associated with the Standard details some topics that could be considered and included in a task list.** **The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.**		
Manitoba Hydro	Yes	MHEB agrees that the revised language makes it clear.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.

3. The SPT SDT revised R3 and added R3.1 to provide clarity in the types of training that can be utilized and the entities that must use simulation/simulator training in their emergency operations training. Do you agree that this requirement now clearly describes the types of training that can be utilized as well as the entities that must provide simulation/simulator training in its emergency operations training? If not, please explain in the comment area.

Summary Consideration:

The majority of the industry participants responding disagreed with Requirement R3.1. Some of those in disagreement misunderstood the use of IROLs as defining the use of simulators while others still disagreed with mandating the use of simulators. The SPT SDT explained the standard utilizes IROLs as a way to define those entities that needed to use a simulator/simulation technology in their training methodology. The SPT SDT further explained that it was responding to a FERC directive to utilize simulator/simulation training for system operator training.

In addition, a few of the responders wanted the SPT SDT to define the minimum number of hours that an entity needed to train a system operator on simulators/simulation. The SPT SDT explained that the SPT SDT was trying to allow each responsible entity to have the flexibility to determine the amount of hours of each type of training needed for their individual system conditions.

Organization	Question 3:	Question 3 Comments:
NorthWestern Corporation	No	R3.1 specifies that the simulator training is required only for IROL situations. However, the corresponding measure (M3.1) does not stipulate the same. It is unclear if this requirement/measure applies only to IROLs or both IROLs and SOLs. Is this requirement not applicable in the Western Interconnection since there is an absence of IROLs in the West?
Response: Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. **The requirement specifies that the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that have operational authority or control over Facilities with established IROLs or has *established operating guides or protection systems to mitigate IROL violations*. If an entity does not have authority or control over facilities with established IROLs or has not established operating guides or protection systems to mitigate IROL violations, then this requirement does not apply to the entity.**		
City Of Tallahassee (TAL)	No	I disagree with tying the requirement to SOL/IROL remediation. I also disagree with having to have a simulator. While they are good tools, a generic simulator (that replicates the response of the BES) is not the cure-all for a training in system response (including restoration). A good table-top on an entities own

Organization	Question 3:	Question 3 Comments:
		system will provide better understanding of the operators own system and how to restore it. The cost-benefit analysis may not justify the expense of producing and maintaining a simulator for many small entities that are quite capable of producing quality training with a table-top. Cost needs to become a factor in what is mandated for the operation of the BES. Compliance is pushing the cost of doing business through the roof. Customers and their advocates are getting fed up with the increased costs they are paying for the same service. They do not see the additional support and tools needed to have an effective compliance program and prevent fines. Do not pass requirements that will be overly burdensome to small utilities to fix a perceived problem with poor training. We can have well trained operators without breaking the bank. The inclusion of mandatory simulators contradicts previous public responses from FERC. This requirement is beyond a minimum standard, it is a "best practice". Leave it out of the standard!
Response: Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. The requirement specifies that the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that have operational authority or control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations. If an entity does not have authority or control over facilities with established IROLs or has not established operating guides or protection systems to mitigate IROL violations, then this requirement does not apply to the entity. **The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.** **With regards to your comment concerning "breaking the bank", it is beyond the scope of all standards to develop a standard based on costs. In the NERC Drafting Team Guidelines, Appendix C – FERC's Criteria for Approving Reliability Standards, it states "Should achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost". The SPT SDT believes the standard as developed achieves the reliability goals and allows applicable entity the flexibility to comply using the most cost effective method available.**		
ISO/RTO Council - Standards Review Committee	No	Subrequirement 3.1 is overly prescriptive regarding how to accomplish training. The objective of this standard is to ensure the RC, TOP and BA develop and implement a training program for its system operators to deal with normal and emergency situations. Handling IROL violations is one of the tasks that an RC operator must be able to perform. How to achieve this training to meet the needed competency level should be left to the responsible entity. The NERC Operator Certification exercise is the vehicle to test the operators' knowledge of handling these situations, not the prescriptive tool for training. The following requirement 3.1 text referring to instructional applications in the current draft is

Organization	Question 3:	Question 3 Comments:
		excessively vague: "shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions." What does it mean to say "virtual technology, or other technology that replicates the operational behavior of the BES...." ? A clear language version of the intended text should be: "shall provide each System Operator with emergency operations training employing power flow results which replicate the operational behavior of the BES during normal and emergency conditions." If a simulator or virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions is required for RC, BA and TOP to facilitate system operator training, where justified, then it should be a requirement for organization certification, not for training program.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. **Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions.** **With regards to your comment concerning the competency level issue, the NERC Operator Certification and Organization Certification are outside the scope of the industry approved SAR used to develop this standard.** **The SPT SDT has considered your concern regarding "simulation technology or other technology that replicates the operational behavior of the BES during normal and emergency conditions" being unclear, however based on current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement. The SPT SDT is trying to allow for the use of other technology, not just a simulator, to achieve the desired outcome.**		
ISO New England Inc.	No	Subrequirement 3.1 is overly prescriptive regarding how to accomplish training. The objective of this standard is to ensure the RC, TOP and BA develop and implement a training program for its system operators to deal with normal and emergency situations. What does it mean to say, "virtual technology, or other technology that replicates the operational behavior of the BES...." ? A clearer language version of the intended text would be: "shall provide each System Operator with emergency operations training employing power flow results which replicate the operational behavior of the BES during normal and emergency conditions."
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.		

Organization	Question 3:	Question 3 Comments:
Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. **The SPT SDT has considered your concern regarding "simulation technology or other technology that replicates the operational behavior of the BES during normal and emergency conditions" being unclear, however based on current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement.**		
NPCC	No	R3.1 is overly prescriptive on how to accomplish training. The objective of this standard is to ensure that the RC, TOP, and BA develop and implement a training program for its system operators to deal with normal and emergency situations. Handling IROL violations is just one of the tasks that an RC operator must be able to perform. How to achieve this training to meet the needed competency level should be left to the responsible entity. The NERC Operator Certification exercise is the vehicle to test the operators' knowledge of handling these situations, not the prescriptive tool for training. If a simulator, virtual, or other technology that replicates the operational behavior of the bulk power system during normal and emergency conditions is required for RC, TOP, and BA to facilitate system operator training, then where justified, it should be a requirement for organization certification, not for a training program.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. **With regards to your comment concerning the competency level issue, NERC Operator Certification and Organization Certification are outside the scope of the industry approved SAR used to develop this standard.**		
SERC Standards Review Group	No	The consensus of this group is that the use of simulators for certain entities should not be mandated and that requirement R3.1 should be removed from the standard. Requirement R3 should be revised to allow every responsible entity the flexibility to meet its emergency operations training requirement using any or all of the following types of training: drills, exercises, training classes, or hands-on training using simulation. If Requirement 3.1 does remain in the standard, this group feels that entities mandated to use simulator training should be limited to Reliability Coordinators that have established IROLs within their coordinating footprint. In addition, the initial phrase in R3, "At least every 12 months" needs further clarification. We understand and appreciate the reason for changing the requirement for 32 hours of emergency training from every calendar year to every 12 months. This change was intended to permit

Organization	Question 3:	Question 3 Comments:
		an operator hired late in year to obtain his/her 32 required hours over a full 12 month period instead of just a month or two. However, this wording does not fully reflect this flexibility. The Drafting Team is requested to add some wording that clearly states that the 12-month period for this required 32 hours of training can be determined by the entity on a case-by-case basis, depending on an operator's specific circumstances.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. **The SPT SDT has considered your concern regarding the term "12 month period" not fully defining a specific period, however based on previous and current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement.**		
SRP	No	The Interconnection Reliability Operating Limit (IROL) should not be used to establish the applicability of this requirement, since the term itself is not well understood within the industry. Based on the obligations of the drafting team to clearly identify the applicability of the standard, it would be necessary for the drafting team to list all RCs, BAs and TOPs who have operational authority or control over Facilities with established IROLs.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The SPT SDT believes that the use of the phrase "established IROLs or has established operating guides or protection systems to mitigate IROL violations" appropriately represent the impact of entities on the reliability of the BES. **The SPT SDT has considered your comment concerning the applicability obligation and feels the applicability is based on the industry approved SAR.**		
Ontario IESO	No	Subrequirement 3.1 is overly prescriptive on how to accomplish training. The objective of this standard is to ensure the RC, TOP and BA develop and implement a training program for its system operators to deal with normal and emergency situations. Handling IROL violations is one of the tasks that an RC operator must be able to perform. How to achieve this training to meet the needed competency level should be left to the responsible entity. The NERC Operator Certification exercise is the vehicle to test the operators' knowledge of handling these situations, not the prescriptive tool for training. If a simulator or virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions is required for RC, BA and TOP to facilitate system operator training, where justified, then it should be a requirement for organization certification, not for training program. Further, in order to be a measurable requirement, the functionality and use of a simulator would need to be specified.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order		

Organization	Question 3:	Question 3 Comments:
693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. **With regards to your comment concerning the competency level issue, NERC Operator Certification and Organization Certification are outside the scope of the industry approved SAR used to develop this standard.**		
AEP	No	R3.1 - We disagree with the requirement to utilize a simulator for annual emergency operations training. Use of a simulator for training should be an option (not a requirement) for all entities. It should not just be optional for those entities without established IROLs. Also, discriminating in the requirement to have a simulator based on having an established IROL or guides/procedures to mitigate IROL violations, could cause a political view by an entity to avoid claiming an IROL to in turn avoid purchasing a simulator.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The SPT SDT believes that the use of the phrase "established IROLs or has established operating guides or protection systems to mitigate IROL violations" appropriately represent the impact of entities on the reliability of the BES. **With regards to your comment concerning an entity trying to avoid purchasing a simulator, it is beyond the scope of all standards to develop a standard based on costs. In the NERC Drafting Team Guidelines, Appendix C – FERC's Criteria for Approving Reliability Standards, it states "Should achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost". The SPT SDT believes the standard as developed achieves the reliability goals and allows applicable entity the flexibility to comply using the most cost effective method available.**		
Santee Cooper	No	In R3.1 the SDT has tried to define what size entity is required to provide simulation training. Santee Cooper recommends removing R3.1 and revising R3 to read "to its organization that reflects emergency operations topics (which includes system restoration) using drills, exercises, training classes, or hands on training using simulations or other training required to maintain qualified personnel." This will provide flexibility for training within the companies and meets FERC's requirement of the use of simulators. The "at least every 12 months" wording in R3 needs to have additional wording added to allow for case by case basis. This change was intended to permit an operator hired late in year to obtain his/her 32 required hours over a full 12 month period instead of just a month or two. However, this wording does not fully reflect this flexibility.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities		

Organization	Question 3:	Question 3 Comments:
that have operational control over a significant portion of load and generation. **The SPT SDT has considered your concern regarding the term "12 month period" not fully defining a specific period, however based on previous and current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement.**		
Duke Energy	No	As written, R3.1 applies only to entities that have IROLs or operating guides or protection systems to mitigate IROL violations. Paragraph 1393 of Order 693 states that simulators should be used by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The Standards Drafting Team should resolve this disconnect. R3.1 also uses undefined terms (simulation technology, virtual technology) that should be further clarified to reduce ambiguity. We also note and agree that while 36 months is allowed for implementation of R3.1, R3 is in effect now for emergency operations training.
Response: The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The SPT SDT believes that the use of the phrase "established IROLs or has established operating guides or protection systems to mitigate IROL violations" appropriately represents the impact of entities on the reliability of the BES. **The SPT SDT has considered your concern regarding "simulation technology or other technology that replicates the operational behavior of the BES during normal and emergency conditions" being unclear, however based on current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement.**		
Ohio Valley Electric Corporation	No	Emergency operations training should not be limited to the tasks "applicable to its organization." Many emergency operations topics are related to concepts and not tasks performed by System Operators. The task list developed in R1 could be used to identify some emergency operations training topics but will not cover all the topics that should qualify as emergency operations training.R3.1 is too specific/detailed to be included as a requirement in the standard. Place the details of R3.1 in a reference document or guide.PER-002 R4 currently defines emergency operations training clearly and is well understood and successfully implemented by the entities required to provide this training. PER-005 R3 should be revised to the wording in PER-002 R4.
Response: The SPT SDT believes that the standard as written provides for the flexibility you have described by allowing "other training required to maintain qualified personnel". **The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.**		
Southern Company Transmission	No	We disagree with mandating the use of a training simulator. R3. should be revised to allow an entity the flexibility of using any or all of the following training resources to meet its emergency operations

Organization	Question 3:	Question 3 Comments:
		requirement; drills, exercises, training classes or hands on training using simulation. This requirement is onerous. Less affluent entities that operate the BES, and also fall under NERC's purview will be hard pressed to afford a "simulator" that truly imitates their system. The purchase, model maintenance and operation of a simulator can be a financial burden for a smaller entity with an IROL.
Response: Requirement R3 states "using drills, exercises or other training required to maintain qualified personnel" and as such does allow an entity the flexibility of choosing training resources. The standard further simply delineates criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. **The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.** **With regards to your comment concerning creating a financial burden on an entity, it is beyond the scope of all standards to develop a standard based on costs. In the NERC Drafting Team Guidelines, Appendix C – FERC's Criteria for Approving Reliability Standards, it states "Should achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost". The SPT SDT believes the standard as developed achieves the reliability goals and allows applicable entity the flexibility to comply using the most cost effective method.**		
PowerSouth Energy Cooperative	No	Section of 3.1 is poorly worded. It is unclear what "simulation technology or other technology that replicates operational behavior" implies. Flexibility in the training including hands-on exercises, table top drills, classes should be allowed.
Response: The SPT SDT has considered your concern regarding "simulation technology or other technology that replicates the operational behavior" being unclear, however based on current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement. **Requirement R3 states "using drills, exercises or other training required to maintain qualified personnel" and as such does allow an entity the flexibility of choosing training resources. The standard further simply delineates criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.** **The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.**		
Arizona Public Service Company	No	I suggest the following revisions:

Organization	Question 3:	Question 3 Comments:
		R3 At least every 12 months each Reliability Coordinator, Balancing Authority, and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization, including system restoration using drills, exercises, or other training activities. R3.1. Each Reliability Coordinator, Balancing Authority, and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training based on the operational behavior of the BES during normal and emergency conditions. These changes maintain the intent of the requirement while allowing for flexibility in training methods.
Response: The SPT SDT thanks you for your clarifying comment. However, the SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.		
PJM Interconnection	No	As written, there is no minimum amount of simulator training needed to satisfy R3 (eg, using a "technology that replicates the operational behavior of the BES" for five minutes would meet the requirement). NERC Certification programs currently mandate that RC, BA, & TO system operators have 30 hours of simulator training over their three year certification period. A duplication here (with no minimum requirement) seems pointlessly redundant.
Response: The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation. **In the case of the NERC Certification Program mandating System Operators to have 30 hours of simulator training over the 3 year certification period, the NERC Certification Program is not a part of this standard. The Certification Program requires "training using a simulator" not "training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions". These are two different requirements, therefore no duplication exists. However, it would appear that if an entity could utilize one training method to complete two separate requirements, it would be in the best interest of the entity.**		
CenterPoint Energy	No	No. CenterPoint Energy believes that additional clarity is needed. R3.1 can be interpreted to mean that for the entities identified simulation technology must be used for (all) 32 hours of emergency operations training. This goes far beyond the directive from FERC in Order 693, paragraphs 1390-1391. CenterPoint Energy believes from the Consideration of Comments on the 3rd Draft? the intent is for the entities identified in R3.1 to include simulation technology within the at least 32 hours? of emergency operations training provided to each System Operator, which is consistent with the directive from FERC in Order 693, paragraphs 1390-1391.In R3.1, CenterPoint Energy proposes to replace "using" with

Organization	Question 3:	Question 3 Comments:
		"including the use of" to clarify the intent as discussed above. R3.1 would read as follows: R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training including the use of simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.
Response: The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation. **In the case of the NERC Certification Program mandating System Operators to have 30 hours of simulator training over the 3 year certification period, the NERC Certification Program is not a part of this standard. The Certification Program requires "training using a simulator" not "training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions". These are two different requirements, therefore no duplication exists. However, it would appear that if an entity could utilize one training method to complete two separate requirements, it would be in the best interest of the entity.**		
BCTC	No	Using simulation to deliver training which may be developed out of R1.4 requires a guideline or a clear number of hours for an entity to determine how many hours should be required to meet the standard. Or, if an entity has no task identified that requires simulation according to the definition in the Standard, then the Standard should reflect completion of your annual NERC certification requirements for certification renewal, i.e. a minimum 10 hours of simulation. We would support 10 hours of simulation training.
Response: The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation. **This standard also does not define the use of simulation to deliver the training for the BES company-specific reliability-related tasks.** **The NERC Certification Program is outside the scope of this standard.**		
WECC Operations Training Subcommittee	No	The WECC OTS believes using simulation to identify training which may be developed out of R1.4 and believes a guideline is needed to determine how many hours should be required in this standard. Or, if no task is identified, then the standard should reflect completion of your annual NERC certification requirements for certification renewal, i.e. a minimum of 10 hours of simulation.
Response: The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation.		

Organization	Question 3:	Question 3 Comments:
This standard also does not define the use of simulation to deliver the training for the BES company-specific reliability-related tasks. **The NERC Certification Program is outside the scope of this standard.**		
Ameren	No	What is "other training required to maintain qualified personnel"? Why not just say "using drills, exercises, or other methods of training".
Response: The SPT SDT is not trying to define all types of emergency operations training to conduct, but is instead allowing the individual Reliability Coordinator, Balancing Authority or Transmission Operator to determine what type of emergency operations training is needed for their particular system. The phrase "other training required to maintain qualified personnel" was added based on previous industry comments received.		
E.ON U.S. LLC	No	The standard does not define what is considered a simulation/simulator training platform. E.ON U.S. does use internal and vendor provided emergency system simulator training. In most programs the emergency conditions embedded in the training programs while not specific to E.ON U.S. operations represent conditions that can reasonably be expected to surface during times of system emergencies.. Therefore, these simulation/simulator training provide valuable framework from which to develop specific operator protocols to follow when experiencing system emergencies. Once again E.ON U.S. requests that NERC either better define what it considers a simulation/simulator training or allow each entity to demonstrate that training currently provided is sufficient to meet the standards.
Response: The standard does not preclude the use of external training simulation not specific to the entity. The standard states that if an entity meets the criteria in Requirement 3.1 that emergency operations training must use simulation technology such as a simulator, virtual technology, or other technology that *replicates the operational behavior of the BES* during normal and emergency conditions. **With regards to your comment concerning demonstrating that current training provided meets the standard, it is the responsibility of the Reliability Coordinator, Balancing Authority or Transmission Operator to demonstrate compliance with the standard.**		
PSEI	No	Who this applies to is still very vague and open to interpretation by auditors. Performing a Google search on "WECC IROL" will produce a "philosophy" document that states "The WECC does not have any IROLs under normal operation, but an SOL condition, depending upon the operating conditions, could become an IROL condition, which would be determined post-analysis." I am afraid of entities honestly believing that this standard does not apply to them, but suddenly finding themselves fined because an auditor believes everyone has IROLs or SOLs that could become IROLs. Perhaps the standard could ask the RRO to further define who this applies to. Of course, nothing would prevent the region from putting out an overly burdensome definition.
Response: The requirement specifies the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that have operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations. If an entity does not have authority or control over facilities with established IROLs or has not established operating guides or protection systems to mitigate IROL violations, then this requirement		

Organization	Question 3:	Question 3 Comments:
does not apply to the entity.		
MRO NSRS	No	The SPT SDT has done a great job on R3.1 but we wonder about R3. R3 mentions other system specific emergency training available to maintain qualified personnel is there a way that the SDT can clarify what type of training is acceptable? Is attending any NERC workshop acceptable? Perhaps, the SDT could suggest some examples and place them in the PER-005 System Personnel Training Reference Document.
Response: The SPT SDT has a list of emergency operations training topics that could be included in the training in the Reference Document associated with this Standard.		
Great River Energy	No	GRE recommends replacing the existing phrase "other training required to maintain qualified personnel" with the following text "or other system specific emergency training available to maintain qualified personnel"
Response: The SPT SDT has considered your comment regarding replacing the phrase "other training required to maintain qualified personnel", however the SPT SDT believes the current wording provides sufficient clarity to the requirement.		
Pacific Gas and Electric Company	Yes and No	We recognize that utilizing a simulator for training can greatly enhance the operator's awareness of system conditions and can enable them to respond in a training environment to simulated events which will not lead to an actual cascading event or collapse of the BES. In many cases of an operator's career, this would constitute approximately 10% or less of their actual work time and what they need to know and how to respond to an emergency situation. This additional requirement for some smaller entities that operate within the BES may create financial burdens with the required purchase, model maintenance and operation of a simulator that imitates their system. We recommend R3. be revised to allow an entity the flexibility of using any or all of the following training resources to meet its emergency operations requirement; drills, exercises, training classes or hands on training using simulation.
Response: With regards to your comment concerning creating a financial burden on an entity, it is beyond the scope of all standards to develop a standard based on costs. In the NERC Drafting Team Guidelines, Appendix C – FERC's Criteria for Approving Reliability Standards, it states "Should achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost". The SPT SDT believes the standard as developed achieves the reliability goals and allows the applicable entity the flexibility to comply using the most cost effective method. **The SPT SDT believes that the requirement as written provides for the flexibility as described in your comment.**		
FirstEnergy	Yes and No	We agree that the addition of R3.1 more clearly specifies when simulators, or simulation technology, is required. However, the duration of required simulator training is not specified in R3.1. We would not want an auditor to think that you would need 32 hours of simulator training since using simulation technology would only be a part of all the training tasks. In R3.1, we suggest the SDT specify that a duration of at least 1 hour of simulation training shall be part of the 32 hours of emergency operations training.
Response: The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying		

Organization	Question 3:	Question 3 Comments:
to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation. **The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.**		
WECC Reliability Coordination Comment Working Group	Yes and No	It does a better job of clarifying what entities must use simulation, but it does not specify what number of EOP hours must be simulation only. We suggest that the number of hours be determined by the entity itself utilizing the requirements in PER 005 R1.4.
Response: The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation.		
FRCC System Operator Subcommittee		FRCC disagrees with tying the requirement to SOL/IROL remediation. FRCC also disagrees with having to have a simulator. While they are good tools, a generic simulator (that replicates the response of the BES) is not the cure-all for training in system response (including restoration). A good table-top on an entity's own system will provide better understanding of the operators own system and how to restore it. Many small entities are quite capable of producing quality training with a table-top. Do not pass requirements that will be overly burdensome to small utilities to fix a perceived problem in the value of training on simulators as compared to table-top exercises. We can have well trained operators without breaking the bank. The inclusion of mandatory simulators contradicts previous public responses from FERC. This requirement is beyond a minimum standard, it is a "best practice". Leave it out of the standard!
Response: Requirement 3.1 uses IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions and is not limiting the emergency operating training under simulation to only address IROL operating conditions. The requirement specifies that the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that have operational authority or control over Facilities with established IROLs or have established operating guides or protection systems to mitigate IROL violations. If an entity does not have authority or control over facilities with established IROLs or has not established operating guides or protection systems to mitigate IROL violations, then this requirement does not apply to the entity. **The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.** **With regards to your comment concerning "breaking the bank", it is beyond the scope of all standards to develop a standard based on costs. In the NERC Drafting Team Guidelines, Appendix C – FERC's Criteria for Approving Reliability Standards, it states "Should**		

Organization	Question 3:	Question 3 Comments:
achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost". The SPT SDT believes the standard as developed achieves the reliability goals and allows the applicable entity the flexibility to comply using the most cost effective method.		
American Transmission Company	Yes	Suggestion on the 12 months: The SDT had the following statement to ATC's previous comment: "THE SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from annually to every 12 months to allow for the situations of new hires late in the calendar year."ATC understands the SPT SDT position on the 12 month period, but believes that the standard should contain this clarity. ATC suggests that the Requirement 3 contain a footnote describing the SPT SDT meaning of the 12-months.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. **The SPT SDT has considered your concern regarding the term "12 month period" not fully defining a specific period, however based on previous and current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement and therefore feels a footnote is not needed.**		
Entergy - System Planning & Operation (Generation)	Yes	However the number of hours required is not clear; is there a minimum number of hours of the 32 that must meet this simulation technology requirement?.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. **The SPT SDT is not mandating a minimum number of hours that an entity must train on a simulator. The SPT SDT is trying to allow the Reliability Coordinator, Balancing Authority or Transmission Operator to determine what level of simulation training is required for their specific situation.**		
Orlando Utilities Commission	Yes	Placing examples directly within the body of text leads to ambiguity. In this case it would appear that drills are only applicable to system restoration. I would recommend always placing examples of items within parentheses, producing:... emergency operations topics (including system restoration) using drills, exercises ...As far as using simulation, I think that the requirement is fairly clear however I hate to bring up that the requirement does not specify that the clock-time of the simulations must use actual clock time and not artificially slowed down events.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment. **The SPT SDT is specifying that system restoration must be a part of the 32 hours of emergency operations training. The requirement does not limit training to only system restoration. The standard allows for each entity to develop training specific to their needs.**		
Manitoba Hydro	Yes	MHEB agrees that the revision more clearly describes the types of training and which entities must provide simulation/simulator training.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.

4. The SPT SDT modified the Data Retention section of this Standard to provide clarity: "Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance, for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation." Do you agree that this Standard now clearly defines the period for which compliance records must be kept? If not, please explain in the comment area

Summary Consideration:

The overwhelming majority of the industry participants responding agreed the revisions to the Data Retention section provided improved and sufficient clarity. One responder misunderstood the use of a measure. The SPT SDT explained that measures were proxies to assess required performance or outcomes.

Organization	Question 4:	Question 4 Comments:
MRO NSRS	No	The SPT SDT has done a great job in revising the Data Retention sections of PER-005-1 Draft 4 and PER-004-1 but we were wondering, each standard states that ?the Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.? (This statement usually appears at the end of the section.) We would like to see this statement removed from the standard since the Compliance Enforcement Authority is not a user, owner, or operator of the Bulk Power System. This statement should be made in the Compliance Monitoring and Enformcement Programs.
Response: As you have stated this is part of all standards. Your comment is outside scope of this standard and will be forwarded on for consideration in the future.		
WECC Reliability Coordination Comment Working Group	Yes and No	Yes the measure is clear but we believe the measure should be reflected in the requrement. The measure expects more information be retained than the requirement identifies.
Response: Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements. Measures are proxies to assess required performance or outcomes.		
Bonneville Power Administration	Yes	
Manitoba Hydro	Yes	MHEB agrees that the revision clearly states the record retention period.
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.		
Ohio Valley Electric Corporation	Yes	Less is often better!
Response: The SPT SDT acknowledges your affirmative response and thanks you for your clarifying comment.		
NorthWestern Corporation	Yes

5. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard PER-005.

Summary Consideration:

The primary focus of the comments received in the "Other Comments" section centered on comments already addressed in Questions 1, 2 and 3. These items included the use of a systematic approach to training, the number of hours of simulator training and interpretation of this standard by an auditor. The SPT SDT restated its response provided from the previous questions.

The only other prevailing comment concerned the VSLs and how they were set. The SPT SDT explained that the VSLs are determined in accordance with the Violation Severity Levels Development Guidelines Criteria. The SPT SDT further explained that the VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs and that this document was a product developed jointly by the stakeholder drafting teams and Subject Matter Experts, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.

Organization	Question 5 Comments:

Organization	Question 5 Comments:
PJM Interconnection	SAT, while a valid training process is not without its shortcomings, or the only acceptable method to develop training. This is especially true in the area of just-in-time training. Mandating a training development process is not conducive to a reliability standard, and would be difficult to monitor for compliance. The standard as written mandates a "How-to" approach which is not within scope of a reliability standard. This standard would divert the already scarce training resources away from training operators to the administrative work of documenting every step of the training process to ensure compliance with the standard. It could have the unintended consequence of actually reducing the number of training hours the operators receive. Ultimately, training effectiveness will be measured by compliance with existing reliability standards. That being said, the objective is to ensure qualified system operators. PJM supports the parallel implementation of hourly training requirements for continuing education as well as initial training. NERC has a Continuing Education Program that ensures high quality training, and sets forth a structure using Continuing Education Hours (CEHs) for "NERC Certified Operators". While NERC has continually stated that the CEH program is separate from the standards, little justification has been provided for this separation. Thus, redundant and possibly conflicting training requirements are being proposed. NERC has stated, in it's 2008 budget, that the CEH program ""promotes excellence" and "advances improved performance". Utilizing the CEH approach, PJM would support the increase of the training time required under R3 to at least 100 CEHs annually with category breakdown (i.e. simulation, standards, EOP) as specified in the NERC Certification program. PJM also proposes that for new operators, R2 be replaced with a fixed training hour requirement that is broken down into specific areas (such as job assignments, NERC Standards, tools, internal procedures, etc.). This initial training requirement would be analogous to the CEH program for existing operators, but focused on specific categories related to the initial requirements of the job. PJM would suggest that the SDT post this idea for industry comments.
Response: **This standard is being developed based on the Industry Approved SAR.** **Concerning your comments regarding the Continuing Education Program, this is outside the scope of the industry approved SAR.**	
Southern Company Transmission	We are concerned with the current draft of PER-005. It is likely that auditors will consistently disagree with the composition of an entity's reliability related task list. Ambiguous subjective requirements have no place in a mandatory reliability standard. A better approach would be to capture in this standard the continuing education requirements and categories by type of NERC certification.
Response: The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program. **Concerning your comments regarding the Continuing Education Program, this is outside the scope of the industry approved SAR.**	

Organization	Question 5 Comments:
Arizona Public Service Company	Simplify step R1.1.1 as follows: Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall review its list of BES company-specific reliability-related tasks performed by its System Operators at least annually to ensure the list's adequacy.
Response: The SPT SDT has considered your suggested modification, however based on previous and current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement.	
Pepco Holdings, Inc. - Affiliates	For the Violation Risk Factors for R1, High and Severe, all the references to -when developing a new or modifying an existing training program- should be removed. This language is no longer a part of the Requirements. Additionally, the High and Severe VSLs should reflect that R1.1, R1.2 and R1.3 should all be at the same severity level because all are equally important to meeting the standard.
Response: The SPT SDT has considered your suggested modification to the VSLs and is in agreement with your comment. The references to "developing a new or modifying an existing program" have been removed.	
E.ON U.S. LLC	E .ON U.S. generally supports the intent of the PER-005 standard, but it does not believe that following the Systematic Approach to Training. While E.ON U.S. acknowledges that formal operator training is essential for the safe and reliable operation of the electricity system, it is concerned that any incremental reliability gains derived from implementing the SAT process may not be worth the substantial cost for companies and their customers. - E.ON U.S. believes that utilities should have the ability to outline and tailor their training programs to reflect the unique characteristics of their systems and the unique circumstances that each operator is likely to confront in the operation of the system. Many parties already have developed and will continue to conduct extensive and highly effective training of their operations staff. Absent some demonstration of substantial incremental benefit, a standard requiring utilities to start from scratch with a formal SAT process will be unjustifiably burdensome, distracting, and require a complete reallocation of already limited resources, all to the potential detriment of continued safe and reliable operations. - E.ON U.S., as well as many other parties, currently trains their system operators through many processes. For E.ON U.S., all new hires are required to complete a structured training program that covers all areas of operations during normal and emergency system conditions. This training is in the form of structured classroom and/or NERC certified vendor training plus direct instruction from supervisory operators through the use of actual control room equipment and, where appropriate, simulators. No operator is allowed to independently work until the supervisory personnel has certified that training has been completed and the employee has satisfactorily demonstrated proficiency in all identified tasks through the successful completion of a rigorous testing program. - All existing operators that have been certified as being proficient at a journeyman level will receive annual refresher instruction and training, both through vendor and simulator training programs to, again, guarantee that operators have a mastery of all tasks required of them. - E.ON U.S. believes, therefore, that its current training program, while not identical with the DOE SAT

Organization	Question 5 Comments:
	process, achieves the same goals and objectives of having well-trained and proficient system operators in place, and in maintaining a rigorous training regimen to keep those skills at the highest attainable levels. Such a program provides systematic, company specific training programs and processes that meet the requirements of PER-005. Companies should be able to demonstrate that their training programs are equal or superior to programs that are identified in the SAT process. – Identification of critical tasks and training necessary to ensure that system operators possess the skills necessary to complete the task is utility specific. Employing a cookie cutter approach as identified by the SAT process seems to largely ignore utility differences. Existing training programs should not be overhauled by use of the SAT unless these programs prove to be deficient.
Response: This standard is based on the industry approved SAR and requires that a systematic approach to training process be applied to all system operator training for reliability-related tasks, either new or existing. The requirement to use a systematic approach to training is a directive from FERC Order 693. In addition, there are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf** **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html** **(3) ADDIE – 1975, Florida State University** **http://www.nwlink.com/~donclark/history_isd/addie.html** **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** **http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf** **With regards to your comment concerning "the substantial cost", it is beyond the scope of all standards to develop a standard based on costs. In the NERC Drafting Team Guidelines, Appendix C – FERC's Criteria for Approving Reliability Standards, it states "Should achieve a reliability goal effectively and efficiently - but does not necessarily have to reflect "best practices" without regard to implementation cost". The SPT SDT believes the standard as developed achieves the reliability goals and allows the applicable entity the flexibility to comply using the most cost effective method.**	
PSEI	I believe there needs to be further clarification of a couple of points in R3. The change to "at least every 12

Organization	Question 5 Comments:
	months" is a compliance nightmare. Does this mean each operator shall have 32 hours for any consecutive 12 month period? Could this mean every calendar year? Does this mean there is a compliance violation if an operator completes a course 12 months and 1 day from the last completion date? Some regional exercises are held annually for operators to complete the 32-hr emergency training. If this training is held a week later the next year, are the entities in violation? I know I will get the response that this is outside the scope of the drafting team, but entities need to know how they are expected to be compliant to the standard as it is written. The use of the term annually in this application differs from updating a document annually. Does it mean within 365 days? Also, the addition of company-specific adds another dynamic to the existing requirement. This now adds another layer of paperwork to the entities that are using vendors to meet their requirements. If an entity is strapped for bodies to create their own training courses, why burden them with linking tasks to vendor courses. This again opens the door to an auditor's opinion of what training is "company-specific" and what is adequate proof. It should remain worded as the current standard.
Response: The SPT SDT has considered your concern regarding the term "12 month period" not fully defining a specific period, however based on previous and current industry comments the SPT SDT feels the present wording provides sufficient clarity to the requirement. **To be in compliance the training must be conducted within 12 months.** **The SPT SDT understands your concern about interpretation of standards by an auditor. However, this is outside the scope of the Standard Development Process and is addressed in the Compliance Monitoring and Enforcement Program.** **This standard is being developed based on the Industry Approved SAR.**	
FRCC System Operator Subcommittee	FRCC does not agree that any Violation Severity Level should be higher than "Moderate" regarding system personnel training.
Response: The VSLs are determined in accordance with the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs and that this document was a product developed jointly by the stakeholder drafting teams and Subject Matter Experts, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.	
Hydro One Networks	A measure for R1.1.1 is missing. We recommend adding the words "? and R1.1.1" to the end of Measure M1.1 and replace the word "revision" with "update and/or review". Considered adding the following to the High VSL for R3: "? OR The responsible entity provided less than 32 hours of emergency training to its System Operators (R3). Can we assume standard PER-004-2 Reliability Coordination - Staffing will eventually be updated and completed within Project 2006-01's timeframe?
Response: The SPT SDT thanks you for your comment concerning Measure M1.1 and will modify the measure.	

Organization	Question 5 Comments:
Regarding the concern that the requirement of providing 32 hours of emergency operations training not being addressed in the VSLs - the VSLs, as presently written, address the issue of providing less than the required number of hours of emergency training. In the instance of an entity only providing 30 hours of emergency training to all of its system operators, that entity would have provided 32 hours of emergency operations training to 0% of the system operators and therefore would be deemed non-compliant. **The Implementation Plan references any requirement in PER-004-2 that is affected by this standard. Any requirement in PER-004-2 that is not referenced in the Implementation Plan is outside the scope of the industry approved SAR.**	
Entergy - System Planning & Operation (Generation)	The second sentence of the PURPOSE section needs to be deleted as it is more of a statement which adds no value to the purpose. Suggest revising the PURPOSE to include concepts of R1 (see response to question 1 above). R2 - How would this apply to System Operators who are currently "qualified" by their entities to fulfill the on-duty position of a System Operator? i.e. - is there some sort of "grandfather" status? R2 - recommend modifying the phrase "at least one time" to "prior to independently staffing a real-time System Operator role", if the intent is to have the individual demonstrate the ability prior to being allowed to staff the on-duty System Operator position. R2 - is there any consideration to "proficiency" of a System Operator who has performed this task once? If an operator demonstrated the ability once 5 years ago, is it still ok? R2.1 - the length of time to verify System Operators abilities on new or modified tasks should not be longer that 3 months. Ideally, the System Operator would be trained prior to assuming the next watch. R3 - why 12 months instead of annually? Is there a difference? Is this intentional? R3 - the phrase "?required to maintain qualified personnel." should be deleted. "Qualified personnel" is not adequately defined or described and should not be used. M1.4 - seems to address on-going evaluations rather than a formal annual evaluation, unless a collective annual review of the items specified in M1.4 is the intent. M3 - what constitutes "training records"? Is the same as what is specified in M1.3? If so, then state as such. VSLs need to be reevaluated such that SEVERE would indicate a complete lack of a documented program. The scoring method used to rate several VSLs could be "shifted to the left" such that they fall into the Lower, Moderate, and High, instead of completely not using the Lower rating.PER-004-2R2 - consider strengthening

Organization	Question 5 Comments:
	the language of this requirement or deleting all together. The terms "particular attention" and "best available" are subjective. Regarding formatting when deleting requirements, is it proper to just shift everything up to fill in the deleted requirement or should it be annotated as "deleted" and the so that the remaining requirements still retain their original requirement number? For example, the proposed R2 was formerly R5. Changing the requirement number will create a logistical/tracking problem for many entities.
Response: The Purpose statement in the standard is from the industry approved SAR. **This standard does not allow for "grandfathering" of System Operators.** **With regards to your comment concerning Requirement R2, the individual would be in compliance with this standard. It should also be noted that it is up to the individual entity to determine how the standard is to be implemented within its own organization.** **The SPT SDT believes that reducing the six month re-verification window of Requirement 2.1 to a 30 day window would be too burdensome on an entity due to the shift schedules associated with a System Operators work environment.** **The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from "annually" to "every 12 months" to allow for the situation of new hires late in the calendar year.** **The phrase "other training required to maintain qualified personnel" was added based on previous industry comments received. This phrase is also from the current PER-002 which was approved by the industry, NERC and FERC.** **The standard requires that at least one time during the year a review of the training program will be completed. However, the standard does not preclude "on-going" review to occur. In addition, it is the responsibility of the individual Reliability Coordinator, Balancing Authority or Transmission Operator to provide evidence of compliance with the standard.** **The VSLs are determined in accordance with the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs and that this document was a product developed jointly by the stakeholder drafting teams and Subject Matter Experts, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.** **With regards to your comments concerning PER-004-2 and the requirement numbering method are outside the scope of this standard.**	
Ohio Valley Electric Corporation	The Violation Severity Levels are all skewed towards the severe level. The Violation Severity levels should be skewed towards the lower level. With the lack of assessment or evaluation of the effectiveness of existing

Organization	Question 5 Comments:
	training programs required by PER-002 R3, why work to create a new training standard? With the lack of such an assessment, the work to develop a new training standard is not a judicious use of limited resources in order to strengthen the reliability of the bulk electric system. The NERC operation certification program already determines that operators possess the minimal requirements to reliably operate the bulk electric system. Why should a training program duplicate the certification process? Currently there is ample incentive to have operators trained on company-specific tasks. An operator who is not capable of performing company specific task will not remain an operator at that company.
Response: The VSLs are determined in accordance with the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs and that this document was a product developed jointly by the stakeholder drafting teams and Subject Matter Experts, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel. **The SPT SDT is responding to directives included in FERC Order 693 as directed by the NERC Standards Committee. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation.** **Concerning your comments regarding the Continuing Education Program, this is outside the scope of the industry approved SAR.**	
City Of Tallahassee (TAL)	No Violation Severity Level should be higher than "Moderate" regarding system personnel training!
Response: The VSLs are determined in accordance with the Violation Severity Levels Development Guidelines Criteria. The VSL Guidelines Criteria document is a tool used in developing Violation Severity Levels to provide a more consistent application when determining VSLs and that this document was a product developed jointly by the stakeholder drafting teams and Subject Matter Experts, along with the NERC Standards and Compliance Monitoring and Enforcement Program personnel.	
BCTC	The Standard drafting team stated in the implementation plan for R3 that it is presently in effect and will remain in effect, but the SDT added two significant changes to this requirement. This results in additional work by the entities to meet these changes and additional time to implement these changes. We recommend a 12 month implementation plan for the new R3 to allow entities to become compliant.? "5. Proposed Effective Date for Regulatory Approvals:" "5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard."? R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. [Risk Factor: Medium] [Time Horizon: Long-term Planning]
Response: The SPT SDT thanks you for your comment concerning the effective date for Requirement R3 and has modified the effective date.	

Organization	Question 5 Comments:
The SPT SDT has considered your recommendation for a 12 month implementation period for Requirement R3, however the SPT SDT does not feel that the changes made to Requirement R3 have modified the intent of the existing requirement PER-002 Requirement R4 and PER-004 Requirement R2 and therefore does not believe the change is necessary.	
WECC Operations Training Subcommittee	The WECC OTS questions the following statement and believes R3 has not been approved in PER-005 and would like the implementation date effective 12 months after the first day of the first calendar quarter following applicable regulatory approval:? "5. Proposed Effective Date for Regulatory Approvals:" "5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard."? R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. [Risk Factor: Medium] [Time Horizon: Long-term Planning]
Response: The SPT SDT thanks you for your comment concerning the effective date for Requirement R3 and has modified the effective date. **The SPT SDT has considered your recommendation for a 12 month implementation period for Requirement R3, however the SPT SDT does not feel that the changes made to Requirement R3 have modified the intent of the existing requirement PER-002 Requirement R4 and PER-004 Requirement R2 and therefore does not believe the change is necessary.**	
MRO NSRS	R 1.4 should be deleted it is covered by R 1.1.1, by adding "and shall implement the changes identified" to R 1.1.1 will give clear direction to registered entities. M 1.2 It will be impossible to provide all training support material for off site audits. Training programs may consist of computers, energy management system, facilities (generation plants, back up control centers, etc.) these can not be "boxed up" and supplied to an off site audit. We would like to see a footnote or note that recognizes that certain training items, such as EMS systems, are excluded. M 1.3 places required items as measures that are not in R 1.3. Requirements need to match the Measurements, exactly. M 1.4 places required items as measures that are not in R 1.4. Requirements need to match the Measurements, exactly. Under Data retention, 1.4.2 and 1.4.3 need to state that they have been removed instead of deleting the statement. Is it possible to say “Not Applicable” under section 1.2 (“Compliance Monitoring Period and Reset”) of the standard PER-005-1; this standard has this phrase.

Organization	Question 5 Comments:
	On page 26 of 73, the NERC Drafting Team Guidelines dated July 1, 2007 states that the compliance monitoring period is when the performance or outcome of a requirement is measured. Is it true that this standard's performance is not measured? The MRO doesn't think the Compliance Enforcement Authority is going to want to have its hands tied for three years until they can assess whether the entity is on track to meeting the requirements listed in the standard. The use of the term "customer" is a little out there. In the PER-005 System Personnel Training Reference Document, the reference #1: Determining Task Performance Requirement lists a question "What response from the customer must be accomplished?" Please define what a customer is.
Response: The SPT SDT disagrees with your comment concerning Requirement R1.1.1 and Requirement R1.4. Requirement R1.1.1 addresses changes in tasks while Requirement R1.4 addresses changes to the program. **The applicability of the standard is to the Reliability Coordinator, Balancing Authority or Transmission Operator, because of this, off-site audits will not be conducted. The standard does not require the entity to send out its evidence – the measures all use the phrase, "shall have available for inspection."** **With regards to your comment concerning Measures M1.3 and M1.4, measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements. Measures are proxies to assess required performance or outcomes.** **The SPT SDT has considered your suggested modification to the Data Retention section of the standard, however based on previous and current industry comments and the lack of clear industry consensus, the SPT SDT feels that no change is necessary.** **The SPT SDT disagrees with your comment concerning the Compliance Enforcement Authority having its hands tied for three years. The standard allows for compliance monitoring through compliance audits, self certifications, spot checking, compliance violation investigations, self-reporting and complaints.** **The SPT SDT has provided information in the Reference Document that an entity may use in development of their training program. However, this information does not contain requirements and is provided only as a guideline.**	
Great River Energy	R 1.4 should be deleted it is covered by R 1.1.1, by adding "and shall implement the changes identified" to R 1.1.1 will give clear direction to registered entities. M 1.4 should be moved to M1.1 with the recommended deletion of R1.4 above. GRE recommends that the percentages referenced under R2 and R3 in the VSLs be replaced with specific quantities of items missed.
Response: The SPT SDT disagrees with your comment concerning Requirement R1.1.1 and Requirement R1.4. Requirement R1.1.1 addresses changes in tasks while Requirement R1.4 addresses changes to the program. **The SPT SDT has considered your comment concerning the VSLs. However, based on previous industry comments and the lack of clear industry consensus the SPT SDT does not feel that a modification is necessary. In addition, the use of specific quantities**	

Organization	Question 5 Comments:
instead of percentages is not practical considering differences in the number of company-specific reliability-related tasks and the number of system operators within each organization.	
Transmission System Operations - Baltimore Gas & Electric	The "Systematic Approach to Training" training should be offered as soon as possible. 24 months to complete a training program is a very aggressive schedule, so there is a need to start these activities in the near term.
Response: Upon NERC BOT approval of this standard, the SPT SDT will coordinate with NERC to schedule the training referenced in the Implementation Plan.	
Pacific Gas and Electric Company	Under "5. Proposed Effective Date for Regulatory Approvals:" "5.2. Requirement R3 is presently in effect and will remain in effect upon approval of this Standard." Since PER-005 has not been approved, R3 "At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel.", has not been approved. This is a change in the language from PER-002 R4 "For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel." We recommend the implementation date effective 12 months after the first day of the first calendar quarter following applicable regulatory approval"
Response: The SPT SDT thanks you for your comment concerning the effective date for Requirement R3 and has modified the effective date. **The SPT SDT has considered your recommendation for a 12 month implementation period for Requirement R3, however the SPT SDT does not feel that the changes made to Requirement R3 have modified the intent of the existing requirement PER-002 Requirement R4 and PER-004 Requirement R2 and therefore does not believe the change is necessary.**	
American Transmission Company	In R3, ATC suggests to move "At least every 12 months" to between "training" and "applicable". We feel that it changes the meaning of the sentence to more accurately reflect that each operator is required to have the required training within a 12 month window. ATC continues disagrees with the SPT SDT VSL's for Requirement 2 and 3. (Please see our comments during the last comment period.) Requirement 2 and 3: The VSLs continue to be based on pass/fail concept and do not represent the extent to which an entity did not comply with the requirement. Requirement 2 should include a component that represents the number of task(s) not completed. Requirement 3 should include a component that represents the number of emergency hours that not completed. PER-004-2 Proposed Effective Date: ATC believes that there is an error in the proposed effective date section based on our review of the red-line version of PER-004-2. The proposed effective date states that requirement 5 is being deleted but it seems that requirement 5 is being re-numbered as requirement 2. This inconsistency should be corrected.

Organization	Question 5 Comments:
Response: The SPT SDT thanks you for your comment regarding the re-wording of Requirement R3. However, based on previous industry comments and the lack of clear industry consensus the SPT SDT does not feel that a modification is necessary. **The SPT SDT thanks you for your comment concerning PER-004-1 Requirement R5 and will make the necessary correction.** **The SPT SDT has considered your comment concerning the VSLs. However, based on previous industry comments and the lack of clear industry consensus the SPT SDT does not feel that a modification is necessary. In addition, it would not appear to be practical considering differences in the number of company-specific reliability-related tasks and the number of system operators within each organization.** **Regarding the concern that the requirement of providing 32 hours of emergency operations training not being addressed in the VSLs - the VSLs, as presently written, address the issue of providing less than the required number of hours of emergency training. In the instance of an entity only providing 30 hours of emergency training to all of its system operators, that entity would have provided 32 hours of emergency operations training to 0% of the system operators and therefore would be deemed non-compliant.**	
Public Service Commission of South Carolina	The PSCSC suggests that the concept of "Systematic Approach to Training", used in PER-005-1, be defined in the standard or in the Glossary pertaining to all standards.
Response: There are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific SAT methodology. Each entity may select its own SAT methodology as long as it includes the elements identified in sub-requirements R1.1 to R1.4. The following are reference documents that can be used in developing a systematic approach to training. These documents are also listed in the Reference Document for this Standard. **(1) DOE-HDBK-1078-94, A Systematic Approach to Training** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1078/hdbk1078.pdf** **(2) DOE-HDBK-1074-95, January 1995, Alternative Systematic Approaches to Training, U.S. Department of Energy, Washington, D.C. 20585 FSC 6910** **http://www.hss.energy.gov/NuclearSafety/techstds/standard/hdbk1074/hdb1074.html** **(3) ADDIE – 1975, Florida State University** **http://www.nwlink.com/~donclark/history_isd/addie.html** **(4) DOE Standard - Table-Top Needs Analysis DOE-HDBK-1103-96** **http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf**	
FirstEnergy	FE has the following additional comments:1. With regard to R1.1.1, the task list would not need to be updated if no new or modified tasks were identified.

Organization	Question 5 Comments:
	Therefore, the subrequirement could be slightly reworded as follows: "R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators at least annually when new or modified tasks for inclusion in training have been identified." Also, the Measures were written so that they align with the Requirements and their respective subrequirements. However, subrequirement R1.1.1 seems to be missing a specific measure that requires proof that the training program task list was updated annually if new or modified tasks were identified per R1.1. The SDT should consider adding a new measure M1.1.1 for R1.1.1.2. Since R3.1 is only applicable for entities that operate with IROLs, the measure for R3 should be consistently worded. We suggest changing M3.1 as follows: "Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1."3. The reference document is a good guide for entities to use to reference industry recognized SAT processes as well as helping to determine their company-specific reliability-related operator tasks. However, this document may not be readily available to industry once the standard is enforceable since the standard does not provide a direct link to this reference material. Standards should be "all inclusive" and provide all the information needed. The SDT should consider adding a "Part F" to the standard (as allowed by NERC standard drafting guidelines) that provides a link to this reference material. This information should be transparent to industry when reviewing the standard for compliance and the SDT's work in preparing the reference document will be put to good use.
Response: The SPT SDT has considered your comment concerning Requirement R1.1.1. However, based on previous industry comments and the lack of clear industry consensus the SPT SDT does not feel that a modification is necessary. **Measure M1.1 has been modified to correct the oversight.** **With respect to your comment concerning Requirement R3.1, the requirement specifies the use of simulation technologies is required for Reliability Coordinators, Balancing Authorities and Transmission Operators that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations. If an entity does not have authority or control over facilities with established IROL's or has not established operating guides or protection systems to mitigate IROL violations, then this requirement does not apply to the entity.** **The SPT SDT thanks your for your comment concerning a link to the Reference Document and will work with NERC to provide access to reference material once the standard has been approved.**

Organization	Question 5 Comments:
	General comment - Some of the requirements listed in this requirement (R1.1.1 & R1.4) include a timing element "annually" – the CEDRP suggest that more definition be associated with the annual requirements. Annual requirements appear to accept "anytime during two consecutive calendar years" which can result in the task being performed during December of one year followed by the task being performed in January of the next year (which we suspect would not meet the SDT intent).
	SDT Proposed Lower VSL
	None
	CEDRP Proposed VSL
	SDT Proposed Moderate VSL
	The responsible entity failed to provide evidence that it updated its company-specific reliability-related tasks to identify new or modified tasks on an annual basis (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s).(R1.4)
	CEDRP Proposed VSL

Organization	Question 5 Comments:
	The entity did create a list of reliability tasks – but did the list was incomplete or was not company specific (R1.1) *OR* *The entity performed an update of the BES company specific reliability tasks, but the update did not occur within the timing criteria specified in the requirement (R1.1.1)* *OR* *The entity conducted an evaluation of its training program, but the evaluation did not occur within the timing criteria specified in the requirement (R1.4)* *OR* *The entity conducted an annual evaluation as required in requirement 1.4, but failed to identify needed changes (R1.4)* *OR* *The entity conducted an annual evaluation as required in requirement 1.4, identified needed changes, but failed to implement changes (R1.4)*
	SDT Proposed High VSL
	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks (when developing a new or modifying an existing training program). (R1.2)
	CEDRP Proposed VSL

Organization	Question 5 Comments:	
	The entity implemented/uses a systematic approach to training, but one or more elements of the systematic approach are not included in the program (R1) *OR* **The entity failed to perform a annual update of BES company specific reliability tasks (R1.1.1)** **OR** *The responsible entity failed to design and develop learning objectives based on the BES company specific reliability related tasks (when developing a new or modifying an existing training program). (R1.2)* *OR* *The entity designed and created learning objectives but did not create associated training material (R1.2)* *OR* *The entity delivered training but training delivered did not include all learning objectives/training material as stated in requirement 1.2 (R1.3)* *OR* *The entity did not conduct an evaluation as stated in requirement 1.4 (R1.4)*	
	SDT Proposed Severe VSL	

Organization	Question 5 Comments:
	When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related tasks (R1.1) OR When developing a new or modifying an existing training program the responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)
	CEDRP Proposed VSL
	The entity does not use a systematic approach to training (R1) *OR* *When developing a new or modifying an existing training program, the responsible entity failed to prepare a company-specific reliability-related tasks (R1.1)* *OR* *When developing a new or modifying an existing training program the responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)*
	FERC Guidance for VSLs (Analysis based on CEDRP Proposed Changes)
	1. Will the VSL assignment signal entities that less compliance than has been historically achieved is condoned?
	No
	2. Is the VSL assignment a binary requirement?
	No
	Is it truly a "binary" requirement?

Organization	Question 5 Comments:
	N/A
	If yes, is the VSL assignment consistent with other binary requirement assignments?
	N/A
	Is the VSL language clear & measurable (ambiguity removed)? If no, does the requirement or measure need to be revised?
	The CEDRP suggests that the SDT review or further define "annual" as it applies to this set of requirements.
	3. Does the VSL redefine or undermine the stated requirement?
	No
	4. Is the VSL based on a single violation of the requirement (not multiple violations)?
	Yes
	Standard – R2 / ***PER-005-1***
	Requirement (including sub-requirements)
	R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator **shall verify each** of its System Operator's **capabilities to perform** each assigned task identified in R1.1 at least one time. *[Risk Factor: High] [Time Horizon: Long-term Planning]* **R2.1.** Within **six months of a modification** of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator **shall verify each** of its System Operator's capabilities to **perform the new or modified tasks**.
	Proposed Measure

	Yes
	3. Does the VSL redefine or undermine the stated requirement?
	No
	4. Is the VSL based on a single violation of the requirement (not multiple violations)?

Organization	Question 5 Comments:

Yes

Standard – R3	*PER-005-1*

Requirement (including sub-requirements)

R3. At **least every 12 months** each Reliability Coordinator, Balancing Authority and Transmission Operator shall **provide each of its System Operators** with **at least 32 hours** of emergency operations training **applicable to its organization** that reflects emergency operations topics, which **includes system restoration using drills, exercises or other training** required to maintain qualified personnel. *[Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational **authority or control** over **Facilities with established IROLs** or has established operating guides or protection systems to mitigate IROL violations **shall provide each** System Operator with emergency operations **training using simulation technology** such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

Proposed Measure

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

Attributes of the requirement		
	Binary	
	Timing	X

Organization	Question 5 Comments:

Omission	X
Communication	
Quality	X
Other	

SDT Proposed Lower VSL

None

CEDRP Proposed VSL

SDT Proposed Moderate VSL

The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)

CEDRP Proposed VSL	

The entity provided 32 hours of training, but the training did not occur within the timing criteria specified in the requirement. (R3)

SDT Proposed High VSL

The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)

CEDRP Proposed VSL

Organization	Question 5 Comments:
	The entity did deliver emergency operations training, but did not provide 32 hours of emergency operations training.(R3) *OR* *The entity provided 32 hours of training within the timing criteria as specified in the requirement, but not all operators were trained. (R3)*
	SDT Proposed Severe VSL
	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3) OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)
	CEDRP Proposed VSL
	The entity did not provide training(R3) *OR* **The entity that has authority/control of IROLs did not provide training (R3.1)** *OR* **The entity that has authority/control of IROLs provided training, but the training did not include simulation technology that replicates behavior of the BES during normal and emergency conditions. (R3.1)**

Organization	Question 5 Comments:
	FERC Guidance for VSLs (Analysis based on CEDRP Proposed Changes)
	5. Will the VSL assignment signal entities that less compliance than has been historically achieved is condoned?
	No
	6. Is the VSL assignment a binary requirement?
	No
	Is it truly a "binary" requirement?
	N/A
	If yes, is the VSL assignment consistent with other binary requirement assignments?
	N/A
	Is the VSL language clear & measurable (ambiguity removed)? If no, does the requirement or measure need to be revised?
	Yes
	7. Does the VSL redefine or undermine the stated requirement?
	No
	8. Is the VSL based on a single violation of the requirement (not multiple violations)?
	Yes
	Additional Compliance Elements
	Compliance Enforcement Authority

Organization	Question 5 Comments:
	For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority. For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.
	Compliance Monitoring Period and Reset Time Frame
	N/A
	Compliance Monitoring and Enforcement Processes:
	Compliance Audits Self-Certifications Spot Checking Compliance Violation Investigations Self-Reporting Complaints
	Data Retention

Organization	Question 5 Comments:
	Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation. If a Reliability Coordinator, Balancing Authority or Transmission Operator is found noncompliant, it shall keep information related to the non-compliance until found compliant. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
	Additional Compliance Information
	None
	CAE Resource Pool Comments
	None
Response: The SPT SDT differentiates between the terms "annual" and "12 months". The SPT SDT is specifying the term "annual" to mean a calendar year from January to December. The SPT SDT has modified the Requirement to say "calendar year". With regards to the term "12 months", the SPT SDT did not intend to define the 12 month period. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from "annually" to "every 12 months" to allow for the situation of new hires late in the calendar year. **The SPT SDT has considered your comments concerning the VSLs and does not find any substantial improvements or clarity in your proposal versus the VSLs included in PER-005-1 Draft 4 and therefore does not feel that a change is warranted. In addition, the industry comments received do not substantiate the need for changes to the VSLs of the magnitude you are proposing, however minor clarifications were made based on industry comments.**	
PPL Electric Utilities	Shouldn't 5.3 read "Subrequirement R3.1 becomes effective..." rather than "Requirement R3.1 becomes effective..."
Response: The SPT SDT thanks you for your comment and will modify the effective date to reflect your suggestion.	
Orlando Utilities Commission	I greatly appreciate the effort that the drafting team has put in this standard and would like to say thank you (my hat comes off to you).

Organization	Question 5 Comments:
Response: The SPT SDT thanks you for your clarifying comment.	
Seattle City Light	The increase in time for the simulation was necessary. Vendors will be flooded with requests to model their system for this simulation requirement and this will take time.
Response: The SPT SDT thanks you for your clarifying comment.	
SERC Standards Review Group	No further comments. The drafting team is to be commended for its diligent efforts on revisions to this draft standard.
Response: The SPT SDT thanks you for your clarifying comment.	
Duke Energy	As we read this standard, we see nothing that precludes the use of contractors to perform System Operators' tasks, or training of the System Operators. We agree that the use of contractors is one of the ways to train or fulfill system operator positions.
Response: The SPT SDT thanks you for your clarifying comment.

Standards Announcement

Two Ballot Pools and Pre-ballot Windows Open
September 26–October 25, 2008

Now available at: https://standards.nerc.net/BallotPool.aspx

New Standard: PER-005-1— System Personnel Training (Project 2006-01)

A 30-day ballot pool and pre-ballot window is now open until **8:00 a.m. EDT on October 25, 2008** for the following items: a new standard (PER-005-1 — System Personnel Training), an associated implementation plan, and a reference document to aid in implementing the standard. The ballot for this standard includes the retirement of the associated approved standard PER-002-0 — Operating Personnel Training as well as conforming changes to PER-004-1 — Reliability Coordination — Staffing.

The purpose of the standard is to help ensure that that System Operators performing real-time, reliability-related tasks on the North American bulk electric system are competent to perform those reliability-related tasks. The proposed standard is applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators.

Project Page:
http://www.nerc.com/filez/standards/System-Personnel-Training.html

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." The list server for this ballot pool is: bp_PER-005-1_in@nerc.com. Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.

New Standard: FAC-008-2 — Facility Ratings (Project 2006-09)

A 30-day ballot pool and pre-ballot window is now open until **8:00 a.m. EDT on October 25, 2008** for the following items: a new standard (FAC-008-2 — Facility Ratings) and an associated implementation plan. The ballot for this standard includes the retirement of the associated approved standards FAC-008-01— Facility Ratings Methodology and FAC-009-01 — Establish and Communicate Facility Ratings.

The Facility Ratings standard is undergoing modifications to address the directives in FERC Order 693. The purpose of the standard is to ensure that Facility Ratings used in the reliable planning and operation of the bulk electric system are determined based on technically sound principles.

Project Page:
http://www.nerc.com/filez/standards/Facility_Ratings_Project_2006-09.html

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." The list server for this ballot pool is: bp_FAC-008-1_in@nerc.com. Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Shaun Streeter, Standards Program Administrator, at shaun.streeter@nerc.net or at 609.452.8060.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.
10. Standards Drafting Team responded to comments and posted the revised standard for comment on June 18, 2008.
11. Standards Drafting Team responded to comments from the fourth posting and will request the Standards Committee to move the standard forward to balloting on September 15, 2008.

Proposed Action Plan and Description of Current Draft:

This is the fifth version of the proposed standard and its associated implementation plan that has been posted for industry comments. The drafting team will be requesting the Standards Committee to move the standard forward to balloting.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the fourth draft of the proposed standard.	September 15, 2008
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	September 15, 2008
3. Post the standard and implementation plan for a 30-day pre-ballot review.	September 17, 2008
4. Conduct an initial ballot for ten days.	October 17, 2008
5. Respond to comments submitted with the initial ballot.	November 1, 2008

6. Conduct a recirculation ballot for ten days.	November 11, 2008
7. Post for a 30-day preview for board.	November 21, 2008
8. BOT adoption.	December 22, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. In those jurisdictions where regulatory approval is required, Requirement R1 and Requirement R2 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R1 and Requirement R2 shall become effective on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

5.2. In those jurisdictions where regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.

5.3. In those jurisdictions where regulatory approval is required Sub-requirement R3.1 shall become effective on the first day of the first calendar quarter, 36 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the Sub-requirement R3.1 shall become effective on the first day of the first calendar quarter, 36 months after Board of Trustees adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators each calendar year to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last review and/or revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is

capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related task list to identify new or modified tasks each calendar year (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s). (R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks. (R1.2)	The responsible entity failed to prepare a company-specific reliability-related task list (R1.1) OR The responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability-related task list. (R2.1)	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3)

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)

E. Regional Variances

None.

5.2. In those jurisdictions where regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.~~Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.~~

5.3. In those jurisdictions where regulatory approval is required ~~S~~sub~~-R~~requirement R3.1 shall become~~s~~ effective on the first day of the first calendar quarter, 36 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. ~~I, or i~~n those jurisdictions where no regulatory approval is required, ~~the S~~s~~s~~ub~~-~~requirement R3.1 shall become~~s~~ effective on the first day of the first calendar quarter, 36 months after ~~the first day of the first calendar quarter after~~ Board of Trustees adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related

tasks performed by its System Operators each calendar yearat least annually to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel~~,~~. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last review and/or revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee

feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.~~.~~

If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

~~2.~~Violation Severity Levels

2.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related task~~s~~ list to identify new or modified tasks each calendar year~~on an annual basis~~ (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s). (R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks ~~(when developing a new or modifying an existing training program)~~. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability~~-~~ related task~~s~~ list. (R2.1)	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3) OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Reliability Coordination — Staffing

2. Number: PER-004-2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Effective Date:

- Retire Requirement 2 when PER-005-1 Requirement 3 becomes effective.
- Retire Requirements 3 and 4 when PER-005-1 Requirements 1 and 2 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an

extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator (Replaced with VSLs)

2.1.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Retire R2 and M1 when PER-005-1 Requirement 3 becomes effective. Retire R3, R4 and M2 when PER-005 R1 and R2 become effective.	Revised

A. Introduction

1. Title: **Reliability Coordination — Staffing**

2. Number: PER-004-~~1~~2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Effective Date: ~~January 1, 2007~~

- Retire Requirement~~s~~ 2 ~~and 5 retired~~ when PER-005-1 Requirement 3 becomes effective.
- ~~1.~~ Retire Requirements 3 and 4 ~~retired~~ when PER-005-1 Requirements 1 and 2 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

~~**R2.** All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.~~

~~**R3.** Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.~~

~~**R4.** Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.~~

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

~~**M1.** The Reliability Coordinator shall have and provide upon request training records that confirm that each of its operating personnel has completed a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel, as specified in Requirement 2.~~

M2.Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to, a documented training program and individual training records for each of its operating personnel or other equivalent evidence that will be used to confirm that it meets Requirements 3 and 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator (Replaced with VSLs)

2.1.Level 1: Not applicable.

2.2. **Level 2:** Not applicable.

2.3. **Level 3:** Not applicable.

2.4.2.1. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

2.4.1 One or more of its shift operating personnel did not complete a minimum of five days per year of training and drills using realistic simulations of system emergencies in the past year. (R2)

2.4.2 No evidence operating personnel have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. (R3)

2.4.3 No evidence operating personnel have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area. (R4)

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Retire R2 and M1 when PER-005-1 Requirement 3 becomes effective. Retire R3, R4 and M2 when PER-005 R1 and R2 become effective.	Revised

The SPT SDT recommends that this entire standard be retired when PER-005 becomes effective.

A. Introduction

1. **Title:** **Operating Personnel Training**

2. **Number:** PER-002-0

3. **Purpose:** Each Transmission Operator and Balancing Authority must provide their personnel with a coordinated training program that will ensure reliable system operation.

4. **Applicability**

   4.1. Balancing Authority.

   4.2. Transmission Operator.

5. **Effective Date:** April 1, 2005

B. Requirements

R1. Each Transmission Operator and Balancing Authority shall be staffed with adequately trained operating personnel.

R2. Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in:

R2.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.

R2.2. Positions directly responsible for complying with NERC standards.

R3. For personnel identified in Requirement R2, the Transmission Operator and Balancing Authority shall provide a training program meeting the following criteria:

R3.1. A set of training program objectives must be defined, based on NERC and Regional Reliability Organization standards, entity operating procedures, and applicable regulatory requirements. These objectives shall reference the knowledge and competencies needed to apply those standards, procedures, and requirements to normal, emergency, and restoration conditions for the Transmission Operator and Balancing Authority operating positions.

R3.2. The training program must include a plan for the initial and continuing training of Transmission Operator and Balancing Authority operating personnel. That plan shall address knowledge and competencies required for reliable system operations.

R3.3. The training program must include training time for all Transmission Operator and Balancing Authority operating personnel to ensure their operating proficiency.

R3.4. Training staff must be identified, and the staff must be competent in both knowledge of system operations and instructional capabilities.

R4. For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.

C. Measures

M1. The Transmission Operator and Balancing Authority operating personnel training program shall be reviewed to ensure that it is designed to promote reliable system operations.

D. Compliance

1. Compliance Monitoring Process

Periodic Review: The Regional Reliability Organization will conduct an on-site review of the Transmission Operator and Balancing Authority operating personnel training program every three years. The operating personnel training records will be reviewed and assessed compared to the program curriculum.

1.1. Compliance Monitoring Responsibility

Self-certification: The Transmission Operator and Balancing Authority will annually provide a self-certification based on Requirements R1 through R4.

1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year.

1.3. Data Retention

Three years.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

2.1. Level 1: N/A.

2.2. Level 2: The Transmission Operator or Balancing Authority operating personnel training program does not address all elements of Requirement R3.

2.3. Level 3: The Transmission Operator or Balancing Authority operating personnel training program does not address Requirement R4.

2.4. Level 4: A Transmission Operator or Balancing Authority has not provided a training program for its operating personnel.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

0	August 8, 2005	Proposed Effective Date	Errata

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours of emergency operations training applicable to its organization that reflect emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. Note: PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be retired. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time.

PER-004-1 Requirement	PER-005-1 Requirements
	Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R2) duplicate PER-004-1 R3 and therefore PER-004-1 R3 should be retired.
R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time. Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R4 and therefore PER-004-1 R4 should be removed.

A red-line version of PER-004-1 is posted with this Implementation Plan.

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators
- Balancing Authorities
- Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement R1 and Requirement R2 become effective the first day of the first calendar quarter 24 months after regulatory approval or, in those jurisdictions where regulatory approval is not required, these requirements become effective the first day of the first calendar quarter 24 months after Board of Trustees adoption.
- PER-002-0 Requirement R4 and PER-004-1 Requirement R2 are presently in effect and will be retired when PER-005-1 Requirement R3 becomes effective on the first day of the first calendar quarter after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter following Board of Trustees adoption.
- Subrequirement R3.1 becomes effective on the first day of the first calendar quarter 36 months after applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, this subrequirement becomes effective on the first day of the first calendar quarter 36 months after Board of Trustees adoption.

Training

- The SPT SDT will provide training on the use of a systematic approach to training, either in conjunction with a NERC workshop or independent PER-005 training, dependent on the preference of the industry.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours of emergency operations training applicable to its organization that reflect emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. - Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement R1 and Requirement R2 become effective ~~24 months after~~ the first day of the first calendar quarter 24 months after~~following~~ regulatory approval or, in those jurisdictions where regulatory approval is not required, these requirements ~~otherwise~~ become~~s~~ effective ~~24 months after~~ the first day of the first calendar quarter 24 months after Board of Trustee~~s~~ adoption.
- PER-002-0 Requirement R4 and PER-004-1 Requirement R2 are presently in effect and will be retired when PER-005-1 Requirement R3 becomes effective on the first day of the first calendar quarter after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter following Board of Trustees adoption.
- ~~is presently in effect and will remain in effect upon approval of this Standard~~.
- Sub-r~~R~~equirement R3.1 becomes effective on~~36 months after~~ the first day of the first calendar quarter 36 months after~~following~~ applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, this sub-requirement becomes effective on ~~36 months after~~ the first day of the first calendar quarter 36 months after Board of Trustee~~s~~ adoption.

Training

- The SPT will provide training on the use of a systematic approach to training, either in conjunction with a NERC workshop or independent PER-005 training, dependent on the preference of the industry.

PER-005 System Personnel Training
Reference Document

Reference #1: Determining Task Performance Requirements

The purpose of this reference is to provide guidance in writing a performance standard that describes the desired outcome of a task. A standard for acceptable performance should be in either measurable or observable terms.

Clear standards of performance are necessary for an individual to know when he or she has completed the task and to ensure agreement between employees and their supervisors on the objective of a task. Performance standards answer the following questions:

How timely must the task be performed?

Or

How accurately must the task be performed?

Or

With what quality must it be performed?

Or

What response from the customer must be accomplished?

When a performance standard is quantifiable, successful performance is more easily demonstrated. For example, in the following task statement, the criteria for successful performance is to return system loading to within normal operating limits, which is a number that can be easily verified.

> Given a System Operating Limit violation on the transmission system, implement the correct procedure for the circumstances to mitigate loading to within normal operating limits.

Even when the outcome of a task cannot be measured as a number, it may still be observable. The next example contains performance criteria that is qualitative in nature, that is, it can be verified as either correct or not, but does not involve a numerical result.

> Given a tag submitted for scheduling, ensure that all transmission rights are assigned to the tag per the company Tariff and in compliance with NERC and NAESB standards.

Reference #2: Systematic Approach to Training References:

The following list of hyperlinks identifies references for the NERC Standard PER-005 to assist with the application of a systematic approach to training:

DOE-HDBK-1103-96
http://hss.energy.gov/NuclearSafety/techstds/standard/hdbk1103/hdbk1103.pdf

Reference #3: Normal and Emergency Operations Topics

These topics are identified as meeting the topic criteria for normal and emergency operations training per Requirement 1 and Requirement 3 of this standard.

A. Recognition and Response to System Emergencies

1. Emergency drills and responses
2. Communication tools, protocols, coordination
3. Operating from backup control centers
4. System operations during unstudied situations
5. System Protection
6. Geomagnetic disturbances weather impacts on system operations
7. System Monitoring – voltage, equipment loading
8. Real-time contingency analysis
9. Offline system analysis tools
10. Monitoring backup plans
11. Sabotage, physical, and cyber threats and responses

B. Operating Policies and Standards Related to Emergency Operations

1. NERC standards that identify emergency operations practices (e.g. EOP Standards)
2. Regional reliability operating policies
3. Sub-regional policies and procedures
4. ISO/RTO policies and procedures

C. Power System Restoration Philosophy and Practices

1. Black start
2. Interconnection of islands – building islands
3. Load shedding – automatic (under-frequency and under-voltage) and manual
4. Load restoration philosophies

D. Interconnected Power System Operations

1. Operations coordination
2. Special protections systems
3. Special operating guides
4. Voltage and reactive control, including responding to eminent voltage collapse
5. Understanding the concepts of Interconnection Reliability Operating Limits versus System Operating Limits
6. DC tie operations and procedures during system emergencies
7. Thermal and dynamic limits
8. Unscheduled flow mitigation − congestion management
9. Local and regional line loading procedures
10. Radial load and generation operations and procedures
11. Tie line operations
12. E-tagging and Interchange Scheduling
13. Generating unit operating characteristics and limits, especially regarding reactive capabilities and the relationship between real and reactive output

E. Technologies and Tools

1. Forecasting tools
2. Power system study tools
3. Interchange Distribution Calculator (IDC)

F. Market Operations as They Relate to Emergency Operations

1. Market rules
2. Locational Marginal Pricing (LMP)
3. Transmission rights
4. OASIS
5. Tariffs
6. Fuel management
7. Real-time, hour-ahead and day-ahead tools

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Two Initial Ballot Windows Open
October 27–November 5, 2008

Now available at: https://standards.nerc.net/CurrentBallots.aspx

Standard PER-005-1— System Personnel Training (Project 2006-01)

An initial ballot window is now open **until 8 p.m. EST on November 5, 2008** for the following items: a new standard (PER-005-1 — System Personnel Training), an associated implementation plan, and a reference document to aid in implementing the standard. The ballot for this standard includes the retirement of the associated approved standard PER-002-0 — Operating Personnel Training as well as conforming changes to PER-004-1 — Reliability Coordination — Staffing.

The purpose of the standard is to help ensure that that System Operators performing real-time, reliability-related tasks on the North American bulk electric system are competent to perform those reliability-related tasks. The proposed standard is applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators.

Project Page:
http://www.nerc.com/filez/standards/System-Personnel-Training.html

Standard FAC-008-2 — Facility Ratings (Project 2006-09)

An initial ballot window is now open **until 8 p.m. EST on November 5, 2008** for the following items: a new standard (FAC-008-2 — Facility Ratings) and an associated implementation plan. The ballot for this standard includes the retirement of the associated approved standards FAC-008-1— Facility Ratings Methodology and FAC-009-1 — Establish and Communicate Facility Ratings.

The Facility Ratings standard is undergoing modifications to address the directives in FERC Order 693. The purpose of the standard is to ensure that Facility Ratings used in the reliable planning and operation of the bulk electric system are determined based on technically sound principles.

Project Page:
http://www.nerc.com/filez/standards/Facility_Ratings_Project_2006-09.html

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Initial Ballot Results

Now available at: https://standards.nerc.net/Ballots.aspx

Standard PER-005-1 — System Personnel Training (Project 2006-01)

The initial ballot results for standard PER-005-1 — System Personnel Training are shown below. The ballot includes the retirement of the associated approved standard PER-002-0 — Operating Personnel Training as well as conforming changes to PER-004-1 — Reliability Coordination — Staffing.

Quorum:	90.13 %
Approval:	82.47 %

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

The Ballot Results Web page provides a link to the detailed results of this ballot. The ballot received some negative votes with comments, and the drafting team will review the comments before determining its next step.

Project page: http://www.nerc.com/filez/standards/System-Personnel-Training.html

Standard FAC-008-2 — Facility Ratings (Project 2006-09)

The initial ballot results for standard FAC-008-2 — Facility Ratings are shown below. The ballot ncludes the retirement of the associated approved standards FAC-008-01— Facility Ratings Methodology and FAC-009-01 — Establish and Communicate Facility Ratings.

Quorum:	89.13 %
Approval:	70.01 %

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and

- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

The Ballot Results Web page provides a link to the detailed results of this ballot. The ballot received some negative votes with comments, and the drafting team will review the comments before determining its next step.

Project Page: http://www.nerc.com/filez/standards/Facility_Ratings_Project_2006-09.html.

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on Initial Ballot — PER-005-1 — System Personnel Training (Project 2006-01)

Summary Consideration: The majority of negative voters expressed concerns surrounding the two (2) year implementation time frame, the treatment of existing training programs and the mandating of the use of simulators. The SDT explained that FERC had expressed concerns with a longer implementation period since the need for improvements to System Operator training was initially identified in the 2003 Blackout Report and that an entity would conceivably have more time than two (2) years to implement the program. Concerning the treatment of existing training programs, the SDT explained that existing training programs would have to be verified against the Standard to ensure compliance with the use of a systematic approach to training. The SDT also explained that the use of a simulator was directed by a FERC Order and that the SDT had expanded the concept of using a simulator to include simulation technology, virtual technology or other technology that replicates the operational behavior of the BES to increase flexibility for an organization to meet the requirement of the standard using the most cost effective solution. The SDT further explained that it proposed the following language as delineating factors for determining those entities that must use simulation technology in their training programs.
". . . that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations. . ."

The above language was proposed as an alternative that is an, equally efficient and effective method of achieving the intent of FERC's directive to include "the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation."

A few of the negative voters are concerned with the definition of the twelve (12) month period for emergency training, the use of a systematic approach to training and that the standard uses a "how-to" approach. With regards to defining the twelve (12) month period for emergency operations training, the SDT explained that it was allowing an entity the flexibility to define this period on a case-by-case basis. The SDT further explained that by allowing an entity this flexibility it was providing for the situation of a new hire late in the calendar year. Concerning the use of a systematic approach to training, the SDT explained this was based on the industry approved SAR requiring that a systematic approach to training be applied to all reliability-related system operator training. The SDT further explained that the requirement to use a systematic approach to training was reinforced as a directive from FERC Order 693. With regards to the concern that the standard uses a "how-to" approach, the SDT explained that the Reliability Standards Development Procedure Version 6.1 stated that "Each requirement identifies who is responsible and what action is to be performed or what outcome is to be achieved.", therefore allowing requirements to be developed utilizing the "how – to approach".

Voter	Entity	Segment	Vote	Comment
John Bussman	Associated Electric Cooperative, Inc.	1	Negative	PER-002 provides adequate requirements for training to ensure that a system operator is competent to perform the system operator duties.
Response: The need for improvements to system operator training was identified in the 2003 Black-out Report. Based on this report the SAR was developed and approved by the industry to improve system operator training practices. Lastly, FERC Order 693 expanded the training requirement through directives for modifications to the PER-002 standard.				
Tony Kroskey	Brazos Electric Power	1	Negative	It is not clear to what extent jurisdiction and regulatory requirements can apply.

Voter	Entity	Segment	Vote	Comment
	Cooperative, Inc.			
Response: The SPT SDT was unsure of the exact nature of your question. If you are concerned about the applicability of this standard to your organization, please refer to the NERC Functional Model and the Statement of Compliance Registry Criteria. These documents provide the current functional type definitions needed by NERC to fulfill its obligation as the Electric Reliability Organization to identify and register all entities that meet the criteria for inclusion in the compliance registry. If your concern is related to regulatory jurisdiction, consult with your legal department.				
Paul Rocha	CenterPoint Energy	1	Negative	Regarding the SDT's Consideration of Comments to the 4th Draft, CenterPoint Energy appreciates that in R3.1 "the SDT is not mandating a minimum number of hours that an entity must train on a simulator"; however, as CenterPoint Energy stated in its comments, the current wording in the standard can still be interpreted such that ALL 32 hours of emergency operations training must be accomplished using simulation technology. Consequently, CenterPoint Energy is voting "negative". CenterPoint Energy again submits the following minor edit, which would clarify R3.1: Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using [delete "using" and insert instead "including the use of"] simulation technology such as a simulator, virtual technology or other technology that replicates the operation behavior of the BES during normal emergency conditions.
Response: Based on industry comments, the SPT SDT feels the present wording provides sufficient clarity to the requirement.				
Joseph Dobes	Northern Indiana Public Service Co.	1	Negative	The existing 3-year program has been vetted throughout the industry and is adequate. Changing the requirement to 2 years would require additional staff.
Response: If you are referring to the 3 year operator re-certification program, this is outside the scope of the industry approved SAR. If you are referring to the 24 month implementation period, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training. Industry consensus and the SPT SDT support a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • NERC filing of BOT approved standard with FERC

• FERC staff review for development of NOPR • NOPR comment period • FERC staff review of NOPR comments • FERC issuing of final rule • Publish in Federal Register • 24 months after the first day of the first calendar quarter following regulatory approval				
Ray Mammarella	PP&L, Inc.	1	Negative	Systematic approach to training, while a valid training process is not without its shortcomings, or the only acceptable method to develop training. This is especially true in the area of just-in-time training. Mandating a training development process is not conducive to a reliability standard, and would be difficult to monitor for compliance. The standard as written mandates a "How-to" approach which is not within scope of a reliability standard. This standard would divert the already scarce training resources away from training operators to the administrative work of documenting every step of the training process to ensure compliance with the standard. It could have the unintended consequence of actually reducing the number of training hours the operators receive. Ultimately, training effectiveness will be measured by compliance with existing reliability standards.
Response: This standard is based on the approved SAR and requires that a systematic approach to training be applied to all system operator training for reliability-related tasks. The requirement to use a systematic approach to training was reinforced as a directive from FERC in Order 693. In addition, there are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific systematic approach to training methodology. The Reference Document associated with this standard contains links to various systematic approach to training methodologies. Reliability Standards Development Procedure Version 6.1 states that “Each requirement identifies who is responsible and what action is to be performed or what outcome is to be achieved.”, therefore allowing requirements to be developed utilizing the “how – to approach”.

Reliability Standards Development Procedure Version 6.1 states that “Each requirement identifies who is responsible and what action is to be performed or what outcome is to be achieved.”, therefore allowing requirements to be developed utilizing the “how – to approach”.				
Catherine Koch	Puget Sound Energy, Inc.	1	Negative	The term "verify" needs further clarification to understand whether the regional compliance enforcement or FERC based on the Order 693 directive would expect verification to be obtained via simulator results. M2 does not mention the term simulator when discussing evidence examples and it is clear the expectation for use of a simulator per R3.1, but the vagueness of "verify" in R2 and R2.1 and the FERC focus on simulator use is cause for concern when audited. In addition it is unclear what extent of "modification" needs to drive the verification on the modified task within 6 months. Training schedules can be tricky to achieve and having to insert training relative to something considered to be minor could be difficult to arrange depending on the expectation of "verify" again. Please confirm that the use of a simulator for training is not required in any requirement but R3.1. The mandate of simulator use in R3.1 based on identified operational

Voter	Entity	Segment	Vote	Comment
				authority or control over facilities with established IROLs is a concern because it is unclear how the WECC region would interpret this based on discussions of IROL versus SOLs. We request clarity regarding how the WECC region would interpret this. What WECC document points to the entities that this is applicable to? Is this identified by the Major WECC Transfer Paths in the BES table? We appreciate the difficulty in determine how to define simulator required entities and appreciate the efforts to narrow the applicability to those entities that have the greatest impact on the BES.
Response: A simulator may be used to verify competency, however, it is not required. Each entity shall determine its own process for compliance with the standard. With respect to your comment concerning the use of IROL as a delineating factor for determining the need for using simulation technologies, the SDT continues to stress it is not just IROLs but also "...or has established operating guides or protection systems to mitigate IROL violations." If further clarification about the implementation and applicability for this Requirement is needed with respect to specific documentation that may exist within WECC, please contact WECC.				
Terry L. Blackwell (1) Zack Dusenbury (3) Suzanne Ritter (6)	Santee Cooper	1,3,6	Negative	It's not feasible to implement R1 and R2 in 24 months with available operator time for identification and required verification of job tasks.
Response: FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training. Industry consensus and the SPT SDT support a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • NERC filing of BOT approved standard with FERC • FERC staff review for development of NOPR • NOPR comment period • FERC staff review of NOPR comments • FERC issuing of final rule

• Publish in Federal Register • 24 months after the first day of the first calendar quarter following regulatory approval				
Horace Stephen Williamson	Southern Company Services, Inc.	1	Negative	The Standard Drafting Team did not follow through with the suggestion for the effective date to be 36 months for both standards. Additionally, industry needs clear direction on existing training programs. The proposed standard does not provide guidance in determining what constitutes “a company-specific” reliability-related task. Consequently, it is subjective. The task list should, at a minimum, fully support the function type definition contained in the NERC Statement of Compliance Registry Criteria. We disagree with mandating the use of a training simulator. The purchase, model maintenance and operation of a simulator can be a financial burden on a smaller entity with an IROL Finally, we still have concerns that auditors will consistently disagree with the composition of an entity’s reliability related task list.
Response: FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training. Industry consensus and the SPT SDT support a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • NERC filing of BOT approved standard with FERC • FERC staff review for development of NOPR • NOPR comment period • FERC staff review of NOPR comments				

Voter	Entity	Segment	Vote	Comment
• FERC issuing of final rule • Publish in Federal Register • 24 months after the first day of the first calendar quarter following regulatory approval Existing training programs need to be verified against the standard for compliance. The System Operator Task List was removed from the standard based on industry comments received from previous postings. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. The SDT agrees that the NERC Functional Model and the Statement of Compliance Registry Criteria provide the current functional type definitions to develop its list of BES company-specific reliability-related tasks. The requirement to use a simulator was a directive from FERC Order 693. The SDT provided an alternative approach of using simulation technology such as a simulator, virtual technology or other technology. The SPT SDT believes the standard as developed achieves the reliability goals and allows each applicable entity the flexibility to comply using the most cost effective method available. The SDT can not address compliance audit practices. However, the intent of this requirement is to ensure a task list exists, the tasks are company specific and that the tasks are reliability related.				
Roger D. Green	Southern Company Services, Inc.	5	Negative	The effective date should be 36 months for this standard. Additionally, industry needs clear direction on existing training programs. The proposed standard does not provide guidance in determining what constitutes “a company-specific” reliability-related task. Consequently, it is subjective. The task list should, at a minimum, fully support the function type definition contained in the NERC Statement of Compliance Registry Criteria. We disagree with mandating the use of a training simulator. Finally, we still have concerns that auditors will consistently disagree with the composition of an entity’s reliability related task list.
Response: FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator

Kim Warren	Independent Electricity System Operator	2	Negative	The IESO maintains that Requirement 3.1 is overly prescriptive on how to accomplish training. The objective of NERC standards should be to define what needs to be done to ensure the reliability of the BES - in this case to ensure the RC, TOP and BA develop and implement a training program for its System Operators to deal with normal and emergency situations. How to achieve this training to meet the needed competency level should be left to the responsible entity. The effectiveness of the methods employed by the entity will then be evaluated through the NERC Operator Certification exercise. Further, the IESO wishes to know whether the "simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES" may be "generic" in nature, intended to develop and assess the general competencies required of System Operators, or must it be specific to the BES of the BA, RC, or TOP and mimic the behavior of their BES, providing realistic experiences with the operator's actual BES. It is unclear from a compliance perspective, what is intended by “virtual technology, or other technology”. We strongly believe that robust “simulation practices” achieve as much or more than “simulation technologies” and feel that if the standard does prescribe “how”, then the former element, “simulation practices”, needs to be included.
Response: Reliability Standards Development Procedure Version 6.1 states that “Each requirement identifies who is responsible and what action is to be performed or what outcome is to be achieved.”, therefore allowing requirements to be developed utilizing the “how – to approach”.				

Voter	Entity	Segment	Vote	Comment
The NERC Operator Certification is outside the scope of the industry approved SAR used to develop this standard. Certification does not verify that a system operator can perform company-specific reliability-related tasks. The intent of the standard is to allow for simulation training that replicates the operational behavior of the BES during normal and emergency conditions. The SPT SDT believes the standard as developed achieves the reliability goals and allows an applicable entity the flexibility to comply using the most cost effective method available. The Reference Document associated with this standard provides additional information concerning simulation technology.				
Tom Bowe	PJM Interconnection, L.L.C.	2	Negative	PJM believes that SAT, while a valid training process is not without its shortcomings or the only acceptable method to develop training. This is especially true in the area of just-in-time training. Mandating a training development process is not conducive to a reliability standard, and would be difficult to monitor for compliance. The standard as written mandates a "How-to" approach which is not within the scope of a reliability standard. This standard would divert already scarce training resources away from training operators to the administrative work of documenting every step of the training process to ensure compliance with the standard. It could have the unintended consequence of actually reducing the number of training hours that operators receive. Ultimately, training effectiveness will be measured by compliance with existing reliability standards. That being said, the objective is to ensure qualified system operators. PJM supports the parallel implementation of hourly training requirements for continuing education as well as initial training. NERC has a Continuing Education Program that ensures high quality training, and sets forth a structure using Continuing Education Hours (CEHs) for "NERC Certified Operators". While NERC has continually stated that the CEH program is separate from the standards, little justification has been provided for this separation. Thus, redundant and possibly conflicting training requirements are being proposed. Utilizing the CEH approach, PJM would support the increase of the training time required under R3 to at least 100 CEHs annually with category breakdown (i.e. simulation,

Voter	Entity	Segment	Vote	Comment
				standards, EOP) as specified in the NERC Certification program. PJM also proposes that for new operators, R2 be replaced with a fixed training hour requirement that is broken down into specific areas (such as job assignments, NERC Standards, tools, internal procedures, etc.). This initial training requirement would be analogous to the CEH program for existing operators, but focused on specific categories related to the initial requirements of the job.
Response: This standard is based on the approved SAR and requires that a systematic approach to training be applied to all system operator training for reliability-related tasks. The requirement to use a systematic approach to training was reinforced as a directive from FERC Order 693. In addition, there are multiple variations of a systematic approach to training and this standard is not prescribing the use of any specific systematic approach to training methodology. The Reference Document associated with this standard contains links to various systematic approach to training methodologies. Reliability Standards Development Procedure Version 6.1 states that "Each requirement identifies who is responsible and what action is to be performed or what outcome is to be achieved.", therefore allowing requirements to be developed utilizing the "how – to approach". The NERC Certification Process or NERC Continuing Education (CE) Program is not within the scope of this standard. An entity can use the CE Program to meet this standard if the CE training meets the requirements in this standard (i.e., addresses company specific reliability-related tasks). Additionally, the industry is in support of the standard as presently written.				
Jalal (John) Babik (3) Mike Garton (5) Louis S Slade (6)	Dominion Resources, Inc.	3,5,6	Negative	In support of PJM comments

William SeDoris	Northern Indiana Public Service Co.	3	Negative	Concern is with the 2-year window.
Response: If you are referring to the 24 month implementation period, FERC has expressed concerns regarding the implementation time frame of this standard since the need for improvements to system operator training was identified in the 2003 Black-out Report and FERC Order 693 directives to establish the criteria for system operator training. Industry consensus and the SPT SDT support a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • NERC filing of BOT approved standard with FERC • FERC staff review for development of NOPR • NOPR comment period • FERC staff review of NOPR comments • FERC issuing of final rule • Publish in Federal Register • 24 months after the first day of the first calendar quarter following regulatory approval				
Scott Peterson	San Diego Gas & Electric	3	Negative	R2.1. Should be clarified to read "Within six months of a modification of the list of the BES company-specific reliability-related tasks, ...". R3. The 12 month timeframe is unworkable. It will force workgroups to go to a shorter timeframe just to make sure they stay within that 12 months. This will cause training to be moved up each year after year. Change to "At least every 16 months, each ...". R3.1. The drafting team needs to clarify how "operational authority and control" will be interpreted in this standard. For example, if a transmission operator has turned over operational control of its system to an ISO, yet that transmission operator still has the physical control device in its control center which it utilizes under the ISO's direction, is that transmission operator subject to this requirement?
Response: The industry has responded in support of the standard as presently written therefore the SDT does not feel that the modification you are suggesting to Requirement R2.1 is necessary or provides any additional clarity.				

Voter	Entity	Segment	Vote	Comment
The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from "annually" to "every 12 months" to allow for the situation of new hires late in the calendar year. The issue of addressing relationships related to "operational authority *or* control" between entities is outside the scope of the industry approved SAR. If you are concerned about the applicability of this standard to your organization, please refer to the NERC Functional Model and the Statement of Compliance Registry Criteria.				
David Frank Ronk	Consumers Energy	4	Negative	This standard would require a complete re-structuring of training programs across the industry. Training programs that have ramped up as a result of the black-out in 2003 and that have been deemed compliant up to the possible passing of this standard. This standard is too restrictive and burdensome. a Training staff of one would need to become a training staff of three just to attempt to install a systematic program described in this standard and it would still take longer than the two years mentioned in the standard.
Response: Existing training programs need to be verified against the standard for compliance. Industry consensus and the SPT SDT support a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • NERC filing of BOT approved standard with FERC • FERC staff review for development of NOPR • NOPR comment period • FERC staff review of NOPR comments • FERC issuing of final rule • Publish in Federal Register • 24 months after the first day of the first calendar quarter following regulatory approval				

Voter	Entity	Segment	Vote	Comment
James B Lewis	Consumers Energy	5	Negative	In our view, the proposed Standard is too restrictive and much too burdensome. Our training staff might need to triple to install a program such as that proposed. Even with a greatly increased training staff, we believe it would take much longer than the two years mentioned in the proposed Standard. Our training program was improved after the August 2003 blackout and has been deemed compliant, but we don't believe it would be should this proposed Standard pass.
Response: Existing training programs need to be verified against the standard for compliance. Industry consensus and the SPT SDT support a 24 month implementation period. The industry should have adequate time to begin preparation to implement Requirement 1 and Requirement 2 of this standard based on the following typical process (with the exception of Canada): • NERC filing of BOT approved standard with FERC • FERC staff review for development of NOPR • NOPR comment period • FERC staff review of NOPR comments • FERC issuing of final rule • Publish in Federal Register • 24 months after the first day of the first calendar quarter following regulatory approval				
Kent Saathoff	Electric Reliability Council of Texas, Inc.	10	Negative	R1.1 and R1.2 require training based on a "task list". A training needs analysis under a systematic approach to training (R1), coupled with verification of capability (R2) may determine that only certain tasks need training. R3 would be more useful in the System Operator Certification Program manual, Section 2, Credential Maintenance as a subset of the Operating Topics requirement similar to the Standards and Simulations. A 90 hour requirement (averaging 30 hours/year over the 3-year certification) would be more preferable than a more rigid 32 hours every twelve months. Providing 32 hours of training in April of one year and in May the next would be a violation of this requirement

Voter	Entity	Segment	Vote	Comment
				as written.
Response: Existing training programs need to be verified against the standard for compliance. The NERC Certification Process or NERC Continuing Education (CE) Program is not a within the scope of this standard. Additionally, the industry has responded in support of the standard as presently written. The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from "annually" to "every 12 months" to allow for the situation of new hires late in the calendar year.				
Carter B. Edge	SERC Reliability Corporation	10	Negative	In order to vote "yes", I would need to see the following changes to the standard: Change the training program implementation period back to 36 months (as it was in a previous draft). Provide clear direction on how responsible entities can incorporate their existing training materials into the established "training program" and still be compliant with R1. Provide a suggested (not prescriptive) list of generic tasks that could be used as a starting point to create the list of BES company-specific reliability-related tasks required by R1.1. This task list would be located in the Reference Document (as opposed to the standard itself) to give the flexibility to modify, add or remove tasks to suit the specific system. Remove R3.1 mandating the use of simulators, or limit the mandated use of simulators to RCs that have established IROLs in their coordinating footprint. Revise R3 to allow every responsible entity the flexibility to meet its emergency operations training requirement using any or all of the following types of training: drills, exercises, classes, hands-on or table-top simulation.

- FERC staff review of NOPR comments
- FERC issuing of final rule
- Publish in Federal Register
- 24 months after the first day of the first calendar quarter following regulatory approval

Existing training programs need to be verified against the standard for compliance.

The System Operator Task List was removed from the standard based on industry comments received from previous postings. The Reference Document associated with the Standard details some topics that could be considered and included in a task list. The SDT agrees that the NERC Functional Model and the Statement of Compliance Registry Criteria provide the current functional type definitions to develop its list of BES company-specific reliability-related tasks.

The SPT SDT is responding to directives included in FERC Order 693. Order 693 includes a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The SDT provided an alternative approach of using simulation technology such as a simulator, virtual technology or other technology.

In addition, the SDT used IROLs as a delineating criterion for those entities that must provide emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

The SPT SDT believes that Requirement R3 as written allows the applicable entity the flexibility to comply using various training methodologies.

Kirit S. Shah (1) Mark Peters (3)	Ameren Services	1,3	Affirmative	We have voted affirmatively; however, we recommend that the drafting team carefully consider the following comments: For the Standard PER-004-2 : (1) The purpose of this standard is to address staffing. The requirement R2 in no way addresses staffing. Therefore, it should be eliminated from this standard and moved to the appropriate IRO standard. If R2 is about training on SOLs and IROLs, then it should specifically state that. (2) This standard does not have any measures. How can there be a reliability standard without any measures? For the Standard PER-005-1: (1) Add the words "review and" in R1.1.1 to read "Each RC, BA, and TOP shall review and update its list of … (2) Requirement R1.3 should specify when/how often the training should be delivered and to whom (Operators? Senior management?) (3) The numbering of Measures should match the Requirement numbering. For example M1 for R1 and M1.1.2 for R1.1.2 etc. If there are no measures (why not, as we questioned earlier) then state "No measure" alongside to maintain the matching numbering system between Measures and Requirements.

Response: Thank you for your affirmative response and your clarifying remarks.

PER-004-2 Requirement R2 and its applicable measures are not a within the scope of this standard. The SDT encourages you to submit a SAR to modify PER-004-2 through the Standards Development Process.

The SPT SDT believes that in order to update a task list it first must be reviewed. Therefore the SPT SDT does not feel that a change in the wording is necessary and is not supported by the industry.

As stated in the purpose statement of the standard and in Requirement 1 (and associated sub-requirements) this standard applies to System Operators.

Voter	Entity	Segment	Vote	Comment
The SPT SDT incorporated the sub-requirement measures (where not specifically stated) into the measures for the Requirement.				
Sam Dwyer	Amerenue	5	Affirmative	We have voted affirmatively; however, we recommend that the drafting team carefully consider the following comments: For the Standard PER-004-2 : (1) The purpose of this standard is to address staffing. Jason Shaver	American Transmission Company, LLC	1	Affirmative	After reviewing the VRF's and VSLs it's our opinion that the proposed VRFs and VSLs may not pass FERC approval. FERC recently posted a NOPR on FAC-010, FAC-011 and FAC-014 in which they made specific observations. (Docket No. RM08-11-000 Issued October 16th) Paragraph 18 of the above mentioned order: (VRF) "..NERC will assign a violation risk factor for each requirement of a Reliability Standard that relates to the expected or potential impact of a violation of the requirement on the reliability of the Bulk Power System." The SDT has not assigned VRF's to sub-requirements. Paragraph 20 of the above mentioned order: (VSL) "... (4) violation severity level assignment should be based on a single violation, not a cumulative number of violations." VSL's for Requirements 2 and 3: The proposed VSLs for requirements 2 and 3 are currently based on a cumulative violation and therefore do not pass FERC's guideline. We believe that the SDT should review the above mentioned FERC NORP and make a decision if this project should be moved forward prior to addressing these issues.
Response: As you have stated in your comments the FERC document referenced is a Notice of Proposed Ruling (NOPR) and not a final ruling. With respect to your concerns on the Violation Risk Factors (VRFs), the VRFs for this standard were developed in accordance with the current Drafting Team Guidelines. In addition, FERC has issued final rulings with only the main Requirement (not sub-requirements) having an associated VRF. The Violation Severity Levels (VSLs) for this standard were developed in accordance with the current VSL Development Guidelines.

Donald S. Watkins (1) Rebecca Berdahl (3) Francis J Halpin (5) Brenda S Anderson (6)	Bonneville Power Administration	1,3,5,6	Affirmative	Although we are in support of this standard, it needs more clarification, in particular Requirement #2 and Measure #2. Obviously, the System Operator Training Program for System Operator's entering training after the effective date of PER-005 will meet this requirement. How does the RC, BA, and TOP meet this standard for each System Operator deemed fully qualified previous to this standard? What is the basis? I.E. NERC Certification? Previous Training Program?, Management Approval? Does every System Dispatcher have to re-enter training? Tests? How do the RC'S, BA'S, and TOP'S determine if the method utilized to verify capability of performing the RC, BA, or TOP tasks meet NERC'S intent of this standard.
Response: The responsible entity must verify that each of its System Operators is capable of performing each company-specific reliability-related task. The standard provides several ways of documenting this verification – and each entity must determine how to accomplish this verification. If additional training is required to meet the verification requirement, then the responsible entity is expected to provide that training. As envisioned, many entities will already have some or most of the documentation needed to demonstrate compliance with Requirement R2. The Measure for M2 provides several examples of acceptable evidence: "This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments."				
Douglas E. Hils	Duke Energy Carolina	1	Affirmative	As currently written, requirement R3.1 says that unless you have an established IROL, or have established operating guides or protection systems to mitigate IROL violations, you do not need to comply with the requirement to train System Operators using simulation technology. However, paragraph 1393 of Order 693 states that simulators should be used by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. We believe that there are large entities who do not have established IROL's within their systems, or established operating guides or protection systems to mitigate IROL violations. Therefore a reliability disconnect exists between R3.1 and paragraph 1393. Requirement R3.1 should be modified to resolve this disconnect.

Voter	Entity	Segment	Vote	Comment
Response: The SPT SDT is responding to directives included in FERC Order 693. Order 693 does include a directive to require the use of simulators by reliability coordinators, transmission operators and balancing authorities that have operational control over a significant portion of load and generation. The SDT believes that the language in Requirement R3.1 provides an alternative approach that meets the intent of the directive - using simulation technology such as a simulator, virtual technology or other technology that replicates the operational behavior of the BES during normal and emergency conditions. As envisioned, the intent of the directive was not aimed so much at an entity's size, but at the level of importance (from a reliability perspective) of the operational control – and by using IROLs as a delineating criterion, the SDT believes it has properly focused R3.1 on those entities that have the greatest impact on reliability of the BES.				
Robert Martinko	FirstEnergy Energy Delivery	1	Affirmative	FirstEnergy appreciates the work of the System Personnel Training standard drafting team and is voting AFFIRMATIVE to the proposed new PER-005-1 standard as well as the conforming changes to the PER-004-2 and retirement of PER-002-0. However, we would appreciate a response from the drafting regarding two questions related to PER-005-1. Requirement R2 states the following: R2: Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. [Violation Risk Factor: High] [Time Horizon: Long-term Planning] R2.1: Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks. QUESTION 1: Based on reading the Implementation Plan, it is understood that we will have roughly 24 months beyond regulatory approval to finalize our list of reliability related tasks as required by R1.1 and complete the initial "one time" assessment of those reliability related tasks for each of our operators. It is assumed that the six month requirement as stated R2.1 only applies after this initial 24 month period and that any adjustments to our list of reliability related tasks within the first 24 month period would not trigger requirement R2.1. Requirement R3 states the following: R3: At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32

Voter	Entity	Segment	Vote	Comment
				hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. QUESTION 2:It is FirstEnergy interpretation that the intent is to complete 32 hours of emergency training on an annual (calendar year) basis and that an entity is not expected to continuously be able to show 32 hours of emergency compliance training on a rolling twelve month basis. It is our opinion that completing on an annual basis is consistent with other continuing education programs and provides greater flexibility in scheduling and completing the needed training. The present wording is open for interpretation and entities are exposed to differing views from compliance auditing staff. If FE's interpretation is correct, we suggest that the drafting team change the wording as follows: "On an annual, calendar year basis, each Reliability Coordinator ..."
Response: If an entity determines a new or modifies an existing reliability-related task, the entity would always have 6 months from the date of identifying a new or modifying an existing reliability-related task to be compliant with Sub-requirement R2.1. The SPT SDT did not intend to define the 12 month period for providing emergency operations training. The SPT SDT believes that this period should be defined by the individual entity on a case-by-case basis. The SPT SDT revised the condition for Requirement 3 from “annually” to “every 12 months” to allow for the situation of new hires late in the calendar year.				
Joanne Kathleen Borrell (3) Kenneth Dresner (5) Mark S Travaglianti (6)	FirstEnergy Solutions	3,5,6	Affirmative	FirstEnergy appreciates the work of the System Personnel Training standard drafting team and is voting AFFIRMATIVE to the proposed new PER-005-1 standard as well as the conforming changes to the PER-004-2 and retirement of PER-002-0. However, we would appreciate a response from the drafting regarding two questions related to PER-005-1. Requirement R2 states the following: R2: Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator’s capabilities to perform each assigned task identified in R1.1 at least one time. [Violation Risk Factor: High] [Time Horizon: Long-term Planning] R2.1: Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing

Ajay Garg (1) Michael D Penstone (3)	Hydro One Networks, Inc.	1,3	Affirmative	Although we agree with the standard, thus the affirmative vote, there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. The words inserted in the Effective Date of the Standard as well as in the Implementation Plan document permit that the Standard becomes effective in some jurisdictions before it does in others. The Standard should be modified to ensure that it becomes effective in all jurisdictions at the same time, including those where such regulatory approval in not required that is, only when all regulatory approvals have been obtained.
Response: This is outside the scope of this SDT and we suggest discussing the inconsistent timing of implementation of standards in North America with the appropriate regulating agency.				

Voter	Entity	Segment	Vote	Comment
Terry Bilke	Midwest ISO, Inc.	2	Affirmative	We appreciate the work that has gone into the development of the training standard. It has come a long way to being something that the industry can achieve and contributes to reliability. We believe it's inappropriate to assign High VRFs to training requirements. While training is very important, failure to have documentation that an operator has been trained on a task does not put the interconnection at risk of cascading. This drains resources from important jobs and may actually decrease the quality and scope of training. It is quite likely that entities will be very cautious on what they put on their JTA as each added task carries a significant compliance administration burden and inflated sanctions exposure. We believe heavy handed VRFs and VSLs are a primary reason the due process pipeline is moving slowly. Not only has it taken Regions a long time to come up with the settlements, they are now required to provide additional documentation of why a lesser sanction is appropriate when the assigned VRF and VSLs come up with a penalty that doesn't reasonably fit the situation. Again, VRFs are supposed to measure the risk caused by violating the standard. Risk includes impact and probability. VRFs are not and should not be a measure of importance. There are many things we do as an industry that are important, but failing to do these important things once does not put the interconnection at risk of cascading. Finally, R1: "BES company-specific reliability-related tasks" appears to exclude potential BES fundamentals-related training and courses that are relevant to BES behavior and performance, yet not company specific.

Response: The SPT SDT believes, based on the existing definitions of the VRFs, the VRFs should not be changed. The analysis of the August 2003 Blackout showed that training, or the lack of training, was a significant factor that contributed to the blackout. The VRF Definitions can be found in the NERC Drafting Team Guidelines at (ftp://www.nerc.com/pub/sys/all_updl/standards/dt/Drafting_Team_Guidelines_01Jul07.pdf) as well as in the Reliability Standards Development Procedure Manual.

The SPT SDT is not trying to define all types of training to conduct, but is instead allowing the individual Reliability Coordinator, Balancing Authority or Transmission Operator to determine what type of BES fundamentals training is needed to operate their particular system.

Voter	Entity	Segment	Vote	Comment
Wayne Lewis	Progress Energy Carolinas	5	Affirmative	Although Progress Energy is voting Affirmative on PEF-005-1, we submit the following comments and request informal clarification on two of the requirements: Clarification on R1.1: What does NERC mean by "BES company-specific reliability-related task list? By using the word reliability, is NERC excluding Generation/AGC/Interchange type tasks? Is NERC only focusing on transmission related tasks? Clarification on R2: "shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time." Are existing NERC certified System Operators grandfathered?
Response: The Reference Document associated with the standard details some topics that could be used in development of a company-specific reliability-related task list. The topics identified in the reference document include generation, interchange and AGC functions. The responsible entity must verify that each of its System Operators is capable of performing each company-specific reliability-related task. There is no grandfathering.				
Richard Salgo	Sierra Pacific Power Co.	1	Affirmative	Nice job by the Standards Drafting Team. This one has been through numerous drafts, and this version hits the mark.
Response: The SDT thanks you for your affirmative response.				
Alan Gale	City of Tallahassee	5	Affirmative	While there are some items I take issue with, this standard is a good compromise and I thank the SDT for there perseverance.
Response: The SDT thanks you for your affirmative response.				

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Recirculation Ballot Window Open
December 12–22, 2008

Now available at: https://standards.nerc.net/CurrentBallots.aspx

Standard PER-005-1— System Personnel Training (Project 2006-01)

A recirculation ballot window is now open **until 8 p.m. EST on December 22, 2008** for a new standard (PER-005-1 — System Personnel Training).

The purpose of the standard is to help ensure that that System Operators performing real-time, reliability-related tasks on the North American bulk electric system are competent to perform those reliability-related tasks. The proposed standard is applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators.

An associated implementation plan and a reference document have been developed to aid in implementing the standard. The reference document has been updated since the last posting with some information about simulation technology. The ballot for this standard includes the retirement of the associated approved standard PER-002-0 — Operating Personnel Training as well as conforming changes to PER-004-1 — Reliability Coordination — Staffing.

Project Page:
http://www.nerc.com/filez/standards/System-Personnel-Training.html

Recirculation Ballot Process

The Standards Committee encourages all members of the Ballot Pool to review the consideration of comments submitted with the initial ballots. In the recirculation ballot, votes are counted by exception only — if a Ballot Pool member does not submit a revision to that member's original vote, the vote remains the same as in the first ballot. Members of the ballot pool may:

- Reconsider and change their vote from the first ballot.
- Vote in the second ballot even if they did not vote on the first ballot.
- Take no action if they do not want to change their original vote.

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance,
please contact Shaun Streeter at shaun.streeter@nerc.net or at 609.452.8060.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.
10. Standards Drafting Team responded to comments and posted the revised standard for comment on June 18, 2008.
11. Standards Drafting Team responded to comments from the fourth posting and will request the Standards Committee to move the standard forward to balloting on September 15, 2008.

Proposed Action Plan and Description of Current Draft:

This is the fifth version of the proposed standard and its associated implementation plan that has been posted for industry comments. The drafting team will be requesting the Standards Committee to move the standard forward to balloting.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the fourth draft of the proposed standard.	September 15, 2008
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	September 15, 2008
3. Post the standard and implementation plan for a 30-day pre-ballot review.	September 17, 2008
4. Conduct an initial ballot for ten days.	October 17, 2008
5. Respond to comments submitted with the initial ballot.	November 1, 2008

6. Conduct a recirculation ballot for ten days.	November 11, 2008
7. Post for a 30-day preview for board.	November 21, 2008
8. BOT adoption.	December 22, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. In those jurisdictions where regulatory approval is required, Requirement R1 and Requirement R2 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R1 and Requirement R2 shall become effective on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

5.2. In those jurisdictions where regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.

5.3. In those jurisdictions where regulatory approval is required Sub-requirement R3.1 shall become effective on the first day of the first calendar quarter, 36 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the Sub-requirement R3.1 shall become effective on the first day of the first calendar quarter, 36 months after Board of Trustees adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related tasks performed by its System Operators each calendar year to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last review and/or revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is

capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related task list to identify new or modified tasks each calendar year (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s). (R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks. (R1.2)	The responsible entity failed to prepare a company-specific reliability-related task list (R1.1) OR The responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability-related task list. (R2.1)	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3)

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
				OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)

E. Regional Variances

None.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Standards Committee approves SAR for posting on December 1, 2004.
2. SAR Drafting Team posted SAR for comments on December 7, 2004.
3. SAR Drafting Team responds to comments, revises SAR, and posts revised SAR for comments on February 17, 2006.
4. SAR Drafting Team responds to comments and revises SAR on May 15, 2006.
5. Standards Committee approves development of Standard on May 15, 2006.
6. The Standards Authorization Committee appointed the Standard Drafting Team on June 21, 2006.
7. Standards Drafting Team posted draft standard for comment on September 27, 2006.
8. Standards Drafting Team responded to comments and posted the revised standard on August 15, 2007.
9. Standard Drafting Team responded to comments and posted the revised standard for comment on February 15, 2008.
10. Standards Drafting Team responded to comments and posted the revised standard for comment on June 18, 2008.
11. Standards Drafting Team responded to comments from the fourth posting and will request the Standards Committee to move the standard forward to balloting on September 15, 2008.

Proposed Action Plan and Description of Current Draft:

This is the fifth version of the proposed standard and its associated implementation plan that has been posted for industry comments. The drafting team will be requesting the Standards Committee to move the standard forward to balloting.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on the fourth draft of the proposed standard.	September 15, 2008
2. Obtain the Standards Committee's approval to move the standard forward to balloting.	September 15, 2008
3. Post the standard and implementation plan for a 30-day pre-ballot review.	September 17, 2008
4. Conduct an initial ballot for ten days.	October 17, 2008
5. Respond to comments submitted with the initial ballot.	November 1, 2008

6. Conduct a recirculation ballot for ten days.	November 11, 2008
7. Post for a 30-day preview for board.	November 21, 2008
8. BOT adoption.	December 22, 2008

A. Introduction

1. Title: **System Personnel Training**

2. Number: PER-005-1

3. Purpose: To ensure that System Operators performing real-time, reliability-related tasks on the North American Bulk Electric System (BES) are competent to perform those reliability-related tasks. The competency of System Operators is critical to the reliability of the North American Bulk Electric System.

4. Applicability:

4.1. Functional Entities:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Transmission Operator.

5. Proposed Effective Date for Regulatory Approvals:

5.1. In those jurisdictions where regulatory approval is required, Requirement R1 and Requirement R2 shall become~~s~~ effective on the first day of the first calendar quarter, 24 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. ~~, or i~~In those jurisdictions where no regulatory approval is required, Requirement R1 and Requirement R2 shall ~~the Reliability Standard~~ become~~s~~ effective on the first day of the first calendar quarter, 24 months after ~~the first day of the first calendar quarter after~~ Board of Trustees adoption.

5.2. In those jurisdictions where regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirement R3 shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.~~Requirement R3 is presently in effect and will remain in effect upon approval of this Standard.~~

5.3. In those jurisdictions where regulatory approval is required ~~S~~sub~~-R~~requirement R3.1 shall become~~s~~ effective on the first day of the first calendar quarter, 36 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. ~~I, or i~~n those jurisdictions where no regulatory approval is required, ~~the S~~s~~s~~ub~~-~~requirement R3.1 shall become~~s~~ effective on the first day of the first calendar quarter, 36 months after ~~the first day of the first calendar quarter after~~ Board of Trustees adoption.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall create a list of BES company-specific reliability-related tasks performed by its System Operators.

R1.1.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall update its list of BES company-specific reliability-related

tasks performed by its System Operators each calendar yearat least annually to identify new or modified tasks for inclusion in training.

R1.2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall design and develop learning objectives and training materials based on the task list created in R1.1.

R1.3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall deliver the training established in R1.2.

R1.4. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall conduct an annual evaluation of the training program established in R1, to identify any needed changes to the training program and shall implement the changes identified.

R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each assigned task identified in R1.1 at least one time. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

R2.1. Within six months of a modification of the BES company-specific reliability-related tasks, each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform the new or modified tasks.

R3. At least every 12 months each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each of its System Operators with at least 32 hours of emergency operations training applicable to its organization that reflects emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel~~,~~. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R3.1. Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence of using a systematic approach to training to establish and implement a training program, as specified in R1.

M1.1 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its company-specific reliability-related task list, with the date of the last review and/or revision, as specified in R1.1.

M1.2 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection its learning objectives and training materials, as specified in R1.2.

M1.3 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection System Operator training records showing the names of the people trained, the title of the training delivered and the dates of delivery to show that it delivered the training, as specified in R1.3.

M1.4 Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have available for inspection evidence (such as instructor observations, trainee

feedback, supervisor feedback, course evaluations, learning assessments, or internal audit results) that it performed an annual training program evaluation, as specified in R1.4

M2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection evidence to show that it verified that each of its System Operators is capable of performing each assigned task identified in R1.1, as specified in R2. This evidence can be documents such as training records showing successful completion of tasks with the employee name and date; supervisor check sheets showing the employee name, date, and task completed; or the results of learning assessments.

M3. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator has obtained 32 hours of emergency operations training, as specified in R3.

M3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator shall have available for inspection training records that provide evidence that each System Operator received emergency operations training using simulation technology, as specified in R3.1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring Period and Reset

Not Applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

Each Reliability Coordinator, Balancing Authority and Transmission Operator shall keep data or evidence to show compliance for three years or since its last compliance audit, whichever time frame is the greatest, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.~~.~~

If a Reliability Coordinator, Balancing Authority and Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

~~2.~~Violation Severity Levels

2.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	None	The responsible entity failed to provide evidence that it updated its company-specific reliability-related task~~s~~ list to identify new or modified tasks each calendar year~~on an annual basis~~ (R1.1.1) OR The responsible entity failed to provide evidence of evaluating its training program to identify needed changes to its training program(s). (R1.4)	The responsible entity failed to design and develop learning objectives and training materials based on the BES company specific reliability related tasks ~~(when developing a new or modifying an existing training program)~~. (R1.2)	~~When developing a new or modifying an existing training program, t~~The responsible entity failed to prepare a company-specific reliability-related task~~s~~ list (R1.1) OR ~~When developing a new or modifying an existing training program t~~The responsible entity failed to deliver training based on the BES company specific reliability related tasks. (R1.3)
R2	None	The responsible entity verified at least 90% but less than 100% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)	The responsible entity verified at least 70% but less than 90% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks (R2) OR The responsible entity failed to verify its system operator's capabilities to perform each new or modified task within six months of making a modification to its BES company-specific reliability~~-~~ related task~~s~~ list. (R2.1)	The responsible entity verified less than 70% of its System Operators' capabilities to perform each assigned task from its list of BES company-specific reliability-related tasks. (R2)

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	None	The responsible entity provided at least 32 hours of emergency operations training to at least 90% but less than 100% of their System Operators. (R3)	The responsible entity provided at least 32 hours of emergency operations training to at least 70% but less than 90% of its System Operators. (R3)	The responsible entity provided 32 hours of emergency operations training to less than 70% of its System Operators (R3) OR The responsible entity did not include simulation technology replicating the operational behavior of the BES in its emergency operations training. (R3.1)

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. Title: Reliability Coordination — Staffing

2. Number: PER-004-2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Effective Date:

- Retire Requirement 2 when PER-005-1 Requirement 3 becomes effective.
- Retire Requirements 3 and 4 when PER-005-1 Requirements 1 and 2 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an

extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator (Replaced with VSLs)

2.1.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Retire R2 and M1 when PER-005-1 Requirement 3 becomes effective. Retire R3, R4 and M2 when PER-005 R1 and R2 become effective.	Revised

A. Introduction

1. Title: **Reliability Coordination — Staffing**

2. Number: PER-004-~~1~~2

3. Purpose:

Reliability Coordinators must have sufficient, competent staff to perform the Reliability Coordinator functions.

4. Applicability

4.1. Reliability Coordinators.

5. Effective Date: ~~January 1, 2007~~

- Retire Requirement~~s~~ 2 ~~and 5 retired~~ when PER-005-1 Requirement 3 becomes effective.
- ~~1.~~ Retire Requirements 3 and 4 ~~retired~~ when PER-005-1 Requirements 1 and 2 become effective.

B. Requirements

R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.

~~**R2.** All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.~~

~~**R3.** Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.~~

~~**R4.** Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.~~

R2. Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.

C. Measures

None

~~**M1.** The Reliability Coordinator shall have and provide upon request training records that confirm that each of its operating personnel has completed a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel, as specified in Requirement 2.~~

M2.Each Reliability Coordinator shall have and provide upon request evidence that could include but is not limited to, a documented training program and individual training records for each of its operating personnel or other equivalent evidence that will be used to confirm that it meets Requirements 3 and 4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator shall keep evidence of compliance for the previous two calendar years plus the current year.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance for a Reliability Coordinator (Replaced with VSLs)

2.1.Level 1: Not applicable.

2.2. **Level 2:** Not applicable.

2.3. **Level 3:** Not applicable.

2.4.2.1. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

2.4.1 One or more of its shift operating personnel did not complete a minimum of five days per year of training and drills using realistic simulations of system emergencies in the past year. (R2)

2.4.2 No evidence operating personnel have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas. (R3)

2.4.3 No evidence operating personnel have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area. (R4)

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Retire R2 and M1 when PER-005-1 Requirement 3 becomes effective. Retire R3, R4 and M2 when PER-005 R1 and R2 become effective.	Revised

The SPT SDT recommends that this entire standard be retired when PER-005 becomes effective.

A. Introduction

1. **Title:** **Operating Personnel Training**

2. **Number:** PER-002-0

3. **Purpose:** Each Transmission Operator and Balancing Authority must provide their personnel with a coordinated training program that will ensure reliable system operation.

4. **Applicability**

   4.1. Balancing Authority.

   4.2. Transmission Operator.

5. **Effective Date:** April 1, 2005

B. Requirements

R1. Each Transmission Operator and Balancing Authority shall be staffed with adequately trained operating personnel.

R2. Each Transmission Operator and Balancing Authority shall have a training program for all operating personnel that are in:

R2.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.

R2.2. Positions directly responsible for complying with NERC standards.

R3. For personnel identified in Requirement R2, the Transmission Operator and Balancing Authority shall provide a training program meeting the following criteria:

R3.1. A set of training program objectives must be defined, based on NERC and Regional Reliability Organization standards, entity operating procedures, and applicable regulatory requirements. These objectives shall reference the knowledge and competencies needed to apply those standards, procedures, and requirements to normal, emergency, and restoration conditions for the Transmission Operator and Balancing Authority operating positions.

R3.2. The training program must include a plan for the initial and continuing training of Transmission Operator and Balancing Authority operating personnel. That plan shall address knowledge and competencies required for reliable system operations.

R3.3. The training program must include training time for all Transmission Operator and Balancing Authority operating personnel to ensure their operating proficiency.

R3.4. Training staff must be identified, and the staff must be competent in both knowledge of system operations and instructional capabilities.

R4. For personnel identified in Requirement R2, each Transmission Operator and Balancing Authority shall provide its operating personnel at least five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.

C. Measures

M1. The Transmission Operator and Balancing Authority operating personnel training program shall be reviewed to ensure that it is designed to promote reliable system operations.

D. Compliance

1. Compliance Monitoring Process

Periodic Review: The Regional Reliability Organization will conduct an on-site review of the Transmission Operator and Balancing Authority operating personnel training program every three years. The operating personnel training records will be reviewed and assessed compared to the program curriculum.

1.1. Compliance Monitoring Responsibility

Self-certification: The Transmission Operator and Balancing Authority will annually provide a self-certification based on Requirements R1 through R4.

1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year.

1.3. Data Retention

Three years.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

2.1. Level 1: N/A.

2.2. Level 2: The Transmission Operator or Balancing Authority operating personnel training program does not address all elements of Requirement R3.

2.3. Level 3: The Transmission Operator or Balancing Authority operating personnel training program does not address Requirement R4.

2.4. Level 4: A Transmission Operator or Balancing Authority has not provided a training program for its operating personnel.

E. Regional Differences

None identified.

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Proposed Effective Date	Errata

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours of emergency operations training applicable to its organization that reflect emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. Note: PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be retired. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time.

PER-004-1 Requirement	PER-005-1 Requirements
	Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R2) duplicate PER-004-1 R3 and therefore PER-004-1 R3 should be retired.
R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time. Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R4 and therefore PER-004-1 R4 should be removed.

A red-line version of PER-004-1 is posted with this Implementation Plan.

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators
- Balancing Authorities
- Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement R1 and Requirement R2 become effective the first day of the first calendar quarter 24 months after regulatory approval or, in those jurisdictions where regulatory approval is not required, these requirements become effective the first day of the first calendar quarter 24 months after Board of Trustees adoption.
- PER-002-0 Requirement R4 and PER-004-1 Requirement R2 are presently in effect and will be retired when PER-005-1 Requirement R3 becomes effective on the first day of the first calendar quarter after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter following Board of Trustees adoption.
- Subrequirement R3.1 becomes effective on the first day of the first calendar quarter 36 months after applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, this subrequirement becomes effective on the first day of the first calendar quarter 36 months after Board of Trustees adoption.

Training

- The SPT SDT will provide training on the use of a systematic approach to training, either in conjunction with a NERC workshop or independent PER-005 training, dependent on the preference of the industry.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for PER-005-1 – System Personnel Training

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

PER-002-0 should be retired when PER-005-0 becomes effective.

PER-004-1 Requirements 2, 3 and 4 should be retired when PER-005-1 becomes effective.

The following tables summarize the mapping of the PER-004-1 requirements to PER-005-1 and other standard requirements:

PER-004-1 Requirement	PER-005-1 Requirements
R2. All Reliability Coordinator operating personnel shall each complete a minimum of five days per year of training and drills using realistic simulations of system emergencies, in addition to other training required to maintain qualified operating personnel.	R3. At least every 12 months, each Reliability Coordinator, Balancing Authority and Transmission Operator shall provide each System Operator with at least 32 hours of emergency operations training applicable to its organization that reflect emergency operations topics, which includes system restoration using drills, exercises or other training required to maintain qualified personnel. R3.1 Each Reliability Coordinator, Balancing Authority and Transmission Operator that has operational authority or control over Facilities with established IROLs or has established operating guides or protection systems to mitigate IROL violations shall provide each System Operator with emergency operations training using simulation technology such as a simulator, virtual technology, or other technology that replicates the operational behavior of the BES during normal and emergency conditions. Note: PER-005-1 R3 includes PER-004-1 R2 and therefore PER-004-1 R2 should be retired. (Note that the five days per year of training has been clarified to mean 32 hours of training.)
R3. Reliability Coordinator operating personnel shall have a comprehensive understanding of the Reliability Coordinator Area and interactions with neighboring Reliability Coordinator Areas.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time.

PER-004-1 Requirement	PER-005-1 Requirements
	Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R2) duplicate PER-004-1 R3 and therefore PER-004-1 R3 should be retired.
R4. Reliability Coordinator operating personnel shall have an extensive understanding of the Balancing Authorities, Transmission Operators, and Generation Operators within the Reliability Coordinator Area, including the operating staff, operating practices and procedures, restoration priorities and objectives, outage plans, equipment capabilities, and operational restrictions.	R1. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall use a systematic approach to training to establish a training program for the BES company-specific reliability-related tasks performed by its System Operators and shall implement the program. R2. Each Reliability Coordinator, Balancing Authority and Transmission Operator shall verify each of its System Operator's capabilities to perform each task identified in R1.1 at least one time. Note: The training program (PER-005-1 R1) and an assessment of each System Operator's capabilities (PER-005-1 R3) duplicate PER-004-1 R4 and therefore PER-004-1 R4 should be removed.

A red-line version of PER-004-1 is posted with this Implementation Plan.

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinators
- Balancing Authorities
- Transmission Operators

Proposed Effective Date

Compliance with PER-005 shall be implemented over a three-year period, as follows:

- Requirement R1 and Requirement R2 become effective ~~24 months after~~ the first day of the first calendar quarter 24 months after~~following~~ regulatory approval or, in those jurisdictions where regulatory approval is not required, these requirements ~~otherwise~~ become~~s~~ effective ~~24 months after~~ the first day of the first calendar quarter 24 months after Board of Trustee~~s~~ adoption.
- PER-002-0 Requirement R4 and PER-004-1 Requirement R2 are presently in effect and will be retired when PER-005-1 Requirement R3 becomes effective on the first day of the first calendar quarter after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter following Board of Trustees adoption.
- ~~is presently in effect and will remain in effect upon approval of this Standard~~.
- Sub-r~~R~~equirement R3.1 becomes effective on~~36 months after~~ the first day of the first calendar quarter 36 months after~~following~~ applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, this sub-requirement becomes effective on ~~36 months after~~ the first day of the first calendar quarter 36 months after Board of Trustee~~s~~ adoption.

Training

- The SPT will provide training on the use of a systematic approach to training, either in conjunction with a NERC workshop or independent PER-005 training, dependent on the preference of the industry.

PER-005 System Personnel Training
Reference Document

Reference #1: Determining Task Performance Requirements

The purpose of this reference is to provide guidance in writing a performance standard that describes the desired outcome of a task. A standard for acceptable performance should be in either measurable or observable terms.

Clear standards of performance are necessary for an individual to know when he or she has completed the task and to ensure agreement between employees and their supervisors on the objective of a task. Performance standards answer the following questions:

How timely must the task be performed?

Or

How accurately must the task be performed?

Or

With what quality must it be performed?

Or

What response from the customer must be accomplished?

When a performance standard is quantifiable, successful performance is more easily demonstrated. For example, in the following task statement, the criteria for successful performance is to return system loading to within normal operating limits, which is a number that can be easily verified.

> Given a System Operating Limit violation on the transmission system, implement the correct procedure for the circumstances to mitigate loading to within normal operating limits.

Even when the outcome of a task cannot be measured as a number, it may still be observable. The next example contains performance criteria that is qualitative in nature, that is, it can be verified as either correct or not, but does not involve a numerical result.

> Given a tag submitted for scheduling, ensure that all transmission rights are assigned to the tag per the company Tariff and in compliance with NERC and NAESB standards.

Reference #3: Normal and Emergency Operations Topics

These topics are identified as meeting the topic criteria for normal and emergency operations training per Requirement 1 and Requirement 3 of this standard.

A. Recognition and Response to System Emergencies

1. Emergency drills and responses
2. Communication tools, protocols, coordination
3. Operating from backup control centers
4. System operations during unstudied situations
5. System Protection
6. Geomagnetic disturbances weather impacts on system operations
7. System Monitoring – voltage, equipment loading
8. Real-time contingency analysis
9. Offline system analysis tools
10. Monitoring backup plans
11. Sabotage, physical, and cyber threats and responses

B. Operating Policies and Standards Related to Emergency Operations

1. NERC standards that identify emergency operations practices (e.g. EOP Standards)
2. Regional reliability operating policies
3. Sub-regional policies and procedures
4. ISO/RTO policies and procedures

C. Power System Restoration Philosophy and Practices

1. Black start
2. Interconnection of islands – building islands
3. Load shedding – automatic (under-frequency and under-voltage) and manual
4. Load restoration philosophies

D. Interconnected Power System Operations

1. Operations coordination
2. Special protections systems
3. Special operating guides
4. Voltage and reactive control, including responding to eminent voltage collapse
5. Understanding the concepts of Interconnection Reliability Operating Limits versus System Operating Limits
6. DC tie operations and procedures during system emergencies
7. Thermal and dynamic limits
8. Unscheduled flow mitigation − congestion management
9. Local and regional line loading procedures
10. Radial load and generation operations and procedures
11. Tie line operations
12. E-tagging and Interchange Scheduling
13. Generating unit operating characteristics and limits, especially regarding reactive capabilities and the relationship between real and reactive output

E. Technologies and Tools

1. Forecasting tools
2. Power system study tools
3. Interchange Distribution Calculator (IDC)

F. Market Operations as They Relate to Emergency Operations

1. Market rules
2. Locational Marginal Pricing (LMP)
3. Transmission rights
4. OASIS
5. Tariffs
6. Fuel management
7. Real-time, hour-ahead and day-ahead tools

Definitions of Simulation and Simulators

Georgia Institute of Technology
Modeling & Simulation for Systems Engineering
http://www.pe.gatech.edu/conted/servlet/edu.gatech.conted.course.ViewCourseDetails?COURSE_ID=840

Simulation is the process of designing a model of a system and conducting experiments to understand the behavior of the system and/or evaluate various strategies for the operation of the system. The modeling & simulation life cycle refers to steps that take place during the course of a simulation study, which include problem formulation, conceptual model development, and output data analysis. Explore modeling & simulation, by using the M&S life cycle as an outline for exploring systems engineering concepts.

University of Central Florida – Institute for Simulation & Training
http://www.ist.ucf.edu/overview.htm

Just what is "simulation" anyway (or, Simulation 101)?
And what about "modeling"? (see below)
But what does IST do with simulations? (answer)

In its broadest sense, simulation is imitation. We've used it for thousands of years to train, explain and entertain. Thanks to the computer age, we're really getting good at using simulation for all three.

Simulations (and models, too) are abstractions of reality. Often they deliberately emphasize one part of reality at the expense of other parts. Sometimes this is necessary due to computer power limitations. Sometimes it's done to focus your attention on an important aspect of the simulation. Whereas models are mathematical, logical, or some other structured representation of reality, simulations are the specific application of models to arrive at some outcome (more about models, below).

Three types of simulations
Simulations generally come in three styles: live, virtual and constructive. A simulation also may be a combination of two or more styles.

Live simulations typically involve humans and/or equipment and activity in a setting where they would operate for real. Think *war games* with soldiers out in the field or manning command posts. Time is continuous, as in the real world. Another example of live simulation is testing a car battery using an electrical tester.

Virtual simulations typically involve humans and/or equipment in a computer-controlled setting. Time is in discrete steps, allowing users to concentrate on the important stuff, so to speak. A flight simulator falls into this category.

Constructive simulations typically do not involve humans or equipment as participants. Rather than by time, they are driven more by the proper sequencing of events. The anticipated path of a hurricane might be "constructed" through application of temperatures, pressures, wind currents and other weather factors.

A simulator is a device that may use any combination of sound, sight, motion and smell to make you feel

that you are experiencing an actual situation. Some video games are good examples of low-end simulators. For example, you have probably seen or played race car arcade games.

The booths containing these games have a steering wheel, stick shift, gas and brake pedals and a display monitor. You use these devices to "drive" your "race car" along the track and through changing scenery displayed on the monitor. As you drive, you hear the engine rumble, the brakes squeal and the metal crunch if you crash. Some booths use movement to create sensations of acceleration, deceleration and turning. The sights, sounds and feel of the game booth combine to create, or simulate, the experience of driving a car in a race.

Most people first think of "flight simulators" or "driving simulators" when they hear the term "simulation." But simulation is much more.

Because they can recreate experiences, simulations hold great potential for training people for almost any situation. Education researchers have, in fact, determined that people, especially adults, learn better by experience than through reading or lectures. Simulated experiences can be just as valuable a training tool as the real thing.

Simulations are complex, computer-driven *re*-creations of the real thing. When used for training, they must recreate "reality" accurately, otherwise you may not learn the right way to do a task.

For example, if you try to practice how to fly in a flight simulator game that does not accurately *model* (see definition, below) the flight characteristics of an airplane, you will not learn how a real aircraft responds to your control.

Building simulator games is not easy, but creating simulations that *accurately* answer such questions as *"If I do this, what happens then?"* is even more demanding.

Over the years, government and industry, working independently with new technologies and hardware, developed a wide range of products and related applications to improve simulation science. This independence, however, often led to sporadic or redundant research efforts.

To benefit from each other's latest advances, researchers from across the country needed better communication and, ideally, a common source of supporting academic studies. The State of Florida recognized these needs and in 1982 established the Institute for Simulation and Training at the University of Central Florida.

What we do at IST

IST's mission is to advance the state of the art and science of modeling and simulation by

- performing basic and applied simulation research
- supporting education in modeling and simulation and related fields
- serving public and private simulation communities

We don't produce simulator hardware. That's a job for industry. But we've successfully developed working prototype hardware that provides new uses for simulations. We'll also help develop new applications for existing hardware, and scientifically test the results using human factors and other criteria for effective human-machine interface and learning. Too often overlooked, human factors testing is crucial to ultimate simulation effectiveness. We're fortunate to be closely connected, through joint faculty appointments and

working relationships, with one of the top, if not the leading human factors department in the nation—right here at UCF.

We also explore the frontiers of simulation science, expanding our knowledge of ways to stimulate the human senses with advanced optical, audio and haptic technologies.

Still obfuscated? Go here...

Modeling: a model definition

A computer model, as used in modeling and simulation science, is a mathematical representation of something—a person, a building, a vehicle, a tree—any object. A model also can be a representation of a process—a weather pattern, traffic flow, air flowing over a wing.

Models are created from a mass of data, equations and computations that mimic the actions of things represented. Models usually include a graphical display that translates all this number crunching into an animation that you can see on a computer screen or by means of some other visual device.

Models can be simple images of things—the outer shell, so to speak—or they can be complex, carrying all the characteristics of the object or process they represent. A complex model will simulate the actions and reactions of the real thing. To make these models behave the way they would in real life, accurate, real-time simulations require fast computers with lots of number crunching power.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Final Ballot Results

Now available at: https://standards.nerc.net/Ballots.aspx

Interpretation of TOP-002-2 — Normal Operations Planning, Requirement R11 (Project 2008-13)

The ballot has passed and will be submitted to the NERC Board of Trustees for approval.

The recirculation ballot for the interpretation of TOP-002-2 — Normal Operations Planning Requirement R11 (requested by Orlando Utilities Commission) ended December 19, 2008. The final ballot results are shown below. The Ballot Results Web page provides a link to the detailed results.

Quorum: 87.62 %
Approval: 97.47 %

Project page: http://www.nerc.com/filez/standards/Project2008-13_TOP-002_Interpretation_OUC.html

Standard FAC-008-2 — Facility Ratings (Project 2006-09)

The ballot has failed.

The recirculation ballot for Standard FAC-008-2 — Facility Ratings (Project 2006-09) ended December 19, 2008. The final ballot results are shown below. The Ballot Results Web page provides a link to the detailed results.

Quorum: 93.04 %
Approval: 57.37 %

Project page: http://www.nerc.com/filez/standards/Facility_Ratings_Project_2006-09.html

Standard PER-005-1— System Personnel Training (Project 2006-01)

The ballot has passed and will be submitted to the NERC Board of Trustees for approval.

The recirculation ballot for Standard PER-005-1— System Personnel Training (Project 2006-01) ended December 22, 2008. The final ballot results are shown below. The Ballot Results Web page provides a link to the detailed results.

Quorum: 91.48 %
Approval: 80.63 %

Project page: http://www.nerc.com/filez/standards/System-Personnel-Training.html

Ballot Criteria

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance,
please contact Shaun Streeter at shaun.streeter@nerc.net or at 609.452.8060.
