FRCC Transmission Working Group	For R6 please consider the following revision: "Each TP and PC shall define and document within their planning assessment any criteria or methodology used in their analysis to identify system instability /deleted/ for /deleted/ conditions such as cascading outages, voltage instability, or uncontrolled islanding." As written originally it could be taken to be the methods for determining if you have instability during a cascading outage, rather than the methods for determining if you are at risk for instability like a cascading outage. the word "potential" into "identify the potential for System instability ". The criteria and methodology may be used to determine if further analysis is warranted, e.g., if steady state voltages fall below 0.9 per unit, then duedo a voltage stability study. Going below 0.9 does not mean voltage collapse, but, it may be an indicator to study it; hence, the word "potential".
Response: The SDT disagrees with your suggestion of adding the term 'potential' in Requirement R6. The Standard does not preclude the application of criteria or methodology to determine potential instability. No change made.	
Orlando Utilities Commission	For R6 please consider the following revision: "Each TP and PC shall define and document within their planning assessment any criteria or methodology used in <<their>> analysis to identify system instability //for// conditions such as cascading outages, voltage instability, or uncontrolled islanding." Adding the text in <<>> and deleting the text in ////. As written originally it could

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 6
	be taken to be the methods for determining if you have instability during a cascading outage, rather than the methods for determining if you are at risk for instability like a cascading outage.
<p>Response: The SDT disagrees with your assessment that the language of "... criteria or methodology used in the analysis to identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding" is misleading. The System instability applies to the cascading outages, voltage instability, OR uncontrolled islanding, not just to cascading outages. No change made.</p>	
Gainesville Regional Utilities	I believe that this requirement is better defined and documented at the regional level with all involved parties contributing. If consensus is not achievable, then the exception utilities can create their own knowing that they need technically valid references to support their position.
<p>Response: The SDT disagrees as it is better to allow the individual a Transmission Planner or Planning Coordinator to determine this versus the region as the region could be quite varied. The Requirement does not preclude the region from doing as you suggest with coordination in the region. No change made.</p>	
FirstEnergy Corp	If an entity is required to adhere to its Facility Ratings, how is it feasible that a cascade violation would occur? FirstEnergy questions the need for this review based on Table 1 performance requirements and the need to adhere to Facility Ratings.
<p>Response: This may not be an issue in the application of this criteria or methodology for planning events P0 through P7, however, this needs to be available when evaluating System response when applying extreme events.</p>	
Arizona Public Service Co.	It is not clear who this applies to. Is it both TP and PC individually, or one of the two, or both jointly?
<p>Response: The requirement is for both.</p>	
American Electric Power	M6 does not appear to align with the content of R6. M6 needs to be reworded to reference documentation of criteria or methodology rather than studies. Corresponding changes will also need to be made to the corresponding bullet under Data Retention.
Manitoba Hydro	The R6 text does not match the Data Retention 6th bullet text "studies performed". The Retention 6th bullet text should be updated to reflect the R6 text "criteria or methodology used in the analysis to identify System instability". The R6 text does not match the M6 text. The M6 text should be revised as follows: replace "studies utilized in preparing the Planning Assessment" with "criteria and methodology to identify System instability used within its analysis".
<p>Response: The SDT agrees and has changed the language of Measure M6 and also the language for Data Retention.</p> <p>M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability that was utilized in preparing the Planning Assessment in accordance with Requirement R6.</p> <p>Requirement R6, data retention - The documentation specifying any criteria or methodology utilized in support of its Planning Assessments since the last</p>	

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 6
compliance audit in accordance with Requirement R6 and Measure M6.	
Ameren	M6: The wording on this measure appears to have been copied from M3 or M4 but is not appropriate since R6 addresses criteria and methodology and not a study.
SERC Dynamics Review Subcommittee (DRS)	M6: The wording on this measure appears to have been copied from M3 or M4 but is not appropriate since R6 addresses criteria and methodology but not a study.
Southern Company	M6: The wording on this measure appears to have been copied from M3 or M4 but is not appropriate since R6 addresses criteria and methodology and not a study. Replace the word "studies" with "criteria or methodology".
TVA System Planning	M6: The wording on this measure appears to have been copied from M3 or M4 but is not appropriate since R6 addresses criteria and methodology and not a study.
SERC Planning Standards Subcommittee	Comments: M6: The wording on this measure appears to have been copied from M3 or M4 but is not appropriate since R6 addresses criteria and methodology and not a study.
<p>Response: The SDT agrees and has changed the language of Measure M6.</p> <p>M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability that was utilized in preparing the Planning Assessment in accordance with Requirement R6.</p>	
MidAmerican Energy Company	MidAmerican commends the SDT for their hard work on this standard. MidAmerican does have comments about this requirement though. MidAmerican recommends the data retention for R6 and M6 be revised to change "All" to "The". The word "All" is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: "THE studies performed in support". The word in caps is a word suggested to be added.
NERC Standards Review Subcommittee	The MRO NSRS recommends the data retention for R6 and M6 be revised to change "All" to "The". The word "All" is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: "The studies performed in support".
<p>Response: The SDT agrees with your suggestion of changing the "All" to "The" in the data retention section for Requirement R6 and Measure M6.</p> <p>M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability that was utilized in preparing the Planning Assessment in accordance with Requirement R6.</p> <p>Requirement R6, data retention - The documentation specifying any criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.</p>	
Duke Energy	R6 includes the phrase "cascading outages". We believe that the word "cascading" should be the capitalized NERC-defined

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 6
	term "Cascading".
<p>Response: The SDT agrees with your suggestion of changing "cascading" to Cascading".</p>	
<p>R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading , voltage instability, or uncontrolled islanding.</p>	
Oklahoma Gas & Electric	R6 OG&E believes the Transmission Coordinator be held accountable for R6. The Transmission Coordinator should coordinate this type of study/documentation with the Transmission Planner for a regional look of the whole system. For example Southwest Power Pool should coordinate this type of study/documentation with the members of the Southwest Power Pool to better examine the entire region of the Southwest Power Pool. We do not see the need to duplicate the work.
<p>Response: The SDT assumes that you mean Planning Coordinator. The requirement is for both entities.</p>	
Tri-State Generation and Transmission Association	R6 seems OK but check M6. Should this refer to R2 and not R6?
Independent Electricity System Operator	We do not have any comments on the requirement, VRF, Time Horizon and the VSL. However, Measure M6 (which refers to "studies utilized in preparing the Planning Assessment") does not seem to be relevant to Requirement R6, which deals with defining and documenting the criteria and methodology used in the analysis to identify System instability.
<p>Response: The SDT agrees and has changed the language of Measure M6.</p> <p>M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability that was utilized in preparing the Planning Assessment in accordance with Requirement R6.</p>	
MAPP	Suggest removing "Transmission Planner" since the PC performs the assessment.
<p>Response: The SDT disagrees with your comment as both entities should be documenting their criteria.</p>	

7. Requirement R7 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Summary Consideration: The SDT modified Measure M7 to clarify the supporting documentation used to establish the individual and joint responsibilities for performing the required studies. The SDT also clarified the data retention associated with Requirement R7. Measure M7 and the data retention associated with Requirement R7 now read:

M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.

Requirement R7 data retention: The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

Organization	Comments for Question 7
ERCOT ISO	<p>* Will any agreements made in R7 override the “each TP and PC” requirement? Would it be appropriate to say: “Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity’s individual and joint responsibilities for performing the required studies and assessments.”*</p> <p>What kind of documentation will be acceptable to demonstrate “each entity’s individual and joint responsibilities”?</p>
<p>Response: The SDT sees no additional clarity being provided by your suggested wording. No change made.</p> <p>To address your concerns the SDT has changed Measure M7 to clarify the type of supporting documentation that could be used to establish individual and joint responsibilities for performing the required studies.</p> <p>M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.</p>	
American Transmission Company	<p>Revise part of the requirement text to read, “. . . identify each entity’s individual and joint responsibilities . . .” to provide better clarity.</p> <p>Perhaps this requirement should be listed at the beginning of the Requirements section, instead being mentioned near the end of this section.</p>
<p>Response: The SDT sees no additional clarity being provided by your suggested wording. No change made.</p> <p>The SDT discussed the change and based on industry input decided not to change the order of the requirements.</p>	

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 7
Progress Energy Florida, Inc.	As PEF is opposed to TPL-001-1 as a whole, PEF will have no further comment on this issue other than to encourage all appropriate parties to review PEF's previous comments to this effect.
Response: Throughout the drafting process, the SDT has carefully considered your comments as well as comments from other industry members.	
CenterPoint Energy	CenterPoint Energy believes R7 relates to matters best addressed through registration, such as JROs or delegation agreements. If other commenters agree, CenterPoint Energy recommends that R7 be deleted.
Response: This requirement was inserted to address industry concern regarding the potential for duplication of work. No change made.	
TVA System Planning	In the VSL associated with R7, we believe that failure to determine and identify one responsibility should be a moderate VSL, failure to determine and identify two responsibilities should be a high VSL, while failure to determine and identify three responsibilities should be a severe VSL. Otherwise failing to document only one responsibility would result in a severe VSL.
Response: The SDT believes that procedurally, Requirement R7 is binary. No change made.	
MidAmerican Energy Company	MidAmerican commends the SDT for their hard work on this standard. MidAmerican does have comments about this requirement though. MidAmerican recommends the data retention for R7 and M7 be revised to delete "All". The word "All" is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: "The current, in force agreement on identified responsibilities, as well as such agreements in force".
NERC Standards Review Subcommittee	The MRO NSRS recommends the data retention for R7 and M7 be revised to delete "All". The word "All" is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: "The current, in force agreement on identified responsibilities, as well as such agreements in force".
<p>Response: The SDT agrees that the proposed change to Measure M7 and the data retention removes the potential for an unintended interpretation.</p> <p>M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.</p> <p>Requirement R7 data retention: The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.</p>	
Tri-State Generation and Transmission Association	R7 - Duties of the Planning Coordinator are being created and changed as we go along, like changing rules of a flag football game as it is played. Is there any requirement that every TP have a PC? As far as we know, the PC was introduced as an additional authority level for regional or inter-utility study work. Previous R7 wording asked PCs and TPs to work together. The present wording implies that every TP must have a PC which is a separate entity, and that PC would dictate study responsibilities. The wording of R4.4.1 seems much better in this regard.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 7
<p>Response: It does not create the requirement that each Transmission Planner report to a Planning Coordinator, that relationship is defined in the Functional Model. This requirement specifies that, if there is a relationship between a Transmission Planner and Planning Coordinator there is no need for duplicate analysis if each entity agrees on the delegation of work. No change made.</p>	
NYISO	R7. - The NYISO requests clarification as to whether the PC will be expected to distribute the TP Planning Assessments as part of its coordination requirement?
<p>Response: This standard does not require the Planning Coordinator to distribute the individual Transmission Planner assessments.</p>	
MAPP	Suggest moving this requirement to the head of the list. It's a basis for the rest of this standard.
<p>Response: The SDT discussed the change and based on industry input decided not to change the order of the requirements.</p>	
Orlando Utilities Commission	The intent is much clearer, thank you for revising this.
Oklahoma Gas & Electric	We agree that it should be clearly stated who does what between the Transmission Planner and the Planning Coordinator. We feel like this will eliminate duplication of work and create a better overall regional examination of the electric grid.
Gainesville Regional Utilities	Looks good.
<p>Response: Thank you.</p>	
Florida Municipal Power Agency, and its Member Cities	The Measure and Data Retention for R7 is ambiguous. While the measure could be interpreted as not requiring a contract, the data retention uses the words "in force agreement" which implies a formal contract, where roles and responsibilities could very well be assigned in regional planning committee minutes and ensuing e-mail correspondence. Suggest changing the words to "Documentation of agreement on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence" in both locations.
<p>Response: The SDT agrees that the proposed changes to Measure M7 and the data retention remove the potential for an unintended interpretation. Measure M7 and the data retention associated with Requirement R7 now read:</p> <p>M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.</p> <p>Requirement R7 data retention: The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.</p>	

8. Requirement R8 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Summary Consideration: The SDT believes revisions to Requirement R3, parts 3.4 and Requirement R4, part 4.4 will clarify the expectation that Transmission Planners and Planning Coordinators analyze Table 1 events outside their Systems for reliability impacts. The proposed, new Requirement R8 (old Requirement R7) requirement (below), will ensure appropriate information is exchanged between Transmission Planners and Planning Coordinators for sharing of information, review, and coordination of plans in conformance with Order 693 paragraph 1755 and 1756 expectations. The SDT believes the NERC Rules and Procedures and delegation agreements cover existing TPL-005 & -006 assessment requirements for regional and inter-regional assessments. The aggregate effect of the above items will be an overlapping assessment of BES reliability from each Transmission Planner area up through each Interconnection.

R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.

R8 data retention. Three calendar years of the notices and other documentation employed in accordance with Requirement R8 and Measure M8

R8 VSL	The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners or adjacent Planning Coordinators, and to one functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	N/A	The responsible entity failed to distribute the results of its Planning Assessment to its adjacent Transmission Planners or adjacent Planning Coordinators, and to any functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.
---------------	--	-----	---	--

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
Independent Electricity System Operator	<p>(1) No comments on the requirement, measure, VRF and Time Horizon.</p> <p>3) VSLs:(a) We do not agree with the Severe VSL condition. In our view, distributing planning assessment results is the intent of the requirement; it is more important to share results than to field questions from recipients of the results. Assigning a Severe VSL for failing Part 8.1 puts the driver at the wrong place.(b) The condition under Low and High seems to be the same. In the Low, failing to distribute the results to ANY ONE of the TPs and PCs means none, which is the same as the condition for High unless the condition under Low really means failing to distribute the results to ONE of the TPs and PCs whereas the High really means failing to distribute the results to two or more of the TPs and PCs. If this is the proper interpretation, then we'd suggest the VSLs be revised as follows:Low: failing to respond to comments within 90 daysHigh: failing to distribute the results to one of the TPs and PCsSevere: failing to distribute the results to two or more of the TPs and PCs.Alternatively, a Moderate can be added to capture the condition for failing to distribute the results to two of the TPs and PCs, while the Severe can become failure to distribute the results to three of the TPs and PCs.</p>

Response: The SDT disagrees because the requirement's focus is on coordination of planning. If questions/concerns are not responded to, coordination of planning is not being accomplished. The VSLs related to failing to distribute results are appropriate. However, the SDT agrees that the Lower VSL is unclear and will make a change to delete the word "any". In addition, the SDT has modified the Lower and High VSL wording to be clearer.

R8 VSL	The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners or adjacent Planning Coordinators, and to one functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	N/A	The responsible entity failed to distribute the results of its Planning Assessment to its adjacent Transmission Planners or adjacent Planning Coordinators, and to any functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

ERCOT ISO	<p>* Will any agreements made in R7 override the "each TP and PC" requirement? To clarify this, the requirement could be rephrased: "In accordance to the responsibilities assigned in R7, the responsible Transmission Planners and Planning Coordinators shall distribute?".**</p> <p>Include "within the interconnection" such as: "distribute its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners within the interconnection and to any functional entity that indicates a reliability related need for the Planning Assessment results"* Should "reliability related need" be defined? This appears in multiple standards.</p>
-----------	---

Response: No, the agreements made in Requirement R7 pertain to performance of the required studies and will not override the Planning Coordinator and Transmission Planner's responsibilities under Requirement R8 relating to distribution of Planning Assessments.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
	<p>The SDT does not believe the suggested language adds any clarity. No change made.</p> <p>A definition is not required. The present wording is in other approved standards and is sufficiently clear based on experience to date. No change made.</p>
Northeast Utilities	<p>[R8.1] There is no statute of limitation for comments, nor is there a limit on the number of comments.</p> <p>There is also potential conflict with the deadline for completing a study and when comments may be submitted.</p> <p>If this requirement is retained the following is suggested: "Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to the functional entities that the Planning Coordinator recognizes as having a reliability need for the Planning Assessment results".</p>
	<p>Response: The SDT disagrees that there should be a statute of limitation for asking questions related to coordination of planning and believes parties will act appropriately.</p> <p>The SDT disagrees that there should be a limit to the number of questions allowed related to coordination of planning and believes parties will act appropriately. The requirement is to distribute the results of the completed Planning Assessments associated with this standard therefore all related supporting studies are complete and there is no potential conflict.</p> <p>The word "indicates" has been changed to "has" to be clearer. This revised wording has the same meaning as the suggested wording and is sufficiently clear. Both the Transmission Planner and Planning Coordinator may be asked for their Planning Assessment by an entity with a reliability related need. Therefore the statement must apply to both the Transmission Planner and Planning Coordinator.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p>
Oncor Electric Delivery	<p>8.1 This requirement should be removed because it appears redundant to FERC 890. (suggest having one statement or the other)</p> <p>However, if it isn't, then the Term "documented" in R8.1 the term documented needs to be defined. Suggest adding the qualifier "written" i.e., "If a recipient of the Planning Assessment results provides "documented written" comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a "documented written" response to that recipient within 90 calendar days of receipt of those comments.</p> <p>The requirement to distribute reports to entities with "need" has very significant CEII implications. This should be tightened to a "bona fide reliability need" for the information, requiring CEII or confidential material handling procedures.</p> <p>R8, 8.1, and Measurement M8 There is no statute of limitation for comments (Suggest clarifying what we mean here assume we are not referring to the NERC Standards Commenting Process), nor is there a limit on the number of comments. There is also potential conflict with the deadline for completing a study and when comments may be submitted (e.g. comments are received the day before the study is to be completed. If this requirement is retained the following is suggested: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to functional entities that demonstrated a reliability need with concurrence from their planning coordinator for the Planning Assessment results. [I think there are issues still with this language. I think it needs to say "and to the functional entities that the Planning Coordinator recognizes as having a reliability need for the Planning Assessment results."]</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
	<p>Compliance 1.4 Data Retention, last bullet - this relates back to Requirements R8, 8.1, and Measurement M8. This seems to be a nuisance requirement to get in trouble for. [Requirement is to keep 3 years of notifications related to R8 & 8.1.]</p>
<p>Response: The SDT seeks to retire the existing TPL-005 & -006 while continuing to meet the purpose of their requirements. FERC Order 693 and 890 each provide expectations and direction to the ERO regarding enhancement of regional coordination and planning. The SDT believes the inclusion of Requirement R8 in the standard and performance of the regional assessments required under NERC delegation agreements will meet these objectives.</p> <p>The present wording is in other approved standards and is sufficiently clear based on experience to date. Bona fide does not add significant clarity.</p> <p>Control of CEII and control of competitive market information per Standards of Conduct are a fundamental expectation of all industry participants and is not required in the standard.</p> <p>The SDT disagrees that there should be a statute of limitation for asking questions related to coordination of planning and believes parties will act appropriately. The SDT also disagrees that there should be a limit to the number of questions allowed related to coordination of planning and believes parties will act appropriately. The requirement is to distribute the results of the completed Planning Assessments associated with this standard therefore all related supporting studies are complete and there is no potential conflict. The SDT agrees the wording is somewhat unclear and will clarify by adding “adjacent” before Transmission Planner. The word "indicates" has been changed to “has” to be clearer. This revised wording has the same meaning as the suggested wording and is sufficiently clear.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p> <p>The SDT believes that retaining the documentation for 3 years is consistent with other standards and appropriate for audit purposes. No change made.</p>	
<p>Progress Energy Florida, Inc.</p>	<p>As PEF is opposed to TPL-001-1 as a whole, PEF will have no further comment on this issue other than to encourage all appropriate parties to review PEF’s previous comments to this effect.</p>
<p>Response: Throughout the drafting process, the SDT has carefully considered your comments as well as comments from other industry members.</p>	
<p>CenterPoint Energy</p>	<p>CenterPoint Energy believes R8 is over-reaching and recommends deleting it. CenterPoint Energy is particularly concerned about requiring assessments to be distributed to “any functional entity that indicates a reliability related need”. There is already a process in place for entities to request and receive the FERC Form 715 submittals of other entities. FERC’s process appropriately recognizes and addresses CEII issues and imposes a requirement that the entity demonstrate need for the information and that the industry complies with certain security-related requirements. Beyond CEII matters, transmission planning information can have implications for market entities bidding on congestion rights in competitive energy markets. Therefore, the dissemination of transmission planning information may be governed by the regulatory authority having jurisdiction over the market functions, which is not necessarily FERC in all cases. In any case, given the availability of the FERC 715 process, there is no need for a somewhat duplicative requirement in this standard. Accordingly, CenterPoint Energy recommends that R8 be deleted in its entirety.</p>
<p>Response: Requirement R8 is necessary to ensure that appropriate coordination of planning occurs and supports regional assessments performed under NERC delegation agreements.</p> <p>Control of CEII is a fundamental expectation of all industry participants and the "reliability related need" restriction ensures only appropriate parties must be given</p>	

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
Western Area Power Adm - RMR	Clarity is needed in the phrase functional entity in R8. Is this referring to the entities identified in the Functional Model or something else?
Deseret Power	Comments: Clarity is needed in the phrase functional entity in R8. Is this referring to the entities identified in the Functional Model or something else?
<p>Response: Yes - The NERC Reliability Functional Model defines the meaning of the term "functional entity".</p>	
SERC Planning Standards Subcommittee	<p>Comments: R8: It is not clear whether the assessment results must be distributed to all parties of interest, or if it would be sufficient to post the assessment at a central location, and distribute information to access the information. Also, FERC Standards of Conduct issues would come into play in assuring that the information is available only to appropriate personnel.</p> <p>R8: It is not clear if the requirement to provide assessment results to adjacent PCs and TPs is required, or only upon a reliability related request. R8: The PC and TP responsibilities should be stated separately for clarity.</p> <p>Part 8.1: It is not clear what the form of the response to the comments should be " would an acknowledgement be sufficient, or would it be necessary to pursue a process of examining comments in detail and revising and reissuing the corresponding assessment" The requirement needs to be revised to make the above points clear.</p>
<p>Response: The standard does not specify the mechanics of distribution of the information, only that it must occur. The method proposed would be acceptable as long as it met Measure M8 and Section 1.4 under compliance monitoring. Control of competitive market information per Standards of Conduct is a fundamental expectation of all industry participants and the "reliability related need" restriction ensures only appropriate parties must be given planning assessments.</p> <p>The SDT agrees and will clarify by adding "adjacent" before Transmission Planner and added wording requiring a written request. The word "indicates" has been changed to "has" to be clearer.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p> <p>The standard should not specify the means of providing and responding to comments, but ensures that appropriate communication is initiated. No change made.</p>	
Orlando Utilities Commission	Excellent requirement, thank you for revising this
<p>Response: Thank you.</p>	
Southern Company	<p>For additional clarity in who should receive the assessment, we recommend replacing "indicates" with "has" and adding words to the end of the sentence so that it states the following: "and to any functional entity that has a reliability related need for the Planning Assessment results and provides a written request."</p> <p>For Part 8.1, we do not believe the intent is for casual emails to be documented and formally responded to. And we do not believe that anyone who happens to receive the assessment should be able to comment. Therefore, we recommend the following wording: "If one of the above named entities provides formal written comments on the results, the respective Planning Coordinator or</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
	Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments." If these recommendations are accepted, then the wording of M8 would have to change accordingly.
<p>Response: The SDT agrees and will clarify by adding "adjacent" before Transmission Planner and added wording requiring a written request.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p> <p>The standard should not specify the means of providing and responding to comments, but ensures that appropriate communication is initiated. The SDT has altered the wording of Requirement R8 to provide clarity and to attempt to alleviate your concern.</p>	
Manitoba Hydro	Is there a need to retain comments and responses to comments for Requirement R8?
<p>Response: Yes, see Measure M8 and the following changes to 1.4 Data Retention.</p> <p>R8 data retention. Three calendar years of the notices and other documentation employed in accordance with Requirement R8 and Measure M8</p>	
SCE&G	It is not clear if the requirement to provide assessment results to adjacent Planning Coordinators and Transmission Planners is always required or only upon a reliability related request.
<p>Response: The SDT considers the distribution to Planning Coordinators and Transmission Planners as mandatory and has changed the wording of Requirement R8 to address the wording for other functional entities.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p>	
MidAmerican Energy Company	<p>MidAmerican commends the SDT for their hard work on this standard. MidAmerican does have comments about this requirement though. MidAmerican asks that the SDT revise R8 to limit the need to provide the Planning Assessment as follows "adjacent Planning Coordinators and ADJACENT Transmission Planners and to any REGISTERED functional entity"? The words in all caps are words that MidAmerican suggests are added to the requirement to clarify that the word adjacent also applies to Transmission Planners and to clarify that the functional entity must be registered in order for the requirement to provide the Planning Assessment to apply.</p> <p>MidAmerican asks that the low VSL for R8 be revised to delete the word "any" from the requirement so that the requirement will read "The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners".</p>
<p>Response: The SDT agrees and will clarify by adding "adjacent" before Transmission Planner, but the SDT believes adding "registered" is unnecessary because it is understood that it relates to NERC Reliability Standards.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p>	

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8			
The SDT agrees and will make change to delete the word “any”.				
R8 VSL	The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners or adjacent Planning Coordinators, and to one functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	N/A	The responsible entity failed to distribute the results of its Planning Assessment to its adjacent Transmission Planners or adjacent Planning Coordinators, and to any functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.
Progress Energy Carolinas	<p>Need to define “adjacent” Planning Coordinators. Does this mean a neighbor with at least one joint interconnection?</p> <p>The requirement to provide the Planning Assessment “to any functional entity that indicates a reliability related need” should be made subject to applicable confidentiality and CEII provisions.</p>			
<p>Response: The SDT believes "adjacent" is an understood term and would apply to any neighbor with a joint Interconnection. No change made.</p> <p>Control of CEII is a fundamental expectation of all industry participants and the "reliability related need" restriction ensures only appropriate parties must be given planning assessments. No change made.</p>				
Tri-State Generation and Transmission Association	R8 - We find that web-site posting would be sufficient distribution if it were not for the need for auditability. Please consider a way to qualify web-posting as an acceptable distribution method.			
<p>Response: The standard does not specify the mechanics of distribution of the information, only that it must occur. The method proposed would be acceptable as long as it met Measure M8 and 1.4 under compliance monitoring. No change made.</p>				
NYISO	<p>R8- It should be made clear that a TP should not be required to send their assessment to adjacent PCs. Likewise the PCs should not be required to send their assessment to TPs not in their footprint.</p> <p>R8.1: This should not be required until the Assessment is complete and posted. Additionally, this could be an administratively intense task to respond to each and every comment and document that a response is made within 90 days. Is there any room for an extension to this requirement?</p>			
<p>Response: The SDT disagrees, the broader communication is necessary to achieve appropriate coordination. No change made.</p> <p>The requirement is to distribute the results of completed Planning Assessments, then respond to comments. Therefore the assessment is posted and complete before</p>				

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
<p>comments can be received and responded to. The SDT recognizes this fact and believes 90 days should be sufficient to develop a response. No change made.</p>	
<p>Oklahoma Gas & Electric</p>	<p>R8 OG&E believes the Transmission Coordinator be held accountable for R8 and coordinate this type of data exchange to ensure a regional coordination effort is achieved.</p>
<p>Response: The SDT believes you were referring to Planning Coordinator in your comment. The SDT believes both the Transmission Planner and Planning Coordinator must distribute their assessments to meet the overall intent of Requirement R8 and achieve appropriate coordination. No change made.</p>	
<p>Xcel Energy</p>	<p>R8 Xcel Energy appreciates the language stating “reliability need” however it is unclear as to what constitutes this or who would make that determination. Please clarify so as to avoid future disputes on providing or obtaining the information.</p>
<p>Response: The present wording is in other approved standards and is sufficiently clear based on experience to date. No change made.</p>	
<p>Central Maine Power Company</p>	<p>R8, 8.1, and Measurement M8 This standard should not be used to remedy deficiencies in meeting the coordination requirements of FERC Order 890. Therefore these should be deleted. If this requirement is retained the following is suggested: “Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to the functional entities that the Planning Coordinator and Transmission Planner recognizes as having a reliability need for the Planning Assessment results.” Additionally, there is no deadline for comments. There is also potential conflict with the deadline for completing a study and when comments may be submitted (e.g. comments are received the day before the study is to be completed.) These issues must be addressed.</p> <p>1.4 Data Retention: The last bullet is unnecessary and should be deleted from the standard.</p>
<p>ISO New England</p>	<p>R8, 8.1, and Measurement M8 This standard should not be used to remedy deficiencies in meeting the coordination requirements of FERC Order 890. Therefore these should be deleted.</p> <p>If this requirement is retained the following is suggested: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to the functional entities that the Planning Coordinator and Transmission Planner recognizes as having a reliability need for the Planning Assessment results.</p> <p>Additionally, there is no statute of limitation for comments. There is also potential conflict with the deadline for completing a study and when comments may be submitted (e.g. comments are received the day before the study is to be completed.) These issues must be addressed.</p> <p>1.4 Data Retention: The last bullet is unnecessary and should be deleted from the standard.</p>
<p>Response: The SDT seeks to retire the existing TPL-005 & -006 while continuing to meet the purpose of their requirements. FERC Orders 693 and 890 each provide expectations and direction to the ERO regarding enhancement of regional coordination and planning. The SDT believes the inclusion of Requirement R8 in the standard</p>

MAPP	<p>R8: Remove Transmission Planners: Each PC shall distribute its Planning Assessment to adjacent PC and to any registered function entity that indicates a reliability need for the Planning Assessment results.</p> <p>R8.1 Remove Transmission Planners from subrequirement.</p>
	<p>Response: The SDT believes both the Transmission Planner and Planning Coordinator must distribute their assessments and respond to comments to meet the overall intent of Requirement R8 and achieve appropriate coordination. No change made.</p>
Midwest ISO	<p>Requirement R8- It should be made clear that a TP should not be required to send their assessment to adjacent PCs. Likewise the PCs should be required to send their assessment to TPs not in their footprint. Please consider the following language change for R8: Each Planning Coordinator shall distribute its planning assessment results to adjacent Planning Coordinators and to any other Planning Coordinators who indicate they have a reliability related need for the planning assessment results. Each Transmission Planner shall distribute its planning assessment results to adjacent Transmission Planner and to any other Transmission Planner who indicates they have a reliability related need for the planning assessment results.</p> <p>Requirement R8.1: This should be clarified such that this requirement is only required on Assessments that are completed and posted as final. If not, this could be an administratively burdensome task for an entity to have to respond to each and every comment and then document that they did respond within 90 days. Please consider the following language changes for R8.1 If a recipient of the Planning Assessment's final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.</p>
	<p>Response: The SDT disagrees with the suggested limitations and believes both the Transmission Planner and Planning Coordinator must distribute their assessments to the applicable entities cited in the requirement to meet the overall intent of Requirement R8 and achieve appropriate coordination. No change made.</p> <p>The Requirement R8 requirement is to distribute Planning Assessment results associated with this standard. Therefore Requirement R8, part 8.1 only requires response to comments on the applicable assessment results. No change in wording is necessary.</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
<p>Northeast Power Coordinating Council--RSC</p>	<p>Requirements R8, 8.1, and Measure M8--There are a number of concerns with these requirements. There needs to be a specified time period upon which comments must be received. As written, there is no sunset on when comments may be made and therefore they must be responded to. Additionally, it is not clear if the 90-day response time may extend beyond the end of the year to maintain and maintain annual compliance.</p> <p>R8 also causes redundancy of distribution of assessments.</p> <p>There is no statute of limitation for comments. There is also potential conflict with the deadline for completing a study and when comments may be submitted (e.g. comments are received the day before the study is to be completed.) These issues must be addressed.</p> <p>This standard should not be used to remedy deficiencies in meeting the requirements of FERC Order 890. Therefore these should be deleted.</p> <p>If this requirement is retained the following revision to Requirement 8 is suggested:"Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to the functional entities that the Planning Coordinator and Transmission Planner recognize as having a reliability need for the Planning Assessment results."</p> <p>Compliance: 1.4 Data Retention: The Transmission Planner and the Planning Coordinator may not be using the same software. If both are required to store the data, do they both have to have the software to use the data? Can this be changed to an "or" such that one of them must retain the data and it can be up to them as to who it is?</p> <p>1.4 Data Retention, last bullet - this relates back to Requirements R8, 8.1, and Measure M8. "Three calendar years of the notifications" seems to be an unnecessary requirement, and should be deleted. As an alternative to deletion, the implementation of a rolling three calendar years of notifications could be considered.</p>
<p>Response: The SDT disagrees that there should be a statute of limitation for asking questions related to coordination of planning and believes parties will act appropriately. The SDT's intent is that compliance would be judged by whether the comment was responded to in the required 90 days.</p> <p>The SDT disagrees, this communication is necessary to achieve appropriate coordination.</p> <p>The SDT disagrees that there should be a statute of limitation for asking questions related to coordination of planning and believes parties will act appropriately. Organization	Comments for Question 8
	<p>Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p> <p>The SDT believes that both the Transmission Planner and Planning Coordinator have the responsibility for data retention. Therefore, the SDT believes that the existing language is adequate and that no changes are required. The SDT believes that both should have the necessary software for using the data.</p> <p>The SDT believes that retaining the documentation for 3 years is consistent with other standards and appropriate for audit purposes.</p>
<p>Hydro-Québec TransEnergie (HQT)</p>	<p>Requirements R8, 8.1, and Measurement M8 There are a number of concerns with these requirements. There needs to be a specified time period upon which comments must be received. As written, there is no sunset on when comments may be made and therefore they must be responded to. Additionally, it is not clear if the 90-day response time may extend beyond the end of the year to maintain and maintain annual compliance.</p> <p>R8 also causes redundancy of distribution of assessments.Suggested revised Requirement R8 to say: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to functional entities that demonstrated a reliability need with concurrence from their planning coordinator for the Planning Assessment results.</p>
<p>Response: The SDT disagrees that there should be a statute of limitation for asking questions related to coordination of planning and believes parties will act appropriately. The SDT's intent is that compliance would be judged by whether the comment was responded to in the required 90 days.</p> <p>The SDT believes both the Transmission Planner and Planning Coordinator must distribute their assessments to meet the overall intent of Requirement R8 and achieve appropriate coordination. No change made.</p>	
<p>US Bureau of Reclamation</p>	<p>Results of the Planning Assessments should be coordinated with all owner entities who all share in system reliability. Any owner that may choose to implement a Corrective ACTION Plan item should have access to the basis for the need.</p>
<p>Response: The SDT agrees and believes Requirement R8 facilitate the necessary interaction between reliability related entities. No change made.</p>	
<p>TIS</p>	<p>Term “document” in R8.1 the term documented needs to be defined. TIS suggests using the term “written “ i.e., “If a recipient of the Planning Assessment results provides documented written comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented written response to that recipient within 90 calendar days of receipt of those comments.</p> <p>”The requirement to distribute reports to entities with “need” has very significant CEII implications. This should be tightened to a “bona fide reliability need” for the information, requiring CEII or confidential material handling procedures.</p> <p>Other general comments:1. Footnotes on P3 and P4 (101 & 19) should be 9 and 10, respectively. This merely appears to be a typo in the latest draft.</p>
<p>Response: The present wording is in other approved standards and is sufficiently clear based on experience to date.</p> <p>Control of CEII is a fundamental expectation of all industry participants and the "reliability related need" restriction ensures only appropriate parties must be given</p>	

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
	<p>planning assessments.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the Summary Considerations for Question 10.</p>
<p>NERC Standards Review Subcommittee</p>	<p>The MRO NSRS asks that the SDT revise R8 to limit the need to provide the Planning Assessment as follows “adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity”? This MRO NSRS suggestion is added to the requirement to clarify that the word adjacent also applies to Transmission Planners and to clarify that the functional entity must be registered in order for the entity to be applicable to the requirement.</p>
<p>Response: The SDT agrees and will clarify by adding "adjacent" before Transmission Planner, but the SDT believes adding “registered” is unnecessary because it is understood as it relates to NERC Reliability Standards.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p>	
<p>Florida Power and Light</p>	<p>The requirement to distribute the Planning Assessment should not mandate distribution of a document but should be more flexible and allow for making the Planning Assessment available, such that those entities that need the information can have it readily available. R8 should be modified as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.</p>
<p>Response: The SDT believes Requirement R8 must be a standards requirement and ensures communication of information necessary for regional assessments. No change made.</p>	
<p>NorthWestern Energy</p>	<p>The term "functional entity" needs to be defined.</p>
<p>Response: The NERC Reliability Functional Model defines the term "functional entity".</p>	
<p>Gainesville Regional Utilities</p>	<p>The wording could be a little better to indicate that the PC and TP should always get each others planning assessments, but other entities need to indicate a reliability related need to get the same. I suggest making a second sentence and eliminating the word “and”.</p>
<p>Response: The SDT agrees that the wording could be a little better and will clarify by adding "adjacent" before Transmission Planner.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p>	
<p>National Grid</p>	<p>This standard should not be used to remedy deficiencies in meeting the requirements of FERC Order 890. Therefore these should be deleted.</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
	<p>If this requirement is retained the following is suggested: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to their adjacent Planning Coordinators and Transmission Planners, respectively, and to the functional entities that the Planning Coordinator and Transmission Planner recognizes as having a reliability need for the Planning Assessment results.</p> <p>Additionally, there is no statute of limitation for comments.</p> <p>There is also potential conflict with the deadline for completing a study and when comments may be submitted (e.g. comments are received the day before the study is to be completed.) These issues must be addressed.</p> <p>Compliance: 1.4 Data Retention: The Transmission Planner and the Planning Coordinator may not be using the same software. If both are required to store the data, do they both have to have the software to use the data? Can this be changed to an “or” such that one of them must retain the data and it can be up to them as to who is it.</p> <p>1.4 Data Retention, last bullet - this relates back to Requirements R8, 8.1, and Measurement M8. “Three calendar years of notification” seems to be a nuisance requirement to get in trouble for. This is unnecessary and should be deleted.</p>
	<p>Response: The SDT seeks to retire the existing TPL-005 & -006 while continuing to meet the purpose of their requirements. FERC Orders 693 and 890 each provide expectations and direction to the ERO regarding enhancement of regional coordination and planning. The SDT believes the inclusion of Requirement R8 in the standard and performance of the regional assessments required under NERC delegation agreements will meet these objectives. No change made.</p> <p>The SDT agrees and will clarify by adding "adjacent" before Transmission Planner. The word "indicates" has been changed to “has” to be clearer. The other revised wording has the same meaning as the suggested wording which is sufficiently clear.</p> <p>R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information.</p> <p>The SDT disagrees that there should be a statute of limitation for asking questions related to coordination of planning and believes parties will act appropriately. Therefore the SDT believes that the existing language is adequate and that no changes are required. The SDT believes that both should have the necessary software for using the data. No change made.</p> <p>The SDT believes that retaining the documentation for 3 years is consistent with other standards and appropriate for audit purposes.</p>
TVA System Planning	<p>TVA believes that the TP and PC are unnecessarily duplicating work as shown in R8 and in M8. TVA believes that just the PC should be responsible for this coordination. R8:</p> <p>It is not clear whether the assessment results must be distributed to all parties of interest, or if it would be sufficient to post the assessment at a central location, and distribute information necessary to access the results.</p> <p>Also, FERC Standards of Conduct issues would come into play in assuring that the information is available only to appropriate</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8
	<p>personnel.</p> <p>R8.1: It is not clear what the form of the response to the comments should be “ would an acknowledgement be sufficient, or would it be necessary to pursue a process of examining comments in detail and revising and reissuing the corresponding assessment”</p>
	<p>Response: The SDT believes both the Transmission Planner and Planning Coordinator must distribute their assessments to meet the overall intent of Requirement R8 and achieve appropriate coordination.</p> <p>The standard does not specify the mechanics of distribution of the information, only that it must occur. The method proposed would be acceptable as long as it met Measure M8 and Section 1.4 under compliance monitoring.</p> <p>Control of competitive market information per Standards of Conduct is a fundamental expectation of all industry participants and the "reliability related need" restriction ensures only appropriate parties must be given planning assessments.</p> <p>The standard should not specify the means of providing and responding to comments, but ensures that appropriate communication is initiated. No change made.</p>
<p>SRC of ISO/RTO</p>	<p>Under R8 it should be made clear that a TP should not be required to send their assessment to adjacent PCs and that PCs should not be required to send their assessments to TPs not in their footprint.</p> <p>Under R8.1: If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments. This should not be required until the Assessment is final and could be an administrative intense task.</p> <p>The following wording is suggested for R8:R8. Each Planning Coordinator shall distribute its planning assessment results to adjacent Planning Coordinators and to any Planning Coordinator who indicates a reliability related need for the planning assessment results. Each Transmission Planner shall distribute its planning assessment results to adjacent Transmission Planners and to any other Transmission Planner who indicates they have a reliability need for the planning assessment results.</p> <p>R8.1 If a recipient of the Planning Assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.</p> <p>AESO does not comment on VSLs or VRFs.</p>
	<p>Response: The SDT believes both the Transmission Planner and Planning Coordinator must broadly distribute their assessments to meet the overall intent of Requirement R8 and achieve appropriate coordination. No change made.</p> <p>The requirement is to distribute the results of the completed Planning Assessments associated with this standard therefore all related supporting studies are complete and there is no potential conflict. The SDT recognizes this fact and believes 90 days should be sufficient to develop a response.</p> <p>The SDT disagrees with the suggested limitations and believes both the Transmission Planner and Planning Coordinator must distribute their assessments to the applicable entities cited in the requirement to meet the overall intent of Requirement R8 and achieve appropriate coordination. No change made.</p>
<p>Pepco Holdings, Inc. - Affiliates</p>	<p>While the SDT has stated in the Description of Current Draft that the issues of TPL-005 and TPL-006 have been addressed. It is not clear to PHI Affiliates that this is true. It is not evident how wide area planning is performed. Requirement 2 states Each</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Comments for Question 8			
PHI	Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES.			
<p>Response: The SDT seeks to retire the existing TPL-005 & -006 while continuing to meet the purpose of their requirements. FERC Orders 693 and 890 each provide expectations and direction to the ERO regarding enhancement of regional coordination and planning. The SDT believes the inclusion of Requirement R8 in the standard and performance of regional assessments will meet these objectives.</p>				
FRCC Transmission Working Group	<p>With regards to the High VSL, what about entities that indicate a reliability related need for the Planning Assessment? Should this be part of the High VSL?</p> <p>Consider changing the requirement to distribute the Planning Assessment to become more flexible and allow for making the Planning Assessment available to those entities that indicates a need. Consider revising as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.</p> <p>The definition of "Known Commitments" should explain how that would differentiate between Planned Commitments</p>			
<p>Response: The SDT agrees and will add those with a reliability related need to the Lower and High VSL.</p>				
R8 VSL	The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners or adjacent Planning Coordinators, and to one functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	N/A	The responsible entity failed to distribute the results of its Planning Assessment to its adjacent Transmission Planners or adjacent Planning Coordinators, and to any functional entity that has a reliability related need and has submitted a written request for the information, respectively in accordance with Requirement R8.	The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.
<p>The proposed revised wording is essentially the same as the current wording and does not provide any additional clarity. No change made.</p> <p>The SDT believes that the existing language regarding known commitments is adequate and no further change is required.</p>				

9. The SDT has revised the definitions in response to industry comments to the third posting. Do you agree with these definition changes? If not, please clearly indicate which definition you disagree with and provide specific comments.

Summary Consideration: The SDT received several comments on definitions. The following summarizes the questions and response on the definitions. **Planning Assessment:** The SDT considered the comment, but feels that a Corrective Action Plan includes the 'do nothing' option, which would address the concern and decided not to change the definition.

Non-Consequential Load Loss: To improve clarity, the SDT has revised the definition.

The SDT believes the exclusion of voltage sensitive load belongs in the Non-Consequential Load Loss definition because it is not Non-Consequential load.

Consequential Load Loss: Due to comments in prior postings, the SDT has elected to define Consequential Load specific to Load that is lost due to a fault. Non-Consequential Load has been defined to be all else, except as noted. That which has been noted is excluded from coverage by the standard. So it is not necessary to include the noted exclusions from the Non-Consequential Load Loss definition in the Consequential Load Loss definition.

Planning Horizon: The only location where planning horizon didn't specify Near-Term or Long-Term was in the 'Purpose'. The SDT didn't feel that this reference needed to be specific or was sufficient to warrant a definition. No changes have been made.

Year One: The SDT believes the definition will capture both a summer and winter peak and is necessary to provide a clear starting point for the planning horizon.

Year One is not considered to be the immediate year following the current year, as suggested by some, because if the study were completed at the end of the year, then there would be no time to implement a Corrective Action Plan. Also, that following year is in the Operational Planning time frame.

The SDT doesn't see a problem with entities having slightly different study periods. This situation exists under the current TPL Standards.

With regards to any possible inconsistencies within the practices of any entity, the SDT believes that the requirements as defined are required for a Planning Assessment. How these requirements are met is beyond the scope of this standard and should be discussed within the responsible entities.

Consequential Generation Loss: Generation run-back and tripping is acceptable. It is up to the Planning Coordinator and the Transmission Planner to determine how many units or cumulative MW may be interrupted due to either a consequential or non-consequential action. Therefore it isn't necessary for the SDT to define Consequential Generation Loss.

Note 'b' has been revised to clarify the issue. Consequential Load Loss as well as generation loss is acceptable as a consequence of any planning or extreme event excluding PO.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Bus-Tie Breaker: The SDT has elected to define a Bus-Tie Breaker. If the SDT were to also define what is not a Bus-Tie Breaker, then anything that was missed would not be defined. To be comprehensive, the SDT has to limit the definition to what a Bus-Tie Breaker is to avoid further complexity.

Steady State: ‘Steady State’ was changed to ‘steady state’, so no definition is required.

The following definition was changed for clarity due to industry comments:

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Note ‘b’: Consequential Load Loss as well as generation loss is acceptable as a consequence of any planning or extreme event excluding P0.

Organization	Yes or No	Comments for Question 9
FRCC Transmission Working Group		<p>Consider the following definition for clarification: Planning Assessment: Documented evaluation of (1) studies of future Transmission System performance and (2) Corrective Action Plans (included in studies) to remedy identified deficiencies.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, or (2) the response of voltage sensitive Load that is disconnected from the System by end-user equipment.</p>
<p>Response: <u>Planning Assessment:</u> The SDT considered the comment, but feels that a Corrective Action Plan includes the ‘do nothing’ option, which would address the concern and decided not to change the definition.</p> <p><u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
ERCOT ISO	No	<p>* Planning horizon is not formally defined but used many times throughout the standards. If there is a need to define the Near- and Long-term Transmission Planning Horizons, then the transmission planning horizon itself also should be defined. Additional confusion on this issue is the use of Long-term Planning as a planning horizon of one year or longer, also not formally defined. We finally found this referenced in the NERC Drafting Team guideline, which is not an obvious place to look for a definition. *</p> <p>Year One is only used two times “ once to define Near-term Transmission Planning Horizon and once in the TPL standard. If this is not used throughout the NERC standards, it should not be defined. As an alternative, the transmission planning horizon could be formally defined, with Near- and Long-term Transmission Planning Horizons defined as subsets of the main definition. This would eliminate the need for a formal definition of Year One. If Year One stays as a new definition, it seems to be too broad, potentially allowing for omission of a peak season in the study. For example, if Year One is the period 12 to 18 months from the end of 2009, then Year One is currently 2011. Why is the year 2010 not considered to be Year One.*</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
		<p>Non-Consequential Load Loss is confusing “ due to the base word “consequence”. Consequential Load Loss is intended to be a load loss that is a result, or consequence, of the isolation. Non-Consequential Load Loss seems intended to imply it was not a consequence of the isolation. Although the standard attempts to define the term, this definition does not agree with the common English definition of the term. “Non-consequential” (or “Inconsequential”) implies that the load loss is unimportant, minor or insignificant. This is the opposite intent of how this term is used in the standard, where it is used to mean the load that it is unacceptable to lose for a particular event. Alternatives could be “Direct Load loss” and “Indirect Load loss” to replace the two concepts that are included as Consequential and Non-Consequential respectively.</p>
<p>Response: <u>Planning Horizon:</u> The only location where planning horizon didn’t specify Near-Term or Long-Term was in the ‘Purpose’. The SDT didn’t feel that this reference needed to be specific or was sufficient to warrant a definition. No changes have been made.</p> <p><u>Year One:</u> Year One is not considered to be the immediate year following the current year because if the study were completed at the end of the year, then there would be no time to implement a Corrective Action Plan. Also, that following year is in the Operational Planning time frame. No changes have been made.</p> <p>As you have indicated, the terms ‘consequential’ and ‘non-sequential’ can be interpreted consistent with the intent of the SDT. Further the use has been accepted by NERC and seems to have been accepted by the industry in the multiple postings to date. By changing ‘Non-consequential’ (or not-consequential) to ‘inconsequential’ you have changed the meaning. The SDT is content with the terms and has focused on the clarity of the definition, which also seems to be the focus of the comments from the industry. The SDT has decided to stay with the existing terms rather than changing them as this late date. No changes have been made.</p>		
Northeast Utilities	No	<p>[Comment on Year One Definition] This still defines Year One as both a particular year AND a window. It cannot be both. We suggest rewording the second sentence to read: “This is further defined as the beginning 12-18 months from the end of the current year”.</p>
Hydro-Québec TransEnergie (HQT)	No	<p>Definitions “ Year One “ This still defines Year One as both a particular year AND a window. It cannot be both. Suggest rewording the second sentence to read: “This is further defined as beginning 12-18 months from the end of the current year.”</p>
<p>Response: The SDT does not agree that there is an issue and has not changed the definition.</p>		
Platte River Power Authority	No	<ol style="list-style-type: none"> 1. Please make the definition for Non-Consequential Load Loss simple and straightforward. For example, Non-Consequential Load Loss: The planned shedding of firm load.(Note that phrases "firm load" and "firm load shedding" are used frequently in a dozen other standards.) 2. Move the remainder of the sentence about "the response of voltage sensitive Load including...by end-user equipment." from the Non-Consequential Load Loss definition to the Consequential Load Loss definition.
<p>Response: <u>Non-Consequential Load Loss:</u> Due to comments received in earlier postings, the SDT believes that the definition can not be that simple. The SDT believes the exclusion of voltage sensitive load belongs in the Non-Consequential Load Loss definition because it is not Non-Consequential Load. Therefore, any reduction in load due to sensitivity to low voltage would not result in a compliance violation. No change made.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
<p>To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
<p>NERC Standards Review Subcommittee</p>	<p>No</p>	<p>A. Add a Consequential Generation Loss definition, which would be a complement to the Consequential Load Loss definition. Both consequential load loss and consequential generation loss are referred to in note “b” of the Steady State & Stability section of Table 1, but only consequential load loss is defined. The MRO NSRS suggests text of: Consequential Generation Loss: All Generation that is no longer delivered to any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions.</p> <p>B. The MRO NSRS offers the following comment to one of the proposed definitions of TPL-001. Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss that is the result of the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment.</p> <p>C. Add a Planning Horizon definition. This term is used in this proposed standard, in the FAC-010-2 standard, and possibly in other future standards, but it has not been defined yet.</p> <p>D. The SDT is to be commended for working on the Year one definition, however, concerns exist that if the standard is adopted as written, it is incompatible with the eastern interconnection wide ERAG model process.</p> <p>E. If the SDT intends to change the planning processes and model building processes throughout NERC in this regard, then the SDT should explain the benefits of changing this process and verify that it does not sabotage the normal model building and study process.</p>
<p>Response: A. Generation run-back and tripping is acceptable. It is up to the Planning Coordinator and the Transmission Planner to determine how many units or cumulative MW may be interrupted due to either a consequential or non-consequential action. Therefore it isn't necessary for the SDT to define Consequential Generation Loss.</p> <p>Note 'b' has been revised to clarify the issue.</p> <p>Note 'b': Consequential Load Loss as well as generation loss is acceptable as a consequence of any planning or extreme event excluding P0.</p> <p>B. 		Consequential Load Loss as “intended post-Contingency loss of load caused by operator or SPS (RAS) action.”
ISO New England	No	As currently defined Non-Consequential Load Loss could allow widespread or cascading motor stall. The language in the definition cannot be this generic. The text is broad enough that it could allow a voltage collapse, the definition is incompatible with Table 1a (BES Transmission voltage instability, cascading outages, and uncontrolled islanding shall not occur). The definition for the non-consequential load loss combined with Table 1 would prohibit any customer from tripping its own load for contingencies that indicate 'no' in the non-consequential load loss column. This is not practical and appears to be unintended consequencetof the change in definition. This requires a change in the definition or the table.We suggest defining Non-Consequential Load Loss as “intended post-Contingency loss of load caused by operator or SPS (RAS) action.”
National Grid	No	As currently defined Non-Consequential Load Loss could allow widespread or cascading motor stall. The language in the definition cannot be this generic. The text is broad enough that it could allow a voltage collapse, the definition is incompatible with Table 1a (BES Transmission voltage instability, cascading outages, and uncontrolled islanding shall not occur). The definition for the non-consequential load loss combined with Table 1 would prohibit any customer from tripping its own load for contingencies that indicate 'no' in the non-consequential load loss column. This is not practical and appears to be unintended consequent of the change in definition. This requires a change in the definition or the table.It is suggested to redefine Non-Consequential Load Loss as “intended post-Contingency loss of load caused by operator or SPS (RAS) action.”
<p>Response: The SDT added Requirement R5 to require that every Transmission Planner and Planning Coordinator has a voltage criteria. The voltage criteria should prevent the exposure to widespread or cascading motor stall and should limit any potential misinterpretation that the Non-Consequential Load Loss would allow such events.</p> <p>Table 1a (BES Transmission voltage instability, Cascading, and uncontrolled islanding shall not occur) supports Requirement R5 and reinforces the point that the definition for Non-Consequential Load Loss should not be read so broadly as to allow for unacceptable events.</p> <p>The definition for the Non-Consequential Load Loss excludes end-user actions, which disconnect the Load from the system. So Table 1 does not apply to such Load.</p> <p>The proposed definition is too narrow and would only capture anticipated Load losses for predefined conditions. It would not capture unanticipated loss of Load, which still needs to be accounted for within the definition.</p> <p>To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment</p>		
Progress Energy Florida, Inc.	No	As PEF is opposed to TPL-001-1 as a whole, PEF will have no further comment on this issue other than to encourage all appropriate parties to review PEF's previous comments to this effect.
<p>Response: Throughout the drafting process, the SDT has carefully considered your comments as well as comments from other industry members.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
Deseret Power	No	<p>Comments: The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language follows Non-Interruptible Load loss other than: “Consequential Load Loss” the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment. This version uses the same wording but clarifies that the term “other than” applies to all three things.</p>
<p>Response: <u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Sacramento Municipal Utility District	No	<p>Definition of Non-Consequential Load (Non-CLL): This definition excludes from the “Non-Consequential Load” only the “Interruptible” portion of Demand Response. The last SDT response to a comment on Draft #3 stated that there is no ceiling on the amount of DSM that can be utilized (see Reference 1 below). Since Demand Response is more than just “Interruptible” demand, it is recommended that the exclusion in the definition for Non-CLL be broadened to include other relevant categories (see Reference 2 below) of Demand Response / DSM that is acceptable. Reference 1: pdf page 310, 337: SDT response related to DSM at http://www.nerc.com/docs/standards/sar/ATFNSTDT_third_posting_comment_responses_2009Sept16.pdf Reference 2: http://www.nerc.com/docs/pc/drdf/DADS_Phase_III_Final_090109.pdf, Figure 3 at pdf page 16, block under Capacity; and, associated definitions in Appendix III at pdf page 46</p> <p>Use of the defined term “Planning Assessment” throughout the standard: Since the definition includes both performance evaluation (assessment) and corrective action to remedy identified deficiencies, its usage throughout the standard should be reviewed to ensure that it does not mandate corrective actions where the minimum requirement may be calling only for an assessment.</p> <p>The SDT should consider including a definition for “Spare Equipment Strategy”. The SDT’s comments on “spare equipment strategy” (at pdf page 122 of Consideration of Comments on 3rd Draft) state that it is based on a directive from FERC Order 693. Directives that impact reliability should be translated in to a requirement in a Standard. Even the proposed scope of MOD-010-0 (reference http://www.nerc.com/files/2010-2012_RS-Development-Plan_Volume-I_II.pdf page 223) makes a reference to the strategy, but does not require it.</p>
<p>Response: <u>DSM:</u> The SDT believes that any Load that is interruptible should be so under an agreement or tariff provision, which excludes it from the constraints of the TPL standard. No changes have been made.</p> <p><u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment</p> <p><u>Planning Assessment:</u> The SDT considered the comment, but feels that a Corrective Action Plan includes the ‘do nothing’ option, which would address the concern</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
<p>and decided not to change the definition.</p> <p><u>Spare equipment strategy</u>: The SDT believes that spare equipment strategy can be managed by individual Transmission Owners and that the term does not have to be defined in the Standard. The SDT further believes it has satisfied the intent of the directive of FERC Order 693 by including Requirement R2, part 2.1.5. No changes have been made.</p>		
Midwest ISO	No	<p>Definition Section: The definition for “Bus Tie Breaker” should be revised to clarify whether a breaker in a standard ring bus or breaker and one-half scheme should be considered a “bus tie breaker”.</p> <p>Definition Section: We believe that the “Year One” definition changes have clarified what is intended.</p> <p>Definition Section: We suggest having the following definition of Consequential Generation Loss added to the definition section. Consequential Generation Loss - All generation that is no longer connected to the transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.</p>
<p>Response: Bus-Tie Breaker: The SDT has elected to define a Bus-Tie Breaker. If the SDT were to also define what is not a Bus-Tie Breaker, then anything that was missed would not be defined. To be comprehensive, the SDT has to limit the definition to what a Bus-Tie Breaker is to avoid further complexity. No changes have been made.</p> <p><u>Consequential Generation Loss:</u> Generation run-back and tripping is acceptable. <p>Response: <u>Year One:</u> The SDT does not agree that there is an issue and has not changed the definition. No change made.</p> <p><u>Non-Consequential Load Loss:</u> The SDT added Requirement R5 to require that every Transmission Planner and Planning Coordinator has a voltage criteria. The voltage criteria should prevent the exposure to widespread or cascading motor stall and should limit any potential misinterpretation that the Non-Consequential Load Loss would allow such events.</p> <p>Table 1a (BES Transmission voltage instability, Cascading, and uncontrolled islanding shall not occur) supports Requirement R5 and reinforces the point that the definition for Non-Consequential Load Loss should not be read so broadly as to allow for unacceptable events.</p> <p>The definition for the Non-Consequential Load Loss excludes end-user actions, which disconnect the Load from the system. So Table 1 does not apply to such Load.</p> <p>The proposed definition is too narrow and would only capture anticipated Load losses for predefined conditions. It would not capture unanticipated loss of Load, which still needs to be accounted for within the definition.</p> <p>To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Gainesville Regional Utilities	No	I still find the Non-Consequential Load Loss definition vague. But, I presently do not have anything better to offer and thus I can live with it.
<p>Response: Thank you for your response.</p>		
SRC of ISO/RTO	No	<p>In note b of the steady state and stability section of Table 1, consequential generation loss is referenced; however, there is no definition of such. A definition of consequential generation loss that is defined similar to "consequential load loss" should be added.</p> <p>The definition for "Bus Tie Breaker" should be revised to clarify whether a breaker in a standard ring bus or breaker and one-half scheme should be considered a "bus tie breaker".</p> <p>"year one" definition changes have clarified what is intended.</p> <p>AESO does not comment on VSLs or VRFs.</p>
<p>Response: <u>Consequential Generation Loss:</u> Generation run-back and tripping is acceptable. It is up to the Planning Coordinator and the Transmission Planner to determine how many units or cumulative MW may be interrupted due to either a consequential or non-consequential action. Therefore it isn't necessary for the SDT to define Consequential Generation Loss.</p> <p>Note 'b' has been revised to clarify the issue.</p> <p>Note 'b': Consequential Load Loss as well as generation loss is acceptable as a consequence of any planning or extreme event excluding P0.</p> <p><u>Bus Tie Breaker:</u> The SDT has elected to define a Bus Tie Breaker. If the SDT were to also define what is not a Bus Tie Breaker, then anything that was missed would not be defined. To be comprehensive the SDT has to limit the definition to what a Bus Tie Breaker is to avoid further complexity.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
<p>The SDT does not see the difference between what is in the draft and what is proposed and does not agree that there is an issue. No change has been made to the definition.</p>		
<p>TVA System Planning</p>	<p>No</p>	<p>Is the 12-18 months referenced in the Year One definition actually from the start of the TA or the anticipated completion date of the same TA?</p> <p>Suggest revising the Non-Consequential Load Loss definition: Non-Interruptible Load loss other than (1) Consequential Load Loss, (2) the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment, and (3) utility loads such as pump storage loads, compressed air generating pumping loads, and scrubber loads, etc when such loads do not result in tripping of a generating unit.</p>
<p>Response: <u>Year One:</u> Year One begins 12-18 months from the end of the calendar year. No change made.</p> <p><u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p> <p>The SDT interpreted utility loads such as pump storage loads, compressed air generating pumping loads, and scrubber loads as interruptible loads, which don't need to be highlighted separately. As a result, no changes were made to include this list.</p>		
<p>NYISO</p>	<p>No</p>	<p>Question # 9 The SDT has revised the definitions in response to industry comments to the third posting. Do you agree with these definition changes? If not, please clearly indicate which definition you disagree with and provide specific comments. No. Need to define "Steady State" and "Consequential Load" as well as other phrases included throughout the NYISO's response.</p>
<p>Response: 'Steady State' was changed to 'steady state', so no definition is required. No change made.</p> <p>No instances of 'Consequential Load' were identified in the draft standard. All of the references were to 'Consequential Load Loss', which is defined. No change made.</p>		
<p>Oklahoma Gas & Electric</p>	<p>No</p>	<p>R 3.4, R3.5, R4.4 & R4.5 There appear to be no standards of directions on identifying severe or extreme system impacts. This may need to be defined. Extreme events evaluated (last page of Table 1) OG&E needs more specific information on what is defined to be an extreme event before offering support. It appears the number of possible combinations and permutations that could be run make any compressive study overwhelming to perform and would provide very limited benefits. This needs to be clarified.</p>
<p>Response: <u>Extreme event:</u> The SDT agrees that extreme event analysis could be overwhelming if all possible combinations and permutations were evaluated. However that is not the expectation. Requirement R3, part 3.5 of the standard requires only those extreme events "that are expected to produce more severe System Impacts". Therefore this is a judgment call with a corollary expectation that one can provide an explanation of the thoughts behind the judgment for selecting the events.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
Duke Energy	No	Reword the definition of Non-Consequential Load Loss as follows: Non-Interruptible Load loss other than Consequential Load Loss and other than the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment.
<p>Response: <u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Florida Power and Light	No	<p>The definition of "Known Commitments" should explain how that would differentiate between Planned Commitments</p> <p>Planning Assessment definition should be clarified as follows: Planning Assessment: Documented evaluation of (1) studies of future Transmission System performance and (2) Corrective Action Plans (included in studies) to remedy identified deficiencies.</p> <p>Non-Consequential Load Loss definition should be clarified as follows: Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, or (2) the response of voltage sensitive Load that is disconnected from the System by end-user equipment.</p> <p>The SDT should do a search through the document (and Table 1) on "cascading" and capitalize the "C" and delete "outages" where it appears after "Cascading".</p>
<p>Response: <u>Known Commitments:</u> The SDT believes that the existing language is adequate and no further change is required. If you do not have any known Firm Transmission Service as an example, then this fact should just be documented.</p> <p><u>Planning Assessment:</u> The SDT considered the comment, but feels that a Corrective Action Plan includes the 'do nothing' option, which would address the concern and decided not to change the definition.</p> <p><u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p> <p>The SDT did change, "cascading outages" to "Cascading" throughout the standard as suggested.</p>		
Ameren	No	<p>The definition of Bus-tie Breaker is unclear. This definition needs to be made clearer to remove issues regarding P2 and P5 planning events. We suggest the following additional language: A breaker in a standard breaker-and-a-half or ring bus configuration is not a Bus-tie Breaker.</p> <p>Suggest rewording Non-Consequential Load Loss definition: Non-Interruptible Load loss other than Consequential Load Loss. Non-Consequential Load Loss does not include the response of voltage sensitive</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
		Load or Load that is disconnected from the System by end-user equipment.
<p>Response: Bus-Tie Breaker: The SDT has elected to define a Bus-Tie Breaker. If the SDT were to also define what is not a Bus-Tie Breaker, then anything that was missed would not be defined. To be comprehensive the SDT has to limit the definition to what a Bus-Tie Breaker is to avoid further complexity.</p> <p>Non-Consequential Load Loss: To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Arizona Public Service Co.	No	The definition of Non-Consequential Load is confusing. It is not clear whether the response of voltage sensitive load and the load that is disconnected by the end user is included or not included. It is suggested that all items that are excluded be itemized and that there be no ambiguity.
<p>Response: <u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Bonneville Power Administration	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language follows Non-Interruptible Load loss other than: " Consequential Load Loss " the response of voltage sensitive Load " Load that is disconnected from the System by end-user equipment. This version uses the same wording but clarifies that the term "other than" applies to all three things.
Idaho Power	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language follows Non-Interruptible Load loss other than: " Consequential Load Loss " the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment. This version uses the same wording but clarifies that the term "other than" applies to all three things.
Modesto Irrigation District Transmission Planning	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language follows Non-Interruptible Load loss other than: " Consequential Load Loss " the response of voltage sensitive Load " Load that is disconnected from the System by end-user equipment. This version uses the same wording but clarifies that the term "other than" applies to all three things.
NV Energy	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language follows Non-Interruptible Load loss other than: " Consequential Load Loss " the response of voltage sensitive Load ? Load that is disconnected from the System by end-user

		equipment.This version uses the same wording but clarifies that the term “other than” applies to all three things.
Pacific Gas and Electric Co.	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language followsNon-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment.This version uses the same wording but clarifies that the term “other than” applies to all three things.
Puget Sound Energy, Inc.	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language followsNon-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment.This version uses the same wording but clarifies that the term “other than” applies to all three things.
San Diego Gas & Electric Co	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language followsNon-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment.
Southern California Edison (SCE)	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language followsNon-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment.This version uses the same wording but clarifies that the term “other than” applies to all three things.
SRP	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language followsNon-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment.This version uses the same wording but clarifies that the term “other than” applies to all three things.
Utility System Efficiencies, Inc. (USE)	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language followsNon-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment.This version uses the same wording but clarifies that the term “other than” applies to all three things.
Western Area Power Adm - RMR	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
		Suggested revision to the language follows: Non-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment. This version uses the same wording but clarifies that the term “other than” applies to all three things.
Xcel Energy	No	The definition of Non-Consequential Load is in need of clarification. As written, it could be interpreted that load that is disconnected from the System by end-user equipment would not be allowed for certain contingencies. Suggested revision to the language follows: Non-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment. This version uses the same wording but clarifies that the term “other than” applies to all three things.
NorthWestern Energy	No	The definition of Non-Consequential Load needs clarification. A possible revision is to list bulleted items in the definition: Non-Interruptible Load loss other than: “ Consequential Load Loss “ the response of voltage sensitive Load ? Load that is disconnected from the System by end-user equipment. This way “other than” applies to all three bullets.
<p>Response: <u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Omaha Public Power District	No	The definition of Non-Consequential Load Loss is not clear. It’s not clear whether “the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment” is considered to be Non-Consequential Load Loss or not. Based on previous drafts, it appears that the SDT’s intent is that “the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment” is considered to be a special type of Consequential Load Loss--a type that transmission-planning entities are not allowed to rely upon to meet steady-state performance requirements. Comments on this fourth draft from one commenter seemed to indicate that he was interpreting the definition of Non-Consequential Load Loss to mean that “the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment” is considered to be Non-Consequential Load Loss. Consider breaking the definition of Non-Consequential Load Loss into two or more sentences to prevent misinterpretation and confusion. Also consider including a reference to “the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment” in the definition of Consequential Load Loss if this type of load loss is considered to be a special type of Consequential Load Loss. If this type of load loss is considered to be a special type of Consequential Load Loss, add the following sentence to the end of Note “b” at the top of Table 1: However, see Note “i” for a restriction that applies to steady state performance.
<p>Response: <u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
<p>The SDT believes the reference to exclude voltage sensitive load belongs in the Non-Consequential Load Loss definition because this is neither Consequential nor Non-Consequential. No change was made to Note 'b' or 'i' for this issue.</p>		
<p>NERC System Protection and Control Subcommittee (SPCS)</p>	<p>No</p>	<p>The Drafting Team should change the definition of Consequential Load Loss to clarify that load lost due to operation of remote backup protection is not Consequential Load Loss. Operation of remote backup protection is not Normal Clearing for a fault. Consequential Load Loss: All Load that is no longer served by the Transmission System as a result of Transmission Facilities being removed from service by Normal Clearing initiated by the a Protection System operation designed to isolate the fault.</p>
<p>Response: <u>Consequential Load Loss considering operation of remote backup protection:</u> For the purpose of the Transmission Planning Standard the remote backup protection is still operating to isolate the fault and the SDT is interpreting the subsequent loss of Load to be Consequential Load Loss. No change was made.</p>		
<p>MidAmerican Energy Company</p>	<p>No</p>	<p>The SDT is to be commended for working on the Year One definition, however, MidAmerican continues to be concerned that if the standard is adopted with the Year One definition as written, it is incompatible with the eastern interconnection wide ERAG model process. The definition as currently provided in the draft standard states that Year One of analysis should begin 12-18 months from the end of the current calendar year. This contradicts the time frames that models are currently made available in the MRO as a result of the process for building models through the ERAG. For example, the models developed through the MRO and ERAG model building process in 2009 include cases for the years 2010, 2011, 2015, and 2020. According to the definition of Year One, the 2011 cases in the 2009 series models would be representative of Year One during the 2009 calendar year. However the ERAG models are not provided until late 2009, and some data sets may not be available until early 2010. With this Year One definition, there would be limited or no time where the ERAG model series would include cases representing Year One as defined in the draft standard. MidAmerican urges the SDT to delete the Year One definition altogether. Since the development of regional models are tied to ERAG models and since ERAG model timing is set at the interconnection-wide level, it is likely that nearly all Transmission Planners and Planning Coordinators are working with similar models that are available at similar times. It seems to MidAmerican that this detail on what Year One is can be easily controlled interconnection-wide through the ERAG and which models they provide when. However, if the SDT believes that the Year One definition is necessary, MidAmerican urges the SDT to revised the Year One definition from stating "12-18 months from the end of the current calendar year" to stating "0-18 months from the end of the current calendar year". This revised definition would be at least compatible with the current ERAG process.</p>
<p>Response: <u>Year One:</u> The SDT believes the definition will capture both a summer and winter peak and is necessary to provide a clear starting point for the planning horizon.</p> <p>With regards to any possible inconsistencies within the practices of any entity, the SDT believes that the requirements as defined are required for a Planning Assessment. How these requirements are met is beyond the scope of this standard and should be discussed within the responsible entities. No changes were made.</p>		
<p>Tri-State Generation and Transmission Association</p>	<p>No</p>	<p>The SDT removed definitions of Extreme Events and Load Reduction. We still need to have some scale to differentiate N-1 from less likely but possibly higher impact events. However, we do understand that such a</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 9
		<p>criteria will take some time to develop, and should perhaps be a separate subject addressed by a new SAR. Year One has a flexible definition. It does not seem very intuitive. We can't say whether this is good or bad, although one entity's year one could overlap with another's year two.</p>
<p>Response: The SDT doesn't see a problem with entities having slightly different study periods. This situation exists under the current TPL Standards.</p>		
<p>US Bureau of Reclamation</p>	<p>No</p>	<p>The term "Consequential Load Loss" and "Planning Assessment" contain the terms "Transmission System" and/or "Transmission Facilities". The terms "Transmission System and Transmission Facilities are not defined in the NERC Glossary of Terms. The terms should either be in lower case or a definition added.</p> <p>The Term "Non-Consequential Load Loss" refers to a "Non-Interruptible Load" loss which is other than Consequential Load Loss. There is no mention in the Consequential Load Loss definition of the type of load (interruptible or non-interruptible). This adds confusion to what appears to be the distinction in the differences between the two, that one was the result of a fault and the other was the result of voltage.</p>
<p>Response: <u>Transmission system:</u> The SDT was unable to find a reference to 'Transmission System'. The SDT believes the references to 'Transmission system' were used correctly and no change was made.</p> <p><u>Transmission Facility:</u> 'Facility' is a defined term in the NERC Glossary. The SDT believes the references to 'Transmission Facilities' are used correctly and no change was made.</p> <p><u>Non- Interruptible Load:</u> Consequential Load Loss can be either interruptible or Non-Interruptible, so the distinction is not required. Non-Consequential is not a concern if it is interrupting interruptible load, but is a concern if it is inappropriately interrupting Non-Interruptible load. So the definition for Non-Consequential Load Loss is specific to Non-Interruptible load.</p> <p>The SDT disagrees with your statement that the loss of Non-Consequential load is the result of voltage. Load Loss as a result of voltage sensitivity is excluded from Non-Consequential Load Loss by the definition. No changes have been made.</p>		
<p>American Transmission Company</p>	<p>No</p>	<p>We suggest the following changes: Add a Consequential Generation Loss definition, which would be a complement to the Consequential Load Loss definition. Both consequential load loss and consequential generation loss are referred to in note "b" of the Steady State & Stability section of Table 1, but only consequential load loss is defined. We suggest text of: "Consequential Generation Loss: All Generation that is no longer delivered to any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions.</p> <p>Revise the Consequential Load Loss definition to include protection for abnormal operating conditions. We suggest text of: "Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions."Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: "Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady</p>

Organization	Yes or No	Comments for Question 9
PJM	Yes	
Response: Thank you.		
Oncor Electric Delivery	Yes	(Motor stall should not be included in this section) The language in the definition cannot be this generic. This becomes open to interpretation in Table 1. Localized load may not be an issue, but the text is broad enough that it could allow a voltage collapse.
<p>Response: <u>Non-Consequential Load Loss:</u> The SDT added Requirement R5 to require that every Transmission Planner and Planning Coordinator has a voltage criteria. The voltage criteria should prevent the exposure to widespread or cascading motor stall and should limit any potential misinterpretation that the Non-Consequential Load Loss would allow such events.</p> <p>Table 1a (BES Transmission voltage instability, Cascading, and uncontrolled islanding shall not occur) supports Requirement R5 and reinforces the point that the definition for Non-Consequential Load Loss should not be read so broadly as to allow for unacceptable events.</p> <p>The definition for the Non-Consequential Load Loss excludes end-user actions, which disconnect the Load from the system. So Table 1 does not apply to such Load. To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		
Southern Company	Yes	Suggest revising the Non-Consequential Load Loss definition for additional clarity to the following: Non-Interruptible Load loss other than (1) Consequential Load Loss and (2) the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment.
<p>Response: <u>Non-Consequential Load Loss:</u> To improve clarity, the SDT has revised the definition for Non-Consequential Load Loss.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p>		

10. Do you agree with the changes in the performance elements and notes in Table 1? If not, please provide specific comments by note number, note alpha character, or performance category.

Summary Consideration: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. Final edits failed to correctly show footnote renumbering needed for removal of the Draft 3 footnote 1 which was moved to Requirement R4. All references to the prior Draft 3 footnote 1 should have been removed in Draft 4 and the remaining footnote references as shown in Draft 3 should have been decremented by a value of one. In Draft 5, the SDT has corrected the footnote references and the changes made are summarized as follows:

Table Area Reference	Footnote Reference Errors in Draft 4	Comment
Header notes	Yes	For item "j" the footnote reference to footnote "1" is now removed.
Title Row, Planning Events	No	All footnote references were shown correctly in Draft 4. No changes required in Draft 5.
Planning Event P0	No	No footnote references are used in this row in Draft 4. No changes required in Draft 5.
Planning Event P1	No	All footnote references were shown correctly in Draft 4. No changes required in Draft 5.
Planning Event P2	No	All footnote references were shown correctly in Draft 4. No changes required in Draft 5.
Planning Event P3	Yes	Footnote references to "19" should have been "9".
Planning Event P4	Yes	In the column titled "Category" the footnote reference to "101" should have been "10". In the column titled "Interruption of Firm Transmission Service Allowed" the footnote reference to "10" should have been "9."
Planning Event P5	Yes	In the column titled "Interruption of Firm Transmission Service Allowed" the footnote reference to "19" should have been "9".
Planning Event P6	No	All footnote references were shown correctly in Draft 4. No changes required in Draft 5.
Planning Event P7	No	All footnote references were shown correctly in Draft 4. No changes required in Draft 5.
Extreme Events Steady-State 2a & 2b	Yes	Footnote references to "12" should have been "11".

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Table Area Reference	Footnote Reference Errors in Draft 4	Comment
Extreme Events Stability 2a, 2b, 2c, 2d	Yes	Footnote references to "11" should have been "10".
Extreme Events Stability 2e	Yes	Footnote references to "11" should have been removed.

A number of commenters indicated that some planning events will result in the same elements being removed from service and sought clarification on whether or not each event required analysis. The SDT acknowledges that different initiating events may result in identical Facilities being removed by protection action. While there may be some overlap in the steady-state timeframe, care must be taken to ensure proper reviews are made in the Stability timeframe where warranted due to delayed clearing modes that may result from the initiating event. For example, a bus fault and a stuck breaker may each clear a bus; however, the stuck breaker will have different reaction times due to the delayed clearing mode and therefore may warrant a review in a Stability environment. The standard allows the Transmission Planner and Planning Coordinator flexibility in using engineering judgment for the Table 1 events it studies for both the steady-state and Stability environments. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events "...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...". If a Transmission Planner/Planning Coordinator can justify that certain events are duplicative for a given timeframe then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that "produce the more severe impacts" for their System. Planning event P2-1 was renamed to "Opening of a line section w/o a fault" to better clarify the SDT's intended analysis. This was in response to some commenters who remained confused by the P2-1 event and felt a detailed breaker model may be necessary. The drafting team clarifies here that a detailed breaker model is not needed. Conforming changes were also made to footnote 7 to make clear the intent of this planning event.

The P5 Protection System Failure event description was changed in support of stakeholders who indicated that multiple element outages may not always result from a P5 event and that it may only result in Delayed Fault Clearing of the faulted Transmission element/Facility. The P5 event now states "Failure of a single Protection System that results in Delayed Fault Clearing on one of the following:"

Footnote 9 is now applied to all "No" items for the column "Interruption of Firm Transmission Service Allowed". Footnote 9 clarifies that Firm Transmission Service can be interrupted so long as appropriate re-dispatch of resources are available and obligated to re-dispatch without any firm Load loss and that Facility ratings are maintained.

Some commenters expressed confusion on whether or not an event is classified as an EHV or HV event. This is an important concept to understand as it directly relates to the stated Table 1 criteria for Interruption of Firm Transmission Service and Non-Consequential Load Loss. The event is classified as EHV or HV based on the lowest nominal system voltage level of all the Facilities removed by the event studied and regardless of the fault location. For example, a fault that removes a 345/138kV

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

transformer is classified as a high-voltage (HV) event and the HV criteria apply. Changes to footnotes 1 and 5 were made to aid understanding in this regard.

Note changes are as follows:

Header note 'f': Applicable Facility Ratings shall not be exceeded.

Header note 'g': System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.

Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.

Footnote 2 - Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.

Footnote 3 - Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.

Footnote 5 - For non-Generator Step Up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.

Footnote 7 - Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.

In addition, the definition of Non-Consequential Load Loss was revised to provide greater clarity:

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Organization	Yes or No	Comments for Question 10
FRCC Transmission Working Group		<p>Please clearly indicate for P3 and P5 that note 1 and note 9 apply. Consider using a comma, not a note 19 that does not exist.</p> <p>The P2-1 event needs to be clarified with its intent. In the SDT Consideration of Comments to the 3rd DRAFT posting, the response to Transmission Planning clarified that "There is no need to show a line energized up to the</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>breakers that opened. The intent is simply to look for low voltage or thermal problems while supplying Load from one end of a normally networked line.” This could be accomplished by adding this to footnote 7 or re-naming the event “Opening of a Line Section w/o fault”.</p>
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT has accepted the commenter’s suggestion to better clarify the P2-1 planning event. The Event description in Table 1 for the P2-1 planning event has been re-titled “Opening of a line section w/o a Fault” and the corresponding footnote number 7 has been revised to read as follows:</p> <p>Footnote 7 - Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.</p>		
SRP	No	<p>: As currently drafted, several outages identified in Categories P2, P4, and P5 appear to potentially result in the same elements being removed from service, so therefore the same event, even though the initiating event is different. We believe that the drafting team needs to conduct a workshop prior to balloting to educate the industry on what outages are required to be simulated for which Categories.</p> <p>Additionally there are footnotes numbered 12, 19, and 101, which do not relate to any foot note in the document, and some other footnotes seem to be misplaced. We encourage the drafting team to carefully review all footnotes to ensure accuracy prior to balloting this standard.</p>
<p>Response: The SDT agrees that some planning events will result in the same elements being removed from service. However, the similarities may only be valid from a steady-state view point and care must be taken to review the events in the Stability timeframe due to delayed clearing modes that may result from the initiating event. For example, a bus fault and a stuck breaker may each clear a bus; however, the stuck breaker will have different reaction times due to the delayed clearing mode and therefore may warrant a review in a Stability environment. The standard allows the Transmission Planner and Planning Coordinator flexibility in using engineering judgment for the Table 1 events in which it studies for both the steady-state and Stability environments. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events “...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...” If a Transmission Planner/Planning Coordinator can justify that certain events are duplicative for a given timeframe then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that “produce the more severe impacts” for their System. At this time the SDT does not plan to conduct a workshop as suggested by the commenter. If Regional Entities wish to conduct seminars on the standard, SDT members from that region could be made available as participants in the discussions.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p>		
Northeast Utilities	No	<p>[Comment on Non-Consequential Load Allowed for certain Planning Events] We recommend that the standard as written should not allow non-consequential load loss to be used to resolve violations arising from the planning events in Table 1. We believe that planning for a reliable power system should discourage mitigation by load loss. Therefore, Non-Consequential Load Loss should not be allowed in a future looking system plan.</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>[Comment on Table 1 Item e, under Steady State & Stability] Our understanding here is that we should be able to redispatch after the first contingency (using fast start generation) to secure the system in anticipation of a second contingency and not redispatch to fix first contingency violations. Is this interpretation correct? Further, this standard doesn't specify which units can be adjusted following the contingency. This seems to stress the fact that the standard needs to address the definition of what is a base case. Also, the standard should be clear on whether we can or cannot rely on generation redispatch after the first contingency, i.e., should the failure of a fast start generator to start up be included in the contingency, or is this another level of contingency?</p> <p>[Comments on Footnotes] Footnotes 1, 10, 11, 19 and 101 need to be fixed. They are either mislabeled or do not point to any item.</p>
<p>Response: The SDT disagrees with the commenter's view related to disallowing Non-Consequential Load Loss for any planning event. The SDT believes they have made the appropriate expectations in not permitting its use for some Contingency planning events involving EHV Facilities. A Transmission Planner/Planning Coordinator may implement a more conservative planning approach beyond what TPL-001-1 requires if they believe one is warranted.</p> <p>The standard in Requirement R2, sub-part 2.7.1 (Corrective Action Plans) indicates that generation curtailment, tripping and re-dispatch are permissible Corrective Action Plans for both single and multiple Contingency events. Therefore, the SDT does not agree with Northeast Utilities view in this regard.</p> <p>The standard does not include prescriptive expectations for a "base case" conditions and allows flexibility to the TP/PC in this regard. See requirement R1 for initial model (P0 starting conditions) requirements.</p> <p>Starting of a "fast-start" generation unit appears to be viewed in the context of a Corrective Action solution to a studied planning event. There may situations like this that lend themselves to sensitivity analysis as required by the TPL-001-1 standard.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p>		
British Columbia Transmission Corp	No	<ol style="list-style-type: none"> 1. Table 1 event indicates loss of one of the equipment. It appears to be silent on the event classification regarding multiple equipments within the same protection zone. Is this considered as a single contingency or multiple contingencies? Please clarify. 2. Table 1 P5 refers to the event on loss of multiple elements caused by the failure of a single protection system while clearing a fault on one contingency. For systems equipped with dual or redundant protections, is a protection failure still a valid concern? Shouldn't this contingency analysis be excluded from the requirement? Please clarify. 3. Table 1 Extreme Events under Stability section, there is a reference to protection failure during fault clearing. Again for systems equipped with dual or redundant protections the requirement should be reconsidered. Please confirm. 4. Table 1 Extreme Events under both Steady State and Stability sections, there is a reference to loss of transmission lines on a common right-of-way. Please consider adding a Footnote to define the common right-of-way using minimum length similar to the one used for circuits on common structure (Footnote 12).

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>5. Performance Table 1 Footnote Item 1 on definition of angular stability, it states “For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism.” o The requirement of no unit pull out of sync is not clear. Does this apply to small generators connected to distribution or lower voltage class lines? Or this is only applicable to generators connected to BEC (i.e. 100kV and above) without intermediary transmission voltage line connections?</p> <p>6. Table 1 Footnote Item 6 refers to the “reference voltage” for transformers. What is the purpose of a reference voltage? Is this used to determine a valid transformer contingency? If so, according to the present definition a 3 phase fault on the 138kV side of a 138/66kV transformer is not considered a valid contingency to be assessed. Is this the intent?</p>
<p>Response:</p> <ol style="list-style-type: none"> The P1 Event is a single Contingency condition. A P1 Event may or may not remove other BES Facilities with it depending on the Protection System design. For example, a fault on a Transmission line (single Contingency) may also remove a BES transformer if no high-side transformer protection device is installed. A P5 Event with a redundant Protection System will be covered by the analogous single Contingency event from a steady-state view. However, even with redundant Protection System designs there may be a delayed clearing mode that may need to be considered with the Stability timeframe. The standard allows the Transmission Planner and Planning Coordinator flexibility in using engineering judgment for the Table 1 events in which it studies for both the steady-state and Stability environments. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events “...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...” If a Transmission Planner/Planning Coordinator can justify that certain events are duplicative for a given timeframe then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that “produce the more severe impacts” for their System. See response to item 2. The commenter appears to have referenced a Draft 3 version of the standard. The change requested was included in Draft 4. Footnote 11 in draft 4 reads as follows: “Excludes circuits that share a common structure or common Right-of-Way for 1 mile or less”. The commenter appears to have referenced a Draft 3 version of the standard as the former Draft 3 footnote 1 was moved to Requirement R4, part 4.1.1 in draft 4. The applicability of the NERC Reliability Standards unless otherwise stated is the Bulk Electric System and Part 4.1.1 applies only to BES generating units. The commenter appears to have referenced a Draft 3 version of the standard and the question is related to footnote 5 of the Draft 4 standard. The term “reference voltage” is used in determining if a transformer is classified as EHV or HV for the BES. This classification then ties to footnote 1 in regards to provisions for the interruption of Firm Transmission Service and Non-Consequential Load Loss. For example, if a 345/138 kV TR is outaged for the Event studied, the high-voltage (HV) allowances for interruption of Firm Transmission Service and loss of Non-Consequential Load would apply. The 138/66 kV transformer may not be classified as a BES Facility, your Regional Entity definition of the BES should be consulted for an official position. 		
NERC Standards Review Subcommittee	No	A. P3 Modify the P3 Category performance criteria to apply only to the loss of two generators because the probability of the loss of two base load generators is an order of magnitude greater than the loss of a generator and any other transmission element. The MRO NSRS suggests the listing of: the loss of transmission circuit, transformer, shunt device, and single pole of DC line be removed from the P3 Events column. Move the

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>“generator + another element” events to the P6 Category by adding “1. Generator” to the listing in the Initial System Condition (Loss of . . .) column.</p> <p>B. The SDT should be commended for the changes that were made to Table 1. However, the MRO NSRS does recommend a few editorial changes. On page 16 under the Steady State and Stability heading is item d. Simulate Normal Clearing unless otherwise specified. This is also listed as footnote 2 to the table. The MRO NSRS recommends that item d under the Steady State and Stability heading be deleted.</p> <p>C. Why is there a footnote 1 indicator to note j. under Stability only? The MRO NSRS suggests that this footnote 1 indicator be deleted.</p> <p>D. Item i. under Steady State only states that “the response of voltage sensitive Load that is disconnected from the System by end-user equipment” is not to be used to meet steady state requirements. However, the non-consequential load loss says yes meaning it is allowed for some events in the table and non-consequential load loss definition includes the “response of voltage sensitive Load that is disconnected from the System by end-user equipment.” This seems to be a direct contradiction. The MRO NSRS suggests that Item i. under steady state only be deleted.</p> <p>E. The MRO NSRS does not understand why there is a footnote 19 indicator for P3 and P5 EHV in the table when no footnote 19 exists. Perhaps the SDT meant footnotes 1 and 9 but The MRO NSRS recommends that this be corrected.F. The MRO NSRS does not understand why there is a footnote 12 indicator for Item 2 a and 2 b. on page 19. Perhaps the SDT meant footnotes 1 and 2 apply but The MRO NSRS recommends that this be corrected.</p>

Response:

- A. The SDT disagrees with the proposed adjustment of moving select generator Contingency outages to new planning event designations. The Table 1 planning event order regarding outage probability is somewhat subjective and the SDT believes appropriate expectations were made for generation outages within the P3 event. No changes made.
- B. The SDT appreciates the support for changes made. The SDT decided to keep both references to “simulate normal clearing unless otherwise specified”. While redundant, we believe it is important information and should aid to ensure industry is aware of the intent.
- C. The reference to footnote 1 in Table note “j” should have been deleted in Draft 4. The SDT has fixed a number of footnote reference errors in Draft 5.
- D. The Draft 4 definition of Non-Consequential Load Loss confused some stakeholders in that some thought the voltage sensitive Load was “inclusive” to this type of Load. The definition was changed to better clarify the SDT’s intent that customer sensitive Load and Load disconnected by the end-user is not included within the definition. With that change the perception of a conflict is now resolved.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.
- E. Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
Bonneville Power Administration	No	<p>As currently drafted, several outages identified in Categories P2, P4, and P5 appear to potentially result in the same elements being removed from service, so therefore the same event, even though the initiating event is different.</p> <p>We believe that the drafting team needs to conduct a workshop prior to balloting to educate the industry on what outages are required to be simulated for which Categories.</p> <p>Additionally there are footnotes numbered 12, 19, and 101, which do not relate to any foot note in the document, and some other footnotes seem to be misplaced. We encourage the drafting team to carefully review all footnotes to ensure accuracy prior to balloting this standard.</p> <p>Table 1, the second to last column: Please clarify what is meant by "Interruption of Firm Transmission Service." Planning studies do not differentiate firm and non-firm transmission services. Planning studies model a load forecast, a generation dispatch, and the system topography. Interruption of firm transmission service is a commercial issue and is not related to assessing reliability of the system. If an assumed transfer is interrupted in a power flow case due to a contingency, and if no consequential load loss were allowed and all criteria were met, the system would still be exhibiting reliable performance. We believe interruption of firm transmission service should be allowed for all planning events P1 through P5 when assessing the reliability of the transmission system. At a minimum, footnote 9 in Table 1 should apply to all events in category's P1 through P5 that do not allow interruption of firm transmission service. The NERC definition of Firm Transmission Service states "highest quality of service offered to customers under a filed rate schedule that anticipates no planned interruption." Planning events required to be evaluated in Table 1 are unplanned interruptions by nature since they are studied to determine mitigation should they occur unexpectedly. This is inconsistent with the definition</p> <p>Table 1, P1.4, P3.4, P4.4, P5.4, and P6.3: Shunt devices are not required to be in service at all times. It does not make sense to include it in the events column. How would you assess it while several of these devices are not deployed because they are not needed for the conditions studied?</p> <p>Table 1, P1 & P2: What is the rationale for having two categories for single contingency?</p> <p>Table 1, P2.1 (Opening of a breaker without a fault): Please clarify what constitutes opening a breaker without a fault mean? Planning for these events will be time consuming (modeling every breaker position open) and expensive to mitigate for events that occur solely due to human error and should be removed for the table.</p> <p>Table 1, P2.2, P2.3, and P2.4: These are not single contingency events and should be moved to P3.</p>
<p>Response: The SDT agrees that some planning events will result in the same elements being removed from service. However, the similarities may only be valid from a steady-state view point and care must be taken to review the events in the Stability timeframe due to delayed clearing modes that may result from the initiating event. For example, a bus fault and a stuck breaker may each clear a bus; however, the stuck breaker will have different reaction times due to the delayed clearing mode and therefore may warrant a review in a Stability environment. The standard allows the Transmission Planner and Planning Coordinator flexibility in using engineering judgment for the Table 1 events in which it studies for both the steady-state and Stability environments. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events "...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ..." If a Transmission</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>Planner/Planning Coordinator can justify that certain events are duplicative for a given timeframe then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that “produce the more severe impacts” for their System.</p> <p>At this time the SDT does not plan to conduct a workshop as suggested by the commenter. As an alternative, the SDT will ask WECC area SDT member(s) to discuss this matter via appropriate WECC technical committees utilizing SDT members as participants in the discussions.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT agreed with the commenter regarding the Table 1 performance requirements related to the Interruption of Firm Transmission Service. The team has applied footnote 9 to all Events that indicated “No” in this column. The Firm Transmission Service within the context of a planning horizon are long-term service arrangements from one Balancing Authority area to another that should be reflected within the planning model and net-interchange.</p> <p>The standard allows engineering judgment and flexibility to exclude certain Contingencies that may not be pertinent for the conditions studied. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events “...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...” If a Transmission Planner/Planning Coordinator can justify that certain events not pertinent for a given study then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that “produce the more severe impacts” for their System.</p> <p>The two Contingency categories are used to delineate between higher ranked P1 single Contingencies and the lower ranked, yet high impact P2 single Contingency events. In P2, the team chose to differentiate between the EHV and HV in regards to performance expectations whereas in P1 the performance requirements for both EHV and HV are the same.</p> <p>The SDT believes the P2.1 event is important for review and it remains in Draft 5. Inadvertent relay operation that trips a breaker(s) is the primary reason forced outage cause for a P2.1 event. The condition could also be a planned (maintenance) event. The P2.1 event has been renamed “opening of a line section w/o a fault” to better align with the team’s intent. Additionally, footnote 7 was revised to better clarify the need to study the P2.1 event. Footnote 7 now reads:</p> <p>Footnote 7 - Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.</p> <p>The P2.2, P2.3, and P2.4 planning events are less likely yet higher impact single Contingency events. While its true that these events will likely result in multiple elements being disconnected from the System they are classified as single Contingency since they are a common mode event resulting from a single fault with normal Protection System clearing. As stated above, the SDT does not treat the P2 events in the same manner as P1 events and there are unique expectations in performance for P2 events that result in HV element outages versus solely EHV element outages.</p>
Idaho Power	No	<p>As currently drafted, several outages identified in Categories P2, P4, and P5 appear to potentially result in the same elements being removed from service, so therefore the same event, even though the initiating event is different.</p> <p>I believe that the drafting team needs to conduct a workshop prior to balloting to educate the industry on what outages are required to be simulated for which Categories.</p> <p>Additionally there are footnotes numbered 12, 19, and 101, which do not relate to any foot note in the document, and some other footnotes seem to be misplaced. We encourage the drafting team to carefully review all footnotes</p>

Utility System Efficiencies, Inc. (USE)	No	<p>As currently drafted, several outages identified in Categories P2, P4, and P5 appear to potentially result in the same elements being removed from service. Simulations of these outages would then be the same, even though the initiating event is different.</p> <p>I believe that the drafting team needs to conduct a workshop prior to balloting to educate the industry on what outages are required to be simulated for which Categories.</p> <p>Additionally there are footnotes numbered 12, 19, and 101, which do not relate to any footnote in the document, and some other footnotes seem to be misplaced. I would encourage drafting team to carefully review all footnotes to ensure accuracy prior to balloting this standard.</p>
Western Area Power Adm - RMR	No	<p>As currently drafted, several outages identified in Categories P2, P4, and P5 appear to potentially result in the same elements being removed from service, so therefore the same event, even though the initiating event is different.</p> <p>I believe that the drafting team needs to conduct a workshop prior to balloting to educate the industry on what outages are required to be simulated for which Categories.</p> <p>Additionally there are footnotes numbered 12, 19, and 101, which do not relate to any footnote in the document, and some other footnotes seem to be misplaced. I encourage the drafting team to carefully review all footnotes to ensure accuracy prior to balloting this standard.</p>
<p>Response: The SDT agrees that some planning events will result in the same elements being removed from service. However, the similarities may only be valid from a steady-state view point and care must be taken to review the events in the Stability timeframe due to delayed clearing modes that may result from the initiating event. For example, a bus fault and a stuck breaker may each clear a bus; however, the stuck breaker will have different reaction times due to the delayed clearing mode and therefore may warrant a review in a Stability environment. The standard allows the Transmission Planner and Planning Coordinator flexibility in using engineering judgment for the Table 1 events in which it studies for both the steady-state and Stability environments. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events "...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...". If a Transmission</p>

<p>System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...” If a Transmission Planner/Planning Coordinator can justify that certain events are duplicative for a given timeframe then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that “produce the more severe impacts” for their System.</p>		
Progress Energy Florida, Inc.	No	As PEF is opposed to TPL-001-1 as a whole, PEF will have no further comment on this issue other than to encourage all appropriate parties to review PEF’s previous comments to this effect.
<p>Response: Throughout the drafting process, the SDT has carefully considered your comments as well as comments from other industry members.</p>		
Pepco Holdings, Inc. - Affiliates PHI	No	<p>Category P5 should be more appropriately titled DELAYED CLEARING OR Loss of multiple elements caused by the failure of a single Protection System while clearing a fault on one of the following....A protection system failure does not necessarily lead to loss of multiple power system elements. Sometimes it may just be delayed clearing of the faulted element. The recommended change is based on the SDT’s response to comments submitted to Draft #2 of the standard? -A number of commenters expressed concern related to Planning Event P5 “Protection System Failure” and the need to evaluate a single component failure of a BES Protection System; particularly a failure of a station battery. The SDT has revised the P5 Planning Event description to remove the reference to “single component failure” and the event description was changed to match what is stated in the currently approved TPL standards under Category C6 through C9. --The intent of P5 is to evaluate a failure of a single Protection System design that introduces a delayed clearing mode that may also include additional electrical Facilities being removed when compared to normal fault clearing.-- A Protection System failure resulting in loss of the substation (one voltage level plus transformers) would not qualify as a P5 Planning Event since that event is considered an Extreme Event.</p> <p>Also, the phrase "failure of a single Protection System" should be defined. Draft #1 language used the term - single component failure- of a protection system. Based on a number of comments that were received, that term was subsequently replaced with the term -failure of a single Protection System-. To avoid confusion, this term needs to be defined within this standard and / or examples provided. If not, there will be confusion on how to study this category of events. This issue has been raised by numerous commenters throughout the standard development process. That fact that it continues to be expressed through numerous drafts indicates a lack of clarity as to exactly what protection system failures are to be studied.For example - Assume there are two protection systems on a facility (Scheme A and Scheme B). Assume one publishes a clearing time for Scheme A, and a slower clearing time for Scheme B. The TPL standard, as written, could imply that for a P5 failure of a single Protection System (scheme A or B fails) you would study the event assuming the worst case clearing time (i.e., using the slower clearing time for Scheme B.) Is that what is intended? If so, it should be so stated. However, that interpretation assumes the failure of a single Protection System would not effect the operation of the second Protection System. In other words it would not address single component points of failure, which could disable both Scheme A and Scheme B. Suppose both schemes were fed from the same set of CT's, VT's, battery, etc. Since the phrase "single component failure of the protection system" was eliminated, does this mean failure of both schemes due to a single component failure is not required to be studied under the P5 category? The standard must be very clear as to what contingency (i.e., what kind of protection system failure) is</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		to be studied. It should not be silent on this point, nor should it refer to another standard for guidance on what contingencies to study.
<p>Response: The SDT agrees with points raised by the commenter and has changed the event description of the P5 planning event to better clarify the intent of simulating this Contingency. The SDT did not agree with the proposal to add a definition for the phrase “failure of a single Protection System”. The SDT believes the description modification in the Event column of Table 1 suffices in this regard. The P5 planning event remains unchanged in the study work intended by the SDT and the description modifications are aimed only at clarifying our intent.</p> <p>The SDT confirms that the intent of P5 is not to study the loss of both Scheme A and Scheme B for the example provided by the commenter and that the expectation would be the study of the slower clearing time scheme (Scheme B).</p>		
Oklahoma Gas & Electric	No	<p>Category P7 OG&E supports as long as footnote 11 is included.</p> <p>Category P6 is an N-2 situation. OG&E does not support the wholesale study of every N-2 combination of contingencies even though one is allowed for the interruption of firm transmission service and non-consequential load loss. Establishing and maintaining operating guides associated with every N-2 set of contingencies is oppressive and would provide limited value. OG&E understands the need for targeted N-2 contingency studies; such as breaker failure.</p> <p>Category P5 Need more specific description of “Protection System failure” before receiving OG&E’s support.</p> <p>Category P4 OG&E supports performing studies. OG&E also supports the differentiation between “DHV” and “HV”. OG&E does not support developing operating guides for every voltage or overload issue discovered.</p> <p>Category P3 OG&E is concerned about the value of P3. Information about the expected value of performing studies for the category is needed before receiving OG&E support.</p> <p>Category P2 OG&E supports even though there are a few minor issues.</p> <p>Category P1 OG&E supportsOG&E will need every bit of the 60 months time mentioned on page 3 under “Effective Date” to implement all indicated upgrades. There is benefit in hardening the OG&E electrical system for such protection system failures, such as P4 & P5, but it may not be cost effective.</p> <p>Comments Stability AnalysisStability Analysis Recommend Planning Coordinator will be responsible for running the stability analysis to assure NERC compliance. The Planning Coordinator and Transmission Planner should work together to prepare the data.</p>
<p>Response: In P7, footnote 11 remains, thanks for your support.</p> <p>In P6 not every possible combination would be expected to be studied, especially for a Transmission Planner/Planning Coordinator covering a very large geographic footprint. The standard allows engineering judgment and flexibility to exclude certain Contingencies that may not be pertinent for the conditions studied. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events “...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ...” If a Transmission Planner/Planning Coordinator can justify that certain events are not pertinent for a given study then at their discretion they may</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
<p>elect to limit their Contingency list so long as their entire Contingency list covers the events that “produce the more severe impacts” for their System.</p> <p>Based on feedback from some commenters the SDT made changes to the P5 planning event description as shown in Table 1. The changes are not substantive, do not alter the team’s prior intent and aimed at clarification only.</p> <p>Regarding the comments provided on P4. The SDT appreciates the commenter's support in regard to the bifurcated approach of performance expectations related to the BES. The SDT believes all performance deficiencies related to thermal ratings and voltage ratings require corrective actions and the standard provides the Transmission Planner/Planning Coordinator a wide range of alternatives, including but not limited to Operating Procedures. As stated above, the Contingencies studied are expected to be those that have the most severe impact on a particular Facility and not necessarily every possible scenario.</p> <p>The SDT's review of outage events associated with various System conditions revealed that the potential for a generating unit outage being coincident with a variety of other Contingency conditions requires close evaluation. Again, study of some your largest units in combination with other events may suffice to cover the “more severe” conditions for your System and flexibility is afforded to the Transmission Planner to ensure proper coverage without the needed to study each and every combination.</p> <p>We appreciate your support on planning event P1 & P2 expectations.</p> <p>Regarding the proposal for Stability to be covered by the Planning Coordinator. The standard in P7 requires the Transmission Planner and Planning Coordinator to determine and identify individual or joint responsibilities for performing required studies. The Transmission Planner may rely on work being preformed by its Planning Coordinator but each is responsible for showing auditable compliance for the TPL-001-1 study requirements including Stability.</p>		
SERC Planning Standards Subcommittee	No	Comments: Some of the footnote superscripts do not appear to have a corresponding reference in the footnotes, in the case of number 19 at several locations in the Firm Transmission Service column, and number 101 in the P4 cell in the Category column.
Southern Company	Yes	<p>Some of the footnote superscripts do not appear to have a corresponding reference in the footnotes, in the case of number 19 at several locations in the Firm Transmission Service column (should be 9), and number 101 in the P4 cell in the Category column (should be 10).</p> <p>In header note j, the reference to footnote 1 should be removed.</p> <p>In steady state extreme events 2a and 2b, the reference to footnote 12 should be to footnote 11.</p> <p>In stability extreme events 2a through 2e, the reference to footnote 11 should be to footnote 10.</p>
Lafayette Utilities System	Yes	While LUS remains concerned as to the way in which what is now footnote 9 may be followed in operation in areas where there have been historic problems with the old “footnote b”, we appreciate the clarifications that have been made, and recognize that this may be the best way to resolve an issue for the industry. Please note that there remains what appears to be a typographical error in Table 1, Category P3, under “Initial System Condition” in that the footnote reference is to footnote 19, which does not exist. The reference was to footnote 10 in v.3 and we assume that the correct reference here is to footnote 9, which used to be footnote 10.
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.		
US Bureau of Reclamation	No	Consequential Load Loss was defined, however, consequential generator loss was not. It may be easier to define "consequential loss" and let it apply to either.
<p>Response: The SDT does not believe a definition to differentiate between consequential or non-consequential generation loss is needed since generation tripping and re-dispatch is permitted as a corrective action for all planning events as stated in Requirement R2, part 2.7.1.</p>		
Tri-State Generation and Transmission Association	No	<p>Extreme Events detailed at the end of Table 1 should be itemized in the same way as for so-called "Planning Events" at the beginning of Table 1. Steady State Extreme Event 1 would be EP1, Dynamic Stability Extreme Event 1 would be ED1, etc.</p> <p>Also, please use the term Dynamic Stability, not just Stability, as explained above.</p> <p>It would be helpful if descriptions had unique identifiers, for example Dynamic Extreme Event 1 could be called N-1-1.</p> <p>For Dynamic Extreme Event 1, the phrase "With an initial condition" conflicts with the phrase "prior to System adjustments" at the end of the sentence. The term "initial condition" suggests a maintenance outage, or at least an outage that has sustained long enough for the system to have responded/adjusted.</p> <p>Footnote text does not line-up with the body text in the Extreme Event Table.</p> <p>It seems to us that a bus-tie breaker would have the same chance of failure as another breaker. Therefore differentiation is not needed in Table 1.</p>
<p>Response: The SDT recognizes a minority position to label the extreme events in a manner similar to the planning events for a short-hand notation. However, based on lack of a significant majority objection to the extreme event table layout the team determined no changes were needed in this regard.</p> <p>The SDT believes the references to Stability in the extreme events portion of the table are sufficient. No changes made.</p> <p>The SDT does not believe that a conflict exists for extreme event 1 in regards to "With an initial condition" and "prior to system adjustment". No changes made.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT agrees that any breaker has an equal chance for failure due to a fault. However, when lumped together with all the BES line breakers and transformer breakers, the Bus-tie Breaker application is much less prevalent within the BES when considering all breaker fault possibilities. The SDT recognizes that Bus-tie Breaker applications are used to lessen the impact of a bus fault outage (P2.2). Therefore, in regards to meeting the single Contingency breaker fault condition, the SDT felt it was necessary to differentiate between performance expectations between bus-tie and non bus-tie breakers. See P2.3 and P2.4 planning events.</p>		
Omaha Public Power District	No	If "the response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment" is considered to be a special type of Consequential Load Loss, add the following sentence to the end

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>of Note “b”: However, see Note “i” for a restriction that applies to steady state performance.</p> <p>In Note “g”, change “voltage limits” to “voltages”.</p> <p>In Note “j”, it appears that the reference to Footnote 1 is not needed.</p> <p>For Category P3, should the reference to Footnote 19 in the second column be a reference to Footnote 9?</p> <p>For Categories P3, P4, and P5, in the column labeled “Interruption of Firm Transmission Service Allowed”, are the references to Footnotes 19 and 10 needed?</p> <p>For Category P4, should the reference to Footnote 101 in the first column be a reference to Footnote 10?</p> <p>For Category P4, should the reference to Footnote 11 in the third column be a reference to Footnote 10?</p> <p>In Items 2a and 2b of the “Steady State” subsection of the “Extreme Events” section, should the references to Footnote 12 be references to Footnote 11?</p> <p>In Footnote 1, change “loss of Non-Consequential Load” to either “Non-Consequential loss of Load” or “Non-Consequential Load Loss”. (The point here is that the adjective “Non-Consequential” applies to the word “loss” rather the word “Load”.)</p> <p>In the first sentence of Footnote 2, change “Normal Clearing faults” to “Normal Clearing of faults”.</p> <p>In the second sentence of Footnote 2, remove the comma following the word “types”.</p> <p>In Footnote 3, change “Non-Consequential Load” to either “Non-Consequential loss of Load” or “Non-Consequential Load Loss”. (The point here is that the adjective “Non-Consequential” applies to the word “loss” rather the word “Load”.)</p> <p>In the second sentence of Footnote 5, change “generator Step Up” to “Generator Step Up” to be consistent with the rest of the footnote.</p>
<p>Response: Load removed by end-user action or voltage sensitive Load that trips while the Transmission Planner/Planning Coordinator transient voltage criteria is being met is NOT a special case on Consequential Load Loss. No changes made.</p> <p>The SDT agrees with the proposed change to note “g” in Table 1.</p> <p>Header note ‘g’: System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT agrees with the proposed wording change to footnote 1. The SDT also made other changes to footnote 1 for clarity and it now reads:</p> <p>Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>Loss.</p> <p>The SDT agrees with the proposed wording change to footnote 2.</p> <p>Footnote 2 - Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.</p> <p>The SDT agrees with the proposed wording change to footnote 3. The team also made other changes to footnote 3 for clarity and it now reads:</p> <p>Footnote 3 - Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.</p> <p>The SDT agrees with the proposed wording change to footnote 5. Footnote 5 now indicates:</p> <p>Footnote 5 - For non-Generator Step Up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.</p>
TVA System Planning	No	<p>In Header note j - the reference to footnote #1 should be removed.</p> <p>Are batteries included as part of Protection System for P5 events?</p> <p>P3 reference to footnote #19 under Initial System Condition and for Interruption of Firm Transmission Service Allowed should actually be footnote #9.</p> <p>P5 reference to footnote #19 for Interruption of Firm Transmission Service Allowed should actually be footnote #9.</p> <p>The reference to footnote #101 in the P4 category should actually be to #10.</p> <p>For Steady State notes under Extreme Events, events 2a and 2b should reference footnote #11 instead of #12.</p> <p>For Stability notes, event 2 should refer to footnote #10 instead of #11. In footnote #3, should there be an “or” before “as defined by the Regional Entity”?</p>
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The P5 event is not a review of individual Protection System components but rather evaluates the loss of a “single Protection System” scheme or design. It is acceptable to simulate that a local (at the same substation) alternate Protection System scheme is still operational when performing a P5 review. The SDT chose this language to align with the SAR titled: Reliability of Protection Systems (Project 2009-7). The SDT believes that the individual component level evaluation of Protection Systems and redundancy requirements should be covered under the PRC standards and has only addressed a single protection scheme failure in the Planning Assessment required for the TPL standard. A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
<p>planning event. Based on feedback from some commenters, the SDT made changes to the P5 planning event description as shown in Table 1. The changes are not substantive, do not alter the team's prior intent, and are aimed at clarification only.</p>		
<p>Arizona Public Service Co.</p>	<p>No</p>	<p>Note a: It would be helpful if there was a clear understanding of what constitutes voltage instability for the purpose of this standard. Is TP expected to have its own criteria for voltage stability?</p> <p>Are the dynamic and angle stabilities intentionally excluded?</p> <p>P3 refers to foot note 19 but there is no foot note 19.</p> <p>P4 refers to foot note 11, but the foot note does not seem to be applicable. Foot notes in second to last column of the table are confusing.</p>
<p>Response: In Requirement R5 the Transmission Planner/Planning Coordinator is expected to have documented its criteria for transient voltage response. It is expected that this criteria would reflect what would be considered voltage instability.</p> <p>Related to the question on dynamic and angle stabilities, the standard provides a requirement for what is considered a stable System in Requirement R4, part 4.1.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p>		
<p>Lakeland Electric</p>	<p>No</p>	<p>Recommended the following changes to the HV definition: Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems, per the Regional Entity's BES criteria/definition. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems, per the Regional Entity's BES criteria/definition.</p>
<p>Response: The SDT has retained the same delineation of the Bulk Electric System (EHV and HV) in Draft 5. No changes made.</p>		
<p>Duke Energy</p>	<p>No</p>	<p>Reword Steady State Only: f. as follows: "Applicable Facility Ratings shall not be exceeded."</p> <p>P3 Initial System Conditions footnote should be 9, not 19.</p> <p>Also, P4 footnote should not be 101.</p> <p>Please check all footnote references.</p>
<p>Response: The SDT agrees with the proposed wording change to header note "f" and it now reads:</p> <p>Header note 'f': Applicable Facility Ratings shall not be exceeded.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
Ameren	No	<p>Some of the footnote superscripts do not appear to have a corresponding reference in the footnotes, in the case of number 19 at several locations in the Firm Transmission Service column, which should be changed to number 9, and numbers 11 and 101 in the P4 cell in the Category column that should be changed to 10.</p> <p>Table 1 - Steady State and Stability Performance - Planning Events, note c., and Table 1 - Steady State & Stability Performance - Extreme Events, note a. will need to be revised to address the restoration of facilities as described above in comments to Questions 3 and 5.</p> <p>A header is needed on the third page of Table 1 Steady State & Stability Performance.</p> <p>Table 1 Steady State and Stability Performance Extreme Events - Steady State: Superscripts on items 2a and 2b should be 11 rather than 12. Similarly, for the Extreme Events - Stability items 2a through 2f, the superscript should be 10 rather than 11.</p>
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>As stated in the SDT's response to comments made by Ameren in Question 3, in Requirement R3, part 3.3.1 the reference to "other automatic controls" is intended to include other tripping means such as cross-tripping and not automatic restoration devices. No change made.</p> <p>Ameren comments to Question 5 do not appear pertinent to "automatic restoration" of facilities. No change made.</p> <p>The SDT agrees that an appropriate page header is needed on for each page of the Table and has worked with NERC staff to correct this in Draft 5.</p>		
SERC Dynamics Review Subcommittee (DRS)	No	<p>Some of the footnote superscripts do not appear to have a corresponding reference in the footnotes, in the case of: Table 1 Planning Events P3 superscripts should be 9 and not 19.</p> <p>Table 1 P5 superscript 19 should also be 9.</p> <p>Table 1 Planning Events P4 superscript 101 should be 10, superscript 11 should also be 10.</p> <p>Table 1 Extreme Events steady state items 2A and 2B superscript should be 11, not 12.</p> <p>Table 1 Extreme Events stability items 2A-2F superscript should be 10, not 11.</p> <p>No header on third page of Table 1 Planning Events.</p> <p>Table 1, Planning Events, wherever it says "no" in the "interruptions of firm transmission service" column, generation tripping by fault clearing action should be allowed.</p>
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT agrees that an appropriate page header is needed on for each page of the Table and has worked with NERC staff to correct this in Draft 5.</p> <p>The SDT agrees with the commenter regarding the suggestion to permit generation re-dispatch when a "No" is indicated in the Table 1 column titled "Interruption of</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
Firm Transmission Service Allowed” and footnote 9 is now reflected on each occurrence.		
SRC of ISO/RTO	No	Table 1 should appear right after the requirements and before the VSLs. AESO does not comment on VSLs or VRFs.
Response: The SDT agrees with the commenter’s recommendation to move Table 1 within the standard so that it follows directly after the requirements. This change was made in Draft 5.		
ERCOT ISO	No	The references to the footnotes need commas there are several references to footnote 19 and at least one to footnote 101.
Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.		
MidAmerican Energy Company	No	<p>The SDT should be commended for the changes that were made to Table 1. However, MidAmerican does recommend a few editorial changes. On page 16 under the Steady State and Stability heading is item d. Simulate Normal Clearing unless otherwise specified. This is also listed as footnote 2 to the table. MidAmerican recommends that item d under the Steady State and Stability heading be deleted.</p> <p>Why is there a footnote 1 indicator to note j. under Stability only? MidAmerican suggests that this footnote 1 indicator be deleted.?</p> <p>Item i. under Steady State only states that “the response of voltage sensitive Load that is disconnected form the System by end-user equipment” is not to be used to meet steady state requirements. However, the non-consequential load loss says yes meaning it is allowed for some events in the table and non-consequential load loss definition includes the “response of voltage sensitive Load that is disconnected from the System by end-user equipment.” This seems to be a direct contradiction. MidAmerican suggest that Item i. under steady state only be deleted.</p> <p>MidAmerican does not understand why there is a footnote 19 indicator for P3 and P5 EHV in the table when no footnote 19 exists. Perhaps the SDT meant footnotes 1 and 9 but MidAmerican recommends that this be corrected.</p> <p>MidAmerican does not understand why there is a footnote 12 indicator for Item 2 a and 2 b. on page 19. Perhaps the SDT meant footnotes 1 and 2 apply but MidAmerican recommends that this be corrected.</p>
<p>Response: While the SDT agrees that the phrase appears twice, it does not create any confusion or unnecessary redundancy. Footnote 2 is just a more detailed explanation of what needs to be done in Stability studies. No change made.</p> <p>The footnote 1 indication has been deleted as suggested.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
<p>The definition of Non-Consequential Load Loss has been revised to provide greater clarity as to the SDT's intent.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p>		
Xcel Energy	No	<p>There are references to footnote 12 on page 19, and footnote 101 on page 17, yet no such footnotes exist on page 20. Some of the other footnotes seem to be misplaced. Please review and validate all footnote references.</p>
Midwest ISO	No	<p>Table 1 Steady State & Stability Performance Planning Events, Note "b": It states that consequential generation loss is acceptable; however, there is no definition of this in the definition section. We suggest having the following definition of Consequential Generation Loss added to the definition section.</p> <p>Table 1 There appears to be a few typos on P3, P4 and P5 note references because there are no Note 19 nor Note 101. Please clarify this.</p> <p>Table 1 Steady State & Stability Performance Planning Events: We believe that this table should appear right after the requirements but before the VSLs.</p>
<p>Response: It appears the commenter intended to suggest a definition for consequential generation loss but neglected to include its proposed definition. Regardless, the SDT considered the need for such a definition and concluded no definition was needed. No change made.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT agrees with the commenter's recommendation to move Table 1 within the standard so that it follows directly after the requirements. This change was made in Draft 5.</p>		
Florida Municipal Power Agency, and its Member Cities	No	<p>Table 1, under Steady State & Stability, "a" states: "BES Transmission voltage instability, cascading outages and uncontrolled islanding shall not occur." There are small portions of the grid where there may be three long lines feeding a load, and if two of those two lines were lost (P6 for instance), the remaining line would go into voltage collapse losing a few hundred MWs of consequential load with no impact to the BES. FMPA suggests that the wording be appended by: "BES Transmission voltage instability, cascading outages and uncontrolled islanding shall not occur for P0 through P2. BES Transmission voltage instability, cascading outages and uncontrolled islanding causing a supply / demand mismatch of more than the largest single loss of source shall not occur."</p> <p>FMPA does not understand why a bus-tie breaker would be treated differently than another breaker. They both have the same chance of failure.</p>
<p>Response: The SDT considered the proposed change to note "a" but did not accept the proposed change. For the situation described, System adjustments are permitted between the outages of a P6 event to minimize the impact. Additionally, following the second outage the use of an SPS could be used to further minimize</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>the impact and avoid an unstable System condition.</p> <p>The team agrees that any breaker has an equal chance for failure due to a fault. However, when lumped together with all the BES line breakers and transformer breakers, the Bus-tie Breaker application is much less prevalent within the BES when considering all beaker fault possibilities. The SDT recognizes that Bus-tie Breaker applications are used to lessen the impact of a bus fault outage (P2.2). Therefore, in regards to meeting the single Contingency breaker fault condition the SDT felt it was necessary to differentiate between performance expectations between bus-tie and non bus-tie breakers. See P2.3 and P2.4 planning events.</p>
Manitoba Hydro	No	<p>Table 1:1. When two (or more) footnotes apply simultaneously they should be separated by commas; ot are these typos?</p> <p>2. The P2 contingency "opening of a breaker without a fault" could be moved up to a P1 contingency. This is a higher probability event then a bus section fault.</p> <p>3. P4, Event column: The 11 superscript, after the phrase "Loss of multiple elements....", should be a 10. In P3, should 19 be 9?</p> <p>4. Footnote 9: The drafting team clearly permits generator redispatch coupled with curtailment of firm transmission service for multiple contingencies (P3-P5). We believe generator redispatch is appropriate for P1 and P2 as well. R2.7.1 lists several actions that are permitted to be used as corrective plans including Special Protection Systems, automatic generator tripping or manual generator runback to respond to both single and multiple contingencies. Any loss of generation will require redispatch to ensure emergency generation reserves are replenished and the system is ready for the next contingency.</p> <p>For contingency P1, loss of generator, load will not be lost because there are generation reserves, however redispatch will be required to restore these reserves.</p> <p>Footnote 9 should apply to P1 and P2 contingencies.</p> <p>5. Footnote 11: This note is a reference for a common tower outage. I think the words "or common Right-of-Way" should be deleted from the sentence. It is obvious that circuits on a common tower must be on a common Right-of-Way.</p> <p>6. Note b: Consequential generation loss could use a definition similar to consequential and non-consequential load loss to add clarity. The standard as written in R4.1.2 permits cascade tripping of generators due to pulling out of synchronism. Typically this has been defined as instability or cascade tripping and not permitted in the past.</p> <p>7. Note i: note i implies that any voltage sensitive load or load dropped by end-user equipment shall not be used to meet steady-state performance requirements. However, given that this note is not included under the stability portion, does this mean that voltage sensitive load or load that is dropped by end-user equipment can be used to meet the TC and PC planning criteria established in R5? Induction motors could trip in the stability analysis if the transient voltage is low enough (non-consequential load loss). The R5 criteria will be met as long as the load is manually switched back in and the post-disturbance steady state loading is acceptable. Can the drafting team</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		clarify the intent of Note i?
<p>Response:</p> <ol style="list-style-type: none"> 1. Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10. 2. The SDT did not accept the proposed change for the placement of the P2.1 planning event into the P1 group. 3. As noted above, errors in reference to various Table 1 footnotes are recognized by the SDT and have been corrected in Draft 5. 4. The SDT agreed with the commenter and footnote 9 was added to the P1 and P2 events in regard to the column titled "Interruption of Firm Transmission Service Allowed" 5. Common structure may be interpreted as common ROW but Common ROW does not necessarily equate to common structure. Since the wording is 'or', it covers both circumstances. No change made. 6. The SDT does not believe a definition to differentiate between consequential or non-consequential generation loss is needed since generation tripping and re-dispatch is permitted as a corrective action for all planning events as stated in Requirement R2, part 2.7.1. 7. Table 1, note "i" is intended to clarify that even if it is known that an end-user who implements a more conservative practice than that of the Transmission Planner/Planning Coordinator regarding steady-state voltage criteria and chooses to interrupt its own Load, the end-use Load must still be represented in the steady-state timeframe. The Load tripping is permitted in a Stability review, however, it should be assumed that a customer will react quickly to restore its Load and therefore the standard requires the Load be represented in the steady-state timeframe. Only actions (manual or automatic) taken by the Transmission Planner/Planning Coordinator are permitted for consideration for a steady-state review. 		
NERC System Protection and Control Subcommittee (SPCS)	No	<p>The Drafting Team should modify the P5 Category column in Table 1 to read "P5 Multiple Contingency (Fault plus Protection System failure to operate). "This addition will focus the P5 Category on the overall Protection System failure to operate."</p> <p>The Drafting Team should include requirements in P5 of Table 1 for simulating both single-phase and 3-phase fault types for Protection System failures to operate.P4 and P5 call for simulations with SLG faults. Prolonged clearing times that result from breaker failures or Protection System failures to operate increase the probability that the fault may evolve from single-phase to multi-phase, and that probability further increases in EHV substations due to the closer clearances of bus work and equipment. Whereas Breaker Failure times are more likely to be known and mitigated through Breaker Failure Protection Systems, the clearing times associated with Protection System failures to operate may be much longer, increasing the probability of evolving in to multi-phase faults.</p> <p>The phrase "or a protection system failure" should be removed from items 2a through 2e in the Extreme Event table following Table 1.If the initializing event is the SLG fault, its evolution to a multi-phase fault alone (due to a Protection System failure to operate) should not be considered an Extreme Event for stability analysis.</p>
<p>Response: While the SDT did not accept the proposed P5 description change a change has been made for clarity. Based on feedback from some commenters the</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
<p>SDT made changes to the P5 planning event description as shown in Table 1. The changes are not substantive, do not alter the team's prior intent, and are aimed at clarification only.</p> <p>In regards to include both a SLG and 3-phase for the P5 planning event the SDT respectfully disagrees with the commenter. Based on the SDT's review of historical outage data the SDT believes that a SLG event evolving to a 3-phase item is less likely and that 3-phase fault with Protection System failure is appropriately treated with the standard as an extreme event under extreme event Stability item 2a through 2d. No change made.</p>		
Florida Power and Light	No	<p>The P2-1 event needs to be clarified with its intent. In the SDT Consideration of Comments to the 3rd DRAFT posting, the response to Transmission Planning clarified that "There is no need to show a line energized up to the breakers that opened. The intent is simply to look for low voltage or thermal problems while supplying Load from one end of a normally networked line." This could be accomplished by adding this to footnote 7 or re-naming the event "Opening of a Line Section w/o fault".</p>
<p>Response: The SDT agrees with comments in regard to the P2-1 planning event. A relay mis-operation that inadvertently trips a breaker is the primary reason forced outage cause for a P2.1 event. The condition could also be a planned (maintenance) event. P2.1 has been renamed "opening of a line section w/o a fault" to better align with the teams intent. Additionally, footnote 7 was revised to better clarify the need to study the P2.1 event. Footnote 7 now reads:</p> <p>Footnote 7 - Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.</p>		
MAPP	No	<p>The table needs to match the stated requirements in R3 & R4</p>
<p>Response: The standard explicitly references Table 1 in both Requirements R3 and R4 regarding the need to address the planning events and extreme events from both a steady-state (Requirement R3) and stability (Requirement R4) timeframe. The standard is written in a manner where both the standard requirements and Table 1 work jointly together to describe study expectations. In short, Table 1 is part and parcel to the standard.</p>		
Hydro-Québec TransEnergie (HQT)	No	<p>There is confusion in interpretation of the Table 1 When the voltages class of the contingency element and the monitored element are different (one is HV and the other is EHV), to which voltage class is the allowance for shedding of non-consequential load applied. For example if the fault is on the 138-kV side of a 345/138-kV autotransformer, are you allowed to shed load to keep the 345-kV from overloading? Conversely, if the fault is on the 345-kV side of a 345/138-kV autotransformer, are you allowed to shed load to keep the 138-kV from overloading?</p> <p>Footnotes on P3 and P4 (101 & 19) should be 9 and 10, respectively. This merely appears to be a typo in the latest draft. Other footnotes appear to be mislabeled as well.</p> <p>If Extreme Events are not deleted from the standard, then a different number for the table for Extreme Events should be used.</p> <p>Extreme Events 2a need to define towerline. Add language to replace towerline with structure.</p> <p>Table 1 Footnotes require a close editorial review. There are two number ones, and multiple items pointing to the</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>wrong footnote or footnotes that don't exist (19, 101), etc. Several instances are discussed below but this is not an exhaustive list.</p> <p>Table 1 Steady State & Stability Performance Planning Events - Note (a) this note is placed under "Steady State & Stability" but issues of voltage instability, cascading outages, and uncontrolled islanding apply only to stability. NPCC suggests this note be relocated to "Stability Only."</p> <p>Table 1 Steady State & Stability Performance Planning Events - Note (i) this indicates that one cannot meet steady state requirements by depending on end-user owned equipment. Please clarify the purpose and performance requirement on this note with respect to end-user schemes and possible arrangements already in place to trip end-user equipment.</p> <p>Table 1, P4 footnote reference in Category column needs to change from 101 to 10. Footnote reference in Event column lead-in description needs to change from 11 to 10.</p> <p>Table 1, P5 As written, this requirement replicates a fault causing a loss of station anywhere that there is only one protection system. This is overly severe and would lead to the requirement for fully redundant protection systems at many stations. The use of the term "Protection System" in P5 is unacceptably inconsistent with the NERC definition of Protection System because it does not exclude the battery and its associated series elements. Battery systems should not be included.</p> <p>Table 1, P7 for Event 1 (the loss of two adjacent circuits), this needs to specify if these are the same phase or different phases. Table 1 Steady State & Stability Performance Extreme Events</p> <p>It appears that for Steady state, item 2, that item (a) is encompassed by (b). If it is not, what makes it different?</p> <p>Table 1, footnote #2 typo there is an erroneous comma in the phrase "are the fault types, that must be evaluated." Please remove said comma.</p> <p>Table 1, footnote #3, HQT, as does NPCC, has asked NERC to put a lower bound on the HV but it seems that this remains unaddressed. More stringent performance requirements should be applied to Facilities that represent the backbone of the electric power grid and act as the medium for moving large amounts of power from production to various Load centers, rather than to those Facilities that directly serve end-use Load customers. However, as had been commented in preceding postings, the EHV breakpoint for these more stringent requirements, defined in note 3 of table 1 as "all Facilities greater than 300 kV", is not appropriately defined and should be reviewed. A uniform voltage-level threshold has not been shown to adequately cover all of the different power systems in North America, and significant additional costs will be incurred without proportional or measurable reliability benefits if this definition is not changed. The following is a proposed modification to the EHV definition "all Facilities greater than 300 kV" : "Facilities representing the backbone of the System, generally operating at voltages greater than 300 kV, as determined by the Planning Coordinator and approved by Regional Entity." In using such language, we believe that the extra investment required would go towards real improvement of the reliability of the Interconnected System. Furthermore, HQT believe that until the BES/BPS definition debate is settled at NERC and FERC level, the proposed definition permits the use of the performance base methodology to determine the BPS element subjected to this standard. The way the standard is actually</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		written, it can be interpreted as 300 kV and above, wheter it is part of BPS or not. HQT believe it is overly prescriptive and leaves no leeway.
<p>Response: The determination of when interrupting Non-Consequential Load and/or Firm Transmission Service is permitted to meet Table 1 performance requirements service is based solely on the lowest voltage level of Facilities disconnected by design for the planning event studied and not based on the monitored Facilities. For the example provided, the HV provisions would apply since a 345/138kV transformer is considered a HV Facility that is removed from service regardless of where the fault originated. Changes were made to footnote 1 to better clarify the SDT's intent and it now reads:</p> <p>Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT has retained extreme events and believe it is important to review the extreme events for potential Cascading and if identified complete an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the extreme event(s). The SDT retained the same table reference area for extreme events.</p> <p>The SDT believes that towerline is a commonly understood term and that the use of "structure" over "tower line" is not a substantive change. No change made in Draft 5 in this regard.</p> <p>As noted above, errors in reference to Table 1 footnotes are recognized by the SDT and have been corrected in Draft 5.</p> <p>The SDT disagrees with the commenter's view that Table 1 note "a" is not valid for the steady-state timeframe. The standard in Requirement R6 requires a Transmission Planner/Planning Coordinator to define and document, within their Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. A steady-state review is not prohibited by the standard and may be included within the criteria used.</p> <p>Table 1 note "i" is intended to clarify that even if it is known that an end-user who implements a more conservative practice than that of the Transmission Planner/Planning Coordinator regarding steady-state voltage criteria and chooses to interrupt its own Load, the end-use Load must still be represented in the steady-state timeframe. The Load tripping is permitted in a Stability review, however, it should be assumed that a customer will react quickly to restore its Load and therefore the standard requires the Load be represented in the steady-state timeframe. Only actions (manual or automatic) taken by the Transmission Planner/Planning Coordinator are permitted for consideration for a steady-state review.</p> <p>As noted above, errors in reference to Table 1 footnotes are recognized by the SDT and have been corrected in Draft 5.</p> <p>The P5 event is not a review of individual Protection System components but rather evaluates the loss of a "single Protection System" scheme or design. It is acceptable to simulate that a local (at the same substation) alternate Protection System scheme is still operational when performing a P5 review. The SDT chose this language to align with the SAR titled: Reliability of Protection Systems (Project 2009-7). The SDT believes that the individual component level evaluation of Protection Systems and redundancy requirements should be covered under the PRC standards and has only addressed a single protection scheme failure in the Planning Assessment required for the TPL standard. A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event. Based on feedback from some commenters, the SDT made changes to the P5 planning event description as shown in Table 1. The P5 is now described as shown below. The changes are not substantive, do not alter the team's prior intent and aimed at clarification only.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 10
		<p>The standard does not specify common or different phase for the P7 planning event and is left to the engineering judgment of the Transmission Planner/Planning Coordinator. No change made.</p> <p>Extreme event 2a does not cover 2b when two or more tower lines are contained in the same Right-of-Way. Extreme event item “2a” is 3 or more circuits on the <u>same tower line or structure</u>. Extreme event item “2b” considers loss of multiple Transmission lines located on a different tower line but within the same the same Right-of-Way.</p> <p>The erroneous comma in footnote 2 has been removed as suggested by the commenter.</p> <p>The SDT has retained the same delineation of the Bulk Electric System (EHV and HV) in Draft 5. No changes made.</p>
National Grid	No	<p>There is confusion in interpretation of the Table 1 When the voltages class of the contingency element and the monitored element are different (one is HV and the other is EHV), to which voltage class is the allowance for shedding of non-consequential load applied. For example if the fault is on the 138-kV side of a 345/138-kV autotransformer, are you allowed to shed load to keep the 345-kV from overloading? Conversely, if the fault is on the 345-kV side of a 345/138-kV autotransformer, are you allowed to shed load to keep the 138-kV from overloading?</p> <p>Footnotes on P3 and P4 (101 & 19) should be 9 and 10, respectively. This merely appears to be a typo in the latest draft. Other footnotes appear to be mislabeled as well.</p> <p>If Extreme Events are not deleted from the standard, then a different number for the table for Extreme Events should be used.</p> <p>Table 1, P5: The use of the term “Protection System” in P5 is unacceptably inconsistent with the NERC definition of Protection System because it does not exclude the battery and its associated series elements.</p> <p>Extreme Events 2a need to define towerline. Add language to replace towerline with structure.</p> <p>Table 1, footnote #3, change Regional Entity to Regional Reliability Organization.</p>
<p>Response: The determination of when interrupting Non-Consequential Load and/or Firm Transmission Service is permitted to meet Table 1 performance requirements service is based solely on the lowest voltage level of Facilities disconnected by design for the planning event studied and not based on the monitored Facilities. For the example provided, the HV provisions would apply since a 345/138kV transformer is considered a HV Facility that is removed from service regardless of where the fault originated. Changes were made to footnote 1 to better clarify the SDT’s intent and it now reads:</p> <p>Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.</p> <p>Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT has retained extreme events and believe it is important to review the extreme events for potential Cascading and if identified complete an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the extreme event(s). The SDT retained the same table</p>

Organization	Yes or No	Comments for Question 10
		<p>reference area for extreme events.</p> <p>The P5 event is not a review of individual Protection System components but rather evaluates the loss of a “single Protection System” scheme or design. It is acceptable to simulate that a local (at the same substation) alternate Protection System scheme is still operational when performing a P5 review. The SDT chose this language to align with the SAR titled: Reliability of Protection Systems (Project 2009-7). The SDT believes that the individual component level evaluation of Protection Systems and redundancy requirements should be covered under the PRC standards and has only addressed a single protection scheme failure in the Planning Assessment required for the TPL standard. A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event. Based on feedback from some commenters, the SDT made changes to the P5 planning event description as shown in Table 1. The changes are not substantive, do not alter the team’s prior intent and aimed at clarification only.</p> <p>The SDT disagrees with the commenter that the P5 event is a misuse of the defined Protection System term.</p> <p>The SDT believes that tower line is a commonly understood term and that the use of “structure” over “tower line” is not a substantive change. No change made in Draft 5 in this regard.</p> <p>The SDT concluded that the use of Regional Entity is not necessary. Other changes have been made to footnote for clarity based on other comments.</p> <p>Footnote 3 - Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.</p>
Northeast Power Coordinating Council--RSC	No	<p>There is confusion in interpretation of the Table 1 When the voltages class of the contingency element and the monitored element are different (one is HV and the other is EHV), to which voltage class is the allowance for shedding of non-consequential load applied. For example if the fault is on the 138-kV side of a 345/138-kV autotransformer, are you allowed to shed load to keep the 345-kV from overloading? Conversely, if the fault is on the 345-kV side of a 345/138-kV autotransformer, are you allowed to shed load to keep the 138-kV from overloading?</p> <p>Footnotes on P3 and P4 (101 & 19) should be 9 and 10, respectively. This merely appears to be a typo in the latest draft. Other footnotes appear to be mislabeled as well.</p> <p>If Extreme Events are not deleted from the standard, then a different number for the table for Extreme Events should be used. Extreme Events 2a need to define towerline. Add language to replace towerline with structure.</p> <p>Table 1 Footnotes require a close editorial review. There are two number ones, and multiple items pointing to the wrong footnote or footnotes that don’t exist (19, 101), etc. Several instances are discussed below but this is not an exhaustive list.</p> <p>Table 1 Steady State & Stability Performance Planning Events - Note (a) this note is placed under “Steady State & Stability” but issues of voltage instability, cascading outages, and uncontrolled islanding apply only to stability. NPCC suggests this note be relocated to “Stability Only.”</p> <p>Table 1 Steady State & Stability Performance Planning Events - Note (i) this indicates that one cannot meet steady state requirements by depending on end-user owned equipment. Please clarify the purpose and performance requirement on this note with respect to end-user schemes and possible arrangements already in</p>

Organization	Yes or No	Comments for Question 10
		<p>place to trip end-user equipment.</p> <p>Table 1, P4 footnote reference in Category column needs to change from 101 to 10. Footnote reference in Event column lead-in description needs to change from 11 to 10.</p> <p>Table 1, P5 As written, this requirement replicates a fault causing a loss of station anywhere that there is only one protection system. This is overly severe and would lead to the requirement for fully redundant protection systems at many stations. The use of the term "Protection System" in P5 is unacceptably inconsistent with the NERC definition of Protection System because it does not exclude the battery and its associated series elements. Battery systems should not be included.</p> <p>Table 1, P7 for Event 1 (the loss of two adjacent circuits), this needs to specify if these are the same phase or different phases.</p> <p>Table 1 Steady State & Stability Performance Extreme EventsIt appears that for Steady state, item 2, that item (a) is encompassed by (b). If it is not, what makes it different?</p> <p>Table 1, footnote #2 typo there is an erroneous comma in the phrase "are the fault types, that must be evaluated." Please remove said comma.</p> <p>Table 1, footnote #3, NPCC has asked NERC to put a lower bound on the HV but it seems that this remains unaddressed. More stringent performance requirements should be applied to Facilities that represent the backbone of the electric power grid and act as the medium for moving large amounts of power from production to various Load centers, rather than to those Facilities that directly serve end-use Load customers. However, as had been commented in preceding postings, the EHV breakpoint for these more stringent requirements, defined in note 3 of table 1 as "all Facilities greater than 300 kV", is not appropriately defined and should be reviewed. A uniform voltage-level threshold has not been shown to adequately cover all of the different power systems in North America, and significant additional costs will be incurred without proportional or measurable reliability benefits if this definition is not changed. The following is a proposed modification to the EHV definition "all Facilities greater than 300 kV"? "Facilities representing the backbone of the System, generally operating at voltages greater than 300 kV, as determined by the Planning Coordinator and approved by Regional Entity." In using such language, we believe that the extra investment required would go towards real improvement of the reliability of the Interconnected System.</p>

Response: The determination of when interrupting Non-Consequential Load and/or Firm Transmission Service is permitted to meet Table 1 performance requirements service is based solely on the lowest voltage level of Facilities disconnected by design for the planning event studied and not based on the monitored facilities. For the example provided, the HV provisions would apply since a 345/138kV transformer is considered a HV Facility that is removed from service regardless of where the fault originated. Changes were made to footnote 1 to better clarify the SDT's intent and it now reads:

Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.

Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected

Organization	Yes or No	Comments for Question 10
		<p>the footnote references and a detailed explanation of the changes required are summarized in the above Summary Considerations for Question 10.</p> <p>The SDT has retained extreme events and believe it is important to review the extreme events for potential Cascading and if identified complete an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the extreme event(s). The SDT retained the same table reference area for extreme events. The SDT believes that tower line is a commonly understood term and that the use of “structure” over “tower line” is not a substantive change. No change made.</p> <p>As noted above, errors in reference to Table 1 footnotes are recognized by the SDT and have been corrected in Draft 5.</p> <p>The SDT disagrees with the commenter’s view that Table 1 note “a” is not valid for the steady-state timeframe. The standard in requirement R6 requires a Transmission Planner/Planning Coordinator to define and document, within their Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading outages, voltage instability, or uncontrolled islanding. A steady-state review is not prohibited by the standard and may be included within the criteria used.</p> <p>Table 1 note “i” is intended to clarify that even if it is known that an end-user who implements a more conservative practice than that of the TP/PC regarding steady-state voltage criteria and chooses to interrupt its own Load, the end-use Load must still be represented in the steady-state timeframe. The Load tripping is permitted in a Stability review, however, it should be assumed that a customer will react quickly to restore its Load and therefore the standard requires the Load be represented in the steady-state timeframe. Only actions (manual or automatic) taken by the Transmission Planner/Planning Coordinator are permitted for consideration for a steady-state review.</p> <p>As noted above, errors in reference to Table 1 footnotes are recognized by the SDT and have been corrected in Draft 5.</p> <p>The P5 event is not a review of individual Protection System components but rather evaluates the loss of a “single Protection System” scheme or design. It is acceptable to simulate that a local (at the same substation) alternate Protection System scheme is still operational when performing a P5 review. The SDT chose this language to align with the SAR titled: Reliability of Protection Systems (Project 2009-7). The SDT believes that the individual component level evaluation of Protection Systems and redundancy requirements should be covered under the PRC standards and has only addressed a single protection scheme failure in the Planning Assessment required for the TPL standard. A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event Based on feedback from some commenters, the SDT made changes to the P5 planning event description as shown in Table 1. The changes are not substantive, do not alter the team’s prior intent and aimed at clarification only.</p> <p>The standard does not specify common or different phase for the P7 planning event and is left to the engineering judgment of the Transmission Planner/Planning Coordinator. No changes made.</p> <p>Extreme event 2a does not cover 2b when two or more tower lines are contained in the same Right-of-Way. Extreme event item “2a” is 3 or more circuits on the <u>same tower line or structure</u>. Extreme event item “2b” considers loss of multiple Transmission lines located on a different tower line but within the same the same Right-of-Way.</p> <p>The erroneous comma in footnote 2 has been removed as suggested by the commenter.</p> <p>The SDT has retained the same delineation of the Bulk Electric System (EHV and HV) in Draft 5. No change made.</p>
ISO New England	No	We generally agree with the table however our issues are as follows:Footnotes on P3 and P4 (101 & 19) should be 9 and 10, respectively. This merely appears to be a typo in the latest draft. Other footnotes appear to be mislabeled as well.

		<p>has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The determination of when interrupting Non-Consequential Load and/or Firm Transmission Service is permitted to meet Table 1 performance requirements service is based solely on the lowest voltage level of Facilities disconnected by design for the planning event studied and not based on the monitored Facilities. For the example provided, the HV provisions would apply since a 345/138kV transformer is considered a HV Facility that is removed from service regardless of where the fault originated. Changes were made to footnote 1 to better clarify the SDT's intent and it now reads:</p> <p>Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.</p> <p>Regarding the note "e" reference to re-dispatch. The re-dispatch of any generation permissible for re-dispatch having impact on the Transmission Planner/Planning Coordinator area. The SDT believes that the standard is clear in Requirement R2, sub-part 2.7.1 (Corrective Action Plans) that generation curtailment, tripping and re-dispatch are permissible Corrective Action Plans for both single and multiple Contingency events.</p> <p>Starting of a "fast-start" generation unit appears to be viewed in the context of a corrective action solution to a studied planning event. There may situations like this that lend themselves to sensitivity analysis as required by the TPL-001-1 standard.</p> <p>The SDT respectfully disagrees with the commenter's view related to disallowing Non-Consequential Load Loss for any planning event. The SDT believes they have made the appropriate expectations in not permitting its use for some Contingency planning events involving EHV facilities. A Transmission Planner/Planning Coordinator may implement a more conservative planning approach beyond what TPL-001-1 requires if they believe one is warranted.</p> <p>Table 1 note "i" is intended to clarify that even if it is known that an end-user who implements a more conservative practice than that of the TP/PC regarding steady-state voltage criteria and chooses to interrupt its own Load, the end-use Load must still be represented in the steady-state timeframe. The Load tripping is permitted in a Stability review, however, it should be assumed that a customer will react quickly to restore its Load and therefore the standard requires the Load be represented in the steady-state timeframe. Only actions (manual or automatic) taken by the Transmission Planner/Planning Coordinator are permitted for consideration for a steady-state review. Interruptible Load agreements are permissible and the Load dropped through contractual arrangements with the end-user can be reflected in the steady-state analysis.</p> <p>The standard does not specify common or different phase for the P7 planning event and is left to the engineering judgment of the Transmission Planner/Planning Coordinator. No change made.</p> <p>Extreme event 2a does not cover 2b when two or more tower lines are contained in the same Right-of-Way. Extreme event item "2a" is 3 or more circuits on the <u>same tower line or structure</u>. Extreme event item "2b" considers loss of multiple Transmission lines located on a different tower line but within the same the same Right-of-Way.</p> <p>The SDT believes that tower line is a commonly understood term and that the use of "structure" over "tower line" is not a substantive change. No change made in Draft 5 in this regard.</p> <p>The SDT has retained the same delineation of the Bulk Electric System (EHV and HV) in Draft 5. No changes made.</p>
TIS	Yes	<p>Footnotes on P3 and P4 (101 & 19) should be 9 and 10, respectively. This merely appears to be a typo in the latest draft.</p> <p>There is confusion in interpretation of the Table 1 When the voltages class of the contingency element and the</p>

Organization	Yes or No	Comments for Question 10
		<p>monitored element are different (one is HV and the other is EHV), to which voltage class is the allowance for shedding of non-consequential load applied?.</p> <p>Please see additional comments provided for R2.</p>
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The determination of when interrupting Non-Consequential Load and/or Firm Transmission Service is permitted to meet Table 1 performance requirements service is based solely on the lowest voltage level of Facilities disconnected by design for the planning event studied and not based on the monitored Facilities. For the example provided, the HV provisions would apply since a 345/138kV transformer is considered a HV Facility that is removed from service regardless of where the fault originated. Changes were made to footnote 1 to better clarify the SDT's intent and it now reads:</p> <p>Footnote 1 - If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.</p> <p>See the SDT's response to your comments provided for Requirement R2.</p>		
Platte River Power Authority	Yes	<p>If clarity is given for the "Non-Consequential Load Loss Allowed" column of Yes/No that it refers to the planned shedding of firm load. (see my comment on Definition)</p>
<p>Response: See the SDT's response to your comment in Q9.</p>		
American Electric Power	Yes	<p>In Table 1, footnotes 19 and 101 should probably read 9 and 10.</p> <p>Also, we suggest adding table borders in P4 to more clearly align the columns that correspond to Event 6 (similar use of table borders as was done in P2).</p>
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>The SDT has made changes to the table borders for the P4 planning event per your recommendation.</p>		
Orlando Utilities Commission	Yes	<p>Note 2 regarding three phase faults being sufficient evidence for SLG faults is an excellent addition, thank you.</p> <p>For P3 and P5 it should be made clearer that note 1 AND note 9 apply, maybe by using a comma in-between, not a note 19 that I wasn't able to locate.</p> <p>For Note 9, reading the context it applies only to P3, P5 and P6, but not to P1. To apply this to actual study methodology, in responding to a P1 event Note 9 can not be applied when returning the system to a continuous (sustainable) state. However after those adjustments are made if additional adjustments are needed to make the system "secure", that is prepared for the next event in the P3 or P6 contingency, then note 9 can be applied? Is</p>

		this a correct understanding?
<p>Response: Several footnote reference errors were reflected in Table 1 when migrating from Draft 3 to Draft 4 that led to unfortunate confusion. In Draft 5, the SDT has corrected the footnote references and a detailed explanation of the changes required is summarized in the above Summary Considerations for Question 10.</p> <p>Footnote 9 is now applied to all “No” items for the column “Interruption of Firm Transmission Service Allowed”. Footnote 9 clarifies that Firm Transmission Service can be interrupted so long as appropriate re-dispatch of resources are available and obligated to re-dispatch without any firm Load loss and that Facility ratings are maintained. Planning events P0, P1, and P2 now also include footnote 9 and is allowed both as a System adjustment to prepare for the next event and as a corrective action to the event studied. Please refer to the footnote for more details.</p>		
NYISO	Yes	Question #10. Do you agree with the changes in the performance elements and notes in Table 1? If not, please provide specific comments by note number, note alpha character, or performance category. Yes

FirstEnergy Corp	Yes	
Gainesville Regional Utilities	Yes	
Independent Electricity System Operator	Yes	
Progress Energy Carolinas	Yes	
SCE&G	Yes	
PJM	Yes	
ITC Holdings	Yes	none
<p>Response: Thank you for your support of the SDT's work.</p>		

11. The SDT has provided a revised Implementation Plan as part of this posting. Do you agree with the revisions to the Plan? If not, please provide specific comments.

Summary Consideration: There were 5 main comments associated with this question.

1. Thirteen commenters requested clarification to better define the 60 month effective date for certain “raising the bar” performance requirements. The SDT believes that the current language in Section A. 5 of the Standard, with a minor change that the SDT will incorporate in the next draft, is clear. That section, as modified, will state that the five year period starts “beginning on the first day of the first calendar quarter following applicable regulatory approval” of the revised standard.
2. Four commenters indicated that 60 months is not enough time to build major lines, especially if up to 24 months is needed to do the Planning Assessment and develop a Corrective Action Plan. The SDT considered this issue when TPL-001-1, draft 3 was prepared, and the SDT again discussed its position in light of the comments received from this posting. The SDT continues to believe that extending the 60 month implementation period would water down the standard by potentially delaying some corrective actions that could be implemented in 60 months or less. The current draft of TPL-001-1 does in fact recognize the distinct possibility that major construction projects could take more than 60 months, in which case Requirement R2, part 2.7.3 would apply.
3. The relevant portion of that requirement states: “If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation.” This provision could be applied when formulating the original Corrective Action Plan when it is known in advance that the permitting and construction process will require longer than 60 months or after the plan is formulated and unexpected delays arise outside the Transmission Planner’s or Planning Coordinator’s control. Four commenters believe that it is inappropriate or in violation of Energy Policy Act 2005 for the revised standard to require building new facilities and some also question the requirement to self-report inability to meet Corrective Action Plan requirements. The Corrective Action Plan, however, does not require construction of facilities per se and, therefore, the SDT does not believe that the language in the current draft violates the Energy Policy Act of 2005. Other choices available as part of the Corrective Action Plan besides constructing new facilities include use of interruptible Load contracts, implementation of Demand Side Management programs, and the addition of generation. The SDT understands that there may be certain circumstances where the only viable solution to a performance deficiency is to add a new Transmission Facility. This is no different than situations that Transmission Planners have faced under the current TPL standards as well as voluntary criteria that have existed for many years. The SDT also points out that should a Transmission Planner or Planning Coordinator find that they can not meet the performance requirements by the end of the 60 month transition period, they would need to submit a mitigation plan to their Regional Entity. As long as an acceptable mitigation plan is offered, the intent of the SDT is that the reporting entity will not be subject to penalties.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

3. Four commenters pointed out a typographical error that reversed the numbering of Requirements R7 and R8 in the Implementation Plan. The implementation plan has been corrected to reflect the SDT’s original intent that Requirements R1 and R7 (not Requirement R8) become effective 12 months after approval and Requirements R2 through R6 plus Requirement R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval.
4. Three commenters asked for clarification of the parenthetical language applicable to Events P1-2 and P1-3. The parenthetical phrase related to P1-2 and P1-3 is intended to limit the application of the 60 calendar month exception to those situations where footnote b of the existing standards was interpreted to mean that controlled interruption of electric supply to local network customers connected to or supplied by the faulted element is permitted. The SDT took this position in recognition of the fact that a significant number of entities interpret footnote ‘b’ in this manner and, therefore, the revised standard represents a “raising of the bar” for them.

Organization	Yes or No	Comments for Question 11
Lafayette Utilities System		LUS remains concerned as to the length of time permitted for implementation, and believes that it should be shorter, but would not oppose adoption of version 4, as it has now been clarified, if that is the only issue of concern. There may be ways, outside the standard development process, to limit the financial harms caused to others as a result of the failure to meet the clarified standard during the implementation period.
<p>Response: Many industry entities have expressed concern that the stated implementation period may not be sufficient, particularly for major projects. The SDT believes it has struck the right balance between the differing views, and does not plan to shorten the time permitted for implementation as you have suggested.</p>		
FRCC Transmission Working Group		<p>The implementation plan needs to be clarified that during the first year the existing TPL standards are still in effect. As written it appears that only R1 and R8 are in effect and the existing TPL standards are not. Assessments are a year long process and are based on a year or more worth of studies, the study work and assessment are not executed in a single day.</p> <p>R2 through R7 is unclear what “coming into effect means”. Please consider adding the following paragraph: “Entities are not required to alter their annual schedule based on the R2-R7 requirements going into place or have duplicate efforts at assessments in the year the old and new standard overlap. Therefore any assessment performed prior to R2-R7 going into effect shall meet R1, R8 and the prior TPL standards; an assessment under the revised standard is not required until the following annual cycle. An assessment performed after R2-R7 are in effect shall meet these new TPL Standard. The date the assessment is “performed” for the purposes of this phase in, shall be determined by the date the entity began formally sharing results with its neighbors under R8.”</p> <p>Please clarify the parenthetical for P1-2 and P1-3. Is the intent of this parenthetical referring to Consequential Load Loss that is allowed for P1 events?</p>
<p>Response: The Implementation Plan has been corrected to reflect the SDT’s original intent that Requirements R1 and R7 (not Requirement R8) become effective 12</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		<p>months after approval and Requirements R2 through R6 plus Requirement R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval. The SDT does not believe that a clarification, as you suggested, is needed to cover the one-year period for months 13 through 24. The NERC standards process is clear that an existing standard that is being revised remains in force until the revised standard becomes effective.</p> <p>The SDT has reviewed your suggested addition to the paragraph that addresses the effective date for Requirements R2 through R6 plus Requirement R8. The SDT does not believe that your suggestion provides further clarification and the SDT has determined that no further change is warranted.</p> <p>The parenthetical phrase related to P1-2 and P1-3 is intended to limit the application of the 60 calendar month exception to those situations where footnote b of the existing standards was interpreted to mean that controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element is permitted. The SDT took this position in recognition of the fact that a significant number of entities interpret footnote b in this manner and, therefore, the revised standard represents a “raising of the bar” for them.</p>
ERCOT ISO	No	<p>* The implementation plan references revisions to the MOD standards. Should the team submit a SAR for the revision of the MOD standards to ensure TPL needs are considered? As stated in the comments for R1 “ if the MOD standards are properly updated, there is no need to state MOD requirements in TPL-001.*</p> <p>Definition comments from Question 9 apply to implementation plan.*</p> <p>The Implementation Plan references R1 and R8 to be effective within 12 months of regulatory approval. R8 per the implementation plan state that the responsibilities of the PC and TP will be defined. This appears to be R7 of Draft 4 and the requirement language does not align. Conversely, the Effective Date should be revised to ensure the references to the requirements align properly. As written it states the assessment should be available before the assessment is complete. *</p> <p>During the 24 month transition period, any entity that can prove compliance with the revised TPL-001 should not have to prove compliance to the old TPL-001 through TPL-004. *</p> <p>The SAR should state that TPL-005 and TPL-006 are to be retired. The only place this has been found is within the implementation plan. It is not an intuitive place to find this information.</p>
<p>Response: The SDT referenced revisions to the MOD standards to establish a record of the need to fill a gap in the overall coordination among the Reliability Standards. The SDT does not intend to submit a SAR; rather the expectation is that NERC will take the necessary action to follow through to address this need at the appropriate point in time.</p> <p>See the SDT’s response to your definition comments in Question 9.</p> <p>The Implementation Plan has been corrected to reflect the SDT’s original intent that Requirements R1 and R7 (not Requirement R8) become effective 12 months after approval and Requirements R2 through R6 plus Requirement R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval.</p> <p>The SDT disagrees with your comment regarding demonstration of compliance during the 24 month transition period. At any point in time, one and only one set of TPL related requirements will be in force. It is those requirements that the Planning Coordinator and Transmission Planner must comply with and not future requirements that have not yet become effective.</p> <p>The SDT assumes that in your last comment the reference to SAR should have been Standard (or more precisely “Standard Development Roadmap”). (A Supplemental SAR was posted for comment and added to this project that does address the possibility of retiring TPL-005 and TPL-006.) The SDT agrees with your</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		<p>suggestion, and the Roadmap has been modified to state: "TPL-005 & -006 issues are addressed in the fourth draft and those standards will also be replaced by TPL-001-1. (See page 1, last sentence of section titled "Proposed Action Plan and Description of Current Draft:" In addition, the "Version History" has been updated to indicate that requirements from TPL-005-0 and TPL-006-0 have been incorporated into TPL-001-1.</p>
<p>NERC Standards Review Subcommittee</p>	<p>No</p>	<p>A. In the implementation plan, the provision which indicates if an entity doesn't construct in time that entity has to report itself as noncompliant. This is a violation of the energy policy act. Since FERC can't force an entity to built, this provision should be deleted.</p> <p>B. This standard does not contain any requirements regarding the implementation of the Corrective Action Plans. So, the wording in this section of "Any entity that cannot fully implement . . .", should be replaced with wording like, "If the Corrective Action Plans to eliminate the need . . . can not be implemented within 60 calendar months . . . then the Transmission Planner and Planning Authority should work with the applicable Transmission Owner (s) and Regional entity(s) to develop mitigation plans for revised Corrective Action Plans until the implementation issue is resolved".</p> <p>C. The proposed standard implies that the 24 month time period (for R2-R7) and 60 month time period (for specific allowances for selected event categories) run in parallel rather than sequentially. As currently proposed, the effective date for performing analyses and developing subsequent Corrective Action Plans is 24 months. If the identification of new needs and action plans take 24 months, then only 36 months would be left to implement the new corrective action plans. It may not be feasible to install some BES facilities, especially above 300 kV, in less than 3 years. Some EHV projects can take 5 to 10 years to implement depending on the size, complexity, and controversial nature of the project.</p> <p>D. The MRO NSRS suggests that the effective date be stated in more "implementation dependent" terms for this "one time" transient period, rather than specific and possibly inappropriate "fixed timeframe" terms. Consider wording such as "tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2, part 2.7.5) is allowed until Corrective Action Plans that are based on TPL-001-1 analyses can be implemented".</p>
<p>Response: A. The SDT disagrees with your characterization of the Corrective Action Plan. The Corrective Action Plan does not require construction of facilities per se and, therefore, the SDT does not believe that the language in the current draft violates the Energy Policy Act of 2005. Other choices available as part of the Corrective Action Plan besides constructing new facilities include use of interruptible load contracts, implementation of Demand Side management programs, and the addition of generation. The SDT understands that there may be certain circumstances where the only viable solution to a performance deficiency is to add a new transmission facility. This is no different than situations that Transmission Planners have faced under the current TPL standards as well as voluntary criteria that have existed for many years. The SDT also points out that should a Transmission Planner or Planning Coordinator find that they can not meet the performance requirements by the end of the 60 month transition period, they would need to submit a mitigation plan to their Regional Entity. As long as an acceptable mitigation plan is offered, the intent of the SDT is that the reporting entity will not be considered non-compliant nor will penalties be imposed. The SDT has modified the Implementation Plan to clarify the wording.</p> <p>B. The SDT believes that the requirement language is clear that the Corrective Action Plan shall be implemented. In Requirement 2, part 2.7.5 reference is made to "implementation of a Corrective Action Plan," and in Requirement R2, part 2.7.6 there is a requirement to review "implementation status."</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		<p>C. Your interpretation that the 24 month and 60 month time periods run in parallel is correct. The SDT understands that some large projects that are part of the Corrective Action Plan may take more than 60 months to complete. However, the SDT also believes that some time limit must be placed on the Corrective Action Plan and 60 months was chosen to strike a balance between those commenters who requested more time and those who would like to see corrective actions completed sooner. The SDT also provided a procedure for mitigation in those situations where 60 months was insufficient. It is the intent of the SDT that the development of an acceptable mitigation plan will avoid penalties.</p> <p>D. The SDT considered your suggested restatement of effective dates during the transition period. The SDT does not believe that such a change would materially improve the standard language. In fact, your specific example would be problematic because Requirement R2, part 2.7.5 applies universally not just to the transition period.</p>
Progress Energy Florida, Inc.	No	<p>As PEF is opposed to TPL-001-1 as a whole, we cannot comment on the details of the Implementation Plan, other than to say that given the fundamental inadequacies of TPL-001-1, PEF does not believe the Standard should be implemented at all. Given that the wording of Question 12 appears to imply that any general comments made in the Question 12 comments section would be unwelcome and disregarded, PEF would respectfully like to make the following comments regarding our overall position on TPL-001-1: PEF filed extensive comments for the 1st, 2nd and 3rd drafts of TPL-001-1 and voiced serious concerns about the consequences that Transmission Owners and ratepayers will undoubtedly face if TPL-001-1 were to be implemented. PEF respectfully asks the SDT to review PEF's previous comments, particularly from the perspective of the ratepayers. The average ratepayer in the U.S. is already experiencing high electricity bills based on fuel pass-through charges and electric utilities? needs to raise rates to successfully operate and maintain the system. Furthermore, the ratepayers have not been involved in this Standard drafting process, and indeed have not even been informed at even the most cursory level. PEF has pointed this out in previous comments, and the SDT's response has been inadequate. Given the erroneous approach of Table 1 in TPL-001-1 to gauge reliability based on whether or not firm transmission service or non-consequential load will be curtailed, implementation of the Standard will dramatically increase ratepayers? already-high rates with little or no appreciable reliability improvement. Additionally, Transmission Owners will be forced to reduce ATC in order to prevent compliance violations, thus shutting out Power Marketers and potentially resulting in construction of more new generation than is really needed.</p> <p>Another major conflict that TPL-001-1 will cause is a rift between the FERC/NERC regulatory environment and the various states? Public Service Commissions (PSC). The major transmission projects that TPL-001-1 will mandate (especially those mandated due to the overly burdensome and unnecessary > 300 kV section) will have to be approved for permitting and funding through Determination of Need hearings at the PSC. When questioned by the PSC on the need for such projects, Transmission Owners will be obligated to admit that the projects really aren't needed but for NERC's new TPL-001-1 Standard, which will undoubtedly result in the PSCs denial of approval.</p> <p>PEF also would like to note that the SDT still has not provided sufficient reason for the need to implement a new TPL Standard. PEF and its fellow members in FRCC have historically demonstrated excellent reliability while performing long-term Transmission Planning under the existing TPL Standards. There simply is no practical reason for improvement on the existing Standards. PEF is aware of the history of the drafting of a new TPL</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		<p>Standard, however, having reviewed FERCs direction to NERC in this matter. Regarding this, PEF feels that NERC should have pointed out the likely consequences to merely following FERCs directions in their entirety; instead, NERC formed a SDT which proceeded to draft a new TPL Standard that satisfied each and every direction FERC had given. This approach has resulted in a draft Standard that is much too stringent, not conducive to significant reliability improvement and prohibitively expensive to implement. In conclusion, PEF strenuously opposes TPL-001-1, and feels the implementation of TPL-001-1 is unfair, irresponsible and unnecessary. PEF furthermore feels that it has sufficiently proven this in previous comments, and will continue to seek additional avenues to ensure that said comments are given proper consideration. TPL-001-1 is thus not in a condition to go to ballot, and it would be highly inappropriate to send this Standard to ballot given the major concerns that PEF and numerous other utilities within NERC have raised.</p>
<p>Response: The wording in Question 12 has created confusion among many commenters and was not intended to imply that if you checked the YES box, the SDT would not consider your comments. The SDT is obligated to consider all comments, make changes in the drafts that the SDT, as representatives of the entire industry, believe need to be made and provide responses to all comments. The SDT has carefully considered the PEF comments throughout the drafting process and has made changes to the drafts based on your comments and those received from the other commenters. Throughout the process, the SDT has been attempting to iterate toward a standard that the industry, as a whole, can support. The SDT, FERC, and the majority of the industry (through their comments) support the need to improve the TPL standards.</p>		
Florida Power and Light	No	<p>Do not understand the parenthetical for P1-2 and P1-3. The language is confusing and needs to be clarified. Isn't it referring to Consequential Load Loss that is allowed for P1 events?</p>
<p>Response: The parenthetical phrase related to P1-2 and P1-3 is intended to limit the application of the 60 calendar month exception to those situations where footnote b of the existing standards was interpreted to mean that controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element is permitted. The SDT took this position in recognition of the fact that a significant number of entities interpret footnote b in this manner and, therefore, the revised standard represents a "raising of the bar" for them.</p>		
MidAmerican Energy Company	No	<p>MidAmerican commends the SDT for changes that improved the Implementation Plan, however, MidAmerican does have a comment about the plan. MidAmerican urges the SDT to modify the implementation plan where it is indicated that any "entity which cannot fully implement their Corrective Action Plan to eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall self report themselves as being unable to meet the performance requirements of the Reliability Standard." This is essentially requiring an entity to self report for failing to build facilities. The Energy Policy Act of 2005 did not give FERC and therefore, NERC, the authority to require construction of electric facilities. Therefore, this implementation plan is implying an authority that is not given to FERC or NERC. This provision of the implementation plan should be completely deleted from the standard, the provision to state that one is non-compliant for this should be deleted from the standard, or there should be a statement that such a requirement is subject to limitations of the Energy Policy Act of 2005. This is a deal-killer for MidAmerican with regard to voting on this standard.</p> <p>MidAmerican believes that 4.1.2 and 4.3.3 as written would require responsible entities in the industry to add</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		<p>additional modeling of relaying in dynamic stability models of our system. MidAmerican suggests that 4.3.3 be limited to transient swings on facilities 345 kV and above so as to limit this part of requirement 4 to those situations that are most likely to result in cascading. If the SDT determines not to add such a limitation, MidAmerican asks that the implementation time for R4 to be increased. MidAmerican believes that many responsible entities would need 3 years to add these relaying models to system stability models so that the fourth year additional transmission planning analysis in this respect is conducted. MidAmerican urges that the SDT increase the implementation time for R4 from 2 years to 4 years. (MidAmerican may this comment in response to Question 4 as well.)</p>
<p>Response: The SDT disagrees with your characterization of the Corrective Action Plan. The Corrective Action Plan does not require construction of facilities per se and, therefore, the SDT does not believe that the language in the current draft violates the Energy Policy Act of 2005. Other choices available as part of the Corrective Action Plan besides constructing new facilities include use of interruptible load contracts, implementation of Demand Side management programs, and the addition of generation. The SDT understands that there may be certain circumstances where the only viable solution to a performance deficiency is to add a new transmission facility. This is no different than situations that Transmission Planners have faced under the current TPL standards as well as voluntary criteria that have existed for many years. The SDT also points out that should a Transmission Planner or Planning Coordinator find that they can not meet the performance requirements by the end of the 60 month transition period, they would need to submit a mitigation plan to their Regional Entity. As long as an acceptable mitigation plan is offered, the intent of the SDT is that the reporting entity will not be considered non-compliant nor will penalties be imposed. The SDT has modified the Implementation Plan to clarify the wording.</p> <p>Requirement R4, parts 4.1.2 and 4.3.3 do not necessarily require modeling of specific relays. Commercially available software includes a generic relay model which can easily be applied to every branch in the simulation. This generic relay includes assumed zone 1, 2, and 3 characteristics based on the branch impedance. If this model shows impedance swings in a branch element, then the Transmission Planner or Planning Coordinator can either take action according to the generic model results or investigate the characteristics of the relays actually used on that line. The SDT agrees that studying the impact of swings should be limited to the study area. However, the SDT does not believe this should be limited to only high voltage lines. Because Requirement R4, part 4.3.3 does not necessarily require modeling of specific relays (as described directly above), the SDT does not agree that a longer time is needed in the Implementation Plan.</p>		
Oklahoma Gas & Electric	No	<p>OG&E will need every bit of the 60 months time mentioned on page 3 under "Effective Date" to implement all indicated upgrades. There is benefit in hardening the OG&E electrical system for such protection system failures, such as P4 & P5, but it may not be cost effective.</p>
<p>Response: Thank you for your comment.</p>		
Manitoba Hydro	No	<p>Requirement R8, as the standard is currently written, doesn't match the language on page 2 of the discussion provided by the drafting team (i.e. related to determining individual and joint assessments). The drafting team should flip Requirements R7 and R8 so that the implementation plan matches the intent or modify the implementation plan.</p>
<p>Response: The implementation plan has been corrected to reflect the SDT's original intent that Requirements R1 and R7 (not Requirement R8) become effective 12 months after approval and Requirements R2 through R6 plus Requirement R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval.</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
Bonneville Power Administration	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
Idaho Power	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
Modesto Irrigation District Transmission Planning	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
NV Energy	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
Pacific Gas and Electric Co.	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
Puget Sound Energy, Inc.	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
Sacramento Municipal Utility District	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
San Diego Gas & Electric Co	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
Southern California Edison (SCE)	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
SRP	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		years from the modeled year or five years from the effective date of this standard.
Western Area Power Adm - RMR	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the Effective Date of this standard.
Xcel Energy	No	Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem, or five years from the modeled year, or five years from the effective date of this standard.
Deseret Power	No	Comments: Revisions are necessary to the Effective Date language to clarify the 60 calendar months language for Corrective Action Plans. It is unclear if the entity has five years from the day they identify the problem or five years from the modeled year or five years from the effective date of this standard.
NorthWestern Energy	No	In the Effective Date section, 60 calendar months is allowed for Corrective Action Plans. When does the 60 month period start? From the day the problem is identified? From the modeled year? Or from the effective date of the standard?
<p>Response: The SDT believes that the current language in Section A. 5 of the Standard, with a minor change that the SDT will incorporate in the next draft, is clear. That section, as modified, will state that the five year period begins “on the first day of the first calendar quarter following applicable regulatory approval” of the revised standard.</p>		
MAPP	No	The last part of the Effective Date section deals with the requirement to submit a Corrective Action Plan, and then to submit a mitigation plan to be approved by the Regional Entity and NERC. Failure do get those done would result in the initiation of “settlement proceedings.” This means that entities may be found non-compliant for failure to build facilities. That seems to fly in the face of the EPAct of 2005.
<p>Response: The SDT disagrees with your characterization of the Corrective Action Plan. The Corrective Action Plan does not require construction of facilities per se and, therefore, the SDT does not believe that the language in the current draft violates the Energy Policy Act of 2005. Other choices available as part of the Corrective Action Plan besides constructing new facilities include use of interruptible load contracts, implementation of Demand Side management programs, and the addition of generation. The SDT understands that there may be certain circumstances where the only viable solution to a performance deficiency is to add a new transmission facility. This is no different than situations that Transmission Planners have faced under the current TPL standards as well as voluntary criteria that have existed for many years. The SDT also points out that should a Transmission Planner or Planning Coordinator find that they can not meet the performance requirements by the end of the 60 month transition period, they would need to submit a mitigation plan to their Regional Entity. As long as an acceptable mitigation plan is offered, the intent of the SDT is that the reporting entity will not be considered non-compliant nor will penalties be imposed.</p>		
SERC Dynamics Review Subcommittee (DRS)	No	There is a concern about the last paragraph in the Implementation Plan. It is easy to interpret this language to state that the entity is noncompliant if the performance requirements are not completed within 5 years. The concern is that the 5 year window for meeting the “raising the bar” requirements is still not adequate. For

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		instance, it typically takes 7 to 10 years to build a new 500-kV transmission line - including time required for such processes as federally mandated NEPA environmental reviews. We strongly suggest increasing this time window to 10 years.
<p>Response: The SDT understands that some large projects that are part of the Corrective Action Plan may take more than 60 months to complete. However, the SDT also believes that some time limit must be placed on the Corrective Action Plan and 60 months was chosen to strike a balance between those commenters who requested more time and those who would like to see corrective actions completed sooner. The SDT also provided a procedure for mitigation in those situations where 60 months was insufficient. It is the intent of the SDT that the development of an acceptable mitigation plan will avoid penalties.</p>		
TVA System Planning	No	<p>TVA agrees with the inclusion of P1-2 and P1-3 in the 60 month implementation window. However TVA also strongly suggests that all Planning Events be included in the same implementation window where local load was allowed to be dropped in the past in footnotes b and c of the existing TPL standards.</p> <p>In the first bullet under Effective Date, both Non-Consequential Load Loss and curtailment of Firm Transmission Service can be permitted for certain events up to 60 months. However these actions are not useful for stability related issues. TVA suggests that out of step relaying or other protection method be allowed in for stability related issues when situations do arise that are beyond the control of the TP or PC.</p> <p>TVA is very concerned about the last paragraph in the Implementation Plan. TVA interprets this language to state that the entity is basically noncompliant if the mentioned Corrective Action Plans are not implemented within 60 calendar months. Due to the large amount of work that some utilities will have to meet these new requirements, TVA strongly suggests that the utilities be found compliant if the utilities are still putting a good faith effort forward in trying to meet the new standards, such as for constructing a long 500-kV transmission line that may take at least 10 years to construct</p> <p>TVA still believes that since breaker duty was not included in the previous TPL standards, this should also have a 60 month implementation window as well due to this now becoming a new TPL compliance issue. TVA noted this same comment in Posting #3; however, TVA requests that this be reconsidered due to being a new official TPL requirement like the other new requirements have with the 60 month implementation window.</p> <p>TVA is concerned that the 60 calendar month window for meeting the “raising the bar” requirements is still not adequate. For instance, it typically takes TVA 7 to 10 years to build a new 500-kV transmission line - including time required for such processes as federally mandated NEPA environmental reviews. Strongly suggest increasing this time window to 10 years.</p>
<p>Response: The SDT believes that footnote ‘c’ conditions in the current TPL standards are adequately addressed in the revised standard.</p> <p>The SDT disagrees that Non-Consequential Load Loss is not useful for Stability related issues. The tripping of such Load as part of an SPS could be accomplished quickly enough to improve Stability margins. Furthermore, there is nothing in the revised standard that precludes the use of out of step relaying.</p> <p>The SDT believes that your interpretation of the last paragraph of the Implementation Plan is incorrect. Should a Transmission Planner or Planning Coordinator find that they can not meet the performance requirements by the end of the 60 month transition period, they would need to provide a mitigation plan to their Regional</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
<p>Entity.</p> <p>Although the SDT agrees that the breaker duty requirement is new to this revision of the standard, the SDT does not believe that there is a need to allow a 60 month transition period for this requirement to become effective. Replacing over-dutied circuit breakers can often be accomplished within the 24 month period provided by the effective date of the requirement. In those cases where the replacement could take longer, there are other approaches available to mitigate the over-duty condition.</p> <p>The SDT understands that some large projects that are part of the Corrective Action Plan may take more than 60 months to complete. However, the SDT also believes that some time limit must be placed on the Corrective Action Plan and 60 months was chosen to strike a balance between those commenters who requested more time and those who would like to see corrective actions completed sooner.</p>		
Ameren	No	<p>We appreciate that the Standards Drafting Team has proposed delayed effective dates to allow tripping of Non-Consequential Load or curtailment of Firm Transmission Service for a number of categories of contingency events to allow more time to become compliant. However, we do not look forward to having to self-report non-compliance because the industry and the government changed the planning rules in the middle of the game.</p>
<p>Response: Please note that should a Transmission Planner or Planning Coordinator find that they can not meet the performance requirements by the end of the 60 month transition period, they would need to submit a mitigation plan to their Regional Entity. It is the intent of the SDT that the development of an acceptable mitigation plan will avoid penalties.</p>		
FirstEnergy Corp	No	<p>We disagree with the proposed Implementation Plan. The implementation period for the TPL-001-1 transmission planning standard should be limited to the time needed to transition to the new study requirements. The proposed 5-year implementation for the "raise the bar" aspects of this standard delves into project management and review of capital construction progress which should remain outside the scope of this standard. The standard should only consider if an entity has completed the required studies and has developed Corrective Action Plans to ensure performance criteria is being maintained. Implementation of transmission system action plans depends on the actions of many other functional entities, other than PCs or TPs. PCs and TPs should not be held responsible for the implementation of action plans since they have little or no control over the activities related to implementation. For example, an RTO/ISO may act as both the PC and the TP for its transmission owner or transmission operator membership, however, the RTO/ISO should not be subject to compliance sanctions for incomplete projects that it does not have direct responsibility. FirstEnergy suggests that a new TPL standard is required to successfully accomplish the vision and endpoint that this drafting team has in mind. It is our opinion that the TO, TOP, DP and GO are needed as applicable entities to bring to fruition the capital enforcement projects or operating procedures that are identified by the PC/TP. This TPL-001-1 standard should stop at the conclusion of studies, assessments and development of Corrective Action Plans and a new TPL standard should be developed to address implementation of Corrective Action Plans.</p>
<p>Response: The SDT has considered your position and still believes that the requirement to implement the Corrective Action Plan is appropriate. Furthermore, the SDT does not believe that the standard should apply to additional entities beyond the Transmission Planner and Planning Coordinator. In fact, doing so would tend to make implementation of the Corrective Action Plan more difficult by reducing clarity as to who is the responsible entity. Where the Transmission Planner or Planning Coordinator is an RTO, agreements between the RTO and its members, which typically include the entities you describe, require those members to implement plans</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
<p>developed by the RTO. Where the Transmission Planner or Planning Coordinator is not an RTO, in most cases, they are a vertically integrated utility that includes all of the entities that you describe. In other cases, the Transmission Planner and Planning Coordinator can establish agreements with the entities for which they are providing those services to specify responsibilities for implementation of the Corrective Action Plan.</p>		
<p>American Transmission Company</p>	<p>No</p>	<p>We offer the following comments. This standard does not contain any requirements regarding the implementation of the Corrective Action Plans. So, the wording in this section of “Any entity that cannot fully implement . . .”, should be replaced with wording like, “If the Corrective Action Plans to eliminate the need . . . can not be implemented within 60 calendar months . . . then the TP and PA should work with the applicable TO(s) and Re(s) to develop mitigation plans for revised Corrective Action Plans until the implementation issue is resolved”.</p> <p>The proposed standard implies that the 24 month time period (for R2-R7) and 60 month time period (for specific allowances for selected event categories) run in parallel rather than sequentially. As currently proposed, the effective date for performing analyses and developing subsequent Corrective Action Plans is 24 months. If the identification of new needs and action plans take 24 months, then only 36 months would be left to implement the new corrective action plans. It may not be feasible to install some BES facilities, especially above 300 kV, in less than 3 years. Some EHV projects can take 5 to 10 years to implement depending on the size, complexity, and controversial nature of the project. We suggest that the effective date be stated in more “implementation dependent” terms for this “one time” transient period, rather than specific and possibly inappropriate “fixed timeframe” terms. Consider wording such as “tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2, part 2.7.5) is allowed until Corrective Action Plans that are based on TPL-001-1 analyses can be implemented”. The “implementation dependent” approach may allow the removal of all or part of the text on implementation exceptions and mitigation procedures that do not appear to be suitable in an Effective Date section.</p>
<p>Response: The SDT believes that the requirement language is clear that the Corrective Action Plan shall be implemented. In Requirement 2, part 2.7.3 reference is made to “implementation of a Corrective Action Plan,” and in Requirement R2, part 2.7.4 there is a requirement to review “implementation status.”</p> <p>Your interpretation that the 24 month and 60 month time periods run in parallel is correct. The SDT understands that some large projects that are part of the Corrective Action Plan may take more than 60 months to complete. However, the SDT also believes that some time limit must be placed on the Corrective Action Plan and 60 months was chosen to strike a balance between those commenters who requested more time and those who would like to see corrective actions completed sooner. The SDT also provided a procedure to submit a mitigation plan to their Regional Entity where 60 months was insufficient. It is the intent of the SDT that the development of an acceptable mitigation plan will avoid penalties. The SDT has modified the Implementation Plan to clarify the wording. The SDT also considered your suggested restatement of effective dates during the transition period. The SDT does not believe that such a change would materially improve the standard language. In fact, your specific example would be problematic because Requirement R2, part 2.7.5 applies universally not just to the transition period.</p>		
<p>Tri-State Generation and Transmission Association</p>	<p>No</p>	<p>Yes and No. We see some potential problems. 12 months after BOT adoption, R1 maintain system models - becomes effective. Why delay</p> <p>Also 12 months after adoption, R8 distribute planning assessment results - becomes effective. As an assessment cannot be distributed before it is completed, this must be coordinated with R2. 24 months after BOT adoption R2 Annual Planning Assessment - timing must coordinate with R8 above.</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
<p>Response: The SDT attempted to strike a balance between those commenters who requested more time and those who would like to see some requirements become effective earlier. In the case of Requirement R1, the SDT saw little value in making this requirement effective before 12 months. Furthermore, doing so would break the standard effective dates into yet another time period possibly leading to confusion as to which portions of the revised and old standards are in effect. The implementation plan has been corrected to reflect the SDT’s original intent that Requirements R1 and R7 (not Requirement R8) become effective 12 months after approval and Requirements R2 through R6 plus Requirements R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval.</p>

NYISO	Yes	Question #11 The SDT has provided a revised Implementation Plan as part of this posting. Do you agree with the revisions to the Plan? If not, please provide specific comments. Yes
Response: Thank you for your input.		
Orlando Utilities Commission	Yes	The phasing in of the higher performance criteria is a very reasonable approach. The implementation plan needs to be painfully clear that during the first year the existing TPL standards are still in effect, and that R1 and R8 are in effect in addition. Most NERC standards have one revision take effect on a specific date, make the old version out of date. In this case however if TPL 001 retires the prior standards, then only R1 and R8 would need to be performed in the first year, which I do not believe that is the intent. In addition to this, further clarification may be needed for the application of R2-R7, even if they were to come into effect the first year. Assessments are a year long process and published once a annually. As an example many entities “publish” or finish the Assessment in December, that being the culmination of months of work. If R2-R7 are effective on June 2011 then the intended application seems to be that the assessment in Dec 2011 should comply with the new

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 11
		<p>standard. Is that the intent, or would there need to be a valid assessment based on the new standard available the day the standard is in effect? Maybe phrasing to this effect. “Entities are not required to alter there annual schedule based on the R2-R7 requirements going into place or have duplicate efforts at assessments in the annual period the old and new standard overlap. Any assessment completed (as determined by the date that the entity formally shared results under R8) after the effective date for R2-R7 shall comply with those requirements.”</p>
<p>Response: First, it should be noted that the Implementation Plan has been corrected to reflect the SDT’s original intent that Requirements R1 and R7 (not Requirement R8) become effective 12 months after approval and Requirements R2 through R6 plus Requirement R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval. The SDT does not believe that a clarification is needed to cover the one-year period for months 13 through 24 when Requirements R1 and R7 plus the existing standard will be in effect because Requirements R1 and R7 are new requirements that do not replace any requirements in the existing standards. The NERC standards process is clear that an existing standard that is being revised remains in force until replaced by revised standard requirements becomes effective. The SDT believes that sufficient flexibility was provided in the definition of Year One to permit Transmission Planners and Planning Coordinators to maintain their current assessment schedule if they desire. It is the SDT’s expectation that any assessment initiated 24 months or more after the effective date of Requirements R2 through R6 plus Requirement R8 would adhere to the revised standard requirements.</p>		
Duke Energy	Yes	<p>Yes, however we don’t understand the meaning of this phrase which follows P1-2 and P1-3: “for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element”.</p>
<p>Response: The parenthetical phrase related to P1-2 and P1-3 is intended to limit the application of the 60 calendar month exception to those situations where footnote b of the existing standards was interpreted to mean that controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element is permitted. The SDT took this position in recognition of the fact that a significant number of entities interpret footnote b in this manner and, therefore, the revised standard represents a “raising of the bar” for them.</p>		
PJM	No	<p>The timeframe to gather additional protection and dynamic load modeling data is too short. Millions of pieces of new data will need to be collected and validated before valid models will be available. Extend the period to 24 months.</p>
<p>Response: The SDT does not intend that detailed protection and dynamic Load models will be required for all Transmission elements and Loads in the System models used for the assessments. In particular, Requirement R2, part 2.4.1 states that “An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.” Furthermore, there is no explicit requirement in Requirement R1 for representation of protection schemes. To the extent such detail is needed, it would apply to the Stability studies required as part of Requirement R4. Requirements R2 and R4 are already specified to be effective in 24 months following regulatory approval.</p>		

12. Do you believe that this standard is ready to go to ballot? (if 'No' is checked here, the SDT will consider that comments raised on the other questions drove that decision.)

Summary Consideration: The initial response of the majority of the commenters was that this standard is not ready to go to ballot. The reasons for the negative responses included: 1) a desire to have a sample detailed Planning Assessment, 2) concern over the value of the “raising the bar” for EHV Facilities, 3) concern with excessive study or documentation requirements, 4) concern that the Implementation Plan could be interpreted to require construction (contrary to the Energy Policy Act of 2005), and 5) concern that some of the requirements are not clear and contain ambiguous language. The SDT learned that some commenters voted ‘No’ to ensure that their comments would be reviewed and considered by the SDT. Other commenters stated that this draft was ready to go to ballot and the remaining commenters stated that it was ready for ballot with favorable consideration of the comments provided.

The SDT has responded to all of these concerns in the responses to the comments. The majority of the issues raised about unclear and ambiguous language were clarified without material changes to the draft. The SDT evaluated the comments provided in response to this draft and has determined that the majority of the remaining ‘No’ votes are because the commenters disagree with the position(s) taken by the SDT and not because the standard is unclear or unenforceable. The issues that were raised about increased performance requirements, increased study requirements, and increased documentation have been vetted by the industry and the SDT through four posting periods over the last 3 years.

The SDT has posted this standard for four posting periods over the last 3 years. In the previous three postings, the SDT has developed more than 1300 pages of comments and responses. The form of the main requirements and sub-parts has changed in response to industry comment, but the substance of the main requirements and sub-parts has not changed substantially in the last two postings.

The SDT has not made any substantive or contextual changes with this posting and has determined that this standard is ready to go to ballot.

Organization	Yes or No	Comments for Question 12
Sacramento Municipal Utility District		The SDT should develop a detailed sample assessment prior to balloting so that the SDT's hard work can be voted on by an informed ballot pool.
Platte River Power Authority	No	No, not until there is some form of common understanding, among the people reading this draft, of how to interpret from Table 1 (Planned and Extreme) all the contingency scenarios that will be required to demonstrate full compliance with the standard. It would be helpful if the Drafting Team spearheaded some workshops to walk us through how this might be done.

Response: The SDT agrees that it is important to have an informed ballot pool; however, the SDT does not plan to develop a sample assessment prior to balloting. The SDT has taken several steps to inform the industry and will continue those outreach efforts.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
FRCC Transmission Working Group		We the FRCC TWG feel that the standard is very close to ballot, but the drafting team still needs to address several issues raised in the comments before balloting.
CenterPoint Energy	No	CenterPoint Energy is well aware of the diligence of the SDT in preparing this major consolidation and rewrite of the existing TPL standards. CenterPoint Energy believes this latest version is almost ready for ballot. CenterPoint Energy respectfully requests consideration by the SDT of the refinements to this latest draft proposed by CenterPoint Energy.
FirstEnergy Corp	No	FirstEnergy does not believe the proposed TPL-001-1 standard is ready for ballot until our primary concern with the Implementation Plan as identified in our comment to Q11 is addressed. Additionally, our most pressing secondary concern is the modeling required for Protection Systems related to 4.3.3. Finally, we believe the standard is overly burdensome related to the annual near-term study requirements as stated in 2.1.1 as noted by our Q2 comments.
SERC Dynamics Review Subcommittee (DRS)	No	If the revisions recommended above are adopted, the standard would then be ready for ballot. We commend the drafting team for their efforts in preparing this draft standard for ballot.
SERC Planning Standards Subcommittee	No	If the revisions recommended above are adopted, the standard would then be ready for ballot. We commend the drafting team for their efforts in preparing this draft standard for ballot.
Midwest ISO	No	Only if the proposed changes and questions are adequately addressed.
NorthWestern Energy	No	Since the definition section needs to be changed, some wording in the requirements needs to be modified, and the footnote numbering in Table 1 need to be corrected, we believe another draft should be issued before taking this standard to ballot.
US Bureau of Reclamation	No	The definitions require revisions. Additional work is required to clarify Corrective Action plan items, agreement on voltage limits and acceptable deviations, as well as coordination of Planning Assessment results with owner entities.
SRC of ISO/RTO	No	The proposed changes and comments need to be adequately addressed before any ballot.
Independent Electricity System Operator	No	The standard has become overly prescriptive and unnecessary (see our comments under Q2, Q3 and Q4 on Part 2.1.4, Parts 3.3 to 3.6, Parts 4.3 to 4.5. Much work is needed to condense or remove these requirements.
Hydro-Québec TransEnergie (HQT)	No	There are still issues as indicated in the submitted comments that need to be addressed before this standard should go to ballot.
Northeast Power Coordinating	No	There are still issues as indicated in the submitted comments that need to be addressed before this standard

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
Council--RSC		should go to ballot.
Orlando Utilities Commission	Yes	I have not seen all the comments of other entities, so there may be some comments that would require the standard be reposted. Assuming I have correctly read the standard, all of my comments would improve the communication of the existing intent, not alter the requirement.
American Electric Power	Yes	The SDT has done an exceptional job working through complex issues and varying perspectives to arrive at this solid draft. This version has significantly improved the standard and has raised the bar where appropriate to do so. With favorable consideration of comments from this round, the revised draft should be ready for ballot.
Duke Energy	Yes	Yes, assuming our comments are addressed effectively.
American Transmission Company	Yes	Yes, if the proposed changes and questions are adequately addressed.
Response: Please see the comment responses for each question to see how the SDT addressed the issues raised in your comments.		
Xcel Energy	No	As currently drafted, several outages identified in Categories P2, P4, and P5 appear to potentially result in the same elements being removed from service, so therefore the same event, even though the initiating event is different.
Response: The SDT agrees that some planning events will result in the same elements being removed from service. However, the similarities may only be valid from a steady-state view point and care must be taken to review the events in the Stability timeframe due to delayed clearing modes that may result from the initiating event. For example, a bus fault and a stuck breaker may each clear a bus; however, the stuck breaker will have different reaction times due to the delayed clearing mode and therefore may warrant a review in a Stability environment. The standard allows the Transmission Planner and Planning Coordinator flexibility in using engineering judgment for the Table 1 events in which it studies for both the steady-state and Stability environments. Both Requirements R3 (steady-state study) and R4 (Stability study) include text indicating the Transmission Planner and Planning Coordinator are to study those events "...that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance ..." If a Transmission Planner/Planning Coordinator can justify that certain events are duplicative for a given timeframe then at their discretion they may elect to limit their Contingency list so long as their entire Contingency list covers the events that "produce the more severe impacts" for their System.		
SCE&G	No	As per our comments.
British Columbia Transmission Corp	No	
Florida Power and Light	No	
Manitoba Hydro	No

Bonneville Power Administration	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
Idaho Power	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, I believe modifications are necessary prior to taking this standard to ballot.
Modesto Irrigation District Transmission Planning	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
NV Energy	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
Pacific Gas and Electric Co.	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
Puget Sound Energy, Inc.	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
San Diego Gas & Electric Co	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
Southern California Edison (SCE)	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
Utility System Efficiencies, Inc. (USE)	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, I believe additional modifications are necessary prior to taking this standard to ballot.
Western Area Power Adm - RMR	No	Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, I believe modifications are necessary prior to taking this standard to ballot.
Deseret Power	No	Comments: Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
SRP	No	: Based on the unclear or ambiguous language identified in the comments above as well as the confusion noted in the Table 1 regarding outages and footnotes, we believe modifications are necessary prior to taking this standard to ballot.
<p>Response: Please see the comment responses for each question to see how the SDT addressed the issues raised in your comments, including the clarifications that the SDT made concerning the Table 1 outages and footnotes.</p>		
Ameren	No	<p>Certainly the proposed assessment and documentation requirements are more comprehensive and the performance standards are more rigorous than the existing TPL-001 through TPL-004 reliability standards. But, by performing the proposed additional required studies and documenting the results, how much additional reliability will be provided to the System? None, but we will be auditably compliant. More planning engineers will need to be hired to perform the studies and develop the assessments, more librarians will need to be hired to keep track of all the paperwork and computer file storage, and more trees will be killed printing the paper to send to all those that need to review the documents and provide comments. Is this the most effective way to improve transmission system reliability from a planning perspective? What measurable benefits are to be accrued for providing an EHV system that would not result in the loss of non-consequential load for P2-2, P2-3, P4 1-5, and P5 1-5 planning events, all of which are rare and infrequent? What is the estimated cost for this incremental "improvement" to cover the System's short-comings? The EHV system is already the most reliable portion of the BES with an availability of approximately 99% and can withstand extreme events without widespread outages.</p>
<p>Response: The SDT believes that the added clarity of the proposed standard is very important to ensure that entities can clearly understand the requirements. Even though EHV outages are less frequent than outages of lower voltage Transmission Facilities, the SDT believes that there should not be Non-Consequential Load Loss</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
for the single Contingencies in P2 and for the failure of a circuit breaker or Protection Systems in the P4 and P5 events.		
ITC Holdings	No	<p>Comments: In addition to our other comments, ITC offers the following feedback. The requirements are rather complex, yet the measures seem extremely simple. Have they been discussed in any detail and are they sufficiently described to insure and understanding of just what is expected (ie., Are the requirements sufficient as measures in and of themselves?) R2.1.5 for example discusses “spare equipment strategy for long-lead time facilities”. If I have a 2p.u. xfmr, can I assume it spares all similar category transformers or would I have to study P0,P1 and P2 contingencies if it replaces a 3 p.u. xfmr. If I don’t have a spare and can’t meet P0,P1 or P2 contingencies without load shedding, do I need a CAP. See also our comments under R3.4.1. We haven’t reviewed all requirements and all measures in this fashion but suggest the SDT do so.</p>
<p>Response: The SDT has reviewed the measures and believe that they are sufficient to measure compliance with the requirements. The issues raised about transformer assumptions are System specific and are, therefore, not addressed by the standard. If you do not have a spare for a piece of equipment with a long lead time and your System cannot meet the performance requirements without that piece of equipment, you must have a Corrective Action Plan to address that deficiency. Part 3.4.1: See response to Q3.</p>		
ERCOT ISO	No	<p>ERCOT recognizes that much effort has been put into this standard. However, a lot of effort will be required to ensure documentation for the standard is sufficient, yet the benefit of the additional documentation effort required is marginal. For a standard like this, stating every possible issue and studying every possible scenario is not realistic and potentially will lead to complacency very little planning outside the scope of this standard will be done regardless of the system needs.</p>
<p>Response: The SDT has attempted to clarify areas where the existing standard is ambiguous. In this effort to clarify, the SDT has introduced new areas where documentation is required; however, in most instances, this documentation was already implicitly required. The SDT believes that it has limited the documentation requirements to the minimum required to ensure thorough evaluation of BES reliability. While the SDT has expanded the scenario analysis required with additional study year requirements and sensitivity requirements, the SDT has not developed an exhaustive list of studies or analysis that the planner must conduct. The SDT believes that the requirements contained within the standard are the minimum requirements necessary to evaluate BES reliability, while continuing to give the planner latitude in the portfolio of studies that the planner will conduct.</p>		
NERC System Protection and Control Subcommittee (SPCS)	No	<p>Inclusion of the changes proposed by the System Protection and Control Subcommittee (SPCS) drove the belief that the standard is not ready to go to ballot. Such changes would be substantial enough to invoke another round of comments by the Industry.</p>
<p>Response: Please see the comment responses for each question to see how the SDT addressed the issues raised in your comments. The SDT has not made substantial changes based on the comments.</p>		
Central Maine Power Company	No	<p>It is closer, but there are still some unacceptable issues that need to be addressed.</p>

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
ISO New England	No	It is closer, but there are still some unacceptable issues that need to be addressed. The single most important comment is to define the base assumptions for use in studies.
National Grid	No	It is closer, but there are still some unacceptable issues that need to be addressed.
<p>Response: The SDT has made changes based on the comments. Please see the individual comment responses to see how the SDT addressed the issues raised in your comments.</p>		
MAPP	No	<p>MAPPCOR urges the SDT to modify the effective date where it is indicated that any “entity that cannot fully implement its Corrective Action Plan to eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for the above listed performance elements within 60 calendar months of the compliance date for Requirements R2 through R4 shall self report itself as being unable to meet the performance requirements of this Reliability Standard.” This is essentially requiring an entity to self report for failing to build facilities. The Energy Policy Act of 2005 did not give FERC and therefore, NERC, the authority to require construction of electric facilities. Therefore, this implementation plan is implying an authority that is not given to FERC or NERC.</p> <p>This provision of the effective date should be completely deleted from the standard, the provision to state that one is non-compliant for this should be deleted from the standard, or there should be a statement that such a requirement is subject to limitations of the Energy Policy Act of 2005.</p>
<p>Response: The SDT has modified the language in the Implementation Plan to address this concern. Additionally, the last paragraph of the effective date section of the standard was eliminated to address this concern.</p>		
NERC Standards Review Subcommittee	No	More discussion is needed pertaining to this standard.
<p>Response: The SDT believes with the clarifications made in Draft 5 that the standard is ready for ballot.</p>		
Portland General Electric Co.	No	PGE believes that this standard should not go to ballot without revisions to restrict the scope of the standard as outlined above.
<p>Response: The SDT has not restricted the standard to Facilities >200 kV, as proposed in your comment to Q2. The Facilities that make up the Bulk Electric System (BES) are defined by each Regional Entity and this standard must address all of the BES Facilities to ensure reliability of the BES.</p>		
NYISO	No	Question #12 Do you believe that this standard is ready to go to ballot? (if “No” is checked here, the SDT will consider that comments raised on the other questions drove that decision.) No. Too many significant questions and key definitions remain unanswered.

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
		<p>Table 1 - General comment - Footnotes needs significant clean-up Page 16</p> <p>Note (a) this note is placed under “Steady State & Stability” but issues of voltage instability, cascading outages, and uncontrolled islanding apply only to stability</p> <p>Note (f) Does this refer to “Normal Ratings”? Please provide clarity.</p> <p>Note (g) “System steady state” should be defined by applicable regional entity.</p> <p>Note (i) indicates that one cannot meet steady state requirements by depending on end-user owned equipment. Please clarify the purpose and performance requirement on this note with respect to end-user schemes and possible arrangements already in place to trip end-user equipment.</p> <p>Page 17 P5 As written, this requirement replicates a fault causing a loss of station anywhere that there is only one protection system. This is overly severe and would lead to the requirement for fully redundant protection systems at many stations.</p> <p>Page 18 P7 for Event 1 (the loss of two adjacent circuits), this needs to specify if these are the same phase or different phasesPage 19How could any system planner reasonably and accurately portray what contingencies might occur from any single or combination of extreme events listed?</p> <p>PAGE 20 Is the one mile exclusion in footnote 14 a contiguous mile, or a total of one mile for the entire length of the lines? (i.e. Are multiple instances of common towers or common rights of way exempt if each instance is less than a mile?)General</p> <p>Comment:The NYISO would like to align itself in supporting the following comment submitted by the NPCC: We agree with the SDT that more stringent performance requirements be applied for Facilities that do not directly serve end-use Load customers but rather represent the backbone of the electric power grid and act as the medium for moving large amounts of power from production to various Load centers.However, as HQT commented on previous draft, we strongly believe that the EHV breakpoint for these more stringent requirements, defined in note 3 of table 1 as “all Facilities greater than 300 kV” is not appropriately defined and should be reviewed. The SDT have not demonstrated that a uniform voltage-level threshold could adequately covers all different power system types in North America and we strongly believe that significant additional costs will be incurred without proportional or measurable reliability benefits if this definition is not changed.We propose to modify EHV definition “all Facilities greater than 300 kV” by the following “Facilities representing the backbone of the System, generally at voltage greater than 300 kV, as determined by the Planning Coordinator and approved by Regional Entity.” In using such a language, we believe that the extra investment required would go towards real improvement of the reliability of the interconnected System.</p>

Response: Footnote references were corrected.

The SDT does not agree that Header Note “a” should only apply in the Stability section, since these conditions should not be allowed to occur in any timeframe.

Header Note “f” is not limited to normal ratings. Facility Ratings are defined in the NERC Glossary as: The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility. Since these ratings are time

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
		<p>dependent, a rating higher than a normal rating can be utilized, as long as Header Note “e” is maintained.</p> <p>Header Note “g” – The SDT believes that it is appropriate for each Transmission Planner and Planning Coordinator to define the acceptable Steady state voltages.</p> <p>Header Note “i” – The purpose of the restriction is to ensure that the planner develops the System so that all of the Load, including voltage sensitive Load, can be served after an event.</p> <p>The P5 event is a Category C event in the existing Table, and the SDT changed the requirement for >300 kV so that Non-Consequential Load Loss is not acceptable.</p> <p>For the P7 event, it is the responsibility of the planner to evaluate the loss of adjacent circuits as the planner believes is appropriate for their System.</p> <p>For footnote 14, the SDT intends to limit the exposure for multiple circuits to less than 1 mile total. It does not matter whether the exposure is contiguous or not.</p> <p>The SDT declines to add “generally” to the requirements that apply to Facilities operated at greater than 300 kV as that would make the requirements unmeasurable.</p>
Lakeland Electric	No	<p>The effective section needs more clarification: The assessment and supporting studies in accordance with the new standard is not effective until two years after this new standard is approved, however, it is required (R8) that PCs and TPs distribute its planning Assessment and results to adjacent PCs and TPs one year after the standard is effective. Which standard does the SDT intend for the (the old TPL standards or the new TPL standard) PCs and TPs to use to assess their system during the first year after the standard is approved?</p> <p>R2 thru R7 (assessments and studies) becomes effective 2 yrs after regulatory approval. That means that utilities have three years left to build/upgrade the projects identified in the studies/assessment (which was not effective until the 2nd year).</p> <p>Three years might not be enough to build long EHV or HV lines to meet the standard requirement. What happens between year 5 and year 7? After year 5, utilities are not allowed to trip Non-Consequential Load or curtailment of Firm Transmission Service for those specific contingency listed. However, the utilities do not have to self report until year 7 (“60 months of the compliance date for R2 through R4”)</p>
<p>Response: A number of commenters pointed out a typographical error that reversed the numbering of Requirements R7 and R8 in the Implementation Plan. The implementation plan has been corrected to reflect the SDT’s original intent that Requirements R1 and R7 (not Requirement R8) become effective 12 months after approval and Requirements R2 through R6 plus Requirement R8 (not Requirement R7), with the noted exceptions, become effective 24 months after approval. Changes were made to the Standard and the Implementation Plan document. Consequently, the revised assessment requirements and Requirement R8 are all effective 24 months after applicable regulatory approval. During the one-year period after Requirements R1 and R7 become effective and before the remaining requirements become effective, Transmission Planners and Planning Coordinators should conduct their assessments based on the current requirements.</p> <p>The SDT considered the concerns of a number of commenters as to whether 60 months will be sufficient to complete major projects when TPL-001-1, draft 3 was prepared, and the SDT again discussed its position in light of the comments received from this posting. The SDT continues to believe that extending the 60 month implementation period would water down the standard by potentially delaying some corrective actions that could be implemented in 60 months or less. The current draft of TPL-001-1 does in fact recognize the distinct possibility that major construction projects could take more than 60 months, in which case Requirement R2, part 2.7.3 would apply. The relevant portion of that requirement states: “If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the</p>		

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
<p>Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation.” This provision could be applied when formulating the original Corrective Action Plan when it is known in advance that the permitting and construction process will require longer than 60 months or after the plan is formulated and unexpected delays arise outside the Transmission Planner’s or Planning Coordinator’s control.</p> <p>All parts of the revised standard will be in effect 60 months after applicable regulatory approval, so there are no unique requirements that exist only between year 5 and year 7.</p>		
Tri-State Generation and Transmission Association	No	<p>The SDT needs to look at the Measures section more closely. Please consider: In what jurisdiction could it be developed, and would it be possible to develop estimates of costs to meet the new requirements contained in this draft TPL by Reliability Area, then have utilities examine whether there will be a corresponding increase in Bulk Transmission System reliability?The primary directive of NERC Reliability Standards is to improve system reliability and thus minimize potential cascading of the Bulk Electric System. This developing TPL Standard will provide some needed clarification and perhaps better uniformity of Planning Study work. Any Standard that would move us toward the primary goal should be attended to meticulously. The SDT must endeavor to ensure this standard moves us in that direction and does not simply give us more structure. That said, please use this guiding test as we put final touches on this standard: Will each Requirement decrease the potential of cascading outages and increase service reliability?</p>
<p>Response: Throughout the development process, the SDT has been cognizant of the changes in the requirements and their potential impact on BES reliability. The SDT believes that all of the requirements and their sub-parts contained in this standard address the NERC directive of ensuring Bulk Electric System reliability.</p>		
Oklahoma Gas & Electric	No	<p>This document needs to be crystal clear because of compliance requirements. It still needs some work to clarify some definitions and address duplication of work (between the Transmission Planner and Planning Coordinator).</p>
<p>Response: The SDT has worked diligently to make the requirements very clear and unambiguous. See responses to Q9 for changes made to the definitions in this draft. The SDT has written the standard such that each Transmission Planner and each Planning Coordinator is responsible for each requirement and its sub-parts.</p>		
TVA System Planning	No	<p>TVA is very concerned about the tremendous amount of additional work that has been proposed for both the steady state and for stability analysis. TVA believes that there will be very little payoff for these additional studies. TVA is concerned that the costs to meet the new requirements contained in this draft TPL will amount to between \$1 billion to \$2 billion with very little impact overall on the reliability of the Bulk transmission system. TVA is also very concerned about the increase in customer rates that will be required to support these new facilities.</p>
<p>Response: The SDT has made efforts to ensure that new study requirements in the proposed standard contribute to the completeness of Planning Assessments and remove the ambiguity in the existing standards. The SDT believes that the higher performance requirements are necessary to ensure a reliable BES.</p>		
Gainesville Regional Utilities	Yes	
Oncor Electric Delivery	Yes	

Consideration of Comments on 4th Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Yes or No	Comments for Question 12
Progress Energy Carolinas	Yes	
Southern Company	Yes	
TIS	Yes	
Exelon Transmission Planning	Yes	Concern is with the issues raised in Question 2. Performance requirements should be based on the voltage level of the overloaded element.
<p>Response: Please see the comment responses for Q2 to see how the SDT addressed the issues raised in your comments. The SDT disagrees that the voltage level of the overloaded element should be used to determine acceptable performance.</p>		
Lafayette Utilities System	Yes	LUS believes that the current draft of the standard is a significant improvement on the previous draft, and that the standard is ready to go to ballot. While there are elements of the standard which we consider to be short of the ideal, we recognize that this has been a consensus-building process and that the version 4, as explained and clarified, is a compromise which may be the best attainable for the industry at the moment.
<p>Response: Thank you for your comment.</p>		

VRF and VSL Statement for Project 2006-02: Assess Transmission Future Needs

The proposed reliability standard includes Violation Risk Factors (“VRFs”) and Violation Severity Levels (“VSLs”) that are specific to individual Requirements. The ranges of penalties for violations of standards are based on the applicable VRFs and VSLs and will be administered based on the Sanctions Table and supporting penalty determination process described in FERC-approved NERC Sanction Guidelines, Appendix 4B in NERC’s Rules of Procedure. The assignment of VRFs and VSLs included consideration of the NERC guidelines. Consistent with NERC’s August 10, 2009 informational filing, assignments of VRFs and VSLs were made at the main requirement level of each standard.

VRF assignments were based on the criteria stated in the guidelines:

- High — A requirement that, if violated, could directly cause or contribute to Bulk Electric System (BES) instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
- Medium — A requirement that, if violated, could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of a medium risk requirement is unlikely to lead to BES instability, separation, or cascading failures.
- Low — A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. A requirement that is administrative in nature.

Utilizing these criteria, the VRFs for TPL-001-1 were assigned as follows:

- Since this is a planning standard, dealing with items in the Long-term Planning Timing Horizon, no requirements were assigned a high VRF.
- A medium VRF was assigned to those requirements dealing with the Planning Assessment and its constituent parts. Therefore, a medium VRF was assigned to Requirements R1 through R5. .
- A lower VRF was assigned to Requirements R6, R7, and R8 which were seen as mainly administrative in nature.

VSLs have been assigned consistent with the established guidelines as can be seen in the following table.

TPL-001-1

R#	<p style="text-align: center;">Guideline 1</p> <p style="text-align: center;">Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p style="text-align: center;">Guideline 2</p> <p style="text-align: center;">Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p style="text-align: center;">Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p style="text-align: center;">Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p style="text-align: center;">Guideline 3</p> <p style="text-align: center;">Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p style="text-align: center;">Guideline 4</p> <p style="text-align: center;">Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>
R1.	This is a new requirement and is more stringent than previous performance.	The VSLs are clear and unambiguous and can only be interpreted one way. The VSLs cover all possible scenarios.	The VSLs do not add to the requirement and cover all elements of the requirement	The VSLs are based on a single violation and not cumulative violations.
R2.	This is a new requirement and is more stringent than previous performance.	The VSLs are clear and unambiguous and can only be interpreted one way. The VSLs cover all possible scenarios.	The VSLs do not add to the requirement and cover all elements of the requirement	The VSLs are based on a single violation and not cumulative violations.
R3.	This is a new requirement and is more stringent than previous performance.	The VSL is binary and the only possibility is Severe.	The VSLs do not add to the requirement and cover all elements of the requirement	The VSLs are based on a single violation and not cumulative violations.
R4.	This is a new requirement and is more stringent than previous performance.	The VSLs are clear and unambiguous and can only be interpreted one way. The VSLs cover all possible scenarios. FERC Order 693	TPL Family	2006-02	1691 - Further, the proposed modifications are intended to ensure that the planning requirements are specific enough to promote rigor and consistency in assessments and provide clear and measurable rules for mandatory and enforceable Reliability Standards. The Commission therefore agrees with SDG&E's comments in this regard and on the need to balance "appropriateness" and "specificity."	TPL-001-1, Requirements R1-R8 & Table 1 - The standard strikes the desired balance between specific requirements (for example, Table 1 event descriptions and performance requirements) and appropriateness where the individual System concerns necessitates variations (for example, Requirement R2, part 2.4.3 addressing what sensitivities should be addressed) so that the standard ensures reliability is maintained
FERC Order 693	TPL Family	2006-02	1692 - Consider integrating TPL-001 through TPL-004 into one standard.	TPL-001-1 incorporates TPL-001-0 through TPL-004-
FERC Order 693	TPL Family	N/A	1693 -Submit an informational filing, in addition to regional criteria, all utility and RTO/ISO differences in transmission planning criteria that are more stringent than those specified by the TPL standards.	The data has been collected and distributed to the SDT and reviewed for consideration. Detailed discussions are contained in the SDT meeting minutes.
FERC Order 693	TPL Family	2006-02	1694, 1704, & 1706 - Consider the full range of variables when determining critical system conditions but only those deemed to be significant need to be assessed and documentation provided that explain the rationale for selection.	TPL-001-1, Requirement R3, part 3.4 & Requirement R4, part 4.4
FERC Order 693	TPL Family	2006-02	1716 - System performance should be assessed based on contingencies that mimic what happens in real-time.	TPL-001-1, Requirement R1
FERC Order 693	TPL Family	2006-02	1719 - Consider appropriate revisions to the reliability standards to deal with cyber security events.	Cyber security events have been added to the list of Extreme Events as #3a.v
FERC Order 693	TPL Family	N/A	Entities that have planned and designed their systems on the basis of a different approach to single contingencies should work with NERC in developing plans to transition to this new approach.	This is not an SDT issue. No action taken.
FERC Order 693 – TPL General Comments	TPL-001-0	2006-02	1693 - Submit an informational filing, in addition to regional criteria, all utility and RTO/ISO differences in transmission planning criteria that are more stringent than those specified by the TPL standards.	The data has been collected and distributed to the SDT and reviewed for consideration. Detailed discussions are contained in the SDT meeting minutes.
FERC Order 693	TPL-001-0	2006-02	1694, 1704, & 1706 - Determine critical system conditions and study years by conducting sensitivity analysis with due consideration of the factors outlined by the Commission.	TPL-001-1, Requirement R2, part 2.1.4
FERC Order 693 – TPL General Comments	TPL-001-0	2006-02	1694, 1704, & 1706 - Consider the full range of variables when determining critical system conditions but only those deemed to be significant need to be assessed and documentation provided that explain the rational for selection.	TPL-001-1, Requirement R3, part 3.4 & Requirement R4, part 4.4

Source	Standard No.	Project No	Language	Resolution
FERC Order 693 – TPL General Comments	TPL-001-0	2006-02	1716 - System performance should be assessed based on contingencies that mimic what happens in real-time.	TPL-001-1, Requirement R1
FERC Order 693 – TPL General Comments	TPL-001-0	2006-02	1719 - Consider appropriate revisions to the reliability standards to deal with cyber security events.	Cyber security events have been added to the list of Extreme Events as #3a.v
FERC Order 693	TPL-001-0	2006-02	1751 - Require a peer review of planning assessments with neighboring entities	TPL-001-1, Requirement R3, part 4.1, R4, part 4.2 and Requirement R8: R3 and R4 address the concern expressed about sharing and coordination of System Contingencies that may affect neighboring Systems. Order 693 uses the term 'neighboring' while the proposed Reliability Standard uses 'adjacent'. 'Adjacent' is actually a more encompassing term as it would pick up embedded cooperatives, municipals, etc., and thus is more stringent than the Order 693 terminology. Additionally, the term 'adjacent' clarifies the intent to cover Transmission Systems that interconnect to the entity System whereas neighbor is vague and could include Systems in the vicinity of an entity's System, but not directly connected.
			Continuation of 1751	Requirement R8 continues to address the appropriate sharing of information with neighboring Systems. Distribution is a better approach than just a peer review as an entity could always decline an offer to participate in a peer review even if they should have participated. The distribution approach means that they will receive the Planning Assessment regardless. R8 ensures that information is shared with those affected and input from those Systems is received, without dictating how the two-way sharing must take place, such as peer review. Due to the continuing cycle of Planning Assessments, comments from other entities at the end of a planning cycle will be utilized at the beginning of the next cycle as the planner moves forward in time. This approach tells entities what to do without stating how to do it but still makes certain that the goal is achieved. This is

Source	Standard No.	Project No	Language	Resolution
			Continuation of 1751	To cover those “neighboring” Systems that may not be adjacent, the standard requires the Transmission Planner and Planning Coordinator to distribute the Planning Assessment to additional “neighbors” who show a “reliability related need” who have requested information in writing and requires a documented response to their comments. This is an equally, effective manner to provide for the appropriate sharing of
FERC Order 693	TPL-001-0	2006-02	1759 - Modify requirement R1.3 to substitute the reference to regional reliability organization with regional entity.	References to RRO have been removed
FERC Order 693	TPL-001-0	2006-02	1786 - Require assessments of outages of critical long lead time equipment, consistent with an entity’s spare equipment strategy	TPL-001-1, Requirement R2, part 2.1.5
FERC Order 693	TPL-001-0	2006-02	1797 - Address concerns with footnote (a) of Table 1 with regard to applicability of emergency ratings and consistency of normal ratings and voltages with values obtained from other reliability standards and concerns raised by International Transmission with reg	TPL-001-1, Table 1, header note 'e'
FERC Order 693 – TPL General Comments	TPL-001-0	2006-02	Entities that have planned and designed their systems on the basis of a different approach to single contingencies should work with NERC in developing plans to transition to this new approach.	This is not an SDT issue. No action taken.
FERC Order 693 – TPL General Comments	TPL-001-0	2006-02	Consider integrating TPL-001 through TPL-004 into one standard.	TPL-001-1 incorporates TPL-001-0 through TPL-004-0
Fill in the Blank Team	TPL-001-0	2006-02	No action needed	No action taken.
Other	TPL-001-0	2006-02	Modify standard to conform to the latest version of NERC’s Reliability Standards Development Procedure, the NERC Standard Drafting Team Guidelines, and the ERO Rules of Procedure.	The SDT is working against the latest set of procedures
Phase III/IV Team	TPL-001-0	2006-02	Add a requirement to verify that there are sufficient reactive resources	TPL-001-1, Requirement R1, part 1.1.3
Phase III/IV Team	TPL-001-0	2006-02	Add a requirement to identify where UVLS should be installed	Not considered appropriate for TPL-001-1
Team Comments	TPL-001-0	2006-02	Provide clarity where the Planning Authority is mentioned	Planning Authority is now Planning Coordinator and clarity has been provided in each requirement as needed
Version 0 Team	TPL-001-0	2006-02	Need to address deliverability to load	TPL-001-1, Table 1, Footnote 10

Source	Standard No.	Project No	Language	Resolution
Version 0 Team	TPL-001-0	2006-02	Clarify use of applicable ratings in Table 1, note 'a'	TPL-001-1, Table 1, header note 'e'
Version 0 Team	TPL-001-0	2006-02	Clarify timing for submittal of corrective plan	TPL-001-1, Requirement R2, part 2.7
Version 0 Team	TPL-001-0	2006-02	Several semantic issues	The standard has been completely rewritten.
Version 0 Team	TPL-001-0	2006-02	Define critical system conditions	This terminology is no longer used.
Version 0 Team	TPL-001-0	2006-02	Having all projected firm transfers modeled may not be practical to achieve in a single snapshot of a powerflow model. The requirement should allow engineering judgment to determine the appropriate level of system utilization to assess reliability considering all projected firm uses.	TPL-001-1, Requirement R1
Version 0 Team	TPL-001-0	2006-02	Table 1, note 'b' – clarify when to curtail firm deliveries	TPL-001-1, Table 1, Interruption of Firm Transmission Service Allowed column added
Version 0 Team	TPL-001-0	2006-02	Table 1 – C.5 goes beyond double circuit outage criteria	TPL-001-1, Table 1, P7
Version 0 Team	TPL-001-0	2006-02	Does planned facilities include just those under construction?	This terminology has been cleared up in TPL-001-1, Requirement R1, part 1.1.2
Version 0 Team	TPL-001-0	2006-02	Table 1, items 6, 7, 8 & 9 need footnote stating that they do not apply to generator breaker failure	Table 1 has been rewritten
Version 0 Team	TPL-001-0	2006-02	Need to include multiple time frames	TPL-001-1, Requirement R2
Version 0 Team	TPL-001-0	2006-02	What is a major load center?	This terminology is no longer used.
VRFs Team	TPL-001-0	2006-02	R1 – time horizon should be long-term planning	All time horizons have been adjusted to Long-term Planning.
FERC Order 693	TPL-002-0	2006-02	1694, 1704, & 1706 - Determine critical system conditions in the same manner as proposed in TPL-001.	This terminology is no longer used.
FERC Order 693	TPL-002-0	2006-02	1773 - Footnote (b) should not allow for firm load shedding or curtailment of firm transfers as part of the system adjustments.	TPL-001-1, Table 1, P1 - associated footnote has been removed
FERC Order 693	TPL-002-0	2006-02	1773 - Clarify the phrase "permit operating steps necessary to maintain system control" in the footnote (a) and the use of emergency ratings.	TPL-001-1, Table 1, header note 'e'
FERC Order 693	TPL-002-0	2006-02	1773 - Clarifies footnote (b) in regard to load loss following a single contingency specifying the amount and duration of consequential load loss and system adjustments permitted after the first contingency to return the system to a normal operating state. NERC	TPL-001-1, Table 1, footnote 9.

Source	Standard No.	Project No	Language	Resolution
FERC Order 693	TPL-002-0	2006-02	1786 - Requires assessment of planned outages of long lead time critical equipment consistent with the entity's spare equipment strategy.	TPL-001-1, Requirement R2, part 2.1.5
FERC Order 693	TPL-002-0	2006-02	1787 - Requires all generators to ride through the same set of category B and C contingencies as required by wind generators in Order No. 661, or to simulate without this capability as tripping.	TPL-001-1, Requirement R3, part 3.3.2 & Requirement R4, part 4.3.2
FERC Order 693	TPL-002-0	2006-02	1788 - Consider NRC's comments regarding clarifying the N-1 state as being always applicable to the current conditions as part of the standards development process.	TPL-001-1, Table 1 & Requirement R1
FERC Order 693	TPL-002-0	2006-02	1789 - Document the load models used in system studies and the rationale for their use.	TPL-001-1, Requirement R1
FERC Order 693	TPL-002-0	2006-02	1794 - Standard should be clarified to not allow an entity to plan for the loss of non-consequential load in the event of a single contingency.	TPL-001-1, Table 1, P1
FERC Order 693	TPL-002-0	2006-02	1795 - Commission, therefore, suggests that the ERO consider developing a ceiling on the amount and duration of consequential load loss that will be acceptable. If the ERO determines that such a ceiling is appropriate, it should be developed through the ERO's Reliability Standards development process	and duration and if it "is appropriate" to develop the ceiling through the standards development process. Originally, the SDT debated the appropriateness and the need for a ceiling and after much debate determined that a single ceiling was not appropriate for the continent-wide standard. The SDT was divided on the reliability need for this item and vetting with industry was determined to be the best course of action. The directive was then further addressed in other stages of the project to determine if another equally effective method could be developed. The SDT added requirements covering the reporting of the magnitude and duration of Consequential Load Loss. In earlier postings, industry overwhelming protested the
			Continuation of 1795	duration than magnitude so the SDT attempted a compromise position. The duration element of the requirement was deleted and a revised requirement covering only magnitude was crafted and posted for comment. Again, the SDT was overwhelmed by industry comments pushing back about the inclusion of an administrative task without a reliability need in a Reliability Standard. At this point, the SDT discussed the matter at length and decided to delete the requirement in its entirety. The SDT addressed the directive to "consider developing a ceiling" as directed in Order 693 as evidenced in meeting notes and by its attempt to include the requirements for an equally effective method in the Reliability Standard. Therefore, the SDT

Implementation Plan for TPL-001-1

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-1 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-1, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-1 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Except as indicated below, all Requirements and associated parts shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-1. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-1 and NERC’s Rules of Procedure, Section 800. However, during this 24-month period, all aspects of TPL-001-0 through TPL-006-0 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-1 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-1 ‘raises the bar’ in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent “raising the bar”:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This “raising the bar” is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon will be provided as follows:

- For 60 months after the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to performance elements P1-2 and P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element), P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service (in accordance with Requirement R2.7.3) that would not otherwise be permitted by the requirements of TPL-001-1.

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Implementation Plan for TPL-001-1

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-1 ~~—~~ Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-1, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: ~~—~~All Load that is no longer served by the Transmission ~~S~~system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) other than Consequential Load Loss, (2) and the response of voltage sensitive Load, or (3) including Load that is disconnected from the System by end-user equipment. ~~—~~

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
TPL-001-1 --- Transmission System Planning Performance Requirements	Transmission Planner	Planning Coordinator
	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Except as indicated below, all Requirements and associated ~~sub-requirements~~ parts shall become effective on the first day of the first calendar quarter, 24 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-1. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-1 and NERC's Rules of Procedure, Section 800. However, during this 24-month period, all aspects of TPL-001-0 through TPL-006-0 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-1 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after ~~the first day of the first calendar quarter following~~ applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-1 ‘raises the bar’ in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent “raising the bar”:

- P1-2 -(for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This “raising the bar” is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. ~~In question 14 of the second posting of the revised standard, the SDT requested input from industry on the amount of time required to implement the Corrective Action Plans needed to address the ‘raise the bar’ issues. The SDT has studied the responses and determined that~~ To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon ~~would be the appropriate~~ will be provided as follows: ~~amount of time to implement the changes. Therefore,~~

- For 60 months after the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to performance elements P1-2 and P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element), P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load ~~or~~ and curtailment of Firm Transmission Service (in accordance with Requirement R2.7.3) that would not otherwise be permitted by the requirements of TPL-001-1.

Any entity which cannot ~~fully implement their Corrective Action Plan to~~ eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall ~~self report themselves as being unable to meet the performance requirements of the Reliability Standard. The entities will~~ submit a mitigation plan to ~~their~~ its Regional Entity outlining the steps ~~they~~ it will take ~~to correct the problem to become compliant and the date they anticipate becoming compliant. The Regional Entity and NERC will review the mitigation plan and the Regional Entity/NERC will either approve it or remand it back for changes (this could include dates, steps, etc.). If the mitigation plan is approved by the Regional Entity and NERC and the entity completes the mitigation plan by the date contained within the~~

~~mitigation plan, If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed. Those entities who do not meet the date outlined in the mitigation plan will begin settlement proceedings at that date.~~

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this fifth draft and those standards will also be replaced by TPL-001-1.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Submit standard(s) to BOT.	2Q10
2. Submit to regulatory authorities for approval.	3Q10

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-1
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

- For 60 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-1, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-1:
 - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P2-1, P2-2 (above 300 kV)
 - P2-3 (above 300 kV)
 - P3-1 through P3-5
 - P4-1 through P4-5 (above 300 kV)
 - P5 (above 300 kV)

B. Requirements

- R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning

Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- 1.1.** System models shall represent:
 - 1.1.1.** Existing Facilities
 - 1.1.2.** Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3.** New planned Facilities and changes to existing Facilities
 - 1.1.4.** Real and reactive Load forecasts
 - 1.1.5.** Known commitments for Firm Transmission Service and Interchange
 - 1.1.6.** Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 2.1.** The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current studies, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:
 - 2.1.1.** System peak Load for either Year One or year two, and for year five.
 - 2.1.2.** System Off-Peak Load for one of the five years.
 - 2.1.3.** P1 events in Table 1 with known outages modeled, as in Requirement R1, part 1.1.2 under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4.** For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.

- Controllable Loads and Demand Side Management.
 - Duration or timing of planned Transmission outages.
- 2.1.5.** When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.
- 2.2.** The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:
- 2.2.1.** A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4.** The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, part 2.6. The following studies are required:
- 2.4.1.** System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2.** System Off-Peak Load for one of the five years.
- 2.4.3.** For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.

- Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5.** The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, part 2.6.
- 2.6.** Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1.** For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2.** For steady state, short circuit, or Stability analysis: the System represented in the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.
- 2.7.** For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1.** List System deficiencies and the associated actions needed to achieve required System performance. Such actions may include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.

- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
 - 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.
 - 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.
- R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention.
 - 3.3.2. Trip generators where simulations show generator bus voltages or high side of the Generation Step Up (GSU) transformer voltages are less than known or assumed minimum generator steady state or ride

- through voltage limitations. Include in the assessment any assumptions made.
- 3.3.3.** Trip Transmission elements when relay loadability limits are exceeded.
 - 3.3.4.** Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
- 3.4.** Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
- 3.4.1.** The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 3.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R3, part 3.2 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2, parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- 4.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, part 4.4.
 - 4.1.1.** For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
 - 4.1.2.** For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
 - 4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, part 4.5.
 - 4.3. Contingency analyses for Requirement R4, parts 4.1 and 4.2 shall :
 - 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention while also considering the impact of successful or unsuccessful high speed reclosing.
 - 4.3.2. Trip generators where simulations show generator bus voltages or high side of the GSU transformer voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - 4.3.3. Simulate the impact of transient swings on Protection System operation for Transmission lines and transformers.
 - 4.3.4. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.
 - 4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4, part 4.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
 - 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R4, part 4.2 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5. Each Transmission Planner and Planning Coordinator shall define and document, within its Planning Assessment, criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within its Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading , voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity’s individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and submits a written request for the information. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. BES Transmission voltage instability, Cascading, and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any planning or extreme event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. For all planning events, planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. The System shall remain stable.
- k. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No
		2. Bus Section Fault	SLG	EHV HV	No ⁹ Yes	No Yes
		3. Internal Breaker Fault ⁸ (Non Bus-tie)	SLG	EHV HV	No ⁹ Yes	No Yes
		4. Internal Breaker Fault (Bus-tie) ⁸	SLG	EHV, HV	Yes	Yes

Standard TPL-001-1 — Transmission System Planning Performance Requirements

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (<i>Fault plus stuck breaker¹⁰</i>)	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie) attempting to clear a Fault on the associated bus	SLG	HV	Yes	Yes
			SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (<i>Fault plus Protection System failure to operate</i>)	Normal System	Failure of a single Protection System that results in Delayed Fault Clearing on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes
P6 Multiple Contingency (<i>Two overlapping singles</i>)	Loss of one of the following followed by System adj. ⁹ : 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency (<i>Common Structure</i>)	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance

Extreme Events	
<p>Steady State & Stability For all extreme events evaluated:</p> <ol style="list-style-type: none"> a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency. b. Simulate Normal Clearing unless otherwise specified. 	
<p>Steady State</p> <ol style="list-style-type: none"> 1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments. 2. Local area events affecting the Transmission System such as: <ol style="list-style-type: none"> a. Loss of a tower line with three or more circuits.¹¹ b. Loss of all Transmission lines on a common Right-of-Way¹¹. c. Loss of a switching station or substation (loss of one voltage level plus transformers). d. Loss of all generating units at a station. e. Loss of a large Load or major Load center. 3. Wide area events affecting the Transmission System based on System topology such as: <ol style="list-style-type: none"> a. Loss of two generating stations resulting from conditions such as: <ol style="list-style-type: none"> i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation. ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Other events based upon operating experience that may result in wide area disturbances. 	<p>Stability</p> <ol style="list-style-type: none"> 1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments. 2. Local or wide area events affecting the Transmission System such as: <ol style="list-style-type: none"> a. 3Ø fault on generator with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. e. 3Ø internal breaker fault. f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance
Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3 \emptyset) are the fault types that must be evaluated in Stability simulations for the event described. A 3 \emptyset or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-Generator Step Up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. Curtailment of Firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Demand. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure or common Right-of-Way for 1 mile or less.

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within its respective area, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and the Planning Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient, date, and contents, or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has indicated a reliability need and has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity.

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying any criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.
- Three calendar years of the notices and other documentation employed in accordance with Requirement R8 and Measure M8.

1.5 Additional Compliance Information

None.

2 Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.	The responsible entity's System model failed to represent three of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1.
R2	The responsible entity failed to comply with Requirement R2, part 2.6.	The responsible entity failed to comply with Requirement R2, part 2.3 or part 2.8.	The responsible entity failed to comply with one of the following parts of Requirement R2: part 2.1, part 2.2, part 2.4, part 2.5, or part 2.7.	The responsible entity failed to comply with two or more of the following parts of Requirement R2: part 2.1, part 2.2, part 2.4, or part 2.7.
R3	The responsible entity did not identify planning events as described in Requirement R3, part 3.4 or extreme events as described in Requirement R3, part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, TPL-004-0, TPL-005, and TPL-006-0 into one, single, comprehensive, coordinated standard: TPL-001-1	Not employed due to scope of revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this fifth draft and those standards will also be replaced by TPL-001-1.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Submit standard(s) to BOT.	2Q10
2. Submit to regulatory authorities for approval.	3Q10

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission ~~S~~system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault-.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) other than Consequential Load Loss, (2) and the response of voltage sensitive Load, or (3) including Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission ~~S~~system performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-1
3. **Purpose:** Establish Transmission System planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R87 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R87 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R76 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

- For 60 calendar months after beginning the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-1, Table 1 are allowed to include tripping of Non-Consequential Load Loss or and curtailment of Firm Transmission Service (in accordance with Requirement R2, part 2.7.53.) that would not otherwise be permitted by the requirements of TPL-001-1:
 - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P2-1, P2-2 (above 300 kV)
 - P2-3 (above 300 kV)
 - P3-1 through P3-5
 - P4-1 through P4-5 (above 300 kV)
 - P5 (above 300 kV)

~~Any entity that cannot fully implement its Corrective Action Plan to eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for the above listed performance elements within 60 calendar months of the compliance date for Requirements R2 through R4 shall self report itself as being unable to meet~~

~~performance requirements of this Reliability Standard. Any such entity shall submit a mitigation plan to its Regional Entity outlining the steps it will take to become compliant and the date it anticipates becoming compliant. The Regional Entity and NERC shall review the mitigation plan and the Regional Entity/NERC will either approve it or remand it for changes (this could include dates, steps, etc.). If the mitigation plan is approved by the Regional Entity and NERC and the entity completes the mitigation plan by the date contained within the mitigation plan, the intent of the SDT is that no penalties will be assessed. Those entities that do not meet the date outlined in an approved mitigation plan will begin settlement proceedings at that date.~~

B. Requirements

- R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 1.1.** System models shall represent:
 - 1.1.1.** Existing Facilities
 - 1.1.2.** Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3.** New planned Facilities and changes to existing Facilities
 - 1.1.4.** Real and reactive Load forecasts
 - 1.1.5.** Known commitments for Firm Transmission Service and Interchange
 - 1.1.6.** Resources ([supply or demand side](#)) required ~~to supply for~~ Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 2.1.** The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current studies, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:
 - 2.1.1.** System peak Load for either Year One or year two, and for year five.
 - 2.1.2.** System Off-Peak Load for one of the five years.
 - 2.1.3.** P1 events in Table 1 ~~for with~~ known outages [modeled](#), as ~~modeled~~ in Requirement R1, part 1.1.2 under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4.** For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of

changes to the basic assumptions used in the model ~~for the list of items shown below~~. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of planned Transmission outages.

2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), ~~an analysis of~~ the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.

2.2. The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:

2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as ~~indicated~~ qualified in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4. The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as ~~indicated~~ qualified in Requirement R2, part 2.6. The following studies are required:

2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of

Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.2. System Off-Peak Load for one of the five years.

2.4.3. For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model ~~for the list of items shown below~~. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

- Load level, Load forecast, or dynamic [Load](#) model assumptions.
- Expected transfers.
- Expected in service dates of new or modified [Transmission Facilities](#).
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.5. The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed generation additions or changes in that timeframe and be supported by current or past studies [as qualified in Requirement R2, part 2.6](#).

2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2. For steady state, short circuit, or Stability analysis: the [System represented in the](#) study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.

2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in ~~Table 1~~. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity ~~case~~ [analyzed](#) in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Such actions may include:

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate ~~S~~steady ~~S~~tate performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2.** Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3.** If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.
- 2.7.4.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8.** For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
- 2.8.1.** List System deficiencies and the associated actions needed to achieve required System performance.
- ~~**2.8.2.** Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.~~
- ~~**2.9.2.8.2.** The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.~~

- R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 3.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, part 3.4.
- 3.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, part 3.5.
- 3.3.** Contingency analyses [for Requirement R3, Parts 3.1 & 3.2](#) shall be performed and:
- 3.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention.
- 3.3.2.** -Trip generators where simulations show generator bus voltages [or high side of the Generation Step Up \(GSU\) transformer voltages](#) are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
- 3.3.3.** [Ensure-Trip Transmission elements when](#) relay loadability limits are [respected exceeded](#).
- 3.3.4.** Simulate the expected automatic operation of existing and planned devices designed to provide ~~S~~steady ~~S~~tate control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
- 3.4.** Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
- 3.4.1.** The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 3.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R3, part 3.2 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there [are is e](#)Cascading [outages](#) caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

~~3.6.3.5. When manual or automatic generation runback or tripping is used to meet steady state performance requirements for planning events P1 through P7 in Table 1, the amount of generation lost shall be documented in the Planning Assessment with a description of why the generation was runback or tripped for each event.~~

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. — [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: ~~When A~~a generator ~~that~~ pulls out of synchronism ~~shall be tripped~~ in the simulations, ~~and~~ the resulting apparent impedance swings shall not result in the tripping of any Transmission ~~S~~system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, part 4.5.

4.3. Contingency analyses ~~for Requirement R4, parts 4.1 and 4.2~~ shall ~~be performed and~~:

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention while also considering the impact of successful or unsuccessful high speed reclosing.

4.3.2. Trip generators where simulations show generator bus voltages or high side of the GSU transformer voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.3. Simulate the impact of transient swings on Protection System operation for Transmission lines and transformers.

4.3.4. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power

system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

- 4.4.** Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4, part 4.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
- 4.4.1.** Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R4, part 4.2 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there ~~are~~ is ~~e~~Cascading ~~outages~~ caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall ~~have~~ define and document, within its Planning Assessment, criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain ~~outside~~ below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within ~~their~~ its Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as ~~e~~Cascading ~~outages~~, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, ~~and~~ adjacent Transmission Planners, ~~and to~~ any functional entity that ~~indicates~~ has a reliability related need ~~for the Planning Assessment results~~ and submits a written request for the information. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. BES Transmission voltage instability, ~~e~~Cascading-outages, and uncontrolled islanding shall not occur.
- b. Consequential Load Loss ~~and~~as well as ~~consequential~~ generation loss ~~are~~is acceptable as a consequence of any planning or extreme event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. For all planning events, planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. ~~Applicable~~ Facility Ratings shall not be exceeded.
- g. System steady state voltages ~~limits~~ and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. The System shall remain stable. ⁴
- k. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of Breaker(s) a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No
		2. Bus Section Fault	SLG	EHV HV	No ⁹ Yes	No Yes
		3. Internal Breaker Fault ⁸ (Non Bus-tie)	SLG SLG	EHV HV	No ⁹ Yes	No Yes
		4. Internal Breaker Fault (Bus-tie) ⁸	SLG	EHV, HV	Yes	Yes

Standard TPL-001-1 — Transmission System Planning Performance Requirements

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ^{4,9}	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ^{4,9}	No
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (Fault plus stuck breaker ^{4,9,10})	Normal System	Loss of multiple elements caused by a stuck breaker ^{4,10} (non-Bus-tie) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ^{4,9}	No
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie) attempting to clear a Fault on the associated bus	SLG	HV	Yes	Yes
			SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (Fault plus Protection System failure to operate)	Normal System	Loss of multiple elements caused by the Failure of a single Protection System that results in Delayed Fault while e clearing a fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ^{4,9}	No
				HV	Yes	Yes
P6 Multiple Contingency (Two overlapping singles)	Loss of one of the following followed by System adj. ⁹ : 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency (Common Structure)	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

**Table 1 – Steady State & Stability Performance
Extreme Events**

<p>Steady State & Stability For all extreme events evaluated:</p> <ol style="list-style-type: none"> Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency. Simulate Normal Clearing unless otherwise specified. 	
<p>Steady State</p> <ol style="list-style-type: none"> Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments. Local area events affecting the Transmission sSystem such as: <ol style="list-style-type: none"> Loss of a tower line with three or more circuits.⁺²¹¹ Loss of all Transmission lines on a common Right-of-Way⁺²¹¹. Loss of a switching station or substation (loss of one voltage level plus transformers). Loss of all generating units at a station. Loss of a large Load or major Load center. Wide area events affecting the Transmission sSystem based on System topology such as: <ol style="list-style-type: none"> Loss of two generating plantsstations resulting from conditions such as: <ol style="list-style-type: none"> Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation. Loss of the use of a large body of water as the cooling source for generation. Wildfires. Severe weather, e.g., hurricanes, tornadoes, etc. A successful cyber attack. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. Other events based upon operating experience that may result in wide area disturbances. 	<p>Stability</p> <ol style="list-style-type: none"> With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments. Local or wide area events affecting the Transmission sSystem such as: <ol style="list-style-type: none"> 3Ø fault on generator with stuck breaker⁺⁴¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. 3Ø fault on Transmission circuit with stuck breaker⁺⁴¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. 3Ø fault on transformer with stuck breaker⁺⁴¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. 3Ø fault on bus section with stuck breaker⁺⁴¹⁰ or a Protection System failure resulting in Delayed Fault Clearing. 3Ø internal breaker fault⁺⁴⁴. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance
Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event ~~for~~ determines the stated performance criteria ~~applies~~ regarding allowances for interruptions of Firm Transmission Service and ~~loss of~~ Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault ~~types, that~~ types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met ~~is~~ sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems ~~as defined by the Regional Entity~~. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruptions ~~s~~ of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-Generator Step Up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and ~~g~~ Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening breaker(s) one end of a line section without a fault on ~~one end of~~ a normally networked Transmission circuit such that the line is ~~now open at that end and~~ possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. Curtailment of Firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Demand. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure or common Right-of-Way for 1 mile or less.

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within its respective area, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies documentation specifying any criteria or methodology used in the analysis to identify System instability that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide ~~evidence, such as a~~ dated documentation, that identifies that agreement on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies ~~for~~and the Planning Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient, date, and contents, or a demonstration of a public posting, that it has ~~distributed~~ its Planning Assessment results to adjacent Planning Coordinators, ~~and~~ adjacent Transmission Planners, and any functional entity ~~who~~that has indicated a reliability need and has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

M8.

D. **D. Compliance**

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity.

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- ~~AH~~The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- ~~AH~~The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- ~~AH~~The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- ~~AH~~The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- ~~AH~~The studies performed documentation specifying any criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- ~~The~~ current, in force documentation for the agreement(s) on ~~identified~~roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.
- ~~The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

- Three calendar years of the ~~notifications~~ notices and other documentation employed in accordance with Requirement R8 and Measure M8.

-

1.5 Additional Compliance Information

None.

2 Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.	The responsible entity's System model failed to represent three of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1.
R2	The responsible entity failed to comply with Requirement R2, part 2.9 or Requirement R2, part 2.6.	The responsible entity failed to comply with Requirement R2, part 2.3 or part 2.8.	The responsible entity failed to comply with one of the following parts of Requirement R2: part 2.1, part 2.2, part 2.4, part 2.5, or part 2.7.	The responsible entity failed to comply with two or more of the following parts of Requirement R2: part 2.1, part 2.2, part 2.4, or part 2.7.
R3	The responsible entity did not identify planning events as described in Requirement R3, part 3.4 or extreme events as described in Requirement R3, part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. Ballot Pool and Pre-ballot Window

January 20–February 19, 2010

Now available at: <https://standards.nerc.net/BallotPool.aspx>

Project 2006-02: Assess Transmission Future Needs

The proposed standard TPL-001-1 — Transmission System Planning Performance Requirements and its associated implementation plan are posted for a 30-day pre-ballot review. Registered Ballot Body members may join the ballot pool to be eligible to vote on these items **until 8 a.m. EST on February 19, 2010**.

During the pre-ballot window, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list server for this ballot pool is: bp-2006-02_ATFNSTDT_TPL_in@nerc.com

Next Steps

Voting will begin shortly after the pre-ballot review closes.

Project Background

The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies. TPL-001-1 — Transmission System Planning Performance Requirements is an update and consolidation of the following standards:

- TPL-001-0 — System Performance under Normal Conditions
- TPL-002-0 — System Performance Following Loss of a Single BES Element
- TPL-003-0 — System Performance Following Loss of Two or More BES Elements
- TPL-004-0 — System Performance Following Extreme BES Events
- TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports
- TPL-006-0 — Data from the Regional Reliability Organization Needed to Assess Reliability

More information is available on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Standards Announcement

Initial Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

Project 2006-02: Assess Transmission Future Needs

The initial ballot for proposed standard TPL-001-1 — Transmission System Planning Performance Requirements and its associated implementation plan ended on March 1, 2010.

Ballot Results

Voting statistics are listed below, and the [Ballot Results](#) Web page provides a link to the detailed results:

Quorum: 91.38%

Approval: 35.36%

Since at least one negative ballot included a comment, these results are not final. A second (or recirculation) ballot must be conducted. Ballot criteria are listed at the end of the announcement.

Next Steps

As part of the recirculation ballot process, the drafting team must draft and post responses to voter comments. The drafting team will also determine whether or not to make revisions to the balloted item(s). Should the team decide to make revisions, the revised item(s) will return to the initial ballot phase.

Project Background

The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies. TPL-001-1 — Transmission System Planning Performance Requirements is an update and consolidation of the following standards:

- TPL-001-0 — System Performance under Normal Conditions
- TPL-002-0 — System Performance Following Loss of a Single BES Element
- TPL-003-0 — System Performance Following Loss of Two or More BES Elements
- TPL-004-0 — System Performance Following Extreme BES Events
- TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports
- TPL-006-0 — Data from the Regional Reliability Organization Needed to Assess Reliability

More information is available on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Applicability of Standards in Project

Planning Coordinator
Transmission Planner

Proposed Additions to Glossary of Terms

Bus-tie Breaker
Consequential Load Loss
Long-Term Transmission Planning Horizon
Near-Term Transmission Planning Horizon
Non-Consequential Load Loss
Planning Assessment
Year One

Standards Development Process

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Ballot Criteria

Approval requires both a (1) quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention, and (2) A two-thirds majority of the weighted segment votes cast must be affirmative; the number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses. If there are no negative votes with reasons from the first ballot, the results of the first ballot shall stand. If, however, one or more members submit negative votes with reasons, a second ballot shall be conducted.

Consideration of Comments on Initial Ballot — Assess Transmission Future Needs (Project 2006-02)

Summary Consideration: Due to industry comments, the SDT has made a number of changes to the standard as shown below. In making these changes, the SDT has attempted to be responsive to the information provided in the initial ballot comments while continuing to be responsive to the FERC Order 693 directives. Please note that footnote 12 on non-consequential load loss is currently being utilized as a placeholder. The resolution of this issue will be provided in Project 2010-11. When that resolution is reached, the content will be copied to TPL-001-2.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

Requirement R1 - Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes the normal system condition in Table 1.

Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.

Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:

Requirement R2, part 2.1.4 - For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

Requirement R2, part 2.4.1 - System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

Requirement R2, part 2.4.3 - For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:

Requirement R2, part 2.5 - The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, part 2.6. The technical rationale for determining material changes shall be documented.

Requirement R3, part 3.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Tripping of generators where simulations show generator bus voltages or high side of the Generation Step Up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
- Tripping of Transmission elements where relay loadability limits are exceeded.

Requirement R3, part 3.5 - Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Successful high speed reclosing and unsuccessful high speed reclosing into a Fault.
- Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
- Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

Requirement R4, part 4.4 - Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

Requirement R4, part 4.5 - Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.

Header note 'a': The System shall remain stable. Cascading and uncontrolled islanding shall not occur.

Header note 'b': Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.

Header note 'e': Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:

Extreme event 2d. Loss of all generating units at a generating station.

11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.

12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.

13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity who has indicated a reliability need and that functional entity has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

<p>R8 VSL</p>	<p>The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners, one adjacent Planning Coordinator, or to one functional entity that has a reliability related need and that has submitted a written request for the information, respectively in accordance with Requirement R8.</p>	<p>N/A</p>	<p>The responsible entity failed to distribute the results of its Planning Assessment to more than one of its adjacent Transmission Planners, adjacent Planning Coordinators, or functional entities that have a reliability related need and that have submitted a written request for the information, respectively in accordance with Requirement R8.</p>	<p>The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.</p>
----------------------	--	------------	--	---

If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herbert Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/files/RSDP_V6_1_12Mar07.pdf.

Voter	Entity	Segment	Vote	Comment
Kent Kujala	Detroit Edison Company	3	Abstain	Document is overly complex.
Daniel Herring	Detroit Edison Company	4	Abstain	I don't believe this end product from the consolidation of the TPL standards into one standard turned out the way the industry was hoping it would. This standard is long, complex, and difficult to follow.
Response: The standard covers a number of complex issues and problems. The SDT has made every attempt to avoid unnecessary complexity. No change made.				
Paul Rocha	CenterPoint Energy	1	Negative	CenterPoint Energy believes the proposed standard has strayed far from its original intent as indicated in the 2002 Version 1 SAR and that this proposed standard is now overly prescriptive. CenterPoint Energy also will not support the proposed expansion of mandatory, auditable long term planning requirements beyond the requirements found in the existing TPL standards and the intent reflected in the 2002 version 1 SAR. This concern is exacerbated by the expansion of stability studies and corrective action plan requirements applied to the long term planning horizon.
Response: The SDT is providing clarity around all of the requirements consistent with the intent of the existing standards, the approved 2002 SAR, and the approved 2006 Supplemental SAR. No change made.				
Gregory L. Pieper	Xcel Energy	1	Negative	No comment.
Response: Without any specific comments to address, the SDT is unable to further address your concerns. No change made.				
Charles Locke	Kansas City Power & Light Co.	3	Negative	The standards are overly prescriptive and will increase industry costs substantially without materially improving customer service or reliability, and I believe they go significantly beyond the original standard. If the reason for a new standard is to clarify interpretation problems with Table I performance, that should be addressed without all the additional requirements that are added in the new standard.
Thomas Saitta	Kansas City Power & Light Co.	6	Negative	
Response: The SDT is providing clarity around all of the requirements consistent with the intent of the existing standards. The SDT has attempted to balance				

Voter	Entity	Segment	Vote	Comment
reliability versus cost based on responses to comments in previous postings. No change made.				
Saurabh Saksena	National Grid	1	Affirmative	1. An annual study shouldn't be required for all areas. A documented assessment based on past studies should be adequate for some areas.
Michael Schiavone	Niagara Mohawk (National Grid Company)	3	Affirmative	<p>2. Years 5 and 10 need to be defined. It appears that the difference between Year One and year 5 is only 3 years.</p> <p>3. In Table 1, event P5 is not clear enough to communicate that it doesn't include the failure of a single element such as a battery, which is included in the NERC glossary definition for a Protection System.</p> <p>4. Part 2.7.2 should include Runback or tripping of HVDC in the list of possible actions.</p> <p>5. Parts 2.1.4 & 2.4.3 should be revised from ' ... the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies' to ' ... the sensitivity analysis in the Planning Assessment must vary one or more of the following original conditions in the studies'. This will provide a reference similar to a Base Case definition as a reference for the sensitivities and will eliminate the implication of infinitely adding one more sensitivity to the list of sensitivities.</p> <p>6. The implementation window for part 2.4.1 needs to be increased from 24 to 36 months.</p>
<p>Response: 1. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and Part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1.4 - For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <p>Requirement R2, part 2.4.3 - For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p>				

Voter	Entity	Segment	Vote	Comment
				<p>2. The SDT believes that this concern is alleviated by the revised definition for Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>Then Year 5 would be four years after Year One and Year 10 would be nine years after Year One. Using the example in the definition of Year One, Year 5 would be the 12 month period that includes the forecasted peak load period of either 2016 or 2017, respectively, and Year 10 would be 2021 or 2022, respectively.</p> <p>3. The SDT has changed the text for the P5 event and added a footnote 13 as a result of your (and others') comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>4. The SDT assumes that you meant Requirement R2, Part 2.7.1. As stated, the list is not all inconclusive but a list of possible actions. The SDT agrees that runback or tripping of HVDC would be allowable actions. No change made.</p> <p>5. The SDT agrees that the current wording may be confusing and has made a change to promote clarity in this area.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1.4 - For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <p>Requirement R2, part 2.4.3 - For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <p>6. The SDT has reviewed similar comments from earlier drafts and believes that the implementation timeframe for this item is appropriate. Without any further specific reasons, the SDT is unable to address your concerns. No change made.</p>

Linda Brown	San Diego Gas & Electric	1	Affirmative	<p>1. The new standard is supposed to be a performance based standard, but goes beyond performance by suggesting solutions (2.7.1).</p> <p>2. The new standard is an overly wordy and poorly organized version of the original four TPLs. In order to understand a requirement, the reader must jump to different sections in the document.</p> <p>3. The new standard is poorly written making it confusing. For example, R2.1.1 says "System peak Load for either Year One or year two, and for year five". I think it means, "study the system as it may exist 5 years from now and as it may exist either one year from now, or two years from now."</p> <p>4. Section R2.1.4 of the new standard requires Real and Reactive forecasted load. This makes no sense. To my knowledge, no one forecasts reactive load. They assume a power factor and using the real power load and the assumed power factor, they calculate the reactive load.</p> <p>5. The load modeling requirement may take some time to achieve.</p> <p>6. It asks for sensitivities that assume generation that may never be built.</p> <p>7. The Corrective Action Plan doesn't define who gets the plan. It just says to make one.</p> <p>8. The new standard makes requirements out of practices. For example, section 3.3.3 requires relay loading actions to be part of the analysis. Any competent transmission planning engineer does this.</p>
<p>Response: 1. The proposed standard clarifies allowable solutions but doesn't mandate any particular solution without deviating from performance-based requirements. No change made.</p> <p>2. Without any specific comments to address, the SDT is unable to further address your concerns. No change made.</p> <p>3. The SDT does not think the requirement is poorly worded nor are there other comments about this particular wording. Your assumption is correct but does not add any additional clarity. No change made.</p> <p>4. Since the reactive Load is based on a forecast of the real Load, the SDT chose to characterize both real and reactive Loads as forecasts. No change made.</p> <p>5. The SDT assumes that you are referring to the induction motor Load modeling required for Stability studies. The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. The SDT believes that 24 months is an adequate time period to accomplish this task. No change made.</p> <p>6. The SDT has made a change to the requirements to promote clarity in this area. Generation is just one of the examples of what could be studied.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p>

Paul B. Johnson	American Electric Power	1	Affirmative	<p>AEP appreciates the extensive efforts by the SDT to develop the version of this standard that is presently before the industry for ballot. The proposed version addresses much of the confusion that exists with the current standards that it will replace. The SDT should be commended for having gone to great lengths to explain the interpretation of this revised standard as part of its reply to industry comments. Adherence to this standard should result in a sufficiently reliable system by narrowing the broad interpretations that have been made of the requirements in the existing standards. AEP believes that the SDT has satisfied enough of FERC's concerns so that FERC will approve this standard if passed by the industry. Therefore, AEP supports approval of this standard.</p> <p>AEP would like to make a suggestion that any future revision of TPL-001-1 should place appropriate restrictions on the use of Special Protection Systems as a permanent solution in the Corrective Action Plan. While AEP recognizes that there are acceptable applications of SPS on a permanent basis, we are concerned that in highly interconnected portions of the grid the use of multiple SPS can cause complex interactions that would be difficult to predict and could lead to unintended consequences. AEP also recognizes that an SPS may be the only practical option on an interim basis.</p>
Raj Rana	American Electric Power	3	Affirmative	
Brock Ondayko	AEP Service Corp.	5	Affirmative	
Edward P. Cox	AEP Marketing	6	Affirmative	

Voter	Entity	Segment	Vote	Comment
<p>Response: Thank you for your response. The SDT will enter a comment in the official NERC issues database on your concern about permanent SPS solutions. That will assure that a future drafting team will address your concern.</p>				
George R. Bartlett	Entergy Corporation	1	Affirmative	<p>Entergy appreciates the work of the drafting team and recognizes the challenges associated with complexities of this effort. Entergy is voting "Affirmative" on the proposed standard but would appreciate the SDT consideration of the following comments in any further efforts to improve the standard:</p> <ol style="list-style-type: none"> 1. The implementation plan is simply too aggressive. Locating and building transmission facilities continues to become more time consuming. Even lower voltage facilities can take 5 to 7 years to navigate through the various technical and regulatory challenges associated with building these facilities. Entergy would propose extending the implementation plan to 7 years for 230 kV and below, and 10 years for above 230 kV where transmission lines must be constructed. While the SDT has the intent that no penalties be imposed where facilities can not be constructed by the end of the implementation plan, we are concerned that ambiguity may exist may lead to issues should enforcement be left to interpret what is "beyond the control of the Transmission Planner or Planning Coordinator" in R2.7.3 2. 2. P5 in the new table is simply not defined to the extent that a consistent analysis method can be applied throughout the industry. While the process of identifying single points of failure will be time consuming and manpower intensive, it is feasible to complete. However, the consequences of those single points of failure can not be defined with consistency across the industry. Consequences of protection system failures are dependent on fault types, initial system conditions, and other factors which are not and can not be tracked in traditional planning tools. The ambiguities associated with P5 will almost certainly lead to additional standards needs and numerous requests for interpretation. Entergy would propose industry standardized proxies be allowed in lieu of detailed analysis of the interface between protection systems and the delivery aspects of the BES. Proxies could be developed to ensure the industry identifies and avoids events which have recently been associated with single points of failure in a protection system. 3. Entergy believes that more clarity is needed in R2.1.4 and R2.7 concerning sensitivity studies. The determination of when sensitivity study results should warrant mitigation should be left to the Transmission Planner and/or Planning Coordinator. The requirement to document the studies and their results will proved transparency and allow for transmission improvements through normal stakeholder and regulatory processes.

Voter	Entity	Segment	Vote	Comment
<p>Response: 1. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>2. The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p style="padding-left: 40px;">P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p style="padding-left: 40px;">13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>3. The SDT did not receive any other comments in this regard and believes that the wording is clear. No change made.</p>				
Robert Martinko	FirstEnergy Energy Delivery	1	Affirmative	<p>FirstEnergy appreciates the dedication of the Assess Transmission and Future Needs Standards Drafting Team commends the group for their hard work to bring the proposed TPL-001-1 standard to industry for consideration. The TPL-001-1 standard provides greater compliance clarity than what presently exists in vague and open for interpretation TPL standards. The project appropriately consolidates six existing TPL standards into a single standard, while driving the industry to needed robust planning reviews. The team has carefully considered the industry feedback during the standards development and made many adjustments to better clarify the requirement language. The team is also commended for the improvements made to the Performance Table describing steady-state and stability performance expectations and creating the distinction between Planning Events and Extreme Events. FirstEnergy is voting to AFFIRM the standard and offers the following suggestions to the standards drafting team for areas of improvement and a more appropriate transition to the TPL-001-1 standard.</p> <p>1) YearOne Definition: FirstEnergy requests that the team consider a change so that Year One is the planning window that begins 12-18 months from the "start" of the current calendar year, and not</p>
Kevin Query	FirstEnergy Solutions	3	Affirmative	
Douglas Hohlbaugh	Ohio Edison Company	4	Affirmative	
Kenneth Dresner	FirstEnergy Solutions	5	Affirmative	

Voter	Entity	Segment	Vote	Comment
Mark S Travagianti	FirstEnergy Solutions	6	Affirmative	<p>from the "end" of the calendar year. This change is needed so that minimal adjustments are needed to the ERAG MMWG model building process, which is the basis for planning models used by many within the Eastern Interconnection. The change would still meet the team's intent of requiring the industry to plan beyond current year load periods which are appropriately considered an operating timeframe in the context of TPL-001-1. If the team does not agree to this change for use in the TPL-001-1 standard, we ask the team to consider adding an Entity Variance that would permit the proposed change within the Eastern Interconnection.</p> <p>2) Implementation Plan: The 60-month transition, as reflected in the team's Implementation Plan, may not be sufficient time for completion of new transmission facilities that may be needed as part of a Corrective Action Plan. The Implementation Plan calls for a 60-month period that is in parallel to the 24-month transition period for completing new model and study expectations per the TPL-001-1 standard. The proposed standard raises study expectations in a number of areas such as removing load shedding for n-1 conditions, more detailed load modeling regarding induction motor loads, developing and documenting transient voltage criterion, etc. FirstEnergy believes it is more appropriate for the 60-month transition for completed Corrective Action Plans to be sequential to the 24-month transitional items. It will take industry some time to transition to the new model and study expectations and industry should be allotted a full 60 months for the completion of major transmission infrastructure that may be included in Corrective Action Plans.</p> <p>3) Two Near-Term Studies: FirstEnergy supports a need for "fresh" annual steady-state studies being completed for both the Near-Term and Long-Term planning horizons as reflected in requirement 2.1 which states "... be supported by the following annual current studies ...". However, we continue to stress that the need for two studies in the Near-Term horizon (requirement R2.1.1) creates unnecessary burden on industry resources, especially in light that sensitivity analyses are required for each study year. The focus should be that the Transmission Planner needs to cover the entire planning horizon through past and present (current annual) studies and allow the Transmission Planner more latitude to pick the current annual studies. A single present year study within the Near-term and Long-Term planning horizons, supplemented with past studies should be sufficient to effectively interpolate and extrapolate results to cover the entire planning horizon. To the extent a past study remains a qualified past study (as described in the standard in R2.6) we believe the transmission planner should still have discretion to continue to use those studies as their study time period moves forward.</p>
<p>Response: 1. Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For</p>				

Voter	Entity	Segment	Vote	Comment
<p>example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>2. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>3. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p>				
William L. Thompson	Dominion Virginia Power	1	Affirmative	<ul style="list-style-type: none"> o Effective Date - For those raising the bar standards, corrective action plans must be implemented by 60 calendar months. We believe as we have commented previously that for new EHV facilities, this may be difficult to achieve. Our recommendation was to add an additional 24 months to that timeframe. However, they have added Requirement R2.7.3 which allows for situations out of our control to use non-consequential load loss to temporarily resolve violations until the corrective action plans are implemented. Although this does cover us as long as we have a legitimate reason, it does leave to the interpretation of the auditor that the reason is "valid". We therefore still believe more time should be allowed. o Requirement R3.3.2 - Dominion does not agree that the low voltage ride through is a steady-state issue as included in requirement R3.3.2. We foresee demonstrating compliance for this requirement as a difficult if not impossible task hence subjecting the industry to undue non-compliance risk. Furthermore, we believe that low voltage ride through is a dynamic modeling issue covered in requirement R4.3.2. o Assessment time and documentation - Although we do see the need and improvements in the standard, it is clear to Planning that more assessments and documentation will be the end result. It is difficult to determine how much time and resource requirements this will take until we begin implementing the standard. Planning does have a concern that additional resources will be required and have heard this from others in the industry.
Jalal (John) Babik	Dominion Resources, Inc.	3	Affirmative	
Mike Garton	Dominion Resources, Inc.	5	Affirmative	
Louis S Slade	Dominion Resources, Inc.	6	Affirmative	

Voter	Entity	Segment	Vote	Comment
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>The SDT voltage ride through is not confined to the dynamic period. There are protection requirements that could result in generator tripping and that must be considered in the steady-state analysis. The SDT has clarified the wording of the requirement.</p> <p>Requirement R3, part 3.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made. • Tripping of Transmission elements where relay loadability limits are exceeded. <p>The SDT is sensitive to this issue and that is why there is a staggered Implementation Plan. The timeframes are designed to allow entities time to catch up to the new requirements and were derived from a specific question asked of the industry.</p>				
Kim Warren	Independent Electricity System Operator	2	Affirmative	On page 3 of the Implementation Plan it is stated: "For 60 months after the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans..." It is unclear how this should be interpreted in those jurisdictions where no regulatory approval is required. For consistency, we recommend the following wording: "For 60 months after the first day of the first calendar quarter following applicable regulatory approval, or, in those jurisdictions where no regulatory approval is required, 60 months after the first day of the first calendar quarter following Board of Trustees adoption, Corrective Action Plans..."
<p>Response: As pointed out in the comment, the wording on page 3 of the Implementation Plan should agree with the wording on page 2. The SDT has made this change. However, due to other comments, the 60 month period has been changed to 84 months.</p> <p>For 84 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption, Corrective Action Plans applying to performance elements...</p>

Tom Bowe	PJM Interconnection, L.L.C.	2	Affirmative	<p>PJM is supports the standard because it helps to remove the ambiguity in the existing TPL standards and it promotes actions that will result in an improvement in the reliability of the Bulk Electric System. PJM believes that the draft standard addresses the issues raised in the SAR and by FERC orders 672 and 693. The industry wide webinars conducted during the drafting process were particularly helpful in providing the industry with an additional vehicle to better understand the proposed modifications to the TPL standards and provided an additional avenue for industry feedback to the Standard Drafting Team.</p> <p>While supportive of the standard PJM believes additional clarifying language should be added to the following requirements:</p> <p>R 2.1. The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current studies, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>R 2.1.1. System peak Load for either Year One or year two, and for year five. It should be made clear the intent of the requirement for a “Year One or year two” assessment is to “dovetail” with the operational horizon in order to assess the steady state impact of changes from the system as planned. As currently written, the intent and required depth of the additional “Year One or year two” study is ambiguous.</p>
<p>Response: Part 2.1 is already part of Requirement R2 so no additional reference is required. No change made.</p> <p>Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p>				
Ronald D. Schellberg	Idaho Power Company	1	Affirmative	<p>Recommend the following slight modification to the specified subrequirements of R2 to include clarifying references to R3 and R4 as follows:</p> <ul style="list-style-type: none"> o 2.1. ...by the following annual current studies in accordance with R3, ... o 2.2. ...by the following annual current study in accordance with R3, ... o 2.4. ... The following studies are required in accordance with R4: o 2.5. ...and be supported in accordance with R4 by current or past studies ...

				The AESO would also like to add that due to provincial acts, regulations, policies and market structure in Alberta, the AESO and Alberta entities involved in the standards process will consider modifications to this standard when adopting it as an Alberta Reliability Standard. In particular we may need to consider rewording the requirements concerning the use of RAS as mitigation for single and multiple contingencies.
<p>Response: 1. The SDT has held several webinars on this project and may well hold another before the project is complete. In addition, the SDT has performed numerous outreach activities to regional entities, sub-committees, etc., on the details of the standard. The project has been presented several times at the NERC Standards Workshops. Once the standard is approved by FERC, the SDT ceases to exist. Therefore, any activities subsequent to that approval would be under general NERC jurisdiction. The SDT suggests that you broach this idea with NERC staff.</p> <p>2.1 & 2.2 – The SDT feels that the linkage between requirements is properly cited in Requirement R3 going back to Requirement R2 and the additional language suggested is not necessary and does not add clarity. No change made.</p> <p>2.4 – Part 2.4 is already part of Requirement R2 so no additional reference is required. No change made.</p> <p>2.5 - The SDT feels that the linkage between requirements is properly cited in Requirement R4 going back to Requirement R2 and the additional language suggested is not necessary and does not add clarity. No change made.</p> <p>Thank you for this information.</p>				
Richard Jones	South Carolina Electric & Gas Co.	5	Negative	<p>“SCE&G appreciates the efforts of the Standard Drafting Team and believes this version of the TPL standard has addressed most of the significant issues found in previous versions. However, SCE&G believes there are several significant issues that need modification or further explanation.</p> <ol style="list-style-type: none"> 1. SCE&G agrees with other submitted comments that the requirement to complete new transmission construction to meet new performance requirements within 60 months is too short. SCE&G believes that 84 months is more reasonable. 2. SCE&G agrees with comments submitted by Duke Energy that the requirement prohibiting loss of non-consequential load for P1, P2.1 and P3 events is an overreach by the standard into local load quality of service issues, does not provide any real benefit to Bulk Electric System (BES) reliability, and may have unintended negative consequences on reliability and service quality. In many

Voter	Entity	Segment	Vote	Comment
Matt H Bullard	South Carolina Electric & Gas Co.	6	Negative	<p>instances, it may be in the best interest of all involved parties from an overall cost/benefit point of view to allow loss of non-consequential load. The standard should continue to allow Transmission Planners to use discretion regarding loss of non-consequential load, such that Transmission Planners, customers, and local regulators jointly control the decision making when BES reliability is not an issue.</p> <p>3. SCE&G believes there are still different interpretations of Consequential and Non-Consequential Load loss and how each should be applied or not applied. The Standard drafting team should provide several examples in its response to these comments showing how to apply and not apply Consequential and Non-Consequential Load Loss. Without clear examples, SCE&G believes many request for interpretation will be submitted to NERC by the industry."</p>
<p>Response: 1. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1, footnote b order.</p> <p>2. The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others' concerns in this area.</p> <p style="padding-left: 40px;">12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>3. The SDT has clarified the issue of Non-Consequential Load Loss as shown above. Providing examples here of what is Non-Consequential Load Loss versus Consequential Load Loss would have no bearing. The words are what matter and the SDT feels that the clarification provided should alleviate your concern.</p>				
Randi Woodward	Minnesota Power, Inc.	1	Negative	<p>1. Requirement 2 - This requirement states that Stability analyses must be performed as part of the annual Planning Assessments. We would like to see the term "Stability analysis" more clearly defined as there are several different types of stability related analysis that can be performed for power systems including: transient stability, voltage stability and small signal stability.</p> <p>2. Requirement 2.5 - This requirement states that "Stability analysis shall be assessed to address the impact of proposed generation additions or changes." We would like to see the term "proposed generation" more clearly defined. It is our opinion that only planned generation should be included in the Long-Term Transmission Planning Horizon assessment. In most generation queues there is a very large amount of proposed generation which would be impractical to study. These proposed generation additions are typically included in a System Impact Study which ultimately determines the transmission upgrades required for interconnection.</p> <p>3. Requirement 2.1.5 - This requirement states that potential impact of the unavailability of major Transmission equipment be assessed annually for equipment (such as transformers) with long</p>

Voter	Entity	Segment	Vote	Comment
				<p>delivery lead times. We believe that it should be acceptable for a Transmission Owner to maintain a spare equipment plan that includes a reliability assessment. This plan would be reviewed and updated annually. We don't believe that a detailed assessment, as part of the Near-Term Transmission Planning Horizon assessment is warranted.</p> <p>4. Requirement 4.1.2 - This requirement states that apparent impedance swings resulting from generator loss of synchronism shall not result in the tripping of any Transmission System elements. We believe that this requirement, as worded, precludes the use of transmission line out-of-step tripping relays to effectively island or isolate larger blocks of generation that have lost synchronism with the BES.</p> <p>5. Requirement 4.3.3 - This requirement states that the assessments should simulate the impact of transient swings on Protection System operation. This would imply that detailed models of all transmission protection elements be included in the stability analysis. We believe that this is impractical due to the large number of relays that would need to be modeled. The standard should state that the use of a relay scanning model is an acceptable alternative to using detailed relay models. A scanning model typically monitors the apparent impedance for an established set of transmission lines and flags when the apparent impedances encroach on a classical 3-zone set of distance relay characteristics based on the monitored line impedance.</p>
<p>Response: 1. The SDT intended for the term Stability analysis to include system Stability and unit Stability analyses. These analyses could include all three aspects of Stability that you mentioned. It is left up to the judgment of the Planning Coordinator/Transmission Planner to decide which aspects of Stability may produce more severe results and therefore, must be analyzed. No change made.</p> <p>2. Each Transmission Planner is governed by rules for when and how proposed generation units will be included in analyses. The current wording of the requirement is to allow for this degree of flexibility to remain part of the planning process. No change made.</p> <p>3. The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.</p> <p>4. Requirement R4, part 4.1.2 – The SDT agrees that you can't use an out-of-step relay and that the situation you described is a system Stability issue and is considered an application for an SPS which is allowed by the standard. No change made.</p> <p>5. The SDT has revised Requirement R4, part 4.3.1, bullet #3 to address this concern.</p> <p>Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect</p>				

Voter	Entity	Segment	Vote	Comment
<p>for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Successful high speed reclosing and unsuccessful high speed reclosing into a Fault. • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made. • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. 				
Robert Pellegrini	United Illuminating Co.	1	Negative	<p>1. Section 2 of the standard requires annual assessment of the system regardless of whether system conditions are essentially unchanged from year to year. This creates unnecessary study work and must be changed in order for UI to support the standard.</p> <p>2. In Table 1 - Steady State & Stability Performance Planning Events, Category P5 wording for the EHV contingency continues to call for no loss of load in the event of the loss of a single protection system. This requirement as currently worded goes well beyond the intent of the Standard Committee as stated in response to comments as follows: "A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event". It is UI's opinion that similar language excluding battery system failures should be incorporated into this requirement.</p> <p>3. UI is concerned that the standard is completely silent regarding base case assumptions and stress levels (loads and interface transfers). The standard should provide some direction or statement of objective regarding base case development and sensitivity testing requirements. For example, the standard should include some statement(s) such as, "base cases(and/or) sensitivity testing must include consideration of reasonable unplanned and planned generation outages". On the other hand UI does not suggest trying to precisely describe the number of generators that should be assumed out of service in this national standard.</p>
<p>Response: 1. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6, as follows:</p>

<p>2. The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>3. The SDT is trying to provide guidance without being overly prescriptive. Projected System conditions as well as the types of sensitivities that need to be studied are described. No change made.</p>				
Dan R. Schoenecker	Midwest Reliability Organization	10	Negative	<p>1. Section 2.5 proposed generation is too broad and overly inclusive. It should be replaced with planned or committed.</p> <p>2. We have a concern that the timeframe of 60-month (5 year) for implementing Corrective Action Plans (CAP), is insufficient. We believe that the implementation timeframe must be extended to seven (7) years. We are aware of Requirement 2.7.3, which covers situations that arise beyond the control of the Transmission Planner (TP) or Planning Coordinator (PC), but believes that the proposed language is ambiguous and maybe problematic for compliance.</p> <p>3. We believe the spare equipment language doesn't belong in the standard. Whether a Transmission Owner has spare equipment is a risk for that Transmission Owner to evaluate and then take responsibility for the decision. For the Planning Coordinator, inclusion of the spare equipment language would mean that for each Transmission Owner's piece of equipment that cannot be replaced within one year 3 more base cases would need to be run for each season and load level, which may lead to an excessive amount of base case development with little resulting benefit to reliability.</p>
<p>Response: 1. Each Transmission Planner is governed by rules for when and how proposed generation units will be included in analyses. The current wording of the requirement is to allow for this degree of flexibility to remain part of the planning process. No change made.</p> <p>2. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>3. James Tucker	Deseret Power	1	Negative	<p>1. While draft 5 of this proposed standard is a substantial improvement over the previous drafts and the existing TPL standards, there are still areas where additional clarity is needed. We believe that a workshop, after FERC approval of the standard, where issues can be discussed and clarified will go a long way towards smooth implementation of this proposed standard.</p> <p>Some of the areas that require additional clarification are:</p> <ul style="list-style-type: none"> o Application of consequential and non-consequential load and the EHV and HV voltage levels o Discussion on what is needed to study the various Planning Events. One example is P5, which involves "failure of a single protection system." <p>2. We recommend the following slight modification to the specified subrequirements of R2 to include clarifying references to R3 and R4 as follows:</p> <ul style="list-style-type: none"> o 2.1. The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current studies in accordance with R3, supplemented with qualified past studies as indicated in Requirement R2, part 2.6: o 2.2. The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study in accordance with R3, supplemented with qualified past studies as indicated in Requirement R2, part 2.6: o 2.4. The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, part 2.6. The following studies are required in accordance with R4: o 2.5. The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed generation additions or changes in that timeframe and be supported in accordance with R4 by current or past studies as qualified in Requirement R2, part 2.6 3. <p>Table 1-P5 Multiple Contingencies (Fault plus Protection System failure to operate) Normal System. There is a significant change in the system normal performance required for EHV systems from the current performance required in TPL-003 (Category C). This TPL-001-1 version does not allow any Non-Consequential load loss (table 1) or firm Demand (note 9) for EHV systems in the event of protection system failure and delayed clearing. This performance requirement would thus preclude use of existing protection systems that rely on remote clearing of interconnected EHV lines or stations if they provide local load service. As written the standard essentially now requires Category B performance rather than Category C performance for multiple contingencies. It is Deseret's opinion</p>

Voter	Entity	Segment	Vote	Comment
				<p>that loss of Non-Consequential load or firm Demand should be allowed for the rare event involving multiple contingencies stated in P5 as long at the load or firm Demand loss is contained and controlled in the local load service area and the event does not impact other interconnected utilities or their loads.</p> <p>4) Table 1 - Steady State & Stability Performance Planning Events Category P5 (Multiple Contingency (Fault plus Protection System failure to operate). Category P5 requires responsible entities to study the Event titled Failure of a single Protection System that results in Delayed Fault Clearing on one of the following: Generator, Transmission Circuit, Transformer, Shunt Device, or Bus Section. It appears that this requirement is an indication that multiple protection system failure is not allowed under the proposed TPL-001-1. This appears to be a requirement for redundant protection systems for all possible events on all voltage levels of the transmission system. It also appears that this requirement is attempting to define what comprises an adequate protection system. As the draft standard is presently written it appears that multiple protection system failures are not included in this part or any part of the draft TPL-001-1 standard. As written, it is Deseret's view that any multiple protection system failure would be categorized as an Extreme Event under the draft TPL-001-1 standard. Deseret contends that the many and varied issues associated with designing appropriate protection systems should be done in the context of the development of a protection system standard and not in the context of TPL-001-1. In fact, there is currently a proposed standard going through the NERC standards development process which goal is exactly that. If the standards drafting team intends to require responsible entities to have 100% redundant protection systems on all of its BES facilities, Deseret contends that this fact should be stated up front in the standard so that all interested parties may become aware of this requirement and provide informed comment. Deseret believes that it is appropriate to wait until the current protection system redundancy standard under development proceeds through the SAR process and approval system, given that this in an important generic issue that affects the entire industry. Notwithstanding the inappropriateness of raising the protection system issue in the context of a planning standard, Deseret believes that any planning requirement that includes the failure of a single protection system that results in delayed fault clearing must have a very clear definition of the terms "single protection system" and "delayed fault clearing" in or for entities to determine what compliance with the standard requires. The draft TPL-001-1 standard does not have clear definitions of these terms, leaving room for considerable latitude for interpretation by various responsible entities, auditors, and compliance enforcement authorities. Clear, specific, and technically defensible language is needed for these terms.</p>
<p>Response: 1. The SDT has held several webinars on this project and may well hold another before the project is complete. <p>general NERC jurisdiction. The SDT suggests that you broach this idea with NERC staff.</p> <p>The SDT feels that the linkage between requirements is properly cited in Requirement R3 going back to Requirement R2 and the additional language suggested is not necessary and does not add clarity. No change made.</p> <p>Part 2.4 is already part of Requirement R2 so no additional reference is required. No change made.</p> <p>The SDT feels that the linkage between requirements is properly cited in Requirement R4 going back to Requirement R2 and the additional language suggested is not necessary and does not add clarity. No change made.</p> <p>The SDT agrees that the bar has been raised for the EHV system in that no planned Load shedding (Non-Consequential Load Loss) is permitted for the P5 condition beyond Protection System clearing that responds to the studied P5 event. All Load removed by the Protection System isolating the Fault is Consequential Load Loss for the event. The SAR for this standard recognized FERC orders which indicated a need to "raise the bar" for the industry. The SDT agrees with this premise and is attempting to do this in a reasonable fashion. No change made.</p> <p>The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p>				
Bernard Pelletier	Hydro-Quebec TransEnergie	1	Negative	<p>The reason for the No vote cast by HQT is that HQT still believe that the EHV and HV threshold defined as a fixed voltage (300 kV) on footnote 3 of Table 1 is too prescriptive, and unnecessary, for NPCC Members using a performance base methodology to determine elements of the BPS. HQT believes that if the 300 kV threshold was introduced as a necessity to reduce the BES portion of the system subject to the Standard in some region with a 100 kV bright line definition of BES so that entities in these regions do not incur prohibitive spending to respect this Standard, there should also be a way to accommodate NPCC Member's use of a performance methodology to determine on which elements to apply the Standards without having entities guessing the way Compliance will be implemented for this Standard in regard to specific voltage threshold. For HQT's system, EHV should correspond to 735 kV since more than half of our 315 kV substations directly supply load. The SDT gave this answer as the rational for choosing the 300 kV threshold when they replied to HQT concerns about the EHV voltage definition as 300 kV and over, in the first posting of the Standard : « Systems operated above 300 kV generally do not directly serve end-use Load customers but rather act as the medium for moving large amounts of power from production to various Load centers where the energy is then delivered by other Transmission or sub-Transmission Systems to end use customers... Obviously the intent of the SDT when choosing a 300 kV threshold do not correspond to the reality of HQTs system characteristic. HQT agrees with the intent of the SDT to raise the bar in that important Standard but disagree with having to systematically apply the</p>

Voter	Entity	Segment	Vote	Comment
				Standard to all 300 kV and above system. One way to clarify the Standard would be to mentioned in the footnote 3 that : `` In the region where there is a performance base methodology to determine BES element, these BES elements would be subject to the Standard; in other region, the 300 kV threshold would apply.
<p>Response: This standard applies to the BES. If there are areas of your system that are not BES, then the standard doesn't apply to them. This would be true even if those elements are above 300 kV. No change made.</p>				
Donald Gilbert	JEA	5	Negative	<p>Although this proposed standard places additional burden of proof upon JEA's Transmission Planning process, JEA finds the overall direction of the standard requirements prudent. JEA appreciates the allowance of Non-Consequential Load Loss afforded in provision 2.7.3 where documented circumstances outside the control of the TP or PC suffice; however, JEA is concerned that there are some limited prudent cases where consumers, local jurisdictions, and state jurisdictions may find it prudent to plan on some Non-Consequential Load Loss in order to defer building transmission infrastructure (just for the purpose to serve speculative load growth) for the overall benefit of the consumer. Therefore, concerning the prohibition of Non-Consequential Load Loss, JEA proposes the addition to the standard that allows the use of Non-Consequential Load Loss for local area load for planning events where it is not presently allowed. In ¶1794 of Order 693, FERC stated "Regarding the comments of Entergy and Northern Indiana that the Reliability Standard should allow entities to plan for the loss of firm service for a single contingency, the Commission finds that their comments may be considered through the Reliability Standards development process. However, we strongly discourage an approach that reflects the lowest common denominator." Clearly, FERC did not direct NERC to eliminate "all" use of Non-Consequential Load Loss for single contingencies, but rather stated that its use should be "considered through the Reliability Standards development process". Therefore, the SDT should define "local area" where load loss is allowed and either set limits on how much load can be lost or a reporting requirement to ensure transparency concerning this planning practice. I propose that the standard should define "local area" as the load that is located on a single loop between two BES sources and limit the Non-Consequential Load Loss to the amount of Consequential Load Loss that would occur if the networked loop of load serving stations were sectionalized such that the loop operated as two radial circuits. The Standard could further require the TP or PC to document the results of both simulations with and without the sectionalization of the loop comparing the levels of Non-Consequential Load Loss to the level of Consequential load loss." This approach would clearly not be "a least common denominator approach", but rather a practical manner to allow the balance between transmission expansion costs and the limited risk to the local load within an area.</p>

Voter	Entity	Segment	Vote	Comment
<p>Response: The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p>				
Kirit S. Shah	Ameren Services	1	Negative	<p>Ameren appreciates the diligence and dedication of the Standard Drafting Team and commends the group for their hard work to bring the proposed standard TPL-001-1 to this level. We have seen considerable improvements to the proposed standard from earlier versions and note the positive changes to many of the requirements. We also recognize that the overall language of the standard has improved to enhance its readability and the language and format of the Tables now provides a clear understanding of acceptable System performance for the various Planning Events. However, inasmuch as the proposed Standard has improved, we cannot support the approval of this document at this time.</p> <p>1. We disagree with the proposed definition of Year One. We believe that Year One should be the planning window that begins 12-18 months from the start of the current calendar year, and not from the end of the calendar year. We believe that following this modification to the definition would require minimal adjustments to the ERAG MMWG model building process, which we all use as the basis for our planning models. Following the proposed definition would require additional models to be built by the MMWG or lead to holes in the model building effort for both the operating and planning horizons.</p> <p>2. We do not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. Building a transmission line in Illinois is estimated to take 7 years (84 months) from the time the project is authorized. Though requirement R2.7.3 is included to address situations beyond the control of the Transmission Planner, it leaves to the interpretation of the auditor whether the appropriate actions are being taken to resolve the issue that would continue to allow dropping of Non-Consequential Load or curtailment of Firm Transmission Service.</p> <p>3. We have concerns for including induction motor representations in the load models without any study or bench-marking activities to meet the requirements of R2.4.1. Although the proposed standard offers that an aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable (to relieve the burden of trying to develop specific induction motor load representation at each load bus), we believe that the modeled System response will be considerably different compared to the actual System response in some parts of the System which will open up the industry to additional scrutiny, such as the Compliance Inquiry (CIQ) and/or Compliance Violation Investigation (CVI).</p> <p>4. We do not agree that low voltage ride-through is a steady-state issue as included in requirement</p>

Voter	Entity	Segment	Vote	Comment
				<p>R3.3.2. We believe that low voltage ride-through is a dynamic modeling issue as correctly included in requirement R4.3.2.</p> <p>5. We have concerns that the dynamics models cannot support the additional data requirements to include actual impedance relay models for all transmission facilities to meet the requirements of R4.1.2 and R4.3.3. In an attempt to relieve our concerns, the SERC presenters indicated that generic PSS/E impedance relay models could be included in the dynamics models. However, we also have concerns for using generic PSS/E impedance relay models as the actual impedance relays may be set differently than the generic PSS/E relay models which will open up the industry to additional scrutiny, such as the Compliance Inquiry (CIQ) and/or Compliance Violation Investigation (CVI).</p>
<p>Response: 1. Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>2. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>3. The SDT assumes that you are referring to the induction motor Load modeling required for Stability studies. The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. The SDT believes that 24 months is an adequate time period to accomplish this task. Dynamic load modeling is important for correct dynamic simulations. Industry has acknowledged the need for accurate Load modeling and the SDT has codified this need in the proposed standard. No change made.</p> <p>4. The SDT voltage ride through is not confined to the dynamic period. There are protection requirements that could result in generator tripping and that must be considered in the steady-state analysis. The SDT has clarified the wording of the requirement.</p> <p>Requirement R3, part 3.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made. • Tripping of Transmission elements where relay loadability limits are exceeded. 				

Voter	Entity	Segment	Vote	Comment
<p>5. 4.3.3 - The SDT has revised Requirement R4, part 4.3.1, bullet #3 to address this concern.</p> <p>Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Successful high speed reclosing and unsuccessful high speed reclosing into a Fault. • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made. • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. 				
Robert D Smith	Arizona Public Service Co.	1	Negative	<p>APS proposes that the standard allows the use of Non-Consequential Load Loss for local area load for P1 events. The current requirements may pose significant burden without appropriate benefits.</p> <p>As currently written APS does not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. Building a transmission line can often take more than 5 years to complete from the time the project is authorized. Though requirement R2.7.3 is included to address situations beyond the control of the Transmission Planner, it leaves to the interpretation of the audit whether the appropriate actions are being taken to resolve the issue. APS proposes that the requirement be changed to 84 months.</p>
<p>Response: The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. John Tolo	Tucson Electric Power Co.	1	Negative	<p>As currently written it is believed that 60 months is not a reasonable time period to build transmission facilities to meet the new performance requirements. Regional and local planning and review process, permitting, siting, legal challenges, routing, and system path rating process can often take more than 5 years to complete from the time the project is authorized.</p> <p>Category P2 requires responsible entities to study the opening of a line section without a fault. The</p>

Voter	Entity	Segment	Vote	Comment
				<p>standard as written states that the opening of this line section will not result in consequential load loss and no voltage or thermal violations will occur on the BES. This requirement should not be applicable to all HV facilities. From a reliability perspective, a more effective and efficient method would be a bifurcated functional requirement rather than a voltage requirement.</p> <p>This TPL-001-1 version does not allow any Non-Consequential load loss (table 1) or firm Demand (note 9) for EHV systems in the event of protection system failure and delayed clearing. This performance requirement would thus preclude use of existing protection systems that rely on remote clearing of interconnected EHV lines or stations if they provide local load service. Category P5 requires responsible entities to study the Event titled Failure of a single Protection System that results in Delayed Fault Clearing on one of the following: Generator, Transmission Circuit, Transformer, Shunt Device, or Bus Section. It appears that this requirement is an indication that multiple protection system failure is not allowed under the proposed TPL-001-1. This appears to be a requirement for redundant protection systems for all possible events on all voltage levels of the transmission system. It also appears that this requirement is attempting to define what comprises an adequate protection system. Many and varied issues associated with designing appropriate protection systems should be done in the context of the development of a protection system standard and not in the context of TPL-001-1.</p> <p>TPL-001-1 has added requirement 2.1.5 discussing spare equipment and lead times and inclusion in the "Planning Assessment". The standard in this section is not performance based requirement but an activity based requirement as currently stated under R2 2.1.5. The standard should be revised and 2.1.5 removed as it does not directly improve the systems performance requirements nor compliance stated in Table 1.</p>
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. The studies shall</p>				

Voter	Entity	Segment	Vote	Comment
be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.				
Brandy A Dunn	Western Area Power Administration	1	Negative	As drafted the standard TPL-001-1 has added requirement 2.1.5 discussing spare equipment strategy and lead times and inclusion in the "Planning Assessment". The standard in this section is not a performance based requirement but an activity based requirement as currently stated under R2 2.1.5. We recommend that the standard be revised and 2.1.5 removed as it does not directly improve the systems performance requirements nor compliance stated in Table 1.
Joseph S. Stonecipher	Beaches Energy Services	1	Negative	We believe that requirement 2.1.5 on spare equipment strategy is discriminatory for smaller entities. For many smaller entities, having a spare transformer is not a practical solution and makes far less sense and has significantly more customer rate impacts than for a larger utility. Yes, it may be possible to arrange an agreement with a neighboring entity for use of their spare, but that assumes that the neighboring entity's transformer specifications are similar enough for use as a spare, which may not be the case. Order 693 states at Paragraph 1725: "... the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy". The standard oversteps this direction by not including a consideration of planned outages versus forced outages in requirement 2.1.5, in other words, if an entity has no plans for a long term outage of a transformer, it should be excluded from the assessment of 2.1.5. Such a condition would allow an entity to assess things like gas in oil analysis to predict when a long term outage might be planned, and the flexibility between start and end dates of that planned outage.
Bruce Merrill	Lincoln Electric System	3	Negative	Requirement 2.1.5 should only address known planned outages of major Transmission equipment that has a lead time of one year or more. As currently drafted requirement 2.1.5 does not specify whether it includes both forced outages and planned outages. Requirement 2.1.5 also does not specify that system adjustments are allowed since adjustments are not allowed in categories P0, P1, and P2. Without system adjustments the requirement 2.1.5 would always produce more severe System impacts than the categories P0, P1, and P2 in Table 1. Allowing System adjustments would make requirement 2.1.5 (P1) match category P6, yet requirement 2.1.5 (P2) would still result in more
Dennis Florum	Lincoln Electric System	5	Negative	

Voter	Entity	Segment	Vote	Comment
Eric Ruskamp	Lincoln Electric System	6	Negative	severe System impacts than currently contemplated in the TPL-001-1 Standard. It appears that requirement 2.1.5 would greatly increase the study work by requiring a new base case for each unique Transmission equipment and repeating the associated contingency analysis. Would Correction Action Plans be required for requirement 2.1.5, whereas, they do not need to be developed solely to meet the performance requirements for a single sensitivity?
<p>Response: The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.</p>				
Elizabeth Howell	ITC Transmission	1	Negative	<p>As written, the balloted standard is a significant advancement over the past planning standards. It raises the bar for the EHV system (>300kV) and is a significant step forward toward the desired improvement in the North American electric grid. The detailed requirements along with the Table 1 performance expectations for Planning Events should result in Corrective Action Plans that improve the electric grid in measurable ways. The additional specifications to insure that load will not be lost, intentionally or otherwise, during relatively routine system outages reinforces the value of reliability standards. While ITC recognizes the significant improvement in the Planning Standard and applauds the Standard Drafting Team (SDT) for constructing this new document, we believe minor changes are still needed to provide clarity to the standard to avoid possible miss-interpretation of the intent of the SDT during compliance audits and the potential for unnecessary duplication of study effort in areas if differences between the studies conditions are relatively small.</p> <p>Minimally, ITC feels additional guidelines need to be supplied for some of the decisions left to engineering judgment, such as in R2.5 where it is clear as to the need for studies of "new" generation, no "minimum" size is indicated. Additional guidelines should be added to the standard and the Reliability Standard Audit Worksheet (RSAW) should be completed prior to balloting the standard.</p> <p>ITC is concerned about the mandatory need for the three distinct studies as required in R2.1 and R2.2 if the differences between the prevalent conditions are projected to be small. For example, if a systems load changes are insignificant between years 1 or 2 and year 5, and other conditions changes such as generation additions, power flow patterns and other are small for the system under study. The same issue may exist between year 5 and years 6 through 10 Under such conditions these studies may not be prudent and necessary to thoroughly evaluate the systems performance. ITC</p>

Voter	Entity	Segment	Vote	Comment
				<p>agrees with the SDT that the three studies make sense and are prudent when a system's conditions are changing. A review of how this section in the standard might be warranted.</p> <p>While a spare equipment strategy is a good idea, R2.1.5, the requirement should be clear to avoid compliance violations for the implications of a major piece of equipment failure with or without spare equipment. Until this is clearer for both Planners and auditors or an RSAW is available, there is a greater likelihood for compliance issues.</p> <p>ITC also has concerns regarding requirements R3.3.2 and R4.3.2 regarding Low Voltage Ride Through (LVRT). Both require tripping of generators when "voltages are less than known or assumed generator low voltage ride through capability". This means the planner either knows the limit or assumes one. For ITC, we only trip for "known" limits, such as those for wind generators. Our policy is to not "assume" LVRT. A concern is if a LVRT is not assumed for all plants will a transmission company be found not compliant. This should be made clearer either in the standard or in an RSAW.</p> <p>For these reasons, ITC is voting no at this time. ITC would like to see the SDT add clarity to the sections identified above or develop a Reliability Standard Audit Worksheet to accompany the standard being balloted. Please feel free to contact us if you have questions regarding our comments.</p>

Response: The SDT has clarified the requirement wording to address your concern.

Requirement R2, part 2.5 - The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, part 2.6. The technical rationale for determining material changes shall be documented.

The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.

Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.

Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:

The SDT has clarified the requirement based on your comments and those of others.

Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible

Voter	Entity	Segment	Vote	Comment
<p>unavailability of the long lead time equipment</p> <p>The SDT voltage ride through is not confined to the dynamic period. There are protection requirements that could result in generator tripping and that must be considered in the steady-state analysis. The SDT has clarified the wording of the requirement.</p> <p>Requirement R3, part 3.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Tripping of generators where simulations show generator bus voltages or high side of the Generation Step Up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made. • Tripping of Transmission elements where relay loadability limits are exceeded. <p>The development of an RSAW is more properly the purview of the Compliance Dept. No change made.</p>				
Jason Shaver	American Transmission Company, LLC	1	Negative	<p>ATC believes that the Standard is moving in the right direction, but has identified the following concern which is preventing us from voting "affirmative".</p> <p>Our concern is that the timeframe of 60-month (5 year) for implementing Corrective Action Plans (CAP), is insufficient. We believe that the implementation timeframe must be extended to seven (7) years.</p> <p>ATC is aware of Requirement 2.7.3, which covers situations that arise beyond the control of the Transmission Planner (TP) or Planning Coordinator (PC), but believes that the proposed language is ambiguous. Clarity needed (R 2.7.3): 1) An auditor could identify many things that could reasonably be within the "control" of a TP or PC but are not covered by NERC standards or a TP / PC's process, procedures or criteria. This wide area of discretion leaves entities open to possible non-compliance violation based on an auditor's perception of what they believe should be in the TP / PC's control. 2) In addition, we believe that the concept of "control" must be limited to an entities compliance obligation as a Transmission Planner and/or Planning Coordinator. In other words entities must be allowed the ability identify situation which fall under its "control" as a Transmission Owner, Transmission Operator, Generator Owner or Generator Operator etc. but is beyond the responsibility of its Transmission Planner or Planning Coordinator functions. . Suggested footnote: A TP or PC is in compliance with this requirement if the situation being documented is not covered in its internal processes, procedures or criteria required for NERC/Regional compliance obligations assigned to the TP or PC functions. Transmission Planners and Planning Coordinators are responsible for the identification of a CAP but it is the Transmission Owner that is ultimately responsible for implementing the CAP.</p>
Gregory J Le Grave	Wisconsin Public Service Corp.	3	Negative	<p>ATC is aware of Requirement 2.7.3, which covers situations that arise beyond the control of the Transmission Planner (TP) or Planning Coordinator (PC), but believes that the proposed language is ambiguous. Clarity needed (R 2.7.3): 1) An auditor could identify many things that could reasonably be within the "control" of a TP or PC but are not covered by NERC standards or a TP / PC's process, procedures or criteria. 				<p>Additional areas of concern: ATC requested that the SDT re-examine the following concerns which we have been previously identified:</p> <ol style="list-style-type: none"> 1. R1.1.2 "known outages of at least six months in duration" - The present wording is inconsistent between R1.1.2 and R2.1.3. We suggest that this requirement be removed because the "known outage(s)" are only to be included in the models when P1 events are simulated, as specified in R2.1.3. We suggest that the intent of this requirement can be more simply handled by stating in R2.1.3 that "known outages be simulated along with P1 events for the System peak or Off-Peak conditions when the outages are scheduled to occur". 2. R2.1.4 & R2.4.3 "range of credible conditions that demonstrate a measurable change in performance" - We suggest that the terms "credible" and "measurable" be defined or use words that more definitively describe the requirement. 3. Table 1 - Requirements are "buried" in the Performance Table, rather than being included in the Requirement Section - a. Add R2.7.5 - We believe that all requirements should appear in the Requirements section and not be "buried" in the performance tables. We propose the addition of the following bullet item to R2.7.5. It could read, "Planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration of the Facility Ratings." Note "e" in the Planning Events, Steady State & Stability section is stated in the form of a Requirement (e.g. use the verb "shall"), but all requirements should be included in the Requirements section and not introduced (and basically hidden) in the performance notes of Table 1. [After bullet item #7 is added, Note "e" under "Steady State & Stability" section of Table 1 should refer to R2.7.5] b. Add R3.3.5 - We believe that all requirements should appear in the Requirements section and not be "buried" in the performance tables. We suggest the addition of R3.3.5. The text of R3.3.5 should read, "Applicable System Operating Limits for the planning horizon shall not be exceeded." Presently, Note "a" and "b" under "Steady State Only" at the beginning of Table 1 are stated in the form of a Requirement (e.g. uses the verb, "shall") and all Requirements should be explicitly stated under Requirements and not be introduced (and basically hidden) in the performance notes of Table 1. [After R3.3.5 is added, Note "a" should be revised and refer to R3.3.5.] c. Add R3.6 - We believe that all requirements should appear in the Requirements section and not be "buried" in the performance tables. We suggest the addition of R3.3.6. The text of R3.3.6 should read, "The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to steady state voltage requirements." because Note "d" under "Steady State Only" at the beginning of Table 1 is stated in the form of a Requirement (e.g. uses the verb, "shall") and all Requirements should be explicitly

Voter	Entity	Segment	Vote	Comment
				<p>stated under Requirements and not be introduced (and basically hidden) in the performance notes of Table 1. [After R3.3.6 is added, Note "d" should be revised to refer to R3.3.6.]</p> <p>4. R2.7.2 - "include actions to resolve performance deficiencies identified in multiple sensitivity studies" - We do not think that mitigation plans should be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. Some of the sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. What is the interpretation of multiple studies - more than one or a majority of the number that were studied?</p> <p>5. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact still be required?</p>

Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.

The SDT believes the existing wording is clear and that the suggested wording is equivalent without providing any additional clarity. No change made.

Requirement R2, part 2.1.4 is part of Requirement R2 which mandates that an entity must document all assumptions utilized in the Planning Assessment. No change made.

The suggested change would move header note 'e' to new Requirement R2, part 2.7.5 on the premise that it is a buried requirement. The phrasing of header note 'e' does not indicate that it is a mandatory requirement. It is a statement of allowed actions consistent with other notes. No change made.

The SDT does not believe that the items mentioned are buried requirements; rather they are statements of system performance that are better placed in the performance table. Requirements R3 & R4 specifically refer to the table which makes the table part and parcel of the requirements. No change made.

The SDT believes that it is more effective to state this as a header note instead of repeating it multiple times throughout the table. It is not a buried requirement but a description of what is utilized in the simulation. No change made.

Voter	Entity	Segment	Vote	Comment
<p>Requirement R2, part 2.7.2 already states that an entity must supply the rationale for when actions were not necessary so the SDT believes that your concerns have already been addressed. No change made.</p>				
<p>The requirement states that an entity must supply the rationale for those events selected so the SDT believes that your concern has already been addressed. It provides the necessary guidance while allowing needed flexibility and not being overly prescriptive. No change made.</p>				
Larry E Watt	Lakeland Electric	1	Negative	<p>Below are some proposed changes and requests for clarification concerning the new TPL-001-1 standard.</p> <p>R2.6.2 The phrase “material changes” is not explicitly defined, and it is unclear what changes constitute a “material” change. It is asked that more precise wording or a definition of the word “material change” be provided.</p> <p>R3.3.2 The words “...known or assumed minimum generator steady state or ride through voltage limitations...” could be (and were) read as a series, with “known”, “assumed minimum generator steady state”, and “ride through voltage limitations” interpreted as three items in the series. For clarity, it is suggested that the standard be rewritten as such: Trip generators where simulations show generator bus voltages or high side of the Generation Step Up (GSU) transformer voltages are less than the known or assumed minimum generator steady state, or the known or assumed ride through voltage limitations. Include in the assessment any assumptions made. Here, the comma separates the two items in the series, with the words “known” and “assumed” modifying each of the items.</p> <p>R4.3.2 Following the changes made to requirement 3.3.2, it is suggested that requirement 4.3.2 be changed to the following: Trip generators where simulations show generator bus voltages or high side of the Generation Step Up (GSU) transformer voltages are less than the known or assumed minimum generator low voltage ride through capability. Include in the assessment any assumptions made.</p> <p>R4.3.3 An issue has been raised as to whether the word “simulate” denotes the modeling of all relays that protect transmission lines and transformers within a power flow/transient simulator. It is suggested that this word be changed to “assess,” to clarify that this requirement does not compel the Planning Coordinator and Transmission Planner to conduct PSS/E simulations to study the above conditions. The revised requirement can read: Assess the impact of transient swings on Protection System operation for Transmission lines and transformers.</p> <p>R4.4.1 There are two concerns with this requirement. The first is that this requirement makes no provision for the adjacent Planning Coordinator (PC) and Transmission Planner (TP) with a System Contingency to notify the PC and TP of the impacted System. Instead, the responsibility falls on the</p>

Voter	Entity	Segment	Vote	Comment
				<p>PC and TP of the impacted System to confer with each of their adjacent PCs and TPs to verify if a contingency on an adjacent System impacts the formers System. Or, it can cause the PC and TP to perform exhaustive contingency analyses (P0-P7) on all adjacent systems to determine which contingency/contingencies can impact their system to include them in their Contingency list.</p> <p>The second is that the term "impact" is not defined. A concern is should a Contingency cause a line on an adjacent System to load from 99% to 101% of its SOL rating, does this 2% constitute an "impact"? Conversely, would a Contingency that causes a significant increase to an adjacent System's line of 5% or more, without violating that line's SOL rating, be considered as having "impacted" the adjacent System? The proposed change to this requirement is: Adjacent Planning Coordinators and adjacent Transmission Planners will coordinate the identification of those Contingencies within their Systems and determine which, if any, impact the adjacent System. Those identified Contingencies may then be added to the adjacent Planning Coordinators and Transmission Planners' Contingency List. With this change, PCs and TPs of both Systems are responsible for coordinating their efforts, and the definition of "impact" is left to the coordinating PCs and TPs to decide.</p> <p>R8 It is unclear whether the adjacent Planning Coordinators and adjacent Transmission Planners must submit a written request for the information, or if the written request applies only to the functional entity that has a reliability related need. If the adjacent Planning Coordinators and adjacent Transmission Planners do not need to submit a written request, should the Planning Assessment be sent to them automatically?</p>

Response: Material change is system specific and difficult to define on a continent-wide basis and is left to engineering judgment with a documented technical rationale as stated in the requirement. No change made.

The SDT does not see any real difference in the suggested wording from what is already there. No change made.

The SDT does not see any real difference in the suggested wording from what is already there. No change made.

The SDT has clarified the requirement to address your concerns.

Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Successful high speed reclosing and unsuccessful high speed reclosing into a Fault.
- Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
- Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual

Voter	Entity	Segment	Vote	Comment
<p>relay models.</p> <p>Since the requirement is written for each Planning Coordinator and Transmission Planner, it covers the exchange of information on critical Contingencies and their impacts among all Planning Coordinators and Transmission Planners and thus distributes the responsibility and work load. No change made.</p> <p>The SDT does not see any real difference in the suggested wording from what is already there. No change made.</p> <p>The requirement clearly states that the entity must have a reliability-based need for the information so that unauthorized requests won't be made and the request for the information must be in writing. No change made.</p>				
Eric Egge	Black Hills Corp	1	Negative	<p>BHC does not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. Building a transmission line varies significantly in regional and local planning and review process, permitting, siting, legal challenges, routing, and system path rating process can often take more than 5 years to complete from the time the project is authorized.</p> <p>Though requirement R2.7.3 is included to address situations beyond the control of the Transmission Planner, it leaves to the interpretation of the audit whether the appropriate actions are being taken to resolve the issue that would continue to allow dropping of Non-Consequential Load or curtailment of Firm Transmission Service.</p> <p>As drafted the standard TPL-001-1 has added requirement 2.1.5 discussing spare equipment and lead times and inclusion in the "Planning Assessment". The standard in this section is not performance based requirement but an activity based requirement as currently stated under R2 2.1.5. PacifiCorp recommends that the standard should be revised and 2.1.5 removed as it does not directly improve the systems performance requirements nor compliance stated in Table 1.</p>
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>Requirement R2, part 2.7.3 requires an entity to document their actions. Therefore, it is up to the entity to ensure that the documentation sufficiently explains their position. No change made.</p> <p>The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall</p>				

Voter	Entity	Segment	Vote	Comment
<p>be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.</p>				
Janelle Marriott	Tri-State G & T Association Inc.	3	Negative	<p>Definitions section- Add a definition to this standard, which would revise the definition of "Stability" in the NERC glossary to read: "Stability: Unless qualified specifically as Voltage Stability, the term Stability shall mean the ability of system generators to maintain angular equilibrium, also known as Dynamic stability."</p>
Keith V. Carman	Tri-State G & T Association Inc.	1	Negative	<p>Definitions section- The definition for Year One is vague. If the definition is intended to capture both a summer and winter season and is necessary to provide a clear starting point for the planning horizon, then this should be stated explicitly in the definition. We recommend inserting the phrase "12-month" before the phrase "planning window"</p> <p>R2.1 The word "current" can mean either "electrical current" - a physical measure of electron movement, or "at the present time" - most recent or up-to-date. If you must use the term "current" in R2.1, say "current annual studies" rather than "annual current studies".</p> <p>R2.1.4 Part 2.1.4 should be removed from the requirement. The benefits of requiring one or more of these is unclear. Which of the listed conditions does an entity choose? There are no criteria for selection of one of the listed sensitivity topics as most-significant to a particular system. It is not apparent how particular sensitivities would increase BES reliability. If this part is not deleted, we recommend removing the phrase "not already included in the studies". Also, this requirement must state how one could determine validity of chosen sensitivity conditions.</p> <p>R2.1.5 We suggest adding the word "individually" to the end of the first sentence of part R2.1.5: "impact of this possible unavailability on System performance shall be assessed individually."</p> <p>In R2.4.1, it is left to the utility what level of load modeling detail is used. This is good because it gives the utility flexibility to select and use appropriate models. However, is it not clear what behavior of induction motors is targeted here. We recommend deleting the phrase "considering the behavior of induction motor loads", or else please specify what behavior is of concern.</p> <p>Part 2.4.3 should be removed from the requirement. As commented in our response to part 2.1.4, the benefit of requiring one or more of these is unclear - which of the listed conditions does an entity choose? There are no criteria for selection of one of the listed sensitivity topics as most-significant to a particular system. It is not apparent how this would increase BES reliability. If this part is not deleted, we recommend removing the phrase "not already included in the studies". Also, this requirement must state how one could determine validity of chosen sensitivity conditions.</p> <p>R2.6.2 We suggest that 2.6.2 be modified to read: "the System represented in the study has not</p>

Voter	Entity	Segment	Vote	Comment
				<p>materially changed, or a technical rationale can be given that the changes do not impact performance in the study area."</p> <p>If 2.1.4 and 2.4.3 are removed as we suggest, then this sentence in part 2.7 should be removed: "Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirement R2, parts 2.1.4 and 2.4.3."</p> <p>In part 2.7.1, remove the second sentence and all bullets. These are not measurable performance criteria.</p> <p>R3.5 asks for evaluation of actions designed to reduce the likelihood of potential cascading caused by extreme events, but 1) does not require documentation of results, and 2) does not require that the evaluation show that proposed actions would affect or limit cascading.</p> <p>R4.1 Insert "compliance with" in R4.1 text, which will then read "based on the Contingency list created in compliance with Requirement R4, part 4.4." There is no list in part 4.4. Part 4.4 requires a list of more severe contingencies (Table 1 planning events) to be created.</p> <p>R4.1.2 is unrealistic. Utilities implement out-of-step tripping schemes to limit the extent of impacts of such events that cause out-of-step conditions. Some of these occurrences can be mitigated better by tripping transmission elements and not generation. The decision to trip either transmission or generation should not be predetermined in the standard. We recommend that part 4.1.2 be reworked.</p> <p>R4.1.3 Does this preclude the regional reliability organization from choosing to establish damping criteria at some time in the future?</p> <p>R4.3.1 It is unclear whether this refers to the possibility of reclosing system failure, or the impacts of reclosing into a still-faulted system.</p> <p>R4.3.2 This is an admirable goal, and we applaud the SDT's vision. However, modeling all Protection Systems may be beyond the capabilities of presently used dynamic modeling tools. The number of impedance and overcurrent relays that would need to be included for lines and transformers would likely overwhelm these programs. We are concerned that the programs in use may not have the capability to model important relay characteristics such as load encroachment or out-of-step operating characteristics.</p> <p>R4.3.4 The phrase "of electrical system quantities" is unclear and can be removed without changing the intent of the requirement.</p> <p>R6 Remove the "for conditions such as ..." list.</p>

Voter	Entity	Segment	Vote	Comment
				<p>Does Table 1, Category P5, require consideration of clearing from all remote terminals and evaluating those time delays assuming no tripping is available locally?</p> <p>Table 1 Extreme Events List- In the Stability section of the Table 1 Extreme Events List, use the term Dynamic Stability, not just Stability - or insert a revised Stability definition as noted above.</p> <p>M8, part 1.4 Simplify by changing "current, in force documentation" to "operative documentation". "Current" is redundant with "in force".</p> <p>Table 1 - Headnotes to Planning Events</p> <ul style="list-style-type: none"> o Table 1, Headnote b - Delete "or extreme" since this headnote is for Planning Events. o Table 1, Headnote e - You may omit the phrase "For all planning events," since this headnote is for Planning Events. o Table 1, Headnote i - It is unclear what is meant by "end-user equipment associated with an event". o Table 1, Headnote h -We suggest this be moved to a footnote for P0: "Planning Event Category P0 is applicable to steady state only. No Dynamic Stability Analysis is required." o Headnote j - It is not clear why this falls under "Stability Only", and suggest that "dynamic stability" be included with headnote "a" <p>Table 1 - Footnotes</p> <ul style="list-style-type: none"> o Table 1, Footnote 2 - We suggest this footnote is not needed. R2.3 covers this sufficiently. o Table 1, new footnote- We suggest a footnote be added to the column labeled "Initial System Condition" indicating that "Normal System means all transmission elements are in service and all portions of the BES within the study area are performing within specified operating limits". <p>Table 1 - Planning Events</p> <ul style="list-style-type: none"> o Event P2 is categorized as 'Single Contingency'; however the listed events would typically result in the loss of more than one element. In other words, Category P2 contingencies are those in which a single system element is removed from service due to one of the listed initiating events. We are concerned because it appears that all events listed for the single-contingency Category P2 are not covered under other multiple-contingency Categories. For example, a faulted Bus Section. o Events P2 and P5 are described in terms of the elements initiating a fault, while the others are in terms of number of elements out-of-service due to a contingency. Event P4 is described in terms of

Voter	Entity	Segment	Vote	Comment
				<p>both - the elements lost and the initiating fault. It would be helpful to have additional notes explaining the apparent inconsistent wording of Planning Events.</p> <p>o The distinction between 'Single Contingency' and 'Multiple Contingency' Category classifications for an event must be clear. Categories A through D have worked well for the industry to this point, and it would be helpful if the transitio</p>
<p>Response: The SDT feels that the current definition fits the intent of the standard. Modifying the definition could have unintended consequences on other standards. No change made.</p> <p>Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>The SDT agrees and has made the change.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>The SDT has deleted the suggested phrase.</p> <p>Requirement R2, part 2.1.4 - For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <p>The SDT has clarified the requirement based on your comments and those of others although the term 'individually' was not added as the SDT did not see that it added any clarity.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. 				<ul style="list-style-type: none"> • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made. • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. <p>The SDT does not see any reason to delete the phrase as it is not causing any confusion. No change made.</p> <p>The SDT believes that the present wording is appropriate. No change made.</p> <p>You need to model the way that Protective System is expected to operate; if there is no local backup, then remote clearing will have to be simulated. No change made.</p> <p>All aspects of Stability are to be considered. No change made.</p> <p>The present language is common in many standards and the SDT sees no reason to change it here. There may be a difference between 'current' and 'in force' due to effective dates. No change made.</p> <p>The SDT has made a clarifying change to the note.</p> <p>Header note 'b': Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.</p> <p>The SDT agrees and has modified the note accordingly.</p> <p>e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</p> <p>End-user equipment is that equipment owned and operated by an end-user over which an entity has no control. No change made.</p> <p>This is simply a matter of preference as the suggested change would not alter the meaning or intent. No change made.</p> <p>The SDT agrees and has deleted header note 'j'. Dynamic stability is covered in the requirements and no reference is needed in the header notes.</p> <p>This footnote is referring to Stability studies and not short circuit analysis. No change made.</p> <p>System normal, or P0, is the starting system condition for the projected study conditions per the model developed in accordance with Requirement R1. The SDT has adjusted Requirement R1 to provide this clarity.</p> <p>Requirement R1 - Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes the normal system condition in Table 1.</p> <p>The category descriptions are meant to characterize the events. A single event may remove more than one element from service and that has been addressed in Header note 'c'. The SDT does not believe that there are inconsistencies within the table. The P2 category describes single events that may result in multiple</p>

Voter	Entity	Segment	Vote	Comment
<p>elements being removed from service. The P2 events differ from the multiple event categories which consider two or more sequential events. No change made.</p> <p>The SDT agrees that the structure of the descriptions are different because they are describing dissimilar types of events but the SDT does not feel that they are inconsistent or causing any confusion. No change made.</p> <p>The change was made since the table is now event based and because the four existing standards were consolidated into one standard. The industry has supported these changes. No change made.</p>				
Fred Frederick	Southern Indiana Gas and Electric Co.	3	Negative	<p>Definitions, Year One - Vectren disagrees with the proposed definition of Year One. Vectren believes that Year One should be the planning window that begins 12-18 months from the start of the current calendar year, and not from the end of the calendar year.</p> <p>Section 5 - Effective Date, the allowance of 60 calendar months for Corrective Action Plan implementation is too short. Recommend this be extended to 84 months to allow for proper planning, budgeting, right-of-way acquisition and construction.</p> <p>R2.4.1 - System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable. Vectren has concern with this requirement. The concern is that Vectren will be held to strict interpretation of this standard with regard to an actual event occurring that was not exactly reproduced by the Vectren model.</p> <p>R2.7.2 - The term "include actions to resolve performance deficiencies identified in multiple sensitivity studies" causes concern. Mitigation plans should not necessarily be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are typically extreme and less likely than base case conditions. Some of the sensitivity study conditions may not be credible or plausible enough to warrant the implementation of mitigation plans. Also, what is the interpretation of multiple studies? Is that more than one, a majority, 2/3 of the number that were studied, or some other number?</p> <p>R2.7.3 - The term "beyond the control of the Transmission Planner or Planning Coordinator" needs to be better defined. An auditor could interpret a situation to be within the "control" of a TP or PC but are not covered by NERC standards or a TP / PC's process, procedures or criteria. This leaves entities open to possible non-compliance violations based on an auditor's perception of what they believe should be in the TP / PC's control.</p> <p>Also, Vectren is not in agreement that Non-Consequential Load Loss should not be allowed for any case. There may be cases, especially future year studies that indicate a need for building transmission infrastructure, to serve speculative load growth. In these cases the consumers, local</p>

Voter	Entity	Segment	Vote	Comment
				<p>jurisdictions, and state jurisdictions may find it a prudent plan to assume some Non-Consequential Load Loss in order to defer building transmission infrastructure.</p> <p>R3.3.3 - Trip Transmission elements when relay loadability limits are exceeded. Vectren has concerns that system models (or software applications) cannot support the requirements of R3.3.3. Another concern is that Vectren will be held to strict interpretation of this standard with regard to an actual event occurring that was not exactly reproduced by the Vectren model.</p> <p>R4.1.3 - For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner. Vectren has concerns with this requirement. What if the PC and the TP cannot reach an agreement in the definition of "acceptable damping"?</p> <p>R4.1.2 - When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities. Vectren has concerns that dynamics models (or software applications) cannot support the requirements of R4.1.2. Another concern is that Vectren will be held to strict interpretation of this standard with regard to an actual event occurring that was not exactly reproduced by the Vectren model.</p> <p>R4.3.3 - Simulate the impact of transient swings on Protection System operation for Transmission lines and transformers. Vectren has concerns that dynamics models (or software applications) cannot support the requirements of R4.3.3. Another concern is that Vectren will be held to strict interpretation of this standard with regard to an actual event occurring that was not exactly reproduced by the Vectren model.</p> <p>Table 1 - Steady State & Stability Performance, Planning Events, k. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner. What if the PC and the TP cannot reach an agreement in the definition of "acceptable limits"?</p> <p>Table 1 - Steady State & Stability Performance, Extreme Events, V. A successful cyber attack. This requirement is too vague. It could be interpreted in any number of ways.</p>

Response: Based on your comment and those of others, the SDT has revised the definition of Year One.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen

Voter	Entity	Segment	Vote	Comment
<p>until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>2.4.1 – The SDT has added the word ‘expected’ to the text to alleviate your concern. Planning models are based on the best information available to the planners at the time of the study and it is well understood that they may not exactly represent actual conditions at any given time. The results of on-going benchmarking and model development activities can be incorporated when those activities yield more representative results.</p> <p>Requirement R2, part 2.4.1 - System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Requirement R2, part 2.7.2 already states that an entity must supply the rationale for when actions were not necessary so the SDT believes that your concerns have already been addressed. No change made.</p> <p>If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility. No change made.</p> <p>The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>The expectation of this requirement is that relay tripping would be handled consistent with their PRC-023 expectations. Planning models are based on the best information available to the planners at the time of the study and it is well understood that they may not exactly represent actual conditions at any given time. No change made.</p> <p>Requirement R4, part 4.1.3 does not state that the criteria are set jointly. If such an item became an issue, the SDT believes that it is covered in Requirement R7. No change made.</p> <p>The SDT believes that the necessary tools are readily available. Planning models are based on the best information available to the planners at the time of the study and it is well understood that they may not exactly represent actual conditions at any given time. No change made.</p> <p>The table does not state that the limits are set jointly. If such an item became an issue, the SDT believes that it is covered in Requirement R7. No change made.</p> <p>The event is the loss of two generating stations. A successful cyber attack is simply an example of a cause of the event. No change made.</p>				
Liam Noailles	Xcel Energy, Inc.	5	Negative	Xcel Energy appreciates the hard work of the Standard Drafting Team and commends the group for making substantial improvements in every successive draft of the TPL-001-1 standard to bring it to the proposed version for balloting. However, in as much as the proposed TPL-001-1 standard has

Voter	Entity	Segment	Vote	Comment
Michael Ibold	Xcel Energy, Inc.	3	Negative	<p>improved, we cannot support its approval at this time for the following reasons:</p> <p>1. Implementation Plan: Xcel Energy does not believe that 60 months is a reasonable time period to build transmission facilities to meet the new "raise-the bar" performance requirements. Building a transmission line in Xcel Energy's service area spanning eight-states (and two RTO's) varies significantly in regional and local planning and review process, regulatory approval process, permitting and routing process, legal challenges, etc. These processes can often take more than 5 years to complete from the time the project is conceived as a proposed solution. Though requirement R2.7.3 is included in the standard to address situations beyond the control of the Transmission Planner, we are concerned that it leaves to the interpretation and judgment of the auditor whether the Transmission Planner is taking appropriate actions to resolve the situation and consequently whether the interim solution of dropping Non-Consequential Load or curtailment of Firm Transmission Service is acceptable. Xcel Energy will be comfortable supporting the standard if the 60 months time-frame is increased to 84 months.</p>
David F. Lemmons	Xcel Energy, Inc.	6	Negative	<p>2. Intended Scope of Planning Event P5: Xcel Energy is unsure of what comprises the scope of "Failure of a single Protection System" - does it imply studying the failure to operate of the relay or communication channel utilized in the primary protection scheme for an equipment (e.g. transmission line), or does it also include studying the failure of other single Protection System components such as current/voltage transformer or station battery? Note that the former interpretation will result in delayed clearing of the faulted transmission element only, consistent with operation of the local backup protection (typically zone 2 operation of line distance relays). On the other hand, the failure of current/voltage transformer or station battery could compromise the operation of both primary and local backup protection schemes for the faulted equipment, thus requiring the remote backup protection to clear the fault, which results in longer-duration delayed clearing and the loss of more than one transmission element. In Table 1, characterizing P5 as a multiple contingency event (like P4 or P7) also contributes to the scope confusion. As discussed above, a primary protection relay failure will typically result in the loss of a single (faulted) element only, not the outage of multiple elements (that always occurs in P4 or P7 events). Then, should the P5 event be construed to study the failure of CT/PT and/or station battery which, as discussed above, will typically result in the loss of multiple elements? If yes, isn't the standard implicitly requiring redundant CTs/PTs or station batteries to enable meeting the EHV performance requirement? If no, shouldn't the P5 event description reflect the intended scope more clearly? This may presumably be achieved by modifying P5 to read "Failure of primary protective relay that results in Delayed Fault Clearing on one of the following:"</p> <p>3. Steady-state Performance of Planning Event P5 versus P1: Assuming that the intent of the P5 event is to study the operation failure of primary protection scheme (failure of the relay or its communication channel), the delayed clearing time associated with local backup protection scheme is</p>

Voter	Entity	Segment	Vote	Comment
				<p>only relevant to the stability performance. If the post-contingency outcome for P5 consists of the loss of the faulted transmission element only, can the post-contingency steady state system condition for event P5 be any different than for event P1? We contend that both events will result in the same post-contingency steady-state system condition since the only difference is the normal versus delayed clearing time. If so, should the steady-state performance requirements for event P5 be any different than for event P1? For steady-state analysis, the HV level performance requirements for P5 in Table 1 become contradictory to those for P1. This is another example of why the intended scope of P5 event needs to be specified more clearly.</p> <p>4. Ambiguities and Inconsistencies: Xcel Energy is providing the following editorial comments for your consideration to improve the consistency and clarity of the standard. Several, but not all, of the ambiguities and/or inconsistencies are confusing enough to qualify as show-stoppers since they prevent the standard's intent and scope to come across clearly.</p> <p>4.1 Table 1 - Headnotes to Planning Events</p> <ul style="list-style-type: none"> o Headnote b - At a minimum, delete "or extreme" since it is out of place in this headnote. Consider truncating at "... generation loss is acceptable." since the headnote is by default applicable to all planning events, and P0 exclusion is implicit in the context. o Headnote e - Consider omitting the phrase "For all planning events," since the headnote is by default applicable to all planning events. o Headnote i - Consider re-wording to remove the unintended association of equipment with event being implied at "...by end-user equipment associated with an event...". Suggest deleting the redundant phrase "associated with an event" since the headnote is by default applicable to all planning events. Alternatively, modify to read as follows: "Load loss resulting from an event due to the response of voltage sensitive Load or due to Load that is disconnected from the System by end-user equipment shall not be used to meet steady state performance requirements." o Headnote h - Unlike other headnotes, this does not describe a system performance but offers a clarification on applicability. Therefore, like other clarifications/qualifications, it belongs in the footnotes - suggest changing it to footnote assigned to P0. o Headnote j - It is not clear why this falls under Stability Only, and it also lacks specificity in expected stability performance. Note that the generic 'stable' is an umbrella term that includes all types of system (in)stability including voltage (in)stability, frequency (in)stability and cascading facility outages, not simply angular (in)stability. Considering that headnote 'a' includes most varieties of system (in)stability, we suggest adding "angular instability" in headnote "a" and deleting this

Voter	Entity	Segment	Vote	Comment
				<p>headnote.</p> <p>4.2 Table 1 - Footnotes Footnote 2 - Suggest deletion of “Unless specified otherwise, simulate normal clearing of faults” since it is redundant with Headnote ‘d’ for Planning Events and Headnote ‘b’ for Extreme Events. Alternatively, delete both Headnotes and do not change Footnote 2.</p> <p>4.3 Table 1 - Planning Events - Column 2 - Initial System Condition - Normal System What are the attributes of Normal System? Is this term intended to be synonymous with “system intact” or N-0 system topology? Is the event P0 intended to be identical to the existing Category A? The intent is not clear and needs to be explicitly stated. We suggest that the first occurrence of the term be modified as follows: “Normal System (all Facilities in service)” to explicitly convey the intent. Note that the qualifier in parenthesis is the verbiage for Category A used in the existing TPL standards. However, we also note that if P0 is intended to be synonymous with “system intact”, then it does not appear that the base case system model built as per Requirement R1, part 1.1, will always be compatible with P0 - due to the known outages to be included in the model (part 1.1.2). Does the standard envisage P0 and “system intact” to connote “All Facilities in service minus the known outages”? If so, this must be clearly stated.</p> <p>.4 Table 1 - Planning Events - Column 1 - Category What is the significance of ‘Single Contingency’ or ‘Multiple Contingency’ qualifier for an event? Is it intended to characterize the number of elements outaged due to the initiating event, or is it intended to convey the number of equipment failures/faults comprising the initiating event? The NERC glossary definition of Contingency “The unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element.” does not help remove this ambiguity.</p> <p>Regardless of the chosen interpretation, inconsistency arises for the following events: Event P2 - Wouldn’t initiating events P2-2, P2-3 and P2-4 typically result in the loss of more than one element? So qualifying P2 as single contingency appears to correspond with the equipment fault/failure description in the Event column but does not correspond to the total number of elements outaged due to the initiating event. Event P3 - Per the description in the Event column, the events P3-1 to P3-5 result in the loss of one element. So qualifying P3 as a multiple contingency appears to correspond with the total number of elements outaged, after including the (overlapping) prior outage. But the multiple contingency qualification is not consistent with the initiating event description in the Event column. Event P6 - Same comment as P3. Event P1 - Can the loss of only one element be presumed as an outcome of normal clearing of a fault, which appears to be the implicit initiating event here? How about the case of a normally cleared fault on a transformer-terminated line that is not breakered at the transformer end? Or the case of a normally cleared fault on a line-connected shunt reactor that is not breakered to the line? The resulting loss of two elements is not consistent</p>

Voter	Entity	Segment	Vote	Comment
				<p>with the event description. And by characterizing the event in terms of loss of one element, it is also inconsistent with headnote c that requires removal of all elements expected to automatically disconnect for each event. 4.5 Table 1 - Planning Events - Column 3 - Event Descriptions for events P1, P3, P6 and P7 are in terms of number of elements (one or multiple) outaged due to the contingency, whereas events P2 and P5 are described in terms of the initiating fault only. The exception is event P4 which is described in terms of both - the elements lost and the initiating fault. Is there a good reason why the event descriptions are not consistently worded? We note that the contingency descriptions in column 2 of the existing Table I are expressed in terms of "Initiating Event(s) and Contingency Element(s)." We think this issue is closely correlated to the previous comment on the apparent lack of consistency between the contingency terminology in column 1 and the event description in column 3.</p>
<p>Response: 1. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>2. The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p style="padding-left: 40px;">P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p style="padding-left: 40px;">13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>3. A P5 event is different and will not duplicate a P1 event for steady state if the entity does not have fully redundant Protection Systems. No change made.</p> <p>The SDT agrees and has made a clarifying change.</p> <p style="padding-left: 40px;">Header note 'b': Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.</p> <p>The SDT agrees and has modified the note accordingly.</p> <p style="padding-left: 40px;">Header note 'e'. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</p> <p>While technically correct, the suggested change does not create additional clarity and the existing wording doe not cause any confusion in the eyes of the SDT. No change made.</p>				

Voter	Entity	Segment	Vote	Comment
<p>This is simply a matter of preference as the suggested change would not alter the meaning or intent. No change made.</p> <p>The SDT agrees and has deleted header note 'j'.</p> <p>This is simply a matter of preference. While somewhat duplicative, it may add clarity and hasn't seemed to cause any confusion. No change made.</p> <p>System normal is the starting system condition for the projected study conditions per the model developed in accordance with Requirement R1. The SDT has adjusted Requirement R1 to provide this clarity.</p> <p>Requirement R1 - Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes the normal system condition in Table 1.</p> <p>The category descriptions are meant to characterize the events. A single event may remove more than one element from service and that has been addressed in Header note 'c'. The SDT does not believe that there are inconsistencies within the table. No change made.</p> <p>The SDT agrees that the structure of the descriptions are different because they are describing dissimilar types of events but the SDT does not feel that they are inconsistent or causing any confusion. No change made.</p>				
Henry Ernst-Jr	Duke Energy Carolina	3	Negative	<p>Duke appreciates the hard work that has been done by the Standard Drafting Team to get the standard to this point. Duke is supportive of the standard as it helps to remove some of the 'grey' in the existing TPL standards, as well as driving actions that will improve the reliability of the Bulk Electric System. However, Duke believes that two areas in the standard need to be improved in order for Duke to vote to approve the standard.</p> <ol style="list-style-type: none"> 1. Duke does not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. In an email to the registered ballot body, Ameren stated " Building a transmission line in Illinois is estimated to take 7 years (84 months) from the time the project is authorized." Duke agrees with the point that Ameren is making that building of a new EHV transmission line can be a very lengthy process. Duke thinks that a more appropriate time frame would be 84 months. 2. Duke believes that the requirement prohibiting loss of non-consequential load for P1, P2.1 and P3 events is an overreach by the standard into local load quality of service issues, does not provide any real benefit to Bulk Electric System (BES) reliability, and may have unintended negative consequences on reliability. Often, corrective actions to mitigate these events are local in nature and only require minor additional loss of local load to avoid major projects. In many instances, it may be in the best interest of all involved parties from an overall cost/benefit point of view to allow loss of non-consequential load. The standard should continue to allow Transmission Planners to use

Voter	Entity	Segment	Vote	Comment
				discretion regarding loss of non-consequential load, such that Transmission Planners, customers, and local regulators jointly control the decision making when BES reliability is not an issue. The transparency requirements of the new standard facilitate this type of decision making. In addition, the prohibition on non-consequential load loss for these events creates an incentive for Transmission Planners to remove lines serving load from network (serve the loads radially) so that they are characterized as consequential load. The unintended consequence of the standard would be a reduction in reliability for service to local load.
<p>Response: 1. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>2. The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p style="padding-left: 40px;">12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p>				
Charles A. Freibert	Louisville Gas and Electric Co.	3	Negative	E.ON U.S. suggests that Extreme Event 2e be clarified by adding: if generating was added in front of station, "Loss of all generating units at a generating station." This would distinguish from a loss of all units at a transmission station. Also, it is consistent with 3a, "Loss of two generating stations ...".
Charlie Martin	Louisville Gas and Electric Co.	5	Negative	E.ON U.S. objects to the modification of P2-1 to only include "Opening of a line section w/o a fault". Footnote 7 indicates that this is to ensure that radial load that would have tripped with a fault can be served. This is a new criteria that opens a line without an actual fault and may result in converting some of these lines to radials to comply with this requirement which could decrease overall reliability.
Daryn Barker	Louisville Gas and Electric Co.	6	Negative	
<p>Response: The SDT assumes that you meant 2d and of so, agrees and has made the change.</p> <p style="padding-left: 40px;">Extreme event 2d. Loss of all generating units at a generating station.</p> <p>This is not a new criterion as this is exactly what was in TPL-002-0, Table 1, Category B "Loss of an Element without a Fault." No change made.</p>				
Luther E. Fair	Gainesville Regional Utilities	1	Negative	Even though I am voting negative on this version of the standard, I want to acknowledge the considerable effort that the SDT has put into developing this change to the NERC Standard TPL-001, Transmission System Planning Performance Requirements. I do consider it, in most part, an improvement to the existing standard, but I feel it falls short by not providing more clarity and less ambiguity. As a very small utility that happens to have chosen a 138 kV loop to circle its city to serve

Voter	Entity	Segment	Vote	Comment
				<p>its citizens, we feel unreasonably burdened at times to accomplish the documentation task at hand.</p> <p>I offer the following as a few examples of concern: GRU believes that requirement 2.1.5 on spare equipment strategy is discriminatory for smaller entities. For many smaller entities, having a spare transformer is not a practical solution and makes far less sense and has significantly more customer rate impacts than for a larger utility. Yes, it may be possible to arrange an agreement with a neighboring entity for use of their spare, but that assumes that the neighboring entity's transformer specifications are similar enough for use as a spare, which may not be the case. Order 693 states at Paragraph 1725: "... the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy".</p> <p>Next, Requirement 3.3.3 as written would require modeling of nearly every phase distance relay, especially when studying extreme events. The requirement ought to have the flexibility afforded in 3.3.2 where the planner can use a conservative assumption and screening methods (e.g., the proposed curves of PRC-024) for relay loadability (e.g., the requirements of PRC-023).</p> <p>Requirement 4.3.1 would also require modeling of nearly every phase distance relay in the Interconnection, again because it applies to extreme events and we will not know ahead of time where the power swings will traverse distance relay characteristics. I look forward to the next generation of this standard's development. L. Earl Fair</p>

Response: The SDT has clarified the requirement based on your comments and those of others.

Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment

The SDT agrees that a planner should be able to utilize conservative assumptions and screening methods and doesn't believe that there is anything in the requirement that precludes an entity from doing so. The SDT disagrees that the modeling of phase distance relays is required. No change made.

The SDT has revised Requirement R4, part 4.3.1, bullet #3 to address this concern.

Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Successful high speed reclosing and unsuccessful high speed reclosing into a Fault.
- Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

Voter	Entity	Segment	Vote	Comment
<ul style="list-style-type: none"> • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. 				
Daniel Brotzman	Commonwealth Edison Co.	1	Negative	<p>Exelon is concerned with the use of the term 'Protection System' in Category P5 of the Table 1 performance criteria. 'Protection System' is a defined term in the NERC Glossary (Protection System - Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry). Thus, a potential interpretation of the standard as currently proposed would be that the loss of a station battery is to be included in analysis as a valid single contingency. We understand that the SDT response to previous comments on this issue indicates that the battery contingency was not intended to be part of the P5 contingencies. However, no changes or clarifications were subsequently made to the proposed Standard to clarify the requirements and exclude this interpretation. This leaves open the potential for multiple interpretations of the Standard and creates ambiguity for the functional entities that will have to implement the revised Standard.</p> <p>Additionally, Exelon is concerned that performance criteria in the draft Standard is based on the voltage level of the contingency element rather than the monitored element.</p>
<p>Response: The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>The SDT placed greater emphasis on the facility being removed than the monitored remaining intact Facilities. The outage of an EHV Facility will typically be of greater concern for the potential of transferring power flow to lower voltage parallel paths than the reverse. No change made.</p>				
Pat G. Harrington	BC Hydro and Power Authority	3	Negative	<p>File: NERC_Std_TPL-001_Draft05_Ballot_Comments_BCH20100226.doc A. GENERAL COMMENTS The standard needs to better define the pre- and post-contingency generation dispatch conditions and stipulate that the worst-case combination of possible load levels and generation dispatch must be studied. For example, the portion of a transmission network connecting a "generation-rich" region (ie, a region with much more generating capacity than local load) to the rest of the BES, should be able to operate within normal voltage level limits without overloading any elements under normal system conditions (N-0). If there are intermittent resources like wind parks or run-of-the-river hydro plants that the system is not depending on to supply dependable generating capacity (or at least not to the full nameplate rating of those resources), generation shedding or run-back can be permitted for single-contingencies (N 1 situation). The amount of generation shedding should be limited to the difference between the aggregate maximum generating capacity of the region and the aggregate</p>

Voter	Entity	Segment	Vote	Comment
				<p>dependable generating capacity of the region and there should be further limits defined for generation shedding/run-back as described below. Add the following definitions:</p> <ul style="list-style-type: none"> o 1. Consequential Generation Loss: All Generation that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault. o 2. Non-Consequential Generation Loss: Dependable Generating Capacity Loss that does not include: (1) Consequential Generation Loss, (2) Generation loss due to low voltage or (3) Generation loss due to protective relays of the generating unit or its step-up transformer. o 3. Dependable Generating Capacity: The level of generating capacity of a plant or unit that the system operator can count on to serve Non-Interruptible Load by virtue of the plant or unit's fuel supply being available to provide that level of generating capacity more than 97% of the time. <p>"EHV" and "HV" need to be defined because they are not defined in the NERC Glossary (NERC Glossary (use "Edit, Find on this page..." and look for "Glossary": http://www.nerc.com/elibrary.php?doc_class=&doc_dept=&submit=Filter)</p> <p>B. SPECIFIC COMMENTS R2, 2.2.1: The system configuration of the last year of the planning period should be studied as well as at least one other year that is most-likely to fail to meet planning criteria with an explanation for why that year is considered the worst case. As it is written, it would be quite acceptable for the TP and/or TC to simply study the year immediately following a major system upgrade with the rationale being that it would likely be the least likely system condition to fail any reliability standards. As it is written, there is no requirement that the rationale provided be logical or reasonable.</p> <p>R2, 2.4: "Stability analysis" does not cover all of the dynamic criteria that need to be met. A more general term, like "Stability and dynamic simulation studies" should be used. "Stability" is defined by NERC as just, "The ability of an electric system to maintain a state of equilibrium during normal and abnormal conditions or disturbances", but the assessments done in what people term "Stability" studies involve more than a check on the electromechanical stability (equilibrium) of the system. Voltage sags and swells, frequency deviations and short term overloading of equipment (eg, transient and dynamic current fluctuations through series capacitors that would provide an indication of the voltage stress across the capacitor dielectric) are usually included in "Stability" studies.</p> <p>R2, 2.4.1: "...for one of the five years" should be changed to "...for the most critical year of the 5 year Near-Term planning period".</p> <p>R2, 2.4.2: This requirement needs to be better defined. Is this requirement meant to demonstrate acceptable system performance during maintenance outages over the daily peak load periods of the off-peak season (ie, summertime for a winter-peaking region) or is this intended to address light-load</p>

Voter	Entity	Segment	Vote	Comment
				<p>issues like over-voltages and frequency deviations?</p> <p>R3, 3.2 The performance requirements for extreme events need to be defined in more detail. The criteria for acceptable system performance for extreme events seems to be only described vaguely in R3 item 3.5.</p> <p>R3, 3.5: Change “Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R3, part 3.2 created” to, “Those extreme events in Table 1 that are expected to produce more severe System impacts most likely to cause Cascading,, equipment damage or pose a significant risk to public or worker safety [needs to be further defined] shall be identified and a list of those events to be evaluated for System performance in Requirement R3, part 3.2 created”</p> <p>Also, simply providing “an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s)” is inadequate. One or more SPSs should be defined and studies should demonstrate that they prevent cascading outages and isolate, in a pre-planned controlled manner, the portion of the system experiencing the extreme event to minimize the extent of the disturbance. If necessary, an SPS should be provided that isolates the control area experiencing the extreme event from the rest of the interconnected system.</p> <p>R4, 4.1.1: Add (referring to the additional text suggested below for Note e of Table 1), “The amount of generating capacity disconnected or “run-back” by a Special Protection Scheme (SPS) shall be limited in accordance with Note e of Table 1”.</p> <p>R4, 4.1.2: Add, “Studies shall be conducted to demonstrate that all circuit breakers that may be called upon to trip for an out-of-step condition (180 degrees across the open breaker) are properly rated for this duty considering the worst case voltage on any isolated transmission circuits due to trapped charge.”</p> <p>R4, 4.1.3: Acceptable damping should be defined (eg, “studies must show that any oscillations are damped to less than 10% of their initial magnitude within 30 seconds”) [or develop a different specific requirement that can be measured].</p> <p>R4. 4.5” Change “Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R4, part 4.2 created” to, “Those extreme events in Table 1 that are expected to produce more severe System impacts most likely to cause Cascading, equipment damage or pose a significant risk to public or worker safety [needs to be further defined] shall be identified and a list of those events to be evaluated for System performance in Requirement R4, part 4.2 created”.</p>

				<p>Also, simply providing “an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s)” is inadequate. One or more SPSs should be defined and studies should demonstrate that they prevent cascading outages and isolate, in a pre-planned controlled manner, the portion of the system experiencing the extreme event to minimize the extent of the disturbance. If necessary, an SPS should be provided that isolates the control area experiencing the extreme event.</p> <p>R5 & R6: Shouldn't the Load Serving Entities (LSEs) define system performance criteria instead of the Transmission Planner or the Planning Coordinator? The LSEs have an obligation to their customers and must demonstrate to their regulators that they are providing acceptable system performance and reliability of supply to their customers. The Transmission Planner and Planning Coordinator have less incentive to provide high levels of system performance. Due to regulatory difficulties in getting approvals for transmission system upgrades, there</p>
<p>Response: The standard requires a normal System model, P0, be developed that projects anticipated conditions for the period under study. Any additional stress of the System prior to loss of an element would be handled through sensitivity analysis as required in Requirement R2. In addition, the SDT explored the possibility of placing limits on the amount of generation runback and the industry clearly indicated in comments that they did not support such limits. No change made.</p> <p>The EHV/HV differentiation is not meant to be a definition in that it only applies to this standard. No change made.</p> <p>One can always study additional years if so desired. The SDT believes that “rationale” implies logic and reason. No change made.</p> <p>The SDT intended for the term Stability analysis to include system Stability and unit Stability analyses. These analyses could include all aspects of Stability that you mentioned. It is left up to the judgment of the Planning Coordinator/Transmission Planner to decide which aspects of Stability may produce more severe results and therefore, must be analyzed. No change made.</p> <p>The critical year can only be determined after reviewing the entire portfolio of current and past studies and is not a pre-determined condition. The SDT expectation is that an entity is building a portfolio over time that covers the entire planning horizon and thus determines any critical periods. No change made.</p> <p>The requirement was intended to cover all conditions that could occur during Off-Peak periods. No change made.</p> <p>Requirement R3, part 3.2 contains no performance obligations. It is simply a requirement to assess the impacts. No change made.</p> <p>The SDT made a clarifying change to the requirement.</p> <p>Requirement R3, part 3.5 - Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.</p>				

Voter	Entity	Segment	Vote	Comment
<p>Due to the complexity associated with extreme events, the SDT believes it is inappropriate to require any more than a list of possible actions. An SPS could be a solution but it is not the only one. No change made.</p> <p>The SDT explored the possibility of placing limits on the amount of generation runback and the industry clearly indicated in comments that they did not support such limits. No change made.</p> <p>This standard is not intended to address engineering specifications such as proposed here. No change made.</p> <p>There is no single definition; the SDT has left it up to each Planning Coordinator or Transmission Planner to define. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.</p> <p>Due to the complexity associated with extreme events, the SDT believes it is inappropriate to require any more than a list of possible actions. An SPS could be a solution but it is not the only one. No change made.</p> <p>These are System requirements for the BES and properly belong to the Planning Coordinator and Transmission Planner. No change made.</p>				
Paul Shipps	Lakeland Electric	6	Negative	Five years is not enough time in many circumstances to build significant new transmission lines.
Joseph G. DePoorter	Madison Gas and Electric Co.	4	Negative	Our concern is that the timeframe of 60-month (5 year) for implementing Corrective Action Plans (CAP), is insufficient. We believe that the implementation timeframe must be extended to seven (7) years.
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p>				

Voter	Entity	Segment	Vote	Comment
W. R. Schoneck	Florida Power & Light Co.	3	Negative	<p>FPL Comments on TPL-001-1 Standard FPL believes the Standard requirements need to be clear and unambiguous. The SDT has addressed many of the gray areas of Draft four in their consideration of comments however these comments are not part of the Standard that is currently out for ballot. Incorporating these types of clarifying comments with the use of footnotes in the Standard to help clarify the intent would be a significant improvement for anyone interpreting the Standard including an auditor or investigator.</p> <p>The definition of Year One is an unnecessary departure from the planning practices used in most of the Eastern Interconnection. It is recommended the phrase end of the current calendar year be changed to the current calendar year. This change will allow PAs to begin their near term analysis with either next year or the year after as deemed appropriate.</p> <p>The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Providing a quantitative cap in non-consequential load loss such as 100 MW may be a reasonable compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. Absent this, the 60 calendar month phase in period described in the Introduction section is too short for transmission facilities rated above 300 kV. Approval and permitting of EHV transmission lines is extremely difficult and time consuming in most parts of the Eastern Interconnection.</p> <p>The phrase any material changes used in requirement R.2.6.2 will effectively cause all Planning Authorities to run all studies every year regardless of minor changes in the model. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes.</p> <p>The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive. Requirement 2.5 represents a significant expansion of Stability Studies into the Long Term horizon. In many cases the stability issue in long term scenarios will be with the response of new generating plants to fault scenarios such as a breaker failure event. The protection upgrades needed to mitigate performance issues are easily</p>

Voter	Entity	Segment	Vote	Comment
				<p>accomplished in the short term. The uncertainty of compliance judgement of rationale documentation will force a tremendous amount of unnecessary study work. It is recommend Requirement 2.5 be removed.</p> <p>We concur with the SDT's opinion expressed in the most recent consideration of comments that the individual component level evaluation of protection systems and redundancy requirements should be covered under the PRC standards and that the intent of the protection failure contingencies specified in Table 1 is to simulation the failure of a single protection scheme. The event description for the P5 contingency was revised in draft 5 but it continues to reflect a range of protection component failures that greatly exceed the intent of the SDT. The term Protection System is in direct conflict with the intent of the SDT, as it is defined in the Glossary to include components such as station batteries. The term Protection System should be replaced with Protection Scheme in Table 1.</p> <p>Requirement 4.3.1 can be interpreted to require dynamic simulation analysis of multiple fault event scenarios for transmission lines with high speed reclosing enabled. This additional analysis may be advisable for certain rare special situations but is unnecessary and burdensome as a general requirement for transmission planning contingency analysis. As such, requirement 4.3.1 will discourage application of high speed reclosing. This would be an unfortunate outcome given the benefits of high speed reclosing both for transmission reliability and customer power quality. It is recommended that 4.3.1 be reworded as follows; Simulate the operation of Protection Systems and other automatic controls as they would be expected for each contingency.</p> <p>The SDT has indicated in their responses to previous comments on requirement R4.3.3 that generic relay models could be used for screening purposes. While we agree with this as a practical method, the language of R4.3.3 could be interpreted to require explicit modeling of all protection and controls which is neither practicable nor an effective use of engineering resources. It is recommended that R4.3.3 be deleted.</p>

Response: Based on your comment and those of others, the SDT has revised the definition of Year One.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.

12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.

Material change is system specific and difficult to define on a continent-wide basis and is left to engineering judgment with a documented technical rationale as

Thomas W. Richards	Fort Pierce Utilities Authority	4	Negative	<p>FPUA believes that 5 years is not enough time in many circumstances to build significant new transmission lines. Seven years is a more appropriate lead time for the implementation plan / effective date.</p> <p>FPUA believes that requirement 2.1.5 on spare equipment strategy is discriminatory for smaller entities. For many smaller entities, having a spare transformer is not a practical solution and makes far less sense and has significantly more customer rate impacts than for a larger utility. Order 693 states at Paragraph 1725: "... the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy". The standard oversteps this direction by not including a consideration of planned outages versus forced outages in requirement 2.1.5, in other words, if an entity has no plans for a long term outage of a transformer, it should be excluded from the assessment of 2.1.5. Such a condition would allow an entity to assess things like gas in oil analysis to predict when a long term outage might be planned, and the flexibility between start and end dates of that planned outage.</p> <p>Requirement 3.3.3 as written would require modeling of nearly every phase distance relay, especially when studying extreme events. The requirement ought to have the flexibility afforded in 3.3.2 where the planner can use a conservative assumption (e.g., the proposed curves of PRC-024) for relay loadability (e.g., the requirements of PRC-023).</p> <p>Requirement 4.3.1 would also require modeling of nearly every phase distance relay in the Interconnection, again because it applies to extreme events and we will not know ahead of time where the power swings will traverse distance relay characteristics. FPUA agrees with Ameren's concerns about the ability of the programs to actually be able to model this requirement and FPUA fears that we are setting ourselves up for failure. We suppose that "generic" relays could be modeled to observe what distance relay characteristics are actually crossed by power swings and then, for that simulation, go back and individually model the actual relays for that specific simulation, but, that is a labor intensive process, not to mention the level of effort that would be required to maintain an interconnection wide database of relay settings. FPUA believes that the SDT ought to evaluate the perceived increase in accuracy that is intended with these requirements. It is FPUA's belief that the expected increase in accuracy is lost when considering other simulation inaccuracies that we really cannot improve (e.g., load modeling, load level modeled, dispatch modeled, etc., versus what would happen in an actual event) until much more work is done on improving our understanding of dynamic load behavior, benchmarking the model to actual system events, and possibly improvements on the ability to perform "real-time" stability analyses so that we have more practical operating experience to insert into our planning processes. Let's be practical in understanding the level of accuracy we can reasonably achieve in our simulations and model in accordance with that level of accuracy.</p>

Harold Taylor, II	Georgia Transmission Corporation	1	Negative	<p>Georgia Transmission Corporation (GTC) supports the efforts of the study team and believes that their efforts to improve the Standard are moving in the right direction. However, we have identified the following concerns which prevent us from voting "affirmative".</p> <p>1. GTC echoes ATC's concerns with the use of the word "control" in R2.7.3. (ref. ATC email; From: Shaver, Jason To: Gilbert, Don C. Manager, Electric System Planning ; bp-2006-02_ATFNSDT_TPL_in@nerc.com Sent: Wed Feb 24 09:43:11 2010 Subject: RE: Comments on TPL-001-1, Project 2006-02) An auditor could identify many things that may reasonably be within the "control" of a TP or PC, that are not covered by NERC standards or a TP / PC's process, procedures or criteria. This wide area of discretion leaves entities open to findings of possible non-compliance based solely on an auditor's perception of what he or she believes should be in the TP / PC's control. In addition, the concept of "control" must be limited to an entity's compliance obligation as a Transmission Planner and/or Planning Coordinator. In other words, an entity must be allowed the ability to identify situations which fall under its "control" as a Transmission Owner, Transmission Operator, Generator Owner or Generator Operator etc. but is beyond the responsibility of its</p>

Voter	Entity	Segment	Vote	Comment
				<p>Transmission Planner or Planning Coordinator functions.</p> <p>2. R2.7.2 - "include actions to resolve performance deficiencies identified in multiple sensitivity studies" - Mitigation plans should not be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. Some of the sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. It is not clear if the interpretation of multiple studies is more than one or a majority of the number that were studied.</p> <p>3. Throughout the Standard there are circular references that make the interpretation confusing. We recommend that all references should refer back to previous sections and not to future sections, thereby avoiding circular references.</p> <p>4. We disagree with the proposed definition of Year One. Year One should be the planning window that begins 12-18 months from the start of the calendar year, and not from the end of the calendar year. This would require minimal adjustments to the ERAG MMWG model building process. The proposed definition would force additional models to be built by the MMWG.</p> <p>5. We agree with others that the timeframe of 60-month (5 year) for implementing Corrective Action Plans (CAP), is insufficient. We believe that the implementation timeframe must be extended to seven (7) years. GTC is aware of Requirement 2.7.3, which covers situations that arise beyond the control of the Transmission Planner (TP) or Planning Coordinator (PC), but believes that the proposed language is ambiguous.</p> <p>6. We have concerns for including induction motor representations in the load models without any study or bench-marking activities to meet the requirements of R2.4.1. This information should be supplied by the LSE as part of the MOD standard. We understand that the proposed standard will accept an aggregate system load model which represents the overall dynamic behavior of the load to relieve the burden of trying to develop specific induction motor load representation at each load bus. However this modeled system response will be considerably different compared to the actual system response which will open up the industry to unwarranted scrutiny and possible compliance violation investigations.</p> <p>7. We disagree with the inclusion of low voltage ride-through in requirement R3.3.2. Low voltage ride-through is a dynamic modeling issue as correctly included in requirement R4.3.2.</p> <p>8. "EHV" and "HV" need to be defined in the NERC Glossary.</p> <p>9. Requirement R2.4.2 needs to be better defined. It is not clear if this requirement is meant to demonstrate acceptable system performance during maintenance outages over the daily peak load</p>

Voter	Entity	Segment	Vote	Comment
				<p>periods of the off-peak season or intended to address light-load issues like over-voltages and frequency deviations.</p> <p>10. A better definition for Consequential Load Loss is needed. The Non-Consequential Load Loss definition conflicts with the Consequential Load Loss definition. The Response of Voltage Sensitive Load exception under the Non-Consequential Load definition is a circular reference. It is not clear whether Voltage Sensitive Load is Consequential Load Loss or Non-Consequential Load Loss.</p> <p>11. It is not clear if Consequential Load Loss is intended to be limited to: a) Load between two open (breaker/switches) protective devices and b) Protective devices (breakers/switches) for radial load.</p> <p>12. Requirement R1.1.5 states that the system model shall represent "Known commitments for Firm Transmission Service and Interchange". GTC requests clarification of how to represent "Known commitments" whose collective magnitude can exceed the Load requirements.</p>

Response: 1. If an entity can demonstrate that it has made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.

2. Requirement R2, part 2.7.2 already states that an entity must supply the rationale for when actions were not necessary so the SDT believes that your concerns have already been addressed. No change made.

3. The SDT has made every attempt to make the standard as easy to follow as possible and believes that all references cited in the standard are correct. No change made.

4. Based on your comment and those of others, the SDT has revised the definition of Year One.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

5. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.

6. The SDT does not disagree that the Load Serving Entity may provide the initial information but someone needs to be responsible for adapting the model accordingly and that entity has to be the Transmission Planner or Planning Coordinator. No change made.

7. The SDT voltage ride through is not confined to the dynamic period. There are protection requirements that could result in generator tripping and that must be

Voter	Entity	Segment	Vote	Comment
<p>considered in the steady-state analysis. The SDT has clarified the wording of the requirement.</p> <p>Requirement R3, part 3.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Tripping of generators where simulations show generator bus voltages or high side of the Generation Step Up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made. • Tripping of Transmission elements where relay loadability limits are exceeded. <p>8. The EHV/HV differentiation is not meant to be a definition in that it only applies to this standard. No change made.</p> <p>9. The requirement was intended to cover all conditions that could occur during Off-Peak periods. No change made.</p> <p>10. The definitions are not in conflict as the definition of Non-Consequential Load Loss specifically states that it doesn't include Consequential Load Loss. The response of Load to voltage is not classified as Consequential or Non-Consequential Load Loss. This standard articulates how voltage sensitive Load should be treated during different time periods of a simulation. No change made.</p> <p>11. Both examples provided are Consequential Load Loss per the definition.</p> <p>12. The SDT does not believe that a continent-wide standard should proscribe a single approach. Requirement R1 states that an entity must document its assumptions. No change made.</p>				
Gordon Pietsch	Great River Energy	1	Negative	<p>GRE recommends the following revision to the wording in subrequirement 2.5: "...the impact of proposed generation additions that have made a commitment to interconnect with the Bulk Electric System..."</p> <p>In addition, it appears that the drafting team has inadvertently included additional compliance requirements in the language of Table 1. The net result of this is that these requirements are effectively buried in the Table 1 language. GRE does not take exception to these additional requirements but believes that they should be included in the Requirements section of the Standard. Having the Table 1 language written as it is presents additional risks for non-compliance that would not otherwise be there if these requirements would be included in the Requirements section.</p>
<p>Response: The SDT has clarified this requirement based on industry comments.</p> <p>Requirement R2, part 2.5 - The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, part 2.6. The technical rationale for determining material changes shall be documented.</p>				

Voter	Entity	Segment	Vote	Comment
Without any specific comments to address, the SDT is unable to further address your concerns. No change made.				
Jacquie Smith	ReliabilityFirst Corporation	10	Negative	<p>In R1.1.6 is OR the proper description of resources? Shouldn't this be AND? Resources are both supply AND demand side.</p> <p>Is R4.1.2 too stringent. At the least, shouldn't there be an exception for Special Protection Systems and Remedial Action Schemes to trip for apparent impedance swings?</p> <p>In 4.3.1 shouldn't the analysis be for both successful high speed reclosing and for unsuccessful high speed reclosing, (AND instead of OR)</p> <p>In Measure 8, the mixture of OR and AND is confusing. As presently written, as long as no entity makes a written request for the information they pass the test. Thus, as long as your neighbors do not complain about not receiving the information an entity is compliant. Better wording would be: The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners, or one of its adjacent Planning Coordinators, or to one functional entity The responsible entity failed to distribute the results of its Planning Assessment to two or more of its adjacent Transmission Planners, adjacent Planning Coordinators, functional entity Also, I think failure to distribute results is more severe than failing to respond to comments. Failing to give their neighbors an opportunity to comment is less severe than failing to acknowledge comments. I presume that the documented response to comments can be nothing more than "Thank you for your comments."</p> <p>All of the above are minor compared to this next problem. (I believe this needs to be addressed before we can vote yes.) The level of detail of Planning Assessment results is missing from the requirements. Is a message to your neighbors stating that you have performed a Planning Assessment and everything is OK, enough to meet the requirement, or does it need to be more detailed? The minimum contents of the Planning Assessment results shared with Transmission Planners, Planning Authorities, and other functional entities needs to be clearly stated.</p> <p>Also, the RRO is not a functional entity. As written, can this standard be used as justification for not sending detailed Reliability Assessment information to the ReliabilityFirst? Would requiring sharing with Stakeholders with a reliability need be better than limiting the required sharing to functional entities?</p>
<p>Response: The SDT believes that 'or' is appropriate. This allows for an entity to model supply or demand or both as appropriate. No change made.</p> <p>Requirement R4, part 4.1.2, deals with a single generator pulling out of synchronism. The situation you described is a system Stability issue and is considered an</p>

Any functional entity such as a Regional Entity or Reliability Assurer would qualify which would allow RFC to get the information. No change made.				
Kathleen Goodman	ISO New England, Inc.	2	Negative	<p>ISO New England is submitting a negative vote on the TPL-001 standard, because:</p> <ol style="list-style-type: none"> 1. Section 2 of the standard requires annual assessment of the system regardless of whether system conditions are essentially unchanged from year to year. This creates unnecessary study work and must be changed in order for ISO NE to support the standard. 2. In Table 1 - Steady State & Stability Performance Planning Events, Category P5 wording for the EHV contingency continues to call for no loss of load in the event of the loss of a single protection system. This requirement as currently worded goes well beyond the intent of the Standard Committee as stated in response to comments as follows: "A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event". It is ISO New England's opinion that similar language to the comment response should be incorporated into this requirement. 3. ISO New England has additional reservations about the standard that should be addressed in subsequent revisions however items 1 and 2 here must be addressed for ISO New England to support the standard.
<p>Response: 1. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>2. The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>3. Without any specific comments to address, the SDT is unable to further address your concerns at this time. No change made.</p>

Brian Conroy	Central Maine Power Company	1	Negative	<p>Issues with TPL-001-1 draft 5 in ballot:</p> <p>R 1 & 2 - There is insufficient direction/specification regarding base case development and sensitivity testing. Only "known outage(s) of generation" is specified.</p> <p>R2.1.1 - Year One or year two are operating time frame studies. Year five, particularly with additional load from load growth, is appropriate for system planning. There should not be a requirement for any more than one short-term and one long-term steady-state assessment.</p> <p>2.1.5 - The 'spare equipment strategy' requirement effectively amounts to a N-1-1 analysis, but without the system adjustment between contingencies. A N-1-1 analysis should be sufficient.</p> <p>R2 - An annual assessment of the system is required regardless of whether system conditions are essentially unchanged from year to year.</p> <p>Note that R2.6 is only for 'support' and are 'supplementation.' This creates unnecessary study work and must be changed in order for ISO NE to support the standard.</p> <p>R2.4.1 - The dynamic load model must consider the behavior of induction motor Loads in the stability assessment. The behavior of customers' induction motor loads is not known.</p> <p>Table 1, Category P5, EHV - loss of load in the event of a fault plus the loss of a protection system, should be allowed.</p> <p>This requirement as currently worded goes well beyond the intent of the Standard Committee as stated in response to comments as follows: "A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event". The draft standard is too prescriptive in some areas and too open to various interpretations in others.</p>

Response: System normal, or P0, is the starting system condition for the projected study conditions per the model developed in accordance with Requirement R1. Requirement R1 contains more than just 'known outages of generation' that need to be considered. The SDT has adjusted Requirement R1 to provide this clarity. The SDT believes that sufficient direction on sensitivities is in the requirement but the SDT has made a slight clarifying change to the requirement.

Requirement R1 - Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes the normal system condition in Table 1.

The SDT has changed the definition of Year One to more clearly show the SDT's intent. The SDT believes that two near-term studies are necessary in order to calibrate the planning assumptions against operations (Year One or year two) and to provide an additional data point for interpolation (Year One or year two and

Voter	Entity	Segment	Vote	Comment
				<p>year five).</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment</p> <p>An annual Planning Assessment is required but it can be supported by current or past studies. The SDT has clarified Requirement R2, part 2.1 accordingly.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>The SDT has changed Requirement R2, part 2.1 as indicated above to address your concern.</p> <p>2.4.1 The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. No change made.</p> <p>The SDT disagrees that Non-Consequential Load Loss should be allowed for EHV. The SDT feels that it was appropriate to raise the bar on situations that would impact the reliability and performance of the System and considered above 300 kV as the backbone of the System and thus needs to be extremely reliable and was an appropriate place for raising of the bar.</p> <p>The SDT has changed the text for the P5 event as a result of comments.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p>

Voter	Entity	Segment	Vote	Comment
Lorees Tadros	Omaha Public Power District	1	Negative	<p>It's unclear what the intent of the SDT was in Requirement R6, especially when R6 is considered in conjunction with Measurement M6. R6 includes the phrase "for conditions such as Cascading, voltage instability, or uncontrolled islanding", while M6 does not. R6 and M6 should use parallel language, similar to the way R5 and M5 use parallel language.</p> <p>Additionally, why is "System instability" mentioned in R6 for conditions such as Cascading, voltage instability, or uncontrolled islanding, when in Note "a" at the top of Table 1, the requirement that Cascading, voltage instability, and uncontrolled islanding not occur applies to both steady-state and stability analysis?</p> <p>In Note "f" at the top of Table 1, the word "applicable" was inserted in front of the term "Facility Ratings". The word "applicable" is unnecessary and should be struck. Inclusion of it could lead to certain Planning Coordinators and Transmission Planners interpreting it in ways that were never intended by the SDT.</p> <p>The word "applicable" should also be struck from Footnote 9 of Table 1.</p> <p>A reference to Footnote 9 was added to each occurrence of the word "No" in the second-to-last column of Table 1. This is confusing, because a "No" in this column means that interruption of firm transmission service is not allowed, while Footnote 9 says that curtailment of firm transmission service is allowed. This needs to be clarified.</p>

Response: The SDT agrees and has revised the wording accordingly.

M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.

Requirement R6 is documentation for criteria and methodology for risk exposure to those items. The SDT does not believe it is in conflict with header note 'a'. This is parallel to using thermal ratings to determine if lines become overloaded during the analysis. No change made.

The word 'applicable' is correct as ratings vary over time and the standard must accommodate this situation. No change made.

As a general rule, curtailment is not allowed. The footnote sets out exceptions to that as long as the conditions in the footnote are met. The SDT believes that this is the proper method to present the concept. No change made.

Garry Baker	JEA	3	Negative	JEA is concerned that there are some limited prudent cases where consumers, local jurisdictions, and state jurisdictions may find it prudent to plan on some Non-Consequential Load Loss in order to defer building transmission infrastructure for the overall benefit of the consumer. Therefore, JEA proposes the addition to the standard that allows the use of Non-Consequential Load Loss for local area planning.
Brad Chase	Orlando Utilities Commission	1	Negative	OUC appreciates that hard work of the STD and of the industry in reviewing and commenting on these standards. The STD has worked hard to try to address the concerns of the industry. OUC is voting against these standards. The proposed standard raise the bar in terms of study and performance requirements, an increase that will result in a non trivial increase in costs for utilities to meet the standards. The change in the standard did address some ambiguities in the old standard, but also introduced some new ones. Reviewing the new standard against the old OUC finds that our cost and that of our neighbors will increase to meet these standards. However OUC does not believe there will be a real increase in reliability on either the bulk system or at the individual user level due to these increased costs. In the current environment the direction from our customers is to keep rates as low as possible, and from our regulatory agency it is to have as little environmental impact as possible. The customers and regulatory agency do look at outages, but transmission is very rarely a contributor to those outages and funds expended can be better spent elsewhere, like on the distribution system or hurricane hardening, then on studying and constructing redundant transmission facilities that provide little to no increase in the end user's reliability. The standard also reduces the range of circumstances where non-consequential load loss is acceptable. OUC does not generally rely on consequential load loss for these circumstances, but this is a choice made based on feedback from our customers and local regulatory authorities. Consequential load loss, when confined to a limited area, is not a Bulk Electric System reliability issue. It is an issue best addressed locally where the cost in terms of capital facilities, condemnation, environmental impacts, probability of event and severity of event can be evaluated and a decision made that addresses these issues. A miniscule decrease in the risk of an outage would often be desirable to the community due to the subsequent rate increase and the impact of constructing power lines through their wetlands, scenic and urban areas. Since such an outage is not even noticeable at a regional scale, the choice should be left to those impacted, not mandated by NERC.
Richard Kinas	Orlando Utilities Commission	5	Negative	
Ballard Keith Mutters	Orlando Utilities Commission	3	Negative	
Kimberly J. Jones	North Carolina Utilities Commission	9	Negative	The NC Utilities Commission is concerned that the requirement prohibiting loss of non-consequential load for events in Table 1 of TPL-001-1 is an inappropriate overreach into service issues that are more appropriately addressed by state regulatory commissions. This requirement does not provide any benefit to reliability of the bulk electric system and could undermine state efforts to balance

Voter	Entity	Segment	Vote	Comment
				reliability issues with cost of service issues. Requiring remediation by a date certain could frustrate the coordinated siting of new lines with other planned infrastructure upgrades such as highways or bridges. The standard should continue to allow Transmission Planners to use discretion regarding loss of non-consequential load, understanding that state commissions are positioned to force electric utilities to address service quality issues on an expedited basis, should it be necessary and in the public interest.
<p>Response: The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p>				
Mike Laney	Luminant Generation Company LLC	5	Negative	<p>Luminant supports the concept of a more robust transmission planning criteria as described in TPL-001-1, but has serious concerns about the timeline being proposed. The 60-month implementation timeframe associated with the elimination of non-consequential load loss does not have any mechanisms to respect the base level of construction activity already underway in the various NERC regions that may materially impact compliance with a 60-month timeline. In ERCOT, the Public Utility Commission of Texas (PUCT) has mandated the construction of over 4,400 circuit miles of transmission within the next five years to support over 18,000 MW of wind generation. The PUCT Competitive Renewable Energy Zones (CREZs) build out plan requires the ERCOT 345 kV transmission network to be expanded by ~51% (in terms of total circuit miles), necessitating complex coordination of transmission clearances for construction of new lines, making it difficult to economically operate in a secure manner. These new CREZ transmission facilities are scheduled for completion by 2014 (i.e., within the next 5 years). The concurrent implementation of TPL-001-01 will compete with the CREZ build-outs and other on-going transmission upgrades needed to support load growth in the ERCOT region, which has historically experienced higher load growth rates than other parts of the country. Given that these major activities (including CREZ) reflect the most aggressive transmission build out plan in the history of ERCOT and that the implementation of TPL-001-1 will only add to that, Luminant is concerned that adding the implementation of TPL-001-1 on top of these activities will not provide adequate clearance windows to economically or reliably implement this plan within the proposed 60-month implementation window. In light of these concerns, Luminant proposes a 120 month implementation timeline of TPL001-1 for the ERCOT region</p> <p>Additionally, Luminant would like to see safeguards added to TPL-001-1 that acknowledge that each NERC region must complete all of the identified transmission upgrades associated with implementation of TPL-001-1 before NERC regions are required to begin operating with this level of security constraints enforced. Given that it is not possible to operate a NERC region any more securely than it is planned to be operated, this type of safeguard may readily appear, but explicitly</p>

Voter	Entity	Segment	Vote	Comment
				stating it would still be helpful. With the modifications outlined above, Luminant could support TPL-001-1. Thanks for the opportunity to comment.
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>The SDT has extended the implementation plan as described above and that Requirement R2, part 2.7.3 provides sufficient latitude for entities to accommodate your concern. No change made.</p>				
Terry Harbour	MidAmerican Energy Co.	1	Negative	MidAmerican find P5 confusing. What analysis is required? Does P5 specify the analysis of individual components of a System Protection system, the entire protection system as a whole, or something else? Do the benefits justify the requirement?
<p>Response: The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p>				
John Canavan	NorthWestern Energy	1	Negative	<p>NorthWestern Energy Rationale for our Vote NO: Below are NorthWestern's Comments on TPL-001-1 Draft 5: January 6, 2010: While this document has improved slightly with each successive draft, there are still several flaws that persist that NorthWestern finds to be unacceptable:</p> <ol style="list-style-type: none"> 1. The definition of a Bus-tie Breaker is vague. As a practical matter any breaker could qualify. 2. The definition of Non-Consequential Load Loss doesn't fit its name. 3. The idea of a Planning Assessment (developed throughout the document) is loose enough that it seems always to be asking the Transmission Planner to "do another comprehensive study anyway just to be sure you won't get sanctioned". There were numerous discussions about this, but the Drafting team has not cleaned up the language on this. The original idea was that a TP whose comprehensive study was not rendered unusable by the developments of a single year could perform an Assessment, and reasonably re-use the results of that study for the following year. The language in R2.1 contains the language: "The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following current studies, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:" This language

Voter	Entity	Segment	Vote	Comment
				<p>convincing any Transmission Planning person that an annual analytical study complete with power flow simulations is required. This requirement is onerous, since there is a significant waste of manpower and resources involved in conducting such a study when for most years a bi-annual study program would clearly be sufficient. NorthWestern considers that this one issue is worthy of a NO vote based on the excessive nature of the requirement.</p> <p>4. The language in R2.3 requires a short circuit analysis to be conducted annually. As with our comment 3 above, we find this excessive. This level of vigilance is not commensurate with the potential threat of a situation where fault duty could exceed breaker interrupting capability.</p> <p>5. The stricter requirements in the table for EHV lines certainly "raise the bar" for these facilities. They are also likely to reduce the enthusiasm for building such facilities. The outcome of this may be unintended consequences that are far more onerous to society than the amount of load loss that is avoided by the standard. It is not clear that this addition to the standard is well reasoned.</p> <p>6. NorthWestern is concerned about the potential for uneven treatment by various auditors as they follow this standard. While there is some risk of this for any standard, we believe the language in this standard is still weak.</p> <p>7. The 60 month time limit for implementing Corrective Action Plans may be quite unrealistic in the Montana transmission line environment. It really is not clear what is in the Transmission Planner's "control" in this arena.</p> <p>8. The definition of "year one" is problematic. Presently the WECC does not produce base cases that are well suited to this choice.</p> <p>We would like to encourage the Drafting Team to work to "tighten up" the language in the standard. This particular standard is so important to the general reliability of the transmission system (BES) that it deserves an extra effort at clarity, conciseness, and thoughtful language to achieve truly beneficial practices in the design of the BES. We believe that a "NO" vote is our best recourse to promote this extra effort. We understand that this standard has been a "long time in the making". That is because it is truly a difficult drafting challenge, not because of a poor effort.</p>
<p>Response: 1. The definition has been iterated several times based on industry comments in the past and seems to have been accepted by the overwhelming majority of the industry to date. No change made.</p> <p>2. The use of non-consequential is in line with the previously used term 'consequential' and doesn't imply that it isn't important. No change made.</p> <p>3. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p>				

Voter	Entity	Segment	Vote	Comment
<p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>4. Past studies are allowed as long as they qualify as per Requirement R2, part 2.6 and that should alleviate your concern. No change made.</p> <p>5. There are many other factors over and above this standard that will determine what entities build in the future. The SDT and many stakeholders believe that it is important to raise the bar for reliability. No change made.</p> <p>6. The SDT has made every attempt to make this standard clear, unambiguous, and enforceable. Without any specific comments to address, the SDT is unable to further address your concerns. No change made.</p> <p>7. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>8. Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p>				
David H. Boguslawski	Northeast Utilities	1	Negative	<p>NU votes to oppose TPL-001-1 with the following comments: Northeast Utilities (NU) is very appreciative of the effort of the SDT in preparing TPL-001-1. NU believes that this effort has resulted in a new TPL standard that shows improvement over the existing TPL standards. However, there are still some important concerns that NU believes should be addressed prior to the adoption of TPL-001-1. Therefore, in its present state NU can not vote for the acceptance of the draft standard and votes to REJECT the proposed standard (TPL-001-1). NU would like the SDT to re-visit and address the concerns listed below:</p> <p>1. The use of Non-Consequential Load Loss to mitigate violations arising from certain planning events: NU has objected to this requirement in comments submitted for previous drafts of TPL-001-1. NU believes that Non-Consequential Load Loss should not be considered for P1 to P7 events to achieve the level of reliability needed when planning the electric power system. The amount of load that could be shed is open ended in TPL-001-1 and this will lead to different interpretations which can be detrimental to the stakeholders. To put it simply the standard as currently drafted will lead to</p>

Voter	Entity	Segment	Vote	Comment
				<p>confusion as Transmission Owners, Regional Reliability Organizations, along with state and federal agencies will need to come to agreement on what the standard allows and what it doesn't. Ultimately, a standard that does not have clear measurable criteria will lead to difficulty in developing and obtaining approval for projects to achieve the required level of reliability. If the SDT and NERC believe that allowing the use of Non-Consequential Load Loss for multiple element contingencies (e.g., N-1-1 or P6 planning events) is necessary in achieving system reliability then NERC should specify that the amount should be minimal, such as less than 100 MW.</p> <p>2. The use of past study reports to satisfy Requirement R2, parts R2.1 and R2.2: The language of Requirement R2, parts R2.1, R2.2 and R2.6 is confusing and will lead to different interpretations from different stakeholders. While Requirements R2.1 and R2.2 indicate that annual studies should be conducted and to be supplemented by past studies, Requirement R2.6 seems to suggest that past studies could be used instead. The SDT's response to NU's comment on this issue supports the assertion that annual studies should always be conducted even if there are no changes in the system conditions and past studies should be used for the years within the assessment period but not called out by the standard. If studies are conducted every year then why the need to use past studies. This creates unnecessary study work and should be changed.</p> <p>3. Table 1 - Steady State & Stability Performance Planning Events, Category P5 Events: This requirement as currently worded goes well beyond the intent of the Standard Committee as stated in response to comments as follows: "A Protection System component failure (i.e., battery) that removes multiple Protection System schemes is beyond the P5 planning event". It is NU's opinion that similar language to the comment response should be incorporated into this requirement to avoid any confusion.</p> <p>4. Base case initial conditions: NU believes that a great deal of confusion and uncertainty will be eliminated or reduced if the standard attempts to define the nature of initial base cases that should be used in planning studies. As it stands now this issue is left to interpretation, which can lead to confusion when determining appropriate planning projects to achieve a reliable power system. Depending upon the interpretation of the base case dispatches and the level of interface flows (level of stress) they may reveal reliability violations in the power system. Non-uniformity in developing base cases for an area or region may mask real reliability problems in the system. This is one of the primary weaknesses of the existing TPL standards.</p> <p>5. Items 1, 2, 3 and 4 are Northeast Utilities primary concerns which should be addressed prior to NU accepting the standard. NU has additional reservations about the standard that should be addressed in subsequent revisions.</p> <p>6. NU also supports the comments from other transmission owners that 60 months may not be</p>

				sufficient to complete construction of transmission facilities.
<p>Response: 1. The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others' concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>2. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>3. The SDT has changed the text for the P5 event as a result of your (and others') comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>4. The SDT is trying to provide guidance without being overly prescriptive. Projected System conditions as well as the types of sensitivities that need to be studied are described. No change made.</p> <p>5. Without any specific comments to address, the SDT is unable to further address your concerns. No change made.</p> <p>6. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. ince problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p>				
Henry G. Masti	New York State Electric & Gas Corp.	1	Negative	<p>NYSEG supports the NYISO comments and also offer: The standard requires that dynamic load models be used that take into account induction motor effects. This information is generally not available and therefore it would be unworkable to develop an accurate model.</p> <p>The standard requires relays be modeled into the dynamic simulation. While standard mho, distance, or reactance distance relay model may exist, manufacturer-specific relay models often do not. Since this modeling is generally not available, it would be unworkable to develop an accurate dynamic model to test relay loadability.</p>

Voter	Entity	Segment	Vote	Comment
<p>Response: The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific so this is not unworkable. No change made.</p> <p>The SDT has clarified Requirement R4, part 4.3.1, bullet #3 to address your concerns.</p> <p>Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Successful high speed reclosing and unsuccessful high speed reclosing into a Fault. • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made. • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. 				
Marvin E VanBebber	Oklahoma Gas and Electric Co.	1	Negative	<p>Oklahoma Gas & Electric (OG&E) Comments on Proposed NERC TPL-001-1</p> <ol style="list-style-type: none"> 1.) OG&E feels that the effective dates of R1 and R7 shall become effective 18 months and not 12 months. Some entities budgeting cycles may not be based on 12 months and expenditures may be required by some to be compliant. 2.) OG&E feels that the effective dates of R2 through R6 shall become effective 30 months and not 24 months. This will allow entities adequate time to budget (personnel & tools), train, and perform the required studies. 3.) As others have mentioned, OG&E would like the 60 months extended to 84 months. 4.) Further examination should be conducted to evaluate the feasibility of performing the stability analysis every two years and not annually. 5.) OG&E has concerns for including induction motor representations in the load models without any study or bench-marking activities to meet the requirements of R2.4.1. 6.) The abbreviations of HV and EHV used in Table 1 shall be defined in the "Definitions of Terms Used in Standard" section. 7.) Although Table 1 has been improved, further work is needed to make Table 1 more intuitive. The notes at the beginning and ending of Table 1 seem awkward within the document.
<p>Response: 1. The SDT believes that 12 months is sufficient. This isn't a completely new requirement – entities should be doing this work now for the existing TPL</p>				

Voter	Entity	Segment	Vote	Comment
<p>standards. No change made.</p> <p>2. The SDT believes that 24 months is sufficient. This isn't a completely new requirement – entities should be doing this work now for the existing TPL standards. No change made.</p> <p>3. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>4. The requirement is for an annual assessment and past studies can be used if qualified as per Requirement R2, part 2.6. No change made.</p> <p>5. The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. No change made.</p> <p>6. The EHV/HV differentiation is not meant to be a definition in that it only applies to this standard. No change made.</p> <p>7. Mark Sampson	PacifiCorp	1	Negative	<p>PacifiCorp appreciates the diligence and dedication of the Standard Drafting Team and commends the group for their hard work to bring the proposed standard TPL-001-1 to this level. PacifiCorp believes the overall language of the standard has improved to enhance its readability and the language and format of the Tables now provides some improvement in the understanding of acceptable System performance for the various Planning Events. However, inasmuch as the proposed Standard has improved, we cannot support the approval of this document at this time. The following comments and suggestions are provided in support of a no vote on the TPL-001-1 standard as currently proposed.</p> <p>1) As currently written our Company does not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. Building a transmission line in PacifiCorp's 6 state service areas varies significantly in regional and local planning and review process, permitting, siting, legal challenges, routing, and system path rating process can often take more than 5 years to complete from the time the project is authorized. Though requirement R2.7.3 is included to address situations beyond the control of the Transmission Planner, it leaves to the interpretation of the auditor whether the appropriate actions are being taken to resolve the issue that would continue to allow dropping of Non-Consequential Load or curtailment of Firm Transmission Service.</p> <p>Table 1 - Steady State & Stability Performance Planning Events Category P2 (Single Contingency). Category P2 requires responsible entities to study the opening of a line section without a fault. The standard as written states that the opening of this line section will not result in consequential load</p>
John Apperson	PacifiCorp	3	Negative	
Sandra L. Shaffer	PacifiCorp	5	Negative	
Gregory D Maxfield	PacifiCorp	6	Negative	

Voter	Entity	Segment	Vote	Comment
				<p>loss and no voltage or thermal violations will occur on the BES. . This requirement is applicable to EHV (above 300 kV) and HV (100-300 kV) facilities. PacifiCorp believes that this requirement should not be applicable to all HV facilities. From a reliability perspective, a more effective and efficient method would be a bifurcated functional requirement rather than a voltage requirement. In PacifiCorp's system, and in much of the Western Interconnection, a breaker that opens without a fault in the 115/138 kV system almost never has the potential to cause impacts beyond the local area. In most cases this extremely rare event (the unplanned opening of a breaker without a fault) cannot impact the EHV Bulk Electric System. As such, this requirement (P2-1) is not appropriate at the HV voltage levels. A more appropriate requirement for P2-1 would be to require this performance level only for the EHV portion of the BES and the HV facilities that perform a transmission service in addition to local load service. This should not be a requirement for HV facilities that only provide local load service.</p> <p>2) Table 1-P5 Multiple Contingencies (Fault plus Protection System failure to operate) Normal System. There is a significant change in the system normal performance required for EHV systems from the current performance required in TPL-003 (Category C).</p> <p>This TPL-001-1 version does not allow any Non-Consequential load loss (table 1) or firm Demand (note 9) for EHV systems in the event of protection system failure and delayed clearing. This performance requirement would thus preclude use of existing protection systems that rely on remote clearing of interconnected EHV lines or stations if they provide local load service. As written the standard essentially now requires Category B performance rather than Category C performance for multiple contingencies. It is PacifiCorp's opinion that loss of Non-Consequential load or firm Demand should be allowed for the rare event involving multiple contingencies stated in P5 as long as the load or firm Demand loss is contained and controlled in the local load service area and the event does not impact other interconnected utilities or their loads.</p> <p>3) Table 1 - Steady State & Stability Performance Planning Events Category P5 (Multiple Contingency (Fault plus Protection System failure to operate). Category P5 requires responsible entities to study the Event titled Failure of a single Protection System that results in Delayed Fault Clearing on one of the following: Generator, Transmission Circuit, Transformer, Shunt Device, or Bus Section. It appears that this requirement is an indication that multiple protection system failure is not allowed under the proposed TPL-001-1. This appears to be a requirement for redundant protection systems for all possible events on all voltage levels of the transmission system. It also appears that this requirement is attempting to define what comprises an adequate protection system. As the draft standard is presently written it appears that multiple protection system failures are not included in this part or any part of the draft TPL-001-1 standard. As written, it is PacifiCorp's view that any multiple protection system failure would be categorized as an Extreme Event under the draft TPL-001-1</p>

Voter	Entity	Segment	Vote	Comment
				<p>standard. PacifiCorp contends that the many and varied issues associated with designing appropriate protection systems should be done in the context of the development of a protection system standard and not in the context of TPL-001-1. In fact, there is currently a proposed standard going through the NERC standards development process which goal is exactly that. If the standards drafting team intends to require responsible entities to have 100% redundant protection systems on all of its BES facilities, PacifiCorp contends that this fact should be stated up front in the standard so that all interested parties may become aware of this requirement and provide informed comment. PacifiCorp believes that it is appropriate to wait until the current protection system redundancy standard under development proceeds through the SAR process and approval system, given that this in an important generic issue that affects the entire industry. Notwithstanding the inappropriateness of raising the protection system issue in the context of a planning standard, PacifiCorp believes that any planning requirement that includes the failure of a single protection system that results in delayed fault clearing must have a very clear definition of the terms "single protection system" and "delayed fault clearing" in or for entities to determine what compliance with the standard requires. The draft TPL-001-1 standard does not have clear definitions of these terms, leaving room for considerable latitude for interpretation by various responsible entities, auditors, and compliance enforcement authorities. Clear, specific, and technically defensible language is needed for these terms.</p> <p>4) As drafted the standard TPL-001-1 has added requirement 2.1.5 discussing spare equipment and lead times and inclusion in the "Planning Assessment". The standard in this section is not performance based requirement but an activity based requirement as currently stated under R2 2.1.5. PacifiCorp recommends that the standard should be revised and 2.1.5 removed as it does not directly improve the systems performance requirements nor compliance stated in Table 1.</p>
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p> <p>The SDT believes that the addition of footnote 12 (when it is finalized) will address your concern.</p> <p>The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p>				

Voter	Entity	Segment	Vote	Comment
<p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p> <p>The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment</p>				
John C. Collins	Platte River Power Authority	1	Negative	<p>Platte River appreciates the efforts and perseverance of the Drafting Team on this important standard. A “no” vote is cast because the following requirements are not clear and have RISKS for different interpretations that could result in non-compliance.</p> <p>(1) Table 1 Planning Events, column for Initial System Condition. Does “Loss of” refer to a planned outage or forced outage?</p> <p>(2) Table 1, Extreme Events, column for Stability. In Stability Event 1, what is the fault type for the first forced outage? (The second forced outage is specified as 3-phase.)</p> <p>(3) Contingency lists required for Planning Events in Table 1. The required scope of contingency analysis for each Category is not clear. P1. Create a list of Contingencies only for the more severe P1 type, or create lists for each of P1-1 through P1-5 types? P2. Create a list of Contingencies only for the more severe P2 type, or create lists for each of P2-1 through P2-4 types? P3. Create a list of Contingencies only for the more severe P3 type, or create lists for each of P3-1 through P3-5 types? P4. Create a list of Contingencies only for the more severe P4 type, or create lists for each of P4-1 through P4-6 types? P5. Create a list of Contingencies only for the more severe P5 type, or create lists for each of P5-1 through P5-5 types? P6. Create a list of Contingencies only for the more severe P6 type, or create lists for each of P6-1-1 through P6-4-4 types, 16 possible combinations? P7. Create a list of Contingencies only for the more severe P7 type, or create lists for each of P7-1 through P7-2 types?</p> <p>(4) Contingency lists required for Extreme Events in Table 1. The required scope of contingency analysis for each Steady State and Stability columns is not clear. Create a list of Contingencies only for the more severe type, or create lists for each of the “such as” types?</p> <p>(5) Table 1, compare footnotes 1, 3, and 5. Does a P4-3 or P5-3 contingency involving an EHV-HV transformer and causing deficiencies on the EHV allow Non-Consequential Load Loss to correct since</p>

Voter	Entity	Segment	Vote	Comment
				<p>the HV is the lowest voltage and override the "No" in the column for Non-Consequential Load Loss Allowed for EHV?</p> <p>(6) What is a "sufficient amount" and how much is a "measurable change" for sensitivity case stressing? See parts 2.1.4 and 2.4.3.</p> <p>(7) Are the actions associated with single vs. multiple sensitivity studies in part 2.7.2 Corrective Action Plans?</p> <p>(8) Are Long-term stability analyses required only if there are generation additions or changes in the long-term horizon? See part 2.5.</p>
<p>Response: 1. Planned outages of six months or more should be incorporated into the PO condition as per the requirements. The events cited are forced outages.</p> <p>2. It doesn't matter what type of Fault creates the first outage condition as it is the second outage that is studied.</p> <p>3. The SDT believes that an entity only needs a list for those types of events that are more severe for your study area.</p> <p>4. An entity doesn't need a list for each 'such as'. The rationale for those selected must be documented as stated in the requirements.</p> <p>5. For an outage of an EHV/HV transformer, performance requirements specified as HV must be met.</p> <p>6. Requirement R2, part 2.1.4 is part of Requirement R2 which mandates that an entity must document all assumptions utilized in the Planning Assessment. No change made.</p> <p>7. Requirement R2, part 2.7.2 is for multiple sensitivities. Requirement R2, part 2.7 states that Corrective Action Plans are not required for single sensitivities.</p> <p>8. Yes, it is required only if there are additions or changes in the long term.</p>				
Christopher L de Graffenried	Consolidated Edison Co. of New York	1	Negative	Reword Table 1 Note (i) as follows: The response of voltage sensitive load that is disconnected from the system by end-user equipment associated with an event shall not be used to meet steady state performance requirements
Nickesha P Carrol	Consolidated Edison Co. of New York	6	Negative	Reword Requirement R 1.1.5 as follows: Known commitments for Firm Transmission Service, and, additionally, other types of transactions provided they have been demonstrated to not violate existing reliability constraints
Peter T Yost	Consolidated Edison Co. of New York	3	Negative	

Voter	Entity	Segment	Vote	Comment
<p>Response: The header note is not just for disconnections by end-user equipment but would also cover the natural response of Load for voltage reduction. The suggested wording changes the intent of the SDT. No change made.</p> <p>The SDT believes that the defined term 'Interchange' covers other transfers as described in your comment. No change made.</p>				
Henry Delk, Jr.	SCE&G	1	Negative	<p>SCE&G appreciates the efforts of the Standard Drafting Team and believes this version of the TPL standard has addressed most of the significant issues found in previous versions. However, SCE&G believes there are several significant issues that need modification or further explanation.</p>
Hubert C. Young	South Carolina Electric & Gas Co.	3	Negative	<p>1. SCE&G agrees with other submitted comments that the requirement to complete new transmission construction to meet new performance requirements within 60 months is too short. SCE&G believes that 84 months is more reasonable.</p> <p>2. SCE&G agrees with comments submitted by Duke Energy that the requirement prohibiting loss of non-consequential load for P1, P2.1 and P3 events is an overreach by the standard into local load quality of service issues, does not provide any real benefit to Bulk Electric System (BES) reliability, and may have unintended negative consequences on reliability and service quality. In many instances, it may be in the best interest of all involved parties from an overall cost/benefit point of view to allow loss of non-consequential load. The standard should continue to allow Transmission Planners to use discretion regarding loss of non-consequential load, such that Transmission Planners, customers, and local regulators jointly control the decision making when BES reliability is not an issue.</p> <p>3. SCE&G believes there are still different interpretations of Consequential and Non-Consequential Load loss and how each should be applied or not applied. The Standard drafting team should provide several examples in its response to these comments showing how to apply and not apply Consequential and Non-Consequential Load Loss. Without clear examples, SCE&G believes many request for interpretation will be submitted to NERC by the industry.</p>
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>The SDT has clarified the issue of Non-Consequential Load Loss as shown above. Providing examples here of what is Non-Consequential Load Loss versus</p>				

Voter	Entity	Segment	Vote	Comment
Consequential Load Loss would have no bearing on eventual compliance findings. The words are what matter and the SDT feels that the clarification provided should alleviate your concern.				
Charles H Yeung	Southwest Power Pool	2	Negative	SPP recommends the standards drafting team review the IRC SRC comments submitted in Oct 2009 and reassess those concerns.
Response: The SDT addressed the comments of the IRC SRC in its responses to the last posting which were captured in the Consideration of Comments report. Without any new specific comments to address, the SDT is unable to further address your concerns. No change made.				
James L. Jones	Southwest Transmission Cooperative, Inc.	1	Negative	<p>SWTC Comments: The SDT has done a lot of good work in developing the TPL 001 standard. However, I agree with the comments of others and suggest that another draft should be produced before the standard is sent to a ballot.</p> <p>SWTC foresees a problem with manpower and the cost of studies for small entities such as ourselves. This will be an extra burden and costs that will ultimately be borne by the consumer who is already not very happy lately.</p> <p>In part 2.7.1, remove the second sentence and all bullets. These are not measurable performance criteria.</p> <p>EHV" and "HV" need to be defined because they are not defined in the NERC Glossary.</p> <p>R4.3.2 This is an admirable goal, and we applaud the SDT's vision. However, modeling all Protection Systems may be beyond the capabilities of presently used dynamic modeling tools. The number of impedance and overcurrent relays that would need to be included for lines and transformers would likely overwhelm these programs. We are concerned that the programs in use may not have the capability to model important relay characteristics such as load encroachment or out-of-step operating characteristics.</p> <p>R5 & R6: Shouldn't the Load Serving Entities (LSEs) define system performance criteria instead of the Transmission Planner or the Planning Coordinator? The LSEs have an obligation to their customers and must demonstrate to their regulators that they are providing acceptable system performance and reliability of supply to their customers. The Transmission Planner and Planning Coordinator have less incentive to provide high levels of system performance. Due to regulatory difficulties in getting approvals for transmission system upgrades, there may be a tendency on the part of TPs and TCs to avoid proposing transmission upgrades, letting system performance degrade instead by abandoning traditional planning criteria and defining less stringent standards for themselves. R6 Remove the "for conditions such as ..." list.</p>

Voter	Entity	Segment	Vote	Comment
<p>Response: The SDT has clarified Requirement R2 and part 2.1 to make it clearer that qualified past studies can be utilized.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>The listed items are simply that – a list of actions that would be included. This is an allowable and encouraged format for Reliability Standards. No change made.</p> <p>The EHV/HV differentiation is not meant to be a definition in that it only applies to this standard. No change made.</p> <p>The SDT believes that your comment is for Requirement R4, part 4.3.3. The SDT has modified the wording of this requirement to address your concern.</p> <p>Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Successful high speed reclosing and unsuccessful high speed reclosing into a Fault. • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made. • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. <p>These are System requirements for the BES and properly belong to the Planning Coordinator and Transmission Planner. No change made.</p>				
Donald S. Watkins	Bonneville Power Administration	1	Negative	The Bonneville Power Administration (BPA) acknowledges and appreciates the hard work and diligence of the Standards Drafting team on such a large effort. BPA respectfully submits the following comments.

Voter	Entity	Segment	Vote	Comment
Rebecca Berdahl	Bonneville Power Administration	3	Negative	<p>1. Requirement R1.1.2: BPA recommends that system models should only represent outages with a duration of one year or more. The planning horizon should not cover an outage less than one year because there is not adequate time for developing and implementing any necessary mitigation plan. Known outages with duration less than one year should be dealt with in the Operations horizon. In addition, the near term steady state studies represent year one or year two and year five as required by R2.1.1. Therefore it is not consistent with the rest of the standard to require modeling outages less than one year.</p> <p>2. Requirement R3.5: BPA recommends removing the requirement to evaluate possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the extreme events. o This is more stringent than the existing requirement without providing any increased reliability benefit. The new standard already requires a significant increase of study cases and this additional requirement results in an undue study burden on utilities without adding any benefit.</p>
Francis J. Halpin	Bonneville Power Administration	5	Negative	<p>o In addition, Table 1, Extreme Events, should be reduced to a more prudent list of possible events to evaluate risks and consequences. It is obvious that several of the events, especially under item 3 (Wide Area Events), would cause cascading and it is not practical to evaluate possible mitigation plans for such extreme events.</p>
Brenda S. Anderson	Bonneville Power Administration	6	Negative	<p>3. Table 1: The category P2 Single Contingency should be removed.</p> <p>o Events P2.2, P2.3 and P2.4 should be moved to category P4 since these events are not single contingencies. P2 is a single contingency category, which by definition takes one system component out of service. Bus section faults and bus-tie breaker faults are multiple contingencies since they are events that take multiple system components out of service.</p> <p>o Event P2.1 "opening of a line section w/o a fault" should not be included in the planning standard. At a minimum Event P2.1 should be moved to Category P1 since it is a single contingency and it should allow Interruption of Firm Transmission Service and Non-Consequential Load Loss for the HV (<300 kV) BES level. Many of the HV (115-kV) lines have taps that serve loads and are designed to remove all elements that the protection system and other automatic controls are expected to disconnect. This is consistent with Requirement 3.3.1 which states "Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention." Inadvertent opening of one end of an HV line section without a fault almost never has the potential to cause impacts beyond the local area, yet has a low probability of occurrence and would be very costly in some cases to mitigate.</p> <p>4. Footnote 11: BPA recommends removing the reference to common Right-of-Way. This could be mis-interpreted that a common Right-of-Way longer than 1mile should be planned for under Category</p>

Voter	Entity	Segment	Vote	Comment
				<p>P7. The NERC standards only include common Right-of-Way under extreme events and in this footnote. So, it would be consistent with the rest of the standard to remove this reference from the footnote and possibly make a specific reference in the Extreme Events category where it applies.</p> <p>5. Requirement R2.4.1: BPA agrees with other commenter's concerns that requiring Load models that consider the behavior of induction motor Loads is premature without adequate development and benchmarking efforts. In addition, specific types of models and data required for analysis should not be mentioned here, but should be specified and submitted through the appropriate MOD Standard's.</p> <p>6. Requirement R4.3.3: BPA agrees with other commenter's concerns regarding simulating the impact of transient swings on Protection System operation for Transmission lines and transformers. It would be an extremely burdensome task to model relay impedance characteristics for all elements with little or no benefit, and it is questionable whether the simulation programs would support this effort.</p>
<p>Response: 1. The time frame is for future outages in the planning horizon and last for at least six months. No change made.</p> <p>2. The SDT disagrees as this is effectively the same requirement as presently stated in TPL-004. No change made.</p> <p>The SDT does not agree that these conditions obviously will create Cascading. The SDT reminds the commenter that not all events must be studied. No change made.</p> <p>3. The category descriptions are meant to characterize the events. A single event may remove more than one element from service and that has been addressed in Header note 'c'. The SDT does not believe that there are inconsistencies within the table. The P2 category describes single events that may result in multiple elements being removed from service. The P2 events differ from the multiple event categories which consider two or more sequential events. No change made.</p> <p>4. The SDT has revised the footnote to provide additional clarity based on your comment.</p> <p style="padding-left: 40px;">11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.</p> <p>5. The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. No change made.</p> <p>6. The SDT has revised Requirement R4, part 4.3.1, bullet #3 to address this concern.</p> <p style="padding-left: 40px;">Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Successful high speed reclosing and unsuccessful high speed reclosing into a Fault. • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. relay models.				
Ralph Frederick Meyer	Empire District Electric Co.	1	Negative	<p>The Empire District Electric Company appreciates the dedication of the Standards Drafting Team. Empire cannot support the approval of the proposed standard as written. Empire finds exception to the proposed standards in the following areas:</p> <ol style="list-style-type: none"> 1) We disagree with the proposed requirement 2.1.5 on spare equipment strategy in that it is discriminatory for smaller entities like Empire. Having a spare transformer is not practical and makes far less sense for a smaller entity but yet has a significant rate impact to our customers. 2) We disagree with requirement 3.3.3 as written would require modeling of nearly every phase distance relay, especially when studying extreme events. The requirement deserves flexibility as allowed in requirement 3.3.2 3) We do not believe 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. Our suggestion to the drafting team would be some amount of time greater than 7 years (84 months).
<p>Response: The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment</p> <p>The SDT agrees that a planner should be able to utilize conservative assumptions and screening methods and doesn't believe that there is anything in the requirement that precludes an entity from doing so. No change made.</p> <p>The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p>

Frank Gaffney	Florida Municipal Power Agency	4	Negative	<p>The Florida Municipal Power Agency (FMPA) appreciates the hard work of the SDT, but, we believe there are significant issues that remain with the standard.</p> <p>FMPA believes that 5 years is not enough time to build significant new transmission lines and believes that 7 years is a more appropriate lead time.</p> <p>FMPA believes that the requirement prohibiting loss of non-consequential load for P1, P2.1 and P3 events is an overreach by the standard into local quality of service issues and does not provide any real benefit to BES reliability. The standard ought to separate what an entity chooses to do for the benefit of its own customers and the impacts it may on the reliability of the BES. FMPA believes that an entity has the right to choose to utilize the existing footnote "b" in the version 0 standards if that choice does not detrimentally impact the ability to provide transmission service to others.</p> <p>FMPA believes that requirement 2.1.5 on spare equipment strategy is discriminatory to smaller entities. Also, Order 693 at Paragraph 1725 states: "... the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy". The standard oversteps this direction by not including a consideration of planned outages versus forced outages.</p> <p>Requirements 3.3.3 and 4.3.1 would require modeling of nearly every phase distance relay in the Interconnection. It is questionable whether we have the software tools to do so, and this would require a huge level of effort to maintain an interconnection wide database of relay settings for questionable benefit. FMPA believes that the SDT ought to evaluate the perceived increase in accuracy that is intended with these requirements. It is FMPA's belief that the expected increase in accuracy is lost when considering other simulation inaccuracies that we really cannot improve (e.g., load modeling) until much more work is done on improving our understanding of dynamic load behavior and benchmarking the model to actual system events.</p>
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Alden Briggs	New Brunswick System Operator	2	Negative	<p>The NBSO applauds the efforts of the Drafting Team on this very important TPL standard. However, we feel that it is not quite ready for acceptance but with a few tweaks and some much needed clarity it would be.</p> <p>NBSO believes the BES versus BPS needs resolution as we much prefer standards that applicable to the bulk power system based on an impact assessment opposed to an arbitrary voltage level.</p> <p>The standard should be more flexible allowing for any trade off between temporarily shedding small amounts of load to recover from a single contingency where the alternative which may force significant transmission upgrades. The standard gives preference to a single line feeding a local area versus two lines, where the loss of one of two under high loading conditions should allow for portions of load to be shed to maintain voltage.</p> <p>The standard considers demand side management as an option but no allowance for instantaneous and temporary load loss that could be required before DSM could be activated. The standard should be clear that if in agreement with a distribution provider some portions of the distribution load (non-consequential load loss) may be shed for a single contingency for undervoltage and underfrequency conditions.</p> <p>The requirements for load models should be clarified so capture dynamic behaviour within reason.</p>

Voter	Entity	Segment	Vote	Comment
				There should be a Q&A guide to allow for examples to clarify the requirements.
<p>Response: The SDT does not believe that it needs to define BES. In its March 18th order, FERC suggested a continent-wide definition of the BES. No change made.</p> <p>The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>DSM is permitted because it is pre-arranged with the customer. For transmission systems, DSM is expected to be used in anticipation of the next transmission system Contingency, not in response to the transmission system Contingency. UVLS & UFLS are intended safety nets for operations and should not be relied upon in transmission planning. No change made.</p> <p>The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. Dynamic load modeling is important for correct dynamic simulations. Industry has acknowledged the need for accurate Load modeling and the SDT has codified this need in the proposed standard. No change made.</p> <p>While a Q&A providing examples may be helpful it would have no official bearing and such an effort is not in the project schedule.</p>				
Gregory Campoli	New York Independent System Operator	2	Negative	<p>The New York Independent System Operator (NYISO) believes this proposed standard is moving in the right direction with the right intentions, and while we truly appreciate the expertise and hard work that the standards drafting team (SDT) has consistently exhibited throughout this lengthy process, we have voted no on the adoption of this balloted version of the proposed NERC Standard TPL-001-1 for the following reasons:</p> <ol style="list-style-type: none"> 1. The proposed Standard would significantly, and unnecessarily, shift responsibilities away from the Transmission Owner (TO). The proposal would require that for the Bulk Electric System (BES) throughout the New York Control Area (NYCA) the NYISO would annually evaluate: specified contingency events, all corrective action plans, and all spare equipment strategies. As we are not a BES facility owner, we believe that facility specific requirements should stay with facility owners. 2. The proposed Standard requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. 3. The proposed Standard would require the PC & TP to assess the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but

Voter	Entity	Segment	Vote	Comment
				<p>provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).</p> <p>4. The proposed Standard would require an “annual” assessment of the system in order for it to be considered “current.” The NYISO has a biennial reliability planning process and does not find it necessary to perform all studies annually in order to be current. We see no reliability benefit to requiring this to be done annually; in fact, dilution of planning efforts and resources is in itself a reliability risk.</p> <p>5. The proposed Standard lacks a clear definition of the first year of the planning horizon. It is defined as the planning window that begins 12-18 months from the end of the current calendar year. If “Year One” is two calendar years out, what is year two? year five? This ambiguity poses an unacceptable risk to compliance.</p> <p>6. For steady-state and stability analysis, the proposed Standard creates a limited list of required sensitivities, and may require sensitivities with no useful objective. The Standard should instead provide a list of suggested sensitivities to allow the planning entity to use its judgment to study sensitivities pertinent to its system. Furthermore, in the absence of a definition of base case conditions, it is difficult to determine, from a compliance standpoint, what is a “stressed” system.</p> <p>7. The proposed Standard requires stability models to represent the dynamic behavior of loads, including the consideration of the behavior of induction motor loads. The NYISO, along with many other systems, has not determined a need to model dynamic loads, and therefore has not benchmarked any such models. The NYISO recommends that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.</p>
<p>Response: 1. Planning the system is the responsibility of the Planning Coordinator and Transmission Planner as per the Functional Model. The Planning Coordinator or Transmission Planner simply needs to account for those strategies and facility specific items that are passed to them by asset owners. No change made.</p> <p>2. The list is not all inconclusive but a list of possible actions. The SDT agrees that runback or tripping of HVDC would be allowable actions. No change made.</p> <p>3. The SDT has clarified the requirement based on your comments and those of others.</p> <p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment</p> <p>4. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words</p>				

Voter	Entity	Segment	Vote	Comment
				<p>may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <p>5. Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>6. The SDT has made clarifying changes to Requirements R1 and R2, part 2.1.4 to address your concerns.</p> <p>Requirement R1 - Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes the normal system condition in Table 1.</p> <p>Requirement R2, part 2.1.4 - For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <p>7. The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. Dynamic load modeling is important for correct dynamic simulations. Industry has acknowledged the need for accurate Load modeling and the SDT has codified this need in the proposed standard. No change made.</p>

Alan Adamson	New York State Reliability Council	10	Negative	<p>The New York State Reliability Council (NYSRC) appreciates the hard work and time the drafting team has devoted during its preparation this standard. The present version represents a significant improvement over the present transmission planning TPL standards. However, the TPL-001-1 standard needs further improvement in several areas before the NYSRC can vote to approve the standard, as follows:</p> <ol style="list-style-type: none"> 1. The standard requires annual assessment of the system regardless of whether system conditions are essentially unchanged from year to year. This may require unnecessary study work. 2. Testing requirements are rigidly defined in the standard, but specifically what is to be tested is loosely defined. 3. The standard requires analyses of a specific list of sensitivities. Instead, the standard should provide a list of suggested sensitivities and allow the planning entity to use its judgment to study those sensitivities that may be more pertinent to its system. 4. The standard requires stability models to represent the dynamic behavior of loads, considering the behavior of induction motor loads. New York has not modeled dynamic loads, and such modeling has never been benchmarked. For many years, simulations of actual system disturbances have been represented with excellent accuracy, without modeling loads dynamically. 5. The definition of BES (100kv bright line) is uncertain at this time. Therefore, until this definition and its application is resolved, it is not possible to know - without a clarifying provision in the standard - which portion of a system that presently has a performance based methodology, such as the New York State Power System, is subject to the TPL-001-1 standard.
<p>Response: 1. The intent of the SDT wasn't that annual studies are required but that an annual Planning Assessment is required. However, the SDT agrees that the words may have been somewhat confusing. Therefore, the SDT has clarified the wording of Requirement R2 and part 2.1.</p> <p>Requirement R2 - Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>Requirement R2, part 2.1 - The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, part 2.6, as follows:</p> <ol style="list-style-type: none"> 2. What needs to be tested is the transmission system that is under the purview of the Planning Coordinator or Transmission Planner. 3. The SDT has made clarifying changes to Requirement R2, part 2.1.4 to address your concerns. <p>Requirement R2, part 2.1.4 - For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to</p>

<p>demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <p>4. The SDT assumes that you are referring to the induction motor Load modeling required for Stability studies. The standard permits an aggregate model assumption that can be applied for a given system that is not substation specific. Dynamic load modeling is important for correct dynamic simulations. Industry has acknowledged the need for accurate Load modeling and the SDT has codified this need in the proposed standard. No change made.</p> <p>5. The SDT does not believe that it needs to define BES. In its March 18th orders, FERC suggested a continent-wide definition of BES. No change made.</p>				
James Armke	Austin Energy	1	Negative	The proposed TPL-001-1 Standard needs to be revised regarding the comments submitted by Ameren, Duke, and JEA.
<p>Response: Please see responses to Ameren, Duke, and JEA.</p>				
Silvia P Mitchell	Florida Power & Light Co.	6	Negative	<p>The SDT has addressed many of the gray areas of Draft four in their consideration of comments however these comments are not part of the Standard that is currently out for ballot. Incorporating these type of clarifying comments in the Standard with the use of footnotes to clarify the intent would be a significant improvement for anyone interpreting the Standard including an auditor or investigator.</p> <p>The definition of Year One is an unnecessary departure from the planning practices used in most of the Eastern Interconnection. It is recommended the phrase end of the current calendar year be changed to the current calendar year. This change will allow PAs to begin their near term analysis with either next year or the year after as deemed appropriate.</p> <p>The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Providing a quantitative cap in non-consequential load loss such as 100 MW may be a rational compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss.</p> <p>Absent this, the 60 calendar month phase in period described in the Introduction section is too short for transmission facilities rated above 300 kV. Approval and permitting of EHV transmission lines is</p>

Voter	Entity	Segment	Vote	Comment
				<p>extremely difficult and time consuming in most parts of the Eastern Interconnection.</p> <p>The phrase any material changes used in requirement R.2.6.2 will effectively cause all Planning Authorities to run all studies every year regardless of minor changes in the model. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes.</p> <p>The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counterproductive. Requirement 2.5 represents a significant expansion of Stability Studies into the Long Term horizon. In many cases the stability issue in long term scenarios will be with the response of new generating plants to fault scenarios such as a breaker failure event. The protection upgrades needed to mitigate performance issues are easily accomplished in the short term. The uncertainty of compliance judgment of rationale documentation will force a tremendous amount of unnecessary study work. It is recommend Requirement 2.5 be removed.</p> <p>We concur with the SDT's opinion expressed in the most recent consideration of comments that the individual component level evaluation of protection systems and redundancy requirements should be covered under the PRC standards and that the intent of the protection failure contingencies specified in Table 1 is to simulation the failure of a single protection scheme. The event description for the P5 contingency was revised in draft 5 but it continues to reflect a range of protection component failures that greatly exceed the intent of the SDT. The term Protection System is in direct conflict with the intent of the SDT, as it is defined in the Glossary to include components such as station batteries. The term Protection System should be replaced with Protection Scheme in Table 1.</p> <p>Requirement 4.3.1 can be interpreted to require dynamic simulation analysis of multiple fault event scenarios for transmission lines with high speed reclosing enabled. This additional analysis may be advisable for certain rare special situations but is unnecessary and burdensome as a general requirement for transmission planning contingency analysis. As such, requirement 4.3.1 will discourage application of high speed reclosing. This would be an unfortunate outcome given the benefits of high speed reclosing both for transmission reliability and customer power quality. It is recommended that 4.3.1 be reworded as follows; Simulate the operation of Protection Systems and other automatic controls as they would be expected for each contingency.</p> <p>The SDT has indicated in their responses to previous comments on requirement R4.3.3 that generic relay models could be used for screening purposes. While we agree with this as a practical method,</p>

Voter	Entity	Segment	Vote	Comment
				the language of R4.3.3 could be interpreted to require explicit modeling of all protection and controls which is neither practicable nor an effective use of engineering resources. It is recommended that R4.3.3 be deleted.
<p>Response: The SDT has made every attempt to fully clarify the intent of the requirements in response to official specific comments. Without specific references, the SDT is unable to act on your comment. No change made.</p> <p>Based on your comment and those of others, the SDT has revised the definition of Year One.</p> <p>Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.</p> <p>The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. Christopher Plantev	Integrus Energy Group, Inc.	4	Negative	<p>The Standard is moving in the right direction, but the following concern is preventing us from voting "affirmative". The timeframe of 60-months (5 year) for implementing Corrective Action Plans (CAP), is insufficient. We believe that the implementation timeframe must be extended to seven (7) years.</p> <p>Requirement 2.7.3, which covers situations that arise beyond the control of the Transmission Planner (TP) or Planning Coordinator (PC), but the proposed language is ambiguous. An auditor could identify many things that could reasonably be within the "control" of a TP or PC but are not covered by NERC standards or a TP / PC's process, procedures or criteria. This discretion leaves entities open to possible non-compliance violation based on an auditor's perception of what they believe should be in the TP / PC's control. In addition, the concept of "control" must be limited to an entities' compliance obligation as a Transmission Planner and/or Planning Coordinator. In other words entities must be allowed the ability identify situations which fall under its "control" as a Transmission Owner, Transmission Operator, Generator Owner or Generator Operator etc. but is beyond the responsibility of its Transmission Planner or Planning Coordinator functions.</p>
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. <p>demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p>				
<p>If an entity can demonstrate that it has made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p>				
Thomas J Trickey	Lakeland Electric	5	Negative	The timeframe of 60-month (5 year) for implementing Corrective Action Plans (CAP), is insufficient, recomend that the implementation timeframe be extended to seven (7) years.
<p>Response: The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p>				
Greg Lange	Public Utility District No. 2 of Grant County	3	Negative	<p>There appears to be many questions about the correct planning long-term horizon. This alone is enough to vote no and ask the drafting team to reconsider that language and their thought process.</p> <p>Grant also has an issue with section 2.1.5. We are struggling with the phrase "major Transmission equipment" and the example of "a transformer". We think it is very important for equipment that is necessary for bulk transfers on the system or one that if lost would cause harm to a neighboring system to be considered in this planning standard. We don't believe a BPS standard should force prescriptive behavior onto an entity, for customer service issues. If the loss of a transformer only impacts local load, this standard should not contemplate or prescribe what the local entity should do. This leaves to much interpretation up to the auditor. The standard could easily become. "You must have spare transformers in inventory to pass compliance with this requirement".</p> <p>Grant is aware that this standard in version zero addressed customer load. Shame on us for not being more proactive and correcting that issue then. We have a new opportunity to correct it now and we would like to see it done. This and all standards should leave local customer service issues alone and concentrate on performance of the major transfers between generation and large load centers. This is not to say that our utilites will choose to leave load off for a year, just that the decision for how to solve this local problem should remain local.</p>
<p>Response: The SDT is unaware of many questions being raised on the long term horizon. Without specific comments, the SDT is unable to address your concern. No change made.</p>				
<p>The SDT has clarified the requirement based on your comments and those of others.</p>				

Voter	Entity	Segment	Vote	Comment
<p>Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment</p> <p>FERC has been quite clear that this standard needs to address the issue of Non-Consequential Load Loss. The SDT has added footnote 12 to address your concerns.</p> <p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p>				
Mace Hunter	Lakeland Electric	3	Negative	<p>There are two requirements in this Standard that could be interpreted in many different ways and will greatly complicate dynamic simulation studies.</p> <p>4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention while also considering the impact of successful or unsuccessful high speed reclosing.</p> <p>4.3.3. Simulate the impact of transient swings on Protection System operation for Transmission lines and transformers.</p> <p>Most problematic is 4.3.3 which can be interpreted as requiring discrete models of all relays protecting transmission lines and transformers. This is an impossible task. Developing explicit relay models for simulations of even a small subset of BES equipment would be an enormous engineering effort with little or no benefit. The SDT's response to this criticism is, "This does not necessarily require modeling of specific relays. Some dynamic simulation programs include a generic relay model which can easily be applied to every branch in the simulation. If this model shows impedance swings in a branch element, then either take action according to the generic model results or investigate the characteristics of the relays actually used on that line." There are two problems with this response. First, if the SDT wishes to allow for the use of screening methods then this allowance needs to be part of the Standard language. The Standard development comments and responses have no standing once the Standard is approved by FERC as law. A narrow, strict interpretation of the Standard based on requirement language is to be expected from auditors and investigators. A second problem with the above SDT response is that applicability of generic models is subject to technical challenge. The generic model available within PSS/E sets up circular characteristics for each branch element that are fixed percentages of the branch impedance. These fixed, non adjustable percentages are 46% for zone A, 75% for zone B and 110% for zone C. These generic reaches are significantly smaller than loadability limits allowed under the PRC-023-1. The intent of Requirement 4.3.3 would be better served if reworded as follows; "R4.3.3 Consider the impact of dynamic swings on protection systems and model protection operation where appropriate" Requirement 4.3.1 can be</p>

Voter	Entity	Segment	Vote	Comment
				<p>interpreted to require dynamic simulation analysis of multiple fault event scenarios for transmission lines with high speed reclosing enabled. This additional analysis may be advisable for certain rare special situations but is unnecessary and burdensome as a general requirement for transmission planning contingency analysis. As such, requirement 4.3.1 will discourage application of high speed reclosing. This would be an unfortunate outcome given the benefits of high speed reclosing both for transmission reliability and customer power quality. It is recommended that 4.3.1 be reworded as follows; "4.3.1 Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each contingency."</p>

Response: The SDT has modified the requirement to address your concern.

Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Successful high speed reclosing and unsuccessful high speed reclosing into a Fault.
- Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
- Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

The SDT has revised Requirement R4, part 4.3.1, bullet #3 to address this concern.

Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Successful high speed reclosing and unsuccessful high speed reclosing into a Fault.
- Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
- Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

Larry Akens	Tennessee Valley Authority	1	Negative	<p>TVA appreciates the work of the ATFN drafting team over the last several years in drafting this new standard. TVA does have concerns on several issues that need to be corrected as we move forward with this standard. Therefore TVA is voting "Negative" on this proposed standard due to the following issues:</p> <p>1. TVA believes that the 5 year implementation plan allowed for "Raising the bar" facilities does not allow sufficient time for TVA to construct the required new facilities. TVA average time for constructing a new 500-kV line is approximately 7 to 10 years, given the lead time on ROW and following all NEPA requirements. If the 5 year implementation plan is not increased, TVA is also concerned about the extensive outages that must take in upgrading 500-kV facilities in order to meet the 5 year requirement. This would require multiple 500-kV outages in the same timeframe which could have a detrimental effect on the overall Bulk Electric System reliability during this construction phase. TVA does understand that the team has added language regarding the TP or PC inability to get the projects completed through no fault of its own; however, there is no guarantee that TVA will be found compliant if all the work cannot be accomplished in this time frame.</p>
George T. Ballew	Tennessee Valley Authority	5	Negative	<p>2. TVA believes that the footnotes b and c that allow for local load drop in the current TPL standards should still be allowed. TVA understands that this is addressed in FERC Order 693; however, the capital improvements to fix many of these issues will have no overall reliability gain for the Bulk Electric System.</p>
Marjorie S. Parsons	Tennessee Valley Authority	6	Negative	<p>3. TVA is concerned that no generating unit shall pull out of synchronism for Planning Event P1, while the standard does allow generator runback/tripping for the same event. TVA believes that this requirement is overly burdensome without providing any material improvement in system reliability. Additionally, R4.1.1 directly conflicts with Table 1, Note a (applicable to both Steady State & Stability) which states "Consequential Load as well as generation loss is acceptable as a consequence of any planning event ... excluding P0." TVA strongly suggests that this loss of synchronism be allowed for P1 or at least add the ability to trip these units for this P1 event by out of step relaying - since other means of tripping the units are allowed - such as thru the use of other actions including Special Protection Schemes as long as the instability does not spread beyond a local area.</p> <p>4. TVA is concerned with the inclusion of battery failures being included in event P5. P5 states "Multiple Contingency Fault plus Protection System failure to operate". TVA understands that the drafting team believes that batteries are not intended to be included in this event; however, station batteries are presently included in the NERC Glossary definition of "Protection Systems." TVA believes that specific language excluding batteries is required for this P5 event in order to prevent future compliance issues regarding this.</p>

<p>Response: 1. The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.</p> <p>2. The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.</p> <p style="padding-left: 40px;">12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p> <p>3. The SDT believes that if an entity has a known condition that identifies a generation unit(s) is prone to trip for a single Contingency event then the entity should proactively trip the unit(s) rather than relying on out-of-step protection to trip the unit. The SDT takes this position because of the concern of the possible detrimental effects of loss of synchronism on the overall reliability of the BES. No change made.</p> <p>4. The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p style="padding-left: 40px;">P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p style="padding-left: 40px;">13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p>				
Lee Schuster	Florida Power Corporation	3	Negative	<p>We appreciate the challenging and time-consuming work that has been done by the Standard Drafting Team (SDT) to draft TPL-001-1 according to the specific requests made by FERC in Order 693. We are supportive of planning, constructing, operating and maintaining the most reliable Bulk Electric System (BES) that is reasonably feasible. We believe that collectively the industry has exhibited excellent BES reliability under existing NERC TPL Standards. For this reason and for others detailed below, we will vote "no" on the proposed standard.</p> <p>1. We do not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. This is especially true of EHV projects. Ameren recently stated in an email to the RBB that "[b]uilding a transmission line in Illinois is estimated to take 7 years (84 months) from the time the project is authorized." In our own experience, we have been limited by permitting and local government processes to the extent that even 69 kV, 115 kV and 230 kV line projects are taking longer than 60 months. We therefore agree with Ameren's point that building of a new EHV transmission line can be a very lengthy process. We think that a more</p>
Sam Waters	Progress Energy Carolinas	3	Negative	

Voter	Entity	Segment	Vote	Comment
Wayne Lewis	Progress Energy Carolinas	5	Negative	<p>appropriate time frame would be 84 months, with provisions to limit or waive fines if a Transmission Owner can demonstrate that the implementation process was unavoidably impeded by permitting, environmental or governmental processes.</p> <p>2. As has been stated in all four commenting periods by Progress as well as certain other registered entities, we believe that the requirement prohibiting loss of non-consequential load for events in Table 1 of TPL-001-1 is an inappropriate overreach by the standard into local load quality of service issues that are already adequately regulated by states' Public Service/Utility Commissions, and does not provide any benefit to BES reliability. The approach of prohibiting the shedding of even a single distribution feeder amounts to feeder reliability rather than BES reliability. This approach, if allowed to be in the Standard, may result in unintended negative results in BES reliability. We therefore appeal to the SDT to discuss this issue with NERC and FERC given the numerous utilities that share this concern. The standard should continue to allow Transmission Planners to use discretion regarding loss of non-consequential load.</p> <p>3. Requirement R4.1.1 states in part that "for planning event P1: No generating unit shall pull out of synchronism." This requirement is overly burdensome without providing any material improvement in system reliability. Additionally, R4.1.1 directly conflicts with Table 1, Note (a) (applicable to both Steady State & Stability) which states "Consequential Load as well as generation loss is acceptable as a consequence of any planning event ... excluding P0." Clearly, the intent the TPL-001-1 standard is to maintain the integrity and reliability of the overall grid, not any particular element. In other words, throughout the standard it is acceptable to lose any generator, load, line or other element as long as more wide reaching consequences are precluded (i.e., cascading outages, non-consequential load loss, etc. is not allowed). As written, R4.1.1 would not allow the use of out of step protective relaying as a solution to trip an unstable generator for a P1 event. It does allow tripping of the same generator due to "fault clearing action" (such as for a fault on the generator terminals) or "by a Special Protection System". Therefore the loss of the generator itself must be acceptable. The notion that preventing loss of synchronism events is the only acceptable means of also precluding more widespread (and unacceptable) consequences resulting from the effect of stability swings is not valid. For some generating units (particularly small, remotely located units) these other unacceptable consequences may not even occur. Also, other means, such as out of step blocking of transmission lines applied in conjunction with out of step generator tripping, may be an effective solution. Any of these solutions is allowed for events P2 through P7 in requirement R4.1.2. We recommend that Requirement R4.1.1 be deleted and R.4.1.2 be revised to include events P1 through P7. Given the concerns raised above, we respectfully request that the SDT make the suggested improvements to TPL-001-1 and continue the process toward approval of the Standard.</p>

The SDT takes this position because of the concern of the possible detrimental effects of loss of synchronism on the overall reliability of the BES. No change made.</p>				
Jason L Marshall	Midwest ISO, Inc.	2	Negative	<p>We are voting negative for several reasons.</p> <ol style="list-style-type: none"> 1. We believe Requirement 2, Part 2.1.5 is an administrative requirement that is not consistent with the NERC BOT approved results/performance based standards effort. Furthermore, the additional reliability benefit is not clear to us. 2. We believe that Requirement 2, Part 2.3 should only be implemented when there is another requirement in the PRC standards for Transmission Owners and Generation Owners to supply the necessary protection information. 3. We believe that that Requirement 2, Part 2.4.1 needs to be further clarified that the dynamic behavior of load model is an estimate only based on engineering assumptions. As written now, it is not clear how much deviation is allowed from actual system operation. 4. We believe Requirement 4, Part 4.3.2 should not be implemented until there is a requirement for the Generator Owners/Operators to supply their generator low voltage ride through capability. 5. We believe Requirement 4, Part 4.3.3 should be further refined to clarify that the purpose is to screen zone 3 relay issues. As written now, it appears that zone 3 relays must be modeled in detail because it is not clear that the intent is to only screen potential problems. We are basing our comments on the drafting team's responses to previous comments that they view using generic zone 3 relay models in PSS/E is acceptable.
<p>Response: 1. The SDT disagrees that this is an administrative requirement as it does not state that you must develop a strategy; it states that you must consider the strategy in your planning. Therefore, it has a direct bearing on the reliability of the BES. No change made.</p> <p>2. This standard describes what must be done and not how to do it. The SDT expects that the information cited could be obtained through several different</p>				

Voter	Entity	Segment	Vote	Comment
<p>mechanisms such as delegation agreements or data requests. No change made.</p> <p>3. The SDT has added the word 'expected' to the text to alleviate your concern. Planning models are based on the best information available to the planners at the time of the study and it is well understood that they may not exactly represent actual conditions at any given time. The results of on-going benchmarking and model development activities can be incorporated when those activities yield more representative results.</p> <p>Requirement R2, part 2.4.1 - System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>4. This standard describes what must be done and not how to do it. The SDT expects that the information cited could be obtained through several different mechanisms such as delegation agreements or data requests. No change made.</p> <p>5. In the summary considerations in draft 4 of this project, the SDT indicated that generic relay models can be applied. If this model shows impedance swings in a branch element, then one can either take action according to the generic model results or investigate the characteristics of the relays actually used on that branch. In this draft, the SDT has clarified the requirement for the use of generic relay models.</p> <p>Requirement R4, part 4.3.1 - Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:</p> <ul style="list-style-type: none"> • Successful high speed reclosing and unsuccessful high speed reclosing into a Fault. • Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made. • Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models. 				
Brenda L Truhe	PPL Electric Utilities Corp.	1	Negative	We are voting 'no' on this ballot as this revision proposes to expand contingency requirements beyond traditional planning levels (example - stuck breaker AND protection failure).
Mark A. Heimbach	PPL Generation LLC	5	Negative	
<p>Response: The SDT agrees that new expectations are contained within the requirements aimed at improving BES reliability. An implementation plan has been created to allow for the industry to comply with the new requirements.</p>				
Terry L. Blackwell	Santee Cooper	1	Negative	We disagree with the proposed definition of Year One. We believe that Year One should be the planning window that begins 12-18 months from the start of the current calendar year, and not from

Voter	Entity	Segment	Vote	Comment
Zack Dusenbury	Santee Cooper	3	Negative	the end of the calendar year. We believe that following this modification to the definition would require minimal adjustments to the ERAG MMWG model building process, which we all use as the basis for our planning models. Following the proposed definition would require additional models to be built by the MMWG or lead to holes in the model building effort for both the operating and planning horizons.
Suzanne Ritter	Santee Cooper	6	Negative	<p>SCPSA does not believe that 60 months is a reasonable time period to build transmission facilities to meet the new performance requirements. In an email to the registered ballot body, Ameren stated " Building a transmission line in Illinois is estimated to take 7 years (84 months) from the time the project is authorized." SCPSA agrees with the point that Ameren is making that building of a new EHV transmission line can be a very lengthy process. SCPSA thinks that a more appropriate time frame would be 84 months.</p> <p>SCPSA believes that the requirement prohibiting loss of non-consequential load for P1, P2.1 and P3 events is an overreach by the standard into local load quality of service issues, does not provide any real benefit to Bulk Electric System (BES) reliability, and may have unintended negative consequences on reliability. Often, corrective actions to mitigate these events are local in nature and only require minor additional loss of local load to avoid major projects. The standard should continue to allow Transmission Planners to use discretion regarding loss of non-consequential load, such that Transmission Planners, customers, and local regulators jointly control the decision making when BES reliability is not an issue. The transparency requirements of the new standard facilitate this type of decision making. In addition, the prohibition on non-consequential load loss for these events creates an incentive for Transmission Planners to remove lines serving load from network (serve the loads radially) so that they are characterized as consequential load. The unintended consequence of the standard would be a reduction in reliability for service to local load.</p>

Response: Based on your comment and those of others, the SDT has revised the definition of Year One.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order.

The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.

Voter	Entity	Segment	Vote	Comment
<p>12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.</p>				
Thomas C. Mielnik	MidAmerican Energy Co.	3	Negative	We find P5, Multiple Contingency (Fault plus Protection System failure to operate) to be confusing. What analysis is required for this? Analysis of individual Protection System component failures or something else? Do the benefits justify this requirement?
<p>Response: The SDT has changed the text for the P5 event as a result of your (and others) comments to address these concerns.</p> <p>P5. Delayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for a Fault on one of the following:</p> <p>13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).</p>				
Ajay Garg	Hydro One Networks, Inc.	1	Negative	We thank the Standard Drafting Team for their long and dedicated effort to develop this standard. At this time, Hydro One has decided to cast a negative vote with the following comments:
Michael D. Penstone	Hydro One Networks, Inc.	3	Negative	<p>1. Note 3 in Table 1 refers to EHV Facilities (above 300 kV) and HV (300 kV and lower voltage systems) The standards uses this threshold to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss. We suggest the following be added to this note: "In the region(s) or area where there is a performance based methodology in place to determine Bulk Electric System (BES) elements (e.g. NPCC), only the BES portion of the system is subject to the Standard."</p> <p>2. The Standard repeatedly uses the capitalized term "Firm Transmission Service (FTS)." The NERC Glossary of Terms defines FTS as "The highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption." We believe that the use of this term and that of "Transmission Service" in TPL-001-1 should be revised as they do not have the same meaning in all jurisdictions. A clarification within the standard will eliminate this confusion.</p> <p>3. The Effective Date Section in the proposed standard gives a time of 60 months to implement certain Corrective Actions. We believe this Standard should not explicitly define timelines (5 years in this case) for transmission projects. Regulatory approvals for new or modified transmission systems may take a significant time in some jurisdictions. We suggest changing the wording to say that Transmission mitigation measures for the reliability of the Bulk Electric System must be implemented as soon as practical exercising due diligence. Progress of and/or delays associated with critical project(s) impacting BES reliability should be submitted to the respective regions and NERC. We recognize that Requirement 2.7.3 covers situations that arise beyond the control of the Transmission Planner (TP) or Planning Coordinator (PC), but we believe that the proposed 60 months timeline</p>

Voter	Entity	Segment	Vote	Comment
				should be removed.
<p>Response: This standard applies to the BES. If there are areas of your system that are not BES, then the standard doesn't apply to them. This would be true even if those elements are above 300 kV. No change made.</p> <p>The SDT reviewed the use of Firm Transmission Service and believes that the term is used correctly in the standard. No change made.</p> <p>The SDT has changed the majority of the implementation timeframe from 60 to 84 months as per your (and others') suggestion. Since problems may not be seen until after the assessments are completed and there is a 24 month implementation for assessments, the total time for items P2-1, P2-2 and P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 KV) has been increased to 84 months. P1-2 and P1-3 were not increased since they are already being covered by the implementation plan for Project 2010-11: TPL Table 1 Order. Requirement R2, part 2.7.3 - If an entity can demonstrate that they have made a best faith effort to implement the planned solution then there should not be a concern. The wording of the requirement allows an entity this flexibility.</p>				
Mark Ringhausen	Old Dominion Electric Coop.	4	Negative	While the SDT has made progress in their changes from the first draft, there are still some areas that need to be clarified. Others are proving more specific comments (PJM) so look for their comments and address.
<p>Response: Please see response to PJM.</p>				

Voter	Entity	Segment	Vote	Comment
Richard Salgo	Sierra Pacific Power Co.	1	Negative	<p>While we greatly appreciate the work of the SDT, and feel that this Standard has achieved significant improvement, there are a number of issues precluding our approval as written:</p> <p>Spare Equipment: need a clarification on what the "assessment" of the impact of equipment availability entails. For instance, is the assessment a simple narrative of the necessary operational mitigation, engineering analysis of the impact, or on the other extreme, is it a full repeat of the NERC study work for all potential permutations of long lead-time equipment?</p> <p>We have difficulty accepting the language regarding the loss of non-consequential load. As written, this creates a disincentive for the implementation of incremental reliability improvements in the network; ie, creation of a parallel path that does not fully provide redundancy to load service would drive a violation of the requirement.</p> <p>Lastly, the treatment of firm transmission service from the standpoint that it cannot be curtailed under various contingencies is problematic. As written, it would appear that the single-contingency loss of a contract transmission path would require continuance of the firm transmission service via some alternate parallel path. Such methodology would require all such paths to have redundancy via parallel transmission or result in dramatic reductions in transfer ratings.</p>

Response: The SDT has clarified the wording of the requirement and believes that this will address your concern.

Requirement R2, part 2.1.5 - When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

The SDT has added footnote #12 to P1, P2-1, and P3 to address your and others concerns in this area.

12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.

Footnote 9 states the conditions for when Firm Transmission Service may be curtailed. If what you are describing is actually Conditional Firm, then see footnote 4. No change made.

Unofficial Comment Form for Informal Comment Period on 5th Draft of Standard TPL-001-2 — Assess Transmission Future Needs (Project 2006-02)

Please **DO NOT** use this form. Please use the [electronic form](#) located at the link below to submit comments on the 5th draft of the TPL-001-2 standard for Assess Transmission Future Needs (Project 2006-02). The electronic comment form must be completed by **September 2, 2010. This is a 30-day informal comment period.** That means that for each question asked on this comment form:

- The drafting team will provide a summary response to indicate whether stakeholders who submitted comments support the modification made to the standard following the initial ballot.
- The drafting team will identify any additional modifications made to the standard based on stakeholder comments submitted in response to that question.
- The team will not provide a response to each individual comment submitted.

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

Background Information

TPL-001-1 Transmission System Planning Performance Requirements

Comments on the initial ballot of the TPL-001-1 (now TPL-001-2) Transmission System Planning Performance Requirements standard were received from the industry through March 1, 2010. The Drafting Team received feedback on a number of issues, and the SDT appreciates the tremendous industry participation in the ballot process. Below is a brief overview of the 5th draft of the standard highlighting areas where the SDT made changes based on stakeholder feedback from the initial ballot. The team's objectives remain unchanged - to create a single Transmission planning standard: 1) with clear, concise requirements set at an appropriate level to ensure reliability, and 2) that fully addresses all issues raised by FERC Orders 693 and 890, and industry inputs, including the SAR scope document.

5th Draft Overview:

1. The Implementation Plan has been revised to provide more time for entities to become compliant.
2. The definition for Year One was changed and an example provided to clarify the intent of the SDT.
3. The following requirements were changed:
 - a. R1 – To provide a reference for normal system conditions.
 - b. R2 – To indicate that 'qualified' past studies can be utilized.
 - c. R2, Part 2.1 – To indicate that 'qualified' past studies can be utilized.
 - d. R2, Part 2.1.4 and Part 2.4.3 – To clarify the sensitivity analysis.
 - e. R2, Part 2.1.5 – Semantic change for clarity.
 - f. R2, Part 2.4.1 – Clarification of what is expected for dynamic load models.

Unofficial Comment Form for Assess Transmission Future Needs (Project 2006-02)

- g. R2, Part 2.5 – Clarification of what is meant by ‘material’.
 - h. R3, Part 3.3.1 & R4, Part 4.3.1 – Semantic re-arrangement of conditions for clarity.
 - i. R3, part 3.5, R4, part 4.4, & R4, part 4.5 – Semantic change for clarity.
4. Header note changes:
- a. Semantic change for clarity in ‘a’.
 - b. Deletion of redundant phrasing in ‘e’.
 - c. Move of ‘j’ to ‘a’.
5. Performance table changes:
- a. Addition of footnote 12 reference in P1, P2-1, and P3.
 - b. Description change in P5 and addition of footnote 13 for relay reference.
6. Extreme event – steady state 2d – Addition of ‘generating’ for clarity.
7. Footnote changes:
- a. #11 – Specific references supplied.
 - b. #12 – Clarification of Non-Consequential Load Loss (pending resolution in Project 2010-11).
 - c. #13 – Relay references supplied.
8. Measurement changes:
- a. M6 – Matching language to requirement.
 - b. M8 – Semantic change for clarity.
9. R8 VSL – Semantic change for clarity and strict adherence to guidelines.

Unofficial Comment Form for Assess Transmission Future Needs (Project 2006-02)

The SDT is interested in tracking comments to the changes made in response to the initial ballot comments and thus has asked only questions that refer solely and directly to those changes.

1. The SDT has revised the Implementation Plan based on industry comments to the initial ballot. Do you support this change? If you do not support this change, please specify why you disagree and include specific alternative language to resolve your concern.

Yes

No

Comments:

2. The SDT has revised the definition of Year One based on industry comments to the initial ballot. Do you support this change? If you do not support this change, please specify why you disagree and include specific alternative language to resolve your concern.

Yes

No

Comments:

3. The SDT has revised the Requirements language based on industry comments to the initial ballot. Do you support these changes? If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Requirement R1 – normal conditions:

Yes

No

Comments:

- 3.1 Requirement R2 and Part 2.1 – past studies:

Yes

No

Comments:

- 3.2 Requirement R2, Parts 2.1.4 & 2.4.3 – sensitivity analysis:

Yes

No

Comments:

- 3.3 Requirement R2, Part 2.4.1 – dynamic load models:

Yes

No

Comments:

- 3.4 Requirement R2, Part 2.5 – material clarification:

Yes

Unofficial Comment Form for Assess Transmission Future Needs (Project 2006-02)

No

Comments:

4. The SDT has revised the header notes based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Yes

No

Comments:

5. The SDT has revised the performance table (including the list of extreme events and footnotes) based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Yes

No

Comments:

6. The SDT has revised the Measures based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Yes

No

Comments:

7. The SDT has revised the Requirement R8 VSL based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Yes

No

Comments:

Implementation Plan for TPL-001-1

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-1 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-1, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-1 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Except as indicated below, all Requirements and associated parts shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-1. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-1 and NERC's Rules of Procedure, Section 800. However, during this 24-month period, all aspects of TPL-001-0 through TPL-006-0 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-1 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-1 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon will be provided as follows:

- For 84 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption, Corrective Action Plans applying to performance elements P1-2 and P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element), P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service (in accordance with Requirement R2.7.3) that would not otherwise be permitted by the requirements of TPL-001-1.

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Implementation Plan for TPL-001-1

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-1 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-1, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first ~~year~~ twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. ~~This is further defined as the planning window that begins 12-18 months from the end of the current calendar year~~ For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-1 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Except as indicated below, all Requirements and associated parts shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-1. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-1 and NERC's Rules of Procedure, Section 800. However, during this 24-month period, all aspects of TPL-001-0 through TPL-006-0 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-1 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-1 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon will be provided as follows:

- For ~~60~~84 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption, Corrective Action Plans applying to performance elements P1-2 and P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element), P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service (in accordance with Requirement R2.7.3) that would not otherwise be permitted by the requirements of TPL-001-1.

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this fifth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Post fifth version of standard.	3Q10
2. Conduct ballot	TBD
3. Respond to comments and determine next step	TBD
4. Submit standard(s) to BOT.	2Q11
5. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

- For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:
 - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P2-1, P2-2 (above 300 kV)
 - P2-3 (above 300 kV)
 - P3-1 through P3-5
 - P4-1 through P4-5 (above 300 kV)
 - P5 (above 300 kV)

B. Requirements

- R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes the normal system condition in Table 1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- 1.1.** System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 2.1.** The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6, as follows:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of planned Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

- 2.2.** The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
- 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4.** The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
- 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2. System Off-Peak Load for one of the five years.
- 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5.** The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6.** Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

- 2.6.2. For steady state, short circuit, or Stability analysis: the System represented in the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Such actions may include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.
- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

- 2.8.** For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
- 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.
- R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- 3.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3.** Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4.** Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
 - 3.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for

evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

- R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3.** Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
- Successful high speed reclosing and unsuccessful high speed reclosing into a Fault.
 - Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
- 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.
- 4.4.** Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

- 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and that functional entity submits a written request for the information. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²

	4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes	
P7 Multiple Contingency (Common Structure)	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.

<ul style="list-style-type: none">i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.ii. Loss of the use of a large body of water as the cooling source for generation.iii. Wildfires.iv. Severe weather, e.g., hurricanes, tornadoes, etc.v. A successful cyber attack.vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. <p>b. Other events based upon operating experience that may result in wide area disturbances.</p>	<p>f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances</p>
---	--

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. Curtailment of Firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Demand. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity who has indicated a reliability need and that functional entity has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying any criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None.

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6. The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-1	Not employed due to scope of revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this fifth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Post fifth version of standard.	3Q10
2. Conduct ballot	TBD
3. Respond to comments and determine next step	TBD
4. Submit standard(s) to BOT.	2Q11
5. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first ~~year~~ [twelve month period](#) that a Planning Coordinator or a Transmission Planner is responsible for assessing. ~~This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.~~ [For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.](#)

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-~~1~~²
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**

4.1. Functional Entity

4.1.1. Planning Coordinator.

4.1.2. Transmission Planner.

5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

- For ~~60~~⁸⁴ calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-~~1~~², Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, ~~part~~^{Part} 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-~~1~~²:
 - P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
 - P2-1, P2-2 (above 300 kV)
 - P2-3 (above 300 kV)
 - P3-1 through P3-5
 - P4-1 through P4-5 (above 300 kV)
 - P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. [This establishes the normal system condition in Table 1.](#) [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

- 1.1. System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 2.1. The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following current ~~current~~ studies, ~~supplemented with or~~ qualified past studies as indicated in Requirement R2, part Part 2.6, as follows:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled, ~~as~~ in Requirement R1, ~~part Part~~ 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, ~~parts~~ Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions ~~not already included in the studies~~ by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of planned Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed studied. The Planning Assessment studies shall ~~reflect~~ be performed for the P0, P1, and P2 categories identified in

Table 1 ~~during~~with the conditions that the System is expected to experience ~~due to~~during the possible unavailability of the long lead time equipment.

- 2.2. The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, ~~part~~Part 2.6:
 - 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, ~~part~~Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4. The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, ~~part~~Part 2.6. The following studies are required:
 - 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, ~~considering~~ the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
 - 2.4.2. System Off-Peak Load for one of the five years.
 - 2.4.3. For each of the studies described in Requirement R2, ~~part~~Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions ~~not already included in the studies~~ by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5. The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, ~~part~~Part 2.6, and shall include documentation to support the technical rationale for determining material changes.
- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: the System represented in the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, ~~part~~Part 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Such actions may include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, ~~part~~Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.
- R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, ~~part~~Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, ~~part~~Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, ~~part~~Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, ~~part~~Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - ~~3.3.2.~~• Tripping of generators where simulations show generator bus voltages or high side of the ~~G~~eneration ~~S~~tep ~~U~~p (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - ~~3.3.3.~~• Tripping of Transmission elements ~~when~~where relay loadability limits are exceeded.
 - ~~3.3.4.~~3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, ~~part~~Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

- 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list ~~created~~ of those events to be evaluated ~~for System performance~~ in Requirement R3, ~~partPart~~ 3.2-~~created~~. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, ~~partPart~~s 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, ~~partPart~~ 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, ~~partPart~~ 4.5.
- 4.3. Contingency analyses for Requirement R4, ~~partPart~~s 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
- ~~while also considering the impact of s~~Successful high speed reclosing ~~or~~and unsuccessful high speed reclosing into a Fault.
 - 4.3.2.• Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - 4.3.3.• SimulateTripping of Transmission lines and transformers ~~the impact of~~where transient swings ~~on~~cause Protection System operation ~~for~~ Transmission lines and transformers based on generic or actual relay models.
- 4.3.4.4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers,

static var compensators, power flow controllers, and DC Transmission controllers.

- 4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated ~~for System performance~~ in Requirement R4, ~~part~~Part 4.1-~~created~~. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
 - 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated ~~for System performance~~ in Requirement R4, ~~part~~Part 4.2-~~created~~. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and ~~any~~ functional entity that has a reliability related need and that functional entity submits a written request for the information. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- 8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. ~~BES Transmission voltage instability~~, The System shall remain stable. Cascading, and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any ~~planning or extreme~~ event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. ~~For all planning events, p~~lanned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

~~j. Stability Only: The System shall remain stable.~~

- ~~k. j.~~ Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
3. Internal Breaker Fault ⁸	SLG	EHV	No ⁹	No		

Standard TPL-001-42 — Transmission System Planning Performance Requirements

Category	Initial System Condition	(Non Bus-tie)	Fault Type ²	HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie) ⁸		SLG	EHV, HV	Yes
Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (Fault plus stuck breaker ¹⁰)	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie) attempting to clear a Fault on the associated bus	SLG	HV	Yes	Yes
			SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (Fault plus Protection System relay failure to operate)	Normal System	Failure of a single Protection System that results in-Delayed Fault Clearing on due to the failure of a relay¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
			SLG	HV	Yes	Yes
P6 Multiple Contingency (Two	Loss of one of the following followed by System adj. ⁹ : 1. Transmission Circuit	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes

overlapping singles)	2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line					
	4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes	
P7 Multiple Contingency (Common Structure)	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a [generating](#) station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a Protection System failure resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.

<ul style="list-style-type: none">i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.ii. Loss of the use of a large body of water as the cooling source for generation.iii. Wildfires.iv. Severe weather, e.g., hurricanes, tornadoes, etc.v. A successful cyber attack.vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. <p>b. Other events based upon operating experience that may result in wide area disturbances.</p>	<p>f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances</p>
---	--

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-Generator Step Up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. Curtailment of Firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Demand. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure ([Planning event P7, Extreme event steady state 2a](#)) or common Right-of-Way ([Extreme event, steady state 2b](#)) for 1 mile or less.
12. [Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.](#)
- ~~12,13.~~ [Applies to the following relay functions or types: pilot \(#85\), distance \(#21\), differential \(#87\), current \(#50, 51, and 67\), voltage \(#27 & 59\), directional \(#32, & 67\), and tripping \(#86, & 94\).](#)

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying any criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient, and date; ~~and contents,~~ or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity who has indicated a reliability need and that functional entity has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying any criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

[If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.](#)

1.5 Additional Compliance Information

None.

Standards Announcement

Informal Comment Period Open

August 3–September 2, 2010

Now available at: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Project 2006-02: Assess Transmission Future Needs

The Assess Transmission Future Needs Standard Drafting Team is seeking comments on the following documents **until 8 p.m. EDT on September 2, 2010**:

- Draft five of TPL-001-1 — Transmission System Planning Performance Requirements
- Revised implementation plan

TPL-001-1 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0. The proposed standard includes several new definitions.

This is the fifth comment period for the proposed standard and includes revisions based on industry comments submitted during the initial ballot for the standard and its implementation plan conducted from February 9–March 1, 2010. The team's response to initial ballot comments has been posted for stakeholder review on the drafting team web site.

Instructions

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Courtney.camburn@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>.

Next Steps

The drafting team will draft and post responses to comments received during this period. This is an informal comment period – for each question asked on the comment form, the drafting team will provide a summary response to indicate whether stakeholders support the proposed revision and to identify any additional changes made based on stakeholder comments. The team will not provide an individual response to each comment submitted. After reviewing the comments, the drafting team will determine whether to post the standard for an additional comment period or seek approval from the Standards Committee to proceed to balloting.

Project Background

The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies. TPL-001-1 — Transmission System Planning Performance Requirements is an update and consolidation of the following standards:

- TPL-001-0 — System Performance under Normal Conditions
- TPL-002-0 — System Performance Following Loss of a Single BES Element
- TPL-003-0 — System Performance Following Loss of Two or More BES Elements
- TPL-004-0 — System Performance Following Extreme BES Events
- TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports
- TPL-006-0 — Data from the Regional Reliability Organization Needed to Assess Reliability

More information is available on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

<p>TPL-001-2 Draft 5 is much better than Draft 4. There is still one significant concern, that I do not believe the drafting team adequately addressed. It is unclear as to what "Planning Assessment results" and "results of its Planning Assessment" entail. The Draft 5 response that "Planning Assessment" is a defined term does not fully address this concern. "Planning Assessment results" or "results of its Planning Assessment" is not necessarily the same thing as "Planning Assessment". As written, "Planning Assessment results" or "results of its Planning Assessment" could be anything from a single sentence, to a few brief high level paragraphs, to a detailed and technically complete Planning Assessment. The Standard needs to more clearly state what is required in the report to other entities. Based on the drafting team response in Draft 4, it seems that replacement of "Planning Assessment results" or "results of its</p>

Planning Assessment” with the term “Planning Assessment” or “its Planning Assessment” would be appropriate. Violation Severity Levels: R8 The failure to provide documented responses to documented comments to “Planning Assessment results” is deemed to be a higher severity level than failing to distribute “results of its Planning Assessment”. Failure to distribute denies functional entities an opportunity to comment, and could prevent coordinated planning, and thus should be deemed to be more severe than failing to provide documented responses to documented comments.

Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay ¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay ¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No ¹² ” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”
No
Measure M6 is too vague. It is unclear how to identify the conditions of Cascading, voltage instability, or uncontrolled islanding. The Glossary of Terms defines Cascading as “The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.” Does the loss of system elements have to extend beyond the Control Area to be considered “Cascading”? Is there a Megawatt threshold that must be satisfied? Is there a time duration involved? Also, “cascading outages” needs to be defined. In addition, “voltage instability” and “uncontrolled islanding” should both be defined.
Yes
Individual
Phuong Tran
Lakeland Electric
Yes
Shouldn't the “Implementation Plan for TPL-001-1” document be for TPL-001-2? Also, “TPL-001-1” is referenced throughout the document.
No
“the latest” is not needed from the second sentence of R1, since the sentence already ended with “...shall represent projected System conditions”. R1 Part 1.1.2 Suggest adding this clarification at the end “... six months during the period under study”. This language addition helps clarify the point that if an outage occurs during the summer and the entity's system peak occurs in the winter, then the system peak Load study case (model) does not have to include this particular outage.
No
Please consider removing R.2.6.2
No

A “measurable change in performance” can be interpreted as not meeting one of the performance requirements as specified in Table 1 in order for the condition to be selected as a sensitivity. This will cause utilities to perform sensitivity analysis for all system conditions listed in R2.1.4 to determine which one fails to meet one of the performance requirements in Table 1, as one may not be able to tell performance impact until after the studies are performed. Suggested change: “...one of the following conditions by a sufficient amount...system conditions that may demonstrate a measurable change in system response.”

Yes

No

Please consider removing R2.6.2. The “any material change” language can cause utilities perform studies due to material changes outside of and remote to its system.

Yes

The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. It is our understanding that footnote 9 is under consideration as part of Project 2010-11 and should be noted as such for clarification.

No

please consider remove “the latest” from M1

No

The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.

Tom Duane

PNM

Yes

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection

System operation based on known Protection System response".

Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).
Group
NERC Staff
Mallory Huggins
Yes
NERC staff supports the change to allow Corrective Action Plans to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service for 7 years. This seems long, but staff understands the stakeholder concern that it could take that long to plan, site, and construct facilities required for compliance with the standard.
Yes
NERC staff supports the revisions to the definition of Year One. However, we believe an associated

change should be made where this term is used in part 2.1.1 of Requirement 2 which requires modeling of “System peak Load for either Year One or year two, and for year five.” It seems the new definition of Year One would negate the need to refer to year two. NERC staff recommends that part 2.1.1 be changed to “System peak Load for Year One and for year five.”

No

NERC staff suggests that the added sentence in R1 be deleted and “Normal System” in Table 1 be replaced with “No unplanned Element outages.” We have a problem with R1 establishing “normal system condition.” “Normal” is not defined, but the system condition that most people would define as “normal” is the System operating within its limits. There are no checks required on the projected system conditions to guarantee “operation within limits.” Staff realizes that if this were the case, the categories tested would all pass their respective tests. (In other words, the category tests may define operating limits that in turn define “normal” from a planning perspective.) Thus, the added sentence in R1 should be deleted. In Table 1, the use of the term “Normal System” in the column “Initial System Condition” really means “No unplanned Element outages.” All Elements that do not have a planned outage are assumed in-service (for transmission Elements) or available for dispatch (for generators). Contrast the term “Normal System” with categories P3 and P6, which have the loss of an Element (which is unplanned) followed by the loss of a second Element (also unplanned). “Normal System” should be replaced with “No unplanned Element outages.”

Yes

NERC staff supports the use of qualified past studies for the Near Term horizon.

Yes

NERC staff supports removing the phrase “not already included in the studies” from the parts 2.1.4 and 2.4.3 of Requirement R2. We believe that the requirement is more clear and less subject to interpretation without this phrase.

No

NERC staff understands why the SDT has inserted the word “expected” before “dynamic behavior of Loads,” but we have concerns with this addition. We understand that a PC or TP that models the best current industry understanding of load behavior should not need to worry about compliance if that model does not match actual load response for all possible system conditions. However, we are concerned that this change to part 2.4.1 of Requirement R2 may be too accommodating. If a PC or TP has unrealistic expectations about load behavior, would this permit the use of unrealistic models? While we have struggled to develop an alternative proposal, we hope that the SDT will identify a way to address this concern.

Yes

NERC staff supports inserting the word “material” in the reference to assessing the impact of proposed generation. We have some concern that this change leaves this part of the requirement open to interpretation, but we also understand the need to permit some degree of engineering judgment to be applied. It would not be appropriate to require that every potential generation addition be included in the assessment where some proposed additions may by inspection be deemed to be immaterial due to size and/or interconnection location.

Yes

NERC staff supports the changes to the header notes in Table 1.

NERC staff is concerned with P5 and footnote 9 and thus cannot support these changes in their entirety. First, a revision to the Draft 4 definition of P5 should be used in lieu of the current Draft 5 version: “Loss of multiple elements caused by the Fault clearing consistent with failure of a single Protection System while clearing a fault on one of the following: . . .” After reviewing the P5 contingency throughout various drafts of this standard, along with existing Table 1 for TPL-001 through TPL-004, NERC staff’s primary concern is that this most recent version is going in the wrong direction by becoming too limiting regarding which Protection System component failures are covered. Draft 5 is an improvement because it removes the reference to loss of multiple elements in Draft 4 (which defined P5 as “Loss of multiple elements caused by the failure of a single Protection System while clearing a fault on one of the following: . . .”). Draft 5 takes a step backward, however, by referring to Delayed Fault Clearing. The advantage of not referring to Delayed Fault Clearing is that for cases where redundant protection systems are provided,

the fault clearing may not be delayed even when a single Protection System failure occurs. Ideally, NERC staff believes that P5 should refer to “failure of any component of a Protection System,” but NERC staff recognizes that we cannot get there until the term Protection System is redefined and Project 2009-07—Reliability of Protection Systems is underway. Until that change is possible, NERC staff encourages the SDT to use the revised version of P5 proposed above. A second concern is with footnote 9, which is used numerous times in Table 1. System adjustments may be used in two different settings: the first is to address the aftermath of a particular Contingency; the second is to prepare for the next Contingency. Staff suggests that the current footnote 9 have this language added: “Post-Contingency Ccurtailment of Firm Transmission Service to address the simulated contingency, when coupled with” Footnote 9 is used in the column labeled “Interruption of Firm Transmission Service Allowed” whenever a “No” is provided. The footnote 9 in this column has to do with System adjustments that address the aftermath of the Contingency that is being simulated. Therefore, no footnote 9 appears appropriate for category P0 (No Contingency). The reference in footnote 9 to no load loss and staying within applicable Facility rating, including those on a neighboring system, is sufficient for addressing the aftermath of the Contingency being simulated. To address next Contingency, an additional footnote is needed in the “Initial System Condition” column for category P3 and category P6. The following is suggested: “System adjustments to prepare for the next Contingency must be completed within 30 minutes.” Footnote 9 is used in the column labeled “Initial System Condition” for category P3 and category P6, and these two categories define the loss of an Element “followed by System adjustments” and then followed by the loss of a second Element. It is unclear whether the intent in footnote 9 in these two cases is meant to address the same issue referenced above (i.e. the aftermath of the Contingency being simulated) or whether it is intended to address the next Contingency. Thus, both situations need to be addressed using the suggestions indicated above.

Yes

NERC staff supports the changes to the Measures.

Yes

NERC staff supports the changes to the VSL for Requirement R8.

Doug Hohlbaugh

FirstEnergy

Yes

We appreciate the effort of the standard drafting team and the changes reflected in the current draft of the TPL-001-1 standard. The changes are improvements that should move the standard towards greater industry consensus. The extended Implementation Plan aligns with suggestions in FE’s prior ballot comments. We support the Implementation Plan change made by the team.

Yes

The change in the Year One definition provides greater flexibility for the industry and also addresses a prior FE comment during the 1st ballot. We appreciate the team’s careful consideration of the industry feedback and support the change.

Yes

Yes

Yes

Yes

Yes

Yes

Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay (footnote 13) protecting the Faulted element to operate as designed”. To the extent fully redundant relaying exists with no expected delay in Fault Clearing its understood that the P5 event would not be a concern for the redundant system design. The drafting team has taken appropriate steps within the TPL standard to focus on relaying failures to provide clarity in what is required for P5 planning event.

Yes

Yes

John Collins

Platte River Power Authority

Yes

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.

Yes

Yes

No

I like that you have requirements for qualifying past studies, but Part 2.6.2 is confusing. Please change Part 2.6.2 to read something like: “For steady state, short circuit or Stability analysis: no material changes have occurred to the System represented in the study or, if material changes have occurred, a technical rationale can be provided to explain that the changes do not impact the performance results in the study area.”

Yes

Yes

For consistency, use the qualifier “expected” in the second sentence of Part 2.4.1 also, such that it reads “...represents the overall expected dynamic behavior...”

Yes

I like the flexibility you give the PC and TP to define what ‘material’ means in their ‘documentation to support the technical rationale for determining material changes.’ In Part 2.5 this rationale will decide whether or not any Long-Term Stability studies are required for the Planning Assessment. And in Part 2.6.2 this rationale will be a factor in qualifying a past study.

Yes

I like the flexibility you give the PC and TP in Requirements R3 and R4 to develop their rationale for the Contingencies they select for evaluation.

No. Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize

the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No¹²" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). In Table 1 – Planning Events – Suggest changing the description for Events P2-3, P2-4, P4 and P4-6 to use the term 'Bus-tie Breaker' or 'non-Bus-tie Breaker' as applicable. In Table 1 – Extreme Events – Stability – Items 2a-2d, do you mean 'Protection System failure' here, or do you want to change to 'relay failure' to be consistent with changes in P5?

Yes
Comments: We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.

Allowing the use of past studies in lieu of new studies for part or all of an assessment when the underlying system hasn't changed in a significant change if very prudent. However the wording in 2.6.2 of "unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area" is of concern. By this wording is it intended that the planner must demonstrate that every material change has no impact? In essence doing more work to prove that a study isn't required then the study would take? Or that the planner must essentially have a technical rationale (overarching) for determining when a material change is "material enough" to impact system performance?
No
What is meant by "measurable change in performance"? Is this a measure that the sensitvity should move the system from meeting the performance requirements to not meeting the performance requirements? Or just a measurable change in system response, IE the loading was 45% on this corridor but is now 76%.
Yes
No
I agree with what I think is the intent. The word "Material" is meant to allow for changes in model to occur that are "small" relative to the TP/PC. For example the 400 MW generator that might be built in 10 years by another utility over a hundred miles, several dozen buses and generators away to not force new study work. However as written in 2.5 it requires you to define what a material change is, and could be applied to mean every change must be identified and explained rather than an overarching rationale that would only have you looking for changes that meet the material criteria. But then in 2.6.2 the word material is used with no obligation to explain what material is, only to explain if a material change would not impact the results in a study area. I recommend leaving the term material, but setting a requirement, measure, or definition that requires the TP/PC to define what they consider material specific to their system and circumstance. Since this will by the hetreogenous nature of the grid be different for each it may not be reasonable to pre-define what is realibale. Just as was done with many items in the ATC (MOD) standards, require that it be documented and questions on that rationale be answered. If a specific level

of technical oversight is desired, consider requiring that description to be on file with the regional entity and approved by their planning committee. I think the team is heading in a good direction, it's just how the words will be applied that concern me. This may be a case where an Example or two would go a long way towards providing guidance to entities and auditors.

Yes

I am assuming you mean the header notes on the performance table

I generally agree with the direction the team has gone. Footnote 9 should also be highlighted as being part of the project 2010-11 discussion just as footnote 12 is.

Yes

No

R8 should require that the PC and TP make available it's planning assessment results when requested, rather than requiring the preemptive transmittal. There is no reliability purpose served by providing unsolicited information.

The last two sentences "System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable." belong in the MOD standards. They are not required in TPL-001-2.

No

Adding the word "material" does not clarify Part 2.5. The word "material" can be interpreted in many ways and is subjective. In order to have a consistent approach by all TPs, the drafting team should add a definition of the term "material". One TP may consider a new 200 MW unit as not being material because there are several larger units in the TPs system.

Yes

In point g, violations are noted in terms of post-Contingency voltage deviations rather than post-Contingency voltage limits. This may lead to confusion, as some utilities evaluate performance based on a post-Contingency voltage deviation criterion while other utilities evaluate performance based on post-Contingency voltage limits. This same comment applies to Requirement R5. Suggested rewording for point g: System steady state voltages and post-Contingency voltages or voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. Suggested rewording for the first sentence in Requirement R5: Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltages or voltage deviations, and the transient voltage response for its System. Note 12 states that an outstanding issue related to non-consequential load loss is being discussed. This will create a lot of uncertainty. Manitoba Hydro could not support this standard unless the resolution of Note B is known.

Requirement R1 Part 1.1 and following states "System models shall represent:... 1.1.5. Known commitments for firm Transmission Service and Interchange. It was commented during a previous posting that 1.1.5 should be reworded to read: Known commitments for Firm Transmission Service, and, additionally, other types of transactions provided they have been demonstrated to not violate existing reliability constraints. The response was that "The SDT believes that the defined term 'Interchange' covers other transfers as described in your comment. No change made." It is agreed that known Interchanges should be modeled. However, it is imperative that existing reliability constraints not be violated in the process. That is, Interchange relating to economic transactions should not drive planning studies. Reliability related investments should not be driven by congestion related to economic transactions incorporated into planning models. Following is a preferred/revised wording: • 1.1.5. Known commitments for firm Transmission Service and Interchange. Interchange is meant to refer to energy transactions other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever

system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and deemed highly interruptible subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability in adherence to reliability criteria delineated in documents such as TPL-001.

No

The definition of Year One could be eliminated, and its wording used in place of Year One within the text of the requirement. The proposed definition has now added ambiguity with respect to “year two” and “year five” which are not defined. Year two could be deleted and R.2.1.1 modified as follows: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated. Define Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment.

Yes

No

The revisions made to Requirement R2 Part 2.1 appear to resolve the concern that past studies could not be used to comply with the short-term steady state study requirements. This revision must be carried through to other sections (R2.2, 2.2.1). However, the language of Requirement R2 Part 2.2 still seems to suggest that current annual studies are always required for the long-term steady state assessment to be compliant. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1. Regarding R2.2, the language should be consistent with 2.1. For example, use "current or qualified past studies" instead of "the following annual current study". Revisions made to Requirement R2.1.5 have made it worse than was originally drafted. This would require the PC & TP to study (meaning performing a technical analysis) of the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6). R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list, and also suggest revising to “Such actions may include but not be limited to:”.

No

Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited to no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. If an entity does a case with a stressed set of assumptions, is it necessary to do a non-stressed case? Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies “only” if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. If not, a suggested revision to Requirement 2.7.2 as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. In general, the scope of this requirement is too broad and non-specific, and only results in undue study burden. Is it necessary for sensitivity analysis to be included in requirements since in accordance with good engineering practices a conservative approach should be used in studies? The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions as commented in issue #3. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

No
There is insufficient information and experience regarding dynamic load modeling. It may also be included as a “sensitivity” analysis in 3.2, rather than requiring and expecting accurate representation of a dynamic load model. If this requirement is kept, a modeling standard must be written that is specific to dynamic loads. Change belongs in a modeling standard, not in TPL-001.
Yes
No
Header note (i) in the first Table 1 (p. 10) could imply that voltage-varying load shall not be used to meet steady state performance requirements. Steady state load models in use include voltage-varying loads. The explicit representation of (voltage-dependent) load models is perfectly consistent with the requirements defined in R1 (which calls for a comprehensive representation of system components and their expected operating status in the planning assessment period) and the impetus to the creation of more specific load models in dynamic assessments found Requirement 2.4 of this draft of TPL-001-2. It is a known that depressed voltage conditions cause certain system elements to perform below their rated capacity. For example, capacitors provide less voltage support and voltage controlling transformers are impeded by their finite tap range to direct VAR flow into areas affected by low voltage conditions. Certain load types, on the other hand, provide a self-compensating relief to depressed voltage by naturally decreasing demand in a manner proportional to their characteristics, without operator intervention. Choosing to negate the voltage-dependence of one of these system elements (load, in our case) results in an inaccurate system representation that, in turn, may lead to erroneous assessments of the reliability state of the interconnected system and, potentially, to the implementation of unwarranted system upgrades. This note should be revised to only reference loads which are disconnected due to voltage.
To support the change to P5, other items need to also be modified. In Table 1 - Steady State & Stability Performance Extreme Events (p. 12), in the Stability Section, the language should be made similar to wording in P5. Protection System should be removed and replaced with the words “relay failure”. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. Note 11 (p. 14) needs clarification as shown: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less. There are two tables labeled “Table 1”. Suggest that the extreme events table be renamed “Table 2”.
Yes
No
Requirement 8 is an administrative burden to TPs and PCs that adds no value to Bulk Power System reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the VSLs for Requirement 8 remain, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. If Requirement 8 and 8.1 are retained, they should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response and there should be a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. Other comments not addressed by this Comment Form as follows: Section 3.3 - The last sentence of 3.3.1 should be removed. This is addressed in PRC-023. Line ratings are addressed in PRC-

023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded.” Section 4.3 - High speed reclosing is not defined, and to help eliminate any confusion that it may introduce into the standard it will be worthwhile for the SDT to define this term. Several specific examples from previous comments on sensitivity analysis and guidance for base case assumptions: The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements. Requiring extreme event analysis is requiring two layers of event analysis beyond what is required and there is no requirement for corrective action if anything is identified. The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions. As for allowing con-consequential load loss for Categories P1 through P5, suggest approval at the Regional level, with a concept of allowing it in a “local area” that does not impact BPS reliability. All references to 300 kV in document should be replaced with EHV (for example in the Introduction, Section 5). The first phrase of Note 3 on p. 14 should be revised as follows: “Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as those representing the backbone of the System, generally at voltage greater than 300 kV, and high voltage (HV) Facilities defined as those not representing the backbone of the System, as determined by the Planning Coordinator and approved by Regional Entity.”

Yes

With exception of the definitions.

No

The language implies a requirement. The language "Year One must include the forecasted peak Load period for one of the following two calendar years" is a requirement and not a statement of clarification. If the definition is that “Year One” can also be the period used for forecast peak load, then it should be stated so. It is suggested that either the language in the definition is modified or the language is deleted from the definition and moved to the body of the standard.

Yes

No

The question is misleading in that R2 also include current studies. The overall structure of the standard could be greatly improved if the standard were segmented into Near Term and Long Term with sub segments for each specific type of analysis to be performed. Second, the standard does not use consistent terms. The Planning Assessment is to include Near Term and Long Term portions which must have steady state analysis, short circuit analysis, and stability analysis (ref. R2). Requirement R 2.1 introduces sensitivity analysis for the Near Term portion, and then refers to the Planning Analysis which is in reality both Near Term and Long Term portions. That implies that sensitivity analysis must be required for both? The standard repeats the requirement for annual stability studies in 2.4 which was already a requirement for Planning Assessments. The requirement 2.1.5 is one the most problematic requirements in this standard. This requirement implies that an entity must have spare equipment and a strategy to employ it. That is beyond the scope of the Energy Policy Act 2005. Spare equipment is not on-line and does not contribute to the reliability of the existing system. The Energy Policy Act of 2005 specifically prohibits the requirement to enhance or modify the system. The use, application, or requirement to have spare equipment violates that prohibition. This section should be removed. In addition, this requirement suffers from an ability to implement. In the first case, the requirement is invoked if the spare equipment strategy could result in unavailability of transmission equipment. How is that determined? There is no nexus to that determination. The unavailability may have already occurred once the transmission equipment has failed. The only way to avoid unavailability if the transmission equipment that fails has a hot stand-by with automatic fail-over. The presence or not of a suitable replacement will still result in unavailability by virtue of the failure o the first piece of transmission equipment. Next problem, who will second guess the owner of the replacement. Where is the requirement to make the replacement strategy available? The standard should focus on system

performance with existing equipment to meet current and future loads.
No
Sensitivity analysis is not included in R2. This gets back to the structure of the standard. There should a clear indication of the studies that are to be included in the Near-Term and Long-Term portions of the Planning Assessments.
No
Not included in R2. See response to Question 3.2
No
The term "material" is arbitrary. It is suggested that a specific value be used to trigger the assessment.
No
The language implies that the responsible entity may choose to not distribute it if it feels the entity making the request does not have a "reliability related need". It is not clear why that distinction is being made?
Group
Exelon Transmission Planning
Eric Mortenson
Yes
Yes
Yes
Yes
Yes
No
There is not an industry consensus around best practices for modeling the dynamic behavior or characteristics of load. It is premature to make this a requirement in an enforceable standard which would be held to this degree of subjective auditing.
No
The term 'material changes' is subjective. It is very difficult to determine a base case to study combinations of generator additions on a changing transmission network in the 6 to 10 year time period to be used for dynamic simulations. Dynamic studies should be performed whenever new generator interconnections are proposed and it is at that time where meaningful calculations can be performed. The long term six to ten year out dynamic studies for groupings of potential units should be done at a high level, if at all.
Yes
Comments: The term 'HV' in the performance table should be defined as 'Bulk Electric System elements up to 300 kV, not simply all elements 'below 300 kV'. Footnote 12 should be clarified to specifically state the requirements before voting takes place. The performance criteria should be based on the voltage level of the element experiencing stress due to the contingency, not based on the voltage level of the outaged element. It does not seem to make sense that the loss of a 500 kV bus would not allow for any non-consequential load shedding unless the bus contained a 500 to 230 kV transformer, in which case additional load shedding would be allowed. If outages on a 230 kV system, such as bus fault with stuck breaker, were to cause overloads on a 500 kV network it is acceptable to shed load, but if the outages

were on the 500 kV system originally it would not be acceptable to shed additional load. It seems as if it should be the severity of the situation and the elements involved that would dictate allowable remedial actions and not the initial cause of the disturbance. If, for example, there was a 500 kV contingency outage that caused problems on the 230 kV system there would be a problem that may require load shedding on the 230 kV system. If there were a 230 kV contingency or series of contingencies that caused overloads on the 500 kV system, it would be more difficult to find enough lower voltage load to shed to bring the 500 kV system back to applicable ratings or conditions. The inability to shed non-consequential load could theoretically be resolved by hanging a small EHV / HV transformer on a particular bus, or by tapping a EHV line with an auto transformer.

TVA Transmission Planning & Compliance

Yes

TVA supports the change from five years to seven years for the implementation plan period.

Yes

TVA supports the change in the Year One definition - but would suggest that the word "started" should be changed to "completed" since a Planning Assessment may be started in one calendar year and finished in the next calendar year.

Yes

Yes
Yes
Yes
Yes
Yes
Yes
TVA is concerned about footnote 12 (known as footnote b in existing TPL standards). TVA believes that utilities should be given some freedom in dropping local load in response to N-1 events as long as overall BES reliability is not impacted. Otherwise significant capital improvements will be required that will have no overall reliability gain for the Bulk Electric System. TVA does agree with the revisions made specifically to the P5 event. TVA wishes to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.
Yes
Yes
Additional TVA comments: TVA wishes to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations. Does high speed reclosing occur in less than 60 cycles or 60 seconds? If a utility does not have reclosing on a transmission line - then must the utility still perform stability studies assuming that there is reclosing? TVA suggests the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." In R4.1.1, TVA is concerned that no generating unit shall pull out of synchronism in a local area only (thus not impacting the overall reliability of the BES) for Planning Event P1, while the standard does allow generator runback/tripping for the same event. Thus the generating unit may be tripped by a special protection scheme - but may not be tripped by an out of step relay. TVA believes that out of step relaying should be allowed for this unit tripping as long as this does not affect the overall reliability of the BES.

Steve Rueckert
Yes
We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on various requirements not identified in the questions below; therefore, we have included our comments here: Requirement and 2.6 and 2.6.1: A study that is five years old is very likely to be out of date. The entity's BES may have not changed much in five years but the entity cannot be certain whether or not their neighbor's system may have changed. Changes outside the immediate entity's system can impact results of studies within their system. Suggest that two years is a maximum that past studies should be allowed. Requirement 3.4.1 and 4.4.1 require PCs and TPs to coordinate with adjacent PCs and TPs to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list. Please clarify whether this means that a PC or TP must coordinate with others to identify contingencies on other Systems that the PC or TP must now include on their Contingency list to simulate and address any performance violations on their own System, or does it mean that the PC or TP must coordinate with others to identify contingencies on their System that the PC or TP must now include on their Contingency list to simulate and address any performance violations on other Systems. In either case, the standard does not seem to clearly state what must be done, or whose responsibility it is to mitigate, if a contingency in one System causes a performance violation in another System. Requirement R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and

transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".

No

We recognize that the drafting team made changes to the definition of Year One based on industry comments. However, we believe that the revised language could allow for a situation where an entity could use its next season's operating study as its Year One planning study. For example, if the entity does its study in the fall of 2011, the proposed definition would allow the entity to use its summer 2012 operating study as its Year One study. This is a very short period to address any issued identified. Suggest working into the requirement that Planning Studies must look out at least 12 months beyond when the study is performed. This would still allow for the provision in the current definition example ("if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013) because the entity would be able to use their 2013 Load period, but it would prevent the entity from using the 2012 Load period if they started the assessment late in 2011.

Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No¹²” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

R2.7.1, last bullet: Please provide specifics on the types of acceptable ‘Corrective Actions’ covered by ‘rate applications and DSM’ and the planning horizon for which they are considered acceptable. As an alternative, NERC should develop a process by which what is considered acceptable is published and continuously updated. (With due apologies for not raising this point earlier).

What is the significance of changing the wording for section R2.1.5 from ‘assessed’ to ‘studied’ and ‘Planning Assessments’ to ‘studies’?

For the Western Interconnection, the performance level for a Bus-tie breaker fault under TPL-001-2, Table 1, Item P2-4, Notes (a) and (f), requires no thermal overloads and no cascading. While, FAC-010-2.1, R1.2, R2.5-R2.6, as modified by E1.1, E1.1.7, E1.3, and E1.3.1 requires a different performance level of no cascading. Please explain why this regional variance is not included under TPL-001-2, Item E.

Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: 8.1 If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. For a Planning Coordinator (PC) who distributes the Planning Assessment to many different entities (to adjacent PCs, TPs, and other functional entities), a concern regarding the Requirement R8 VSL is that it is overly restrictive to apply a violation for failing to distribute the results of its Planning Assessment to only one PC, TP, or functional entity (and to apply a High VSL for failing to distribute to more than one entity), particularly since an entity's contact is subject to change over time, and since Measure M8 allows for publicly posting the results of its Planning Assessment to its website. Should the SDT decide to include the VSLs for Requirement 8, would recommend revising to use a percentage approach rather than applying a violation to a Planning Coordinator who fails to provide the results of its Planning Assessment to one PC, TP, or other functional entity (or applying a High VSL for failing to distribute to more than one entity.) Recommend applying a similar percentage approach to the VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1) to be considered for the TPL-001-2 R8 VSLs. For example, • Lower VSL: The responsible entity failed to provide the Planning Assessment final results to 5% or less of the required entities. • Moderate VSL: The responsible entity failed to provide the Planning Assessment final results to more than 5% up to (and including) 10% of the required entities. • High VSL: The responsible entity failed to provide the Planning Assessment final results to more than 10% up to (and including) 15% of the required entities. • Severe VSL: The responsible entity failed to provide the Planning Assessment final results to more than 15% of the required entities OR [the existing language for the Severe VSL]. Explanation: The VSLs were modified for consistency with other standards and VSLs. Reference: Link to VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1): http://www.nerc.com/docs/standards/sar/Staff_Proposed_VSLs_2010July27.pdf

The definition of Year One is now too flexible and does not meet the intent of the standard. For example, our system peak is generally in January of the year. If I perform TPL studies in November 2011, studying the peak in January 2012 is acceptable according to the new definition. This is only two months from the date of the study. The intent of the TPL standard should be that entities must study and plan for inadequacies found in the studies. A one- or two-month lead time is not adequate to address any problems identified. Year One should be the year containing the first peak 12 months or more from the current date. Otherwise, TPL studies become merely seasonal operational studies, not planning studies. Alternative Language: "For the Planning Assessment started in a given year, Year One should contain the first system peak that occurs twelve months or more after the date of the Planning Assessment."

Table 1, P5 does not recognize the existence of redundant (or backup) relays. These are an integral part of the protection system design and should be considered in analysis of SLG faults. The TPL standard should encourage redundant, fail-safe systems, not ignore them. In Table 1, P2 and P3, we have a concern about not allowing non-consequential load loss. Project 2010-11 is deciding on this issue, but is not completed (see footnote 12). Should the standard become effective before this project is completed, no non-consequential load loss would be allowed, requiring many transmission additions and reconfigurations. Please change the "NO" in the last column to "YES" until the completion of Project 2010-11.

Yes

No

The definition of Year One could be deleted and used in place of Year One within the text of the

requirement. The proposed definition has now added ambiguity with respect to “year two” and “year five” which are not defined. Year two could be deleted and R.2.1.1 modified as follows: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated.

No

R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.

No

We can agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study."

No

Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited to no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies “only” if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Requirement 2.7.2 should be revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.

Yes

Yes

Yes

We are supportive of the change to P5. However, in making this modification, other items need to also be changed. In Table 1 – Stability, the language should be made similar to wording in P5. Protection System should be removed and replaced with the words “relay failure”. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. We also believe that Note 11 needs clarifying wording as shown below: "Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less"

Yes

Yes

Requirement 8 and 8.1, should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response and there should be a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. We have other comments not addressed by this Comment Form as follows - Sections 2.7, 3.3, 4.3 and

overall. R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Runback/tripping of HVDC should be added to the list. Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded." Section 4.3 - High speed reclosing needs to be defined.

Year One should be used within the text of the requirement. Do not have a definition for Year One.

No

For R1 Ambiguity regarding base case assumptions, in combination with lack of clarity and clear direction of purpose regarding the sensitivity analysis, undermines the objectives of the standard; R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.

No

We can agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study".

No

If an entity does a stressed set of assumptions do they always need to do a non-stressed case?

Yes

Yes

Yes

In Table 1 – Stability, Make language similar to wording in P5. "Protection System" should be removed and replaced with the words "relay failure". This would avoid future interpretation issues about the intent of this requirement (as we understand it) to exclude more severe though less likely failures such as

battery systems. This change should be made for 2a through 2d on page 12). In Note 11 (page 14) ADD the wording shown in "quotes" below: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for "a total of" 1 mile or less.

Yes

Yes

General Comment: We have other comments not addressed by this Comment Form as follows - Section 3.3, Section 4.3 and overall Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded." Section 4.3 - High speed reclosing is not defined. Overall – ISO New England and New England Transmission Owners have previously made comments which have not been addressed in the current version of the proposed standard. Support for the standard can at most be limited without addressing comments. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required.

We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied." We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.

For measurements M3 and M4, there is some question as to what is to be provided as evidence of a study. Would the study results alone provide sufficient evidence, or does the entire powerflow, stability, or short circuit effort need to be documented in a formal study report? There are no measures for the creation and coordination of contingency lists that are to be developed in R3.4, R3.5, R4.4, and R4.5. Are these contingency lists required to be a documented part of the study?

No
The sharing issues of requirement R8 are still not clear, therefore the R8 VSL is not clear. It is not clear if the intent of the SDT is for the PC to share the assessments with PCs and TPs are to share the assessments with TPs, or whether the intent is for the TP to share its assessments with its PC. Will posting the assessment to a secure web-site meet the intent of the requirement? Although the comment form is not designed to allow for such, we need to comment on R4.3.1: As written, it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations, regardless of whether high-speed reclosing is actually implemented. A suggested wording change for the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." Another comment needs to be made regarding the stability extreme event table: Changes were made in planning event P5 to concentrate on specific relay failures. The same changes need to be made for stability extreme events 2a, 2b, 2c, and 2d. The proposed standard will significantly increase the amount of work required to develop more detailed and complex system models, to perform and document the engineering studies to meet the performance requirements, and to develop the assessments necessary for compliance. All of these increased engineering activities are perceived to provide marginal benefit to the reliability of the bulk electric system, but will require significant increases in manpower across the industry. Further, the manpower is presently not available to develop these more detailed models and to perform these studies with any reasonable assuredness. It will be a continuing challenge to the industry to obtain and keep the engineering talent needed to perform these compliance activities for such marginal benefits.

We propose the following changes and questions: R1 – We offer the minor suggestion of replacing the wording of “maintain System models within their respective areas” with “maintain System models of elements that are interconnected to any portion of the BES that is owned or operated by the TP or PC”. This wording would avoid the ambiguity that can occur when a BA that is associated primarily with one TP declares ownership of a bus in another TP’s geographic area, but expects its primary TP to maintain the BA’s model data for the remote generation or load. R1.1.2 – We request the SDT opinion on how two individual outages should be modeled if they are both in excess of six months duration and they overlap by less than six months. Should the overlapping condition only be modeled if the condition is expected to last more than six months?

Yes

R2.1.3 – We offer the minor suggestion of revising R2.1.3 to state, “Known outages of generation or Transmission Facilities with a duration of at least six months be simulated along with P1 events for the System peak or Off-Peak conditions when the outages are scheduled to occur.” We interpret that the requirement should only call for the simulation of individual outages with duration of six months or more and not imply the simulation of sequential (back-to-back) outages where each individual outage is less than six months, but the composite duration of the back-to-back outages is more than six months. We also interpret that if two or more known outages with duration of at least six months are overlapping, then the overlapping outage condition would only be simulated for the conditions when the overlapping outages are scheduled to occur if the duration of the overlapping condition is at least six months. R2.1.5 – We offer a major suggestion regarding the phrase “could result in the unavailability of major transmission equipment” because this phrase is ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC “shall provide documentation to support the technical rationale for defining unavailability of major transmission equipment” similar to R2.5.

No

R2.1.4 & R2.4.3 – We offer a major suggestion regarding the terms of ‘credible’ and ‘measurable change’ because these terms are ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC “shall provide documentation to support the technical rationale for determining the range of credible conditions and measurable change in performance” similar to R2.5. R2.1.4 & R2.4.3 bullet items – We offer the minor suggestion that the number and description of the bullet items in R2.1.4 match the bullet points in R2.4.3. Otherwise, please explain the reasons for any differences between the bullet items in R2.1.4 and R2.4.3. R2.1.4 bullet #2 & # 5 – We suggest that the wording in bullet #2 be changed to “Expected transfers and other generation dispatch scenarios”. This modification would put the transfer and dispatch element, which are complementary, together in the same bullet item, rather than grouping the ‘generation dispatch’ (operating level) element together with the generation capacity elements in bullet item #5. R2.1.4 bullet #7 – We offer the minor suggestion that the term “planned” be replaced with “known” to be consistent with R1.1.2 and R2.1.3. Besides the term “planned outage” has a specific meaning in the Reliability Standards that are specific to the Operating horizon. R2.7.2 – With regard to “include actions to resolve performance deficiencies identified in multiple sensitivity studies”, we do not think that mitigation plans should be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. It’s impractical to require corrective actions for longer term horizon sensitivities due to how fast the electric

grid changes. We believe sensitivity analyses are valuable to improving the development of mitigation plans to address base case performance limit concerns. Some of the sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. What is the interpretation of multiple sensitivity studies - more than one or a majority of the number that were studied?

Yes

Yes

Yes

We offer the major suggestion that Requirements not be created in the Performance Table and be absent from the Requirement section. Requirements should only be referred to in the Performance Table after they already exist in the Requirement section. a. Notes “f” and “g” under “Steady State Only” section in the Table 1 header create requirements (e.g. use the verb, “shall”) that do not appear in the Requirements section. We suggest adding R3.3.5, which could read, “Applicable System Operating Limits for the planning horizon shall not be exceeded.” [After R3.3.5 is added, Notes “f” and “g” should be revised and refer to R3.3.5.]. b. Note “i” under “Steady State Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R3.3.6, which could read, “The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state voltage requirements.” [After R3.3.6 is added, Note “d” should be revised to refer to R3.3.6. c. Note “j” under the “Stability Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R4.1.4, which could read, “Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner”. [After R4.1.4 is added, Note “j” should be revised to refer to R4.1.4.]

We offer the major suggestion that the P3 Category performance criteria be modified to apply only to the loss of two generators. The SDT properly recognizes that generator outages are significantly more probable than line or transformer outages and should be “higher” in the category list. However given the clearly higher probability of generator outages, the probability of the loss of two generators is clearly higher than the loss of a generator and line or the loss of a generator and transformer. Therefore, if the loss of two generators is in the P3 category, then the loss of a generator and line or transformer should be clearly “lower” in the category list. We suggest the listing of: the loss of a generator and some other element (e.g. transmission circuit, transformer, shunt device, and single pole of DC line) be moved to a lower event category, such as the P6 Category by adding “1. Generator” to the listing in the Initial System Condition (Loss of . . .) column. Item 2.a in the Extreme Events, Steady State section – Clarify the meaning of the loss of multiple circuits in Item 2.a by using wording similar to P7. We suggest this text: “a. Loss of three or more circuits that share a common structure.” Footnote 6 – Further clarify the applicable shunt devices in Footnote 6 with this suggested text: “6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters.”

Yes

Yes

Other Comments: 1. How are backup relays handled (TPL-002-0, R1.3.10 & TPL-001-2 R1 & P5)? What does FERC construe as normal system for a protection system. The TPL-001-2 R1 & P5, this standard doesn’t appear to address primary protection and how this handled. 2. Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” 3. R2.1.5 – We propose replacing the term ‘major Transmission’ with “BES” because BES is a well defined term, while the term, ‘major Transmission’, is not. 4. Add R2.3.1 – We suggest the addition of a R2.3.1 requirement to emulate the

distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, "Perform an analysis for at least one year in the Near Term Transmission Planning Horizon." This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. 5. R2.7.4 – We suggest that the wording of R2.7.4 be the same as R.2.8.2. Otherwise, we propose that R2.7.4 and R2.8.2 be revised with wording like, ". . . implementation status of identified Corrective Action Plans for System Facilities and Operating Procedures." to clarify that the identified system facilities and operating procedures refer only to those that were in the previous year's Corrective Action Plans. 6. R3.3.1 – The term of 'controls' is ambiguous and not defined, unlike the term, 'Protection Systems', which is defined. Therefore, we suggest that this item be defined or more clearly described to avoid the risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. 7. R3.3.1, bullet #1 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, "Trip generating units that are connected to the BES when actual or assumed minimum generator steady state or ride through voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment". The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R3.3.1 bullet #1 must be different from its counterpart, R4.3.1 bullet #2, then please explain the reasons for any differences. 8. R3.4.1 – Compliance with the requirement "to coordinate" is problematic and non-measurable We suggest replacing it with the requirement "to communicate". 9. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required? 10. R4.1.1 – We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, "No generating unit connected to the BES shall pull out of synchronism." For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases. 11. R4.1.2 – We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above. 12. R4.3.1 – This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement. 13. R5 – This requirement should remove the criterion item, "post-Contingency voltage deviation", because this criterion is not used widely enough in the industry to be well established criterion. 14. R8 – This requirement should be revised to limit the need to provide the Planning Assessment as follows "adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity..." This suggestion is added to the requirement to clarify that the word adjacent also applies to Transmission Planners and to clarify that the functional entity must be registered in order for the entity to be applicable to the requirement.

The first bullet item in Section 3.3.1 should be the same as the second bullet in Section 4.3.1. The wording is somewhat confusing in both. Also, the wording as proposed does not recognize that a high voltage limit could also be violated. Edits to the item as shown below are suggested. Tripping of generators where simulations show generation bus voltages or high side generation step up (GSU) voltages are outside known limits, or assumed to be outside generator steady state limits, or have reached the generator ride through voltage limit. Include in the assessment any assumptions made.
Yes
No
The third bullet of 4.3.1 requires the addition of relay models for stability studies. This type of analysis is performed today by scripting the tripping of multiple lines due to breaker failure events. The inclusion of relay models into the stability study will result in added complexity and an over reliance on relay models for system stability assessment. The stability assessment should assess stability resulting from the operation of relays as opposed to reliance on a relay model for proper system representations. Assurance of the proper operation of relays results from the analysis performed to set relays not from stability studies. From Section 4.3.1: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models." Section 4.5 requires that "The rationale for those Contingencies selected for evaluation shall be available as supporting information." This will have to be developed. Requirement R5 requires the establishment of criteria for transient voltage response of the system. This seems unnecessary given the proposed changes to Table 1. The proposed changes to table 1 seem to make clear the type of system response that is allowable through its specification of what is allowable in terms of interruptions to Firm Transmission and Non-Consequential loads. R5 states: "Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level."
An important footnote to Table 1 is omitted from this proposed revision. This omission prevents adequate evaluation of the footnote. Footnote 12 in Table 1 is no longer applied to P2.1, P2.2, P2.3, P4, and P5. The footnote states: "Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here." The footnote should be removed from the proposed revision until Project 2010-11 is concluded.

We offer the major suggestion that Requirements not be created in the Performance Table and be absent from the Requirement section. Requirements should only be referred to in the Performance Table after they already exist in the Requirement section. (a.) Notes “f” and “g” under “Steady State Only” section in the Table 1 header create requirements (e.g. use the verb, “shall”) that do not appear in the Requirements section. We suggest adding R3.3.5, which could read, “Applicable System Operating Limits for the planning horizon shall not be exceeded.” [After R3.3.5 is added, Note “a” should be revised and refer to R3.3.5.]. (b.) Note “i” under “Steady State Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R3.3.6, which could read, “The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to steady state voltage requirements.” [After R3.3.6 is added, Note “i” should be revised to refer to R3.3.6.]. (c.) Note “j” under the “Stability Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R4.1.4, which could read, “Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner”. [After R4.1.4 is added, Note “j” should be revised to refer to R4.1.4.]
We offer the major suggestion that the P3 Category performance criteria be modified to apply only to the loss of two generators. The SDT properly recognizes that generator outages are significantly more probable than line or transformer outages and should be “higher” in the category list. However given the clearly higher probability of generator outages, the probability of the loss of two generators is clearly

higher than the loss of a generator and line or the loss of a generator and transformer. Therefore, if the loss of two generators is in the P3 category, then the loss of a generator and line or transformer should be clearly “lower” in the category list. We suggest the listing of: the loss of a generator and some other element (e.g. transmission circuit, transformer, shunt device, and single pole of DC line) be moved to a lower event category, such as the P6 Category by adding “1. Generator” to the listing in the Initial System Condition (Loss of . . .) column. We offer the minor suggestion that Item 2.a in the Extreme Events, Steady State section – Clarify the meaning of the loss of multiple circuits in Item 2.a by using wording similar to P7. We suggest this text: “a. Loss of three or more circuits that share a common structure.” We offer the minor suggestion that Footnote 6 – Further clarify the applicable shunt devices in Footnote 6 with this suggested text: “6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters.” ATC has significant concerns with Q3.2 (R2.1.4 & R2.4.3), Q4 (Table requirements) and Q5 (P3 scope), as noted above. In addition, ATC offers the following suggestions to promote proper Reliability Standard quality and content. (1.) Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” (2.) R2.1.5 – We propose replacing the term ‘major Transmission’ with “BES” because BES is a well defined term, while the term ‘major Transmission’ is not. (3.) Add R2.3.1 – We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, “Perform an analysis for at least one year in the Near Term Transmission Planning Horizon.” This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. (4.) R2.7.4 – We suggest that the wording of R2.7.4 be the same as R.2.8.2. Otherwise, we propose that R2.7.4 and R2.8.2 be revised with wording like, “. . . implementation status of identified Corrective Action Plans for System Facilities and Operating Procedures.” to clarify that the identified system facilities and operating procedures refer only to those that were in the previous year’s Corrective Action Plans. (5.) R3.3.1 – The term of ‘controls’ is ambiguous and not defined, unlike the term, ‘Protection Systems’, which is defined. Therefore, we suggest that this item be defined or more clearly described to avoid the risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. (6.) R3.3., bullet #1 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, “Trip generating units that are connected to the BES when actual or assumed minimum generator steady state or ride through voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment“. The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R3.3.1, bullet #1 must be different from its counterpart, R4.3.1, then please explain the reasons for any differences. (7.) R3.4.1 – Compliance with the requirement “to coordinate” is problematic and non-measurable. We suggest replacing it with the requirement “to communicate”. (8.) R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required? (9.) R4.1.1 – We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, “No generating unit connected to the BES shall pull out of synchronism.” For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases. (10.) R4.1.2 – We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above. (11.) R4.3.1 – This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles.

rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement. (12.) R5 – We propose removing the criteria item, “post-Contingency voltage deviation”, because this criterion has not been developed and used widely enough in the industry to be introduced into the standards. (13.) R7 - Revise part of the requirement text to read, “. . . identify each entity’s individual and joint responsibilities . . .” to provide better clarity. Perhaps this requirement should be listed at the beginning of the Requirements section, instead being mentioned near the end of this section. (14.) Change the forward referencing to backward referencing. We agree with R2.6, R3.1, R3.5, R4.1, and 4.2. However, we suggest that the requirements be ordered so that all of the references refer back to earlier text, rather later text to be consistent with the rest of this standard and other referencing in this standard (e.g. R2.1.3, R2.1.4, R2.4.3, R3, R3.3, R3.5, R4, R4.3, R4.4, R4.5), as well as other standards.

Comments: The Year One definition is somewhat clearer now, but there is still some ambiguity. We recommend the removal of the term “Year One, year two, and year five” from R2.1.1. and deletion of the

Year One definition (definitions are not required for year two and year five, for instance). The Year One concept can be integrated into the definition of Near-Term Transmission Planning Horizon, which we suggest changing to “The period beginning with the first year following the operating horizon, as determined by the Transmission Planner or Planning Coordinator, through the fifth year.” Then, rather than say “Year One, year two, and year five”, we can use the phrase “at least one of the first two years of the Near-Term Transmission Planning Horizon, and the fifth year”. This will require corresponding changes in R2.1.1 and R2.1.2.

No

We suggest changing the added sentence to “This establishes the Category P0, No Contingency, Initial System Conditions in Table 1.”

No

2.1.5 – Change “shall be performed for” to “shall have been performed for.”

Yes

No

Rather than specifically call out induction motor loads, we recommend changing the second sentence to “Stability analysis shall include models that represent the expected dynamic behavior of system elements that could impact the study area.”

Yes

Yes

Table 1, P5 does not seem to account for redundant relays in the Protection System to mitigate potential relay failure. We recommend changing the “Event” to “Delayed Fault Clearing due to the failure of a relay to operate as designed, if that is the only relay protecting the Faulted element, for one of the following:” In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No12” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). Second, we are unclear why voltage relays are included in footnote 13 and think they can be removed. Third, in the Extreme Events – Stability section of Table 1, items 2a-2d “Protection System failure” should be changed to “relay failure” to be consistent with Table 1, Category P5.

Yes

Yes

None regarding R8. The following comments refer to parts of the proposed standard for which no questions are asked. R4, Part 4.1.2: The response to our previous comment indicated that our description was for a system Stability issue. R4 is addressing system Stability and we believe the

comment still applies and that it was not answered in the response. We have two issues with 4.1.2: Sometimes out-of-step (loss of generator synchronism) is better mitigated through islanding by tripping transmission rather than by tripping generators; the second point is that the ability of present modeling programs does not include the capability to model all types of impedance relays and their associated OOS blocking and tripping capabilities that are available. R4, Part 4.3.1: The third bullet implies that all impedance relays (and perhaps others) will need to be modeled in the stability databases. We question whether the existing simulation programs can accommodate this large magnitude of data inclusion and whether there is any benefit to BES reliability. Certainly using generic models rather than actual models would be of no benefit. We recommend changing the third bullet to "Evaluation of Protection System behavior when transient power swings are detected or predicted to have impedance characteristics that may approach relay operating characteristics."

While the definition of Year One addresses the time span this year occupies, it does not address when that time span begins. The example which was added to the definition suggests that Year One begins twelve months from the start of the Planning Assessment, but it does not appear to be specifically stated. The following language is recommended: "The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing, beginning twelve months from the planned completion date of the Planning Assessment."

No

Consider removing "...the latest..." from R1 and changing R1.1.2 to state "...six months during the period of study."

No

No, the phrase any material changes used in requirement R.2.6.2 will effectively cause all Planning Authorities to run all studies every year regardless of minor changes in the model. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes. The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive. Please consider removing R.2.6.2

No

It is recommended that the phrase "...measureable change in performance..." be changed to "...measurable change in system response..." A change in performance is unclear, and could suggest that a sensitivity study is valid only if the System is stressed to the point that it no longer performs within the criteria established by Table 1. In addition, it is recommended that the following text appear after the last sentence of 2.4.3: "The condition or conditions to be varied shall be left to the discretion of the Transmission Planner or Planning Coordinator, provided they are selected from the list below."

Yes

Yes

Yes

The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the

reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. It is our understanding that footnote 9 is under consideration as part of Project 2010-11 and should be noted as such for clarification.

No

Consider removing "the latest" from M1.

No

The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.

Group

E.ON U.S.

Brent.Ingebrigtsen@eon-us.com

Comments: 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected. E.ON U.S. believes the scope of the 'current study' should be defined. It is not clear whether the scope is the same as outlined in section 2.1.

No

In the statement: "the Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list." E.ON U.S. believes that the use of the pronoun "their" in the quoted section above is confusing. "Their" could be read as applying to the adjacent Planning Coordinators and not to the Planning Coordinator to whom the standard applies. E.ON U.S. recommends that the word "their" should be changed to "the Planning Coordinator's and Transmission Planner's" in order to make it clear.

E.ON U.S. believes that Table 1 should be formatted to avoid having the tables split by page breakers. In addition, tables spanning across multiple pages should have headers at the top of each page.

We have concerns for including induction motor representations in the load models without any study or bench-marking activities to meet the requirements of R2.4.1. This information should be supplied by the LSE as part of the MOD standard. We understand that the proposed standard will accept an aggregate system load model which represents the overall dynamic behavior of the load to relieve the burden of trying to develop specific induction motor load representation at each load bus. However this modeled system response will be considerably different compared to the actual system response which will open up the industry to unwarranted scrutiny and possible compliance violation investigations.

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R3 or R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”. Section 3.4.1 and 4.4.1 require PCs and TPs to coordinate with adjacent PCs and TPs to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list. Please clarify whether this means 1) that a PC or TP must coordinate with others to identify contingencies on other Systems that the PC or TP must now include on their Contingency list to simulate and address any performance violations on their own System, or 2) that the PC or TP must coordinate with others to identify contingencies on their System that this PC or TP must now include on their Contingency list to simulate and address any performance violations on the other Systems. In either case, the standard does not seem to clearly state what must be done, or whose responsibility it is to develop the corrective action plan, if a contingency in

one System causes a performance violation in another System.

We recognize that the drafting team made changes to the definition of Year One based on industry comments. However, we believe that the revised language could allow for a situation where an entity could use its next season's operating study as its Year One planning study. For example, if the entity does its study in the fall of 2011, the proposed definition would allow the entity to use its summer 2012 operating study as its Year One study. This is a very short period to address any issued identified. Suggest working into the requirement that Planning Studies must look out at least 12 months beyond when the study is performed. This would still allow for the provision in the current definition example ("if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013) because the entity would be able to use their 2013 Load period, but it would prevent the entity from using the 2012 Load period if they started the assessment late in 2011.

Yes

Yes

Yes

Yes

Yes

PG&E does not support the performance table, as currently revised. Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No¹²" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Group
Florida Reliability Coordinating Council, Inc - Transmission Working Group
Richard BEcker
Yes
No
No, because it is worded to be dependent upon when an assessment is started rather than when the assessment is completed and valid. Assessments don't typically include a "start date". An assessment completed on a calendar date should include (be valid for) the forecasted peak load for a timeframe that begins no more than 24 months from the date that the assessment was completed.
No
No, Since "the latest" data may become available after the study is complete, a planner may not be able to ever complete a study. Please consider removing "the latest" from the second sentence.
No
No, Please consider removing R.2.6.2. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes. The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive.
No
This change does not clarify the required sensitivity analysis. A measureable change in performance is unclear? Instead of a measurable change in performance, a measureable change in contingency response of the Bulk Electric System would be more appropriate. A change in performance implies not meeting one of the performance requirements as specified in Table 1.
Yes
No
This change does not clarify material. Material should be quantified somehow. We recommend changing the phrase "material generation additions or changes" to "generation in the vicinity with additions of changes larger than 200 MW".
Yes
We support the changes to the performance tables.
Footnote 12 performance requirements of Table 1 should allow the loss of non-consequential load for all contingency categories except for P0. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. Footnote 9 should also be under consideration as part of Project 2010-11 and should be noted as such for clarification.
No
It appears that there is a disagreement between R8 and M8, regarding public posting. We Agree with M8 posting option.
No

The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified to replace distribute with "make available:", so the new requirement would read as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.

Individual

Michael R. Lombardi

Northeast Utilities

Yes

No

NU does not support the revised definition of Year One as we believe it leads to confusion. Our suggestion is that Year One should be the Peak Load Year after the study is initiated. The subsequent years should be counted from Year One (e.g., a study that is started in year 2010 with peak load in 2011 will have Year One as 2011 and Year Two as 2012, etc.).

No

NU believes that the Normal System Conditions as stated in Requirement R1 should establish the base case conditions to be used for the assessment studies. More guidelines for developing base cases should be addressed in the requirements. What the statement in Requirement R1 lacks is the manner of creating generation dispatches and the level of interface flows (level of stress), which are central to any base case to be used to assess the reliability of the electric power network. Depending upon how the base case dispatches and the level of interface flows are created, a study may reveal reliability violations in the power system. This is a weakness of the existing TPL standards. NU, however, will support the idea of developing regional guidelines in regard to the nature of the base cases to be used for the NERC reliability studies. Comment on Requirement R1.1, Part 1.1.2: With respect to known outages NU requests that the six month duration listed by the requirement should be changed to one year duration. Requirement R1.1 Part 1.1.6: The phrase "required for Load" should be deleted as this confuses the issue [since resources may also be used for export to other areas and not just internal load].

No

The revisions made to Requirement R2 Part 2.1 appear to resolve the concern that past studies could not be used to comply with the short-term steady state study requirements. However, the language of Requirement R2 Part 2.2 still seems to suggest that current annual studies are always required for the long-term steady state assessment to be compliant. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1.

No

The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions as commented in Question #3. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

Yes

Yes

Yes

Checked "No" NU agrees with the changes that have been made to the language of P5. However, for Table 1 (Steady State and Stability Performance Extreme Events) – Stability, the wording "Protection Systems failure" should be changed to "relay failure" similarly to the change in P5. This change should be made for items 2a through 2d.

Yes

Yes
No comments on Question 7. Other Comments: As detailed below, NU has other comments that are not addressed by this Comment Form as follows – Section 3.3, Section 4.3, Non-Consequential Load Loss as referenced in the events Table 1 and studies using extreme event contingencies. Section 3.3 – NU believes that the last sentence of Part 3.3.1 should be removed since this is handled by PRC-023. Line ratings are addressed by PRC-023 which requires coordination with the Reliability Coordinator. NU suggests the removal of the following sentence: “Tripping of Transmission elements where relay loadability limits are exceeded.” Section 4.3 - High speed reclosing is not defined and to help eliminate any confusion that it may introduce into the standard it will be worthwhile for the SDT to define this term. Non-Consequential Load Loss – Depending upon the resolution of “Project 2010-11, TPL Table 1, Footnote b” NU may have additional comments regarding this issue. Studies Using Extreme Event Contingencies: The requirements for sensitivity analysis already address issues going beyond what is expected to meet the reliability requirements of the standard. Therefore, requiring extreme event analysis is requiring two layers of event analysis beyond what is required and there is no requirement for corrective action if a concern is identified.

Requirement R1 Part 1.1 and following states “System models shall represent:... 1.1.5. Known commitments for firm Transmission Service and Interchange. It was commented during a previous posting that 1.1.5 should be reworded to read: Known commitments for Firm Transmission Service, and, additionally, other types of transactions provided they have been demonstrated to not violate existing reliability constraints. The response was that “The SDT believes that the defined term ‘Interchange’ covers other transfers as described in your comment. No change made.” It is agreed that known Interchange should be modeled. However, it is imperative that existing reliability constraints not be violated in the process. That is, Interchange relating to economic transactions should not drive planning studies. Reliability-related investments should not be driven by congestion related to economic transactions incorporated into planning models. Con Edison’s Preferred approach: • 1.1.5. Known commitments for firm Transmission Service and Interchange. Interchange is meant to refer to energy transactions other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and deemed highly interruptible subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability in adherence to reliability criteria delineated in documents such as TPL-001.

There is insufficient information and experience regarding dynamic load modeling. It may also be included as a “sensitivity” analysis in 3.2, rather than requiring and expecting accurate representation of a dynamic load model. If this requirement is kept, a modeling standard should be written that is specific

to dynamic loads. This change belongs in a modeling standard, not in TPL-001.
Yes
No
<ul style="list-style-type: none"> Header note (i) in the first Table 1 (p. 10) The explicit representation of (voltage-dependent) load models is perfectly consistent with the requirements defined in R1 (which calls for a comprehensive representation of system components and their expected operating status in the planning assessment period) and the impetus to the creation of more specific load models in dynamic assessments found Requirement 2.4 of this draft of TPL-001-2. It is a known that depressed voltage conditions cause certain system elements to perform below their rated capacity. For example, capacitors provide less voltage support and voltage controlling transformers are impeded by their finite tap range to direct VAR flow into areas affected by low voltage conditions. Certain load types, on the other hand, provide a self-compensating relief to depressed voltage by naturally decreasing demand in a manner proportional to their characteristics, without operator intervention. Choosing to negate the voltage-dependence of one of these system elements (load, in this case) results in an inaccurate system representation that, in turn, may lead to erroneous assessments of the reliability state of the interconnected system and, potentially, to the implementation of unwarranted system upgrades.

<p>We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.</p>
No
The definition as it is in the current standards is fine. The new proposed definition is unclear.
Yes
Yes
No
This new requirement will expand the scope of the study work beyond a reasonable extent.
Yes

Yes
Individual
Alex Rost
NBSO
Yes
No
To avoid confusion, the formal definition for Year One should be eliminated and wording used to describe Year One be placed within the appropriate requirement. For example, R2.1.1 could be re-written to state: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated.
No
R1 should have some language to state that base case assumptions should be made such that they appropriately stress the system to be tested and are in accordance with good engineering practice.
No
NBSO agrees with the language for R2.1, but the language with R2.2 should be changed to be consistent with R2.1. NBSO disagrees with the revisions to R2.1.5. Requiring PAs to study instead of assess the possible unavailability of equipment with a lead time of a year or more will result in significant demand on resources with little impact on system reliability. NBSO also questions what additional value such studies will bring in addition to the N-1-1 requirements (P6).
No
Base case assumptions should be made such that they appropriately stress the system to be tested and are in accordance with good engineering practice. If the base cases are already stressed, the requirement to study sensitivity cases may result in the study of less severe conditions, and thus require additional time and resources while providing little additional value to the overall assessment.
No
By implication, the response of induction motor load would need to be considered when modeling the expected dynamic behaviour of loads that could impact the study area. NBSO suggests re-wording parts of R2.4.1 as follows: System peak load levels shall include a model which represents the expected dynamic behaviour of loads that could impact the study area. An aggregate system load model which represents the overall expected dynamic behaviour of load is acceptable.
Yes
Yes
For consistency, 'Protection System' should be replaced with 'relay' on Table 1 (p12) Stability Section, items 2a-2d.
Yes
Yes
NBSO suggests considering rewording the VSL so that they address the failure to distribute the final results of planning assessments.

No
The added clarification to the definition of Year One serves to remove most ambiguity with respect to Year One. However, the revision has added further ambiguity to the terms “year two” and “year five” which are not defined. For the Planning Assessment started in a given calendar year, the first year that is studied must include the forecasted peak Load period for one of the following two calendar years. An additional Near-term study must be performed that is four calendar years beyond the first year that is studied. We recommend defining Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment. We further recommend revising R2.1.1 as follows: “System peak Load for Year One and for Year Five.” Alternatively, the definition of Year One could be eliminated and described within the text of the requirements.
No
For R1 Ambiguity regarding base case assumptions, in combination with lack of clarity and clear direction of purpose regarding the sensitivity analysis, undermines the objectives of the standard; R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.
No
We completely agree with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1) and R2.2 language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study". Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).
No
These sensitivities need to be considered if not already included in the base case assumptions.
No
We have not determined a need to model dynamic loads, and therefore have not benchmarked any such models. We recommend that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.
Yes
No
Header note (i) in the first Table 1 could imply that voltage-varying load shall not be used to meet steady state performance requirements. NYISO steady state load models include voltage-varying loads. This note should be revised to only reference loads which are disconnected due to voltage.
In Table 1 – Stability, Make language similar to wording in P5. Protection System should be removed and replaced with the words relay failure. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. In Note 11 change wording as shown below to include the words “a total of”: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less
Yes
No

Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. We also have other comments not addressed by this Comment Form as follows – Section 2.7, Section 3.3, Section 4.3, and overall: Section 2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list. Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded.” Section 4.3 - High speed reclosing is not defined. Overall – We have previously made comments which have not been addressed in the current version of the proposed standard. Support for the standard can at most be limited without addressing comments. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required. The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements. Requiring extreme event analysis is requiring two layers of event analysis beyond what is required, and there is no requirement for corrective action if anything is identified. The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

Western Area Power Administration

Brandy A. Dunn

Yes

The whole bullet point section in the Effective Date section referring to Corrective Action Plans could be deleted and instead captured by Requirement R2.7.3. A seven year grace period is probably not favorable to FERC, and a better solution could be developed to meet industry needs. In R2.7.3, a possible example of "beyond the control of the Transmission Planner" could be that the physics of a significant percentage of induction motors in low inertia air-conditioning loads would tend to pull out for certain N-1 events. This may in significant part occur because such motors may have nearly no dynamic stability margin to withstand such N-1 events as close-in 3-phase faults with normal clearing during peak load conditions. So until the Transmission Planner has been able to institute changes in the industry to address the basic physics of such loads, this Requirement 2.7.3 would permit the use of such "Non-Consequential" Load Loss and curtailment of Firm Transmission Service. In this example, it may take longer than a seven year time period to fix the problem. On the other hand, some examples of Non-Consequential Load Loss could perhaps be mitigated in a shorter timeframe. Provided that an entity has a good technical justification and defined margin for “Non-Consequential” Load Loss or curtailment of Firm Transfers, then it may be acceptable. Requirement R2.7.3 seems to move in this direction. Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping

transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".

Yes

Yes, this clarification helps. The drafting team could also define "year five".

No

It's difficult to tell whether Requirement R1 is intended to require only one base case or whether it was intended to require creation of separate models for each possible N-0 condition ("normal system condition") under a variety of stressing scenarios. The inserted language does not seem to provide additional clarity. Suggested language may be "This establishes the initial 'Normal System' condition corresponding to category P0 in Table 1." Also, in Requirement R1.1.5, how are the Firm Transmission Service commitments supposed to be modeled in Power Flow Cases? Are they just to be modeled as loads, generation, and control area interchanges? Suppose a POR or POD is not at a generator or load bus. What selection of generation and load would represent the projected system conditions for this Firm Transmission Service commitment?

No

R 2.1.5: The issue in this Requirement is studied in the Operations next-day; next-week; next-month studies required under the TOP Standards; and are also covered by processes such as the Operational Transfer Capability Policy Committee (OTCPC) seasonal study process within the WECC. It would be quite onerous to run a complete power flow simulation on separate base cases for each transformer (or other equipment with long lead time) initially out of service. The revision in language from "Planning Assessment" to "studies" does not clarify that a power flow simulation is not necessarily required for each situation. A valid assessment could include other methods such as using sound technical reasoning to relate the initial out-of-service condition to a condition that has already been studied. This condition may have taken place in previous operational studies. The language in the standard could be improved to make this clarification – perhaps reference R2.6. Additionally, this Requirement still needs further clarification. Currently the scope of equipment applicable to the requirement could be misinterpreted as larger than that contemplated by FERC. The standard as written seems to say that the responsible entity needs to study the spare equipment strategy for all "major transmission equipment" with long lead times. In the directive to include this requirement, FERC used the term "critical facilities". In the NOPR to Order No. 693 they stated, "Critical facilities are those facilities that impact IROs and deliverability of generation to firm load" (P1081). In Order No. 693 FERC also said, "if an entity's spare equipment strategy for the permanent loss of a transformer is to use a 'hot spare' or to relocate a transformer from another location in a timely manner, the outage of the transformer need not be assessed under peak system conditions" (P1725). Finally, the drafting team could clarify if this requirement applies to radial branches (such as generator step-ups or step-down to load). Such branches may be construed as "critical facilities" but the impediment to deliverability of generation to firm load is consequential to the initial outage.

Yes

In Requirement 2.1.4, "Sensitivity Analysis". How much change does it take in any of the modeling assumptions (load, generation, voltage support, topology, etc.) to significantly stress the system within a range of credible condition? As this Requirement relates to R2.7, Would it be necessary to have Corrective Action Plan(s) if needed to meet all the Sensitivity Cases? How many Sensitivities before must have Corrective Action Plan? Also – why is it essential to use the qualifier "annual" for "current studies" in Part 2.1? Can a study be considered current if it is conducted less frequently than once per year? Note that Parts 2.3, 2.4 and 2.5 do not use the "annual" qualifier, nor does Requirement R2. Recommend deleting this apparently non-essential qualifier in both R2.1 and R2.2. We are unable to appreciate why the wording in Part 2.3 is not consistent with that in Part 2.1, 2.2, 2.4 or 2.5. Note that the semantics of the wording "... (steady state / stability) analysis shall be assessed annually..." can be interpreted to be much different than the semantics of the Part 2.3 wording "The short circuit analysis.... shall be conducted annually ...". The former requires the analysis to be *assessed* annually but 2.3 requires the analysis to be *conducted* annually without explicitly requiring it be assessed — is the usage

of “conducted” instead of ‘assessed” consistent with the intent? In Part 2.6.2, the intent is awkwardly conveyed within the phrase “...the System represented in the study shall not include any material changes unless...”. In the context of a *past* study, how can the System represented possibly include any material changes (that would have presumably occurred after the study)? Suggest modifying Part 2.6.2 to read “For steady state, short circuit or Stability analysis: no material changes have occurred in the System represented in the study or, if material changes have occurred, a technical rationale shall be provided to explain why they do not significantly impact the study results.”

Yes

Yes

The drafting team could provide guidance on what is "material". In Part 2.5, should “annually” be inserted after “shall be assessed” to make it consistent with Parts 2.1, 2.2, 2.3 and 2.4? If the omission is intentional in 2.5, please explain why.

Yes

Following is a suggested re-ordering of header notes to replace of the three categories concept – same information: a. Applicable Facility Ratings shall not be exceeded. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Planning event P0 is applicable to steady state only. c. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event except P0. d. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment as a consequence of any event shall not be used to meet steady state performance requirements. e. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits established by the Planning Coordinator and Transmission Planner. f. Transient voltage response shall be within acceptable limits as established by the Planning Coordinator and Transmission Planner. g. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. h. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. Simulate Normal Clearing unless otherwise specified.

In footnotes 9 and 12, two critical issues are being addressed in large part via these "clarifying" footnotes. These are curtailment of "Firm Transmission Service" (which seems primarily to be a contract/scheduling issue) and the loss of "Non-Consequential Load." Perhaps these issues should receive more attention in the actual requirements. In P5 the term “Protection System” was removed and replaced with “relay”. How are protection system elements other than relays accounted for? In studying a multiple contingency event with a communication system or control circuitry failure would it be necessary demonstrate P1 performance levels? These details could become critical as industry deals with issues such as FERC’s interpretation of TPL-002-0 Requirement R1.3.10 (RM10-6-000). In Table 1 – Extreme Events – Stability – Items 2a-2d, change “Protection System failure” to “relay failure” to be consistent with changes in P5. Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. Footnote 13 – Delete “voltage (#27, #59)” since the under/over voltage relays are not called upon to provide the primary protection for fault clearing on Transmission elements. Suggest modifying Event P4 description to be more consistent with Event P5 description by including Delayed Fault Clearing in the description in lieu of “Loss of multiple elements”. Suggested Event P4 description is: “Delayed Fault Clearing caused by a stuck non Bus-tie Breaker attempting to clear a fault on one of the following.” In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed

in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

The primary concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required by varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies “only” if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Alternatively, Requirement 2.7.2 could be revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. If a Planning Coordinator includes Corrective Action Plans to resolve performance deficiencies identified in multiple sensitivity analysis, the Planning Coordinator shall provide documentation to support those Plans.
Yes
Yes
However, the requirement infers that a subjective judgment from a compliance auditor will be required.
Yes
Yes
No
(AESO is not a party to the following comments since its VSLs are set by the Alberta regulatory authority.) Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: 8.1 If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. For a Planning Coordinator (PC) who distributes the Planning Assessment to many different entities (to adjacent PCs, TPs, and other functional entities), a concern regarding the Requirement R8 VSL is that it is overly restrictive to apply a violation for failing to distribute the results of its Planning Assessment to only one PC, TP, or functional entity (and to apply a High VSL for failing to distribute to more than one entity), particularly since an entity’s contact is subject to change over time, and since Measure M8 allows for publicly posting the results of its Planning Assessment to its website. Should the SDT decide to include the VSLs for Requirement 8, we would recommend revising to use a percentage approach rather than applying a violation to a Planning Coordinator who fails to provide the results of its Planning Assessment to one PC, TP, or other functional entity (or applying a High VSL for failing to distribute to more than one entity.) Recommend applying a similar percentage approach to the VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1) to be considered for the TPL-001-2 R8 VSLs. For example, • Lower VSL: The responsible entity failed to provide the Planning Assessment final results to 5% or less of the required entities. • Moderate VSL: The responsible entity failed to provide the Planning Assessment final results to more than 5% up to (and including) 10% of the required entities. • High VSL: The responsible entity failed to provide the Planning Assessment final results to more than 10% up to (and including) 15% of the required entities. • Severe VSL: The responsible entity failed to provide the Planning Assessment final results to more than 15% of the required entities OR [the existing language for the Severe VSL]. Explanation: The VSLs were modified for consistency with other standards and VSLs. Reference: Link to VSLs drafted by NERC Staff for

Project #2007-23 VSLs (e.g., for FAC-013-1): http://www.nerc.com/docs/standards/sar/Staff_Proposed_VSLs_2010July27.pdf

While PE does not disagree with the basic premise of 2.1, PE disagrees with the language to the extent that 2.1 is qualified by language in 2.6 and 2.6.2. The issue of managing modeling of case data is already adequately handled in MOD Standards. Furthermore, PE does not feel that the term “material” can be defined with any mutually agreed-upon boundaries, and could be construed to require any and all

Transmission Planners and/or Planning Authorities to make multiple revisions of base cases each year. PE therefore appeals to the SDT to remove the language referring to R2 Part 2.6.2 and furthermore appeals for the deletion of R2.6.2. Furthermore, PE appeals to the SDT to modify R2.6.1 to say "For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate the validity of the results of any studies older than five years or any studies using cases containing major modeling differences from other submitted studies."

No

PE does not have concerns in general with either 2.1.4 or 2.4.3. PE does, however, disagree with the wording at the end of the main paragraph of 2.4.3. Whether or not analysis qualifies as sensitivity analysis should not be predicated upon the end results; rather, it should be based upon major case modeling differences. PE therefore recommends that the phrase "...that demonstrate a measurable change in performance" be removed so that the last sentence in the main paragraph read "...by a sufficient amount to stress the System within a range of credible conditions."

Yes

No

PE agrees in general with the changes made to R2.5. PE disagrees, however, with the language stipulating that current and past studies be qualified by the language in R2.6 Part 2.6.2 (see notes for Question 3.1 regarding recommending changes with regard to R2.6.2).

Yes

PE assumes the term "header notes" is referring to the "Planning Performance Events" at the top of Table 1. If this is the case, PE has no concerns with the present language.

PE remains concerned with the present draft of TPL-001-2 regarding the presence or absence of footnotes in particular events. PE believes that, for all events in Table 1 except P0, any "No" designation in the "Non-Consequential Load Loss allowed" column should have Footnote 12 appended to it. Several events do append footnote 12 to a "No" answer, but several do not. PE does not see why certain events should be denied the use of Footnote 12 as long as Footnote 12 is worded in a manner such that the BES will not be adversely affected. PE has additional concerns regarding two Footnotes. Footnote 9 contains language regarding firm transmission service that is very similar to language presently under review in NERC Project 2010-11. PE feels that Footnote 9 should have had a statement at the end similar to that of Footnote 12, such as "Note: Firm Transmission Service is being decided in Project 2010-11. When that project is finalized, the resolution will be copied into Footnote 9." Without such a statement, PE cannot understand why the Firm Transmission language in footnote (b) under Project 2010-11 is being reviewed, while it is apparently no longer being reviewed in Project 2006-02. Footnote 12 contains the following language as a place holder: "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here." PE has filed substantial comments on the footnote (b) issue in previous drafts, pointing out that disallowance of curtailment of non-consequential load is a local load issue and not a BES concern. PE therefore cannot make any positive determination as to whether the draft Standard, TPL-001-2, and its associated Table 1, will be a viable Standard until the language in Footnote 12 is resolved via Project 2010-11. Given the potential for unresolved and confusing issues regarding the parallel development of Project 2006-02 and 2010-11, PE encourages NERC to resolve all issues within Project 2010-11 before taking the draft Standard TPL-001-2 to ballot in Project 2006-02.

Please clarify R1.1.2 to state "Known outage(s) of generation or Transmission Facility(ies) during the Planning Horizon with a duration of of at least six months."
Yes
Yes
Yes
Yes
It should be noted that if there is more generation proposed in an area than there load and export capability, all proposed material generation additions would not be represented. Determining what future generation additions to include in the Long-Term Transmission Planning Horizon may be based on a non-technical rationale rather than a technical rationale.
Yes
Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay ¹³ protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay ¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No ¹² " appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore the proposed footnote 12 should include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers."

Previous Comment unaddressed: Requirement 2.1.5: Including the spare equipment strategy will be difficult for a PC that doesn't own or manage the transmission equipment or the strategies. This

requirement should only be applicable to TP. Furthermore, R7 should be deleted and the responsibilities of each entity should be explicitly stated within the specific requirements.

No

The stress test requirements should be deleted. The purpose of this proposed Standard is to establish planning performance standards that support reliable operation. This is achieved by imposing performance requirements relative to specific conditions and contingencies. Compliance with the performance metrics within these boundaries is presumably indicative of a reliable system. It is unclear what value is added by stress testing the system in accordance with undefined, vague parameters, as required by Requirements 2.1.4 and 2.4.3. The criteria in the relevant requirements that govern the stress testing are defined by the following ambiguous phrase: 1) "by a sufficient amount"; 2) "range of credible conditions"; and 3) "measurable change of performance". Application of these criteria introduces uncertainty for both the regulated community and the relevant compliance enforcement authorities, which, in turn, creates audit risks for regulated entities. Furthermore, there is no reliability value because the stress test requirements do not establish objective criteria and do not prescribe any actions based on the stress test results. Reliability Standards should set specific obligations that are readily discernible and achievable on a consistent basis. The existing Standard does this by setting specific performance obligations relative to specific conditions and contingencies. Conversely, the stress test requirements introduce ambiguity and uncertainty with no reliability benefit; the only apparent effect is unnecessary audit liability risk for regulated entities. Accordingly, ERCOT believes that these requirements should be deleted.

No

ERCOT ISO suggests adding "best available" as a descriptor to load models. Distribution Providers (DPs)/Load Serving Entities (LSEs) are the appropriate NERC functional entities to provide dynamic load data. Accordingly, Planning Coordinators (PCs) and Transmission Planners (TPs) must rely on those entities for that data. Despite reliance on DPs/LSEs for this data, the Standard proposes to impose an obligation on PCs and TPs to include a load model representative of "expected" dynamic behavior. Simply put, PCs and TPs do not have this information and should not be subject to compliance liability risk for an issue that is beyond their control. This change will still accomplish the goal of reflecting dynamic data in the relevant models, while mitigating PC/TP compliance risk by basing their compliance on information that is within their control – i.e. the "best available" information. Based on this change, the language should read - "System peak Load levels shall include best available Load models which represent the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads". This language is also a more accurate reflection of the Consideration of Comments by the Standard Drafting Team after the March 2010 comment period. To address this issue in the most appropriate manner, the Standard should be revised to establish an appropriate process for collection, reporting and use of dynamic data based on assigning obligations to the appropriate functional entities. In essence, DPs/LSEs should be required to collect the data and report it to TPs. Because TP models are the basis for PC models, the dynamic data will be included in PC models as part of the process. However, DPs and TPs should still only be required to use the "best available" data. Continued use of this language will mitigate the liability risk associated with a requirement related to data that is within the control of a third party. Even under a construct where DPs/LSEs are required to collect and report dynamic data, there is no guarantee they will do so and PCs/TPs should not be held accountable in those circumstances. Accordingly, PC/TP compliance risk will be mitigated by use of a "best available" standard.

Yes

Yes

Yes

ADDITIONAL COMMENTS: Short circuit analysis (R2.3 and R2.8) should only be applicable to TPs.

Fault duty issues are typically local in nature and it would be an overlap for PCs to perform this same analysis done by the local Transmission Planner. Furthermore, R7 should be deleted and the responsibilities of each entity should be explicitly stated within the specific requirements. Previous Comment Unaddressed : Requirement 2.6.2: Reads as if a change is being made to an existing study. It is confusing. Possibly restate: "2.6.2 For steady state, short circuit, or stability analysis: previous studies can be used only if a material change to the system has not occurred or if a change that did occur does not impact the study area." R4.1.2 – Planning Coordinators do not perform protection coordination nor do they have access to the relay settings information required to do this analysis. This requirement should apply to Transmission Planners only because they perform system protection. The substantive scope of the standard is relative to Long-Term Transmission Planning Horizon and Near-Term Transmission Planning Horizon. The Purpose section is described in terms of the “planning horizon” generally. It may be worthwhile aligning the two to mitigate the potential for any confusion. ERCOT proposes the following revisions to the Purpose section: 3.Purpose: Establish Transmission system planning performance requirements within the relevant planning horizon (i.e. Long-Term or Near-Term) to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies. In addition, the “Time Horizon” for the Standard is “Long-Term Planning”. Obviously, this necessarily encompasses both Long-Term and Near-Term Transmission Planning Horizons. However, the scope of the Long-Term Planning time horizon is not readily apparent. ERCOT recommends appropriate revisions that clearly define the applicable time horizons.

Yes

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We have included additional comments here since we were not able to find a place to include comments on the following: Requirement R4; Requirement, Parts 2.1.5, 2.3, and 2.8; Requirement 3, Part 3.3.2; and Requirement 4, Parts 4.3.1 and Part 4.3.2 Requirement 2, Part 2.1.5: The spare equipment strategy does not improve reliability performance. If an outage of a long lead time piece of equipment occurs, the system should still be able to operate in a reliable manner that meets the performance measures of Categories P3 and P6. If an entity cannot meet its performance requirements under this standard, a capital project is indicated. Spare equipment being available would not mitigate this need it only increases expenses until the item is needed. Requirement 2, Parts 2.3 and 2.8: Short circuit fault duty is a localized phenomena that is mainly impacted by the addition of new generation or transmission facilities. Due to proprietary concerns of generation and transmission interconnection requests, short circuit studies are performed in forums outside the annual Planning Assessment. Normally, these studies will be conducted before the projects can be included in regional base cases. As such, short circuit analysis should not be included in this Standard since it would provided limited benefit. Requirement 3, Part 3.3.2 and Requirement 4, Part 4.3.2 Steady state response of dynamic control devices should also be included in the Part 3.3.2. and the list of possible devices included should be removed from Part 3.3.2 and 4.3.2. Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.

No

A seasonal reference should be included in the example. Alternative language beginning with the second sentence: For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak load period for the forecasted peak load season that is between 12 and 24 months into

the future from the current season. For example, if a Planning Assessment was started in 2011 prior to the forecasted peak season, then Year One must include the forecasted peak load for 2012. If the Planning Assessment was started in 2011 during or after the forecasted peak season, then Year One must include the forecasted peak load for 2013.

No

Proposed changes 1.1.1 Existing Facilities that will not be changed before the study year 1.1.3 New planned Facilities and planned changes to existing facilities

Yes

No

TEP agrees with removing the phrase "not already included in the studies." However, TEP does not understand the purpose of sensitivity studies. TEP is concerned that imposing additional sensitivity studies could lead to requirements that exceed the proposed standards. TEP recommends removing sensitivity analysis from the standard.

Yes

No

If a material change (generator addition/retirement, new generator models based on unit testing, or transmission line or non-distribution transformer addition) is not planned for the longer-term planning horizon, do the longer-term stability studies need to be performed? TEP's agreement/disagreement with Part 2.4.1 is dependent on the response to this question. If the answer is the studies do not need to be performed, then TEP supports these changes.

Yes

Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No¹²" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). Non-Consequential Load Loss and curtailment of Firm Transmission Service should be allowed for loss of EHV BES elements for Category P4 and P5 events.

No
The added clarification to the definition of Year One serves to remove most ambiguity with respect to Year One. However, the revision has added further ambiguity to the terms “year two” and “year five” which are not defined. NYISO recommends defining Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment. NYISO further recommends revising R2.1.1 as follows: “System peak Load for Year One and for Year Five.” Alternatively, the definition of Year One could be eliminated and described within the text of the requirements.
Yes
No
NYISO completely agrees with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1). Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6). R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list.
No
Our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies “only” if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Requirement 2.7.2 should be revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.
No
The NYISO, along with many other systems, has not determined a need to model dynamic loads, and therefore has not benchmarked any such models. The NYISO recommends that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.
Yes
No
Header note (i) in the first Table 1 could imply that voltage-varying load shall not be used to meet steady state performance requirements. NYISO steady state load models include voltage-varying loads. This note should be revised to only reference loads which are disconnected due to voltage.
There are two tables labeled “Table 1”. The extreme events table should be renamed “Table 2”.
Yes

No
Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.

Yes
Yes
Yes
Yes
Under Category P2 (Single Contingency) and Normal System Conditions, the performance table indicates that, for both HV and EHV, interruption of firm transmission service and non-consequential load loss are not allowed following the opening of a line section without a fault. This section of the performance table should distinguish between EHV and HV – performance requirements following the opening of a line section without a fault should be the same as those for a bus section fault. As with the bus section fault, interruption of firm transmission service and non-consequential load loss should be allowed for HV.
Yes
No
The language for Requirement R8 is ambiguous with regard to which adjacent entities must request in writing the results of the Planning Assessment. The language should be clarified to read: "Upon request made in writing, each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any other functional entity that has a reliability related need." The Requirement R8 VSL language should also be revised accordingly.

We disagree with the Implementation Plan and we suggest changes as follows: - The title should read "Implementation Plan for TPL-001-2" - With regards to the Prerequisite Approvals, NERC project #2010-11 still in progress (Table 1, Footnote 'b') must be implemented before this current TPL-001-2 standard gets implemented. However, while the 2010-11 NERC project does not define any of the new terms such as consequential / non-consequential load, the footnote 'b' cannot be just copied into the new standard (see TPL-001-2 standard Table 1, note 12). Note 'b' may further change to reflect the verbiage in the TPL-001-2 standard. - Not sure what is the intent of the last paragraph. While the proposed changes to Table 1, footnote 'b' are quite precise, are we still open a door to those entities that will continue to trip Non-Consequential Load and curtail Firm Transmission Service? If no penalties for such practices while the proposed standard allows a sufficient time frame to correct any deficiencies, then what is the point to all the effort behind the development of a new TPL standard?
No
The definition it seem both incomplete and exhaustive: - If taken out of the planning assessment context, the definition is missing the matter that is supposed to identify. We suggest changing the first sentence such as "The first twelve month period to which the functional entity is responsible for the assessment of Transmission System Planning performance." - While it will be a burdensome task to define each year that follows Year One, the definition of Year One may include a sentence that define the rule for the following years such as "All of the twelve months period following Year One shall commence immediately after the end of the preceding twelve months period." - The definition should not include examples.
No
The Time Horizon should be for both Near-Term and Long-Term Planning.
Yes
No
The requirements are extremely burdensome. We recommend changing the last sentence of 2.1.4 requirement by removing "by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:" because there are instances where listed conditions may not result in measurable changes in performance (Ex. An increase in load in a well built system may not cause any measurable changes in performance because there is sufficient transmission capacity to serve the load).
No
We disagree with the content of this requirement based on several facts: - We believe that the dynamic behavior of the load cannot be accurately estimated beyond current time. We are concern about the effort required to ascertain the dynamic response of the load - The requirement references "Loads that could impact the study area" without specifying how an entity will identify these loads. Perhaps the standard should provide guidelines to determine which loads would impact the study area.
No
We are not sure what will be included in these "material generation additions or changes". Perhaps the standard should provide guidelines to determine what are these material changes or additions?
Yes
Individual
Terry Harbour
MidAmerican Energy
Yes
Yes

No
There are concerns over the FERC outstanding March order on TPL and how FERC interprets “normal” or base case conditions and “assuming” an entities primary protection system is out of service and must rely on its backup protection system to operate. This concept combined with the new tables cannot be perpetuated.
Yes
Yes
R2.1.4 bullet #7 – Replace the adjective “planned” with “known” for consistency with R1.1.2 and R2.1.3. R2.3 Replace “conducted” with “assess” for consistency with R1.1.2 and R2.1.3. R2.4 Replace “current or past studies as qualified” with “current or qualified past studies as indicated” for consistency with R2
No
MidAmerican questions if the widespread use of composite load models really provides significant benefits to additional dynamic analyses over generic load conversion assumptions which have been historically used. The use of composite load models may result in more precise individual load models, but no more accurate dynamic simulations. This poorly worded requirement should be deleted in its entirety as providing additional burden without any additional reliability benefits. If the composite load model requirement must be kept, it should be modified to include the following bolded text: “...System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads, but without requiring a detailed load survey be conducted...”
Yes
No
The reference to BES should be placed back into Note a in the header above table 1.
Voting "no" - Footnote 6 – Further clarify the applicable shunt devices in Footnote 6 with this suggested text: 6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters
No
Revise measures to be consistent with requirements. 1. R6 Delete “any”. The use of the word any in standards should not be allowed. 2. Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” 3. R2.1.5 – We propose replacing the term ‘major Transmission’ with “BES” because BES is a well defined term, while the term, ‘major Transmission’, is not. 4. Add R2.3.1 – We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, “Perform an analysis for at least one year in the Near Term Transmission Planning Horizon.” This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. 5. R2.7.2 – Delete 2.7.2. With regard to "include actions to resolve performance deficiencies identified in multiple sensitivity studies", mitigation plans should not be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. Some of the sensitivity study conditions are not credible. 6. R2.7.4 – We suggest that the wording of R2.7.4 be the same as R.2.8.2. 7. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability).

Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required? 8. R4.1.1 – We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, “No generating unit with a Point of Interconnection connected to the BES shall pull out of synchronism.” For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases. 9. R4.1.2 – We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above. 10. R4.3.1 – This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement. 11. R.4.3.2 – We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, “Trip generating units that are connected to the BES when actual or assumed minimum generator transient voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment“. The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R4.3.2 must be different from its counterpart, R3.3.2, then please explain the reasons for any differences. 12. R5 – This requirement should allow the applicable entity (such as the TOP / TO) to define a “Post-Contingency Voltage Deviation” as this criteria is not used widely enough in the industry to be a well established criteria. 13. Revise R8 to limit the need to provide the Planning Assessment as follows “adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity...” 14. Data Retention for R3, R5, R6, & R7 - The MRO NSRS proposes that the wording in these elements be revised to change “All” to “The”. The word “All” is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: “The studies performed in support....”

Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).</p>

Why is Footnote 12 used for some occurrences of the word "No" in the last column of Table 1 but not other occurrences of the word "No"?

Informal Comments on Assess Transmission Future Needs – Project 2006-02.

The TPL-001-2 standard for Assess Transmission Future Needs (Project 2006-02) Drafting Team thanks all commenters who submitted comments on the fifth draft overview. These standards were posted for a 30-day public comment period from August 3, 2010 through September 2, 2010. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 7 sets of comments, including comments from 77 different people from approximately 69 companies representing 6 of the 10 Industry Segments as shown in the table on the following pages.

<http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

The SDT has completed the review of the informal comments from industry for Project 2006-02: Assess Transmission Future Needs. Each and every comment was reviewed and considered by the SDT regardless of whether there is a formal written response shown. The majority of the cases where the SDT did not make a change or provide a written response was because the SDT had already responded to the issue or the SDT did not believe that the proposed revision added clarity or otherwise improved the quality of the proposed standard.

The SDT made a number of changes due to the comments received from industry and drafting team discussions arising from those comments as highlighted below:

- Year One definition – deleted ‘must’
- Conforming changes to the language in the Effective Date – made language consistent with the Implementation Plan
- Requirement R1 and M1 – changed, “. . . the latest data consistent with . . .” to “data consistent with. . .” and established P0 as normal System condition in Table 1
- Requirement R2, part 2.1.4 – replaced ‘performance’ with ‘System response’ and changed last bullet from “. . . planned Transmission outages” to “. . . known Transmission outages”
- Requirement R2, part 2.6.2 – require documentation explaining material changes
- Requirement R2, part 2.7.1 – made it clear that statement is not all inclusive
- Requirement R2, part 2.8.2 – made language consistent with Requirement R2, part 2.7.4
- Requirement R4, part 4.3.1, bullet #1 – added qualifier for high speed reclosing
- Requirement R6 and M6 and data retention for R6 – changed ‘any’ to ‘the’
- Table 1, header note ‘i’ – deleted ‘including Load’
- Table 1, P0 – delete superscript in column 6
- Table 1, P2 – added ‘Breaker’ to description
- Table 1, P4 – added ‘Breaker’ to description
- Table 1, P5: added ‘non-redundant’
- Table 1, extreme events – Stability: made language consistent with Table 1, P5
- Measure M8 – spelled out the functional entity involved
- Data retention for Requirement R7 – deleted ‘all such’
- Changed, “Initial System Conditions” to “Initial Conditions” in column heading of Table 1 and Table 1 Note 9
- Deleted section, “Compliance Monitoring and Reset Timeframe as this is no longer included in the standard template.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs — Project 2006-02

The SDT believes that with these changes, the industry concerns have been addressed except for Footnote 12 (content of existing footnote b). Until the issues with footnote 'b' in Project 2010-11: TPL Table 1 are resolved, the SDT will not request the Standards Committee to move the project to the ballot phase. This could mean that Project 2006-02 may sit in limbo for several months pending the outcome of the Project 2010-11 deliberations. So that industry can see what has transpired with regard to their comments on Project 2006-02, the SDT is requesting that the consideration of comments document, along with the redlined version of TPL-001-2 corresponding to those comment responses be posted immediately. In this way, the industry can see what the SDT has decided in response to comments while the content of the comments is still fresh in the minds of the commenters. The SDT encourages anyone reading the posted documents to reach out to members of the SDT for informal discussions of posted documents.

Once Project 2010-11 is resolved, the wording for footnote 'b' will be essentially copied to TPL-001-2. The SDT realizes that this cannot be a simple cut and paste due to format differences between the old standard and the revised TPL-001-2 and will take appropriate actions to make things fit correctly. Once this has been accomplished, the SDT expects to ask the Standards Committee to move Project 2006-02 to the ballot stage.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Reliability Standards Development Procedures: <http://www.nerc.com/standards/newstandardsprocess.html>.

1. The SDT has revised the Implementation Plan based on industry comments to the initial ballot. Do you support this change? If you do not support this change, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

The majority of respondents agree with the changes to the Implementation Plan and no further changes to the Implementation Plan are deemed necessary.

The SDT fully realizes that Project 2010-11 ([Table 1 - footnote "b"](#)) must reach resolution prior to finalizing TPL-001-2 and stated [the](#) same in the information attached with the fifth posting of Project 2006-02.

The SDT reviewed the comment on consistency of language in the Implementation Plan and the Roadmap and agrees with the comment. The paragraph under Effective Date in the standard has been changed accordingly.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, [or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption](#), Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments. In many of the cases relating to the comments, the SDT has already responded to similar comments and those responses are quoted here for convenience:

1.1.5 – “The SDT believes that the base cases should include any area interchange that is planned between utilities.” In addition, non-firm transactions are not required to be modeled.

2.1.5 – “When a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the “normal” (PO) condition in Table 1 and the rest of Table 1 will be applied as stated. This requirement is intended for the Planning Coordinator and/or Transmission Planner to take into account its spare equipment strategy for long lead time Equipment when assessing the performance of its System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Actions such as out of merit dispatch, operational restrictions, System reconfiguration can be part of a Corrective Action Plan if the System cannot meet performance requirements without the Facility in service.”

2.3/2.8 – “is intended for the Planning Coordinator and/or Transmission Planner to assess whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt. Even though the effects of short circuit capability are localized and may be related to new planned Facilities, it is important to BES reliability.”

3.4.1/4.4.1 – “The SDT has determined that it is necessary for the Planning Coordinator and Transmission Planner to coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list created.” In addition, the SDT wants to make it clear that an entity is responsible for corrective actions on its own System.

4.3.1 – “does not require modeling of Protection System equipment. It just requires you to have simulations which include the effects of Protection System equipment operation. You don't have to specifically model a relay to simulate the effect of clearing a fault at 3 cycles. If you need to model a relay to capture its effect, then model that relay. And certainly engineering judgment should be used to determine which relay effects should be included in the simulations.”

References to TPL-001-1 are a typo and will be cleaned up. The correct reference, as pointed out, is TPL-001-2.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council Consolidated Edison Co. of New York, Inc	No	Requirement R1 Part 1.1 and following states “System models shall represent... 1.1.5. Known commitments for firm Transmission Service and Interchange. It was commented during a previous posting that 1.1.5 should be reworded to read: Known commitments for Firm Transmission Service, and, additionally, other types of transactions provided they have been demonstrated to not violate existing reliability constraints. The response was that “The SDT believes that the defined term ‘Interchange’ covers other transfers as described in your comment. No change made.”It is agreed that known Interchanges should be modeled. However, it is imperative that existing reliability constraints not be violated in the process. That is, Interchange relating to economic transactions should not drive planning studies. Reliability related investments should not be driven by congestion related to economic transactions incorporated into planning models. Following is a preferred/revised wording: o 1.1.5. Known commitments for firm Transmission Service and Interchange. Interchange is meant to refer to energy transactions other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and deemed highly interruptible subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability in adherence to reliability criteria delineated in documents such as TPL-001.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 1 Comment
GDS Associates, Inc.	No	<p>We disagree with the Implementation Plan and we suggest changes as follows:- The title should read “Implementation Plan for TPL-001-2”- With regards to the Prerequisite Approvals, NERC project #2010-11 still in progress (Table 1, Footnote ‘b’) must be implemented before this current TPL-001-2 standard gets implemented. However, while the 2010-11 NERC project does not define any of the new terms such as consequential / non-consequential load, the footnote ‘b’ cannot be just copied into the new standard (see TPL-001-2 standard Table 1, note 12). Note ‘b’ may further change to reflect the verbiage in the TPL-001-2 standard.-</p> <p>Not sure what is the intent of the last paragraph. While the proposed changes to Table 1, footnote ‘b’ are quite precise, are we still open a door to those entities that will continue to trip Non-Consequential Load and curtail Firm Transmission Service? If no penalties for such practices while the proposed standard allows a sufficient time frame to correct any deficiencies, then what is the point to all the effort behind the development of a new TPL standard?</p>
SMUD		<p>R2.7.1, last bullet: Please provide specifics on the types of acceptable ‘Corrective Actions’ covered by ‘rate applications and DSM’ and the planning horizon for which they are considered acceptable. As an alternative, NERC should develop a process by which what is considered acceptable is published and continuously updated. (With due apologies for not raising this point earlier).</p>
Western Electricity Coordinating Council	Yes	<p>We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on various requirements not identified in the questions below; therefore, we have included our comments here: Requirement and 2.6 and 2.6.1: A study that is five years old is very likely to be out of date. The entity’s BES may have not changed much in five years but the entity cannot be certain whether or not their neighbor’s system may have changed. Changes outside the immediate entity’s system can impact results of studies within their system. Suggest that two years is a maximum that past studies should be allowed.</p> <p>Requirement 3.4.1 and 4.4.1 require PCs and TPs to coordinate with adjacent PCs and TPs to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list. Please clarify whether this means that a PC or TP must coordinate with others to identify contingencies on other Systems that the PC or TP must now include on their Contingency list to simulate and address any performance violations on their own System, or does it mean that the PC or TP must coordinate with others to identify contingencies on their System that the PC or TP must now include on their Contingency list to simulate and address any performance violations on other Systems. In either case, the standard does not seem to clearly state what must be done, or whose responsibility it is to mitigate, if a contingency in one System causes a performance violation in another System.</p> <p>Requirement R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping</p>

Organization	Yes or No	Question 1 Comment
		<p>of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.</p>
Tucson Electric Power Company	Yes	<p>We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We have included additional comments here since we were not able to find a place to include comments on the following: Requirement R4; Requirement, Parts 2.1.5, 2.3, and 2.8; Requirement 3, Part 3.3.2; and Requirement 4, Parts 4.3.1 and Part 4.3.2</p> <p>Requirement 2, Part 2.1.5: The spare equipment strategy does not improve reliability performance. If an outage of a long lead time piece of equipment occurs, the system should still be able to operate in a reliable manner that meets the performance measures of Categories P3 and P6. If an entity cannot meet its performance requirements under this standard, a capital project is indicated. Spare equipment being available would not mitigate this need it only increases expenses until the item is needed.</p> <p>Requirement 2, Parts 2.3 and 2.8: Short circuit fault duty is a localized phenomena that is mainly impacted by the addition of new generation or transmission facilities. Due to proprietary concerns of generation and transmission interconnection requests, short circuit studies are performed in forums outside the annual Planning Assessment. Normally, these studies will be conducted before the projects can be included in regional base cases. As such, short circuit analysis should not be included in this Standard since it would provide limited benefit.</p> <p>Requirement 3, Part 3.3.2 and Requirement 4, Part 4.3.2: Steady state response of dynamic control devices should also be included in the Part 3.3.2. and the list of possible devices included should be removed from Part 3.3.2 and 4.3.2.</p> <p>Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring</p>

		the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.
Western Area Power Administration	Yes	<p>The whole bullet point section in the Effective Date section referring to Corrective Action Plans could be deleted and instead captured by Requirement R2.7.3. A seven year grace period is probably not favorable to FERC, and a better solution could be developed to meet industry needs. In R2.7.3, a possible example of "beyond the control of the Transmission Planner" could be that the physics of a significant percentage of induction motors in low inertia air-conditioning loads would tend to pull out for certain N-1 events. This may in significant part occur because such motors may have nearly no dynamic stability margin to withstand such N-1 events as close-in 3-phase faults with normal clearing during peak load conditions. So until the Transmission Planner has been able to institute changes in the industry to address the basic physics of such loads, this Requirement 2.7.3 would permit the use of such "Non-Consequential" Load Loss and curtailment of Firm Transmission Service. In this example, it may take longer than a seven year time period to fix the problem. On the other hand, some examples of Non-Consequential Load Loss could perhaps be mitigated in a shorter timeframe. Provided that an entity has a good technical justification and defined margin for “Non-Consequential” Load Loss or curtailment of Firm Transfers, then it may be acceptable. Requirement R2.7.3 seems to move in this direction.</p> <p>Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.</p>
NERC staff	Yes	NERC staff supports the change to allow Corrective Action Plans to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service for 7 years. This seems long, but staff understands the stakeholder concern that it could take that long to plan, site, and construct facilities required for compliance with the standard.
SERC Dynamics Review	Yes	“The comments expressed herein represent a consensus of the views of the above named members of the SERC Engineering Committee Dynamics Review Subcommittee only and should not be construed as the

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 1 Comment
Subcommittee		position of SERC Reliability Corporation, its board or its officers.”
Lakeland Electric	Yes	Shouldn't the "Implementation Plan for TPL-001-1" document be for TPL-001-2? Also, "TPL-001-1" is referenced throughout the document.
FirstEnergy	Yes	We appreciate the effort of the standard drafting team and the changes reflected in the current draft of the TPL-001-1 standard. The changes are improvements that should move the standard towards greater industry consensus. The extended Implementation Plan aligns with suggestions in FE's prior ballot comments. We support the Implementation Plan change made by the team.
US Bureau of Reclamation	Yes	With exception of the definitions.
TVA Transmission Planning & Compliance	Yes	TVA supports the change from five years to seven years for the implementation plan period.
Independent Electricity System Operator	Yes	We agree with this change. We further suggest that this change and the additional wording: "or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption" be added to P. 3 of the standard that starts with "For 84 calendar months..." to be totally consistent.
Pacific Gas and Electric Company	Yes	<p>We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R3 or R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".</p> <p>Section 3.4.1 and 4.4.1 require PCs and TPs to coordinate with adjacent PCs and TPs to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list. Please clarify whether this means 1) that a PC or TP must coordinate with others to identify contingencies on other</p>

Organization	Yes or No	Question 1 Comment
		Systems that the PC or TP must now include on their Contingency list to simulate and address any performance violations on their own System, or 2) that the PC or TP must coordinate with others to identify contingencies on their System that this PC or TP must now include on their Contingency list to simulate and address any performance violations on the other Systems. In either case, the standard does not seem to clearly state what must be done, or whose responsibility it is to develop the corrective action plan, if a contingency in one System causes a performance violation in another System.
Puget Sound Energy Sacramento Municipal Utility District Modesto Irrigation District Los Angeles Department of Water and Power Idaho Power Co California Energy Commission SRP Platte River Power Authority PNM Arizona Public Service Company	Yes	We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. 2. The SDT has revised the definition of Year One based on industry comments to the initial ballot. Do you support this change? If you do not support this change, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

The majority of respondents agree with the changes to the Year One definition but there was one change made due to industry comments for consistency of terminology.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One ~~must include~~ the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One ~~must include~~ the forecasted peak Load period for either 2012 or 2013.

The SDT acknowledges the concerns expressed by a minority of commenters on ambiguity of wording, embedding the definition in the requirements, and use of operating horizon studies. However, the SDT believes that the definition has been vetted through numerous industry comment periods and that it now represents a reasonable definition for a continent-wide standard while still providing a level of flexibility for the planner.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	The definition of Year One could be eliminated, and its wording used in place of Year One within the text of the requirement. The proposed definition has now added ambiguity with respect to “year two” and “year five” which are not defined. Year two could be deleted and R.2.1.1 modified as follows: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated. Define Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment.
ISO New England Inc.	No	The definition of Year One could be deleted and used in place of Year One within the text of the requirement. The proposed definition has now added ambiguity with respect to “year two” and “year five” which are not defined. Year two could be deleted and R.2.1.1 modified as follows: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 2 Comment
Western Electricity Coordinating Council	No	We recognize that the drafting team made changes to the definition of Year One based on industry comments. However, we believe that the revised language could allow for a situation where an entity could use its next season's operating study as its Year One planning study. For example, if the entity does its study in the fall of 2011, the proposed definition would allow the entity to use its summer 2012 operating study as its Year One study. This is a very short period to address any issued identified. Suggest working into the requirement that Planning Studies must look out at least 12 months beyond when the study is performed. This would still allow for the provision in the current definition example ("if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013) because the entity would be able to use their 2013 Load period, but it would prevent the entity from using the 2012 Load period if they started the assessment late in 2011.
E.ON U.S.	No	Comments: 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected. E.ON U.S. believes the scope of the 'current study' should be defined. It is not clear whether the scope is the same as outlined in section 2.1.
Florida Reliability Coordinating Council, Inc - Transmission Working Group	No	No, because it is worded to be dependent upon when an assessment is started rather than when the assessment is completed and valid. Assessments don't typically include a "start date". An assessment completed on a calendar date should include (be valid for) the forecasted peak load for a timeframe that begins no more than 24 months from the date that the assessment was completed.
Lakeland Electric	No	<p>"the latest" is not needed from the second sentence of R1, since the sentence already ended with "...shall represent projected System conditions".</p> <p>R1 Part 1.1.2 Suggest adding this clarification at the end "... six months during the period under study". This language addition helps clarify the point that if an outage occurs during the summer and the entity's system peak occurs in the winter, then the system peak Load study case (model) does not have to include this particular outage.</p>
Seattle City Light	No	The definition of Year One is now too flexible and does not meet the intent of the standard. For example, our system peak is generally in January of the year. If I perform TPL studies in November 2011, studying the peak in January 2012 is acceptable according to the new definition. This is only two months from the date of the study. The intent of the TPL standard should be that entities must study and plan for inadequacies found in the studies. A one- or two-month lead time is not adequate to address any problems identified. Year One should be the year containing the first peak 12 months or more from the current date. Otherwise, TPL studies become merely seasonal operational studies, not planning studies. Alternative Language: "For the Planning Assessment started in a given year, Year One should contain the first system peak that occurs twelve months or more after the date

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 2 Comment
		of the Planning Assessment."
US Bureau of Reclamation	No	The language implies a requirement. The language "Year One must include the forecasted peak Load period for one of the following two calendar years" is a requirement and not a statement of clarification. If the definition is that "Year One" can also be the period used for forecast peak load, then it should be stated so. It is suggested that either the language in the definition is modified or the language is deleted from the definition and moved to the body of the standard.
United Illuminating	No	Year One should be used within the text of the requirement. Do not have a definition for Year One.
National Grid	No	Year One should be used within the text of the requirement. Do not have a definition for Year One. Year two could be deleted and R.2.1.1 modified as follows: For the Planning Assessment started in a given calendar year, the first year that is studied must include the forecasted peak Load period for one of the following two calendar years. An additional Near-term study must be performed that is four calendar years beyond the first year that is studied.
Tri-State Generation & Transmission	No	Comments: The Year One definition is somewhat clearer now, but there is still some ambiguity. We recommend the removal of the term "Year One, year two, and year five" from R2.1.1. and deletion of the Year One definition (definitions are not required for year two and year five, for instance). The Year One concept can be integrated into the definition of Near-Term Transmission Planning Horizon, which we suggest changing to "The period beginning with the first year following the operating horizon, as determined by the Transmission Planner or Planning Coordinator, through the fifth year." Then, rather than say "Year One, year two, and year five", we can use the phrase "at least one of the first two years of the Near-Term Transmission Planning Horizon, and the fifth year". This will require corresponding changes in R2.1.1 and R2.1.2.
Lakeland Electric	No	While the definition of Year One addresses the time span this year occupies, it does not address when that time span begins. The example which was added to the definition suggests that Year One begins twelve months from the start of the Planning Assessment, but it does not appear to be specifically stated. The following language is recommended: "The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing, beginning twelve months from the planned completion date of the Planning Assessment."
Northeast Utilities Consolidated Edison Co. of New York, Inc.	No	NU does not support the revised definition of Year One as we believe it leads to confusion. Our suggestion is that Year One should be the Peak Load Year after the study is initiated. The subsequent years should be counted from Year One (e.g., a study that is started in year 2010 with peak load in 2011 will have Year One as

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 2 Comment
		2011 and Year Two as 2012, etc.).
Modesto Irrigation District	No	The definition as it is in the current standards is fine. The new proposed definition is unclear.
NBSO	No	To avoid confusion, the formal definition for Year One should be eliminated and wording used to describe Year One be placed within the appropriate requirement. For example, R2.1.1 could be re-written to state: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated.
Central Maine Power Company New York State Electric & Gas Corp New York Independent System Operator	No	The added clarification to the definition of Year One serves to remove most ambiguity with respect to Year One. However, the revision has added further ambiguity to the terms “year two” and “year five” which are not defined. For the Planning Assessment started in a given calendar year, the first year that is studied must include the forecasted peak Load period for one of the following two calendar years. An additional Near-term study must be performed that is four calendar years beyond the first year that is studied. We recommend defining Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment. We further recommend revising R2.1.1 as follows: “System peak Load for Year One and for Year Five.”Alternatively, the definition of Year One could be eliminated and described within the text of the requirements.
Tucson Electric Power Company	No	A seasonal reference should be included in the example. Alternative language beginning with the second sentence: For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak load period for the forecasted peak load season that is between 12 and 24 months into the future from the current season. For example, if a Planning Assessment was started in 2011 prior to the forecasted peak season, then Year One must include the forecasted peak load for 2012. If the Planning Assessment was started in 2011 during or after the forecasted peak season, then Year One must include the forecasted peak load for 2013.
GDS Associates, Inc.	No	The definition it seem both incomplete and exhaustive:- If taken out of the planning assessment context, the definition is missing the matter that is supposed to identify. We suggest changing the first sentence such as “The first twelve month period to which the functional entity is responsible for the assessment of Transmission System Planning performance.”- While it will be a burdensome task to define each year that follows Year One, the definition of Year One may include a sentence that define the rule for the following years such as “All of the twelve months period following Year One shall commence immediately after the end of the preceding twelve months period.”- The definition should not include examples.
Pacific Gas and Electric Company		We recognize that the drafting team made changes to the definition of Year One based on industry comments. However, we believe that the revised language could allow for a situation where an entity could use its next season’s operating study as its Year One planning study. For example, if the entity does its study in the fall of

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 2 Comment
		2011, the proposed definition would allow the entity to use its summer 2012 operating study as its Year One study. This is a very short period to address any issued identified. Suggest working into the requirement that Planning Studies must look out at least 12 months beyond when the study is performed. This would still allow for the provision in the current definition example (“if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013) because the entity would be able to use their 2013 Load period, but it would prevent the entity from using the 2012 Load period if they started the assessment late in 2011.
NERC staff	Yes	NERC staff supports the revisions to the definition of Year One. However, we believe an associated change should be made where this term is used in part 2.1.1 of Requirement 2 which requires modeling of “System peak Load for either Year One or year two, and for year five.” It seems the new definition of Year One would negate the need to refer to year two. NERC staff recommends that part 2.1.1 be changed to “System peak Load for Year One and for year five.”
Western Area Power Administration	Yes	Yes, this clarification helps. The drafting team could also define “year five”.
FirstEnergy	Yes	The change in the Year One definition provides greater flexibility for the industry and also addresses a prior FE comment during the 1st ballot. We appreciate the team’s careful consideration of the industry feedback and support the change.
TVA Transmission Planning & Compliance	Yes	TVA supports the change in the Year One definition - but would suggest that the word “started” should be changed to “completed” since a Planning Assessment may be started in one calendar year and finished in the next calendar year.

3.

The SDT has revised the Requirements language based on industry comments to the initial ballot. Do you support these changes? If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

Due to various industry comments, the SDT made the following clarifying change to Requirement R1:

R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use ~~the latest~~-data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes PO as the normal sSystem condition in Table 1.

The SDT believes that 6 months is the correct number in Requirement R1, Part 1.1.2 because the planner is evaluating longer term periods, and shorter duration outages, which have scheduling flexibility, are addressed by Operations Planning. Outages six months or longer will typically be over the study periods (peak and Off-Peak) addressed in Requirement R2, Part 2.1.3.

Requirement R1, Part 1.1.6 – An issue was raised that resources could be used for export to other areas. The SDT did not make a change to the requirement since exports to other areas are covered in Requirement R1, Part 1.1.5.

The majority of respondents agree with the posted changes to these requirements and no other changes have been made based on stakeholder comments.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 3 Comment
NERC staff	No	NERC staff suggests that the added sentence in R1 be deleted and “Normal System” in Table 1 be replaced with “No unplanned Element outages.” We have a problem with R1 establishing “normal system condition.” “Normal” is not defined, but the system condition that most people would define as “normal” is the System operating within its limits. There are no checks required on the projected system conditions to guarantee “operation within limits.” Staff realizes that if this were the case, the categories tested would all pass their respective tests. (In other words, the category tests may define operating limits that in turn define “normal” from a planning perspective.) Thus, the added sentence in R1 should be deleted. In Table 1, the use of the term “Normal System” in the column “Initial System Condition” really means “No unplanned Element outages.” All Elements that do not have a planned outage are assumed in-service (for transmission Elements) or available for dispatch (for generators).

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 3 Comment
		Contrast the term “Normal System” with categories P3 and P6, which have the loss of an Element (which is unplanned) followed by the loss of a second Element (also unplanned). “Normal System” should be replaced with “No unplanned Element outages.”
SERC Planning Standards Subcommittee Southern Company Ameren	No	The definition does not adequately address normal (pre-contingency) operating procedures or system configurations. Language should be added to the requirement (perhaps as R1.1.7) to include normal operating procedures or system configurations in place prior to any contingency occurring.
Bonneville Power Administration	No	Please clarify R1.1.2 to state “Known outage(s) of generation or Transmission Facility(ies) during the Planning Horizon with a duration of of at least six months.”
E.ON U.S.	No	In the statement: “the Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.”E.ON U.S. believes that the use of the pronoun “their” in the quoted section above is confusing. “Their” could be read as applying to the adjacent Planning Coordinators and not to the Planning Coordinator to whom the standard applies. E.ON U.S. recommends that the word “their” should be changed to “the Planning Coordinator’s and Transmission Planner’s” in order to make it clear.
Florida Reliability Coordinating Council, Inc - Transmission Working Group	No	No, Since “the latest” data may become available after the study is complete, a planner may not be able to ever complete a study. Please consider removing “the latest” from the second sentence.
Western Area Power Administration	No	It’s difficult to tell whether Requirement R1 is intended to require only one base case or whether it was intended to require creation of separate models for each possible N-0 condition (“normal system condition”) under a variety of stressing scenarios. The inserted language does not seem to provide additional clarity. Suggested language may be “This establishes the initial 'Normal System' condition corresponding to category P0 in Table 1.” Also, in Requirement R1.1.5, how are the Firm Transmission Service commitments supposed to be modeled in Power Flow Cases? Are they just to be modeled as loads, generation, and control area interchanges? Suppose a POR or POD is not at a generator or load bus. What selection of generation and load would represent the projected system conditions for this Firm Transmission Service commitment?
CenterPoint Energy	No	The SDT did not incorporate CenterPoint Energy's previous comment regarding R1; therefore, CenterPoint Energy's concerns remain.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 3 Comment
United Illuminating National Grid Central Maine Power Company New York State Electric & Gas Corp	No	For R1 Ambiguity regarding base case assumptions, in combination with lack of clarity and clear direction of purpose regarding the sensitivity analysis, undermines the objectives of the standard; R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.
ISO New England Inc.	No	R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.
American Transmission Company	No	We propose the following changes and questions: R1 - We offer the minor suggestion of replacing the wording of "maintain System models within their respective areas" with "maintain System models of elements that are interconnected to any portion of the BES that is owned or operated by the TP or PC". This wording would avoid the ambiguity that can occur when a BA that is associated primarily with one TP declares ownership of a bus in another TP's geographic area, but expects its primary TP to maintain the BA's model data for the remote generation or load. R1.1.2 - We request a SDT opinion on how two individual outages should be modeled if they are both in excess of six months duration and they overlap by less than six months. Should the overlapping condition only be modeled if the condition is expected to last more than six months?
Tri-State Generation & Transmission	No	We suggest changing the added sentence to "This establishes the Category P0, No Contingency, Initial System Conditions in Table 1."
Lakeland Electric	No	Consider removing "...the latest..." from R1 and changing R1.1.2 to state "...six months during the period of

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 3 Comment
		study.”
Northeast Utilities	No	<p>NU believes that the Normal System Conditions as stated in Requirement R1 should establish the base case conditions to be used for the assessment studies. More guidelines for developing base cases should be addressed in the requirements. What the statement in Requirement R1 lacks is the manner of creating generation dispatches and the level of interface flows (level of stress), which are central to any base case to be used to assess the reliability of the electric power network. Depending upon how the base case dispatches and the level of interface flows are created, a study may reveal reliability violations in the power system. This is a weakness of the existing TPL standards. NU, however, will support the idea of developing regional guidelines in regard to the nature of the base cases to be used for the NERC reliability studies.</p> <p>Comment on Requirement R1.1, Part 1.1.2: With respect to known outages NU requests that the six month duration listed by the requirement should be changed to one year duration.</p> <p>Requirement R1.1 Part 1.1.6: The phrase "required for Load" should be deleted as this confuses the issue [since resources may also be used for export to other areas and not just internal load].</p>
NBSO	No	R1 should have some language to state that base case assumptions should be made such that they appropriately stress the system to be tested and are in accordance with good engineering practice.
Tucson Electric Power Company	No	<p>Proposed changes 1.1.1 Existing Facilities that will not be changed before the study year</p> <p>1.1.3 New planned Facilities and planned changes to existing facilities</p>
GDS Associates, Inc.	No	The Time Horizon should be for both Near-Term and Long-Term Planning.
MidAmerican Energy	No	There are concerns over the FERC outstanding March order on TPL and how FERC interprets “normal” or base case conditions and “assuming” an entities primary protection system is out of service and must rely on its backup protection system to operate. This concept combined with the new tables cannot be perpetuated.
Xcel Energy	No	<p>Although we support the change conceptually, we believe the sentence added in R1 needs more specificity to ensure a better correlation to the relevant portions of Table 1. Please make it clear that the system model created as per R1 corresponds to Category P0 by explicitly referring to it.</p> <p>Suggested language is: ‘This establishes the “Normal System” initial condition corresponding to category P0 in Table 1.’ Further, consider omitting the word “System” in Table 1 Column 2 heading by calling it “Initial Condition” – the redundancy produced by its usage in both heading and entry does not appear to provide any</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 3 Comment
		<p>value.</p> <p>Alternative suggested language is: ‘This establishes the “Normal” initial system condition corresponding to category P0 in Table 1.’ This alternative approach envisages changing the Column 2 entries to “Normal” since the word “System” is now retained in the heading.</p>
MRO's NERC Standards Review Subcommittee	Yes	<p>We propose the following changes and questions:R1 - We offer the minor suggestion of replacing the wording of “maintain System models within their respective areas” with “maintain System models of elements that are interconnected to any portion of the BES that is owned or operated by the TP or PC”. This wording would avoid the ambiguity that can occur when a BA that is associated primarily with one TP declares ownership of a bus in another TP’s geographic area, but expects its primary TP to maintain the BA’s model data for the remote generation or load.</p> <p>R1.1.2 - We request the SDT opinion on how two individual outages should be modeled if they are both in excess of six months duration and they overlap by less than six months. Should the overlapping condition only be modeled if the condition is expected to last more than six months?</p>

3.1 Requirement R2 and Part 2.1 – past studies

Summary Consideration:

The majority of respondents agree with the changes to these requirements and only the changes to these requirements noted below have been made.

The SDT believes that the supposed inconsistencies mentioned in the language are not inconsistencies at all but necessary qualifiers. No change made.

Based on comments received, the SDT has modified Requirement R2, part 2.6.2 as follows to provide additional clarity:

2.6.2 For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. ~~shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.~~ Documentation to support the technical rationale for determining material changes shall be included.

The following change was made to clarify that the list following the statement is not all inclusive:

2.7.1 List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions may include:

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered them. In some of the cases relating to the above comments, the SDT has already responded to similar comments and those responses are quoted here for convenience:

2.1.5 – “When a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the “normal” (PO) condition in Table 1 and the rest of Table 1 will be applied as stated. This requirement is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Actions such as out of merit dispatch, operational restrictions, System reconfiguration can be part of a Corrective Action Plan if the System cannot meet performance requirements without the Facility in service.”

Organization	Yes or No	Question 4 Comment
<p>Northeast Power Coordinating Council Consolidated Edison Co. of New York, Inc.</p>	<p>No</p>	<p>The revisions made to Requirement R2 Part 2.1 appear to resolve the concern that past studies could not be used to comply with the short-term steady state study requirements. This revision must be carried through to other sections (R2.2, 2.2.1). However, the language of Requirement R2 Part 2.2 still seems to suggest that current annual studies are always required for the long-term steady state assessment to be compliant. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1.</p> <p>Regarding R2.2, the language should be consistent with 2.1. For example, use "current or qualified past studies" instead of "the following annual current study".</p> <p>Revisions made to Requirement R2.1.5 have made it worse than was originally drafted. This would require the PC & TP to study (meaning performing a technical analysis) of the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).</p> <p>R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list, and also suggest revising to "Such actions may include but not be limited to:".</p>
<p>Florida Reliability Coordinating Council, Inc - Transmission Working Group</p>	<p>No</p>	<p>No, Please consider removing R.2.6.2. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes. The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive.</p>
<p>Western Area Power Administration</p>	<p>No</p>	<p>R 2.1.5: The issue in this Requirement is studied in the Operations next-day; next-week; next-month studies required under the TOP Standards; and are also covered by processes such as the Operational Transfer Capability Policy Committee (OTCPC) seasonal study process within the WECC. It would be quite onerous to run a complete power flow simulation on separate base cases for each transformer (or other equipment with long lead time) initially out of service. The revision in language from "Planning Assessment" to "studies" does not clarify that a power flow simulation is not necessarily required for each situation. A valid assessment could include other methods such as using sound technical reasoning to relate the initial out-of-service</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 4 Comment
		<p>condition to a condition that has already been studied. This condition may have taken place in previous operational studies. The language in the standard could be improved to make this clarification - perhaps reference R2.6. Additionally, this Requirement still needs further clarification. Currently the scope of equipment applicable to the requirement could be misinterpreted as larger than that contemplated by FERC. The standard as written seems to say that the responsible entity needs to study the spare equipment strategy for all "major transmission equipment" with long lead times. In the directive to include this requirement, FERC used the term "critical facilities". In the NOPR to Order No. 693 they stated, "Critical facilities are those facilities that impact IROLs and deliverability of generation to firm load" (P1081). In Order No. 693 FERC also said, "if an entity's spare equipment strategy for the permanent loss of a transformer is to use a 'hot spare' or to relocate a transformer from another location in a timely manner, the outage of the transformer need not be assessed under peak system conditions" (P1725). Finally, the drafting team could clarify if this requirement applies to radial branches (such as generator step-ups or step-down to load). Such branches may be construed as "critical facilities" but the impediment to deliverability of generation to firm load is consequential to the initial outage.</p>
Lakeland Electric	No	Please consider removing R.2.6.2
Platte River Power Authority	No	I like that you have requirements for qualifying past studies, but Part 2.6.2 is confusing. Please change Part 2.6.2 to read something like: "For steady state, short circuit or Stability analysis: no material changes have occurred to the System represented in the study or, if material changes have occurred, a technical rationale can be provided to explain that the changes do not impact the performance results in the study area."
Orlando Utilities Commission	No	Allowing the use of past studies in lieu of new studies for part or all of an assessment when the underlying system hasn't changed in a significant change if very prudent. However the wording in 2.6.2 of "unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area" is of concern. By this wording is it intended that the planner must demonstrate that every material change has no impact? In essence doing more work to prove that a study isn't required then the study would take? Or that the planner must essentially have a technical rationale (overarching) for determining when a material change is "material enough" to impact system performance?
Minnesota Power	No	Requirement 2 - This requirement states that Stability analyses be performed as part of the annual Planning Assessments. Minnesota Power would like to see the term "Stability analysis" more clearly defined as there are several different types of stability related analysis that can be performed for power systems including: transient stability, voltage stability and small signal stability.
US Bureau of Reclamation	No	The question is misleading in that R2 also include current studies. The overall structure of the standard

Organization	Yes or No	Question 4 Comment
		<p>could be greatly improved if the standard were segmented into Near Term and Long Term with sub segments for each specific type of analysis to be performed.</p> <p>Second, the standard does not use consistent terms. The Planning Assessment is to include Near Term and Long Term portions which must have steady state analysis, short circuit analysis, and stability analysis (ref. R2). Requirement R 2.1 introduces sensitivity analysis for the Near Term portion, and then refers to the Planning Analysis which is in reality both Near Term and Long Term portions. That implies that sensitivity analysis must be required for both? The standard repeats the requirement for annual stability studies in 2.4 which was already a requirement for Planning Assessments.</p> <p>The requirement 2.1.5 is one the most problematic requirements in this standard. This requirement implies that an entity must have spare equipment and a strategy to employ it. That is beyond the scope of the Energy Policy Act 2005. Spare equipment is not on-line and does not contribute to the reliability of the existing system. The Energy Policy Act of 2005 specifically prohibits the requirement to enhance or modify the system. The use, application, or requirement to have spare equipment violates that prohibition. This section should be removed. In addition, this requirement suffers from an ability to implement. In the first case, the requirement is invoked if the spare equipment strategy could result in unavailability of transmission equipment. How is that determined? There is no nexus to that determination. The unavailability may have already occurred once the transmission equipment has failed. The only way to avoid unavailability if the transmission equipment that fails has a hot stand-by with automatic fail-over. The presence or not of a suitable replacement will still result in unavailability by virtue of the failure o the first piece of transmission equipment. Next problem, who will second guess the owner of the replacement. Where is the requirement to make the replacement strategy available? The standard should focus on system performance with existing equipment to meet current and future loads.</p>
CenterPoint Energy	No	The SDT did not incorporate CenterPoint Energy's previous comments regarding R2; therefore, CenterPoint Energy's concerns remain.
ISO New England Inc. United Illuminating National Grid	No	We can agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study."
Northeast Utilities	No	The revisions made to Requirement R2 Part 2.1 appear to resolve the concern that past studies could not be used to comply with the short-term steady state study requirements. However, the language of Requirement R2 Part 2.2 still seems to suggest that current annual studies are always required for the long-term steady state assessment to be compliant. This may have been an oversight, for consistency Requirement R2 Part

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 4 Comment
		2.2 should be modified to similarly read as Requirement R2, Part 2.1.
Hydro-Quebec TransEnergie	No	Requirement R2 Part 2.2 should be modified to read as 2.1 (not impose current annual studies as the only requirement for assessment)
American Transmission Company	No	R2.1.3 - We offer the minor suggestion of revising R2.1.3 to state, “Known outages of generation or Transmission Facilities with a duration of at least six months be simulated along with P1 events for the System peak or Off-Peak conditions when the outages are scheduled to occur.” We interpret that the requirement should only call for the simulation of individual outages with duration of six months or more and not imply the simulation of sequential (back-to-back) outages where each individual outage is less than six months, but the composite duration of the back-to-back outages is more than six months. We also interpret that if two or more known outages with duration of at least six months are overlapping, then the overlapping outage condition would only be simulated for the conditions when the overlapping outages are scheduled to occur if the duration of the overlapping condition is at least six months.
Tri-State Generation & Transmission	No	2.1.5 - Change “shall be performed for” to “shall have been performed for.”
Lakeland Electric	No	No, the phrase any material changes used in requirement R.2.6.2 will effectively cause all Planning Authorities to run all studies every year regardless of minor changes in the model. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes. The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive. Please consider removing R.2.6.2
NBSO	No	NBSO agrees with the language for R2.1, but the language with R2.2 should be changed to be consistent with R2.1. NBSO disagrees with the revisions to R2.1.5. Requiring PAs to study instead of assess the possible unavailability of equipment with a lead time of a year or more will result in significant demand on resources with little impact on system reliability. NBSO also questions what additional value such studies will bring in addition to the N-1-1 requirements (P6).

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 4 Comment
Central Maine Power Company New York State Electric & Gas Corp	No	<p>We completely agree with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1) and R2.2 language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study".</p> <p>Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).</p>
Progress Energy	No	<p>While PE does not disagree with the basic premise of 2.1, PE disagrees with the language to the extent that 2.1 is qualified by language in 2.6 and 2.6.2. The issue of managing modeling of case data is already adequately handled in MOD Standards. Furthermore, PE does not feel that the term “material” can be defined with any mutually agreed-upon boundaries, and could be construed to require any and all Transmission Planners and/or Planning Authorities to make multiple revisions of base cases each year. PE therefore appeals to the SDT to remove the language referring to R2 Part 2.6.2 and furthermore appeals for the deletion of R2.6.2.</p> <p>Furthermore, PE appeals to the SDT to modify R2.6.1 to say “For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate the validity of the results of any studies older than five years or any studies using cases containing major modeling differences from other submitted studies.”</p>
ERCOT ISO	No	<p>Previous Comment unaddressed: Requirement 2.1.5: Including the spare equipment strategy will be difficult for a PC that doesn’t own or manage the transmission equipment or the strategies. This requirement should only be applicable to TP.</p> <p>Furthermore, R7 should be deleted and the responsibilities of each entity should be explicitly stated within the specific requirements.</p>
New York Independent System Operator	No	<p>NYISO completely agrees with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1).</p> <p>Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).</p>

Organization	Yes or No	Question 4 Comment
		<p>R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list.</p>
Xcel Energy	No	<p>Specifically, the phrase “as follows” at the end of Part 2.1 does not appear to be an appropriate lead-in for the sub-parts under 2.1. Please consider re-wording Part 2.1 consistent with Part 2.4 to use the lead-in “The following studies are required:”</p> <p>Why is it essential to use the qualifier “annual” for “current studies” in Part 2.1? Can a study be considered current if it is conducted less frequently than once every year? Note that Parts 2.3, 2.4 and 2.5 do not use the “annual” qualifier, nor does Requirement R2. Recommend deleting this apparently non-essential qualifier in both 2.1 and 2.2 to improve consistency.</p> <p>In Part 2.5, should “annually” be inserted after “shall be assessed” to make it consistent with Parts 2.1, 2.2, 2.3 and 2.4? If the omission is intentional in 2.5, please explain why.</p> <p>To improve semantics and consistency, please modify 2.2.1 as follows to make it consistent with 2.1.1 and 2.4.1 “System peak Load for one of the years in the...”</p> <p>We are unable to appreciate why the wording in Part 2.3 is not consistent with that in Part 2.1, 2.2, 2.4 or 2.5. Note that the semantics of the wording “... (steady state / stability) analysis shall be assessed annually...” can be interpreted to be much different than the semantics of the Part 2.3 wording “The short circuit analysis.... shall be conducted annually ...”. The former requires the analysis to be *assessed* annually but 2.3 requires the analysis to be *conducted* annually without explicitly requiring it be assessed — is the usage of “conducted” instead of ‘assessed” consistent with the intent?</p> <p>It is unclear why the stipulation to use “current or qualified past studies“ needs to be repeated in each of the Parts 2.1, 2.2, 2.3, 2.4 and 2.5 when it is already specified in Requirement R2 at the highest hierarchy level. Suggest eliminating redundant usage by deleting from the parts under R2.</p> <p>In Part 2.6.2, the intent is awkwardly conveyed within the phrase “...the System represented in the study shall not include any material changes unless...”. In the context of a *past* study, how can the System represented possibly include any material changes (that would have presumably occurred after the study)? Suggest modifying Part 2.6.2 to read “For steady state, short circuit or Stability analysis: no material changes have occurred in the System represented in the study or, if material changes have occurred, a technical rationale shall be provided to explain why they do not significantly impact the study results.”</p> <p>In Parts 2.6.1 and 2.6.2, the lead-in phrase “For steady state, short circuit or Stability analysis:” does not appear to be essential. Even in the absence of this phrase, wouldn’t these two attributes of a qualified past study apply (by default) to all types of analysis? Suggest deleting this seemingly redundant phrase in both 2.6.1 and 2.6.2.</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 4 Comment
		<p>Perhaps this comment is more persuasive when considered together with the next comment.</p> <p>Recommend moving Part 2.6 to the first part under R2 (Part 2.1) because it defines the qualified past studies which are applicable to all types of analysis (steady state, stability and short circuit) that are detailed in the subsequent parts.</p>
MRO's NERC Standards Review Subcommittee	Yes	<p>R2.1.3 - We offer the minor suggestion of revising R2.1.3 to state, "Known outages of generation or Transmission Facilities with a duration of at least six months be simulated along with P1 events for the System peak or Off-Peak conditions when the outages are scheduled to occur." We interpret that the requirement should only call for the simulation of individual outages with duration of six months or more and not imply the simulation of sequential (back-to-back) outages where each individual outage is less than six months, but the composite duration of the back-to-back outages is more than six months. We also interpret that if two or more known outages with duration of at least six months are overlapping, then the overlapping outage condition would only be simulated for the conditions when the overlapping outages are scheduled to occur if the duration of the overlapping condition is at least six months.</p> <p>R2.1.5 - We offer a major suggestion regarding the phrase "could result in the unavailability of major transmission equipment" because this phrase is ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC "shall provide documentation to support the technical rationale for defining unavailability of major transmission equipment" similar to R2.5.</p>
NERC staff	Yes	NERC staff supports the use of qualified past studies for the Near Term horizon.
American Electric Power (AEP)	Yes	R2, Part 2.1 - idicates that 'qualified' past studies can be utilized. This is an ambiguous term and we suggest the SDT consider the implications.

3.2 Requirement R2, Parts 2.1.4 & 2.4.3 – sensitivity analysis:

Summary Consideration:

The SDT intent is that multiple condition sensitivities will be assessed since you are required to run the cases for peak and Off-peak conditions, multiple years, etc. If the problem exists in two or more of these cases, it would be an indication of ‘multiple’ problems. No change made.

The SDT understands that running sensitivities may require additional work for some entities. The sensitivities studied should be used to compare system response to different conditions to provide a broader perspective for the planner and the SDT believes that this is important enough to justify the additional work.

The SDT has made a clarifying change to the words in Requirement R2, part 2.1.4 based on comments received:

2.1.4 For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response performance:

The SDT has made the language in Requirement R2, part 2.7, bullet 7 consistent with the other parts of the standard as follows:

- List System deficiencies and the associated actions needed to achieve required System performance. Examples of Ssuch actions may include:

The majority of respondents agree with the changes to these requirements and only the changes to the requirements noted above have been made in response to stakeholder comments.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council Consolidated Edison Co. of New York, Inc.	No	Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited to no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. If an entity does a case with a stressed set of assumptions, is it

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 5 Comment
		<p>necessary to do a non-stressed case? Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies “only” if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2.</p> <p>Requirement 2.7.2 adds ambiguity and should be removed. If not, a suggested revision to Requirement 2.7.2 as follows:2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. In general, the scope of this requirement is too broad and non-specific, and only results in undue study burden. Is it necessary for sensitivity analysis to be included in requirements since in accordance with good engineering practices a conservative approach should be used in studies? The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions as commented in issue #3. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.</p>
Hydro One Networks Inc.	No	The scope of this requirement is too broad and non-specific and only results in undue study burden.
MRO's NERC Standards Review Subcommittee	No	<p>R2.1.4 & R2.4.3 - We offer a major suggestion regarding the terms of ‘credible’ and ‘measurable change’ because these terms are ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC “shall provide documentation to support the technical rationale for determining the range of credible conditions and measurable change in performance” similar to R2.5.</p> <p>R2.1.4 & R2.4.3 bullet items - We offer the minor suggestion that the number and description of the bullet items in R2.1.4 match the bullet points in R2.4.3. Otherwise, please explain the reasons for any differences between the bullet items in R2.1.4 and R2.4.3.</p> <p>R2.1.4 bullet #2 & # 5 - We suggest that the wording in bullet #2 be changed to “Expected transfers and other generation dispatch scenarios”. This modification would put the transfer and dispatch element, which are complementary, together in the same bullet item, rather than grouping the ‘generation dispatch’ (operating level) element together with the generation capacity elements in bullet item #5.</p> <p>R2.1.4 bullet #7 - We offer the minor suggestion that the term “planned” be replaced with “known” to be consistent with R1.1.2 and R2.1.3. Besides the term “planned outage” has a specific meaning in the Reliability Standards that are specific to the Operating horizon.</p> <p>R2.7.2 - With regard to "include actions to resolve performance deficiencies identified in multiple sensitivity</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 5 Comment
		studies", we do not think that mitigation plans should be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. It's impractical to require corrective actions for longer term horizon sensitivities due to how fast the electric grid changes. We believe sensitivity analyses are valuable to improving the development of mitigation plans to address base case performance limit concerns. Some of the sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. What is the interpretation of multiple sensitivity studies - more than one or a majority of the number that were studied?
IRC Standards Review Committee	No	The primary concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required by varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Alternatively, Requirement 2.7.2 could be revised as follows:2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. If a Planning Coordinator includes Corrective Action Plans to resolve performance deficiencies identified in multiple sensitivity analysis, the Planning Coordinator shall provide documentation to support those Plans.
Florida Reliability Coordinating Council, Inc - Transmission Working Group	No	This change does not clarify the required sensitivity analysis. A measureable change in performance is unclear? Instead of a measurable change in performance, a measureable change in contingency response of the Bulk Electric System would be more appropriate. A change in performance implies not meeting one of the performance requirements as specified in Table 1.
Lakeland Electric	No	A "measureable change in performance" can be interpreted as not meeting one of the performance requirements as specified in Table 1 in order for the condition to be selected as a sensitivity. This will cause utilities to perform sensitivity analysis for all system conditions listed in R2.1.4 to determine which one fails to meet one of the performance requirements in Table 1, as one may not be able to tell performance impact until after the studies are performed. Suggested change: "...one of the following conditions by a sufficient amount...system conditions that may demonstrate a measurable change in system response."
Orlando Utilities Commission	No	What is meant by "measurable change in performance"? Is this a measure that the sensitivty should move the system from meeting the performance requirements to not meeting the performance requirements? Or just a measurable change in system response, IE the loading was 45% on this corridor but is now 76%.
US Bureau of Reclamation	No	Sensitivity analysis is not included in R2. This gets back to the structure of the standard. There should a clear indication of the studies that are to be included in the Near-Term and Long-Term portions of the Planning

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 5 Comment
		Assessments.
CenterPoint Energy	No	The SDT did not incorporate CenterPoint Energy's previous comments regarding R2; therefore, CenterPoint Energy's concerns remain.
California ISO	No	Requirement 2.7.2 could be revised as follows:2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. If a Planning Coordinator includes Corrective Action Plans to resolve performance deficiencies identified in multiple sensitivity analysis, the Planning Coordinator shall provide documentation to support those Plans.
ISO New England Inc.	No	Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited to no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies “only” if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Requirement 2.7.2 should be revised as follows:2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.
United Illuminating National Grid	No	If an entity does a stressed set of assumptions do they always need to do a non-stressed case?
Hydro-Quebec TransEnergie	No	It is questionable that sensitivity analysis be included in Requirements since a conservative approach should already be used in studies, in accordance with good engineering practices.
American Transmission Company	No	<p>R2.1.4 & R2.4.3 - We offer a major suggestion regarding the terms of ‘credible’ and ‘measurable change’ because these terms are ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC “shall provide documentation to support the technical rationale for determining the range of credible conditions and measurable change in performance” similar to R2.5.</p> <p>R2.1.4 & R2.4.3 bullet items - We offer the minor suggestion that the number and description of the bullet items in R2.1.4 match the bullet points in R2.4.3. Otherwise, please explain the reasons for any differences between</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 5 Comment
		<p>the bullet items in R2.1.4 and R2.4.3.</p> <p>R2.1.4 bullet #7 - We offer the minor suggestion that the term “planned” be replaced with “known” to be consistent with R1.1.2 and R2.1.3. Besides the term “planned outage” has a specific meaning in the Reliability Standards that are specific to the Operating horizon.</p> <p>R2.7.2 - With regard to "include actions to resolve performance deficiencies identified in multiple sensitivity studies", we do not think that mitigation plans should be required for deficiencies found in multiple sensitivity studies because the conditions in sensitivity studies are more extreme and less likely than base case conditions. Some sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. What is the SDT interpretation of multiple studies - more than one or a majority of the sensitivities that were studied?</p>
Lakeland Electric	No	<p>It is recommended that the phrase “...measureable change in performance...” be changed to “...measurable change in system response...” A change in performance is unclear, and could suggest that a sensitivity study is valid only if the System is stressed to the point that it no longer performs within the criteria established by Table 1.</p> <p>In addition, it is recommended that the following text appear after the last sentence of 2.4.3: “The condition or conditions to be varied shall be left to the discretion of the Transmission Planner or Planning Coordinator, provided they are selected from the list below.”</p>
Northeast Utilities	No	The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions as commented in Question #3. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.
Modesto Irrigation District	No	This new requirement will expand the scope of the study work beyond a reasonable extent.
NBSO	No	Base case assumptions should be made such that they appropriately stress the system to be tested and are in accordance with good engineering practice. If the base cases are already stressed, the requirement to study sensitivity cases may result in the study of less severe conditions, and thus require additional time and resources while providing little additional value to the overall assessment.
Central Maine Power Company New York State Electric & Gas	No	These sensitivities need to be considered if not already included in the base case assumptions.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 5 Comment
Corp		
Progress Energy	No	PE does not have concerns in general with either 2.1.4 or 2.4.3. PE does, however, disagree with the wording at the end of the main paragraph of 2.4.3. Whether or not analysis qualifies as sensitivity analysis should not be predicated upon the end results; rather, it should be based upon major case modeling differences. PE therefore recommends that the phrase "...that demonstrate a measurable change in performance" be removed so that the last sentence in the main paragraph read "...by a sufficient amount to stress the System within a range of credible conditions."
ERCOT ISO	No	The stress test requirements should be deleted. The purpose of this proposed Standard is to establish planning performance standards that support reliable operation. This is achieved by imposing performance requirements relative to specific conditions and contingencies. Compliance with the performance metrics within these boundaries is presumably indicative of a reliable system. It is unclear what value is added by stress testing the system in accordance with undefined, vague parameters, as required by Requirements 2.1.4 and 2.4.3. The criteria in the relevant requirements that govern the stress testing are defined by the following ambiguous phrase: 1) "by a sufficient amount"; 2) "range of credible conditions"; and 3) "measurable change of performance". Application of these criteria introduces uncertainty for both the regulated community and the relevant compliance enforcement authorities, which, in turn, creates audit risks for regulated entities. Furthermore, there is no reliability value because the stress test requirements do not establish objective criteria and do not prescribe any actions based on the stress test results. Reliability Standards should set specific obligations that are readily discernible and achievable on a consistent basis. The existing Standard does this by setting specific performance obligations relative to specific conditions and contingencies. Conversely, the stress test requirements introduce ambiguity and uncertainty with no reliability benefit; the only apparent effect is unnecessary audit liability risk for regulated entities. Accordingly, ERCOT believes that these requirements should be deleted.
Tucson Electric Power Company	No	TEP agrees with removing the phrase "not already included in the studies." However, TEP does not understand the purpose of sensitivity studies. TEP is concerned that imposing additional sensitivity studies could lead to requirements that exceed the proposed standards. TEP recommends removing sensitivity analysis from the standard.
New York Independent System Operator	No	Our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 5 Comment
		Requirement 2.7.2 adds ambiguity and should be removed. Requirement 2.7.2 should be revised as follows:2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.
GDS Associates, Inc.	No	The requirements are extremely burdensome. We recommend changing the last sentence of 2.1.4 requirement by removing “by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:” because there are instances where listed conditions may not result in measurable changes in performance (Ex. An increase in load in a well built system may not cause any measurable changes in performance because there is sufficient transmission capacity to serve the load).
SMUD		What is the significance of changing the wording for section R2.1.5 from ‘assessed’ to ‘studied’ and ‘Planning Assessments’ to ‘studies’?
Western Area Power Administration	Yes	<p>In Requirement 2.1.4, "Sensitivity Analysis". How much change does it take in any of the modeling assumptions (load, generation, voltage support, topology, etc.) to significantly stress the system within a range of credible condition? As this Requirement relates to R2.7, Would it be necessary to have Corrective Action Plan(s) if needed to meet all the Sensitivity Cases? How many Sensitivities before must have Corrective Action Plan?</p> <p>Also - why is it essential to use the qualifier “annual” for “current studies” in Part 2.1? Can a study be considered current if it is conducted less frequently than once per year? Note that Parts 2.3, 2.4 and 2.5 do not use the “annual” qualifier, nor does Requirement R2. Recommend deleting this apparently non-essential qualifier in both R2.1 and R2.2.</p> <p>We are unable to appreciate why the wording in Part 2.3 is not consistent with that in Part 2.1, 2.2, 2.4 or 2.5. Note that the semantics of the wording “... (steady state / stability) analysis shall be assessed annually...” can be interpreted to be much different than the semantics of the Part 2.3 wording “The short circuit analysis.... shall be conducted annually ...”. The former requires the analysis to be *assessed* annually but 2.3 requires the analysis to be *conducted* annually without explicitly requiring it be assessed -- is the usage of “conducted” instead of ‘assessed’ consistent with the intent?</p> <p>In Part 2.6.2, the intent is awkwardly conveyed within the phrase “...the System represented in the study shall not include any material changes unless...”. In the context of a *past* study, how can the System represented possibly include any material changes (that would have presumably occurred after the study)? Suggest modifying Part 2.6.2 to read “For steady state, short circuit or Stability analysis: no material changes have occurred in the System represented in the study or, if material changes have occurred, a technical rationale shall be provided to explain why they do not significantly impact the study results.”</p>

3.3 Requirement R2, Part 2.4.1 – dynamic load models:

Summary Consideration:

The majority of respondents agree with the changes to these requirements and no changes to these requirements have been made in response to stakeholder comments.

The SDT does not intend that detailed dynamic Load models will be required for Loads in the System models used for the assessments. In particular, Requirement R2, part 2.4.1 states that an aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

The SDT has placed this requirement in TPL standards because it is not presently covered in MOD standards.

Organization	Yes or No	Question 6 Comment
NERC staff	No	NERC staff understands why the SDT has inserted the word “expected” before “dynamic behavior of Loads,” but we have concerns with this addition. We understand that a PC or TP that models the best current industry understanding of load behavior should not need to worry about compliance if that model does not match actual load response for all possible system conditions. However, we are concerned that this change to part 2.4.1 of Requirement R2 may be too accommodating. If a PC or TP has unrealistic expectations about load behavior, would this permit the use of unrealistic models? While we have struggled to develop an alternative proposal, we hope that the SDT will identify a way to address this concern.
Northeast Power Coordinating Council	No	There is insufficient information and experience regarding dynamic load modeling. It may also be included as a “sensitivity” analysis in 3.2, rather than requiring and expecting accurate representation of a dynamic load model. If this requirement is kept, a modeling standard must be written that is specific to dynamic loads. Change belongs in a modeling standard, not in TPL-001.
Hydro One Networks Inc.	No	There is insufficient information and experience regarding dynamic load modeling. Hence, this should not be a requirement but a guide or an item to be considered to the extent possible. It may also be included as a “sensitivity” analysis in 3.2, rather than requiring and expecting accurate representation of dynamic load model.
Transmission Issues Subcommittee	No	TIS believes that the term “expected” leaves the question as to “whose expectation.” It should be stated as to “expected...by the Transmission Planner.”

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 6 Comment
Exelon Transmission Planning	No	There is not an industry consensus around best practices for modeling the dynamic behavior or characteristics of load. It is premature to make this a requirement in an enforceable standard which would be held to this degree of subjective auditing.
Manitoba Hydro	No	The last two sentences “System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.” belong in the MOD standards. They are not required in TPL-001-2.
US Bureau of Reclamation	No	Not included in R2. See response to Question 3.2
CenterPoint Energy	No	The SDT did not incorporate CenterPoint Energy's previous comments regarding R2; therefore, CenterPoint Energy's concerns remain.
Ameren	No	Industry needs guidance regarding how to provide reasonable induction motor representation as opposed to generic models.
Hydro-Quebec TransEnergie	No	There is insufficient data available to accurately model system wide motor loads.
LCRA TSC	No	The first bullet item in Section 3.3.1 should be the same as the second bullet in Section 4.3.1. The wording is somewhat confusing in both. Also, the wording as proposed does not recognize that a high voltage limit could also be violated. Edits to the item as shown below are suggested. Tripping of generators where simulations show generation bus voltages or high side generation step up (GSU) voltages are outside known limits, or assumed to be outside generator steady state limits, or have reached the generator ride through voltage limit. Include in the assessment any assumptions made.
Tri-State Generation & Transmission	No	Rather than specifically call out induction motor loads, we recommend changing the second sentence to “Stability analysis shall include models that represent the expected dynamic behavior of system elements that could impact the study area.”
GTC	No	We have concerns for including induction motor representations in the load models without any study or bench-marking activities to meet the requirements of R2.4.1. This information should be supplied by the LSE as part of the MOD standard. We understand that the proposed standard will accept an aggregate system load model which represents the overall dynamic behavior of the load to relieve the burden of trying to develop specific induction motor load representation at each load bus. However this modeled system response will be considerably different compared to the actual system response which will open up the

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 6 Comment
		industry to unwarranted scrutiny and possible compliance violation investigations.
Consolidated Edison Co. of New York, Inc.	No	There is insufficient information and experience regarding dynamic load modeling. It may also be included as a “sensitivity” analysis in 3.2, rather than requiring and expecting accurate representation of a dynamic load model. If this requirement is kept, a modeling standard should be written that is specific to dynamic loads. This change belongs in a modeling standard, not in TPL-001.
NBSO	No	By implication, the response of induction motor load would need to be considered when modeling the expected dynamic behaviour of loads that could impact the study area. NBSO suggests re-wording parts of R2.4.1 as follows: System peak load levels shall include a model which represents the expected dynamic behaviour of loads that could impact the study area. An aggregate system load model which represents the overall expected dynamic behaviour of load is acceptable.
Central Maine Power Company New York State Electric & Gas New York Independent System Operator	No	We have not determined a need to model dynamic loads, and therefore have not benchmarked any such models. We recommend that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.
ERCOT ISO	No	ERCOT ISO suggests adding “best available” as a descriptor to load models. Distribution Providers (DPs)/Load Serving Entities (LSEs) are the appropriate NERC functional entities to provide dynamic load data. Accordingly, Planning Coordinators (PCs) and Transmission Planners (TPs) must rely on those entities for that data. Despite reliance on DPs/LSEs for this data, the Standard proposes to impose an obligation on PCs and TPs to include a load model representative of “expected” dynamic behavior. Simply put, PCs and TPs do not have this information and should not be subject to compliance liability risk for an issue that is beyond their control. This change will still accomplish the goal of reflecting dynamic data in the relevant models, while mitigating PC/TP compliance risk by basing their compliance on information that is within their control - i.e. the “best available” information. Based on this change, the language should read - “System peak Load levels shall include best available Load models which represent the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads”. This language is also a more accurate reflection of the Consideration of Comments by the Standard Drafting Team after the March 2010 comment period. To address this issue in the most appropriate manner, the Standard should be revised to establish an appropriate process for collection, reporting and use of dynamic data based on assigning obligations to the appropriate functional entities. In essence, DPs/LSEs should be required to collect the data and report it to TPs. Because TP models are the basis for PC models, the dynamic data will be included in PC models as part of the process. However, DPs and TPs should still only be required to use the “best available” data. Continued use of this language will mitigate the liability risk associated with a

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 6 Comment
		requirement related to data that is within the control of a third party. Even under a construct where DPs/LSEs are required to collect and report dynamic data, there is no guarantee they will do so and PCs/TPs should not be held accountable in those circumstances. Accordingly, PC/TP compliance risk will be mitigated by use of a “best available” standard.
GDS Associates, Inc.	No	We disagree with the content of this requirement based on several facts:- We believe that the dynamic behavior of the load cannot be accurately estimated beyond current time. We are concern about the effort required to ascertain the dynamic response of the load- The requirement references “Loads that could impact the study area” without specifying how an entity will identify these loads. Perhaps the standard should provide guidelines to determine which loads would impact the study area.
MidAmerican Energy	No	MidAmerican questions if the widespread use of composite load models really provides significant benefits to additional dynamic analyses over generic load conversion assumptions which have been historically used. The use of composite load models may result in more precise individual load models, but no more accurate dynamic simulations. This poorly worded requirement should be deleted in its entirety as providing additional burden without any additional reliability benefits. If the composite load model requirement must be kept, it should be modified to include the following bolded text:”...System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads, but without requiring a detailed load survey be conducted...”
Platte River Power Authority	Yes	For consistency, use the qualifier “expected” in the second sentence of Part 2.4.1 also, such that it reads “...represents the overall expected dynamic behavior...”
Xcel Energy	Yes	For consistency, use the qualifier “expected” in the second sentence of Part 2.4.1 also, such that it reads “...represents the overall *expected* dynamic behavior...”

3.4 Requirement R2, Part 2.5 – material clarification:

Summary Consideration:

The majority of respondents agree with the changes to these requirements and no changes to these requirements have been made based on stakeholder comments.

The SDT discussed defining ‘material change’ but did not believe that such a definition was appropriate in a continent-wide standard. With the wide variety in sizes and types of systems, the number of parameters that need to be considered, etc., there are too many variables involved. With the inclusion of Requirement R8 and the sharing of information, there is an opportunity for open discussion on such matters.

The SDT notes that Part 2.6.2 allows an entity to rely on a past study with a material change if “a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area”. Therefore, it is up to the entities performing the study to provide the rationale based on changes, such as Load growth.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 7 Comment
Exelon Transmission Planning	No	The term ‘material changes’ is subjective. It is very difficult to determine a base case to study combinations of generator additions on a changing transmission network in the 6 to 10 year time period to be used for dynamic simulations. Dynamic studies should be performed whenever new generator interconnections are proposed and it is at that time where meaningful calculations can be performed. The long term six to ten year out dynamic studies for groupings of potential units should be done at a high level, if at all.
Florida Reliability Coordinating Council, Inc - Transmission Working Group	No	This change does not clarify material. Material should be quantified somehow. We recommend changing the phrase “material generation additions or changes” to “generation in the vicinity with additions of changes larger than 200 MW”.
Lakeland Electric	No	Please consider removing R2.6.2. The “any material change” language can cause utilities perform studies due to material changes outside of and remote to its system.

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 7 Comment
Orlando Utilities Commission	No	I agree with what I think is the intent. The word "Material" is meant to allow for changes in model to occur that are "small" relative to the TP/PC. For example the 400 MW generator that might be built in 10 years by another utility over a hundred miles, several dozen buses and generators away to not force new study work. However as written in 2.5 it requires you to define what a material change is, and could be applied to mean every change must be identified and explained rather than an overarching rationale that would only have you looking for changes that meet the material criteria. But then in 2.6.2 the word material is used with no obligation to explain what material is, only to explain if a material change would not impact the results in a study area. I recommend leaving the term material, but setting a requirement, measure, or definition that requires the TP/PC to define what they consider material specific to their system and circumstance. Since this will by the hetroogenous nature of the grid be different for each it may not be reasonable to pre-define what is reliable. Just as was done with many items in the ATC (MOD) standards, require that it be documented and questions on that rationale be answered. If a specific level of technical oversight is desired, consider requiring that description to be on file with the regional entity and approved by their planning committee. I think the team is heading in a good direction, it's just how the words will be applied that concern me. This may be a case where an Example or two would go a long way towards providing guidance to entities and auditors.
Manitoba Hydro	No	Adding the word “material” does not clarify Part 2.5. The word “material” can be interpreted in many ways and is subjective. In order to have a consistent approach by all TPs, the drafting team should add a definition of the term “material”. One TP may consider a new 200 MW unit as not being material because there are several larger units in the TPs system.
US Bureau of Reclamation	No	The term "material" is arbitrary. It is suggested that a specific value be used to trigger the assessment.
CenterPoint Energy	No	The SDT did not incorporate CenterPoint Energy's previous comments regarding R2; therefore, CenterPoint Energy's concerns remain.
Progress Energy	No	PE agrees in general with the changes made to R2.5. PE disagrees, however, with the language stipulating that current and past studies be qualified by the language in R2.6 Part 2.6.2 (see notes for Question 3.1 regarding recommending changes with regard to R2.6.2).
Tucson Electric Power Company	No	If a material change (generator addition/retirement, new generator models based on unit testing, or transmission line or non-distribution transformer addition) is not planned for the longer-term planning horizon, do the longer-term stability studies need to be performed? TEP's agreement/disagreement with Part 2.4.1 is

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 7 Comment
		dependent on the response to this question. If the answer is the studies do not need to be performed, then TEP supports these changes.
GDS Associates, Inc.	No	We are not sure what will be included in these “material generation additions or changes”. Perhaps the standard should provide guidelines to determine what are these material changes or additions?
Xcel Energy	No	It appears that the requirement appended at the end of Part 2.5 “...and shall include documentation to support the technical rationale for determining material changes.” is duplicative of Part 2.6.2. Please address this apparent redundancy.
NERC staff	Yes	NERC staff supports inserting the word “material” in the reference to assessing the impact of proposed generation. We have some concern that this change leaves this part of the requirement open to interpretation, but we also understand the need to permit some degree of engineering judgment to be applied. It would not be appropriate to require that every potential generation addition be included in the assessment where some proposed additions may by inspection be deemed to be immaterial due to size and/or interconnection location.
IRC Standards Review Committee	Yes	However, the requirement infers that a subjective judgment from a compliance auditor will be required.
Bonneville Power Administration	Yes	It should be noted that if there is more generation proposed in an area than there load and export capability, all proposed material generation additions would not be represented. Determining what future generation additions to include in the Long-Term Transmission Planning Horizon may be based on a non-technical rationale rather than a technical rationale.
Western Area Power Administration	Yes	The drafting team could provide guidance on what is "material". In Part 2.5, should “annually” be inserted after “shall be assessed” to make it consistent with Parts 2.1, 2.2, 2.3 and 2.4? If the omission is intentional in 2.5, please explain why.
Platte River Power Authority	Yes	I like the flexibility you give the PC and TP to define what ‘material’ means in their ‘documentation to support the technical rationale for determining material changes.’ In Part 2.5 this rationale will decide whether or not any Long-Term Stability studies are required for the Planning Assessment. And in Part 2.6.2 this rationale will be a factor in qualifying a past study.
Independent Electricity System	Yes	We do not have a concern with this change but we don’t think it is necessary. It is not a requirement, and

4. The SDT has revised the header notes based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

The SDT clarified the language of header note ‘i’ as a result of comments received as follows:

- i. The response of voltage sensitive Load ~~including Load~~ that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

The majority of respondents agree with the changes to the header notes and no other changes to the header notes have been made based on stakeholder comments.

Requirements cannot be ‘hidden’ in the Table because the Table is specifically cited in the requirements text and is thus part of the requirements.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 8 Comment
Northeast Power Coordinating Council	No	Header note (i) in the first Table 1 (p. 10) could imply that voltage-varying load shall not be used to meet steady state performance requirements. Steady state load models in use include voltage-varying loads. The explicit representation of (voltage-dependent) load models is perfectly consistent with the requirements defined in R1 (which calls for a comprehensive representation of system components and their expected operating status in the planning assessment period) and the impetus to the creation of more specific load models in dynamic assessments found Requirement 2.4 of this draft of TPL-001-2. It is a known that depressed voltage conditions cause certain system elements to perform below their rated capacity. For example, capacitors provide less voltage support and voltage controlling transformers are impeded by their finite tap range to direct VAR flow into areas affected by low voltage conditions. Certain load types, on the other hand, provide a self-compensating relief to depressed voltage by naturally decreasing demand in a manner proportional to their characteristics, without operator intervention. Choosing to negate the voltage-dependence of one of these system elements (load, in our case) results in an inaccurate system representation that, in turn, may lead to erroneous assessments of the reliability state of the interconnected system and, potentially, to the implementation of unwarranted system upgrades. This note should be revised

Organization	Yes or No	Question 8 Comment
		to only reference loads which are disconnected due to voltage.
Transmission Issues Subcommittee	No	Delete the word “voltage” from the last header note J concerning Stability Only. All types of transient stability must be observed.
LCRA TSC	No	<p>The third bullet of 4.3.1 requires the addition of relay models for stability studies. This type of analysis is performed today by scripting the tripping of multiple lines due to breaker failure events. The inclusion of relay models into the stability study will result in added complexity and an over reliance on relay models for system stability assessment. The stability assessment should assess stability resulting from the operation of relays as opposed to reliance on a relay model for proper system representations. Assurance of the proper operation of relays results from the analysis performed to set relays not from stability studies. From Section 4.3.1: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.”</p> <p>Section 4.5 requires that “The rationale for those Contingencies selected for evaluation shall be available as supporting information.” This will have to be developed.</p> <p>Requirement R5 requires the establishment of criteria for transient voltage response of the system. This seems unnecessary given the proposed changes to Table 1. The proposed changes to table 1 seem to make clear the type of system response that is allowable through its specification of what is allowable in terms of interruptions to Firm Transmission and Non-Consequential loads. R5 states: “Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level.”</p>
Consolidated Edison Co. of New York, Inc.	No	<p>o Header note (i) in the first Table 1 (p. 10) The explicit representation of (voltage-dependent) load models is perfectly consistent with the requirements defined in R1 (which calls for a comprehensive representation of system components and their expected operating status in the planning assessment period) and the impetus to the creation of more specific load models in dynamic assessments found Requirement 2.4 of this draft of TPL-001-2. It is a known that depressed voltage conditions cause certain system elements to perform below their rated capacity. For example, capacitors provide less voltage support and voltage controlling transformers are impeded by their finite tap range to direct VAR flow into areas affected by low voltage conditions. 		system and, potentially, to the implementation of unwarranted system upgrades.
Central Maine Power Company New York State Electric & Gas Corp New York Independent System Operator	No	Header note (i) in the first Table 1 could imply that voltage-varying load shall not be used to meet steady state performance requirements. NYISO steady state load models include voltage-varying loads. This note should be revised to only reference loads which are disconnected due to voltage.
MidAmerican Energy	No	The reference to BES should be placed back into Note a in the header above table 1.
Xcel Energy	No	<p>Although we support the revised header notes, we believe that the following additional changes are needed to enhance clarity and improve consistency:</p> <p>We are unable to see the compelling need and/or the value of separating the header notes in three categories. Since the applicability of each header to either one or both steady-state and stability performance is obvious from its respective verbiage, we suggest eliminating the categorization. This will also allow the header notes to be reordered/regrouped as per related functionality, thus improving the Table 1 readability.</p> <p>Following is a suggested re-ordering of header notes:</p> <ul style="list-style-type: none"> a. Applicable Facility Ratings shall not be exceeded. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Planning event P0 is applicable to steady state only. c. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event except P0. d. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment as a consequence of any event shall not be used to meet steady state performance requirements. e. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits established by the Planning Coordinator and Transmission Planner. f. Transient voltage response shall be within acceptable limits as established by the Planning Coordinator and Transmission Planner. g. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. h. Simulate the removal of all elements that Protection Systems and other controls are expected

Organization	Yes or No	Question 8 Comment
<p>MRO's NERC Standards Review Subcommittee</p> <p>American Transmission Company</p>	<p>Yes</p>	<p>to automatically disconnect for each event. Simulate Normal Clearing unless otherwise specified.</p> <p>We offer the major suggestion that Requirements not be created in the Performance Table and be absent from the Requirement section. Requirements should only be referred to in the Performance Table after they already exist in the Requirement section.</p> <p>a. Notes “f” and “g” under “Steady State Only” section in the Table 1 header create requirements (e.g. use the verb, “shall”) that do not appear in the Requirements section. We suggest adding R3.3.5, which could read, “Applicable System Operating Limits for the planning horizon shall not be exceeded.” [After R3.3.5 is added, Notes “f” and “g” should be revised and refer to R3.3.5.]</p> <p>b. Note “i” under “Steady State Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R3.3.6, which could read, “The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state voltage requirements.” [After R3.3.6 is added, Note “d” should be revised to refer to R3.3.6.</p> <p>c. Note “j” under the “Stability Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R4.1.4, which could read, “Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner”. [After R4.1.4 is added, Note “j” should be revised to refer to R4.1.4.]</p>
<p>Western Area Power Administration</p>	<p>Yes</p>	<p>Following is a suggested re-ordering of header notes to replace of the three categories concept - same information: a. Applicable Facility Ratings shall not be exceeded. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Planning event P0 is applicable to steady state only. c. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event except P0. d. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment as a consequence of any event shall not be used to meet steady state performance requirements. e. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits established by the Planning Coordinator and Transmission Planner. f. Transient voltage response shall be within acceptable limits as established by the Planning Coordinator and Transmission Planner. g. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. h. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. Simulate Normal Clearing unless otherwise specified.</p>
<p>NERC staff</p>	<p>Yes</p>	<p>NERC staff supports the changes to the header notes in Table 1.</p>

5.

The SDT has revised the performance table (including the list of extreme events and footnotes) based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

The SDT has made the following clarifying changes to address concerns raised in the comments:

- P0 – delete superscript 9 in column 6: No⁹
- P5 event description: Delayed Fault -Clearing –due to the failure of a non-redundant relay¹³ protecting the Faulted element to operate as designed, for one of the following:
- Extreme events language for Stability events has been made consistent with P5.
- Added ‘Breaker’ to the Bus-tie and non-Bus-tie phrases in P2 and P4

No other changes were made to the Performance Table based on stakeholder comments.

The SDT fully realizes that Project 2010-11 must reach resolution prior to finalizing TPL-001-2 and stated same in the information attached with the fifth posting of Project 2006-02.

The SDT has made the language in Requirement R2, part 2.8.2 consistent with that in Requirement R2, part 2.7.4:

2.8.2 Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 9 Comment
NERC staff		NERC staff is concerned with P5 and footnote 9 and thus cannot support these changes in their entirety. First, a revision to the Draft 4 definition of P5 should be used in lieu of the current Draft 5 version: “Loss of multiple elements caused by the Fault clearing consistent with failure of a single Protection System while clearing a fault on one of the following: . . .”After reviewing the P5 contingency throughout various drafts of this standard, along with existing Table 1 for TPL-001 through TPL-004, NERC staff’s primary concern is that this most recent version is going in the wrong direction by becoming too limiting regarding which Protection System component failures are covered. Draft 5 is an improvement because it removes the reference to loss of

Organization	Yes or No	Question 9 Comment
		<p>multiple elements in Draft 4 (which defined P5 as “Loss of multiple elements caused by the failure of a single Protection System while clearing a fault on one of the following: . . .”). Draft 5 takes a step backward, however, by referring to Delayed Fault Clearing. The advantage of not referring to Delayed Fault Clearing is that for cases where redundant protection systems are provided, the fault clearing may not be delayed even when a single Protection System failure occurs. Ideally, NERC staff believes that P5 should refer to “failure of any component of a Protection System,” but NERC staff recognizes that we cannot get there until the term Protection System is redefined and Project 2009-07-Reliability of Protection Systems is underway. Until that change is possible, NERC staff encourages the SDT to use the revised version of P5 proposed above.</p> <p>A second concern is with footnote 9, which is used numerous times in Table 1. System adjustments may be used in two different settings: the first is to address the aftermath of a particular Contingency; the second is to prepare for the next Contingency. Staff suggests that the current footnote 9 have this language added: “Post-Contingency Ccurtailment of Firm Transmission Service to address the simulated contingency, when coupled with” Footnote 9 is used in the column labeled “Interruption of Firm Transmission Service Allowed” whenever a “No” is provided. The footnote 9 in this column has to do with System adjustments that address the aftermath of the Contingency that is being simulated. Therefore, no footnote 9 appears appropriate for category P0 (No Contingency). The reference in footnote 9 to no load loss and staying within applicable Facility rating, including those on a neighboring system, is sufficient for addressing the aftermath of the Contingency being simulated.</p> <p>To address next Contingency, an additional footnote is needed in the “Initial System Condition” column for category P3 and category P6. The following is suggested: “System adjustments to prepare for the next Contingency must be completed within 30 minutes.” Footnote 9 is used in the column labeled “Initial System Condition” for category P3 and category P6, and these two categories define the loss of an Element “followed by System adjustments” and then followed by the loss of a second Element. It is unclear whether the intent in footnote 9 in these two cases is meant to address the same issue referenced above (i.e. the aftermath of the Contingency being simulated) or whether it is intended to address the next Contingency. Thus, both situations need to be addressed using the suggestions indicated above.</p>
<p>Northeast Power Coordinating Council Consolidated Edison Co. of New York, Inc.</p>		<p>To support the change to P5, other items need to also be modified. In Table 1 - Steady State & Stability Performance Extreme Events (p. 12), in the Stability Section, the language should be made similar to wording in P5. Protection System should be removed and replaced with the words “relay failure”. This change should be made for 2a through 2d:2. Local or wide area events affecting the Transmission System such as: a. 3\bar{A} fault on generator with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3\bar{A} fault on Transmission circuit with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3\bar{A} fault on transformer with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3\bar{A} fault on bus section with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing.</p>

Organization	Yes or No	Question 9 Comment
		<p>Note 11 (p. 14) needs clarification as shown: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less.</p> <p>There are two tables labeled “Table 1”. Suggest that the extreme events table be renamed “Table 2”.</p>
MRO's NERC Standards Review Subcommittee		<p>We offer the major suggestion that the P3 Category performance criteria be modified to apply only to the loss of two generators. The SDT properly recognizes that generator outages are significantly more probable than line or transformer outages and should be “higher” in the category list. However given the clearly higher probability of generator outages, the probability of the loss of two generators is clearly higher than the loss of a generator and line or the loss of a generator and transformer. Therefore, if the loss of two generators is in the P3 category, then the loss of a generator and line or transformer should be clearly “lower” in the category list. We suggest the listing of: the loss of a generator and some other element (e.g. transmission circuit, transformer, shunt device, and single pole of DC line) be moved to a lower event category, such as the P6 Category by adding “1. Generator” to the listing in the Initial System Condition (Loss of . . .) column.</p> <p>Item 2.a in the Extreme Events, Steady State section - Clarify the meaning of the loss of multiple circuits in Item 2.a by using wording similar to P7. We suggest this text: “a. Loss of three or more circuits that share a common structure.”</p> <p>Footnote 6 - Further clarify the applicable shunt devices in Footnote 6 with this suggested text: “6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters.”</p>
Bonneville Power Administration		<p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”.</p> <p>In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No¹²” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore the proposed footnote 12 should include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 9 Comment
		customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”
Exelon Transmission Planning		<p>Comments: The term ‘HV’ in the performance table should be defined as ‘Bulk Electric System elements up to 300 kV, not simply all elements ‘below 300 kV’.</p> <p>Footnote 12 should be clarified to specifically state the requirements before voting takes place. The performance criteria should be based on the voltage level of the element experiencing stress due to the contingency, not based on the voltage level of the outaged element. It does not seem to make sense that the loss of a 500 kV bus would not allow for any non-consequential load shedding unless the bus contained a 500 to 230 kV transformer, in which case additional load shedding would be allowed. If outages on a 230 kV system, such as bus fault with stuck breaker, were to cause overloads on a 500 kV network it is acceptable to shed load, but if the outages were on the 500 kV system originally it would not be acceptable to shed additional load. It seems as if it should be the severity of the situation and the elements involved that would dictate allowable remedial actions and not the initial cause of the disturbance. If, for example, there was a 500 kV contingency outage that caused problems on the 230 kV system there would be a problem that may require load shedding on the 230 kV system. If there were a 230 kV contingency or series of contingencies that caused overloads on the 500 kV system, it would be more difficult to find enough lower voltage load to shed to bring the 500 kV system back to applicable ratings or conditions. The inability to shed non-consequential load could theoretically be resolved by hanging a small EHV / HV transformer on a particular bus, or by tapping a EHV line with an auto transformer.</p>
Southern Company		NO. We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.
Western Electricity Coordinating Council Arizona Public Service Company PNM SRP California Energy Commission Los Angeles Department of		<p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. Organization	Yes or No	Question 9 Comment
Water and Power Pacific Gas and Electric Company Modesto Irrigation District Puget Sound Energy Sacramento Municipal Utility District		Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).
E.ON U.S.		E.ON U.S. believes that Table 1 should be formatted to avoid having the tables split by page breakers. In addition, tables spanning across multiple pages should have headers at the top of each page.
Florida Reliability Coordinating Council, Inc - Transmission Working Group		Footnote 12 performance requirements of Table 1 should allow the loss of non-consequential load for all contingency categories except for P0. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. Footnote 9 should also be under consideration as part of Project 2010-11 and should be noted as such for clarification.
Western Area Power Administration		In footnotes 9 and 12, two critical issues are being addressed in large part via these "clarifying" footnotes. These are curtailment of "Firm Transmission Service" (which seems primarily to be a contract/scheduling issue) and the loss of "Non-Consequential Load." Perhaps these issues should receive more attention in the

Organization	Yes or No	Question 9 Comment
		<p>actual requirements.</p> <p>In P5 the term “Protection System” was removed and replaced with “relay”. How are protection system elements other than relays accounted for? In studying a multiple contingency event with a communication system or control circuitry failure would it be necessary demonstrate P1 performance levels? These details could become critical as industry deals with issues such as FERC’s interpretation of TPL-002-0 Requirement R1.3.10 (RM10-6-000).</p> <p>In Table 1 - Extreme Events - Stability - Items 2a-2d, change “Protection System failure” to “relay failure” to be consistent with changes in P5.</p> <p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”.</p> <p>Footnote 13 - Delete “voltage (#27, #59)” since the under/over voltage relays are not called upon to provide the primary protection for fault clearing on Transmission elements.</p> <p>Suggest modifying Event P4 description to be more consistent with Event P5 description by including Delayed Fault Clearing in the description in lieu of “Loss of multiple elements”. Suggested Event P4 description is: “Delayed Fault Clearing caused by a stuck non Bus-tie Breaker attempting to clear a fault on one of the following:”</p> <p>In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No¹²” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. Organization	Yes or No	Question 9 Comment
		<p>affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).</p>
PacifiCorp		<p>Under Category P2 (Single Contingency) and Normal System Conditions, the performance table indicates that, for both HV and EHV, interruption of firm transmission service and non-consequential load loss are not allowed following the opening of a line section without a fault. This section of the performance table should distinguish between EHV and HV - performance requirements following the opening of a line section without a fault should be the same as those for a bus section fault. As with the bus section fault, interruption of firm transmission service and non-consequential load loss should be allowed for HV.</p>
NorthWestern Energy (NWMT) Idaho Power Co		<p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”.</p> <p>In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No¹²” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”</p>

Organization	Yes or No	Question 9 Comment
Lakeland Electric		<p>The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. It is our understanding that footnote 9 is under consideration as part of Project 2010-11 and should be noted as such for clarification.</p>
FirstEnergy		<p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay (footnote 13) protecting the Faulted element to operate as designed”. To the extent fully redundant relaying exists with no expected delay in Fault Clearing its understood that the P5 event would not be a concern for the redundant system design. The drafting team has taken appropriate steps within the TPL standard to focus on relaying failures to provide clarity in what is required for P5 planning event.</p>
Platte River Power Authority		<p>No. Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”.</p> <p>In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No¹²” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. 		<p>Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).</p> <p>In Table 1 - Planning Events - Suggest changing the description for Events P2-3, P2-4, P4 and P4-6 to use the term 'Bus-tie Breaker' or 'non-Bus-tie Breaker' as applicable.</p> <p>In Table 1 - Extreme Events - Stability - Items 2a-2d, do you mean 'Protection System failure' here, or do you want to change to 'relay failure' to be consistent with changes in P5?</p>
Orlando Utilities Commission		<p>I generally agree with the direction the team has gone.</p> <p>Footnote 9 should also be highlighted as being part of the project 2010-11 discussion just as footnote 12 is.</p>
Manitoba Hydro		<p>In point g, violations are noted in terms of post-Contingency voltage deviations rather than post-Contingency voltage limits. This may lead to confusion, as some utilities evaluate performance based on a post-Contingency voltage deviation criterion while other utilities evaluate performance based on post-Contingency voltage limits. This same comment applies to Requirement R5.Suggested rewording for point g: System steady state voltages and post-Contingency voltages or voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. Suggested rewording for the first sentence in Requirement R5: Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltages or voltage deviations, and the transient voltage response for its System.</p> <p>Note 12 states that an outstanding issue related to non-consequential load loss is being discussed. This will create a lot of uncertainty. Manitoba Hydro could not support this standard unless the resolution of Note B is known.</p>
CenterPoint Energy		<p>CenterPoint Energy appreciates the effort put forth by the SDT in revising the performance table. The current draft of P5 is preferable to previous versions.</p>
TVA Transmission Planning & Compliance		<p>TVA is concerned about footnote 12 (known as footnote b in existing TPL standards). TVA believes that utilities should be given some freedom in dropping local load in response to N-1 events as long as overall</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 9 Comment
		<p>BES reliability is not impacted. Otherwise significant capital improvements will be required that will have no overall reliability gain for the Bulk Electric System.</p> <p>TVA does agree with the revisions made specifically to the P5 event.</p> <p>TVA wishes to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.</p>
SMUD		<p>For the Western Interconnection, the performance level for a Bus-tie breaker fault under TPL-001-2, Table 1, Item P2-4, Notes (a) and (f), requires no thermal overloads and no cascading. While, FAC-010-2.1, R1.2, R2.5-R2.6, as modified by E1.1, E1.1.7, E1.3, and E1.3.1 requires a different performance level of no cascading. Please explain why this regional variance is not included under TPL-001-2, Item E.</p>
California ISO		<p>We support these changes, although we suggest that the proposed footnote 12 include an interim provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”</p>
Seattle City Light		<p>Table 1, P5 does not recognize the existence of redundant (or backup) relays. These are an integral part of the protection system design and should be considered in analysis of SLG faults. The TPL standard should encourage redundant, fail-safe systems, not ignore them.</p> <p>In Table 1, P2 and P3, we have a concern about not allowing non-consequential load loss. Project 2010-11 is deciding on this issue, but is not completed (see footnote 12). Should the standard become effective before this project is completed, no non-consequential load loss would be allowed, requiring many transmission additions and reconfigurations. Please change the "NO" in the last column to "YES" until the completion of Project 2010-11.</p>
ISO New England Inc.		<p>We are supportive of the change to P5. However, in making this modification, other items need to also be changed. In Table 1 - Stability, the language should be made similar to wording in P5. Protection System should be removed and replaced with the words “relay failure”. This change should be made for 2a through 2d:2. Local or wide area events affecting the Transmission System such as: a. 3Å~ fault on generator with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. b. 3Å~ fault on Transmission circuit with</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 9 Comment
		<p>stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. c. 3Ã fault on transformer with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. d. 3Ã fault on bus section with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing.</p> <p>We also believe that Note 11 needs clarifying wording as shown below:"Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less"</p>
<p>United Illuminating National Grid Central Maine Power Company New York State Electric & Gas Corp</p>		<p>In Table 1 - Stability, Make language similar to wording in P5. "Protection System" should be removed and replaced with the words "relay failure". This would avoid future interpretation issues about the intent of this requirement (as we understand it) to exclude more severe though less likely failures such as battery systems. This change should be made for 2a through 2d on page 12).In Note 11 (page 14) ADD the wording shown in "quotes" below: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for "a total of" 1 mile or less.</p>
<p>Hydro-Quebec TransEnergie</p>		<p>In table 1 on page 12 (Stability section), Relay failure should replace Protection System</p>
<p>LCRA TSC</p>		<p>An important footnote to Table 1 is omitted from this proposed revision. This omission prevents adequate evaluation of the footnote. Footnote 12 in Table 1 is no longer applied to P2.1, P2.2, P2.3, P4, and P5. The footnote states: "Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here." The footnote should be removed from the proposed revision until Project 2010-11 is concluded.</p>
<p>American Transmission Company</p>		<p>We offer the major suggestion that the P3 Category performance criteria be modified to apply only to the loss of two generators. The SDT properly recognizes that generator outages are significantly more probable than line or transformer outages and should be "higher" in the category list. However given the clearly higher probability of generator outages, the probability of the loss of two generators is clearly higher than the loss of a generator and line or the loss of a generator and transformer. Therefore, if the loss of two generators is in the P3 category, then the loss of a generator and line or transformer should be clearly "lower" in the category list. We suggest the listing of: the loss of a generator and some other element (e.g. transmission circuit, transformer, shunt device, and single pole of DC line) be moved to a lower event category, such as the P6 Category by adding "1. Generator" to the listing in the Initial System Condition (Loss of . . .) column.</p> <p>We offer the minor suggestion that Item 2.a in the Extreme Events, Steady State section - Clarify the meaning of the loss of multiple circuits in Item 2.a by using wording similar to P7. We suggest this text: "a. Loss of three or more circuits that share a common structure."</p>

Organization	Yes or No	Question 9 Comment
		<p>We offer the minor suggestion that Footnote 6 - Further clarify the applicable shunt devices in Footnote 6 with this suggested text: “6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters.”</p> <p>ATC has significant concerns with Q3.2 (R2.1.4 & R2.4.3), Q4 (Table requirements) and Q5 (P3 scope), as noted above.</p> <p>In addition, ATC offers the following suggestions to promote proper Reliability Standard quality and content.</p> <p>(1.) Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.”</p> <p>2.) R2.1.5 - We propose replacing the term ‘major Transmission’ with “BES” because BES is a well defined term, while the term ‘major Transmission’ is not.</p> <p>(3.) Add R2.3.1 - We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, “Perform an analysis for at least one year in the Near Term Transmission Planning Horizon.” This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted.</p> <p>4.) R2.7.4 - We suggest that the wording of R2.7.4 be the same as R.2.8.2. Otherwise, we propose that R2.7.4 and R2.8.2 be revised with wording like, “. . . implementation status of identified Corrective Action Plans for System Facilities and Operating Procedures.” to clarify that the identified system facilities and operating procedures refer only to those that were in the previous year’s Corrective Action Plans.</p> <p>(5.) R3.3.1 - The term of ‘controls’ is ambiguous and not defined, unlike the term, ‘Protection Systems’, which is defined. Therefore, we suggest that this item be defined or more clearly described to avoid the risk of different and possibly contradictory interpretations by TPs, PCs, and auditors.</p> <p>(6.) R3.3., bullet #1 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, “Trip generating units that are connected to the BES when actual or assumed minimum generator steady state or ride through voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment”. The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R3.3.1, bullet #1 must be different from its counterpart, R4.3.1, then please explain the reasons for any differences.</p>

Organization	Yes or No	Question 9 Comment
		<p>(7.) R3.4.1 - Compliance with the requirement “to coordinate” is problematic and non-measurable. We suggest replacing it with the requirement “to communicate”.</p> <p>8.) R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required?</p> <p>(9.) R4.1.1 - We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, “No generating unit connected to the BES shall pull out of synchronism.” For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases.</p> <p>(10.) R4.1.2 - We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above.</p> <p>(11.) R4.3.1 - This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement.</p> <p>(12.) R5 - We propose removing the criteria item, “post-Contingency voltage deviation”, because this criterion has not been developed and used widely enough in the industry to be introduced into the standards.</p> <p>(13.) R7 - Revise part of the requirement text to read, “. . . identify each entity’s individual and joint responsibilities . . .” to provide better clarity. Perhaps this requirement should be listed at the beginning of the Requirements section, instead being mentioned near the end of this section.</p> <p>(14.) Change the forward referencing to backward referencing. We agree with R2.6, R3.1, R3.5, R4.1, and 4.2. However, we suggest that the requirements be ordered so that all of the references refer back to earlier text, rather later text to be consistent with the rest of this standard and other referencing in this standard (e.g. R2.1.3, R2.1.4, R2.4.3, R3, R3.3, R3.5, R4, R4.3, R4.4, R4.5), as well as other standards.</p>
Tri-State Generation & Transmission		<p>Table 1, P5 does not seem to account for redundant relays in the Protection System to mitigate potential relay failure. We recommend changing the “Event” to “Delayed Fault Clearing due to the failure of a relay to operate as designed, if that is the only relay protecting the Faulted element, for one of the following:”</p> <p>In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement</p>

		<p>"No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).</p> <p>Second, we are unclear why voltage relays are included in footnote 13 and think they can be removed.</p> <p>Third, in the Extreme Events - Stability section of Table 1, items 2a-2d "Protection System failure" should be changed to "relay failure" to be consistent with Table 1, Category P5.</p>
Lakeland Electric		<p>The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. It is our understanding that footnote 9 is under consideration as part of Project 2010-11 and should be noted as such for clarification.</p>
NBSO		<p>For consistency, 'Protection System' should be replaced with 'relay' on Table 1 (p12) Stability Section, items</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 9 Comment
Progress Energy		<p>2a-2d.</p> <p>PE remains concerned with the present draft of TPL-001-2 regarding the presence or absence of footnotes in particular events. PE believes that, for all events in Table 1 except P0, any “No” designation in the “Non-Consequential Load Loss allowed” column should have Footnote 12 appended to it. Several events do append footnote 12 to a “No” answer, but several do not. PE does not see why certain events should be denied the use of Footnote 12 as long as Footnote 12 is worded in a manner such that the BES will not be adversely affected. PE has additional concerns regarding two Footnotes.</p> <p>Footnote 9 contains language regarding firm transmission service that is very similar to language presently under review in NERC Project 2010-11. PE feels that Footnote 9 should have had a statement at the end similar to that of Footnote 12, such as “Note: Firm Transmission Service is being decided in Project 2010-11. When that project is finalized, the resolution will be copied into Footnote 9.” Without such a statement, PE cannot understand why the Firm Transmission language in footnote (b) under Project 2010-11 is being reviewed, while it is apparently no longer being reviewed in Project 2006-02. Footnote 12 contains the following language as a place holder: “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.” PE has filed substantial comments on the footnote (b) issue in previous drafts, pointing out that disallowance of curtailment of non-consequential load is a local load issue and not a BES concern. PE therefore cannot make any positive determination as to whether the draft Standard, TPL-001-2, and its associated Table 1, will be a viable Standard until the language in Footnote 12 is resolved via Project 2010-11. Given the potential for unresolved and confusing issues regarding the parallel development of Project 2006-02 and 2010-11, PE encourages NERC to resolve all issues within Project 2010-11 before taking the draft Standard TPL-001-2 to ballot in Project 2006-02.</p>
Tucson Electric Power Company		<p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”.</p> <p>In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No¹²” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this</p>

Organization	Yes or No	Question 9 Comment
		<p>particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”</p> <p>Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). Non-Consequential Load Loss and curtailment of Firm Transmission Service should be allowed for loss of EHV BES elements for Category P4 and P5 events.</p>
New York Independent System Operator		There are two tables labeled “Table 1”. The extreme events table should be renamed “Table 2”.
MidAmerican Energy		Voting "no" - Footnote 6 - Further clarify the applicable shunt devices in Footnote 6 with this suggested text: 6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters
Southern California Edison Company		SCE supports the revised performance table.
Omaha Public Power District		Why is Footnote 12 used for some occurrences of the word "No" in the last column of Table 1 but not other occurrences of the word "No"?
Hydro One Networks Inc.		No selection boxes in this question. Yes, we support.
SERC Dynamics Review Subcommittee		Yes. The SERC DRS supports the revisions.
Duke Energy		We support the changes.

Organization	Yes or No	Question 9 Comment
South Carolina and Gas		Yes
Xcel Energy		<p>The defined term “Bus-tie Breaker” is not used per se anywhere in the Requirements or in Table 1. Suggest changing the description for Events P2-3, P2-4, P4 and P4-6 to use the term Bus-tie Breaker or non-Bus-tie Breaker, as applicable.</p> <p>Existing P5 event description needs improvement since the phrase “...failure of relay protecting the Faulted element to operate as designed...” reads awkwardly and also includes some superfluous verbiage that can be omitted. For example, isn’t “protecting the faulted element” the basic function of every protective relay? Also, isn’t “(failure) to operate as designed” inherent in the definition of Delayed Fault Clearing?</p> <p>Suggested P5 event description is: “Delayed Fault Clearing due to the operation failure of a primary protection relay¹³ when attempting to clear a fault on one of the following:”</p> <p>Footnote 13 – Delete “voltage (#27, #59)” since the under/over voltage relays are not called upon to provide the primary protection for fault clearing on Transmission elements.</p> <p>In Table 1 – Extreme Events – Stability – Items 2a-2d, change “Protection System failure” to “relay failure” to be consistent with changes in P5.</p> <p>Suggest modifying Event P4 description to be more consistent with Event P5 description by including Delayed Fault Clearing in the description in lieu of “Loss of multiple elements”. Suggested Event P4 description is: “Delayed Fault Clearing caused by a stuck non Bus-tie Breaker attempting to clear a fault on one of the following:”</p>

6. The SDT has revised the Measures based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

The SDT has made the following changes due to industry comments:

M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using ~~the latest~~ data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, ~~any the~~ criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding.

M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity who has indicated a reliability need and that ~~the functional entity~~ Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

Data retention for R7 - The current, in force documentation for the agreement(s) on roles and responsibilities, as well as ~~all such~~ documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

Conforming changes were made to M6 and the data retention for R6/M6. Conforming changes were made to R1 to eliminate the phrase, “the latest.” The majority of respondents agree with the changes to the Measures and no other changes to the Measures have been made based on stakeholder comments.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 10 Comment
--------------	-----------	---------------------

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 10 Comment
Florida Reliability Coordinating Council, Inc - Transmission Working Group	No	It appears that there is a disagreement between R8 and M8, regarding public posting. We Agree with M8 posting option.
NorthWestern Energy (NWMT)	No	Measure M6 is too vague. It is unclear how to identify the conditions of Cascading, voltage instability, or uncontrolled islanding. The Glossary of Terms defines Cascading as “The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.” Does the loss of system elements have to extend beyond the Control Area to be considered “Cascading”? Is there a Megawatt threshold that must be satisfied? Is there a time duration involved? Also, “cascading outages” needs to be defined. In addition, “voltage instability” and “uncontrolled islanding” should both be defined.
Lakeland Electric	No	please consider remove “the latest” from M1
Ameren	No	For measurements M3 and M4, there is some question as to what is to be provided as evidence of a study. Would the study results alone provide sufficient evidence, or does the entire powerflow, stability, or short circuit effort need to be documented in a formal study report? There are no measures for the creation and coordination of contingency lists that are to be developed in R3.4, R3.5, R4.4, and R4.5. Are these contingency lists required to be a documented part of the study?
MidAmerican Energy	No	Revise measures to be consistent with requirements. 1. R6 Delete “any”. The use of the word any in standards should not be allowed. 2. Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” 3. R2.1.5 - We propose replacing the term ‘major Transmission’ with “BES” because BES is a well defined term, while the term, ‘major Transmission’, is not. 4. Add R2.3.1 - We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, “Perform an analysis for at least one year in the Near Term Transmission Planning Horizon.” This requirement would set an expectation

Organization	Yes or No	Question 10 Comment
		<p>that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted.</p> <p>5. R2.7.2 - Delete 2.7.2. With regard to "include actions to resolve performance deficiencies identified in multiple sensitivity studies", mitigation plans should not be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. Some of the sensitivity study conditions are not credible.</p> <p>6. R2.7.4 - We suggest that the wording of R2.7.4 be the same as R.2.8.2.</p> <p>7. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required?</p> <p>8. R4.1.1 - We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, "No generating unit with a Point of Interconnection connected to the BES shall pull out of synchronism." For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases.</p> <p>9. R4.1.2 - We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above.</p> <p>10. R4.3.1 - This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement.</p> <p>11. R.4.3.2 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, "Trip generating units that are connected to the BES when actual or assumed minimum generator transient voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment". The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R4.3.2 must be different from its counterpart, R3.3.2, then please explain the reasons for any differences.</p> <p>12. R5 - This requirement should allow the applicable entity (such as the TOP / TO) to define a "Post-Contingency Voltage Deviation" as this criteria is not used widely enough in the industry to be a well</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 10 Comment
		<p>established criteria.</p> <p>13. Revise R8 to limit the need to provide the Planning Assessment as follows “adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity...”</p> <p>14. Data Retention for R3, R5, R6, & R7 - The MRO NSRS proposes that the wording in these elements be revised to change “All” to “The”. The word “All” is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: “The studies performed in support....”</p>

7. The SDT has revised the Requirement R8 VSL based on industry comments to the initial ballot. If you do not support these changes, please specify why you disagree and include specific alternative language to resolve your concern.

Summary Consideration:

The SDT made the following clarification due to industry comments:

4.3.1, bullet #1: Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

The VSL was not changed as the majority response was that the industry is in general agreement with the VSL.

The SDT did not pose questions for items that were not redlined, i.e., changed, in this posting since those items not redlined were considered by the SDT as sufficiently vetted by the industry through the various phases of the project to date. However, the SDT has reviewed all comments regardless of whether specific questions were asked and has considered the comments.

Organization	Yes or No	Question 11 Comment
Northeast Power Coordinating Council Consolidated Edison Co. of New York, Inc.	No	<p>Requirement 8 is an administrative burden to TPs and PCs that adds no value to Bulk Power System reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the VSLs for Requirement 8 remain, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. If Requirement 8 and 8.1 are retained, they should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response and there should be a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.</p> <p>Other comments not addressed by this Comment Form as follows: Section 3.3 - The last sentence of 3.3.1 should be removed. This is addressed in PRC-023. Line ratings are addressed in PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded."</p> <p>Section 4.3 - High speed reclosing is not defined, and to help eliminate any confusion that it may introduce</p>

Organization	Yes or No	Question 11 Comment
		<p>into the standard it will be worthwhile for the SDT to define this term.</p> <p>Several specific examples from previous comments on sensitivity analysis and guidance for base case assumptions: The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements.</p> <p>Requiring extreme event analysis is requiring two layers of event analysis beyond what is required and there is no requirement for corrective action if anything is identified.</p> <p>The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.</p> <p>As for allowing con-consequential load loss for Categories P1 through P5, suggest approval at the Regional level, with a concept of allowing it in a “local area” that does not impact BPS reliability.</p> <p>All references to 300 kV in document should be replaced with EHV (for example in the Introduction, Section 5).The first phrase of Note 3 on p. 14 should be revised as follows: “Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as those representing the backbone of the System, generally at voltage greater than 300 kV, and high voltage (HV) Facilities defined as those not representing the backbone of the System, as determined by the Planning Coordinator and approved by Regional Entity.”</p>
IRC Standards Review Committee	No	<p>(AESO is not a party to the following comments since its VSLs are set by the Alberta regulatory authority.)Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary.Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: 8.1 If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.For a Planning Coordinator (PC) who distributes the Planning Assessment to many different entities (to adjacent PCs, TPs, and other functional entities), a concern regarding the Requirement R8 VSL is that it is overly restrictive to apply a violation for failing to distribute the results of its Planning Assessment to only one PC, TP, or functional entity (and to apply a High VSL for failing to distribute to more than one entity), particularly since an entity’s contact is subject to change over time, and since Measure M8 allows for publicly posting the results of its Planning Assessment to its website. Should the SDT decide to include the VSLs for Requirement 8, we would recommend revising to use a percentage approach rather than applying a violation to a Planning</p>

Organization	Yes or No	Question 11 Comment
		<p>Coordinator who fails to provide the results of its Planning Assessment to one PC, TP, or other functional entity (or applying a High VSL for failing to distribute to more than one entity.) Recommend applying a similar percentage approach to the VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1) to be considered for the TPL-001-2 R8 VSLs. For example,</p> <ul style="list-style-type: none"> o Lower VSL: The responsible entity failed to provide the Planning Assessment final results to 5% or less of the required entities. o Moderate VSL: The responsible entity failed to provide the Planning Assessment final results to more than 5% up to (and including) 10% of the required entities. o High VSL: The responsible entity failed to provide the Planning Assessment final results to more than 10% up to (and including) 15% of the required entities. o Severe VSL: The responsible entity failed to provide the Planning Assessment final results to more than 15% of the required entities OR [the existing language for the Severe VSL].Explanation: The VSLs were modified for consistency with other standards and VSLs.Reference: Link to VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1):http://www.nerc.com/docs/standards/sar/Staff_Proposed_VSLs_2010July27.pdf
Southern Company	No	<p>We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: “Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP.”</p> <p>Also, we wish to make a comment on footnote #13 of Table 1. 13. Applies to any of the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, & 67), voltage (#27 & 59), directional (#32 & 67), and associated tripping (#86 & 94) relays.</p>
Florida Reliability Coordinating Council, Inc - Transmission Working Group	No	<p>The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified to replace distribute with “make available:”, so the new requirement would read as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.</p>
PacifiCorp	No	<p>The language for Requirement R8 is ambiguous with regard to which adjacent entities must request in writing the results of the Planning Assessment. The language should be clarified to read: “Upon request made in</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 11 Comment
		writing, each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any other functional entity that has a reliability related need.” The Requirement R8 VSL language should also be revised accordingly.
ReliabilityFirst	No	<p>TPL-001-2 Draft 5 is much better than Draft 4. There is still one significant concern, that I do not believe the drafting team adequately addressed. It is unclear as to what “Planning Assessment results” and “results of its Planning Assessment” entail. The Draft 5 response that “Planning Assessment” is a defined term does not fully address this concern. “Planning Assessment results” or “results of its Planning Assessment” is not necessarily the same thing as “Planning Assessment”. As written, “Planning Assessment results” or “results of its Planning Assessment” could be anything from a single sentence, to a few brief high level paragraphs, to a detailed and technically complete Planning Assessment. The Standard needs to more clearly state what is required in the report to other entities. Based on the drafting team response in Draft 4, it seems that replacement of “Planning Assessment results” or “results of its Planning Assessment” with the term “Planning Assessment” or “its Planning Assessment” would be appropriate.</p> <p>Violation Severity Levels: R8The failure to provide documented responses to documented comments to “Planning Assessment results” is deemed to be a higher severity level than failing to distribute “results of its Planning Assessment”. Failure to distribute denies functional entities an opportunity to comment, and could prevent coordinated planning, and thus should be deemed to be more severe than failing to provide documented responses to documented comments.</p>
Lakeland Electric	No	The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.
Orlando Utilities Commission	No	R8 should require that the PC and TP make available it's planning assessment results when requested, rather than requiring the preemptive transmittal. There is no reliability purpose served by providing unsolicited information.
US Bureau of Reclamation	No	The language implies that the responsible entity may choose to not distribute it if it feels the entity making the request does not have a "reliability related need". It is not clear why that distinction is being made?
California ISO	No	Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the

Organization	Yes or No	Question 11 Comment
		<p>Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows:</p> <p>8.1 If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. For a Planning Coordinator (PC) who distributes the Planning Assessment to many different entities (to adjacent PCs, TPs, and other functional entities), a concern regarding the Requirement R8 VSL is that it is overly restrictive to apply a violation for failing to distribute the results of its Planning Assessment to only one PC, TP, or functional entity (and to apply a High VSL for failing to distribute to more than one entity), particularly since an entity's contact is subject to change over time, and since Measure M8 allows for publicly posting the results of its Planning Assessment to its website. Should the SDT decide to include the VSLs for Requirement 8, would recommend revising to use a percentage approach rather than applying a violation to a Planning Coordinator who fails to provide the results of its Planning Assessment to one PC, TP, or other functional entity (or applying a High VSL for failing to distribute to more than one entity.) Recommend applying a similar percentage approach to the VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1) to be considered for the TPL-001-2 R8 VSLs. For example,</p> <ul style="list-style-type: none"> o Lower VSL: The responsible entity failed to provide the Planning Assessment final results to 5% or less of the required entities. o Moderate VSL: The responsible entity failed to provide the Planning Assessment final results to more than 5% up to (and including) 10% of the required entities. o High VSL: The responsible entity failed to provide the Planning Assessment final results to more than 10% up to (and including) 15% of the required entities. o Severe VSL: The responsible entity failed to provide the Planning Assessment final results to more than 15% of the required entities OR [the existing language for the Severe VSL]. <p>Explanation: The VSLs were modified for consistency with other standards and VSLs. Reference: Link to VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1): http://www.nerc.com/docs/standards/sar/Staff_Proposed_VSLs_2010July27.pdf</p>
Ameren	No	<p>The sharing issues of requirement R8 are still not clear, therefore the R8 VSL is not clear. It is not clear if the intent of the SDT is for the PC to share the assessments with PCs and TPs are to share the assessments with TPs, or whether the intent is for the TP to share its assessments with its PC. Will posting the assessment to a secure web-site meet the intent of the requirement?</p> <p>Although the comment form is not designed to allow for such, we need to comment on R4.3.1: As written, it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations, regardless of whether high-speed reclosing is actually implemented. A suggested wording change for the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP."</p>

Organization	Yes or No	Question 11 Comment
		<p>Another comment needs to be made regarding the stability extreme event table: Changes were made in planning event P5 to concentrate on specific relay failures. The same changes need to be made for stability extreme events 2a, 2b, 2c, and 2d. The proposed standard will significantly increase the amount of work required to develop more detailed and complex system models, to perform and document the engineering studies to meet the performance requirements, and to develop the assessments necessary for compliance. All of these increased engineering activities are perceived to provide marginal benefit to the reliability of the bulk electric system, but will require significant increases in manpower across the industry. Further, the manpower is presently not available to develop these more detailed models and to perform these studies with any reasonable assuredness. It will be a continuing challenge to the industry to obtain and keep the engineering talent needed to perform these compliance activities for such marginal benefits.</p>
<p>Central Maine Power Company New York State Electric & Gas Corp</p>	<p>No</p>	<p>Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.</p> <p>We also have other comments not addressed by this Comment Form as follows - Section 2.7, Section 3.3, Section 4.3, and overall: Section 2.7 requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list.</p> <p>Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded."</p> <p>Section 4.3 - High speed reclosing is not defined. Overall - We have previously made comments which have not been addressed in the current version of the proposed standard. Support for the standard can at most be limited without addressing comments.</p>

Consideration of Comments from Informal Comment Period – Assess Transmission Future Needs – Project 2006-02

Organization	Yes or No	Question 11 Comment
		<p>We have previously commented on sensitivity analysis and guidance for base case assumptions.</p> <p>Also, extreme event analysis should not be mandated in this standard as no corrective action is required. The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements. Requiring extreme event analysis is requiring two layers of event analysis beyond what is required, and there is no requirement for corrective action if anything is identified. The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.</p>
New York Independent System Operator	No	<p>Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.</p>
NERC staff	Yes	NERC staff supports the changes to the VSL for Requirement R8.
SERC Planning Standards Subcommittee	Yes	<p>Comments: We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP."</p> <p>We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.</p>
Hydro One Networks Inc.	Yes	Requirement 8 is an administrative burden and adds little or no value to the BPS reliability. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary.
SERC Dynamics Review	Yes	We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful

Organization	Yes or No	Question 11 Comment
Subcommittee		<p>and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied." We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.</p>
MRO's NERC Standards Review Subcommittee	Yes	<p>Other Comments:</p> <ol style="list-style-type: none"> 1. How are backup relays handled (TPL-002-0, R1.3.10 & TPL-001-2 R1 & P5)? What does FERC construe as normal system for a protection system. The TPL-001-2 R1 & P5, this standard doesn't appear to address primary protection and how this handled. 2. Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: "Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard." 3. R2.1.5 - We propose replacing the term 'major Transmission' with "BES" because BES is a well defined term, while the term, 'major Transmission', is not. 4. Add R2.3.1 - We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, "Perform an analysis for at least one year in the Near Term Transmission Planning Horizon." This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. 5. R2.7.4 - We suggest that the wording of R2.7.4 be the same as R.2.8.2. Otherwise, we propose that R2.7.4 and R2.8.2 be revised with wording like, ". . . implementation status of identified Corrective Action Plans for System Facilities and Operating Procedures." to clarify that the identified system facilities and operating procedures refer only to those that were in the previous year's Corrective Action Plans. 6. R3.3.1 - The term of 'controls' is ambiguous and not defined, unlike the term, 'Protection Systems', which is defined. Therefore, we suggest that this item be defined or more clearly described to avoid the risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. 7. R3.3.1, bullet #1 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, "Trip generating units that are connected to the BES when actual or assumed minimum generator steady state or ride through voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment". The requirement should not apply to all relevant generating units until one of the MOD

Organization	Yes or No	Question 11 Comment
		<p>standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R3.3.1 bullet #1 must be different from its counterpart, R4.3.1 bullet #2, then please explain the reasons for any differences.</p> <p>8. R3.4.1 - Compliance with the requirement “to coordinate” is problematic and non-measurable We suggest replacing it with the requirement “to communicate”.</p> <p>9. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required?</p> <p>10. R4.1.1 - We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, “No generating unit connected to the BES shall pull out of synchronism.” For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases.</p> <p>11. R4.1.2 - We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above.</p> <p>12. R4.3.1 - This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement.</p> <p>13. R5 - This requirement should remove the criterion item, “post-Contingency voltage deviation”, because this criterion is not used widely enough in the industry to be well established criterion.</p> <p>14. R8 - This requirement should be revised to limit the need to provide the Planning Assessment as follows “adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity...” This suggestion is added to the requirement to clarify that the word adjacent also applies to Transmission Planners and to clarify that the functional entity must be registered in order for the entity to be applicable to the requirement.</p>
TVA Transmission Planning & Compliance	Yes	<p>Additional TVA comments:TVA wishes to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations. Does high speed reclosing occur in less than 60 cycles or 60 seconds? If a utility does not have reclosing on a</p>

Organization	Yes or No	Question 11 Comment
		<p>transmission line - then must the utility still perform stability studies assuming that there is reclosing? TVA suggests the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP."</p> <p>In R4.1.1, TVA is concerned that no generating unit shall pull out of synchronism in a local area only (thus not impacting the overall reliability of the BES) for Planning Event P1, while the standard does allow generator runback/tripping for the same event. Thus the generating unit may be tripped by a special protection scheme - but may not be tripped by an out of step relay. TVA believes that out of step relaying should be allowed for this unit tripping as long as this does not affect the overall reliability of the BES.</p>
South Carolina and Gas	Yes	We wish to make a comment on the revisions to R4.3.1. We believe that the analysis of both successful and unsuccessful high speed reclosing for all cases is not justified and should be left to the discretion of the Transmission Planner.
ISO New England Inc.	Yes	<p>Requirement 8 and 8.1, should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response and there should be a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.</p> <p>We have other comments not addressed by this Comment Form as follows - Sections 2.7, 3.3, 4.3 and overall. R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Runback/tripping of HVDC should be added to the list.</p> <p>Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded."</p> <p>Section 4.3 - High speed reclosing needs to be defined.</p>
Hydro-Quebec TransEnergie	Yes	<ul style="list-style-type: none"> o All references to 300 kV in document should be replaced with EHV (In the introduction, section 5) o The first phrase of Note 3 on p 14 should be revised as follows: "Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as those representing the backbone of the System, generally at voltage greater than 300 kV, and high voltage (HV) Facilities defined as those not representing the backbone of the System, as determined by the Planning Coordinator and approved by Regional Entity."

Organization	Yes or No	Question 11 Comment
National Grid	Yes	<p>Other Comments:Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded.”</p> <p>Section 4.3 - High speed reclosing is not defined. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required.</p>
Tri-State Generation & Transmission	Yes	<p>None regarding R8.</p> <p>The following comments refer to parts of the proposed standard for which no questions are asked.R4, Part 4.1.2: The response to our previous comment indicated that our description was for a system Stability issue. R4 is addressing system Stability and we believe the comment still applies and that it was not answered in the response. We have two issues with 4.1.2: Sometimes out-of-step (loss of generator synchronism) is better mitigated through islanding by tripping transmission rather than by tripping generators; the second point is that the ability of present modeling programs does not include the capability to model all types of impedance relays and their associated OOS blocking and tripping capabilities that are available.</p> <p>R4, Part 4.3.1: The third bullet implies that all impedance relays (and perhaps others) will need to be modeled in the stability databases. We question whether the existing simulation programs can accommodate this large magnitude of data inclusion and whether there is any benefit to BES reliability. Certainly using generic models rather than actual models would be of no benefit. We recommend changing the third bullet to “Evaluation of Protection System behavior when transient power swings are detected or predicted to have impedance characteristics that may approach relay operating characteristics.”</p>
Northeast Utilities	Yes	<p>No comments on Question 7.Other Comments: As detailed below, NU has other comments that are not addressed by this Comment Form as follows - Section 3.3, Section 4.3, Non-Consequential Load Loss as referenced in the events Table 1 and studies using extreme event contingencies. Section 3.3 - NU believes that the last sentence of Part 3.3.1 should be removed since this is handled by PRC-023. Line ratings are addressed by PRC-023 which requires coordination with the Reliability Coordinator. NU suggests the removal of the following sentence: “Tripping of Transmission elements where relay loadability limits are exceeded.”</p> <p>Section 4.3 - High speed reclosing is not defined and to help eliminate any confusion that it may introduce into the standard it will be worthwhile for the SDT to define this term. Non-Consequential Load Loss - Depending upon the resolution of “Project 2010-11, TPL Table 1, Footnote b” NU may have additional comments regarding this issue.</p> <p>Studies Using Extreme Event Contingencies: The requirements for sensitivity analysis already address issues</p>

Organization	Yes or No	Question 11 Comment
		going beyond what is expected to meet the reliability requirements of the standard. Therefore, requiring extreme event analysis is requiring two layers of event analysis beyond what is required and there is no requirement for corrective action if a concern is identified.
NBSO	Yes	NBSO suggests considering rewording the VSL so that they address the failure to distribute the final results of planning assessments.
ERCOT ISO	Yes	<p>ADDITIONAL COMMENTS: Short circuit analysis (R2.3 and R2.8) should only be applicable to TPs. Fault duty issues are typically local in nature and it would be an overlap for PCs to perform this same analysis done by the local Transmission Planner.</p> <p>Furthermore, R7 should be deleted and the responsibilities of each entity should be explicitly stated within the specific requirements.</p> <p>Previous Comment Unaddressed : Requirement 2.6.2: Reads as if a change is being made to an existing study. It is confusing. Possibly restate: "2.6.2 For steady state, short circuit, or stability analysis: previous studies can be used only if a material change to the system has not occurred or if a change that did occur does not impact the study area."</p> <p>R4.1.2 - Planning Coordinators do not perform protection coordination nor do they have access to the relay settings information required to do this analysis. This requirement should apply to Transmission Planners only because they perform system protection. The substantive scope of the standard is relative to Long-Term Transmission Planning Horizon and Near-Term Transmission Planning Horizon. The Purpose section is described in terms of the "planning horizon" generally. It may be worthwhile aligning the two to mitigate the potential for any confusion.</p> <p>ERCOT proposes the following revisions to the Purpose section: 3.Purpose: Establish Transmission system planning performance requirements within the relevant planning horizon (i.e. Long-Term or Near-Term) to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies</p> <p>.In addition, the "Time Horizon" for the Standard is "Long-Term Planning". Obviously, this necessarily encompasses both Long-Term and Near-Term Transmission Planning Horizons. However, the scope of the Long-Term Planning time horizon is not readily apparent. ERCOT recommends appropriate revisions that clearly define the applicable time horizons.</p>

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.
12. Version 5 of the revised standard posted for comment on August 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this fifth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Conduct ballot	TBD
2. Submit standard(s) to BOT.	2Q11
3. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One includes the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One includes the forecasted peak Load period for either 2012 or 2013.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1, P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes P0 as the normal System condition in Table 1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- 1.1.** System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 2.1.** The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6, as follows:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of known Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

- 2.2.** The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
- 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4.** The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
- 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2. System Off-Peak Load for one of the five years.
- 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5.** The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6.** Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Include documentation to support the technical rationale for determining material changes.
- 2.7.** For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.
- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8.** For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the

Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

- 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
- 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
- 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
- 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
- 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes

there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

- R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- 4.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3.** Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
- Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
 - Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
- 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.
- 4.4.** Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

- 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and that functional entity submits a written request for the information. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²

P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adj. ⁹ : 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.

<ul style="list-style-type: none">a. Loss of two generating stations resulting from conditions such as:<ul style="list-style-type: none">i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.ii. Loss of the use of a large body of water as the cooling source for generation.iii. Wildfires.iv. Severe weather, e.g., hurricanes, tornadoes, etc.v. A successful cyber attack.vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.b. Other events based upon operating experience that may result in wide area disturbances.	<ul style="list-style-type: none">e. 3Ø internal breaker fault.f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances
---	---

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. Curtailment of Firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled 'Initial Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Demand. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity who has indicated a reliability need and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.4 Additional Compliance Information

None.

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. R8	The responsible entity failed to distribute the results of its Planning Assessment to one of its adjacent Transmission Planners, one adjacent Planning Coordinator, or to one functional entity that has a reliability related need and that has submitted a written request for the information, respectively in accordance with Requirement R8.	N/A	The responsible entity failed to distribute the results of its Planning Assessment to more than one of its adjacent Transmission Planners, adjacent Planning Coordinators, or functional entities that have a reliability related need and that have submitted a written request for the information, respectively in accordance with Requirement R8.	The responsible entity failed to provide a documented response to a recipient of the Planning Assessment results who provided documented comments on the results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-1	Not employed due to scope of revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.
- ~~11,12.~~ Version 5 of the revised standard posted for comment on August 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this fifth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
Post fifth version of standard.	3Q10
1. Conduct ballot	TBD
Respond to comments and determine next step	TBD
2. Submit standard(s) to BOT.	2Q11
3. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

Year One: The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One ~~must~~ includes the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One ~~must~~ includes the forecasted peak Load period for either 2012 or 2013.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1, P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use ~~the latest~~ data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes **P0** as the normal ~~s~~System condition in Table 1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- 1.1. System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 2.1. The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6, as follows:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response performance:
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of planned known Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

- 2.2.** The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
- 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4.** The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
- 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2. System Off-Peak Load for one of the five years.
- 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5.** The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6.** Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. ~~shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.~~ Include documentation to support the technical rationale for determining material changes.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of Ssuch actions may include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.
- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
- 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
 - 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in

Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.

R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.

4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.

4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.

4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.

4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

- Successful high speed (**less than one second**) reclosing and unsuccessful high speed reclosing into a Fault **where high speed reclosing is utilized**.
- Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
- Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those

Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

- 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, ~~any~~ the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity that has a reliability related need and that functional entity submits a written request for the information. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load ~~including Load~~ that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
3. Internal Breaker Fault ⁸	SLG	EHV	No ⁹	No		

Standard TPL-001-2 — Transmission System Planning Performance Requirements

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
		(Non-Bus-tie Breaker)		HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker)	SLG	EHV, HV	Yes	Yes
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (Fault plus stuck breaker ¹⁰)	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (Fault plus relay failure to operate)	Normal System	Delayed Fault -Clearing -due to the failure of a non-redundant relay ¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes

P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adj. ⁹ : 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. 		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a **Protection System-relay** failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a **Protection System-relay** failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a **Protection System-relay** failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a **Protection**

<ul style="list-style-type: none">a. Loss of two generating stations resulting from conditions such as:<ul style="list-style-type: none">i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.ii. Loss of the use of a large body of water as the cooling source for generation.iii. Wildfires.iv. Severe weather, e.g., hurricanes, tornadoes, etc.v. A successful cyber attack.vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.b. Other events based upon operating experience that may result in wide area disturbances.	<ul style="list-style-type: none">System-relay failure¹³ resulting in Delayed Fault Clearing.e. 3Ø internal breaker fault.f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances
---	---

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. Curtailment of Firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled 'Initial ~~System~~ Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Demand. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1. Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using ~~the latest~~ data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5. Each Transmission Planner and Planning Coordinator shall provide evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of documentation specifying ~~any~~the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8. Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has ~~distributed~~ its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any functional entity who has indicated a reliability need and that ~~the functional entity-Planning Coordinator or Transmission Planner~~ has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 ~~Compliance Monitoring Period and Reset Timeframe~~

~~Not applicable.~~

1.3 ~~1.2~~ Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

4.41.3 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying ~~any~~the criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as ~~all such~~ documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

4.51.4 Additional Compliance Information

None.

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. None.

Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-1	Not employed due to scope of revision

Standards Announcement Response to Comments Posted

Available at: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Project 2006-02 - Assess Transmission Future Needs and Develop Transmission Plans

The standard drafting team working on Project 2006-02 (ATFN SDT) has posted its response to comments to Draft 5 of TPL-001-2 and a preliminary, informational draft of Draft 6 of TPL-001-2. Formal comments will be solicited at a later time.

TPL-001-1 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0. The proposed standard includes several new definitions.

The standard drafting team working on Project 2006-02 (AFTN SDT) solicited comments from industry on the fifth posting of the revised TPL-001-2 through an informal comment period that ended on September 2, 2010. That posting represented the changes made to the revised standard based on industry comments received on the initial ballot of TPL-001-2 with one exception – inclusion of a final solution for [Project 2010-11 TPL Table 1](#) (footnote ‘b’). The revisions to Table 1 footnote ‘b’ are being addressed under Project 2010-11, and that project is still in progress. The objective of the AFTN SDT is to adapt the technical tenets of the final solution for footnote ‘b’ for inclusion in TPL-001-2.

Project 2006-02 can’t move forward until Project 2010-11 is complete however the ATFN SDT believes that there is benefit to posting the other changes made in response to industry comments as quickly as possible. Therefore, the AFTN SDT has posted its consideration of comments report showing the comments received in response to the fifth posting of the standard and the proposed revisions to TPL-001-2 associated with those comments. Posting now will allow interested stakeholders to observe the progress being made in achieving consensus on the standard.

Project Background

The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies. TPL-001-1 — Transmission System Planning Performance Requirements is an update and consolidation of the following standards:

- TPL-001-0 — System Performance under Normal Conditions
- TPL-002-0 — System Performance Following Loss of a Single BES Element
- TPL-003-0 — System Performance Following Loss of Two or More BES Elements
- TPL-004-0 — System Performance Following Extreme BES Events

- TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports
- TPL-006-0 — Data from the Regional Reliability Organization Needed to Assess Reliability

More information is available on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Applicability of Standards in Project

Planning Coordinator

A. Introduction

- 1. Title:** Data From the Regional Reliability Organization Needed to Assess Reliability
- 2. Number:** TPL-006-0.1
- 3. Purpose:** To ensure that each Regional Reliability Organization complies with planning criteria, for assessing the overall reliability (Adequacy and Security) of the interconnected Bulk Electric Systems, both existing and as planned.
- 4. Applicability:**
 - 4.1.** Regional Reliability Organization
- 5. Effective Date:** April 1, 2005

B. Requirements

- R1.** Each Regional Reliability Organization shall provide, as requested (seasonally, annually, or as otherwise specified) by NERC, system data, including past, existing, and future facility and Bulk Electric System data, reports, and system performance information, necessary to assess reliability and compliance with the NERC Reliability Standards and the respective Regional planning criteria.

The facility and Bulk Electric System data, reports, and system performance information shall include, but not be limited to, one or more of the following types of information as outlined below:

- R1.1.** Electric Demand and Net Energy for Load (actual and projected demands and Net Energy for Load, forecast methodologies, forecast assumptions and uncertainties, and treatment of Demand-Side Management.)
- R1.2.** Resource Adequacy and supporting information (Regional assessment reports, existing and planned resource data, resource availability and characteristics, and fuel types and requirements.)
- R1.3.** Demand-Side resources and their characteristics (program ratings, effects on annual system loads and load shapes, contractual arrangements, and program durations.)
- R1.4.** Supply-side resources and their characteristics (existing and planned generator units, Ratings, performance characteristics, fuel types and availability, and real and reactive capabilities.)
- R1.5.** Transmission system and supporting information (thermal, voltage, and Stability Limits, contingency analyses, system restoration, system modeling and data requirements, and protection systems.)
- R1.6.** System operations and supporting information (extreme weather impacts, Interchange Transactions, and Congestion impacts on the reliability of the interconnected Bulk Electric Systems.)
- R1.7.** Environmental and regulatory issues and impacts (air and water quality issues, and impacts of existing, new, and proposed regulations and legislation.)

Measures

- M1.** The Regional Reliability Organization shall provide evidence to its Compliance Monitor that it provided Regional system data, reports, and system performance information per Reliability Standard TPL-006-0_R1.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: NERC.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Requested Regional system data, reports, or system performance information were incomplete.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Requested Regional system data, reports, or system performance information were not provided.

D. Regional Differences

- 1.** None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0.1	April 15, 2009	Corrected formatting for M1.	Errata

A. Introduction

1. **Title:** **Regional and Interregional Self-Assessment Reliability Reports**
2. **Number:** TPL-005-0
3. **Purpose:** To ensure that each Regional Reliability Organization complies with planning criteria, for assessing the overall reliability (Adequacy and Security) of the interconnected Bulk Electric Systems, both existing and as planned.
4. **Applicability:**
 - 4.1. Regional Reliability Organization
5. **Effective Date:** April 1, 2005

B. Requirements

- R1.** Each Regional Reliability Organization shall annually conduct reliability assessments of its respective existing and planned Regional Bulk Electric System (generation and transmission facilities) for:
 - R1.1.** Current year:
 - R1.1.1.** Winter.
 - R1.1.2.** Summer.
 - R1.1.3.** Other system conditions as deemed appropriate by the Regional Reliability Organization.
 - R1.2.** Near-term planning horizons (years one through five). Detailed assessments shall be conducted.
 - R1.3.** Longer-term planning horizons (years six through ten). Assessment shall focus on the analysis of trends in resources and transmission Adequacy, other industry trends and developments, and reliability concerns.
 - R1.4.** Inter-Regional reliability assessments to demonstrate that the performance of these systems is in compliance with NERC Reliability Standards TPL-001-0, TPL-002-0, TPL-003-0, TPL-004-0 and respective Regional transmission and generation criteria. These assessments shall also identify key reliability issues and the risks and uncertainties affecting Adequacy and Security.
- R2.** The Regional Reliability Organization shall provide its Regional and Inter-Regional seasonal, near-term, and longer-term reliability assessments to NERC on an annual basis.
- R3.** The Regional Reliability Organization shall perform special reliability assessments as requested by NERC or the NERC Board of Trustees under their specific directions and criteria. Such assessments may include, but are not limited to:
 - R3.1.** Security assessments.
 - R3.2.** Operational assessments.
 - R3.3.** Evaluations of emergency response preparedness.
 - R3.4.** Adequacy of fuel supply and hydro conditions.
 - R3.5.** Reliability impacts of new or proposed environmental rules and regulations.

Standard TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports

R3.6. Reliability impacts of new or proposed legislation that affects, has affected, or has the potential to affect the Adequacy of the interconnected Bulk Electric Systems in North America.

C. Measures

M1. The Regional Reliability Organization shall provide evidence to its Compliance Monitor that annual Regional and Inter-Regional assessments of reliability for seasonal, near-term, and longer-term planning horizons, and special assessments, were developed and provided as requested by other Regional Reliability Organizations or NERC.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: NERC.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Regional, Inter-Regional, and/or special reliability assessments were provided as requested, but were incomplete.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Regional, Inter-Regional, and/or special reliability assessments were not provided.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

A. Introduction

- 1. Title:** System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)
- 2. Number:** TPL-004-1
- 3. Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
- 4. Applicability:**
 - 4.1.** Planning Authority
 - 4.2.** Transmission Planner
- 5. Effective Date:** The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective

B. Requirements

- R1.** The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is evaluated for the risks and consequences of a number of each of the extreme contingencies that are listed under Category D of Table I. To be valid, the Planning Authority’s and Transmission Planner’s assessment shall:
 - R1.1.** Be made annually.
 - R1.2.** Be conducted for near-term (years one through five).
 - R1.3.** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category D contingencies of Table I. The specific elements selected (from within each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1.** Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
 - R1.3.2.** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
 - R1.3.3.** Be conducted annually unless changes to system conditions do not warrant such analyses.
 - R1.3.4.** Have all projected firm transfers modeled.
 - R1.3.5.** Include existing and planned facilities.

- R1.3.6.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
- R1.3.7.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
- R1.3.8.** Include the effects of existing and planned control devices.
- R1.3.9.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Consider all contingencies applicable to Category D.

- R2.** The Planning Authority and Transmission Planner shall each document the results of its reliability assessments and shall annually provide the results to its entities' respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment for its system responses as specified in Reliability Standard TPL-004-1_R1.
- M2.** The Planning Authority and Transmission Planner shall provide evidence to its Compliance Monitor that it reported documentation of results of its reliability assessments per Reliability Standard TPL-004-1_R1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

- 2.1. Level 1:** A valid assessment, as defined above, for the near-term planning horizon is not available.
- 2.2. Level 2:** Not applicable.
- 2.3. Level 3:** Not applicable.
- 2.4. Level 4:** Not applicable.

B. Regional Differences

- 1. None identified.

Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization. 	1. Generator	3. Transformer	2. Transmission Circuit	4. Bus Section	<p>Evaluate for risks and consequences.</p> <ul style="list-style-type: none"> ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.
1. Generator	3. Transformer					
2. Transmission Circuit	4. Bus Section					

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or System Voltage Limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

A. Introduction

1. **Title:** System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
2. **Number:** TPL-003-1a
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
4. **Applicability:**
 - 4.1. Planning Authority
 - 4.2. Transmission Planner
5. **Effective Date:** The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission systems is planned such that the network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand Levels over the range of forecast system demands, under the contingency conditions as defined in Category C of Table I (attached). The controlled interruption of customer Demand, the planned removal of generators, or the Curtailment of firm (non-recallable reserved) power transfers may be necessary to meet this standard. To be valid, the Planning Authority and Transmission Planner assessments shall:
 - R1.1. Be made annually.
 - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
 - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1. Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
 - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

- R1.3.3.** Be conducted annually unless changes to system conditions do not warrant such analyses.
 - R1.3.4.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
 - R1.3.5.** Have all projected firm transfers modeled.
 - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system demands.
 - R1.3.7.** Demonstrate that System performance meets Table 1 for Category C contingencies.
 - R1.3.8.** Include existing and planned facilities.
 - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet System performance.
 - R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
 - R1.3.11.** Include the effects of existing and planned control devices.
 - R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those Demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category C.
- R1.5.** Consider all contingencies applicable to Category C.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-003-1_R1, the Planning Authority and Transmission Planner shall each:
 - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
 - R2.1.1.** Including a schedule for implementation.
 - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
 - R2.1.3.** Consider lead times necessary to implement plans.
 - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these Reliability Assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-003-1_R1 and TPL-003-1_R2.

- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-003-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

- 1.** None identified.

Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization. 	<p>Evaluate for risks and consequences.</p> <ul style="list-style-type: none"> ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.
---	---	--

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2
Received from MISO on August 9, 2007:**

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

A. Introduction

1. **Title:** **System Performance Following Loss of a Single Bulk Electric System Element (Category B)**
2. **Number:** TPL-002-1b
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
4. **Applicability:**
 - 4.1. Planning Authority
 - 4.2. Transmission Planner
5. **Effective Date:** The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:
 - R1.1. Be made annually.
 - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
 - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1. Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
 - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.
 - R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

- R1.3.4.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
 - R1.3.5.** Have all projected firm transfers modeled.
 - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system Demands.
 - R1.3.7.** Demonstrate that system performance meets Category B contingencies.
 - R1.3.8.** Include existing and planned facilities.
 - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
 - R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
 - R1.3.11.** Include the effects of existing and planned control devices.
 - R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category B of Table I.
- R1.5.** Consider all contingencies applicable to Category B.
- R2.** When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-1_R1, the Planning Authority and Transmission Planner shall each:
 - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
 - R2.1.1.** Including a schedule for implementation.
 - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
 - R2.1.3.** Consider lead times necessary to implement plans.
 - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-1_R1 and TPL-002-1_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0a	October 23, 2008	Added Appendix 1 – Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO	Revised
0b	November 5, 2009	Added Appendix 2 – Interpretation of R1.3.10 approved by BOT on November 5, 2009	Addition
1b	Approved by the Board of Trustees February 17, 2011	Revised footnote ‘b’ pursuant to FERC Order RM06-16-009	Revised (Project 2010-11)

Table I. Transmission System Standards — Normal and Emergency Conditions

Category	Contingencies	System Limits or Impacts		
	Initiating Event(s) and Contingency Element(s)	System Stable and both Thermal and Voltage Limits within Applicable Rating ^a	Loss of Demand or Curtailed Firm Transfers	Cascading Outages
A No Contingencies	All Facilities in Service	Yes	No	No
B Event resulting in the loss of a single element.	Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault.	Yes Yes Yes Yes	No ^b No ^b No ^b No ^b	No No No No
	Single Pole Block, Normal Clearing ^c : 4. Single Pole (dc) Line	Yes	No ^b	No

1. Generator	3. Transformer					
2. Transmission Circuit	4. Bus Section					

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2
Received from MISO on August 9, 2007:**

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

Appendix 2

Requirement Number and Text of Requirement
<p>R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).</p> <p style="padding-left: 40px;">R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.</p>
Background Information for Interpretation
<p>Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations:</p> <ol style="list-style-type: none"> 1. That the assessment is supported by “study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies).” 2. “...these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).” 3. “Include the effects of existing and planned protection systems, including any backup or redundant systems.” <p><i>Category B of Table 1 (single Contingencies) specifies:</i></p> <p>Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing:</p> <ol style="list-style-type: none"> 1. Generator 2. Transmission Circuit 3. Transformer <p>Loss of an Element without a Fault.</p> <p>Single Pole Block, Normal Clearing^e:</p> <ol style="list-style-type: none"> 4. Single Pole (dc) Line <p><i>Note e specifies:</i></p> <p>e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.</p> <p>The NERC Glossary of Terms defines Normal Clearing as “A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.”</p>
Conclusion
<p>TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations.</p> <p>This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or More Bulk</p>

Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3 \emptyset) Fault on the performance of the Transmission System.

In regards to PacifiCorp’s comments on the material impact associated with this interpretation, the interpretation team has the following comment:

Requirement R2.1 requires “a written summary of plans to achieve the required system performance,” including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

A. Introduction

1. **Title:** System Performance Under Normal (No Contingency) Conditions (Category A)
2. **Number:** TPL-001-1
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
4. **Applicability:**
 - 4.1. Planning Authority
 - 4.2. Transmission Planner
5. **Effective Date:** The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective.

B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that, with all transmission facilities in service and with normal (pre-contingency) operating procedures in effect, the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services at all Demand levels over the range of forecast system demands, under the conditions defined in Category A of Table I. To be considered valid, the Planning Authority and Transmission Planner assessments shall:
 - R1.1. Be made annually.
 - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
 - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category A of Table 1 (no contingencies). The specific elements selected (from each of the following categories) shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1. Cover critical system conditions and study years as deemed appropriate by the entity performing the study.
 - R1.3.2. Be conducted annually unless changes to system conditions do not warrant such analyses.

- R1.3.3.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
 - R1.3.4.** Have established normal (pre-contingency) operating procedures in place.
 - R1.3.5.** Have all projected firm transfers modeled.
 - R1.3.6.** Be performed for selected demand levels over the range of forecast system demands.
 - R1.3.7.** Demonstrate that system performance meets Table 1 for Category A (no contingencies).
 - R1.3.8.** Include existing and planned facilities.
 - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
 - R1.4.** Address any planned upgrades needed to meet the performance requirements of Category A.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-001-1_R1, the Planning Authority and Transmission Planner shall each:
 - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon.
 - R2.1.1.** Including a schedule for implementation.
 - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
 - R2.1.3.** Consider lead times necessary to implement plans.
 - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these reliability assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-001-1_R1 and TPL-001-1_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its Reliability Assessments and corrective plans per Reliability Standard TPL-001-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	February 8, 2005	BOT Approval	Revised
0	June 3, 2005	Fixed reference in M1 to read TPL-001-0 R2.1 and TPL-001-0 R2.2	Errata
0	July 24, 2007	Corrected reference in M1. to read TPL-001-0 R1 and TPL-001-0 R2.	Errata

Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization. 	1. Generator	3. Transformer	2. Transmission Circuit	4. Bus Section	<p>Evaluate for risks and consequences.</p> <ul style="list-style-type: none"> ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.
1. Generator	3. Transformer					
2. Transmission Circuit	4. Bus Section					

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Comment Form for 6th Draft of Standard TPL-001-1 Assess Transmission Future Needs (Project 2006-02)

Please **DO NOT** use this form to submit comments on the 6th draft of the TPL-001-2 standard for Assess Transmission Future Needs (Project 2006-02). This comment form must be completed by **May 31, 2011**.

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

Background Information

TPL-001-1 Transmission System Planning Performance Requirements

Comments on the 5th draft of the TPL-001-2 Transmission System Planning Performance Requirements standard were received from the industry through September 2, 2010. The Drafting Team received feedback on a number of issues, and the SDT appreciates the tremendous industry participation in the process. Below is a brief overview of the 6th draft of the standard highlighting areas where the SDT made changes based on stakeholder feedback as well as the Standards Quality Review Team. The team's objectives remain unchanged - to create a single Transmission planning standard: 1) with clear, concise requirements set at an appropriate level to ensure reliability, and 2) that fully addresses all issues raised by FERC Orders 693 and 890, and industry inputs, including the SAR scope document.

6th Draft Overview:

The following changes were made due to industry comments:

1. The definitions of Near-Term Transmission Planning Horizon and Year One have been deleted as the same definition has already been filed by another project.
2. The following requirements were changed:
 - a. Several grammatical changes for clarity.
 - b. R1 – Establish P0 as the normal system condition.
 - c. R2 – The VRF has been changed to High to reflect the importance of the Planning Assessment and to meet the latest guidelines.
 - d. R2, part 2.1.4 – Change from 'performance' to 'System response'.
 - e. R2, part 2.1.4, bullet #7 –Change 'planned' to 'known'.
 - f. R2, part 2.6.2 – Added documentation of technical rationale.
 - g. R2, part 2.8 2– Added '...of identified System Facilities and Operating Procedures'.
 - h. R4, part 4.3.1 – Provided timing criteria and added that it is only applicable when high speed reclosing is utilized.
 - i. R8 – Changed VRF from Low to Medium to meet latest guidelines.
3. Header note changes:
 - a. Deleted 'including Load' as a redundant phrase.
4. Performance table changes:
 - a. Changed Column 2 heading to 'Initial Condition'.

**Comment Form for 3rd Draft of Standard TPL-001-1
Assess Transmission Future Needs (Project 2006-02)**

- b. Deleted superscript for footnote 9 in P0, column 6
 - c. Added 'Breaker' to P2 Event column, parts 3 & 4 and P4 Event for clarity.
 - d. Added 'non-redundant' to P5 Event for clarity.
 - e. Spelled out 'adjustments' to P6 Initial Condition for clarity.
5. Extreme event – Stability 2 – Changed Protection System' to 'relay' for clarity and added footnote 13 reference.
 6. Footnote changes:
 - a. #9 – Added resolutions from footnote 'b' clarification (Project 2010-11).
 - b. #12 – Added resolutions from footnote 'b' clarification (Project 2010-11).
 7. Measurement changes:
 - a. Updated to reflect changes in requirements.
 8. Data Retention – grammatical changes for clarity.

The following changes were made due to the Quality Review:

1. Added 'Category' to Requirement R1 for clarity.
2. Made grammatical changes to requirement R2 for clarity.
3. Added 'For the Planning Assessment' and made grammatical changes to Requirement R2 for clarity.
4. Added 'For the Planning Assessment' to Requirement R2, parts 2.2, 2.4, and 2.5 for clarity.
5. Added timing elements to Requirement R8 and adjusted Measure M8 and the VSL accordingly.
6. Added 'dated' to Measures M2, M3, M4, M5, and M6 to conform to the latest guidelines.
7. Added 'in-force' to Data retention for Requirement R1 and Measure M1 to conform to the latest guidelines.
8. Moved one item from Moderate to Severe in the VSL for Requirements R1, R2, and R4 to conform to the latest guidelines.

**Comment Form for 3rd Draft of Standard TPL-001-1
Assess Transmission Future Needs (Project 2006-02)**

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The SDT has made revisions to the requirements language of TPL-001-2 based on industry comments and the Quality Review. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments with clear indications as to which requirement you are commenting on.

Yes:

No:

2. The SDT has made revisions to the VRF and VSL of TPL-001-2 which will be part of a non-binding poll with this posting based on industry comments and the Quality Review. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Yes:

No:

Comments:

3. If you have any other comments on this Standard that you have not already provided in response to the prior questions, please provide them here.

Comments:

Implementation Plan for TPL-001-2

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-2 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-2, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-2 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Except as indicated below, all Requirements and associated parts shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where

no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-2. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-2 and NERC's Rules of Procedure, Section 800. However, during this 24-month period, all aspects of TPL-001-0 through TPL-006-0 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-2 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-2 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-2, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon will be provided as follows:

- For 84 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption, Corrective Action Plans

applying to performance elements P1-2 and P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element), P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service (in accordance with Requirement R2.7.3) that would not otherwise be permitted by the requirements of TPL-001-2.

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.
12. Version 5 of the revised standard posted for comment on August 3, 2010.
13. Version 6 of the revised standard posted for information on October 19, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q11. The current draft is the sixth iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-2, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this sixth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Conduct ballot	1Q11
2. Submit standard(s) to BOT.	2Q11
3. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1, P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. [*Violation Risk Factor: Medium*]
[*Time Horizon: Long-term Planning*]

- 1.1.** System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*
 - 2.1.** For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies (as indicated in Requirement R2, Part 2.6). Qualifying studies need to include the following conditions:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of known Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is

expected to experience during the possible unavailability of the long lead time equipment.

- 2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
 - 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
 - 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
 - 2.4.2. System Off-Peak Load for one of the five years.
 - 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that

Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

- 3.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3.** Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
- Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
 - Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
- 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment

such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

- 4.4.** Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

 - 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

 - 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
3. Internal Breaker Fault ⁸	SLG	EHV	No ⁹	No		

Standard TPL-001-2 — Transmission System Planning Performance Requirements

		(non-Bus-tie Breaker)		HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) 8	SLG	EHV, HV	Yes	Yes
Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (<i>Fault plus stuck breaker¹⁰</i>)	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV		
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (<i>Fault plus relay failure to operate</i>)	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay ¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV		

Standard TPL-001-2 — Transmission System Planning Performance Requirements

P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adjustments. ⁹ 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:
 - i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
 - ii. Loss of the use of a large body of water as the cooling source for generation.
 - iii. Wildfires.
 - iv. Severe weather, e.g., hurricanes, tornadoes, etc.
 - v. A successful cyber attack.
 - vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
 - b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.
 - f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None.

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR, The responsible entity does not have a completed annual Planning Assessment.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the

Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2	Not employed due to scope of revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.

[12. Version 5 of the revised standard posted for comment on August 3, 2010.](#)

[13. Version 6 of the revised standard posted for information on October 19, 2010.](#)

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in ~~4Q10~~1Q11. The current draft is the ~~second~~sixth iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-~~12~~, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this ~~fifth~~sixth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Post fifth version of standard.	3Q10
2.1. Conduct ballot	TBD <u>1Q11</u>
3. Respond to comments and determine next step	TBD
4.2. Submit standard(s) to BOT.	2Q11
5.3. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

~~**Near-Term Transmission Planning Horizon:** Transmission planning period that covers Years One through five.~~

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

~~**Year One:** The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013.~~

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**

4.1. Functional Entity

- 4.1.1. Planning Coordinator.
- 4.1.2. Transmission Planner.

5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1, P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use ~~the latest~~ data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- 1.1. System models shall represent:
- 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, ~~summarize documented and document summarized~~ results, ~~and cover of the~~ steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: ~~Medium~~High] [Time Horizon: Long-term Planning]*

2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies (as indicated in Requirement R2, Part 2.6, ~~as follows~~). Qualifying studies need to include the following conditions:

- 2.1.1. System peak Load for either Year One or year two, and for year five.
- 2.1.2. System Off-Peak Load for one of the five years.
- 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
- 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in ~~performance~~System response :
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of ~~planned~~known Transmission outages.
- 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1, and P2 categories identified in Table 1 with the conditions that the System is

expected to experience during the possible unavailability of the long lead time equipment.

- 2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
 - 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
 - 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
 - 2.4.2. System Off-Peak Load for one of the five years.
 - 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study ~~shall not include any material changes unless a.~~ Documentation to support the technical rationale ~~can be provided to demonstrate that System~~ for determining material changes ~~do not impact the performance results in the study area shall be included.~~
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions ~~may~~ include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that

Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

- 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
- Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
 - Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
- 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment

such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

- 4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
- 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, ~~any~~the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. *[Violation Risk Factor: Low] [Time Horizon: Long-term Planning]*
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, ~~and~~ adjacent Transmission Planners, ~~and~~ within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and ~~that functional entity~~ submits a written request for the information: within 30 days of such a request. *[Violation Risk Factor: ~~Low~~Medium] [Time Horizon: Long-term Planning]*
- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load ~~including Load~~ that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹ No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
3. Internal Breaker Fault ⁸	SLG	EHV	No ⁹	No		

Standard TPL-001-2 — Transmission System Planning Performance Requirements

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
		(non-Bus-tie Breaker)		HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) ₈	SLG	EHV, HV	Yes	Yes
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (Fault plus stuck breaker ¹⁰)	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (Fault plus relay failure to operate)	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay ¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes

Standard TPL-001-2 — Transmission System Planning Performance Requirements

P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adjustments . ⁹ :- 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:
 - i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
 - ii. Loss of the use of a large body of water as the cooling source for generation.
 - iii. Wildfires.
 - iv. Severe weather, e.g., hurricanes, tornadoes, etc.
 - v. A successful cyber attack.
 - vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
 - b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a ~~Protection System failure~~ relay failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a ~~Protection System failure~~ relay failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a ~~Protection System failure~~ relay failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a ~~Protection System failure~~ relay failure¹³ resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.
 - f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service ~~-, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch,~~ is allowed both as a System adjustment (as identified in the column entitled 'Initial ~~System Conditions Condition~~') and a corrective action ~~-, when achieved through the appropriate re-dispatch of resources obligated to re-dispatch,~~ where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and ~~these adjustments do the re-dispatch does~~ not result in ~~the shedding of any firm Demand Non-Consequential Load Loss.~~ Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. ~~Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.~~
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
- ~~12. Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here.~~
12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in

Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)

an open and transparent stakeholder process that includes addressing stakeholder comments.

13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using ~~the latest~~ data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying ~~any~~ criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, ~~and~~ adjacent Transmission Planners, ~~and~~ within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that ~~functional entity~~ the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current ~~in-force~~ Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying ~~any~~the criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as ~~all such~~ documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None.

Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001- 1 <u>2</u>	Not employed due to scope of revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.
12. Version 5 of the revised standard posted for comment on August 3, 2010.
13. Version 6 of the revised standard posted for information on October 19, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10~~1~~. The current draft is the ~~second~~sixth iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-~~12~~, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 issues are addressed in this ~~first~~sixth draft and those standards will also be replaced by TPL-001-~~1~~-~~2~~.

Future Development Plan:

Anticipated Actions	Anticipated Date
<u>1. Conduct ballot</u>	<u>1Q11</u>
1 <u>2</u> . Submit standard(s) to BOT.	2Q10 1
2 <u>3</u> . Submit to regulatory authorities for approval.	3Q10 1

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

~~**Near-Term Transmission Planning Horizon:** Transmission planning period that covers Years One through five.~~

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

~~**Year One:** The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.~~

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-~~12~~
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For ~~60~~84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption. Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-~~12~~, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-~~12~~:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1, P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use ~~the latest~~ data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.

This establishes Category P0 as the normal System condition in Table 1. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

- 1.1. System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies; (as indicated in Requirement R2, Part 2.6). document assumptions, summarize documented and document summarized results; and cover of the steady state analyses, short circuit analyses, and Stability analyses. [Violation Risk Factor: ~~Medium~~High] [Time Horizon: Long-term Planning]
 - 2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current annual studies; supplemented with or qualified past studies (as indicated in Requirement R2, Part 2.6). Qualifying studies need to include the following conditions:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled; as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performanceSystem response:
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of plannedknown Transmission outages.

- 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be ~~assessed~~studied. The ~~Planning Assessment~~studies shall ~~reflect~~be performed for the P0, P1, and P2 categories identified in Table 1 ~~during~~with the conditions that the System is expected to experience ~~due to~~during the possible unavailability of the long lead time equipment.
- 2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
- 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
- 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
- 2.4.2. System Off-Peak Load for one of the five years.
- 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions ~~not already included in the studies~~ by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
- Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past

studies as qualified in Requirement R2, ~~part 2.6.~~Part 2.6 and shall include documentation to support the technical rationale for determining material changes.

- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:
- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study ~~shall not include any material changes unless a~~. Documentation to support the technical rationale ~~can be provided to demonstrate that System~~ for determining material changes ~~do not impact the performance results in the study area~~ shall be included.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions ~~may~~ include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would

normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - ~~Trip~~Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) ~~transformer~~ voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - ~~Trip~~Tripping of Transmission elements where ~~are~~ relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

- 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
- 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated ~~for System performance~~ in Requirement R3, Part 3.2 ~~created~~. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention ~~while also considering~~. The analyses shall include the impact of ~~successful or unsuccessful high speed reclosing~~ subsequent:
- Trip Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

- Tripping of generators where simulations show generator bus voltages or high side of the GSU-~~transformer~~ voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - ~~Simulate the impact~~Tripping of Transmission lines and transformers where transient swings ~~on cause~~ Protection System operation ~~for Transmission lines and transformers~~based on generic or actual relay models.
- 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.
- 4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated ~~for System performance~~ in Requirement R4, Part 4.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
- 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated ~~for System performance~~ in Requirement R4, Part 4.2-~~created~~. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5. Each Transmission Planner and Planning Coordinator shall ~~define and document, within its Planning Assessment, have~~ criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6. Each Transmission Planner and Planning Coordinator shall define and document, within ~~its~~their Planning Assessment, ~~any~~the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, ~~and~~ adjacent Transmission Planners, ~~and~~ within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a

reliability related need and submits a written request for the information- within 30 days of such a request. [*Violation Risk Factor: ~~Low~~Medium*] [*Time Horizon: Long-term Planning*]

- 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. ~~BES Transmission voltage instability. The System shall remain stable.~~ Cascading, and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any ~~planning or extreme~~ event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. ~~For all planning events,~~ Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive ~~Load including~~ Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

~~j. The System shall remain stable.~~

~~k. j.~~ Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No ⁹ No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
3. Internal Breaker Fault ⁸	SLG	EHV	No ⁹	No		

Standard TPL-001-42 — Transmission System Planning Performance Requirements

Category	Initial System Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
		(non-Bus-tie Breaker)		HV	Yes	Yes
		4. Internal Breaker Fault (Bus-tie Breaker) ₈	SLG	EHV, HV	Yes	Yes
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency (Fault plus stuck breaker ¹⁰)	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie Breaker) attempting to clear a Fault on the associated bus	SLG	HV	Yes	Yes
			SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (Fault plus Protection System relay failure to operate)	Normal System	Failure of a single Protection System that results in Delayed Fault Clearing and due to the failure of a non-redundant relay ¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
			SLG	HV	Yes	Yes

P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adjustments. ⁹ 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:
 - i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
 - ii. Loss of the use of a large body of water as the cooling source for generation.
 - iii. Wildfires.
 - iv. Severe weather, e.g., hurricanes, tornadoes, etc.
 - v. A successful cyber attack.
 - vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
 - b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a Protection System failure relay failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a Protection System failure relay failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a Protection System failure relay failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a Protection System failure relay failure¹³ resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.
 - f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service ~~-, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch,-~~ is allowed both as a System adjustment (as identified in the column entitled 'Initial ~~System Conditions~~ Condition') and a corrective action ~~-, when achieved through the appropriate re-dispatch of resources obligated to re-dispatch,-~~ where it can be demonstrated that Facilities internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and ~~these adjustments do the re-dispatch does~~ not result in ~~the shedding of any firm Demand~~ Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered. ~~Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions should also be respected.~~
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.

Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)

~~44.13.~~ Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within ~~its~~their respective area, using ~~the latest~~ data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying ~~any~~the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and ~~the Planning~~ Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient, ~~date,~~ and ~~contents,~~date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators, ~~and~~ adjacent Transmission Planners; ~~and~~ within 90 days of having completed its Planning Assessment, and to any functional entity ~~that~~who has indicated a reliability need ~~and~~within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. ~~1.~~ Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity:

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying anythe criteria or methodology utilized in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as all such documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the ~~notices and other documentation~~notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None.

Ballot Pool Window Open: April 18 – May 18, 2011

Successive Formal Comment Period Open: April 18 – May 31, 2011

Now available at: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

The standard drafting team working on Project 2006-02 (ATFN SDT) is seeking comments on revisions to TPL-001-2 after submitting Draft 6 of the standard and supporting documents for quality review, and now that TPL Table 1 footnote 'b' changes have been approved by the ballot pool and filed with FERC. Clean and redline versions of the standard showing revisions since the last posting, along with the associated implementation plan, are posted on the project page. No redline of the implementation plan has been posted since only formatting changes have been made since the last posting.

Ballot Pool Open through 8 a.m. on May 18, 2011

A new ballot pool is being formed for the balloting of revisions to TPL-001-2. The Standards Committee has authorized posting the standard and implementation plan for a formal comment period with a successive ballot and concurrent non-binding poll conducted during the last 10 days of that comment period. The Standards Committee also authorized forming a new ballot pool because the last ballot of this project was conducted more than a year ago.

The ballot pool will be open through 8 a.m. on May 18, 2011, and the ballot window will be from 8 a.m. Eastern on May 18 through 8 p.m. Eastern on May 31, 2011.

Instructions for Joining the New Ballot Pool for Project 2006-02

Registered Ballot Body members may join the ballot pool to be eligible to vote in the upcoming ballot at the following page: <https://standards.nerc.net/BallotPool.aspx>

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list server for this ballot pool is: bp-2006-02_TPL_sb_in@nerc.com

Members who join the ballot pool to vote on the standard will automatically be entered in a separate pool to participate in the non-binding poll of the associated violation risk factor (VRF) and violation severity levels (VSLs).

Instructions for Commenting

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Next Steps

A successive ballot of draft 7 of TPL-001-2, and a concurrent non-binding poll of the associated VRFs and VSLs, will begin on May 18, 2011 and end at 8 p.m. Eastern on Tuesday, May 31, 2011.

Background

TPL-001-1 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0. The proposed standard includes several new definitions. The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies.

The AFTN SDT solicited comments from the industry on the fifth posting of the revised TPL-001-2 through an informal comment period that ended on September 2, 2010. The team revised the standard in response to comments received, and posted Draft 6 for information, while awaiting the outcome of [Project 2010-11 TPL Table 1](#) (footnote 'b'). The revisions to Table 1 footnote 'b' have been approved by the NERC Board of Trustees and filed with FERC. The AFTN SDT adopted the technical tenets of the final solution for footnote 'b' for inclusion in TPL-001-2.

Revised Standards Announcement

Project 2006-02 Assess Transmission and Future Needs Successive Ballot and Non-Binding Poll Now Open May 18 – 31, 2011

Now available at: <https://standards.nerc.net/CurrentBallots.aspx>

A successive ballot for the proposed standard, TPL-001-2 — Transmission System Planning Performance Requirements, and a concurrent, non-binding poll of the revised VRFs and VSLs are being conducted through **8:00 pm Eastern on Tuesday, May 31, 2011.**

Since the last time this standard was balloted was prior to the approval of footnote ‘b’, a redline showing all changes made to the standard since the last balloted version of the standard has been added to the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Instructions

Members of the ballot pool associated with this project may log in and submit their votes from the following page: <https://standards.nerc.net/CurrentBallots.aspx>.

Special Instructions for Submitting Comments With a Ballot or Non-Binding Poll

Comments submitted with ballots are extremely valuable to help the drafting team revise its work. In an effort to reduce the burden on stakeholders providing comments, the drafting team requests that all comments (both those submitted with a ballot and those submitted by stakeholders not balloting) be submitted through the electronic [comment form](#). Note that question 2 asks specifically about revisions the team has made to the VRFs and VSLs, and members of the ballot pool who wish to enter comments to support their opinion in the non-binding poll may provide them in response to question 2.

This approach will ensure that stakeholders only provide a single set of comments, but have an opportunity to notify the drafting team if they have provided comments. During the successive ballot window, members of the ballot pool associated with this project may log in and submit their votes from the following page: <https://standards.nerc.net/CurrentBallots.aspx>. When submitting a ballot with comments, simply record a “Comments submitted” in the comments field of the ballot to indicate that comments were submitted.

Documents for this project, including an off-line unofficial copy of the questions listed in the comment forms are posted at the following site: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Next Steps

The drafting team will consider all comments received during the formal comment period, ballot, and non-binding poll, and will determine whether to make additional changes to the standard and its implementation plan

Background

TPL-001-2 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0. The proposed standard includes several new definitions. The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies.

The AFTN SDT solicited comments from the industry on the fifth posting of the revised TPL-001-2 through an informal comment period that ended on September 2, 2010. The team revised the standard in response to comments received, and posted Draft 6 for information, while awaiting the outcome of [Project 2010-11 TPL Table 1](#) (footnote 'b'). The revisions to Table 1 footnote 'b' have been approved by the NERC Board of Trustees and filed with FERC. The AFTN SDT adopted the technical tenets of the final solution for footnote 'b' for inclusion in TPL-001-2.

SERC Planning Standards Subcommittee
Yes
Yes
R1 does not seem to address issues where data errors have been introduced into the latest model data. Also, R1 and its VSL may be interpreted to exclude the use of past studies. The Implementation Plan should include a five-year delay in the effective date for short circuit studies (R2 parts 2.3 and 2.8) since these studies are not required in the current version 0 standards. The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Group
Progress Energy
First, Progress Energy ("PE") notes that many changes to the Requirements language have been appropriate or have improved upon the language of the previous drafts, and PE commends the SDT in this. PE does have concerns, however, with the language in R8 and its corresponding Measure M8, and therefore must select 'no' for Q1 and provide comments. PE disagrees with the language of R8 primarily to the extent that the use of the verb "distribute" with respect to communicating Planning Assessments leads the reader to M8, which lacks language that would provide for the optimal correlation with R8. Regarding the M8 language, PE feels that the term "demonstration of a public posting" is a valid action in demonstrating compliance with R8 and thus should be more clearly described as one of several acceptable methods of distributing Planning Assessments. In addition, given the appropriate concern that NERC and FERC have recently raised regarding Cyber threats and the need for additional Cyber Security measures, PE feels that the public posting language should contain a qualification regarding the security of CEII information. PE thus recommends that an appropriate phrase to use would be "demonstration of a secure public posting", thereby making clear that a public posting would not be a website accessible to just anyone due to CEII concerns.

The wording of Part 1.1.2, "known outages...with a duration of at least 6 months" should be revised to "...at least 1 year". Also for consideration is that "known outages...with a duration of at least 6 months" are dealt with in operational studies rather than planning studies. Any adverse impacts that these outages might have are mitigated by operational decisions rather than planning decisions within a 6 month horizon. Moving this requirement out of the TPL Standard to an operational standard should be considered. Make the wording consistent between 2.1 and 2.2 as it relates to qualified past studies. Specifically: Parts 2.1.2, 2.1.4, 2.1.5 The language of requirements 2.1.4 and 2.4.3 allowing the performance of one or more sensitivities appears to be inconsistent with language in 2.7.2. 2.7.2

requires multiple sensitivities to determine if actions to resolve performance deficiencies are necessary. Will varying only one measurable quantity several times in multiple simulations satisfy multiple sensitivity studies or just one sensitivity study? The numbers and types of required sensitivity studies is unclear, and subject to interpretation by PCs and TPs. The current wording in Part 2.1.5, "spare strategy", appears to be open-ended regarding the number of permutations to be analyzed. It should be restricted to assessing only one piece of equipment being unavailable or outaged at a time. 2.1.5 should be consistent with R2 and 2.1 regarding the use of the terms assessment and studies. As with the preceding comment regarding Part 1.1.2, moving this requirement out of the TPL Standard and to an operational standard should be considered. It is unclear if the last sentence of R2.1.5 allows for the curtailment of firm transmission service before the application of category P0, P1 and P2 events. This last sentence states: "...with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment." The wording in Part 2.2 "be supported by the following annual current study, supplemented with qualified past studies" should be replaced with the similar statement in Part 2.1: "be supported by current annual studies or qualified past studies". Part 2.7.1 lists potential system actions to address System deficiencies. It is suggested that this list be moved to a guideline or white paper. The wording in Part 8.1 needs to be amended to restrict comments to the most recent assessment only. Contingencies on back to back HVDC installations are not mentioned in the standard. The treatment of combined cycle facilities (all units in outage?) needs to be clarified, as well as Footnote 7 of Table 1 requiring clarification. In Table 1, Event 1 of Category P2 and related Footnote 7 are not clear because of the use of the word "possibly". If the intension is to simulate the line end opening condition of tapped lines, this should be clearly stated in the table (without reference to "Opening of a line section" and use of different language in the footnote). From Table 1b: "Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0." Firm Transmission Services Loss is also acceptable and should be added (particularly in P1 loss of a single pole of a DC line for which the transfer is reduced accordingly to the remaining pole capability).

R2.4.1: The SDT has put a stronger emphasis on dynamic load behavior in stability studies (FIDVR, induction motor loads, etc) to be included in the peak models. The standard does indicate that "An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable." We feel that this should be clarified to ensure that the current modeling processes address what NERC desires with this requirement. At a minimum, we recommend that a grace period be implemented to account for any regional modeling practices which need time to implement dynamic load behavior per the draft standard. R2.5: It is our understanding that the Long-Term Transmission Planning Horizon does not require the sensitivity analysis which is required in R2.4 for the Near-Term Transmission Planning Horizon for the stability portion of the studies. R2.7: It is our understanding that Corrective Action Plan(s) do not need to be developed for performance violations observed in the sensitivity analysis (steady state and stability) unless the violation is observed in several sensitivities as it is indicated in R2.7.2: "Include actions to resolve performance deficiencies indentified in multiple sensitivity studies or provide rationale for why actions were not necessary". We feel that this needs to be further clarified. R3.3.1: This requirement indicates that steady state analysis should include the effect of ride-through voltage limitations of generating units. We are having difficulty seeing how this is a steady-state issue. Generally one would expect a generator to experience ride-through voltage issues during faults. Per Table 1, P1.1 already require generator outages be taken – wouldn't that cover this issue? We feel that this needs to be further clarified. R3.4.1: This requirement states that "Transmission Planners shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list". We feel that the coordination requirement should be removed from the standard as this will result in a massive increase in workload/time required to perform the TPL studies. AECI has several ties to adjacent Transmission Planners and Planning Coordinators – it will be a very time intensive task to coordinate with all of these parties. If the standard wants to ensure that the Contingencies overlap – we can agree to that, however we feel

that the SDT needs to give some firm clarity on how far to go with it (how many buses away, only include ties, etc?). R4.1.2: We would like clarification on what is mean by "apparent impedance swings". R4.3.1: Is the intent of the SDT to require that generic or actual relay models be added to the stability models? We feel that this needs to be further clarified. R8: This requirement states that the Planning Assessments shall be distributed within 90 days of their completion to adjacent Planning Coordinators, Transmission Planners, and functional entities that have a reliability need (3rd Interconnection Customers?). We do not agree with the mandatory requirement of distributing the results of our TPL studies: We consider this information to be CEII We can agree to distribute the results upon request, but do not agree with the 30 day timeframe as more time will be needed to sign applicable Non-Disclosure Agreements, etc.

A5 It would seem that 84 months wouldn't be universally attainable due to different system configurations, terrain, geography, and permitting issues that are required to complete a corrective action plan. In 2.4.1 we would like to see better clarity on what an Aggregate system load model is and how granular it should be. If the answer is a very detailed representation of the load system then it may take a longer time to implement. In section 2.7 we would like to see clarification on the sensitivity analysis. Is this in reference to seasonal models and differences in fuel availability? We need more detail on how this is to be done so that it won't be left up to interpretation. We would like for clarification of the planning assessment and who is performing which tasks. We would also like to utilize a regional assessment due to limited resources. Under which criteria should the assessment fall under the regional entity or the individual companies? In section 3.4.1 this type of coordination could be difficult due to other adjacent entities on different schedules and some possibly couldn't have the amount of detail to incorporate into another's processes. We know this is generally covered in coordination of real time operations and wonder if it is appropriate to require this type of coordination in the long term process. Is there already an operational standard that covers this? Would it be better to address this in the operational standards? PC's between regions are already coordinating for long term studies. Should this standard fall more on the back of the PC's rather than the TP Can we get a bright line definition of what apparent impedance swings means? R4.3.1 will the detailed amount of data then be incorporated back into the NERC modeling processes and create a more detailed model with better accuracy? R8 We do not agree that we should provide the assessment to every adjacent

PC and TP. We do agree however that if requested by these entities we would provide the assessment. We don't mind sharing information with requestors but would like a longer duration than 30 days due to the fact that we would like to know what type of "reliability need" any entity would have considering that some of the information could be considered CEII. Non disclosure agreements may be needed in order to provide this information.

The SDT, Observers, and the Industry as a whole have put a tremendous amount of thought and work into the development of this latest draft. While nobody should claim that this latest version is perfect, it is far clearer, more in tune with current industry needs, and much improved compared to the existing approved Standards that it will replace.

With regards to R2, it appears that the VRF has changed from Medium to High without any justification; and with the time horizon of long term planning, AZPS believes there is no justification for changing it from Medium to High.

AZPS would like to reiterate its "Affirmative" voting recommendation with regard to the proposed revisions to the Standard. AZPS erroneously entered a "Negative" Standard vote for one of its voting segments.

1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months. This is a little confusing to me. Does this mean the outage must last at least six months? Or does this mean at least model outages that last six months or more. If it is the latter then, I'm not sure that is stringent enough. There may be known critical outages occurring over peak that do not last 6 months. If non-consequential load loss is not allowed for loss of one element, then what about the next contingency? Couldn't that result in having to interrupt Firm service? Is that okay as a corrective action plan in the outage coordination horizon? Does this apply to both near-term and long-term planning? If so, we probably need to model additional unplanned potential outages on top of n-1 conditions. Lastly, in section 2.1.4 should there be a category for high/low wind conditions?

Individual

Muscatine Power and Water

Yes

No

MP&W would like to recommend that the VRF for Requirement 8 remain "Low", rather than "Medium." It is our belief that there is not a significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entities or a documented response to Planning Assessment

comments is not provided within 90 days of a request. This is more administrative in nature. The findings in an assessment report are not urgent, but address system needs that will emerge over years in the future. Additionally, entities with a reliability-related need for Planning Assessment information generally have the ability to perform their own independent planning assessment of adjacent systems or other areas of interest.

MP&W recommends that the term "System" be replaced with "BES" in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems. This is the current definition of the NERC Glossary term "System". The locations where "System" can be found in the Standard are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6.

1. If current study is performed to assess the system, there is no need to supplement with past studies. • Suggested language for R2.2:- For the planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed and be supported by the following annual current study or qualified past studies as indicated in Requirement R2, Part 2.6 2. Load models should be consistent across the region • Suggested language for R2.4.1:- System peak load for one of the five years. System peak load levels shall include a the latest load model developed by the regional planning coordinator which represents the expected dynamic behavior of loads that could impact the study area, considering the behavior of induction motor loads. 3. R2.5 is redundant and should be deleted. It is already included in R1.1.3 and R2.6.2. 4. R3.5: This standard requires mitigating the consequences of extreme events. Requiring potentially very costly mitigation actions for very low probability event is unnecessary burden to utilities. • Suggested language for R3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. Evaluation of the risk, consequences and adverse impacts of the event(s) shall be conducted.

No

The VRF for R2 was changed from Medium to High without any explanation. Since the time horizon for R2 is Long Term Planning, BPA believes that the VRF should be Medium, as are the VRFs for the other requirements related to conducting the assessments, rather than High.

Group

Tri-State Generation & Transmission

Yes

No

Many of the sub-requirements of R2 do not warrant high risk VRFs, yet violation of any R2 sub-requirement would result in a "High Risk Factor" violation assessment. We believe that having so many sub-requirements can result in inaccurate overall severity classification. For example, skipping one study defined in R2.1.2 (Planning Assessments) for a particular time frame or load level would probably not result in a direct actual degradation in system performance, but would still result in a High Violation Risk Factor.

Change R1.1 to "System models used for Steady State and Stability Analysis shall represent:" Much

of what is in R1.1 is unnecessary for Short Circuit studies. In contrast, there are items not mentioned in R1.1 that are necessary for short circuit studies. R2.1.4 requires sensitivity analysis to study "a range of credible conditions that demonstrate a measurable change". How will the required actions in R2.1.4 be documented or measured, and what is accomplished by performing sensitivity analysis in the context of a system performance assessment? In R2.3, change the first sentence to read "The short circuit analysis portion of the Planning Assessment shall be conducted annually, using one of the cases described in 2.1.1, addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6." There appears to be no reason to perform short circuit studies for all three Near-Term Transmission Planning Horizon cases. R2.4.3 requires sensitivity analysis to study "a range of credible conditions that demonstrate a measurable change". How will the required actions in R2.4.3 be documented or measured, and what is accomplished by performing sensitivity analysis in the context of a system performance assessment? R2.7.1 remove the last bullet. We believe these programs are already factored into the load forecast, as they are associated with resource scheduling and planning load serving, and not transmission planning. In particular, DSM measures would fall under R2.4.1, and the term "new technologies, or other initiatives" The language of Requirement 3 unnecessarily repeats the language of R1 and R2. As now written, R3 states "For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1." R3 We recommend that the introductory language in Requirement R3 be changed to read "The studies in Requirement R2, Parts 2.1, and 2.2 shall be performed using models as defined in Requirement R1 in accordance with the following criteria." We believe that Requirements 3.1 and 3.4 should be combined into R3.1, eliminating R3.4. It is redundant to have Requirement 3.1 say "perform R3.4". We recommend that R3.4 be deleted and that R3.1 be replaced with: R3.1 Planning event studies shall be performed in accordance with "Table 1 – Steady State & Stability Performance Planning Events;" and shall be based on a supportable Contingency list. Comment: The content of 3.4.1 was intentionally omitted as it is redundant with R7. Also, the language "...more severe System impacts..." was intentionally omitted as it could be subject to a wide range of interpretations. Similarly, we recommend that R3.5 be deleted and that R3.2 be replaced with: R3.2 Extreme event studies shall be performed in accordance with "Table 1 – Steady State & Stability Extreme Events;" and shall be based on a supportable Contingency list. We recommend the following new requirement be inserted after the revised R3.2 language: Should the extreme event studies identify potential Cascading, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted. Comment: As before, the language "...more severe System impacts..." was intentionally omitted as it could be subject to a wide range of interpretations. We recommend removing the second bullet of R3.3.1, "Tripping of Transmission elements where relay loadability limits are exceeded" for the following reasons: 1. There is currently no tool to model relay loadability characteristics in Steady State analysis. 2. Requirement R3.3.1 would require inclusion of relay models in modeling data that are not currently provided. MOD-012 does not require impedance or overcurrent relay models to be submitted. 3. In Requirement 3.3.1, the second bullet, it is impossible to model complete and accurate relay loadability using present-day steady state simulation tools. At best an individual point could be chosen to model relays based on a selected power factor. We recommend changing the opening text of Requirement R.3.3.2 to say "Simulate the expected automatic or manual operation..." Subrequirement R4.1.2 represents a tremendous increase in dynamic modeling complexity. Modeling relay action during apparent impedance swings would require inclusion of impedance relay models in modeling data that are not required to be submitted in MOD-012. If such modeling is necessary, then the corresponding data requirements need to be addressed in MOD standards. We believe that Requirements 4.1 and 4.4 should be combined into R4.1 as shown below and R4.4 should be deleted. It is redundant to have Requirement 4.1 say "perform R4.4." We recommend R4.1 language be revised to read as follows: R4.1 Planning event studies shall be performed in accordance with "Table 1 – Steady State & Stability Performance Planning Events;" and shall be based on a supportable Contingency list. Comment: The content of 4.4.1 should be omitted as it is redundant with R7. Also, the language "...more severe System impacts..." should be omitted as it could be subject to a wide range of interpretations. Similarly, R4.5 should be deleted and R4.2 should be replaced with: R4.2 Extreme event studies shall be performed in accordance with "Table 1 – Steady State & Stability Extreme Events;" and shall be based on a supportable Contingency list. We recommend the following new requirement be inserted after the revised R4.2: Should the extreme

event studies identify potential Cascading, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the even(s) shall be conducted. Comment: As before, the language "...more severe System impacts..." was intentionally omitted as it could be subject to a wide range of interpretations. Clarify the first bullet in Requirement R4, part 4.3.1 by changing it to "High-speed (less than 1 second) reclosing, where the fault has cleared, and high-speed reclosing into the permanent fault , but in each case only if high-speed reclosing is utilized". In Requirement R4, part 4.3.1, third bullet, it is impossible to model complete and accurate relay loadability using present-day steady state simulation tools. Existing applications do have impedance relay models, but these models do not model many relay capabilities– for example, non-circular protection regions and load-encroachment. We recommend removing this bullet. The comment statement we made above referring to R4.1.2 also applies to R4.3.1. MOD-012 does not require reclosing relay model data to be submitted. If such modeling is necessary, then the corresponding data requirements need to be addressed in MOD standards. Furthermore, there is not a standard built-in reclosing relay model in current stability simulation tools. Comments regarding Table 1- We assume the headnote i. to Table 1 - "The response of voltage sensitive Load..." - means that studies must not rely on end-user load tripping to meet the performance requirements defined in TPL-001-2 but that it should be modeled (when known) so that its occurrence would be evident. We don't see the need to apply Footnote 12 to only certain contingency categories or certain events in categories. Recommend putting the footnote in the column header just as with Footnotes 1, 2, 3, and 4. Recommend changing "utilized" in Measurement M3 to "performed." Recommend changing "utilized" in Measurement M4 to "performed." Modify Measurement M7 to "Each Planning Coordinator shall provide dated documentation on roles and responsibilities of its Transmission Planners, such as..." The deleted phrase, "in conjunction with each of its Transmission Planners," appears to be unnecessary.

Individual

Anthony Jablonski

ReliabilityFirst

Yes

1. In requirement 4.3, the high speed recloser time of 1 second is too restrictive. We suggest that the time be expanded to 2 seconds to capture all reclosing operations that might impact stability studies. We interpret the use of bullet points in Requirement 4.3.1 to mean that any one of the statements can be included in the analyses. In this requirement, the use of bullet points should be removed and replaced with language that requires all of the statements to be included in the analyses. We strongly believe that the language needs amended in requirement 4.3.1, such that, we will reconsider our voting position. 2. In Table 1 labeled Steady State and Stability Performance Extreme Events we contend that the change to "relay failure" is unnecessarily limiting. The previous use of Protection system was satisfactory. Protection System is a defined term and encompasses many components that may fail and not just the relay. 3. In table 1 Steady State & Stability Performance Planning Events under P5 "non-redundant" needs to be better defined. We suggest saying in a footnote that two devices do not need to be identical in order to be redundant. Redundant relays or relay schemes need to have the same performance level to be considered redundant but do not need to be identical equipment.

No

ReliabilityFirst generally agrees with the Violation Risk Factors (VRFs) but disagrees with the Violation Severity Levels (VSLs) for the following reasons: 1. VSL for R1 a. Under the last "Severe" VSL, the word "latest" should be removed to be consistent with the language in Requirement 1. This is a violation of the FERC Guideline 3: "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement" 2. VSLs for R2 a. To be consistent with the language in Requirement 2, suggest modifying the last "Severe" VSL to state "The responsible entity failed to prepare an annual Planning Assessment of its portion of the BES" 3. VSLs for R3 a. Under the last VSL under the "High" category, the word "perform" should be replaced with "simulate" to be consistent with the requirement. (e.g. "The responsible entity did not simulate Contingency analysis as described in Requirement R3, Part 3.3.") 4. VSL's for R4 a. Under the last VSL under the "High" category, the word "perform" should be replaced with "simulate" to be consistent with the requirement (e.g. "The responsible entity did not simulate Contingency analysis as described in Requirement R4, Part 4.3."). 5. VSLs for R6 a. To be consistent with the language in Requirement 6, suggest modifying the "Severe" VSL to state "The responsible entity failed to define and document, within their Planning

Assessment, the criteria or methodology used in the analysis to identify System instability for conditions, as described in Requirement R6.” 6. VSLs for R7 a. Suggest adding the following language to the end of the “Severe” VSL; “for the Planning Assessment”, to be consistent with the requirement. 7. VSL for R8 a. Under all four categories of VSLs, any reference to “Planning Assessment” should be changed to “Planning Assessment results” to be consistent with the language in Requirement 8 (or more appropriately, the term “results” should be removed from Requirement 8). This is a violation of the FERC Guideline 3: “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement” b. Under the “Lower” VSL, it is unclear why there is a 30 day timeframe for the first VSL, while the “Moderate”, and “High” VSLs have a 10 day timeframe. Based on FERC recommendations, suggest making the timeframe for all four VSL s, 10 day increments. c. VSLs need to be developed to deal with a violation of Part 8.1 (i.e. the PC or TP failed to provide a documented response to that recipient within 90 calendar days of receipt of those comments)

1. Requirement 8 and 8.1 uses the language of “Planning Assessment results”. This language is not defined in the section of the standard that defines the terms of use. For consistency “Planning Assessment results” should be replaced with “Planning Assessment”. 2. Requirement 2.1.5 has statements that are ambiguous. What is considered major transmission equipment? What is an entity’s “spare equipment strategy”? The requirement is not clear as to how many power flow models are required (one per piece of “major transmission equipment” without a spare, or one model with every piece of “major transmission equipment” without a spare being out of service)? As written, if an entity has no “spare equipment strategy” they could be exempt from this requirement. 3. We interpret the use of bullet points in Requirement 3.3.1 to mean that either one of the statements can be chosen. This requirement should be written where all the bulleted statements are included in the analyses.

Group

MRO’s NERC Standards Review Forum

Yes

No

The NSRF recommends that the VRF for Requirement 8 remain “Low”, rather than be changed to “Medium”. We do not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entities or a documented response to Planning Assessment comments is not provided within 90 days of a request. The findings in an assessment report are not urgent, but address system needs that will emerge over years in the future. In addition, entities with a reliability related need for Planning Assessment information generally have the means to make their own independent planning assessment of adjacent systems or other areas of interest.

The NSRF recommends that the term, “System” be replaced with “BES” in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems, which is the definition of the NERC Glossary term, “System”. These locations are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6

ITC

Yes

No

ITC recommends revising R8 VSLs as follows: Lower VSL The responsible entity distributed its Planning Assessment to known adjacent Planning Coordinators and known adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion. OR, The responsible entity distributed its Planning Assessment to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 30 days but less than or equal to 40 days following the request. Moderate VSLs The responsible entity distributed its Planning Assessment more than 30days but less than 60 days after subsequent requests by adjacent Planning Coordinators or adjacent Transmission Planners who were not sent copies upon completion of the Planning Assessment. OR. The responsible entity distributed its

Planning Assessment to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 40 days but less than or equal to 50 days following the request High VSLs - eliminate this section. i.e., no high VSLs only lower, moderate and severe Severe VSLs The responsible entity distributed its Planning Assessment to functional entities having a reliability related need, adjacent Transmission Planners and adjacent Planning coordinators who requested the Planning Assessment in writing but it was more than 60 days following the request.

ITC COMMENTS on TPL-001 vote ITC will reluctantly vote to approve the draft standard. While we have concerns, we are voting to approve this standard because we believe the positive elements outweigh the portions of the draft standard that we object to. It is important that the improved requirements that effectively "raise the bar" over the existing standard should become effective sooner rather than later. A negative vote, which might cause a further delay in implementation of the standard, would be the least desirable outcome. However, we still believe that the VSL that would find that an entity had committed a "severe" violation for failure to distribute its planning assessment to an adjacent Transmission Planner or Planning Coordinator has the potential to overly punish a simple error in oversight. We would agree that willfully withholding an assessment from a neighbor or a valid requestor justifies a severe violation but an administrative or clerical oversight does not. For example, it might escape our attention that an entity, particularly a smaller one, registers as a TP or TP. As far as we know, there is no requirement that a registrant, or even one who de-registers, must notify an "adjacent" TP or PC of their change in status. As written, the standard requires you be found in "severe" violation, even if that new entity fails to notify you of their change in status. You would still be in severe violation even if they later ask for your planning assessment. Even if the standard passes, we request that this VSL be fixed to make the distinction between an administrative error and willful neglect. Our response to question 2 offers a suggested method to do this.

Yes

Yes

R1 does not seem to address errors in data that have been introduced in the latest model data. In addition, R1 and its VSL may be interpreted to exclude the use of past studies. The Implementation Plan should include a five year delay in the effective date for short circuit studies for parts 2.3 and 2.8 of R2 because these studies are not required in the current Version 0 standards.

-R2.1.4 and R2.4.3: 'Expected transfers' should be replaced with 'Firm Transmission Service and Interchange' to correlate to R1 (R1.1.5 states 'Known commitments for Firm Transmission Service and Interchange' must be represented in system models). -R2.1.4 and R2.4.3: 'Generation additions, retirements, or other dispatch scenarios' should be deleted since generator connections are required to be studied as specified in FAC-002. -R2.1.5: The Standard Drafting Team needs to clarify R2.1.5 for a scenario where a spare transformer is available but is used to replace a failed transformer say one month before the expected system peak. If this scenario occurs, does the Transmission Planner need to study the impact of the unavailability of a transformer to cover the situation that could occur if a second transformer failure occurs before the expected system peak? -R2.4 and R2.5: 'current or past studies' should be replaced with 'current annual studies or qualified past studies' to be consistent with R2.1. -R2.5: The wording allows the PC/TP to determine what is 'material'. This could lead to large differences in generator additions or changes that would be included. The Standard Drafting Team should consider registration criteria to set size limits for this sensitivity. -R2.7.3: What is the required timeframe? How long will Non-Consequential Load Loss or curtailment of Firm Transmission Service be allowed with this exception? -R3.3.1 Second bullet: If relay loadability limits are exceeded, the protection would be in violation of PRC-023. This standard should assume this situation would not

occur. -R3.5 and R4.5: What is the point of identifying mitigating measures for extreme events when there is no Requirement to implement such measures? -R4: The first sentence in R4 requires one to perform the Contingencies in Table 1. This sentence should read 'For the Stability portion of the Planning Assessment, as described in Requirement R2, -Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform Contingency analyses based on the list of Table 1 Contingencies defined in Requirement R4, Part 1'. -R4.1.2: A generator should not be allowed to pull out of synchronism for P2.1. -R4.1.3: The Planning Coordinator and Transmission Planner should have to document the damping criteria used to access 'acceptable damping'. -R8: Why 30 days for 'any functional entity that has a reliability related need and submits a written request'? The timeframe should be 90 days as it is for 'adjacent Planning Coordinators and adjacent Transmission Planners'. - Table 1-Steady State and Stability Performance Planning Events, Category P5, now includes "non-redundant" relay in the Event column. What is meant by non-redundant relay? The term "non-redundant" is not a defined term. -Regarding Note 12- An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments. -Non-Consequential Load Loss is only allowed in very unlikely scenarios as a last resort that would cause local load issues. When used as intended by the drafting team (ie. as a last resort) Non-Consequential Load Loss would have no negative effect on the network since it would only be used to improve network conditions like low voltage or line overloads. Should NERC be worried about documenting this use of Non-Consequential Load Loss? NERC should focus on network issues, not local load issues. -NERC should remove the last part of Note 12: "and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments." It is inappropriate for NERC to mandate an open stakeholder process and Manitoba Hydro cannot support this mandate. In addition, it is unclear how NERC can mandate an open stakeholder process and who that might include. FERC has defined such a process in Order 890. Is that what is envisioned?

No

-The language "latest data" is used in the Severe VSL for R1, however "latest" was removed from R1 and M1. "Latest" should also be removed from the Severe VSL for consistency. -What is the rationale for changing the preparation of the Planning Assessment (R2) VRF to High from Medium? The R2 VRF should remain at Medium. The R2 Time Horizon is Long-term Planning, an entity can rely on qualified past studies to complete the Planning Assessment and the actual performance of studies (R3 and R4) have Medium VRFs. -Please explain the phrase 'completed annual Planning Assessment' used in the Severe VSL for R2. What is the reason for the change in VSL for having a 'completed annual Planning Assessment'? -Can the drafting team please explain why defining the criteria for steady-state voltage limits etc. in R5 has a VRF of medium? Criteria development is administrative, therefore the VRF for R5 should be Low. Setting the VRF for R5 to Low would be consistent with the Low VRF for R6 that relates to defining the criteria for cascading. -Requirement 8 is an administrative burden that adds little to improve reliability. The revisions made to the VRF and VSL for Requirement 8 further exacerbate this administrative burden. One could conclude from observation of the VSLs and VRFs, that Requirement 8 was the most important requirement of TPL-001-2. The drafting team should simplify the VSLs and revert R8 back to a low VRF. Where are the timeframes used in the VSLs for Requirement 8 coming from? Requirement R8 does not specify these timeframes.

-Why was the Near Term Transmission Planning Horizon definition moved to the Glossary prior to TPL-001-2 approval? -The definition of Non-Consequential Load Loss should not contain '(2) the response of voltage sensitive Load' because voltage sensitive load is not load that is lost (it is load that is still served). -M8: Why 30 days for 'any functional entity who has indicated a reliability need'? The timeframe should be 90 days as it is for adjacent Planning Coordinators and adjacent Transmission Planners.

Hydro One Networks Inc.

No

Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the

April 15, 2011, draft are minor. The concerns of the industry on several important issues have not been sufficiently addressed in this draft (see our response to Question 3).

A. Regarding Requirement 1.1.2, assessment of "known outages... with a duration of at least 6 months", are dealt with in the operational studies rather than planning studies. In addition, any adverse impact that these outages might have, are mitigated by operational decisions rather than "planning" decisions within a 6-month horizon. It is suggested to move this requirement out of TPL standards and instead include it a relevant operational standards. B. The statement in R 2.1.4, "must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response", leaves room for very different interpretations by PCs and TPs as to the number and type of required sensitivity studies. Are all interpretations, based on the engineering judgment of the PC and TP, acceptable? C. The language of R 2.1.4 and 2.4.3 allowing to perform one or more sensitivities appears to be inconsistent with the language in R 2.7.2 which requires multiple sensitivities to determine if actions to resolve performance deficiencies are necessary. Will varying only one measurable quantity several times in multiple simulations constitute multiple sensitivity studies or one sensitivity study? D. The language of Requirement 2.1.5, "spare strategy", appears to be open-ended regarding the number of permutations to be analyzed. It is suggested to move this requirement out of TPL standard and instead have this issue dealt with in the operational standards. E. In R 2.2, the statement "be supported by the following annual current study, supplemented with qualified past studies" should be replaced with a similar statement in R 2.1 which says: "be supported by current annual studies or qualified past studies". F. In R 4.1.1, "For planning event P1: No generating unit shall pull out of synchronism" is too restrictive. In many cases a P1 event may result in instability of a small nearby generator without a significant impact on the reliability of BES. The same requirement states that "A generator being disconnected from the System ... by a Special Protection System is not considered pulling out of synchronism". If rejection of ANY generator by SPS is acceptable, why should instability of a small generator, resulting in its disconnection by its protection without a severe impact on the system, be unacceptable in all circumstances? If this requirement is unchanged, it dictates the addition of an SPS (Generation Rejection) for any unit that might go unstable without any benefit for the reliability of the BES. G. In Table 1, Event 1 of Category P2 and related Footnote 7 (simulation of LEO condition) are not clear (concern with the use of the word "possibly"). If the intension is to simulate LEO condition of tapped lines, this should be clearly stated in the table (without reference to "Opening of a line section" and use of different language in the footnote).

Nebraska Public Power District

No

The existing TPL-001 through TPL-004 Standards and Requirements are clear and concise. The new merged TPL-001-1 Standard and Requirements is no longer clear and concise. Further, the modification made to allow an SPS to trip a remote generator for an N-1 (TPL-002) type of event is a degradation of system reliability. Transmission system facilities should be added to maintain stability for a new generator interconnection for any N-1 Category B event. An SPS should not be relied upon for a Category B event, an SPS should only be allowed for Category C & D (TPL-003 & TPL-004) type events.

BC Hydro agrees with merging the standards together into one and we feel the new version brings further clarity to the annual planning assessment. BC Hydro would vote Affirmative for bringing clarity, however we do not believe the rewording in Footnote 9 is clear which is why we are voting Negative. Footnote B, as approved by the NERC Board of Trustees on February 17, 2011 was reworded as Foot Note 9 in the proposed TPL 001-2 draft 7 amendment. This rewording still does not clearly define what impact the proposed revision would have on the curtailment of firm transfers in the regional entities.

a. 2.6.2 - What was the intent of this change? The old language seemed to work. The language should not be changed from the previous version. b. For 2.8.2 - Was the phrase changed to reflect modifications of facilities? If so the requirement should be modified to read "Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures with respect to modifications of facilities. Otherwise the requirement is unclear. c. For Section R8.1 - the proposed requirement conflicts with a long standing stakeholder process in our area which posts study results and allows comment within a defined period before studies are finalized. If this section is to be retained then it should be modified to only allow comments on Transmission studies less than one-year old. Requirement 8 and 8.1, should be revised to include a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. d. With respect to Table 1 – We suggest adding an event 6 to P1 to address the contingent loss of back to back HVDC Facilities. If not added to P1 then this event needs to be added somewhere in the standard. e. We don't agree with footnote 7 specifying that only one end of the line should be open for this condition. If the SDT is to keep this concept make P2 event 1 simply say "Opening one end of a line section w/o a fault" and delete the footnote. The existing footnote is unclear due to the use of language such as "possibly".

R2.8.2 We recommend this requirement be clarified with the following modification: The Corrective Action Plan shall: 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance. 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of planned modifications to System Facilities and Operating Procedures.
No
R 2.0 We recommend that the VRF for this Planning Requirement remain at "Medium". The risks associated with Planning Requirements have a longer time horizon for corrective action than, for example, those risks associated with much shorter Operational time frames.
R 1.1.2 We recommend the known facility outage duration be defined as facility outage durations lasting at least twelve months. R 1.1. (page 4) System models shall represent: 1.1.1. Existing Facilities 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six twelve months. 1.1.3 R 2.1.4 We recommend that this requirement be eliminated. We do not see the value of this additional analysis when the number, type and severity of the sensitivity tests are not well defined. These tests are then used to define Corrective Action Plans in cases only where multiple tests show performance deficiencies. R 2.1.5 Spare equipment strategies are typically designed to prevent long outages (possibility a year or more) of equipment with very long lead times. Any such strategy "could" result in these long outages depending upon the number of failures that may be postulated. This requirement is misleading and we thus recommend it be eliminated. R 2.2 We recommend the language for R 2.2 should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study." R 2.6.2 We recommend that the wording of this requirement remain unchanged. R 2.7.1 This portion of the requirement provides a list of "acceptable" Corrective Action Plans. It provides equal weight to infrastructure reinforcements and Special Protection Systems as means to mitigate violations resulting form single or multiple contingencies at both the EHV and HV levels. National Grid's position is that a national standard should not endorse the use of Special Protection Systems as corrective actions to mitigate single contingency violations. Local Northeast Planning Criteria indicates that special protection systems (SPS) shall be used judiciously and may be used to provide protection for infrequent contingencies, or for temporary conditions that may exist such as project delays, unusual combinations of system demand and equipment outages or availability, or specific equipment maintenance outages. A SPS may also be applied to preserve system integrity in the event of severe facility outages and extreme contingencies. The decision to employ a SPS shall take into account the complexity of the scheme and the consequences of correct or incorrect operation as well as its benefits. We are further of the opinion that specific methods of correcting system performance deficiencies should not be specified in a National Standard. We thus recommend that the Corrective Action List be eliminated from this requirement as illustrated below. 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. R 2.7.2 We feel that this requirement and requirement R 2.1.4 adds ambiguity to the process as we have indicated above. We thus recommend that this requirement be eliminated. R 3.3.1 We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded" Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall: 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent: • Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made. R 3.4.1 We would recommend the following addition as a clarification to the required information exchange: 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information. 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their respective Systems are

included in the Contingency list. R 8.1 National Grid's concern regarding this requirement stems from the apparent open ended time frame afforded report recipients in their review of the Planning Assessment. This has the potential to stall the review process. National Grid thus recommends that any recipient of the Planning Assessments be given a specific time period for their response as indicated in R 8.1 below. R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, and adjacent Transmission Planners, within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. [Violation Risk Factor: LowMedium] [Time Horizon: Long-term Planning] 8.1. The recipient of the Planning Assessment results shall provides documented final comments on the results within 90 calendar days of receipt of the Planning Assessment. The respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments. Table 1 Steady State & Stability Performance Planning Events (Page10). The event description for Category P2 Event 1. along with the accompanying footnote 7 (Page 14) creates some confusion for multi-terminal lines. We recommend that Footnote 7 be eliminated and the event description be changed as follows: Category Initial Conditions Event P2 Normal System 1. Opening of a single load interrupting device at one terminal of a line without a fault. Table 1 (Planning Events and Extreme Events) Footnote 12 (Page 14). We are concerned that additional stakeholder process indicated in Footnote 12 has the potential to stall the Planning Assessment review process. We recommend that reference to this new process be eliminated from the Footnote. Our additional, concerns with Footnote 12 are addressed in comments originally provided by ISO-NE. We agree with their following comments : The following language for Footnote 12 is proposed: "Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems." If Footnote 12 in Table 1 must be retained, the following language is proposed: "An objective of the planning process shall be to minimize the likelihood and magnitude of interruption of Demand, (excluding Interruptible Demand or Demand-Side Management), following Contingency events. However, it is recognized that Demand will be interrupted if it is directly served by the Elements removed from service as a result of the Contingency. Furthermore, in limited circumstances Demand may need to be interrupted to address BES performance requirements. When interruption of Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to: a. Interruptible Demand or Demand-Side Management b. Circumstances where the uses of Demand interruption not directly interrupted by the contingency are documented c. Curtailment of firm transfers is allowed to meet BES performance requirements and meet applicable Facility Ratings, where it can be demonstrated it does not result in the interruption of any Demand (other than Interruptible Demand or Demand Side Management)"

Tim E. Ponseti, VP

TVA TP&C

Yes

Yes

TVA - has following comments: TVA is concerned about footnote 12 (known as footnote b in existing TPL standards). TVA believes that utilities should be given some freedom in dropping local load in response to N-1 events as long as overall BES reliability is not impacted. Otherwise significant capital improvements will be required that will have no overall reliability gain for the Bulk Electric System. In R4.1.1, TVA is concerned that no generating unit (including distributed generation) shall pull out of synchronism in a local area only (thus not impacting the overall reliability of the BES) for Planning Event P1, while the standard does allow generator runback/tripping for the same event. Thus the generating unit may be tripped by a special protection scheme - but may not be tripped by an out of step relay. TVA believes that out of step relaying should be allowed for this unit tripping as long as this does not affect the overall reliability of the BES. Table 1 contains both planning events and extreme events. Suggest labeling the planning events as Table 1 and the extreme events as Table 2 to help reduce confusion. VSL for R1 does not seem to address issues where data errors have been

introduced into the latest model data. Also, R1 and its VSL may be interpreted to exclude the use of past models. The Implementation Plan should include a five-year delay in the effective date for short circuit studies (R2 parts 2.3 and 2.8) since these studies are a new TPL requirement and are not required in the current version 0 standards.

Entergy Services

Yes

Yes

Footnote 12 to Table 1 concerning non-consequential load loss should be clarified. The existing language will result in difficulties in proving compliance. Suggested language would be: "Planned or controlled interruption of Demand supplied by Transmission Facilities made temporarily radial as a result of a P1 or P2 event and where the location of the planned loss of Demand is limited to those Transmission Facilities made radial."

Independent Electricity System Operator

No

IESO is generally supportive of the draft of TPL-001-2 as evidenced by our previous AFFIRMATIVE vote during the last ballot. Further, IESO also supported the revisions to Footnote 'b' to Table 1 of the TPL standards under Project 2010-11. That revision was balloted and approved by the ballot pool in February 2011 and filed with FERC for approval in March 2011. The revised footnote has been incorporated into the current draft of TPL-001-2 as Footnotes 9 and 12 but the Commission, by letter to NERC dated May 17, 2011, has requested NERC to provide supplemental information before the revised Footnote 'b' could be approved. In light of FERC's request and the uncertainty regarding the final provisions of these footnotes, coupled with the ongoing work on Project 2010-17 for the revision of the BES definition and development of an Exception Process and the impact that may have, we respectfully suggest that the drafting team delay further work on TPL-001-2 pending FERC's ruling on NERC's petition seeking approval of the transmission planning standards that contain the revised Footnote 'b' to Table 1.

NBSO

No

Items that, if not addressed, will likely cause a negative vote from NBSO: R2.2 differs from R2.1, R2.3, R2.4 and R2.5 since R2.2 does not state that the annual assessment of the Long-Term Transmission Planning Horizon portion of the steady state analysis can be supported by qualified past studies. Likely this omission is an oversight, but unresolved it can cause significant burden with little gain in reliability. Individual items that, if not addressed, may not cause NBSO to vote Negative, but in combination may result in a negative vote: The language of requirements R2.1.4 and R2.4.3 allowing the performance of one or more sensitivities appears to be inconsistent with language in R2.7.2 that requires multiple sensitivities to determine if actions to resolve performance deficiencies are necessary. R7 (and M7) seem to indicate that the PC is ultimately responsible for determining the individual and joint responsibilities for performing the required planning assessment studies, with the expectation to consult and come to agreement with its corresponding TPs, but this interpretation is not clear. The correct interpretation of this requirement is important for resolving situations where a PC and TP do not agree on the assignment of responsibilities. Suggested wording: "Each PC shall work in conjunction with each of its TPs to determine and identify..." The language in R8 is unclear. One point of confusion relates to which entity is responsible for sending their Planning assessments to other entities. For example, who does a PC distribute their planning assessments to?: -Adjacent PC?

(Seems to be clearly addressed) -TPs within its PC footprint? (Not clearly covered by the language in R8) -TPs adjacent to its PC footprint (Not clear if this is the responsibility of the PC, TP or both) In addition, the language in R8.1 appears to offer unlimited opportunity to request response to comments on any past assessment, long after their release. Providing limits in the language of R8.1 is recommended in order to avoid unnecessary burden on PCs and TPs for little gain in reliability or constructive stakeholder involvement.

Items that, if not addressed, will likely cause a negative vote from NBSO: NBSO believes that R1.1.2 is more appropriately addressed in the operational timeframe. Perhaps more appropriate alternatives could include: -only considering planned outages with durations of one year or more (in-line with typical planning timeframes), or -requiring that facilities with planned outages lasting over the complete duration of time period being studied be modeled out of service. R2.1.5 may significantly increase the demands of the planning assessments with little gain in reliability. Depending on interpretation, R2.1.5 could exponentially increase the work load of the annual planning assessment. NBSO interprets the intent of R2.1.5 to require that entities have, review and evaluate their spare equipment strategies. Perhaps the assessment of a spare equipment strategy would be more appropriately addressed in a separate standard. Further, categories P0, P1 and P2 do not reference footnote 9 in the Initial Condition column. NBSO is unclear if the last sentence of R2.1.5 allows for the curtailment of firm transmission service under the N-1 conditions before the application of category P0, P1 and P2 events. This last sentence states: "...with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment." Table 1, note b should be modified to allow for the loss of Firm Transmission Service. This addresses cases where Firm Transmission Service is lost in direct consequence to the event (e.g. loss of one DC pole, an interface comprised of a single line, a bus fault that clears multiple lines in an interface, etc...) Individual items that, if not addressed, may not cause NBSO to vote Negative, but in combination may result in a negative vote: The definitions of "near-term transmission planning horizon" and "year one" have been removed from the standard, yet they are still used in draft 7. Further, the definition of these terms is being filed as part of another project. NBSO is concerned with endorsing a standard based on terms whose definitions may change independently of this project. For R7, NBSO is concerned that one entity may be found noncompliant should another entity fail to meet their agreed upon responsibilities. For example, a PC may be relying on the results from a TP's studies to complete its own planning assessment, but the TP did not meet their responsibilities. In this case, the PC should not be found non-compliant for an incomplete planning assessment due to the failure of the TP to meet their responsibilities. Contingencies on back to back HVDC facilities are not addressed in the standard.

Group

Western Area Power Administration

No

We concur that the standard is an improvement over previous drafts, but we vote "No" to the existing draft and request additional clarifications and/or modified language for a re-circulated vote prior to adoption. The following are areas where we suggest improvement or have questions: Please further define Consequential and/or Non-Consequential Load Loss: Does the Consequential Load Loss definition include underfrequency or undervoltage load shedding installed to protect transmission system reliability? Does the Consequential Load Loss definition include load tripped by a Special Protection System (SPS) or a Remedial Action Scheme (RAS)? Either how underfrequency and undervoltage load shedding or how load shedding by a RAS relates to Consequential Load Loss should be clear in the Consequential and/or Non-Consequential Load Loss definition of the approved version of this NERC standard. Why is Near-Term Transmission Planning Horizon deleted from the definitions of Terms Used in this Standard, yet it is used throughout the standard? This definition should remain. R1.1.5: How are "known commitments for Firm Transmission Service" to be modeled and tracked in power flow cases? Is it acceptable for Transmission Planners to simply assume what the ultimate sources and ultimate sinks are for each firm transmission service commitment or are Transmission Planners to know exactly which ultimate sources and ultimate sinks are associated with each commitment and to track each one accordingly in each power flow case? Assuming the intent here is reliability based and not marketing based, is the application of Firm Transmission intended to apply to reliability designated 'paths'? Most all Firm Transmission service contracts have caveats for unplanned interruption and such agreements should qualify as "re-dispatch" per Footnote 9? R2.1.5: If a group

of utilities were to develop and manage among themselves a coordinated spare equipment program, such that the risk to any one of its participating entities of experiencing a significant unavailability for any major Transmission equipment that has a lead time of one year or more is deemed not significant, then would those utilities still have to do the studies required by R2.1.5 to evaluate the system impact of extended outages of such equipment? Scenario for Clarification: Short of spare equipment for items with a greater than 1 yr lead time, assessment studies are required to include sensitivities and operating plans for sustained loss of these equipment items, as a prior outage. For example, if an EHV facility is lost for more than 1 yr, and firm transmission interruption is not allowed, it appears the only compliant alternative (to a redundant facility) is a redispatch plan that is well documented and accepted by all stakeholders, per Footnote 9. R2.3: Is only the 5-year Near-Term Transmission Planning Horizon case required for the annual short-circuit analysis? R2.4.1: How is the dynamic modeling of induction motor Loads to be developed by the Transmission Planners? Is it acceptable for Transmission Planners to assume the same induction motor modeling as has generally been assumed and applied by most Transmission Planners throughout the Western Interconnection or will the induction motor modeling have to be based upon the type and amount of actual induction motors installed in the system? R2.5: Does NERC have a particular technical rationale about what determines "proposed material generation additions or changes?" R2.6.2: Does NERC have a particular technical rationale about what determines "material changes?" R2.7.3: Please define "beyond the control" under Definition of Terms Used in Standard. This is an important concept. Without NERC definition, this term is highly debatable and should be eliminated. Scenario for Clarification: If the stakeholder rate payers do not approve expenditures for facility improvements required to eliminate non-consequential load loss, is this beyond the control of the Transmission Planner? Rate payers should be able make the ultimate free market choice determination of risk versus cost associated with their reliability. Otherwise market interests (particularly generation) disproportionately pressure excessive reliability based improvements that must be borne by all rate payers. R3.3.1: Please define "relay loadability limit" under Definitions of Terms Used in Standard. This is an extremely important concept. This term has been used quite commonly for decades and is now used in this latest proposed standard. Without NERC definition, this term is highly debatable and should be eliminated. Scenario for Clarification: If PRC-023 is met whereby all "relay loadability limits" are set at least 150% of the highest thermal limiter (0.85 voltage and 30 lagging powerfactor) this sensitivity would justifiably not be needed so long as verification is shown that no element overloaded greater than 150%. R3.1 and R3.4: The interrelation between these two paragraphs needs additional clarification. R3.1 calls for verification via studies that the BES meets Table 1 performance criteria based on the contingency list resulting from R3.4. However, R3.4 states that the contingency list used to meet R3.1 only need include "Those planning events in Table 1, that are expected to produce more severe System impacts on.....the BES" and the associated "rationale" for those chosen contingencies. Is NERC suggesting that the studies do not need to include all contingencies based on Table 1, so long as ample "rationale" is provided? However, the Transmission Planner must provide studies to determine if every contingency of Table 1 meets performance requirements. How are the "more severe" contingencies determined if the Table 1 contingencies are not evaluated comprehensively? It seems R3.4 could be eliminated and the contingencies be based simply on Table 1. Please define "more severe", relative to less severe under Definitions of Terms Used in Standard, in an effort to help evaluate the suitability of a particular contingency for inclusion on this list. Looking at context, it appears that the purpose of this statement is to ensure that the worst contingencies are studied. Is the intent here simply to allow a given contingency to cover for a less severe or similar contingency and avoid duplicate simulations? R3.4.1 and R4.4.1 Please include and define a reasonable number of contingent buses into adjacent systems that should be considered. No more than 2 are recommended for the standard. R3.5 and R4.5: How many of the "events in Table 1 that are expected to produce more severe system impacts" should the required evaluation identify and evaluate? To what extent should the evaluation focus on the "other" Extreme Events described under items 3.b and 2.f in Table 1, particularly if existing disturbance reports in the Western (or Eastern) Interconnection have recorded and evaluated the occurrence of particular events that have already created cascading? Because the requirement seems to involve a check for Cascading, perhaps some clarity could be provided with respect to the NERC definition of "Cascading." In particular, in the Cascading definition, how widespread is "widespread;" is the phrase "electric service interruption" only about the loss of firm load or could it also be only about the loss of firm generation or only about the loss of firm transmission service or is it about some combination of loss of firm load, loss of firm generation, and loss of firm transmission service; how large an area is meant by the expression "spreading beyond an

area predetermined by studies” when the simulations that analyze the initiating Extreme Event will model the entire Western (or Eastern) Interconnection? So how does the study determine that the sequentially spreading service interruption has spread beyond the entire Western (or Eastern) Interconnection that is modeled in the simulation? Or is the term “area” meant to describe only that part of the Western (or Eastern) Interconnection that the Transmission Planner has evaluated for system impacts while ignoring impacts to the rest of the Interconnection? Table 1 – Planning Events, Steady State Only Note i: “The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event” seems to be included as items 2) and 3) under the Non-Consequential Load Loss definition. So, it seems acceptable to use this form of load loss to meet the stability performance requirements. However, the “Steady State Only” note i in Table 1 specifically does not allow its use to meet steady state performance requirements. Therefore, the “Steady State Only” note i in Table 1 should clarify why it seems acceptable to use it to meet stability performance requirements but not to meet steady state performance requirements. Table 1 – Planning Events, Category P2: Category P2 seems to include an unrelated mix of planning events ranging from a seemingly benign event (i.e., opening of a line section without a fault) to what would seem to be much more severe events (i.e., bus section fault or internal breaker fault). A clarification of why these planning events were lumped into the same Category P2 would be helpful to the Transmission Planner. Also, does the language in footnote 7 (i.e., “opening one end of a line section without a fault on a normally networked Transmission circuit ...”) mean that P2-1 (“opening of a line section without a fault”) should be modeled as an open-ended line section? Table 1 – Planning Events, P2-2 (EHV) and P2-3 (EHV): For each of these planning events, its corresponding “Non-Consequential Load Loss Allowed” column should include a footnote 12 with each of the “No” boxes, similar to that allowed under the seemingly much less severe event P2-1 (“opening of a line section without a fault”). Otherwise, please explain why the seemingly much less severe P2 event (P2-1) has a footnote 12 exception for Non-Consequential Load Loss Allowed but the two seemingly more severe P2 events (P2-2 and P2-3) do not. Table 1 – Planning Events, P4-1 through P4-5 (EHV): For the stuck breaker planning events of P4-1 through P4-5 on the EHV system, their corresponding “Non-Consequential Load Loss Allowed” column should include a footnote 12 with their “No” box, similar to that allowed under the seemingly much less severe N 1 planning events (P1-1 through P1-5). Otherwise, please explain why the seemingly much less severe N 1 events (P1-1 through P1-5) have a footnote 12 exception for Non-Consequential Load Loss Allowed but the seemingly much more severe stuck breaker events (P4-1 through P4-5) do not. Table 1 – Planning Events, P5-1 through P5-5 (EHV): For the relay failure planning events of P5-1 through P5-5 on the EHV system, their corresponding “Non-Consequential Load Loss Allowed” column should include a footnote 12 with their “No” box, similar to that allowed under the seemingly much less severe N 1 events (P1-1 through P1-5). Otherwise, please explain why the seemingly much less severe N 1 events (P1-1 through P1-5) have a footnote 12 exception for Non-Consequential Load Loss Allowed but the seemingly much more severe relay failure events (P5-1 through P5-5) do not.

Xcel Energy

Yes

Effective Date: The effective date section seems to imply that Non-Consequential Load Loss will not be permitted after the 84 month implementation period. We do not believe that was the drafting team’s intent and request that it be modified. Footnote # 12 in Table 1, in particular, seems to support our assumption that the team did not intend to disallow it. For reference, the footnote states: “12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load

Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.” However, if it was the drafting team’s intent to not allow Non-consequential Load Loss after the 84 month implementation period, we disagree and ask the team to reconsider. Particularly for rural areas, in some cases, this will be the only action possible. R2.1.4: a) We would like to see clarification on the term “sensitivity analysis”. Is this in reference to seasonal models and differences in fuel availability? We would like more detail on how this is to be done so that it won’t be left up to interpretation. b) We would like the drafting team to consider stratification of the tasks needed to perform a Planning Assessment. In our opinion, having both the TP and PC do exactly the same study produces tremendous and unnecessary duplication. Without stratification, the TPL-001 standard will continue to perpetuate the same paradigm used in the existing TPL-001 through TPL-004 standards. The NERC Functional Model makes a clear distinction between PC and TP functions/responsibilities. It is not clear why that distinction is not leveraged in the new TPL-001 standard. This will be particularly troublesome in areas where an ISO or RTO is the Planning Coordinator. In order for the RTO/ISO, as the PC, to be able to do their Planning Assessment, the Transmission Planners would have to provide a lot of detailed input data. So, in effect, both the PC and TP would be performing their assessment from the same data. It would make more sense if the RTO (as the PC) performed the required studies on the 500-345 kV network and the TP performed the required studies on everything below 230 KV. We also recommend the allowance for utilization of a regional assessment, instead of performing your own, due to individual entity resource constraints. R2.4.1: We would like to see better clarity on what an Aggregate system load model is and how granular it should be. If the intent is for the model to contain a very detailed representation of the load system, then it may take a longer time to implement. R3.4.1: a) This type of coordination could be difficult due to other adjacent entities on different schedules and some may not have the amount of detail to incorporate into another’s processes. We know this is generally covered in coordination of real time operations and wonder if it is appropriate to require this type of coordination in the long term process. Is there already an operational standard that covers this? Would it be better to address this in the operational standards? We would like the roles of the coordinators vs. the planners to be clarified in order to ensure that no work is being duplicated. b) PC’s between regions, such as RTOs, are already coordinating for long term studies. In these cases, we feel the PC should alone be responsible for the requirements, rather than also the TPs. c) Can we get a clear definition of what apparent impedance swings means? We interpret it as rotor angle stability. R4.3.1: We would like to see that the detailed data is incorporated back into the NERC modeling processes and create a more detailed model with better accuracy. R8: We do not agree with the requirement to provide the assessment to every adjacent PC and TP because we fail to see the reliability benefit in doing so. However, we do agree that the PC and TP should be required to provide the assessment to any of these entities, if requested. Additionally, for entities that make such requests, we would like to have 90 days instead of 30 to respond. In many cases a non-disclosure agreement will have to be executed due to CEII classification of some information, and this can take several months.

ERCOT ISO believes that the revisions do not go far enough in addressing previously submitted comments. As written this standard would require restructuring of the functions in the ERCOT Region because several requirements are being assigned to the PC that are currently performed only by the TPs. It would not provide any reliability benefits to have the ERCOT PC assume these functions. Specifically, the following requirements should be modified: R2.1.5 should be clarified to be applicable to TPs only since the ERCOT PC does not have the information necessary to perform this analysis; R2.3 and R2.8 should be clarified to be applicable to TPs only since the ERCOT PC does not perform this analysis (it is performed by the TPs in ERCOT); R4.1.2 should be clarified to only apply to TPs because the ERCOT PC does not have the modeling information necessary to perform this analysis. Additionally, R2.1.4 and R2.4.3 should be removed because the requirements are subjective and there are no actions prescribed to be taken based on the sensitivity results. The Load model requirement should be removed from R2.4.1 because this would be better addressed in a MOD standard. Alternatively, R2.4.1 should be rewritten as “System peak Load for one of the five years with expected dynamic load models.” A concurrent requirement should be incorporated to mandate DSPs and TPs to supply dynamic load model data to the PC to perform the required studies.

No
ERCOT ISO believes that the VRF for R8 should be "low". The distribution of the Planning Assessment is administrative in nature, the failure to distribute the Planning Assessment does not necessarily equate to not communicating the content of the assessment, and the consequence of not distributing the Planning Assessment does not immediately impact the reliability of the BES; thus it does not warrant a 'Medium' risk factor.

Requirement R1.1.5: Delete "and Interchange." The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the application of well established reliability standards and criteria that are based on the electrical characteristics of the interconnected system, but without economic considerations. Instead, economic transactions are types of transactions that a TO may enter into once its load obligations are met, and are evaluated based on economic parameters that are markedly different from the aforementioned reliability criteria (e.g. congestion costs). Modeling all types of transactions in a power flow case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).

a. 2.6.2 - What was the intent of this change? The old language seemed to work. The language should not be changed from the previous version. b. For 2.8.2 - Was the phrase changed to reflect modifications of facilities? If so the requirement should be modified to read "Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures with respect to modifications of facilities. Otherwise the requirement is unclear. c. For Section R8.1 - the proposed requirement conflicts with a long standing stakeholder process in our area which posts study results and allows comment within a defined period before studies are finalized. If this section is to be retained then it should be modified to only allow comments on Transmission studies less than one-year old. Requirement 8 and 8.1, should be revised to include a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. d. With respect to Table 1 – We suggest adding an event 6 to P1 to address the contingent loss of back to back HVDC Facilities. If not added to P1 then this event needs to be added somewhere in the standard. e. We don't agree with footnote 7 specifying that only one end of the line should be open for this condition. If the SDT is to keep this concept make P2 event 1 simply say "Opening one end of a line section w/o a fault" and delete the footnote. The existing footnote is unclear due to the use of language such as "possibly".
Yes
We feel previous comments have largely been ignored by the Standards Drafting Team leading to a lack of support for the standard. Overall the standard should be more precise in its language. The following comments are provided for serious consideration with respect to revisions: Comments: From Section A.3 – the introduction please strike the word "probable" as shown below Purpose: Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies This is deterministic contingency testing and this

word introduces probability into the standard where it does not belong. For R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be acceptable. Duration of known outages should be increased from six months to one year. For R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load. REMOVE INTERCHANGE from 1.1.5 - Definition of Interchange – The inclusion of Interchange requires designing for non-Firm service. In the NERC Glossary of Terms Used the term Interchange is defined as "Energy transfers that cross Balancing Authority boundaries." It is meant to refer to energy transaction other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and are deemed highly interruptible and subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability under TPL-001. Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited or no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple condition sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed or revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. We agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study." For 2.7.1 – We don't believe this list provides value nor should it be included in the standard. Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded." In Table 1 - The fault descriptions must be clear. They must use "3-phase", "single-phase-to ground", or "2-phases-to ground" in the descriptions of a fault rather than SLG (a line is not a phase in electrical terms--single line to ground is not precise enough). In Table 1 - Where two elements are affected by a fault it must be clear whether the requirement is for a single-phase-to ground fault, or a 2-phase-to ground fault. They are different faults that will have different dynamic responses. For Table 1– add a footnote for the term generator to address the treatment of Combined Cycle Generators – "In addition to evaluating the loss of a single generator, the loss of all interrelated generators shall also be considered as a single contingency." Operating experience has shown that trips of the entire CC facility often occur even on facilities that claim the combined cycle generators are independent. Where a category involves an initial condition representing the loss of a facility followed by an event representing the loss of a facility such as P3, the standard must be clear as to the amount of time assumed between faults. An assumption may be 30 minutes, but the standard must not leave this unsaid. This clarity must be provided in the Table 1 Notes. In addition, the standard must be clear on the allowable re-adjustments between contingencies such as P3, or better, must be clearly limit the permissible re-adjustments. For example, it is not realistic to assume an unlimited amount of re-dispatch between faults—e.g. the allowable re-adjustment should be limited to actions that can be effectively implemented in less than 30 minutes, such as a, b, c, d,, and the amount of generation re-dispatch must not exceed the amount of future planned contingency reserve, or similar language. This clarity must be derivable from the Table 1 Notes.

1. Footnote a. Footnote should state "Draft 7" instead 2. Requirement R1 a. Time Horizon should include both Near-term and Long-term Planning 3. Requirement R2 a. Time Horizon should include both Near-term and Long-term Planning b. Requirement R2, Part 2.1 • The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. • The term "Qualifying studies" from the last sentence is referring to the qualified past studies, or the annual studies, or both actually? Suggesting adjusting the verbiage so it would not create confusion. • Subpart 2.1.4 - Requirement R2, Part 2.1.1 and Part 2.1.2 are referring to system conditions, not studies. The second sentence may be subject of non-objective interpretations and may generate burdensome and unrealistic amount of work. The requirement should state instead "For each of the system conditions described in Requirement R2, Part 2.1.1 and Part 2.1.2, the studies shall include sensitivity cases utilized to demonstrate whether there is any significant impact due to changes on the basic assumptions used in the model. The analysis, by case, may contemplate varying one or more of the following conditions:" • Subpart 2.1.5 - We suggest adjusting the time threshold of potential equipment unavailability in order to be consistent with the time frame for the "known Transmission outages". c. Requirement R2, Part 2.2 • The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. • While the Near-Term portion of the Planning Assessment details the premises of the study, the Long-Term is lacking in such thing. d. Requirement R2, Part 2.3 • Although both the steady-state and transient stability studies are required for the Near-Term and Long-Term, the short-circuit study is required only for the Near-Term. This is big disconnect, because there can be stability analyses conducted without a short-circuit assessment. • Breakers should be checked for their breaking capability, as well as to withstand the fault. All other disconnecting equipment, as well as current transformers in particular shall be also verified for their withstand capabilities. The current statement should be replaced with "The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term and Long-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to assess performances of transmission elements affected by a potential increase of short-circuit contributions to fault" e. Requirement R2, Part 2.4 • The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. • Similar with 2.1, the last sentence should read "The studies should include the following conditions:" • Subpart 2.4.1 - We believe that the dynamic behavior of the load cannot be accurately estimated beyond current time. We are concerned about the effort required to ascertain the dynamic response of the load. As for the "Loads that could impact the study area" the standard doesn't include any directions in how an entity will identify these loads. Perhaps the standard should provide guidelines to determine which loads would impact the study area. • Subpart 2.4.3 - See comments from Subpart 2.1.4 f. Requirement R2, Part 2.5 • The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. g. Requirement R2, Part 2.6 • Subpart 2.6.2 - We agree with the suggested changes as responding to previous comments h. Requirement R2, Part 2.7 • Subpart 2.7.1 - We disagree with the implemented changes. The standard should not include examples. If needed, a white paper can accompany the standard. We suggest adjusting the last sentence to read "Such actions may include, but are not limited to, the following:" i. Requirement R2, Part 2.8 • This should apply to all disconnecting equipment and CT in particular with respect not only to their interrupting duty, but to their withstand capabilities also. See comment on Part 2.3. 4. Table 1 a. Footnote 9 • With respect to the Curtailment of Firm Transmission Service we suggest SDT to revise the language in order to be consistent with the Implementation Plan. 5. Measure M1 a. This measure it is hard to read. For simplicity, we suggest adjusting this measure to read "Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, and the models reflect the System conditions in accordance with Requirement R1." 6. Measure M7 a. The measure encompasses the particular scenario where the parties involved have reached an agreement for performing the required studies. In order to cover situations where the parties have not reach an agreement, the measure should read "Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies all individual and joint responsibilities for

performing the required studies and Assessments in accordance with Requirement R7." 7. Compliance a. Data retention • The 5th bullet should read "The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5." • The 6th bullet should read "The documentation specifying the criteria or methodology used to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding since the last compliance audit in accordance with Requirement R6 and Measure M6." • The 7th bullet should be reworded in accordance with suggested changes at M7.

Definition of Terms Used in the Standard The definitions of "Near-Term Transmission Planning Horizon" and "Year One" have been deleted from the standard, yet they are still used in draft 7. NU is concerned about voting in favor of this standard with these terms being defined by another project without a full discussion of the impact to this proposed standard. NU suggests repeating the definitions in this proposed standard. Requirement R1 NU believes that the Normal System Conditions as stated in Requirement R1 should establish the base case conditions to be used for the assessment studies. However, a more detailed guideline for developing base cases should be addressed by the requirements. By just modifying the language of requirement R1 to indicate that "P0" constitutes the initial system conditions does not address this concern in Draft #7. A more detailed guideline for base case development is needed. Requirement R8 The wording in requirement R8 needs to be amended to restrict comments to the most recent assessment only, for a limited period (say 3 months) after its release. The current wording appears to offer unlimited opportunity to comment on past assessments, long after their release. Footnote 7 It appears there is a discrepancy between Footnote 7 and Event P2-1. Footnote 7 could be eliminated by rewording Event P2-1 as follows: "Opening one end of a line section w/o a fault". Footnote 12 NU did not agree with the clarification of Table 1 Footnote B of TPL-002 and did not vote for its approval. Therefore, NU does not agree with the same clarification being applied here for Non-Consequential Load Loss. For reference, below is NU's comment on TPL-002 Table 1, Footnote B: "The revised language of Footnote b suggests that non-consequential demand interruption (load that is not directly served by the elements removed from service as a result of the contingency) could be used to mitigate reliability concerns arising from NERC Category B contingency events (i.e., single element contingencies). This language seems to encourage operational workarounds and adds burdens for operators of the system. NU believes this is not consistent with planning a highly reliable bulk electric system and thus does not support this weaker language". General comment NU believes that a standard should contain statements and requirements that are direct and measurable. TPL-001-2 should not be an exception to this rule. Therefore, statements like "An objective" which appears in Footnotes 9 and 12 shall not be used.

Yes

The following previous comments that were filed by NU were not addressed by the SDT in the current draft. For NU to support the standard these comments should be addressed or reasons should be provided why they have not been addressed. Repeated below are NU's comments that were filed for

the previous draft. Requirement R1, Part 1.1.2 NU requests that the six month duration stated by Requirement R1, Part 1.1.2 should be modified to one year duration to eliminate outages that occur within the "operational planning timeframe". Requirement R1, Part 1.1.6 The phrase "required for Load" should be deleted as this confuses the issue. Requirement R2, Part 2.2 The language of Requirement R2 Part 2.2 seems to suggest that current annual studies are always required for the long-term steady state assessment. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1. Requirement R2, Parts 2.1.4 & 2.4.3 1) The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions. 2) Requirement R2, Part 2.1.4 and Part 2.4.3 should clarify what is meant by multiple sensitivity studies and one sensitivity study. Will varying only one measurable quantity several times in multiple simulations constitute multiple sensitivity studies or one sensitivity study? Requirement R3, Part 3.3.1 NU feels that the last sentence of Requirement R3, Part 3.3.1 should be removed since this is handled by PRC-023. Line ratings are addressed by PRC-023 which requires coordination with the Reliability Coordinator. NU suggests the removal of the following sentence: "Tripping of Transmission elements where relay loadability limits are exceeded."

Marie Knox

MISO

Yes

No

Regarding Requirement 8, we do not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entity or if a documented response to Planning Assessment comments is not provided within 90 days of a request. Requirement 8 is an administrative requirement that adds little to improve reliability. We recommend that the VRF for Requirement 8 remain "Low", rather than be changed to "Medium".

Overall, we remain concerned that the revisions to the TPL standard are not on balance an improvement to the original. The document is not well organized topically, making it more difficult to navigate and understand. If the primary improvements sought in requirements for reliability planning were to increase system performance levels (no loss of firm demand) for certain multiple contingency events, and to ensure more stressed system sensitivities are analyzed, this can be accomplished in a much simpler revision. We do not believe that this standard as written improves the clarity of what is required, and therefore provides an opportunity for greater disputes between compliance monitors and applicable entities, and this is not a positive outcome. We also believe that the standard is too prescriptive as to what critical system conditions must be modeled, as these conditions vary considerably from system to system and within large systems. Table 1-Steady State and Stability Performance Planning Events, Category P5, now includes "non-redundant" relay in the Event column. What is meant by non-redundant relay? It is unclear if the SDT's intent is to provide distinction between a back-up relay and a redundant relay. We recommend that the SDT provide a definition for the term "non-redundant".

Imperial Irrigation District

Yes

Yes

Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, board of directors/Public Utility should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote. 1. R2 (2.5): The value of assessing system stability for years 6-10 is questionable. Stability studies should be conducted for new generation interconnections or for planned major transmission system improvements that have regional impact. 2. R8 requirement to distribute all Planning Assessment results to adjacent PCs and TPs are excessive and

cumbersome. Regarding R8, IID suggest the following languages: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners in accordance with the overseeing Reliability Coordinator requirements. Any functional entity that has a reliability related need and submits a written request for the Planning Assessment results, the Transmission Planner and Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request.

No

If the following recommended revisions are made to the requirements listed, subject to other unforeseen material changes, NYISO would no longer oppose the approval of this standard. Requirement R2.1.5 The current requirement language can be interpreted to require evaluation of the simultaneous unavailability of multiple long-lead-time components. Also, as a transformer outage is already evaluated as part of category P6 in Table 1, additional studies should not be required, however spare equipment strategies could be ASSESSED in the context of the Planning Assessment. NYISO thus recommends this requirement be revised as follows: R 2.1.5 When an entity's spare equipment strategy could result in the unavailability of a major Transmission component that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed with due regard to categories P0, P1, and P2 identified in Table 1. Requirement R2.2 The language in this requirement is materially inconsistent with R2.1, unnecessarily requiring a current study. NYISO requests that R2.2 and the sub-requirement be revised as follows: 2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies shall include: 2.2.1. Expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected. Requirement R8.1 There is an apparent open ended time frame afforded report recipients in their review of any Planning Assessment. This requirement should apply to only the most recent Planning Assessment. NYISO thus recommends the following language: 8.1. If a recipient of the most recent Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

No

Requirement 8 is an administrative burden that adds no value to reliability. Comments have been provided on several past drafts highlighting this effect. The revisions made to the VRF and VSL for Requirement 8 further exacerbate this burden. One could conclude from observation of the VSLs and VRFs, that Requirement 8 was the most important requirement of TPL-001-1. Many Planning Coordinators and Transmission Planners have stakeholder processes that govern participation and notification. Further, FERC Order 890 requires stakeholder participation and transparent processes.

Requirement R2.4.1 The NYISO, along with many other systems, has not determined a need to model dynamic loads, and therefore has not benchmarked any such models. The NYISO recommends that prior to the implementation of this requirement a modeling standard should exist that is specific to dynamic loads, including as assessment for the need for dynamic load models.

Group

Tri-State Generation and Transmission Assn., Inc.

Yes

In general, revisions are editorial and seem to have improved the overall document.

No

Many of the sub-requirements of R2 do not warrant high risk VRFs, yet violation of any R2 sub-requirement would result in a "High Risk Factor" violation assessment. We believe that having so many sub-requirements can result in inaccurate overall severity classification. For example, skipping one study defined in R2.1.2 (Planning Assessments) for a particular time frame or load level would probably not result in a direct actual degradation in system performance, but would still result in a High Violation Risk Factor.

R1.1 to "System models used for Steady State and Stability Analysis shall represent:" Much of what is in R1.1 is unnecessary for Short Circuit studies. In contrast, there are items not mentioned in R1.1 that are necessary for short circuit studies. R2.1.4 requires sensitivity analysis to study "a range of credible conditions that demonstrate a measurable change". How will the required actions in R2.1.4 be documented or measured, and what is accomplished by performing sensitivity analysis in the context of a system performance assessment? In R2.3, change the first sentence to read "The short circuit analysis portion of the Planning Assessment shall be conducted annually, using one of the cases described in 2.1.1, addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6." There appears to be no reason to perform short circuit studies for all three Near-Term Transmission Planning Horizon cases. R2.4.3 requires sensitivity analysis to study "a range of credible conditions that demonstrate a measurable change". How will the required actions in R2.4.3 be documented or measured, and what is accomplished by performing sensitivity analysis in the context of a system performance assessment? R2.7.1 remove the last bullet. We believe these programs are already factored into the load forecast, as they are associated with resource scheduling and planning load serving, and not transmission planning. In particular, DSM measures would fall under R2.4.1, and the term "new technologies, or other initiatives" The language of Requirement 3 unnecessarily repeats the language of R1 and R2. As now written, R3 states "For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1." R3 We recommend that the introductory language in Requirement R3 be changed to read "The studies in Requirement R2, Parts 2.1, and 2.2 shall be performed using models as defined in Requirement R1 in accordance with the following criteria." We believe that Requirements 3.1 and 3.4 should be combined into R3.1, eliminating R3.4. It is redundant to have Requirement 3.1 say "perform R3.4". We recommend that R3.4 be deleted and that R3.1 be replaced with: R3.1 Planning event studies shall be performed in accordance with "Table 1 – Steady State & Stability Performance Planning Events;" and shall be based on a supportable Contingency list. Comment: The content of 3.4.1 was intentionally omitted as it is redundant with R7. Also, the language "...more severe System impacts..." was intentionally omitted as it could be subject to a wide range of interpretations. Similarly, we recommend that R3.5 be deleted and that R3.2 be replaced with: R3.2 Extreme event studies shall be performed in accordance with "Table 1 – Steady State & Stability Extreme Events;" and shall be based on a supportable Contingency list. We recommend the following new requirement be inserted after the revised R3.2 language: Should the extreme event studies identify potential Cascading, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted. Comment: As before, the language "...more severe System impacts..." was intentionally omitted as it could be subject to a wide range of interpretations. We recommend removing the second bullet of R3.3.1, "Tripping of Transmission elements where relay loadability limits are exceeded" for the following reasons: 1. There is currently no tool to model relay loadability characteristics in Steady State analysis. 2. Requirement R3.3.1 would require inclusion of relay models in modeling data that are not currently provided. MOD-012 does not require impedance or overcurrent relay models to be submitted. 3. In Requirement 3.3.1, the second bullet, it is impossible to model complete and accurate relay loadability using present-day steady state simulation tools. At best an individual point could be chosen to model relays based on a selected power factor. We recommend changing the opening text of Requirement R.3.3.2 to say "Simulate the expected automatic or manual operation..." Subrequirement R4.1.2 represents a tremendous increase in dynamic modeling complexity. Modeling relay action during apparent impedance swings would require inclusion of impedance relay models in modeling data that are not required to be submitted in MOD-012. If such modeling is necessary, then the corresponding data requirements need to be addressed in MOD standards. We believe that Requirements 4.1 and 4.4 should be combined into R4.1 as shown below and R4.4 should be deleted. It is redundant to have Requirement 4.1 say "perform R4.4." We recommend R4.1 language be revised to read as follows: R4.1 Planning event studies shall be performed in accordance with "Table 1 – Steady State & Stability Performance Planning Events;" and shall be based on a supportable Contingency list. Comment: The content of 4.4.1 should be omitted as it is redundant with R7. Also, the language "...more severe System impacts..." should be omitted as it could be subject to a wide range of interpretations. Similarly, R4.5 should be deleted and R4.2 should be replaced with: R4.2 Extreme event studies shall be performed in accordance with "Table 1 – Steady State & Stability Extreme Events;" and shall be based on a supportable Contingency list. We

recommend the following new requirement be inserted after the revised R4.2: Should the extreme event studies identify potential Cascading, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the even(s) shall be conducted. Comment: As before, the language "...more severe System impacts..." was intentionally omitted as it could be subject to a wide range of interpretations. Clarify the first bullet in Requirement R4, part 4.3.1 by changing it to "High-speed (less than 1 second) reclosing, where the fault has cleared, and high-speed reclosing into the permanent fault , but in each case only if high-speed reclosing is utilized". In Requirement R4, part 4.3.1, third bullet, it is impossible to model complete and accurate relay loadability using present-day steady state simulation tools. Existing applications do have impedance relay models, but these models do not model many relay capabilities– for example, non-circular protection regions and load-encroachment. We recommend removing this bullet. The comment statement we made above referring to R4.1.2 also applies to R4.3.1. MOD-012 does not require reclosing relay model data to be submitted. If such modeling is necessary, then the corresponding data requirements need to be addressed in MOD standards. Furthermore, there is not a standard built-in reclosing relay model in current stability simulation tools. Comments regarding Table 1- We assume the headnote i. to Table 1 - "The response of voltage sensitive Load..." - means that studies must not rely on end-user load tripping to meet the performance requirements defined in TPL-001-2 but that it should be modeled (when known) so that its occurrence would be evident. We don't see the need to apply Footnote 12 to only certain contingency categories or certain events in categories. Recommend putting the footnote in the column header just as with Footnotes 1, 2, 3, and 4. Recommend changing "utilized" in Measurement M3 to "performed." Recommend changing "utilized" in Measurement M4 to "performed." Modify Measurement M7 to "Each Planning Coordinator shall provide dated documentation on roles and responsibilities of its Transmission Planners, such as..." The deleted phrase, "in conjunction with each of its Transmission Planners," appears to be unnecessary.

No

There were a number of comments made on the previous draft of TPL-001-2 for which there were few, if any, changes made to the latest draft of the standard. Specifically: Requirement R1 does not address normal (pre-contingency) operating procedures or system configurations. Language should be added to the requirement (possibly as an additional Requirement R1.1.7) to include normal operating procedures or system configurations in place prior to any contingency occurring. Requirement R2.4.1, which addresses dynamic load modeling, has been a cause for concern because of the lack of guidance regarding reasonable induction motor representation as opposed to generic load models. While it is recognized that the effort to simulate the effects of induction motor loads is important, it is premature to include such modeling as part of the requirements for this standard. In addition, it appears that only the peak load model in R2.4.1 is required to represent expected dynamic behavior of Load. Such load models, if adopted should represent dynamic behavior of the load for all dynamic studies.

No

The VRF for Requirement R8 should remain Low. There is no significant risk to the reliability of the BES if a Planning Assessment is not distributed to another entity, or if a documented response is not provided within 90 days of a request. The assignment of some VRFs are inconsistent with the importance of the requirements. R2 requires the development of an assessment and it is determined to have a high VRF. However, R3 and R4 require that studies be performed and these studies are determined to have a medium VRF. Performing the studies is essential to developing an assessment and more important to maintaining reliability. If the VRFs for R3 and R4 are correct, then the VRF for R2 should be no higher than medium. The VRF for R5 to develop a steady-state voltage criteria is determined to be medium. However, the VRF for R6 to develop instability criteria is determined to be low. If the VRF for R6 is correct, then the VRF for R5 should also be low.

With respect to Requirement R8, will posting the assessment to a secure web site meet the intent of the requirement? What are the Planning Assessment results identified in R8, and how are they different from the Planning Assessment? It appears that the language for R8 is inconsistent with the VSL for R8. The revised language for the VSL for R8 has removed the word "results". For

Measurements M3 and M4, there is still some question as to what is to be provided as sufficient evidence of a study. It is not clear whether the study results would be sufficient, or whether the entire powerflow, stability, or short circuit effort needs to be documented in a formal study report. For example, it is not clear whether contingency lists used in performing the study work would need to be retained as part of the documentation. The items listed as 4.1.1 through 4.1.3 are not requirements but are performance criteria and should be included in the Table 1 only, consistent with the other performance criteria. Overall, we believe that this standard does not improve the clarity of what is required, and would give additional occasions for disputes between compliance monitors and various registered entities. The standard as written is too prescriptive with regard to critical system conditions which are to be modeled. Such conditions would vary considerably for different systems across the continent.

Standards Announcement

Project 2006-02 Assess Transmission Future Needs Successive Ballot and Non-binding Poll Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

A successive ballot on revisions to TPL-001-2 Transmission System Planning Performance Requirements, and a concurrent non-binding poll of associated VRFs and VSLs, concluded on May 31, 2011. The standard was approved by the ballot pool with an approval rating of 73.99% and a quorum of 92.07%.

Ballot Results for Revisions to TPL-001-2

Voting statistics are listed below, and the [Ballot Results](#) Web page provides a link to the detailed results:

Quorum: 92.07 %

Approval: 73.99 %

Non-binding Poll Results for Associated VRF and VSLs

Of those who registered to participate, 86.79% provided an opinion; 71.9% of those who provided an opinion indicated support for the VRFs and VSLs that were proposed.

Next Steps

The drafting team will consider all comments received during the formal comment period, ballot, and non-binding poll, and will determine whether to make additional changes to the standard and its implementation plan and associated VRFs and VSLs. If the team makes substantive changes to address issues raised in comments, an additional 30-day formal comment period will be conducted with a successive ballot during the last ten days of the comment period. If the team makes only minor clarifying changes to address issues identified in comments, a recirculation ballot may be conducted.

Background:

TPL-001-2 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0. The proposed standard includes several new definitions. The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies.

The AFTN SDT solicited comments from the industry on the fifth posting of the revised TPL-001-2 through an informal comment period that ended on September 2, 2010. The team revised the standard in response to comments received, and posted Draft 6 for information, while awaiting the outcome of [Project 2010-11 TPL Table 1](#) (footnote 'b'). The revisions to Table 1 footnote 'b' have been approved by the NERC Board of Trustees and filed with FERC. The AFTN SDT adopted the technical tenets of the final solution for footnote 'b' for inclusion in TPL-001-2.

Additional information about this project is available on the project page at:

<http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>.

Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

*For more information or assistance, please contact Monica Benson,
Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.*

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

The Assess Transmission Future Needs and Develop Transmission Plans Drafting Team thanks all commenters who submitted comments on the 6th draft of the TPL-001-2 standard for Assess Transmission Future Needs (Project 2006-02). These standards and associated documents were posted for a 45-day public comment period from April 18, 2011 through May 31, 2011. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 43 sets of comments, including comments from approximately 78 different people and approximately 69 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

No changes were made to the text of any Requirement. The SDT made several changes in response to comments submitted during the formal comment period and successive ballot that ended May 31, 2011.

- The 5th and 6th bullets of the Data Retention section to make the language in the data retention statements consistent with the language in the requirements.
- The third part of the Severe VSL for Requirement R1 to make the language consistent with the requirement.
- The VSL for Requirement R8 to make the language consistent with the language in the requirement.
- The Effective Date section of the Implementation Plan to make the language consistent with the language in the Effective Date section in the proposed TPL-001-2.
- The bullets in Requirement R3, Part 3.3.1 were replaced with numbers because the bullets were inconsistent with NERC's protocol on the use of bullets in Requirements.
- The bullets in Requirement R4, Part 4.3.1 were replaced with numbers because the bullets were inconsistent with NERC's protocol on the use of bullets in Requirements.

The SDT is requesting that this project be moved to the recirculation ballot stage.

All comments submitted may be reviewed in their original format on the standard's project page:

<http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Reliability Standards Development Procedures:
<http://www.nerc.com/standards/newstandardsprocess.html>.

Index to Questions, Comments, and Responses

1. The SDT has made revisions to the requirements language of TPL-001-2 based on industry comments and the Quality Review. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments with clear indications as to which requirement you are commenting on. 10
2. The SDT has made revisions to the VRF and VSL of TPL-001-2 which will be part of a non-binding poll with this posting based on industry comments and the Quality Review. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments. 39
3. If you have any other comments on this Standard that you have not already provided in response to the prior questions, please provide them here. 54

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. **The SDT has made revisions to the requirements language of TPL-001-2 based on industry comments and the Quality Review. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments with clear indications as to which requirement you are commenting on.**

Summary Consideration: Several commenters stated that Requirement R1, Part 1.1.5 should not include interchange because interchange introduces economic considerations into a Reliability Standard. The SDT explained that the requirement is to include known commitments for interchange and therefore the requirement is not for economic purposes, but rather planning to meet obligations.

A number of commenters stated that they believed that there was an inconsistency between Requirement R2, Parts 2.1 and 2.2, since qualified studies were not allowed for the Long-Term Transmission Planning Horizon case. The SDT believes that the requirement to conduct the annual study on one of the study years in the Long-Term Transmission Planning Horizon ensures that the planner conducts a new study annually to evaluate the System improvement needs in the Long-Term Transmission Planning Horizon, even if they utilize qualified past studies for the Near-Term Transmission Planning Horizon cases.

Several commenters stated that they believed that Requirement R2, Part 2.1.5 was ambiguous since it was not clear that the planner did not have to include multiple outages of long lead time components simultaneously. The SDT explained that Requirement R2, Part 2.1.5 does not require simultaneous outages of multiple long lead time components.

Some commenters expressed concerns with Requirement R2, Part 2.4.1 since they were concerned with the ability for planners to adequately model the dynamic behavior of Load. The SDT explained that since it is important to correctly model the characteristics of the Load, it believes that the requirement to represent the dynamic behavior of the Load is needed to ensure BES reliability.

A number of commenters expressed concern that Requirement R7 was administrative and was not required. The SDT explained that it believes that the requirement is necessary to ensure that there are no gaps created between the Transmission Planners and the Planning Coordinators when they determine their individual responsibilities.

Several commenters stated that they had concerns with Requirement R8. These concerns are that the requirements create excessive work and should include time limits on requesting the Planning Assessment, are ambiguous, and should include the ability to post the Planning Assessment. The SDT explained that the requirements are only to distribute the Planning Assessment, which should not require a large amount of work, and the requirements are clear that the planners must distribute to adjacent Transmission Planners and Planning Coordinators and others with a reliability need. The SDT further explained that posting the Planning Assessment could meet the requirement to distribute.

Several commenters stated that they believed that Table 1, P2-1 was inconsistent with Footnote 7. The SDT explained that Footnote 7 was included to clarify that “Opening a line section without a fault” could include, but does not always, creating a radial line section with Load and that the planner must evaluate this situation as a part of P2-1.

A number of commenters expressed concern that Footnote 12 was not appropriate or that this standard should be delayed until FERC approved TPL-002-1 Footnote ‘b’. The SDT explained that Footnote 12 was consistent with language in the recent NERC Board of Trustees approved TPL-002-1 Footnote ‘b’ and that this standard should not be delayed until FERC rules on the other standard.

No changes were made to requirements due to industry comments to question 1. However changes were made to the wording of the Implementation Plan to make it consistent with the language in the Effective Date section of the standard. Also, the language in the data retention section was changed for bullets five and six to make it consistent with the language in the requirements – no changes were made to the timeframe for data retention.

DR, 5th bullet: The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.

DR, 6th bullet: The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.

Organization	Yes / No	Question 1 Comment
Lower Colorado River Authority	Ballot Comment	<p>1. R2 (2.5): The requirement for stability assessment in years 6-10 should be limited for new generation interconnections or for planned major transmission system improvements that have regional impact. The standard should clarify the ‘material changes’ that would necessitate stability planning assessments and documentation.</p> <p>2. R8 requirement to distribute all Planning Assessment results to adjacent PCs and TPs are excessive and cumbersome. Regarding R8, LCRA TSC suggests the following language: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners in accordance with the overseeing Reliability Coordinator requirements. Any functional entity that has a reliability related need and submits a written request for the Planning Assessment results, the Transmission Planner and Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
<p>Response: For Requirement R2, Part 2.5, the SDT believes it is important to evaluate Stability when the planners are evaluating new generation additions or changes which can be more than 5 years in the future, as required in NERC Standard FAC-001-0. The SDT discussed defining 'material change' but did not believe that such a definition was appropriate in a continent-wide standard. With the wide variety in sizes and types of systems, the number of parameters that need to be considered, etc., there are too many variables involved. No change made.</p> <p>For Requirement R8, the SDT disagrees that the requirement is excessive and cumbersome and did not make the suggested change. In addition, the proposed language would place requirements on the Reliability Coordinators, who are not included in the Applicability for this standard, and they should not be involved in determining the extent of the distribution of the Planning Assessments.</p>		
Florida Municipal Power Agency	Ballot Comment	<p>FMPA has minor comments to help improve the clarity of the standard. R7 is not needed and administrative in nature. Instead it should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures.</p> <p>R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request?</p> <p>Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)</p>
<p>Response: Requirement R7 ensures that there are no gaps between Transmission Planners or the Planning Coordinators that may cause reliability concerns. No change made.</p> <p>Requirement R8 requires the automatic distribution to neighboring Planning Coordinators and Transmission Planners without a written request and to others with a reliability related need following a written request. The SDT believes this is an important considerations and not ambiguous. No change made.</p> <p>Table 1, bullet c under first heading, is not in conflict with the requirements. The SDT decided to include additional details in Table 1 so that it would have the basic information necessary for the planner to develop the simulations for their studies without always referring back to the requirements language. No change made.</p>		
Madison Gas and Electric Co.	Ballot Comment	Please revise the words "System" to "system" or preface with BES System. NERC defines System to include distribution components. Plus this Standard is only applicable to PCs and TPs.

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
MidAmerican Energy Co.	Ballot Comment	Resolve the conflict between R2 and other requirements in the TPL standards by replacing the term, “System” with “BES” in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems, which is the definition of the NERC Glossary term, “System”. These locations are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6.
<p>Response: Even though the capitalized term “System” includes distribution components, the SDT believes that its usage within this standard is correct because the Reliability Standards apply only to the BES. Therefore, adding additional qualifiers is not needed. No change made.</p>		
City of Austin dba Austin Energy Lower Colorado River Authority	Ballot Comment	<p>Previous TPL Standard balloting included the FERC Order that clarified footnote ‘b’, regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, a Registered Entity’s Board of Directors, local public utility commission, and/or its customers should determine what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.</p> <p>Regarding R2 (2.5): The value of annually assessing system stability for years 6-10 is questionable. The requirement for stability assessment in years 6-10 should be limited to new generation interconnections or planned major transmission system improvements with regional impact. The standard should clarify the ‘material changes’ that would necessitate stability planning assessments and documentation.</p> <p>Regarding the R8 requirement to distribute all Planning Assessment results to adjacent Planning Coordinators and Transmission Planners is excessive and cumbersome. Regarding R8, we suggest the following language: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners in accordance with the requirements of the applicable Reliability Coordinator. Any Registered Entity with a reliability-related need may submit a written request for the Planning Assessment results and the Transmission Planner or Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request.</p>
<p>Response: The SDT incorporated the language in Footnote 12 that was approved in Project 2010-11 TPL Table 1 Footnote B.</p> <p>For Requirement R2, Part 2.5, the SDT believes it is important to evaluate Stability when the planners are evaluating new generation additions or changes which can be more than 5 years in the future, as required in NERC Standard FAC-001-0. The SDT discussed defining ‘material change’ but did not believe that such a definition was appropriate in a continent-wide standard. With the wide variety in sizes and types of systems, the number of parameters that need to be considered, etc., there are too many variables involved. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

<p>For Requirement R8, the SDT disagrees that the requirement is excessive and cumbersome and did not make the suggested change. In addition, the proposed language would place requirements on the Reliability Coordinators, who are not included in the Applicability for this standard, and they should not be involved in determining the extent of the distribution of the Planning Assessments.</p>		
<p>City of Green Cove Springs City of Vero Beach Fort Pierce Utilities Authority Keys Energy Services</p>	<p>Ballot Comment</p>	<p>R7 is not needed and administrative in nature. Instead it should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures.</p> <p>R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request? Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)</p>
<p>Response: Requirement R7 ensures that there are no gaps between Transmission Planners or the Planning Coordinators that may cause reliability concerns. No change made.</p> <p>Requirement R8 requires the automatic distribution to neighboring Planning Coordinators and Transmission Planners without a written request and to others with a reliability related need following a written request. The SDT believes this is an important consideration and not ambiguous. No change made.</p>		
<p>Alberta Electric System Operator</p>	<p>Ballot Comment</p>	<p>With respect to R2, Part 2.7.1 which lists system deficiencies and the associated actions needed to achieve System performance, the 3rd and 4th bullet identify the following actions as being acceptable: :Installation or modification of automatic generation tripping as a response to a single or multiple contingency to mitigate Stability performance violations. :Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations. The current Alberta transmission policy does not allow for the tripping or runback of generation for a single contingency; however for multiple contingencies it is acceptable.</p> <p>The AESO will bring TPL-001-2, with any modifications, through the standard development consultation process in Alberta and ultimately to the Alberta Utilities Commission for approval.</p>
<p>Response: The list in Requirement R2, Part 2.7.1 are examples of actions that are acceptable under the NERC Reliability Standard, however, certain actions may not be acceptable under state, provincial, or other regulatory policies or requirements and are not intended to supersede other regulations or policies.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
ReliabilityFirst	Yes	<p>1. In requirement 4.3, the high speed recloser time of 1 second is too restrictive. We suggest that the time be expanded to 2 seconds to capture all reclosing operations that might impact stability studies. We interpret the use of bullet points in Requirement 4.3.1 to mean that any one of the statements can be included in the analyses. In this requirement, the use of bullet points should be removed and replaced with language that requires all of the statements to be included in the analyses. We strongly believe that the language needs amended in requirement 4.3.1, such that, we will reconsider our voting position.</p> <p>2. In Table 1 labeled Steady State and Stability Performance Extreme Events we contend that the change to “relay failure” is unnecessarily limiting. The previous use of Protection system was satisfactory. Protection System is a defined term and encompasses many components that may fail and not just the relay.</p> <p>3. In table 1 Steady State & Stability Performance Planning Events under P5 “non-redundant” needs to be better defined. We suggest saying in a footnote that two devices do not need to be identical in order to be redundant. Redundant relays or relay schemes need to have the same performance level to be considered redundant but do not need to be identical equipment.</p>
<p>Response: The SDT believes that high speed reclosing is less than one second and has not received other comments that the time should be extended. The SDT believes that the language is clear that any of the three items shall be included in the analyses, if applicable. No change made.</p> <p>Table 1, Extreme Events, Stability Item 2 – The SDT made the language consistent with the language in the Planning Events to ensure that the planner was evaluating Stability based on performance of the System after the failure of a relay to operate and the planner should not address the many component failures that could create different failure modes. No change made.</p> <p>The SDT believes that non-redundant is understood by the industry. No change made.</p>		
Bonneville Power Administration	Yes	<p>1. If current study is performed to assess the system, there is no need to supplement with past studies. o Suggested language for R2.2:- For the planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed and be supported by the following annual current study or qualified past studies as indicated in Requirement R2, Part 2.6</p> <p>2. Load models should be consistent across the region o Suggested language for R2.4.1:- System peak load for one of the five years. System peak load levels shall include a the latest load model developed by the regional planning coordinator which represents the expected dynamic behavior of loads that could impact the study area, considering the behavior of induction motor loads.</p> <p>3. R2.5 is redundant and should be deleted. It is already included in R1.1.3 and R2.6.2.4. R3.5: This</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>standard requires mitigating the consequences of extreme events. Requiring potentially very costly mitigation actions for very low probability event is unnecessary burden to utilities.</p> <p>o Suggested language for R3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. Evaluation of the risk, consequences and adverse impacts of the event(s) shall be conducted.</p>
<p>Response: For Requirement R2, Part 2 - If the planner chooses to annually complete current studies to assess the system, the planner is not required to use past studies, but rather is allowed to use information from past studies in lieu of completing additional current studies. No change made.</p> <p>For Requirement R2, Part 2.4.1 – Not all Transmission Planners and Planning Coordinators are under a regional Planning Coordinator. However, for areas with a regional Planning Coordinator, that regional Planning Coordinator may have a requirement for all Transmission Planners and Planning Coordinators in its area utilize the regional Load model. No change made.</p> <p>Requirement R2, Part 2.5 is not redundant since the referenced requirements do not require the planner to assess the impact in the Long-Term Transmission Planning Horizon. The requirement is that the planners assess the impact of proposed material changes and have corrective action plans to resolve concerns from those proposed changes. The planner is not required to implement the corrective action plans unless the proposed material changes occur and the issues remain unresolved. No change made.</p> <p>Requirement R3, Part 3.5 – The SDT does not believe that the suggested language adds clarity and is also concerned that evaluation of possible actions to reduce the likelihood or mitigate the consequences and adverse impacts of the event are not required by the proposed language. No change made.</p>		
Ameren Services	Ballot Comment	<p>(1) Requirement R2.4.1, which addresses dynamic load modeling, has been a cause for concern because of the lack of guidance regarding reasonable induction motor representation as opposed to generic load models. While it is recognized that the effort to simulate the effects of induction motor loads is important, it is premature to include such modeling as part of the requirements for this standard.</p> <p>(2) For Measurements M3 and M4, there is still some question as to what is to be provided as sufficient evidence of a study. It is not clear whether the study results would be sufficient, or whether the entire powerflow, stability, or short circuit effort needs to be documented in a formal study report. For example, it is not clear whether contingency lists used in performing the study work would need to be retained as part of the documentation.</p> <p>(3) The standard as written is too prescriptive with regard to critical system conditions which are to be modeled. Such conditions would vary considerably for different systems across the continent. (4) Overall,</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		we believe that this standard does not improve the clarity of what is required, and would give additional occasions for disputes between compliance monitors and various registered entities.
<p>Response: For Requirement R2, Part 2.4.1, the SDT believes that there are models available that account for the dynamic nature of the Load. No change made.</p> <p>For Measurements M3 and M4, the planner is required to retain evidence that they completed the tasks required in each sub-part of Requirements R3 & R4. These sub-parts require evidence including steady state power flow, Stability and short circuit. Further, the Contingency lists are specifically required in Requirement R3, Parts 3.4 & 3.5 and Requirement R4, Parts 4.4 & 4.5. No change made.</p> <p>The SDT disagrees that the standard is too restrictive about the system conditions to be evaluated. The SDT believes that this standard is a significant improvement and adds needed clarity to the existing TPL standards. No change made.</p>		
New York State Reliability Council	Ballot Comment	<ol style="list-style-type: none"> 1. In R1.1.5, known commitments for Firm Transmission Service, plus other Interchange that does not violate reliability constraints - it is imperative to model other Interchange after accounting for all existing and planned Firm Transmission Service to ensure that reliability-based transactions are not confused with economic interchange. 2. In R2.2.5, the current requirement language can be interpreted to require evaluation of the simultaneous unavailability of multiple long-lead-time components. Also, as a transformer outage is already evaluated as part of category P6 in Table 1, additional studies should not be required; however, spare equipment strategies could be assessed in the context of the planning assessment. 3. In R2.2, the language in this requirement is materially inconsistent with R2.1, unnecessarily requiring a current study.
<p>Response: The SDT selected known commitments for Firm Transmission Service and Interchange to separate the planning requirements of commitments from the economic transactions. No change made.</p> <p>In Requirement R2, Part 2.1.5, the requirement is for the planner to make an assessment of the loss of long lead time (>1 year) equipment, unless the entity's spare equipment strategy can mitigate the issue in less than one year. Therefore, in those instances, the system will be evaluated against the system with the component out of service (multiple Contingencies). While P6 will simulate the same set of outages, the requirements of P1 and P2 are different than P6. Therefore, the planner needs to make an assessment of their system under the more stringent performance requirements. No change made.</p> <p>Requirement R2, Part 2.1 and 2.2 – The SDT left the requirement to conduct the annual study on one of the study years in the Long-Term Planning Horizon to ensure that the planner would conduct a new study annually to evaluate the System improvement needs in the Long-Term Planning Horizon. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
Tennessee Valley Authority	Ballot Comment	<p>1. TVA is concerned about the additional studies, modeling, and projects that must be performed to meet this proposed standard. TVA believes that this amount of work will have little overall improvement on the reliability of the BES.</p> <p>2. TVA believes that the 7 year implementation plan allowed for “Raising the bar” facilities does not allow sufficient time for TVA to construct the required new facilities. TVA average time for constructing a new 500-kV line can be up to 10 years, given the lead time on ROW and following all NEPA requirements. TVA does understand that the team has language (R2.7.3) regarding the TP or PC inability to get the projects completed through no fault of its own; however, there is no safeguard that the entity will be found non-compliant if all the work cannot be accomplished in this time frame.</p> <p>3. TVA believes that the footnotes b and c that allow for local load drop in the current TPL standards should still be allowed. TVA understands that this is addressed in FERC Order 693; however, the capital improvements to fix many of these issues will have little overall reliability gain for the Bulk Electric System. TVA believes that this is a local load reliability issue and not a BES concern.</p> <p>4. TVA is concerned that no generating unit shall pull out of synchronism for Planning Event P1, while the standard does allow generator runback/tripping for the same event. TVA believes that this requirement is overly burdensome without providing any material improvement in system reliability. Does distributed generation have to meet the same requirements for not pulling out of synchronism as a large nuclear unit?</p> <p>5. The Implementation Plan should include a five-year delay in the effective date for short circuit studies (R2 parts 2.3 and 2.8) since these studies are a new TPL requirement and are not required in the current version 0 standards.</p>
<p>Response: 1) The SDT appreciates the concern about additional work compared to the reliability benefits. The SDT believes that the changes within the proposed standard represent the appropriate work to ensure BES reliability. No change made.</p> <p>2) The SDT believes that the Implementation Plan gives entities the necessary time to develop and implement Corrective Action Plans. No change made.</p> <p>3) The SDT incorporated the language in Footnote 12 that was approved in Project 2010-11 TPL Table 1 Footnote B. No change made.</p> <p>4) The SDT does not believe that any generator should pull out of synchronism for a single Contingency. No change made.</p> <p>5) While short circuit study requirements may be new in the realm of mandatory enforceable standards, the SDT does not believe that they present a significant “raising of the bar” for industry. The SDT believes that prudent short circuit practices are effectively in place today to ensure safe operation of the equipment.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
<p>Therefore, no extension in the Implementation Plan was made in regard to short circuit studies.</p>		
<p>Florida Municipal Power Pool</p>	<p>Ballot Comment</p>	<p>A. Spare Equipment, R2.1.5 - The requirement reaches beyond the FERC directive. The directive was: "Accordingly, the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy." So, the directive is only to address planned outage, not unplanned outages. Also note that the applicability to GSUs is ambiguous. "Transmission" is defined as: "An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems." Is the "point of supply" the generator terminal, or the GSU high side terminal?</p> <p>B. Table 1, under first heading of "Steady State Only", bullet i is open to interpretation. Many utilities use steady state P-V analyses to study voltage stability and design UVLS systems in apart around those steady state analyses. Would this bullet essentially eliminate P-V and Q-V studies and the related use of UVLS?</p> <p>C. R7 is not needed and administrative in nature. Instead is should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures.</p> <p>D. R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request?</p> <p>E. Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)</p>
<p>Response: The SDT respectfully disagrees that the Commission directive regarding a spare equipment strategy is limited to planned outages. In Order 693, Par 1725, the Commission states in its discussion "Thus, if an entity's spare equipment strategy for the permanent loss of a transformer is to use a "hot spare" or to relocate a transformer from another location in a timely manner, the outage of the transformer need not be assessed under peak system conditions." The SDT believes FERC clearly intended the spare equipment strategy to cover a catastrophic loss of such long lead-time equipment. Further, the SDT believes it has appropriately limited this review to a small subset of the overall Planning Events – P0, P1, and P2 and for a loss that would be sustained for a year or longer. No change made.</p> <p>Table 1, Steady State and Stability, Item I does not restrict the use of UVLS since it only addresses equipment disconnected by end-user equipment. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>Requirement R7 ensures that there are no gaps between Transmission Planners or the Planning Coordinators that may cause reliability concerns. No change made.</p> <p>Requirement R8 requires the automatic distribution to neighboring Planning Coordinators and Transmission Planners without a written request and to others with a reliability related need following a written request. The SDT believes this is an important consideration and not ambiguous. No change made.</p> <p>Table 1, Bullet c under first heading, is not in conflict with the requirements. The SDT decided to include additional details in Table 1 so that it would have the basic information necessary for the planner to develop their simulations for their studies without always referring back to the requirements language. No change made.</p>
Modesto Irrigation District	Ballot Comment	<p>Both Sections 2.1.4 (seven sensitivities) and 2.4.3 (five sensitivities) require sensitivity studies to be run for all planning events and for all years specified , which increases the number of required studies beyond a reasonable and manageable limit.</p> <p>Also, both Section 2.1.4 and 2.4.3 specify that running studies over "...a range of credible conditions that demonstrate a measurable change in System response (performance)." must be completed, yet using "credible conditions" and also "demonstrating a measurable change in System response (performance)", may be mutually exclusive. "Measurable change in System response (performance)" is open to a broad interpretation, which increases the risk that the auditor may very likely interpret it differently than the utility system planner. The definition of the extreme events that have to be analyzed has been made nebulous, where in the existing standards they are quite specific.</p> <p>Requirement 2.1.5 requires the modeling of the loss of any system element that does not have a back-up or spare available sooner than 1 year, as part of the system normal state. It is not clear why using 1 year of loss of use for a system element is being used as the triggering point requiring further system enhancements. Thank you.</p>
		<p>Response: Requirement R2, Part 2.1.4 and Part 2.4.3 do not require an unreasonable amount of sensitivities, since they both state the planner must “vary one or more of the following conditions”. No change made.</p> <p>Requirement R2, Parts 2.1.4 and Part 2.4.3 allow the planner to use engineering judgment to determine the sensitivities to be completed. No change made.</p> <p>Requirement R2, Part 2.1.5 uses one year as a typical definition of a long lead time for equipment, so that the planner will assess their system performance without that equipment over peak periods. No change made.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
Hydro One Networks, Inc.	Ballot Comment	Hydro One Networks is casting a negative vote. Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the proposed draft are minor. The concerns of the industry on several important issues have not been sufficiently addressed in this draft. For detailed comments please refer to our submission through the on-line comment form.
<p>Response: The SDT posted a redline draft against the last posted draft and also posted a redline draft against the previous ballot draft. The SDT addressed important issues that were raised during the first ballot. Please see specific responses to your comments where they were submitted.</p>		
Luminant Energy	Ballot Comment	<p>Our most significant concerns are related to the following: (1) The requirements for Sensitivity Analysis are not stringent enough.</p> <p>(2) Studies should include variations in the duration and timing of transmission outages. "Anticipated" outages should be included in the studies and not just "known" transmission outages. It is our experience that only including "known" outages drastically under represents the actual number of transmission outages.</p> <p>(3) Major equipment outages lasting three or more months, as a result of Spare equipment strategies should be included in studies. The time limit of one year as specified in the Standard is too lax.</p> <p>Specific suggested language: 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months or any known outage(s) of generation or Transmission Facility(ies) that will extend into the high stress period of the BES.</p> <p>2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies (as indicated in Requirement R2, Part 2.6, as follows). Qualifying studies shall include the following conditions:</p> <p>Add language between 2.1.3 and 2.1.4 to account for generation limitations due to Ancillary Services. Suggested wording: All planning studies must recognize and make provision for secure delivery of each of the Ancillary Services (eg Operating Reserve). In no case shall these studies double count capacity as being available for congestion management and Ancillary Services unless processes are in place to allow for location specific deployment of these Ancillary Service reserves for congestion management purposes.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>2.1.4 (bullet 7) Duration and timing of anticipated Transmission outages such as required maintenance activities.</p> <p>2.1.4 (bullet 8 added) Reasonable variations of anticipated generator availability after accounting for equivalent forced outage rate.</p> <p>2.1.5 If an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that would cause an outage of three months or more, (such as a transformer) the impact of this outage on System performance shall be studied.</p> <p>2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:  Load level, Load forecast, or dynamic Load model assumptions.  Expected transfers.  Expected in service dates of new or modified Transmission Facilities.  Reactive resource capability.  Generation additions, retirements, or other dispatch scenarios.  Duration or timing of anticipated Transmission outages such as required maintenance activities.  Reasonable variations of anticipated generator availability after accounting for equivalent forced outage rate.</p> <p>2.4.4. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.</p> <p>2.4.5 If an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that would cause an outage of three months or more, (such as a transformer) the impact of this outage on System performance shall be studied.</p>
<p>Response: 1) The sensitivities addressed in Requirement R2, Parts 2.1.4 and Part 2.4.3 allow the planner to use engineering judgment to determine the sensitivities to be completed. Since sensitivities are included to ensure that the planner evaluates alternative conditions, it is necessary to allow flexibility to evaluate different types of changes that could occur. No change made.</p> <p>2) Reliability Standards are the minimum requirements and if conditions warrant, entities may add additional outages to be evaluated in their planning studies.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>No change made.</p> <p>3) Requirement R2, Part 2.1.5 uses one year as a typical definition of a long lead time for equipment, so that the planner will assess their system performance without that equipment over peak periods. No change made.</p> <p>For Requirement R2, Part 2.1, the SDT did not add language between Parts 2.1.3 and 2.1.4 to account for generation limitations due to Ancillary Services. The proposed addition assumes a particular market structure and that market structure is not uniform across North America. The “projected System conditions” in Requirement R1 would be violated if an entity double counted its Ancillary Services. No change made.</p> <p>Requirement R2, Part 2.1.4, bullet 7 & 8 are examples of sensitivities and the examples provided would address those contemplated by the SDT. No change made.</p> <p>Requirement R2, Part 2.1.5 uses one year as a typical definition of a long lead time for equipment, so that the planner will assess their system performance without that equipment over peak periods. No change made.</p> <p>Requirement R2, Part 2.4.3 – Since the five conditions for sensitivities have been vetted through six postings, the SDT did not add the two proposed conditions. No change made.</p> <p>Requirement R2, proposed 2.4.4 – Since the known outages are already included in the cases, as required by Requirement R.1, Part 1.1.2, there is not a need to require specific studies that include them – No change made.</p> <p>Requirement R2, proposed Part 2.4.5 – The proposed requirement is already contained in Requirement 2, Part 2.1.5 and does not need to be duplicated here. The SDT has used the typical one year time period to define long lead time for equipment and believes that three months is too short a time period for this requirement. No change made.</p>
MidAmerican Energy Co.	Ballot Comment	<p>Regarding Requirement 8, there is not a significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entity or if a documented response to Planning Assessment comments is not provided within 90 days of a request. Requirement 8 is an administrative requirement that adds little to improve reliability.</p> <p>We recommend that the VRF for Requirement 8 remain “Low”, rather than be changed to “Medium”.</p>
<p>Response: The SDT believes that sharing the Planning Assessments with adjacent Transmission Planners and Planning Coordinators is an important component of the planning process.</p> <p>The SDT did not change the VRF. The previous change reflects the latest guidelines on the topic.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
Consolidated Edison Co. of New York	Ballot Comment	Requirement R1.1.5: Delete “and Interchange.” The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the application of well established reliability standards and criteria that are based on the electrical characteristics of the interconnected system, but without economic considerations. Instead, economic transactions are types of transactions that a TO may enter into once its load obligations are met, and are evaluated based on economic parameters that are markedly different from the aforementioned reliability criteria (e.g. congestion costs). Modeling all types of transactions in a power flow case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).
<p>Response: Requirement R1, Part 1.5 does not require Interchange for economic purposes. The requirement is to represent “Known commitments”. No change made.</p>		
Platte River Power Authority	Ballot Comment	Stability requirements R4.1.2, along with the second and third bullets of R4.3.1, could be misunderstood to require the development of comprehensive relaying models for all Facilities represented in the stability model. These requirements should be made clear that Stability studies are to simulate the effects of relaying (tripping certain Facilities) and not require relaying models to trigger and cause the effects.
<p>Response: The SDT language in Requirement R4, Part 4.3.1 states “The analyses shall include the impact of subsequent” and does not require comprehensive relaying models. However, it does require that the planner take into account the effects of System Protection on System performance. No change made.</p>		
GDS Associates, Inc.	No	<p>1. Footnotea. Footnote should state “Draft 7” instead</p> <p>2. Requirement R1a. Time Horizon should include both Near-term and Long-term Planning3. Requirement R2a. Time Horizon should include both Near-term and Long-term Planningb.</p> <p>Requirement R2, Part 2.1</p> <ul style="list-style-type: none"> o The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. o The term “Qualifying studies” from the last sentence is referring to the qualified past studies, or the annual studies, or both actually? Suggesting adjusting the verbiage so it would not create confusion. o Subpart 2.1.4- Requirement R2, Part 2.1.1 and Part 2.1.2 are referring to system conditions, not studies. The second sentence may be subject of non-objective interpretations and may generate burdensome and

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>unrealistic amount of work. The requirement should state instead "For each of the system conditions described in Requirement R2, Part 2.1.1 and Part 2.1.2, the studies shall include sensitivity cases utilized to demonstrate whether there is any significant impact due to changes on the basic assumptions used in the model. The analysis, by case, may contemplate varying one or more of the following conditions:"</p> <ul style="list-style-type: none"> o Subpart 2.1.5- We suggest adjusting the time threshold of potential equipment unavailability in order to be consistent with the time frame for the "known Transmission outages". c. Requirement R2, Part 2.2 o The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. o While the Near-Term portion of the Planning Assessment details the premises of the study, the Long-Term is lacking in such thing. d. Requirement R2, Part 2.3 o Although both the steady-state and transient stability studies are required for the Near-Term and Long-Term, the short-circuit study is required only for the Near-Term. This is big disconnect, because there can be stability analyses conducted without a short-circuit assessment. o Breakers should be checked for their breaking capability, as well as to withstand the fault. All other disconnecting equipment, as well as current transformers in particular shall be also verified for their withstand capabilities. The current statement should be replaced with "The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term and Long-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to assess performances of transmission elements affected by a potential increase of short-circuit contributions to fault" e. Requirement R2, Part 2.4 o The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else. o Similar with 2.1, the last sentence should read "The studies should include the following conditions:" o Subpart 2.4.1- We believe that the dynamic behavior of the load cannot be accurately estimated beyond current time. We are concerned about the effort required to ascertain the dynamic response of the load. As for the "Loads that could impact the study area" the standard doesn't include any directions in how an entity will identify these loads. Perhaps the standard should provide guidelines to determine which loads would impact the study area. o Subpart 2.4.3- See comments from Subpart 2.1.4f.

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>Requirement R2, Part 2.5 o The inclusion of the words "For the Planning Assessment" it seem unnecessary as long as main requirement R2 is only about the Planning Assessment and nothing else.</p> <p>g. Requirement R2, Part 2.6 o Subpart 2.6.2- We agree with the suggested changes as responding to previous commentsh.</p> <p>Requirement R2, Part 2.7 o Subpart 2.7.1- We disagree with the implemented changes. The standard should not include examples. If needed, a white paper can accompany the standard. We suggest adjusting the last sentence to read "Such actions may include, but are not limited to, the following:"</p> <p>i. Requirement R2, Part 2.8 o This should apply to all disconnecting equipment and CT in particular with respect not only to their interrupting duty, but to their withstand capabilities also. See comment on Part 2.3.4. Table 1a. Footnote 9</p> <p>o With respect to the Curtailment of Firm Transmission Service we suggest SDT to revise the language in order to be consistent with the Implementation Plan.</p> <p>5. Measure M1a. This measure it is hard to read. For simplicity, we suggest adjusting this measure to read "Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, and the models reflect the System conditions in accordance with Requirement R1."</p> <p>6. Measure M7a. The measure encompasses the particular scenario where the parties involved have reached an agreement for performing the required studies. In order to cover situations where the parties have not reach an agreement, the measure should read "Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies all individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7."</p> <p>7. Compliancea. Data retention o The 5th bullet should read "The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5."</p> <p>o The 6th bullet should read "The documentation specifying the criteria or methodology used to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding since the last compliance audit in accordance with Requirement R6 and Measure M6."</p> <p>o The 7th bullet should be reworded in accordance with suggested changes at M7.</p>

Organization	Yes / No	Question 1 Comment
		<p>Response: 1. This is the sixth time that this standard has been posted for comments. The reference to a seventh posting on the web site is because the standard was posted once for informational purposes. No change made.</p> <p>2. Requirement R1. Per the standards process, the Time Horizon for this standard is Long-term Planning; which includes both the Short-Term and Long-Term Planning Horizon. No change made.</p> <p>3. Requirement R2, Part 2.1 – “For the Planning Assessment” were added in a previous draft for clarity – No change made.</p> <p>Requirement R2, Part 2.1 – “Qualifying Studies” could be either or both – No change made.</p> <p>Requirement R2, Part 2.1.4 – The requirement is for the planner to have a completed study for each of the conditions in Parts 2.1.1 & 2.1.2. The requirement to complete sensitivity studies has been included to ensure that the planner tests their system by stressing the system beyond what is within their base cases. Since the System conditions vary across North America, the relevant sensitivities are best determined by the planner. The proposed language does not convey the same intent. No change made.</p> <p>Requirement R2, Part 2.1.5 – The SDT determined that the impact of “known outages ...” does not directly correlate to the entity’s spare equipment strategy. No change made.</p> <p>c. Requirement R2, Part 2.2 – “For the Planning Assessment” were added in a previous draft for clarity – No change made.</p> <p>Requirement R2, Part 2.2 - The SDT limited the requirements in the Long-Term to allow the planner more latitude in that time frame, while ensuring that the planner conducted a Long-Term assessment of their portion of the BES. No change made.</p> <p>d. Requirement R2, Part 2.3 - A planner may choose to complete a short circuit study in conjunction with its Long-Term Steady State and Stability studies, but the SDT does not believe that the planner should be required to complete a short circuit study in the Long-Term Transmission Planning Horizon. No change made.</p> <p>The SDT agrees that any system element must be able to withstand the stresses that they may be subjected to, however, the standard must ensure BES reliability. Therefore, the SDT limited the requirement to the breakers since they protect other system elements from the fault. No change made.</p> <p>e. Requirement R2, Part 2.4 – “For the Planning Assessment” were added in a previous draft for clarity . The SDT does not believe that replacing the last sentence as proposed adds any additional clarity. No change made.</p> <p>Requirement R2, Part 2.4.1 – The SDT believes that the planner must consider the dynamic behavior of its System Load and develop a representative model, however, the SDT should not dictate “how” the Load should be modeled. Those specific details must be included in the model by the individual planner. No change made.</p> <p>Requirement R2, Part 2.4.3 - The requirement is for the planner to have a completed study for each of the conditions in Parts 2.4.1 & 2.4.2. The requirement to</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

		<p>complete sensitivity studies has been included to ensure that the planner tests their system by stressing the system beyond what is within their base cases. Since the System conditions vary across North America, the relevant sensitivities are best determined by the planner. The proposed language does not convey the same intent. No change made.</p> <p>Requirement R2, Part 2.5 – “For the Planning Assessment” were added in a previous draft for clarity – No change made.</p> <p>Requirement R2, Part 2.7.1 – The SDT has included limited examples where we believe that additional clarity is needed. Since the list is clearly marked as “examples”, the SDT believes the phrase “but not limited to”, is not required. No change made.</p> <p>Requirement R2, Part 2.8 - The SDT agrees that any system element must be able to withstand the stresses that they may be subjected to, however, the standard must ensure BES reliability. Therefore, the SDT limited the requirement to the breakers since they protect other system elements from the fault. No change made.</p> <p>The Implementation Plan has been revised as suggested although the SDT wishes to point out that no dates have been changed.</p> <p>Measure M1 – While the suggested language is shorter it does not contain all of the terminology of the matching requirement and thus violates a basic guideline for measures. No change made.</p> <p>6. Measure 7 – The suggested language doesn’t change the assumed scenario cited and provides no additional clarity. No change made.</p> <p>7. Data retention, 5th bullet – The SDT agrees that for consistency the suggested terms should be added so that this bullet matches up with the language of the requirement.</p> <p>DR, 5th bullet: The documentation specifying the criteria <u>for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response</u> since the last compliance audit in accordance with Requirement R5 and Measure M5.</p> <p>Data retention, 6th bullet - The SDT agrees that for consistency the suggested terms should be added so that this bullet matches up with the language of the requirement.</p> <p>DR, 6th bullet: The documentation specifying the criteria or methodology utilized <u>in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding</u> in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.</p> <p>Data retention, 7th bullet – The SDT declined to make the suggested changes to Requirement R7 so no change is necessary for Measure M7.</p>
<p>United Illuminating ISO New England Inc</p>	<p>No</p>	<p>a. 2.6.2 - What was the intent of this change? The old language seemed to work. The language should not be changed from the previous version.</p> <p>b. For 2.8.2 - Was the phrase changed to reflect modifications of facilities? If so the requirement should be</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>modified to read “Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures with respect to modifications of facilities. Otherwise the requirement is unclear.</p> <p>c. For Section R8.1 - the proposed requirement conflicts with a long standing stakeholder process in our area which posts study results and allows comment within a defined period before studies are finalized. If this section is to be retained then it should be modified to only allow comments on Transmission studies less than one-year old. Requirement 8 and 8.1, should be revised to include a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.</p> <p>d. With respect to Table 1 - We suggest adding an event 6 to P1 to address the contingent loss of back to back HVDC Facilities. If not added to P1 then this event needs to be added somewhere in the standard.</p> <p>e. We don’t agree with footnote 7 specifying that only one end of the line should be open for this condition. If the SDT is to keep this concept make P2 event 1 simply say “Opening one end of a line section w/o a fault” and delete the footnote. The existing footnote is unclear due to the use of language such as “possibly”.</p>
<p>Response: a. Requirement R2, Part 2.6.2 was revised in response to comments that a “qualified” study may have material changes remote from the area of study and the previous version would not have allowed the use of that study. No change made.</p> <p>b. Requirement R2, Part 2.8.2 – The added phrase – “of identified System Facilities and Operating Procedures” was added to ensure that it was clear what “implementation status” was referencing. No change made.</p> <p>c. Requirement R8, Part 8.1 - The SDT does not believe that the requirement conflicts with other stakeholder processes and does not believe that a time limit is required. Beyond responding to the comment, other actions by the planner are at the discretion of the planner. No change made.</p> <p>d. Table 1, P1 back to back DC - The contingent loss of back to back HVDC facilities is included as a transformer. Footnote 5 states, in part, that “Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. Therefore, the SDT has not explicitly included back-to-back HVDC as a separate Contingency. No change made.</p> <p>e. Table 1, footnote 7 – The SDT added the footnote to further explain its intent for P2-1 and to ensure that the planner assess the voltage of a load bus that was on a radial line. The word “possibly” was used since having load on a radial is not always the outcome of opening one end of a line section. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
Northeast Utilities	No	<p>Definition of Terms Used in the Standard The definitions of “Near-Term Transmission Planning Horizon” and “Year One” have been deleted from the standard, yet they are still used in draft 7. NU is concerned about voting in favor of this standard with these terms being defined by another project without a full discussion of the impact to this proposed standard. NU suggests repeating the definitions in this proposed standard.</p> <p>Requirement R1 NU believes that the Normal System Conditions as stated in Requirement R1 should establish the base case conditions to be used for the assessment studies. However, a more detailed guideline for developing base cases should be addressed by the requirements. By just modifying the language of requirement R1 to indicate that “P0” constitutes the initial system conditions does not address this concern in Draft #7.</p> <p>A more detailed guideline for base case development is needed.</p> <p>Requirement R8 The wording in requirement R8 needs to be amended to restrict comments to the most recent assessment only, for a limited period (say 3 months) after its release. The current wording appears to offer unlimited opportunity to comment on past assessments, long after their release.</p> <p>Footnote 7 It appears there is a discrepancy between Footnote 7 and Event P2-1. Footnote 7 could be eliminated by rewording Event P2-1 as follows: “Opening one end of a line section w/o a fault”.</p> <p>Footnote 12 NU did not agree with the clarification of Table 1 Footnote B of TPL-002 and did not vote for its approval. Therefore, NU does not agree with the same clarification being applied here for Non-Consequential Load Loss. For reference, below is NU’s comment on TPL-002 Table 1, Footnote B:”The revised language of Footnote b suggests that non-consequential demand interruption (load that is not directly served by the elements removed from service as a result of the contingency) could be used to mitigate reliability concerns arising from NERC Category B contingency events (i.e., single element contingencies). This language seems to encourage operational workarounds and adds burdens for operators of the system. NU believes this is not consistent with planning a highly reliable bulk electric system and thus does not support this weaker language”.</p> <p>General comment NU believes that a standard should contain statements and requirements that are direct and measurable. TPL-001-2 should not be an exception to this rule. Therefore, statements like “An objective” which appears in Footnotes 9 and 12 shall not be used.</p>
<p>Response: Definitions of Near-Term Transmission Planning Horizon and Year One are now approved NERC Glossary Terms and are no longer needed in this proposed standard. The definitions have been vetted through this process through the 1st six postings of this standard and were approved by the Commission in</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>FAC-013.</p> <p>With the wide variety of system conditions and market structures across North America, the SDT chose not to establish a single set of conditions for a base case. Each planner shall establish their base case that meets their needs and their other regulatory requirements. No change made.</p> <p>Requirement R8, Part 8.1 - The SDT does not believe that a time limit for commenting on a Planning Assessment is required. Beyond responding to the comment, other actions by the planner are at the discretion of the planner. No change made.</p> <p>Table 1, P2-1 – The SDT does not agree that there is a discrepancy between the Contingency and Footnote 7. Footnote 7 was utilized to clarify a specific condition that would need to be evaluated as a part of P2-1. No change made.</p> <p>Footnotes 12 and 9 were translated from the BOT approved language from TPL-002-1, Footnote 'b'.</p>
<p>Electric Reliability Council of Texas, Inc.</p>	<p>No</p>	<p>ERCOT ISO believes that the revisions do not go far enough in addressing previously submitted comments. As written this standard would require restructuring of the functions in the ERCOT Region because several requirements are being assigned to the PC that are currently performed only by the TPs. It would not provide any reliability benefits to have the ERCOT PC assume these functions.</p> <p>Specifically, the following requirements should be modified: R2.1.5 should be clarified to be applicable to TPs only since the ERCOT PC does not have the information necessary to perform this analysis;</p> <p>R2.3 and R2.8 should be clarified to be applicable to TPs only since the ERCOT PC does not perform this analysis (it is performed by the TPs in ERCOT);</p> <p>R4.1.2 should be clarified to only apply to TPs because the ERCOT PC does not have the modeling information necessary to perform this analysis.</p> <p>Additionally, R2.1.4 and R2.4.3 should be removed because the requirements are subjective and there are no actions prescribed to be taken based on the sensitivity results. The Load model requirement should be removed from R2.4.1 because this would be better addressed in a MOD standard.</p> <p>Alternatively, R2.4.1 should be rewritten as “System peak Load for one of the five years with expected dynamic load models.” A concurrent requirement should be incorporated to mandate DSPs and TPs to supply dynamic load model data to the PC to perform the required studies.</p>
<p>Response: Requirement R2, Part 2.1.5 requires that studies be completed based on an entity's spare equipment strategy. The ERCOT Planning Coordinator could utilize Requirement R7 to document the individual and joint responsibilities for these studies and document the outcome of these studies. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>Requirement R2, Parts 2.3 and 2.8 – The ERCOT Planning Coordinator could utilize Requirement R7 to document the individual and joint responsibilities for these studies and document the outcome of these studies. No change made.</p> <p>Requirement R4, Part 4.1.2 requires the Transmission Planner and Planning Coordinator to accurately represent the behavior of the system if a generator pulls out of synchronism. Therefore, this information is needed by each Transmission Planner and Planning Coordinator to ensure that the appropriate system response is modeled. No change made.</p> <p>Requirement R2, Parts 2.1.4 and R2.4.3 require the completion of sensitivity studies and allows the planner the discretion on which variables to vary. In addition, Requirement R2, Part 2.7 requires Corrective Action Plans to address issues that are present in multiple sensitivities. The MOD standards only require data to be submitted, and this requirement allows the variation of the forecasted load as one of the possible sensitivities. No change made.</p> <p>Requirement R2, Part 2.4.1 – The SDT believes that the drafted language more clearly explains the requirement than the proposed language. This requirement is for the planner to utilize models that reflect the dynamic nature of the load with an expectation that the planner will obtain the required information in Requirement R1 to determine how it is modeled. No change made.</p>
Independent Electricity System Operator	No	<p>IESO is generally supportive of the draft of TPL-001-2 as evidenced by our previous AFFIRMATIVE vote during the last ballot. Further, IESO also supported the revisions to Footnote ‘b’ to Table 1 of the TPL standards under Project 2010-11. That revision was balloted and approved by the ballot pool in February 2011 and filed with FERC for approval in March 2011. The revised footnote has been incorporated into the current draft of TPL-001-2 as Footnotes 9 and 12 but the Commission, by letter to NERC dated May 17, 2011, has requested NERC to provide supplemental information before the revised Footnote ‘b’ could be approved. In light of FERC’s request and the uncertainty regarding the final provisions of these footnotes, coupled with the ongoing work on Project 2010-17 for the revision of the BES definition and development of an Exception Process and the impact that may have, we respectfully suggest that the drafting team delay further work on TPL-001-2 pending FERC’s ruling on NERC’s petition seeking approval of the transmission planning standards that contain the revised Footnote ‘b’ to Table 1.</p>
<p>Response: The SDT believes that it is important to continue with the approval of this standard. If FERC directs changes based on TPL-002-1, Footnote ‘b’, they will be addressed with this project.</p>		
New York Independent System Operator	No	<p>If the following recommended revisions are made to the requirements listed, subject to other unforeseen material changes, NYISO would no longer oppose the approval of this standard.</p> <p>Requirement R2.1.5 The current requirement language can be interpreted to require evaluation of the simultaneous unavailability of multiple long-lead-time components. Also, as a transformer outage is already</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>evaluated as part of category P6 in Table 1, additional studies should not be required, however spare equipment strategies could be ASSESSED in the context of the Planning Assessment.</p> <p>NYISO thus recommends this requirement be revised as follows: R 2.1.5 When an entity’s spare equipment strategy could result in the unavailability of a major Transmission component that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be assessed with due regard to categories P0, P1, and P2 identified in Table 1.</p> <p>Requirement R2.2The language in this requirement is materially inconsistent with R2.1, unnecessarily requiring a current study. NYISO requests that R2.2 and the sub-requirement be revised as follows:2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies shall include: 2.2.1. Expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.</p> <p>Requirement R8.1There is an apparent open ended time frame afforded report recipients in their review of any Planning Assessment. This requirement should apply to only the most recent Planning Assessment. NYISO thus recommends the following language: 8.1. If a recipient of the most recent Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.</p>
<p>Response: Requirement R2, Part 2.1.5 is not the same as P6 – Table 1, however, the analysis for P6 could be utilized, if the results show there will not be load loss. Except for the outages being evaluated under P0, P1, and P2 for individual components out of service without a long term spare, the requirement does not require the evaluation of the simultaneous loss of multiple long lead time components. The SDT believes that the language “with due regard to” is not as clear as the proposed language. No change made.</p> <p>Requirement R2, Part 2.1 and 2.2 – The SDT left the requirement to conduct the annual study on one of the study years in the Long-Term Planning Horizon to ensure that the planner would conduct a new study annually to evaluate the System improvement needs in the Long-Term Planning Horizon. No change made.</p> <p>Requirement R8, Part 8.1 - The SDT does not believe that a time limit for commenting on a Planning Assessment is required. Beyond responding to the comment, other actions by the planner are at the discretion of the planner. No change made.</p>		
NBSO	No	Items that, if not addressed, will likely cause a negative vote from NBSO:R2.2 differs from R2.1, R2.3, R2.4 and R2.5 since R2.2 does not state that the annual assessment of the Long-Term Transmission Planning

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>Horizon portion of the steady state analysis can be supported by qualified past studies. Likely this omission is an oversight, but unresolved it can cause significant burden with little gain in reliability.</p> <p>Individual items that, if not addressed, may not cause NBSO to vote Negative, but in combination may result in a negative vote: The language of requirements R2.1.4 and R2.4.3 allowing the performance of one or more sensitivities appears to be inconsistent with language in R2.7.2 that requires multiple sensitivities to determine if actions to resolve performance deficiencies are necessary.</p> <p>R7 (and M7) seem to indicate that the PC is ultimately responsible for determining the individual and joint responsibilities for performing the required planning assessment studies, with the expectation to consult and come to agreement with its corresponding TPs, but this interpretation is not clear. The correct interpretation of this requirement is important for resolving situations where a PC and TP do not agree on the assignment of responsibilities. Suggested wording: “Each PC shall work in conjunction with each of its TPs to determine and identify...”</p> <p>The language in R8 is unclear. One point of confusion relates to which entity is responsible for sending their Planning assessments to other entities. For example, who does a PC distribute their planning assessments to?: -Adjacent PC? (Seems to be clearly addressed)-TPs within its PC footprint? (Not clearly covered by the language in R8)-TPs adjacent to its PC footprint (Not clear if this is the responsibility of the PC, TP or both) In addition, the language in R8.1 appears to offer unlimited opportunity to request response to comments on any past assessment, long after their release. Providing limits in the language of R8.1 is recommended in order to avoid unnecessary burden on PCs and TPs for little gain in reliability or constructive stakeholder involvement.</p>
<p>Response: Requirement R2, Part 2.1 and 2.2 – The SDT left the requirement to conduct the annual study on one of the study years in the Long-Term Planning Horizon to ensure that the planner would conduct a new study annually to evaluate the System improvement needs in the Long-Term Planning Horizon. No change made.</p> <p>Requirement R2, Parts 2.1.4 and 2.4.3 are not inconsistent with Requirement R2, Part 2.7.2. With the various requirements, the planners are required to conduct multiple sensitivities. Therefore, Requirement R2, Part 2.7.2 could be used when the results of these multiple sensitivities identify common concerns. No change made.</p> <p>Requirement R7 – The SDT believes that the current language addresses the various arrangements that could exist between the Planning Coordinator and Transmission Planner, better than the proposed language. If agreement is not reached, both the Planning Coordinator and the Transmission Planner would be required individually to perform all of the required studies. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
<p>Requirement R8 – Each planner is required to distribute its Planning Assessment to all adjacent planners (Transmission Planners and Planning Coordinators). Requirement R8, Part 8.1 - The SDT does not believe that a time limit for commenting on a Planning Assessment is required. Beyond responding to the comment, other actions by the planner are at the discretion of the planner. No change made.</p>		
Hydro One Networks Inc.	No	Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the April 15, 2011, draft are minor. The concerns of the industry on several important issues have not been sufficiently addressed in this draft (see our response to Question 3).
<p>Response: Please see the response to Question 3.</p>		
Manitoba Hydro	No	-R2.1.4 and R2.4.3: 'Expected transfers' should be replaced with 'Firm Transmission Service and Interchange' to correlate to R1 (R1.1.5 states 'Known commitments for Firm Transmission Service and Interchange' must be represented in system mode
<p>Response: Requirement R2, Parts 2.1.4 and R2, Part 2.4.3 use the more inclusive term - Expected transfers – for sensitivities. The SDT does not want to unnecessarily restrict the transfers that could be evaluated as a part of a sensitivity study. No change made.</p>		
Associated Electric Cooperative Inc	No	<p>R2.4.1:The SDT has put a stronger emphasis on dynamic load behavior in stability studies (FIDVR, induction motor loads, etc) to be included in the peak models. The standard does indicate that “An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.” We feel that this should be clarified to ensure that the current modeling processes address what NERC desires with this requirement. At a minimum, we recommend that a grace period be implemented to account for any regional modeling practices which need time to implement dynamic load behavior per the draft standard.</p> <p>R2.5:It is our understanding that the Long-Term Transmission Planning Horizon does not require the sensitivity analysis which is required in R2.4 for the Near-Term Transmission Planning Horizon for the stability portion of the studies.</p> <p>R2.7:It is our understanding that Corrective Action Plan(s) do not need to be developed for performance violations observed in the sensitivity analysis (steady state and stability) unless the violation is observed in several sensitivities as it is indicated in R2.7.2: “Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide rationale for why actions were not necessary”. We feel</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>that this needs to be further clarified.</p> <p>R3.3.1:This requirement indicates that steady state analysis should include the effect of ride-through voltage limitations of generating units. We are having difficulty seeing how this is a steady-state issue. Generally one would expect a generator to experience ride-through voltage issues during faults. Per Table 1, P1.1 already require generator outages be taken - wouldn't that cover this issue? We feel that this needs to be further clarified.</p> <p>R3.4.1:This requirement states that "Transmission Planners shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list". We feel that the coordination requirement should be removed from the standard as this will result in a massive increase in workload/time required to perform the TPL studies. AECI has several ties to adjacent Transmission Planners and Planning Coordinators - it will be a very time intensive task to coordinate with all of these parties. If the standard wants to ensure that the Contingencies overlap - we can agree to that, however we feel that the SDT needs to give some firm clarity on how far to go with it (how many buses away, only include ties, etc?).</p> <p>R4.1.2:We would like clarification on what is mean by "apparent impedance swings".</p> <p>R4.3.1:Is the intent of the SDT to require that generic or actual relay models be added to the stability models? We feel that this needs to be further clarified.</p> <p>R8:This requirement states that the Planning Assessments shall be distributed within 90 days of their completion to adjacent Planning Coordinators, Transmission Planners, and functional entities that have a reliability need (3rd Interconnection Customers?). We do not agree with the mandatory requirement of distributing the results of our TPL studies: We consider this information to be CEII We can agree to distribute the results upon request, but do not agree with the 30 day timeframe as more time will be needed to sign applicable Non-Disclosure Agreements, etc.</p>
<p>Response: Requirement R2, Part 2.4.1 – The SDT has allowed flexibility for the planner to determine how to meet this requirement. The implementation plan has allowed at least 24 months for coordination and development of modeling practices. No change made.</p> <p>Requirement R2, Part 2.5 – Sensitivities are not required for years in the Long-Term Transmission Planning Horizon.</p> <p>Requirement R2, Part 2.7 – Your understanding of the need for Corrective Action Plans to address deficiencies identified by sensitivity studies is correct. The SDT believes that the proposed language is clear. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>Requirement R3, Part 3.3.1 – Within the steady state analysis, the planner is required to represent the actual state of each generator based on the system response to a contingency and this includes voltage ride-through for generators. Table 1, P1-1 does not address this issue, since it is only a single generator outage and the requirements of Requirement R3, Part 3.3.1 could be a generator out of service (because it doesn't ride-through) as a result of a more severe contingency. No change made.</p> <p>Requirement R3, Part 3.4.1 – The SDT added the requirement to coordinate Contingency lists to ensure that these lists do not omit Contingencies on adjacent systems that may cause performance concerns. The SDT believes that most planners are already considering outages on the fringes of their neighbors system to ensure that they meet the performance requirements. The SDT does not agree that this will be a massive increase in workload for planners. No change made.</p> <p>Requirement R4, Part 4.1.2 – The “apparent impedance swing” is the trajectory of changes in the apparent impedance seen by a distance relay for various system and fault conditions. In the case contemplated in Requirement R4, Part 4.1.2, it is the trajectory seen by the distance relay for the initial fault and the subsequent generator(s) pulling out of synchronism. If that trajectory were to come within the tripping characteristic of the relay for a sufficient length of time, the relay would cause its associated line to trip. No change made.</p> <p>Requirement R4, Part 4.3.1, bullet 3 – The planner may reflect the effects of either generic or actual relay models. No change made.</p> <p>Requirement R8 – The SDT believes that 30 days should be adequate time to get the necessary agreements in place to make the Planning Assessment available. No change made.</p>
National Grid	No	<p>R2.8.2We recommend this requirement be clarified with the following modification: The Corrective Action Plan shall:2.8.1. List System deficiencies and the associated actions needed to achieve required System performance. 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of planned modifications to System Facilities and Operating Procedures.</p>
<p>Response: The proposed change of “identified” to “planned modifications to” does not change the proposed requirement or add clarity. No change made.</p>		
Consolidated Edison Co. of NY, Inc.	No	<p>Requirement R1.1.5: Delete “and Interchange.” The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the application of well established reliability standards and criteria that are based on the electrical characteristics of the interconnected system, but without economic considerations. Instead, economic transactions are types of transactions that a TO may enter into once its load obligations are met, and are evaluated based on economic parameters that are markedly different from the aforementioned reliability criteria (e.g. congestion costs). Modeling all types of transactions in a power flow</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).
<p>Response: Requirement R1, Part 1.5 does not require Interchange for economic purposes. The requirement is to represent “Known commitments”. No change made.</p>		
Nebraska Public Power District	No	<p>The existing TPL-001 through TPL-004 Standards and Requirements are clear and concise. The new merged TPL-001-1 Standard and Requirements is no longer clear and concise.</p> <p>Further, the modification made to allow an SPS to trip a remote generator for an N-1 (TPL-002) type of event is a degradation of system reliability. Transmission system facilities should be added to maintain stability for a new generator interconnection for any N-1 Category B event. An SPS should not be relied upon for a Category B event, an SPS should only be allowed for Category C & D (TPL-003 & TPL-004) type events.</p>
<p>Response: The SDT believes that there is much less ambiguity in the proposed standard than the existing standards.</p> <p>There is no restriction in the existing TPL-002-1 on a planner’s ability to utilize an SPS to trip a remote generator for a Category B event and the SDT did not change this. No change made.</p>		
Northeast Power Coordinating Council	No	<p>The wording of Part 1.1.2, “known outages...with a duration of at least 6 months” should be revised to “...at least 1 year”. Also for consideration is that “known outages...with a duration of at least 6 months” are dealt with in operational studies rather than planning studies. Any adverse impacts that these outages might have are mitigated by operational decisions rather than planning decisions within a 6 month horizon. Moving this requirement out of the TPL Standard to an operational standard should be considered.</p> <p>Make the wording consistent between 2.1 and 2.2 as it relates to qualified past studies. Specifically:Parts 2.1.2, 2.1.4, 2.1.5The language of requirements 2.1.4 and 2.4.3 allowing the performance of one or moresensitivities appears to be inconsistent with language in 2.7.2. 2.7.2 requires multiplesensitivities to determine if actions to resolve performance deficiencies are necessary.Will varying only one measurable quantity several times in multiple simulationssatisfy multiple sensitivity studies or just one sensitivity study? The numbers and types of required sensitivity studies is unclear, and subject to interpretation by PCs and TPs.</p> <p>The current wording in Part 2.1.5, “spare strategy”, appears to be open-ended regarding the number of</p>

Organization	Yes / No	Question 1 Comment
		<p>permutations to be analyzed. It should be restricted to assessing only one piece of equipment being unavailable or outaged at a time.</p> <p>2.1.5 should be consistent with R2 and 2.1 regarding the use of the terms assessment and studies. As with the preceding comment regarding Part 1.1.2, moving this requirement out of the TPL Standard and to an operational standard should be considered. It is unclear if the last sentence of R2.1.5 allows for the curtailment of firm transmission service before the application of category P0, P1 and P2 events. This last sentence states: "...with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment."</p> <p>The wording in Part 2.2 "be supported by the following annual current study, supplemented with qualified past studies" should be replaced with the similar statement in Part 2.1: "be supported by current annual studies or qualified past studies".</p> <p>Part 2.7.1 lists potential system actions to address System deficiencies. It is suggested that this list be moved to a guideline or white paper.</p> <p>The wording in Part 8.1 needs to be amended to restrict comments to the most recent assessment only. Contingencies on back to back HVDC installations are not mentioned in the standard. The treatment of combined cycle facilities (all units in outage?) needs to be clarified, as well as Footnote 7 of Table 1 requiring clarification.</p> <p>In Table 1, Event 1 of Category P2 and related Footnote 7 are not clear because of the use of the word "possibly". If the intension is to simulate the line end opening condition of tapped lines, this should be clearly stated in the table (without reference to "Opening of a line section" and use of different language in the footnote).</p> <p>From Table 1b: "Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0." Firm Transmission Services Loss is also acceptable and should be added (particularly in P1 loss of a single pole of a DC line for which the transfer is reduced accordingly to the remaining pole capability).</p>
<p>Response: Requirement R1, Part 1.1.2 does not address the outages in the operational time frame. However, if a planner knows that a System component is going to be out of service for more than 6 months, the planner must model the component outage in the appropriate models and evaluate the System to ensure that the System meets the performance requirements of the standard. No change made.</p> <p>Requirement R2, Part 2.1 and 2.2 – The SDT left the requirement to conduct the annual study on one of the study years in the Long-Term Planning Horizon to</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>ensure that the planner would conduct a new study annually to evaluate the System improvement needs in the Long-Term Planning Horizon. No change made.</p> <p>Requirement R2, Part 2.1.4 and 2.4.3 each require two studies on sensitivity cases, but more studies can be performed by the planner. Requirement R2, Part 2.7.2 states that Corrective Action Plans are required (or rationale for why they are not needed) are required if performance deficiency exists in multiple sensitivity studies, not just one study. No change made.</p> <p>Requirement R2, Part 2.1.5 requires the study of each major Transmission equipment outage, consistent with spare equipment strategy, for System normal and P1 and P2 Contingencies. It does not require the study of P1 and P2 Contingencies with more than one major Transmission equipment, except for other equipment that are modeled out as “Known outages” consistent with Requirement R1, Part 1.1.2. No change made.</p> <p>Requirement R2, Part 2.1.5 is a planning requirement to ensure that an entity’s spare equipment strategy is considered during the development of the Planning Assessment. The curtailment of Firm Transmission Service (FTS) for the situation outlined would be considered curtailing FTS for Normal System conditions and is not allowed. No change made.</p> <p>Requirement R2, Part 2.1 and 2.2 – The SDT left the requirement to conduct the annual study on one of the study years in the Long-Term Planning Horizon to ensure that the planner would conduct a new study annually to evaluate the System improvement needs in the Long-Term Planning Horizon. No change made.</p> <p>Requirement R2, Part 2.7.1 – The list represents examples, but not an exhaustive list of actions that could make up a Corrective Action Plan. No change made.</p> <p>Requirement R8, Part 8.1 - The SDT does not believe that a time limit for commenting on a Planning Assessment is required. Beyond responding to the comment, other actions by the planner are at the discretion of the planner. No change made.</p> <p>Table 1, P1 {back to back DC - The contingent loss of back to back HVDC facilities is included as a transformer. Footnote 5 states, in part, that “Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. Therefore, the SDT has not explicitly included back-to-back HVDC as a separate Contingency. No change made.</p> <p>Combined cycle generation outages are expected to be modeled in the manner that they would be tripped, per Requirement R3, Part 3.3.1 and Requirement R4, Part 4.3.1. Therefore, if the outage of one generator causes more generation to be lost (via the Protection System or other automatic controls are expected to disconnect), then, the entire amount of generation lost must be modeled for that specific contingency. No change made.</p> <p>Table 1, footnote 7 – The SDT added the footnote to further explain its intent for P2-1 and to ensure that the planner assess the voltage of a load bus that was on a radial line. The word “possibly” was used since having load on a radial is not always the outcome of opening one end of a line section. No change made.</p> <p>Table 1, Top note 1b – The SDT disagrees that Firm Transmission Service (FTS) may be interrupted for all events. The events where the interruption of FTS is not permitted are shown with a “No” in the column titled “Interruption of Firm Transmission Service Allowed”, however, footnote 9 clarifies that interruption of Firm Transmission Service can be used as both a corrective action and system adjustment as permitted within Table 1. For the specific issue raised, loss of a single pole of a DC line, to the extent the availability of the DC pole is a condition of the transfer being viable, footnote 4 may also address the commenter’s</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
concern. No change made.		
Ameren	No	<p>There were a number of comments made on the previous draft of TPL-001-2 for which there were few, if any, changes made to the latest draft of the standard. Specifically: Requirement R1 does not address normal (pre-contingency) operating procedures or system configurations. Language should be added to the requirement (possibly as an additional Requirement R1.1.7) to include normal operating procedures or system configurations in place prior to any contingency occurring.</p> <p>Requirement R2.4.1, which addresses dynamic load modeling, has been a cause for concern because of the lack of guidance regarding reasonable induction motor representation as opposed to generic load models. While it is recognized that the effort to simulate the effects of induction motor loads is important, it is premature to include such modeling as part of the requirements for this standard. In addition, it appears that only the peak load model in R2.4.1 is required to represent expected dynamic behavior of Load. Such load models, if adopted should represent dynamic behavior of the load for all dynamic studies.</p>
<p>Response: The SDT posted a redline draft against the last posted draft and also posted a redline draft against the previous ballot draft. The SDT addressed many important issues that were raised during the first ballot.</p> <p>The SDT did not include all of the different procedures that are permitted. Normal operation procedures or system configuration may be utilized as long as they are consistent with the way the System would be operated and not inconsistent with the requirements within the standard.</p> <p>Requirement 2, Part 2.4.1 – One focus of dynamic Load model requirement in Part 2.4.1 is “considering the behavior of induction motor Load”. The areas of concern for induction motor Load are the Peak Load periods since Fault Induced Delayed Voltage Recovery (FIDVR) is primarily a concern at high Load levels with a high penetration of induction motor Loads. The SDT has spelled out this requirement in the Peak Load studies but did not include the explicit requirement, with focus on induction motor Load, for the other Load periods. Even though the standard doesn’t have the explicit requirement for other Load levels, Requirement R1 includes the statement “shall represent projected System conditions”, so the planner cannot ignore the dynamic behavior of the Load for those other Load periods. No change made.</p>		
Western Area Power Administration	No	<p>We concur that the standard is an improvement over previous drafts, but we vote "No" to the existing draft and request additional clarifications and/or modified language for a re-circulated vote prior to adoption. The following are areas where we suggest improvement or have questions: Please further define Consequential and/or Non-Consequential Load Loss: Does the Consequential Load Loss definition include underfrequency or undervoltage load shedding installed to protect transmission system reliability?</p> <p>Does the Consequential Load Loss definition include load tripped by a Special Protection System (SPS) or a</p>

Organization	Yes / No	Question 1 Comment
		<p>Remedial Action Scheme (RAS)?</p> <p>Either how underfrequency and undervoltage load shedding or how load shedding by a RAS relates to Consequential Load Loss should be clear in the Consequential and/or Non-Consequential Load Loss definition of the approved version of this NERC standard.</p> <p>Why is Near-Term Transmission Planning Horizon deleted from the definitions of Terms Used in this Standard, yet it is used throughout the standard? This definition should remain.</p> <p>R1.1.5: How are “known commitments for Firm Transmission Service” to be modeled and tracked in power flow cases? Is it acceptable for Transmission Planners to simply assume what the ultimate sources and ultimate sinks are for each firm transmission service commitment or are Transmission Planners to know exactly which ultimate sources and ultimate sinks are associated with each commitment and to track each one accordingly in each power flow case? Assuming the intent here is reliability based and not marketing based, is the application of Firm Transmission intended to apply to reliability designated ‘paths’? Most all Firm Transmission service contracts have caveats for unplanned interruption and such agreements should qualify as “re-dispatch” per Footnote 9?</p> <p>R2.1.5: If a group of utilities were to develop and manage among themselves a coordinated spare equipment program, such that the risk to any one of its participating entities of experiencing a significant unavailability for any major Transmission equipment that has a lead time of one year or more is deemed not significant, then would those utilities still have to do the studies required by R2.1.5 to evaluate the system impact of extended outages of such equipment? Scenario for Clarification: Short of spare equipment for items with a greater than 1 yr lead time, assessment studies are required to include sensitivities and operating plans for sustained loss of these equipment items, as a prior outage. For example, if an EHV facility is lost for more than 1 yr, and firm transmission interruption is not allowed, it appears the only compliant alternative (to a redundant facility) is a redispatch plan that is well documented and accepted by all stakeholders, per Footnote 9.</p> <p>R2.3: Is only the 5-year Near-Term Transmission Planning Horizon case required for the annual short-circuit analysis?</p> <p>R2.4.1: How is the dynamic modeling of induction motor Loads to be developed by the Transmission Planners? Is it acceptable for Transmission Planners to assume the same induction motor modeling as has generally been assumed and applied by most Transmission Planners throughout the Western Interconnection or will the induction motor modeling have to be based upon the type and amount of actual</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>induction motors installed in the system?</p> <p>R2.5: Does NERC have a particular technical rationale about what determines “proposed material generation additions or changes?”</p> <p>R2.6.2: Does NERC have a particular technical rationale about what determines “material changes?”</p> <p>R2.7.3: Please define “beyond the control” under Definition of Terms Used in Standard. This is an important concept. Without NERC definition, this term is highly debatable and should be eliminated. Scenario for Clarification: If the stakeholder rate payers do not approve expenditures for facility improvements required to eliminate non-consequential load loss, is this beyond the control of the Transmission Planner? Rate payers should be able make the ultimate free market choice determination of risk versus cost associated with their reliability. Otherwise market interests (particularly generation) disproportionately pressure excessive reliability based improvements that must be borne by all rate payers.</p> <p>R3.3.1: Please define “relay loadability limit” under Definitions of Terms Used in Standard. This is an extremely important concept. This term has been used quite commonly for decades and is now used in this latest proposed standard. Without NERC definition, this term is highly debatable and should be eliminated. Scenario for Clarification: If PRC-023 is met whereby all “relay loadability limits” are set at least 150% of the highest thermal limiter (0.85 voltage and 30 lagging powerfactor) this sensitivity would justifiably not be needed so long as verification is shown that no element overloaded greater than 150%.</p> <p>R3.1 and R3.4: The interrelation between these two paragraphs needs additional clarification. R3.1 calls for verification via studies that the BES meets Table 1 performance criteria based on the contingency list resulting from R3.4. However, R3.4 states that the contingency list used to meet R3.1 only need include “Those planning events in Table 1, that are expected to produce more severe System impacts on.....the BES” and the associated “rationale” for those chosen contingencies. Is NERC suggesting that the studies do not need to include all contingencies based on Table 1, so long as ample “rationale” is provided? However, the Transmission Planner must provide studies to determine if every contingency of Table 1 meets performance requirements. How are the “more severe” contingencies determined if the Table 1 contingencies are not evaluated comprehensively? It seems R3.4 could be eliminated and the contingencies be based simply on Table 1. Please define “more severe”, relative to less severe under Definitions of Terms Used in Standard, in an effort to help evaluate the suitability of a particular contingency for inclusion on this list. Looking at context, it appears that the purpose of this statement is to ensure that the worst contingencies are studied. Is the intent here simply to allow a given contingency to cover for a less severe or similar contingency and avoid duplicate simulations?</p>

Organization	Yes / No	Question 1 Comment
		<p>R3.4.1 and R4.4.1 Please include and define a reasonable number of contingent buses into adjacent systems that should be considered. No more than 2 are recommended for the standard.</p> <p>R3.5 and R4.5: How many of the “events in Table 1 that are expected to produce more severe system impacts” should the required evaluation identify and evaluate?</p> <p>To what extent should the evaluation focus on the “other” Extreme Events described under items 3.b and 2.f in Table 1, particularly if existing disturbance reports in the Western (or Eastern) Interconnection have recorded and evaluated the occurrence of particular events that have already created cascading? Because the requirement seems to involve a check for Cascading, perhaps some clarity could be provided with respect to the NERC definition of “Cascading.” In particular, in the Cascading definition, how widespread is “widespread;” is the phrase “electric service interruption” only about the loss of firm load or could it also be only about the loss of firm generation or only about the loss of firm transmission service or is it about some combination of loss of firm load, loss of firm generation, and loss of firm transmission service; how large an area is meant by the expression “spreading beyond an area predetermined by studies” when the simulations that analyze the initiating Extreme Event will model the entire Western (or Eastern) Interconnection? So how does the study determine that the sequentially spreading service interruption has spread beyond the entire Western (or Eastern) Interconnection that is modeled in the simulation? Or is the term “area” meant to describe only that part of the Western (or Eastern) Interconnection that the Transmission Planner has evaluated for system impacts while ignoring impacts to the rest of the Interconnection?</p> <p>Table 1 - Planning Events, Steady State Only Note i: “The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event” seems to be included as items 2) and 3) under the Non-Consequential Load Loss definition. So, it seems acceptable to use this form of load loss to meet the stability performance requirements. However, the “Steady State Only” note i in Table 1 specifically does not allow its use to meet steady state performance requirements. Therefore, the “Steady State Only” note i in Table 1 should clarify why it seems acceptable to use it to meet stability performance requirements but not to meet steady state performance requirements.</p> <p>Table 1 - Planning Events, Category P2: Category P2 seems to include an unrelated mix of planning events ranging from a seemingly benign event (i.e., opening of a line section without a fault) to what would seem to be much more severe events (i.e., bus section fault or internal breaker fault). A clarification of why these planning events were lumped into the same Category P2 would be helpful to the Transmission Planner. Also, does the language in footnote 7 (i.e., “opening one end of a line section without a fault on a normally networked Transmission circuit ...”) mean that P2-1 (“opening of a line section without a fault”) should be</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>modeled as an open-ended line section?</p> <p>Table 1 - Planning Events, P2-2 (EHV) and P2-3 (EHV): For each of these planning events, its corresponding “Non-Consequential Load Loss Allowed” column should include a footnote 12 with each of the “No” boxes, similar to that allowed under the seemingly much less severe event P2-1 (“opening of a line section without a fault”). Otherwise, please explain why the seemingly much less severe P2 event (P2-1) has a footnote 12 exception for Non-Consequential Load Loss Allowed but the two seemingly more severe P2 events (P2-2 and P2-3) do not.</p> <p>Table 1 - Planning Events, P4-1 through P4-5 (EHV): For the stuck breaker planning events of P4-1 through P4-5 on the EHV system, their corresponding “Non-Consequential Load Loss Allowed” column should include a footnote 12 with their “No” box, similar to that allowed under the seemingly much less severe N 1 planning events (P1-1 through P1-5). Otherwise, please explain why the seemingly much less severe N 1 events (P1-1 through P1-5) have a footnote 12 exception for Non-Consequential Load Loss Allowed but the seemingly much more severe stuck breaker events (P4-1 through P4-5) do not.</p> <p>Table 1 - Planning Events, P5-1 through P5-5 (EHV): For the relay failure planning events of P5-1 through P5-5 on the EHV system, their corresponding “Non-Consequential Load Loss Allowed” column should include a footnote 12 with their “No” box, similar to that allowed under the seemingly much less severe N 1 events (P1-1 through P1-5). Otherwise, please explain why the seemingly much less severe N 1 events (P1-1 through P1-5) have a footnote 12 exception for Non-Consequential Load Loss Allowed but the seemingly much more severe relay failure events (P5-1 through P5-5) do not.</p>
<p>Response: The definition of Consequential Load Loss does not include underfrequency or undervoltage load shedding, since this Load is not interrupted by the “Protection System operation designed to isolate the fault”. No change made.</p> <p>The definition of Consequential Load Loss does not include Load tripped by a Special Protection System (SPS) or a Remedial Action Scheme (RAS), since this Load is not interrupted by the “Protection System operation designed to isolate the fault”. No change made.</p> <p>The definition of Near-Term Transmission Planning Horizon is now an approved NERC Glossary Term. No change made.</p> <p>Requirement R1, Part 1.1.5 (Known commitments for Firm Transmission Service and Interchange) is required to ensure that planners consider those transactions that have been committed to and meet the system performance requirements. “How” the planners account for these commitments should be developed by the planner in accordance to all of the regulatory and market rules that apply to them. No change made.</p> <p>Requirement R2, Part 2.1.5 does not require a planner to study the unavailability of major long lead time equipment if the entity’s spare equipment strategy could</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>not result in the unavailability of that equipment for one year or more. No change made.</p> <p>Requirement R2, Part 2.3 requires the short circuit analysis only for the years of the Near-Term Transmission Planning Horizon. No change made.</p> <p>Requirement R2, Part 2.4.1 – The SDT believes that the planner must consider the dynamic behavior of its System load and develop a representative model, however, the SDT should not dictate “how” the load should be modeled. No change made.</p> <p>Requirement R2, Part 2.5 does not specify “how” an entity determines that “proposed material generation additions or changes” have occurred. It is up to each entity to develop its technical rationale for its determination. No change made.</p> <p>Requirement R2, Part 2.6.2 does not specify “how” an entity determines that “material changes” have occurred. It is up to each entity to develop its technical rationale for its determination. No change made.</p> <p>Requirement R2, Part 2.7.3 has been included to account that certain Corrective Action Plans may not be able to be implemented due to circumstances that the planner cannot control. The SDT expects that these situations will be limited and that the impact to BES will be limited to interrupting Non-Consequential Load if the Contingency were to occur. Due to the wide variety of circumstances across North America, the SDT did not believe that it was appropriate to articulate the acceptable set of conditions. No change made.</p> <p>Requirement R3, Part 3.3.1 utilizes the term “relay loadability limits” as it is utilized in the PRC standard. No change made.</p> <p>Requirement R3, Parts 3.1 and 3.4 together require the planner to create a list of the “more severe” Contingencies, along with the rationale for “why” those Contingencies were selected, that will be simulated to ensure that the System meets the performance requirements. This language was included to be consistent with the existing TPL standards that do not require the planner to run simulations of all possible Contingencies. No change made.</p> <p>Requirements R3, Part 3.4.1 and Requirement R4 Part 4.4.1 do not include “how” to define the Contingencies in adjacent systems that should be included since it will be variable based on the conditions of the System. It is the responsibility of the planners to coordinate the list of Contingencies to ensure BES reliability. No change made.</p> <p>Requirement R3, Part 3.5 and Requirement R4 Part 4.5 require the planner to identify the “events in Table 1 that are expected to produce more severe system impacts”. The number of “events” that should be included in the list are a “how” that the planner must determine. No change made.</p> <p>Table 1, Extreme Events Steady State 3b and Stability 2f are included to ensure that the planner considers “operating experience” when determining the extent of Contingency analysis to conduct for the entity’s Extreme Event simulations. The term “widespread” categorizes those events that are more far-reaching than the Local Area events identified in Extreme Events Steady State 2 a-e. No change made.</p> <p>Table 1, Top note ‘i’ Steady State Only does not apply to Stability studies. Therefore, voltage sensitive Load disconnected by end-user equipment may be used during Stability simulations. The planner should not depend on this voltage sensitive Load being disconnected to meet the performance requirements (steady state after the system transient reaction ends) but this Load should be disconnected from the System for the Stability simulations to accurately represent how the</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 1 Comment
		<p>System will respond. No change made.</p> <p>Table 1, P2 contains single Contingency events that have the same performance requirements. No change made.</p> <p>Table 1, P2-1 covers the opening of line section without a fault and Footnote 7 clarifies that the line section may be energized from one end and still serving Load. The expectation is that both situations are evaluated when appropriate. No change made.</p> <p>Table 1 P2-2 (EHV) and P2-3 (EHV) do not allow the exception allowed by Footnote 12. The SDT believes that the EHV system should be planned to handle these single Contingencies without Non-Consequential Load Loss. No change made.</p> <p>Table 1, P4-1 through P4-5 (EHV) does not allow the exception allowed by Footnote 12. The SDT believes that the EHV system should be planned to handle these Contingencies without Non-Consequential Load Loss. No change made.</p> <p>Table 1, P5-1 through P5-5 (EHV) does not allow the exception allowed by Footnote 12. The SDT believes that the EHV system should be planned to handle these Contingencies without Non-Consequential Load Loss. No change made.</p>
Progress Energy		<p>First, Progress Energy ("PE") notes that many changes to the Requirements language have been appropriate or have improved upon the language of the previous drafts, and PE commends the SDT in this. PE does have concerns, however, with the language in R8 and its corresponding Measure M8, and therefore must select 'no' for Q1 and provide comments. PE disagrees with the language of R8 primarily to the extent that the use of the verb "distribute" with respect to communicating Planning Assessments leads the reader to M8, which lacks language that would provide for the optimal correlation with R8. Regarding the M8 language, PE feels that the term "demonstration of a public posting" is a valid action in demonstrating compliance with R8 and thus should be more clearly described as one of several acceptable methods of distributing Planning Assessments. In addition, given the appropriate concern that NERC and FERC have recently raised regarding Cyber threats and the need for additional Cyber Security measures, PE feels that the public posting language should contain a qualification regarding the security of CEII information. PE thus recommends that an appropriate phrase to use would be "demonstration of a secure public posting", thereby making clear that a public posting would not be a website accessible to just anyone due to CEII concerns.</p>
<p>Response: Requirement R8 - The SDT agrees that posting is an acceptable method of distributing but the intent of the standard requirement is to ensure that affected parties obtain the Planning Assessment. Measure M8 clarifies that posting is acceptable but not the only way to meet the requirement. While the SDT recognizes that certain planning information is covered by CEII requirements, the responsibility to protect that information already resides with the entity and is therefore not needed within this standard. No change made.</p>

2. The SDT has made revisions to the VRF and VSL of TPL-001-2 which will be part of a non-binding poll with this posting based on industry comments and the Quality Review. Do you agree with these changes? If you do not support these changes or you agree in general but feel that alternative language would be more appropriate, please provide specific suggestions in your comments.

Summary Consideration: Comments received were predominantly about individual assessments of whether a VRF or VSL had been assigned correctly and some pointed out what they thought were incorrect interpretations of established guidelines by the SDT. The SDT followed guidelines established by FERC and NERC in these areas and therefore no changes were made in this regard.

In two particular instances, inconsistencies between wording in the requirement and VSL were pointed out and the SDT made the following changes due to those comments:

R1. VSL – Severe (third part): The responsible entity's System model did not use ~~the latest~~ data consistent with ~~the data that~~ provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.

<p>R8 VSL</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion.</p> <p>OR,</p> <p>The responsible entity distributed its Planning Assessment <u>results</u> to functional entities having a reliability related need who requested the Planning Assessment in writing but</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 120 days but less than or equal to 130 days following its completion.</p> <p>OR,</p> <p>The responsible entity distributed its Planning Assessment <u>results</u> to functional entities having a reliability related need who requested the Planning Assessment in writing but</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 130 days but less than or equal to 140 days following its completion.</p> <p>OR,</p> <p>The responsible entity distributed its Planning Assessment <u>results</u> to functional entities having a reliability related need who requested the Planning Assessment in writing but</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 140 days following its completion.</p> <p>OR</p> <p>The responsible entity did not distribute its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners.</p>

Organization	Yes / No	Question 2 Comment
Consolidated Edison Co. of New York	Ballot Comment	Requirement R1.1.5: Delete “and Interchange.” The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the application of well established reliability standards and criteria that are based on the electrical characteristics of the interconnected system, but without economic considerations. Instead, economic transactions are types of transactions that a TO may enter into once its load obligations are met, and are

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
		evaluated based on economic parameters that are markedly different from the aforementioned reliability criteria (e.g. congestion costs). Modeling all types of transactions in a power flow case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).
<p>Response: The SDT selected Known commitments for Firm Transmission Service and Interchange to separate the planning requirements of commitments from the economic transactions. No change made.</p>		
San Diego Gas & Electric	Ballot Comment	The clarity of this standard is getting worse. Our earlier comments did not seem impacting. At this point, we believe the existing TPL-001-0.1, TPL-002-0a, TPL-003-0a and TPL-004-0 provide much better clarity for us to comply with the TPL standards.
<p>Response: The SDT believes that there is much less ambiguity in the proposed standard than the existing standards, based on feedback from previous postings. . No change made.</p>		
Alberta Electric System Operator	Ballot Comment	The AESO casts an abstain vote as the VSLs and VRFs in Alberta are established by provincial authorities.
<p>Response: Thank you for your response.</p>		
Western Electricity Coordinating Council	Ballot Comment	I'm not certain that I agree with changing the VRF for R2 from Medium to High. I understand that it is accordance with the VRF guidelines, but I guess I disagree with the guidelines. I don't believe that any requirement with a planning time frame, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.
<p>Response: The SDT is required to follow the VRF guidelines established by FERC, which apply to both operations and planning on equal footing. No change made.</p>		
Florida Municipal Power Agency	Ballot Comment	FMPA has minor comments to help improve the clarity of the standard. R7 is not needed and administrative in nature. Instead is should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures.

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
		<p>R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request?</p> <p>Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)</p>
<p>Keys Energy Services City of Green Cove Springs</p>	<p>Ballot Comment</p>	<p>R7 is not needed and administrative in nature. Instead it should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures.</p> <p>R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request?</p> <p>Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)</p>
<p>Response: Requirement R7 ensures that there are no gaps between Transmission Planners or the Planning Coordinators that may cause reliability concerns. No change made.</p> <p>Requirement R8 requires the automatic distribution to neighboring Planning Coordinators and Transmission Planners without a written request and to others with a reliability related need following a written request. The SDT believes this is an important consideration and not ambiguous. No change made.</p> <p>Table 1, Bullet c under first heading, is not in conflict with the requirements. The SDT decided to include additional details in Table 1 so that it would have the basic information necessary for the planner to develop their simulations for their studies without always referring back to the requirements language. No change made.</p>		
<p>City of Austin dba Austin Energy</p>	<p>Ballot Comment</p>	<p>Previous TPL Standard balloting included the FERC Order that clarified footnote "b" regarding the planned or controlled interruption of electric supply for an N-1 event. In our view, a Registered Entity's Board of Directors, local public utility commission or customers should determine the acceptable level of service and the associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.</p> <p>Additionally, with respect to R2 (2.5), the value of annually assessing system stability for years 6-10 is</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
		<p>questionable. The requirement for stability assessment in years 6-10 should be limited to new generation interconnections or planned major transmission system improvements with regional impact. The standard should clarify the "material changes" that would necessitate stability planning assessments and documentation.</p> <p>Finally, The R8 requirement to distribute all Planning Assessment results to adjacent Planning Coordinators and Transmission Planners is excessive and cumbersome. Regarding R8, we suggest the following language: "Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners in accordance with the requirements of the applicable Reliability Coordinator. Any Registered Entity with a reliability-related need may submit a written request for the Planning Assessment results and the Transmission Planner or Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request."</p>
<p>Response: Footnotes 12 and 9 were translated from the BOT approved language from TPL-002-1, Footnote 'b'. No change made.</p> <p>For Requirement R2, Part 2.5, the SDT believes it is important to evaluate Stability when the planners are evaluating new generation additions or changes which can be more than 5 years in the future, as required in NERC Standard FAC-001-0. The SDT discussed defining 'material change' but did not believe that such a definition was appropriate in a continent-wide standard. With the wide variety in sizes and types of systems, the number of parameters that need to be considered, etc., there are too many variables involved. No change made.</p> <p>For Requirement R8, the SDT disagrees that the requirement is excessive and cumbersome and did not make the suggested change. In addition, the proposed language would place requirements on the Reliability Coordinators, who are not included in the Applicability for this standard, and they should not be involved in determining the extent of the distribution of the Planning Assessments.</p>		
Southwest Power Pool Regional Entity	Ballot Comment	I'm voting affirmative, but I'd prefer to avoid having VSLs where the only choice is Severe. I'd like to see either some gradation or we should use a different term to clarify that the requirement is either met or not (binary) instead of Severe VSL.
<p>Response: The SDT is required to follow the guidelines established by NERC and FERC. No change made. No change made.</p>		
Arizona Public Service Co.	Ballot Comment	While AZPS generally supports this standard, AZPS cannot support the violation severity levels that are proposed in the recirculation ballot. AZPS believes the time frames set forth in the proposed security levels are unreasonably short (10 days) and should be extended to 30 days between each elevation in severity level. For these reasons, AZPS has changed its vote to "negative."

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
<p>Response: The SDT has followed the accepted guidelines for timeframes in the proposed VSLs. The SDT is required to follow the guidelines established by NERC and FERC. . No change made.</p>		
Balancing Authority of Northern California NCR11118	Ballot Comment	SMUD believes believes that the VRF should be Medium, as are the VRFs for the other requirements related to conducting the assessments, rather than High.
<p>Response: The SDT is required to follow the VRF guidelines established by FERC,.. No change made.</p>		
Black Hills Corp	Ballot Comment	Black Hills is voting against the proposed VRF/VSL's based on the fact that the VRF for R2 was changed from Medium to High without any explanation.
Deseret Power	Ballot Comment	R2 was moved from medium to high without reason. Since it is long term it should remain medium.
California ISO	Ballot Comment	The VRF for Requirement R2 was changed from Medium to High without explanation. The other VRF's for assessment requirements continue to have a Medium VRF designation, and for consistency it would be appropriate for Requirement R2 to continue to have a Medium VRF designation.
Bonneville Power Administration	No	The VRF for R2 was changed from Medium to High without any explanation. Since the time horizon for R2 is Long Term Planning, BPA believes that the VRF should be Medium, as are the VRFs for the other requirements related to conducting the assessments, rather than High.
Arizona Public Service Company	No	With regards to R2, it appears that the VRF has changed from Medium to High without any justification; and with the time horizon of long term planning, AZPS believes there is no justification for changing it from Medium to High.
Idaho Power Company	Ballot Comment	<p>The VRF for R2 was changed from Medium to High without any explanation.</p> <p>The time horizon for R2 is Long Term Planning and the Idaho Power believes that the VRF should be Medium, as are the VRFs for the other requirements related to conducting the assessments, rather than High.</p>
Tucson Electric Power Co.	Ballot	This recommendation is based on the fact that the VRF for R2 was changed from Medium to High without any

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
	Comment	<p>explanation.</p> <p>The time horizon for R2 is Long Term Planning and it is believed that the VRF should be Medium, as are the VRFs for the other requirements related to conducting the assessments, rather than High.</p>
<p>Response: In the comment form for this posting, the SDT did address this issue as shown below:</p> <p>R2 – The VRF has been changed to High to reflect the importance of the Planning Assessment and to meet the latest guidelines. No change made.</p>		
MidAmerican Energy Co.	Ballot Comment	<p>Regarding Requirement 8, we do not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entity or if a documented response to Planning Assessment comments is not provided within 90 days of a request. Requirement 8 is an administrative requirement that adds little to improve reliability. We recommend that the VRF for Requirement 8 remain “Low”, rather than be changed to “Medium”.</p>
<p>Response: In assigning the VRF for Requirement R8, the SDT is required to follow the guidelines established by NERC and FERC. No change made.</p>		
Independent Electricity System Operator	Ballot Comment	<p>IESO is generally supportive of the draft of TPL-001-2 as evidenced by our previous AFFIRMATIVE vote during the last ballot. Further, IESO also supported the revisions to Footnote ‘b’ to Table 1 of the TPL standards under Project 2010-11. That revision was balloted and approved by the ballot pool in February 2011 and filed with FERC for approval in March 2011. The revised footnote has been incorporated into the current draft of TPL-001-2 as Footnotes 9 and 12 but the Commission, by letter to NERC dated May 17, 2011, has requested NERC to provide supplemental information before the revised Footnote ‘b’ could be approved. In light of FERC’s request and the uncertainty regarding the final provisions of these footnotes, coupled with the ongoing work on Project 2010-17 for the revision of the BES definition and development of an Exception Process and the impact that may have, we respectfully suggest that the drafting team delay further work on TPL-001-2 pending FERC’s ruling on NERC’s petition seeking approval of the transmission planning standards that contain the revised Footnote ‘b’ to Table 1.</p>
<p>Response: The SDT believes that it is important to continue with the approval of this standard. If FERC directs changes based on TPL-002-1, Footnote ‘b’, they will be addressed with this project.</p>		
Hydro One Networks, Inc.	Ballot	<p>Hydro One Networks is casting a negative vote. Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the proposed draft are minor. The concerns of the industry on several</p>

Organization	Yes / No	Question 2 Comment
	Comment	important issues have not been sufficiently addressed in this draft. For detailed comments please refer to our submission through the on-line comment form.
<p>Response: Please see responses to on-line comments.</p>		
Platte River Power Authority	Ballot Comment	<p>VRF for R2 should be changed back to Medium.</p> <p>VRF for R8 should be changed back to Low.</p>
<p>Response: The SDT is required to follow the VRF guidelines established by NERC and FERC. . No change made.</p>		
American Municipal Power	Ballot Comment	<p>The VSLs appear to have a very low threshold for a SEVERE violation of the individual standard requirements for a planning standard. Please consider the impact of having arbitrarily low thresholds for SEVERE violations. The way the VSLs are set now, an honest interpretation or a small administrative mistake could result in a very high dollar penalty and would be construed as having a high correlation with causing a cascading outage by the media. I think we all just want the appropriate fines or sanctions for a violation and to have minimal fines or sanctions for accidental interpretations or menial paperwork based violations. Please consider another metric or raising the current thresholds.</p>
<p>Response: The SDT is required to follow the VSL guidelines established by NERC and FERC, which apply to both operations and planning on equal footing. No change made.VSL</p>		
Florida Municipal Power Pool	Ballot Comment	<p>A. Spare Equipment, R2.1.5 - The requirement reaches beyond the FERC directive. The directive was: "Accordingly, the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy." So, the directive is only to address planned outage, not unplanned outages. Also note that the applicability to GSUs is ambiguous. "Transmission" is defined as: "An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems." Is the "point of supply" the generator terminal, or the GSU high side terminal?</p> <p>B. Table 1, under first heading of "Steady State Only", bullet i is open to interpretation. Many utilities use steady state P-V analyses to study voltage stability and design UVLS systems in apart around those steady</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
		<p>state analyses. Would this bullet essentially eliminate P-V and Q-V studies and the related use of UVLS?</p> <p>C. R7 is not needed and administrative in nature. Instead it should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures.</p> <p>D. R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request?</p> <p>E. Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)</p>
<p>Response: Requirement R2, Part 2.1.5 ensures BES reliability by requiring the planner to assess the system for long lead time items based on the entities' spare equipment strategy. The footnotes in Table 1 clearly define the way transformers are evaluated. No change made.</p> <p>Table 1, Steady State and Stability, Item I does not restrict the use of UVLS since it only addresses equipment disconnected by end-user equipment. No change made.</p> <p>Requirement R7 ensures that there are no gaps between Transmission Planners or the Planning Coordinators that may cause reliability concerns. No change made.</p> <p>Requirement R8 requires the automatic distribution to neighboring Planning Coordinators and Transmission Planners without a written request and to others with a reliability related need following a written request. The SDT believes this is an important consideration and not ambiguous. No change made.</p> <p>Table 1, Bullet c under first heading, is not in conflict with the requirements. The SDT decided to include additional details in Table 1 so that it would have the basic information necessary for the planner to develop their simulations for their studies without always referring back to the requirements language. No change made.</p>		
MRO's NERC Standards Review Forum	No	<p>The NSRF recommends that the VRF for Requirement 8 remain "Low", rather than be changed to "Medium". We do not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entities or a documented response to Planning Assessment comments is not provided within 90 days of a request. The findings in an assessment report are not urgent, but address system needs that will emerge over years in the future. In addition, entities with a reliability related need for Planning Assessment information generally have the means to make their own independent planning assessment of adjacent systems or other areas of interest.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
Minnkota Power Coop. Inc.	Ballot Comment	MPC echoes the comments of the MRO NSRS/F
Lincoln Electric System	Ballot Comment	Refer to comments submitted by the MRO NERC Standards Review Subcommittee.
<p>Response: The SDT is required to follow the guidelines established by NERC and FERC.. No change made.</p>		
Tri-State Generation and Transmission Assn., Inc.	No	<p>Many of the sub-requirements of R2 do not warrant high risk VRFs, yet violation of any R2 sub-requirement would result in a “High Risk Factor” violation assessment. We believe that having so many sub-requirements can result in inaccurate overall severity classification. For example, skipping one study defined in R2.1.2 (Planning Assessments) for a particular time frame or load level would probably not result in a direct actual degradation in system performance, but would still result in a High Violation Risk Factor.</p>
<p>Response: The SDT is required to follow the VRF guidelines established by NERC and FERC, which apply to both operations and planning on equal footing.. No change made.</p>		
Muscatine Power and Water	No	<p>MP&W would like to recommend that the VRF for Requirement 8 remain “Low”, rather than “Medium.” It is our belief that there is not a significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entities or a documented response to Planning Assessment comments is not provided within 90 days of a request. This is more administrative in nature. The findings in an assessment report are not urgent, but address system needs that will emerge over years in the future. Additionally, entities with a reliability-related need for Planning Assessment information generally have the ability to perform their own independent planning assessment of adjacent systems or other areas of interest.</p>
American Transmission Company, LLC	No	<p>ATC recommends that the VRF for Requirement 8 remain “Low”, rather than be changed to “Medium”. ATC does not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entities or a documented response to Planning Assessment comments is not provided within 90 days of a request. The findings in an assessment report are not urgent, but address system needs that will emerge over years in the future. In addition, entities with a reliability related need for Planning Assessment information generally have the means to make their own independent planning assessment of adjacent systems or other areas of interest.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
Electric Reliability Council of Texas, Inc.	No	ERCOT ISO believes that the VRF for R8 should be “low”. The distribution of the Planning Assessment is administrative in nature, the failure to distribute the Planning Assessment does not necessarily equate to not communicating the content of the assessment, and the consequence of not distributing the Planning Assessment does not immediately impact the reliability of the BES; thus it does not warrant a ‘Medium’ risk factor.
Response: The SDT is required to follow the VRF guidelines established by NERC and FERC. No change made.		
ReliabilityFirst	No	<p>ReliabilityFirst generally agrees with the Violation Risk Factors (VRFs) but disagrees with the Violation Severity Levels (VSLs) for the following reasons:</p> <ol style="list-style-type: none"> 1. VSL for R1a. Under the last “Severe” VSL, the word “latest” should be removed to be consistent with the language in Requirement 1. This is a violation of the FERC Guideline 3: “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement” 2. VSLs for R2a. To be consistent with the language in Requirement 2, suggest modifying the last “Severe” VSL to state “The responsible entity failed to prepare an annual Planning Assessment of its portion of the BES” 3. VSLs for R3a. Under the last VSL under the “High” category, the word “perform” should be replaced with “simulate” to be consistent with the requirement. (e.g. “The responsible entity did not simulate Contingency analysis as described in Requirement R3, Part 3.3.”) 4. VSL’s for R4a. Under the last VSL under the “High” category, the word “perform” should be replaced with “simulate” to be consistent with the requirement (e.g. “The responsible entity did not simulate Contingency analysis as described in Requirement R4, Part 4.3.”). 5. VSLs for R6a. To be consistent with the language in Requirement 6, suggest modifying the “Severe” VSL to state “The responsible entity failed to define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions, as described in Requirement R6.” 6. VSLs for R7a. Suggest adding the following language to the end of the “Severe” VSL; “for the Planning Assessment”, to be consistent with the requirement. 7. VSL for R8a. Under all four categories of VSLs, any reference to “Planning Assessment” should be changed to “Planning Assessment results” to be consistent with the language in Requirement 8 (or more appropriately, the term “results” should be removed from Requirement 8). This is a violation of the FERC

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment		
		<p>Guideline 3: “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement”</p> <p>b. Under the “Lower” VSL, it is unclear why there is a 30 day timeframe for the first VSL, while the “Moderate”, and “High” VSLs have a 10 day timeframe. Based on FERC recommendations, suggest making the timeframe for all four VSL s, 10 day increments.</p> <p>c. VSLs need to be developed to deal with a violation of Part 8.1 (i.e. the PC or TP failed to provide a documented response to that recipient within 90 calendar days of receipt of those comments)</p>		
<p>Response: 1. The SDT has corrected the language used as shown:</p> <p>R1. VSL – Severe (third part): The responsible entity’s System model did not use the latest data consistent with the data that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.</p> <p>2. The SDT believes that the wording shown must be taken in context and thus is clear. No change made.</p> <p>3. & 4. The SDT believes the word ‘perform’ is consistent with the language used in the requirement. No change made.</p> <p>5. The SDT sees the suggested change as unnecessary and not providing any additional clarity as it is clear that the analysis is part of the Planning Assessment. No change made.</p> <p>6. The entire standard is about the Planning Assessment and the SDT believes that this is clear in the language used. No change made.</p> <p>7. The SDT has made the suggested change as shown below:</p>				
<p>R8 VSL</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion.</p> <p>OR,</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 120 days but less than or equal to 130 days following its completion.</p> <p>OR,</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 130 days but less than or equal to 140 days following its completion.</p> <p>OR,</p>	<p>The responsible entity distributed its Planning Assessment <u>results</u> to adjacent Planning Coordinators and adjacent Transmission Planners but it was more than 140 days following its completion.</p> <p>OR</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
ITC	No	<p>ITC recommends revising R8 VSLs as follows:</p> <p>Lower VSLThe responsible entity distributed its Planning Assessment to known adjacent Planning Coordinators and known adjacent Transmission Planners but it was more than 90 days but less than or equal to 120 days following its completion. OR, The responsible entity distributed its Planning Assessment to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 30 days but less than or equal to 40 days following the request.</p> <p>Moderate VSLsThe responsible entity distributed its Planning Assessment more than 30days but less than 60 days after subsequent requests by adjacent Planning Coordinators or adjacent Transmission Planners who were not sent copies upon completion of the Planning Assessment. OR, The responsible entity distributed its Planning Assessment to functional entities having a reliability related need who requested the Planning Assessment in writing but it was more than 40 days but less than or equal to 50 days following the request</p> <p>High VSLs - eliminate this section. i.e., no high VSLs only lower, moderate and severe</p> <p>Severe VSLsThe responsible entity distributed its Planning Assessment to functional entities having a reliability related need, adjacent Transmission Planners and adjacent Planning coordinators who requested the Planning Assessment in writing but it was more than 60 days following the request.</p>
<p>Response: 1. The suggested wording change is not consistent with the language used in the Requirement. Furthermore, the SDT does not believe that the word 'known' is necessary in this regard. No change made.</p> <p>2. The suggested wording is not consistent with the language used in the requirement. Furthermore, the increment suggested would violate established guidelines. The SDT is required to follow the VSL guidelines established by FERC. No change made.</p> <p>3. When dealing with incremental times in VSLs, the established guidelines indicate that all 4 types of VSL should be utilized. No change made.</p> <p>4. The SDT believes the suggested change makes the VSL less clear. No change made.</p>		
Manitoba Hydro	No	<p>-The language "latest data" is used in the Severe VSL for R1, however "latest" was removed from R1 and M1. "Latest" should also be removed from the Severe VSL for consistency.-What is the rationale for changing the preparation of the Planning</p>
<p>Response: The SDT has corrected the language used as shown:</p> <p>R1. VSL – Severe (third part): The responsible entity's System model did not use the latest data consistent with the datathat provided in accordance with the</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.		
National Grid	No	R 2.0 We recommend that the VRF for this Planning Requirement remain at “Medium”. The risks associated with Planning Requirements have a longer time horizon for corrective action than, for example, those risks associated with much shorter Operational time frames.
Response: The SDT is required to follow the VRF guidelines established by NERC and FERC. No change made.		
Independent Electricity System Operator	No	See our response to Q1.
Response: See response to Q1.		
Consumers Energy	Ballot Comment	We agree with comments submitted by MISO
MISO	No	Regarding Requirement 8, we do not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entity or if a documented response to Planning Assessment comments is not provided within 90 days of a request. Requirement 8 is an administrative requirement that adds little to improve reliability. We recommend that the VRF for Requirement 8 remain “Low”, rather than be changed to “Medium”.
Response: The SDT is required to follow the VRF guidelines established by NERC and FERC. No change made.		
New York Independent System Operator	No	Requirement 8 is an administrative burden that adds no value to reliability. Comments have been provided on several past drafts highlighting this effect. The revisions made to the VRF and VSL for Requirement 8 further exacerbate this burden. One could conclude from observation of the VSLs and VRFs, that Requirement 8 was the most important requirement of TPL-001-1. Many Planning Coordinators and Transmission Planners have stakeholder processes that govern participation and notification. Further, FERC Order 890 requires stakeholder participation and transparent processes.
Response: The SDT is required to follow the VRF guidelines established by NERC and FERC.. No change made.		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes / No	Question 2 Comment
Ameren	No	<p>The VRF for Requirement R8 should remain Low. There is no significant risk to the reliability of the BES if a Planning Assessment is not distributed to another entity, or if a documented response is not provided within 90 days of a request.</p> <p>The assignment of some VRFs are inconsistent with the importance of the requirements. R2 requires the development of an assessment and it is determined to have a high VRF. However, R3 and R4 require that studies be performed and these studies are determined to have a medium VRF. Performing the studies is essential to developing an assessment and more important to maintaining reliability. If the VRFs for R3 and R4 are correct, then the VRF for R2 should be no higher than medium.</p> <p>The VRF for R5 to develop a steady-state voltage criteria is determined to be medium. However, the VRF for R6 to develop instability criteria is determined to be low. If the VRF for R6 is correct, then the VRF for R5 should also be low.</p>
<p>Response: The SDT is required to follow the VRF guidelines established by NERC and FERC. No change made.</p> <p>The SDT agrees that studies are essential to the Planning Assessment but believes that the Planning Assessments are more than just the studies. For example, under the correct set of circumstances, an entity can use past studies in their Planning Assessment. Therefore, the SDT believes that the VRFs assigned are correct and in adherence with established guidelines. No change made.</p> <p>The SDT believes that having the criteria (Requirement R5) is more important for the reliability of the BES than documenting the methodology (Requirement R6). No change made.</p>

3. If you have any other comments on this Standard that you have not already provided in response to the prior questions, please provide them here.

Summary Consideration: Several commenters stated that the SDT failed to address significant concerns and that only minor changes were made from the prior draft. The SDT believes that some stakeholders based their review on a red-line document of the TPL standard which only describes changes made following the Quality Review (QR) team review of the standard; shown as a red-line document http://www.nerc.com/docs/standards/sar/tpl-001-2_redline_to_last_posted_110415.pdf. A complete and thorough red-line of all changes made from the prior 3/01/10 ballot period to the version posted on the most recent ballot (concluded on 5/31/11) was posted and communicated after the start of the last comment period. A number of changes were made in response to industry feedback prior to the latest ballot. Those changes can be viewed at: http://www.nerc.com/docs/standards/sar/TPL-001-2_Redline_to_last_balloted.pdf.

A number of commenters indicated they cast a negative vote and recommended the SDT delay further work on TPL-001-2 pending FERC's ruling on the revised Footnote 'b' to Table 1 found in the existing TPL standards. The SDT believes concerns in process efficiency related to this project and FERC's on-going review of the revised footnote 'b' should not be the sole reason for a negative vote on the new proposed TPL standard and that an entity's vote should be based on the technical merits of the standard. The SDT has taken care to ensure footnotes 9 and 12 in combination are written consistently with footnote 'b'. The SDT encourages that any negative ballot based solely on FERC's pending ruling on footnote "b" be revisited.

Some commenters stated they find the new standard to be poorly organized and too prescriptively written and that the existing standards are preferred over the proposed TPL-001-2. The SDT and others in industry, as evidenced by the 74% ballot approval, hold a different opinion in regard to the standard. The SDT believes the comments of one stakeholder well articulate its view of the standard: "The SDT, Observers, and the Industry as a whole have put a tremendous amount of thought and work into the development of this latest draft. While nobody should claim that this latest version is perfect, it is far clearer, more in tune with current industry needs, and much improved compared to the existing approved Standards that it will replace." The SDT believes many important improvements in transmission planning are driven by the proposed TPL-001-2 that will further improve reliability of the Bulk Electric System.

A few commenters questioned the term "non-redundant relay" as used in planning event P5 and asked the SDT to clarify a distinction between a "back-up relay" and a "redundant relay" and proposed the SDT provide a definition for the term "non-redundant". The SDT clarifies that redundant means 'duplicate capability resulting in the same outcome.' A redundant relay is not the same as back-up relaying capability which may result in more Facilities being removed for failure of the primary/redundant relay to operate as designed. The SDT believes this concept is widely understood by most in industry and does not see the need for a NERC Glossary Definition.

Several commenters noted that the standard makes use of new capitalized "defined" terms, yet the definitions proposed in previous drafts were removed from the most recent draft of TPL-001-2. The SDT clarified that two previously proposed

definitions that were part of this project were moved to another standard development project – Project 2010-10, titled “FAC Order 729”. The two definitions, “Near-Term Transmission Planning Horizon” and “Year One” were approved by the NERC Board of Trustees on January 24, 2011.

Some commenters indicated that the standard’ Implementation Plan should be extended to permit a full 5-years implementation of any Corrective Action Plans required due to short circuit studies. The commenters indicate that these studies are not presently covered by a NERC Reliability Standard and they see this as a significant “raising of the bar” as characterized by other new requirements. The SDT clarified that while a short circuit study requirement is new to mandatory enforceable standards, the SDT does not believe the short circuit study requirements present a significant “raising of the bar” for industry and that good utility short circuit practices are already in place to ensure safe operation of equipment. No extension in the Implementation Plan was made in regard to short circuit studies.

Several commenters stated an opinion that Requirement R1, Part 1.1.2 indicating the models maintained by the Transmission Planners should reflect “known outages ... with a duration of at least 6 months”, are more appropriately dealt with in the operational studies rather than planning studies and that the item should be removed from the standard. The SDT disagrees with the view that outages of 6 months or more should only be reviewed in the operations timeframe. Such an outage could be for an upcoming construction project requiring certain Facilities to be removed from service for long durations of time one or more years in the future and those situations should be evaluated with sufficient lead time to determine any vulnerabilities and development of sufficient Corrective Action Plans as required. The SDT retained the requirement in the standard.

A number of commenters stated that they believed that there was an inconsistency between Requirement R2, Parts 2.1 and 2.2, since qualified past studies were not allowed for the Long-Term Transmission Planning Horizon case. The SDT clarifies that the requirement to conduct a current annual study for one of the study years in the Long-Term Transmission Planning Horizon is intentional to drive earlier identification of potential Transmission performance limitations and earlier development of Corrective Action Plans (CAP). The study results can be used as qualified past studies as they advance to later years, including moving to the Near-Term Transmission Planning Horizon.

Several commenters stated that they believed that Requirement R2, Part 2.1.5 was ambiguous since it was not clear that the planner did not have to include multiple outages of long lead time components simultaneously. The SDT explained that Requirement R2, Part 2.1.5 does not require simultaneous outages of multiple long lead time components.

Some commenters expressed concerns with Requirement R2, Part 2.4.1 since they were concerned with the ability of planners to adequately model the dynamic behavior of Load. The SDT explained that the “aggregate” dynamic Load model may include high-level assumptions on Load profiles for industrial, commercial, and residential Loads that are applied generically across the planning area study based on the planner’s engineering judgment and system knowledge. The model is not required to be “bus” specific.

The SDT appreciates the concern raised by multiple commenters in regard to the inclusion of the 2nd bulleted item of Requirement R3, Part 3.3.1 that states the steady-state Contingency analysis should include subsequent “Tripping of

Transmission elements where relay loadability limits are exceeded". The commenters believe this concern is addressed by PRC-023 and should be removed from the standard. The SDT believes the item is warranted and that TPL studies may earlier identify and flag relay setting concerns based on required Long-Term Transmission Planning Horizon studies. Within the TPL standard, such a concern would have a Corrective Action Plan that would address the issue which would also meet the expectations of PRC-023. The SDT sees this as a defense in depth approach.

A number of commenters expressed concern that Requirement R7 was administrative and was not required. The SDT explained that it believes that the requirement is necessary to ensure that there are no gaps created between the Transmission Planners and the Planning Coordinators when they determine their individual responsibilities.

Several commenters stated that they had concerns with Requirement R8. These concerns are that the requirements create excessive work and should include time limits on requesting the Planning Assessment, are ambiguous, and should include the ability to post the Planning Assessment. The SDT explained that the requirements are only to distribute the Planning Assessment, which should not require a large amount of work, and the requirements are clear that the planners must distribute to adjacent Transmission Planners and Planning Coordinators and others with a reliability need. The SDT further explained that posting the Planning Assessment could meet the requirement to distribute.

Several commenters stated that they believed that Table 1, P2-1 was inconsistent with Footnote 7. The SDT explained that Footnote 7 was included to clarify that "Opening a line section without a fault" could include, but does not always, creating a radial line section with Load and that the planner must evaluate this situation as a part of P2-1.

No requirements were changed as a result of comments received. However, two bulleted items were marked as bullets incorrectly and that formatting has been corrected.

3.1.1 Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.

3.3.1.2 Tripping of Transmission elements where relay loadability limits are exceeded.

4.3.1.1 Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.

4.3.1.2 Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.

4.3.1.3 Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
James A. Maenner	Ballot Comment	The medium VRF for R8 should remain at low. Not sharing planning assessments with other entities within 90 days doesn't create a serious or imminent threat to the BES.
<p>Response: The change to a Medium VRF resulted from the Quality Review (QR) conducted by the independent QR team prior to the last ballot. This requirement is seen as more than simply an administrative response to a request but rather a proactive step required of the applicable planner to share results of its system assessment which may include and reflect potential system impacts to neighboring systems. The SDT is required to follow the VRF guidelines established by NERC and FERC. No change made.</p>		
San Diego Gas & Electric	Ballot Comment	Clarity of this standard is getting worse. Our earlier comments did not seem impacting. At this point, we believe the existing TPL-001-0.1, TPL-002-0a, TPL-003-0a and TPL-004-0 provide much better clarify for us to comply with the TPL standards.
<p>Response: The SDT respectfully disagrees with your view. According to results of the last ballot, 74% of the ballot pool support the proposed standard. The SDT believes the standard clarifies a number of expectations and that appropriate changes have been made to further improve the future planning and review of the Bulk Electric System's ability to reliably serve users of the system. No change made.</p>		
Western Electricity Coordinating Council	Ballot Comment	It is unknown at this time what the outcome of the FERC request for additional information related to footnote B will be, but if it results in changes to the language of footnote B, that may change our support for this standard.
Salt River Project	Ballot Comment	Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or controlled interruption of electric supply for an N-1 situation. In SRP's view, a Registered Entity's Board of Directors, state Utilities Commission, and/or its customers should determine what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining Affirmative vote.
Public Utility District No. 1 of Chelan County	Ballot Comment	Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, board of directors/Public Utility should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.
Snohomish County PUD No. 1	Ballot	Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or

	Comment	controlled interruption of electric supply for an N-1 situation. In our view, a Registered Entity’s Board of Directors, Utility Commission, and/or its customers should determine what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.
Public Utility District No. 1 of Chelan County	Ballot Comment	Previous TPL Standard balloting included the FERC Order that clarified footnote ‘b’, regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, board of directors/Public Utility should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.
Clark Public Utilities	Ballot Comment	Previous TPL Standard balloting included the FERC Order that clarified footnote ‘b’, regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, the utility’s elected board of commissioners should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.
<p>Response: The SDT has taken care to ensure consistency in footnote 12 (and footnote 9) with the prior footnote ‘b’ revision supported by industry, approved by the NERC Board of Trustees and submitted for regulatory approval. No change made.</p>		
Imperial Irrigation District		<p>Previous TPL Standard balloting included the FERC Order that clarified footnote ‘b’, regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, board of directors/Public Utility should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.</p> <p>1. R2 (2.5): The value of assessing system stability for years 6-10 is questionable. Stability studies should be conducted for new generation interconnections or for planned major transmission system improvements that have regional impact.</p> <p>2. R8 requirement to distribute all Planning Assessment results to adjacent PCs and TPs are excessive and cumbersome. Regarding R8, IID suggest the following languages: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners in accordance with the overseeing Reliability Coordinator requirements. Any functional entity that has a reliability related need and submits a written request for the Planning Assessment results, the Transmission Planner and Planning Coordinator shall provide the latest Planning Assessment</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		results within 30 days of such request.
<p>Response: The SDT has taken care to ensure consistency in footnote 12 (and footnote 9) with the prior footnote ‘b’ revision supported by industry, approved by the NERC Board of Trustees and submitted for regulatory approval. No change made.</p> <p>Regarding Requirement R2, Part 2.5, the SDT believes the requirement as written meets your perspective. For the long-term period, the stability assessment is only required to address “... the impact of proposed material generation additions or changes in that timeframe ...”. No change made.</p> <p>Regarding Requirement R8, the SDT disagrees that the requirements for distributing assessment results should be based on requirements of the Reliability Coordinator. The Reliability Coordinator is primarily focused on real-time issues/concerns not planning horizon timeframes. The SDT does not see this requirement as overly burdensome as the results could be emailed to multiple entities in a single notification. Additionally, we do not see Requirement R8 as excessive as we believe it is important to communicate assessment results with others in industry whose systems for which they are responsible for may be impacted by the host analysis being communicated. No changes made.</p>		
Gainesville Regional Utilities	Ballot Comment	I do have one point of concern for your consideration; This standard does raise the bar in some areas, most notably for an entity the size of GVL it applies performance requirements for long lead equipment emergency replacement. For example if we don't have the ability to replace a transformer at Parker within a few months of failure, then we would have to demonstrate that we can meet many (but not all) of the same performance criteria without the transformer that we can with the transformer.
<p>Response: The commenter is referring to expectations stated in Requirement R2, Part 2.1.5 related to a spare equipment strategy regarding the potential unavailability of long lead time equipment that could be out of service for a year or more in the absence of a spare replacement. The SDT believes it has appropriately limited the analysis to address Planning Events P0, P1, and P2 as stated in Table 1. No change made.</p>		
Beaches Energy Services	Ballot Comment	My biggest concern is the spare transformer issue. Beaches Energy Services is fine because our Transmission Planner (FMPA) actually run the assessments proposed in the new standard and we have excess transformer capacity; but, I'm concerned for other small entities. Essentially, the requirement will likely be interpreted as requiring us to meet the loss of a Bulk Electric System transformer, plus another contingency (two contingencies) to the same performance criteria as a single contingency, if we don't have a spare. This seems discriminatory to small entities.
<p>Response: The commenter is referring to expectations stated in Requirement R2, Part 2.1.5 related to a spare equipment strategy regarding the potential unavailability of long lead time equipment that could be out of service for a year or more in the absence of a spare replacement. The SDT believes it has appropriately limited the analysis to address Planning Events P0, P1, and P2 as stated in Table 1. Any organization – large or small - meeting functional entity</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
<p>registration obligations has the potential to impact the Bulk Electric System and their assessments must include appropriate spare equipment strategies. No change made.</p>		
Hydro One Networks, Inc.	Ballot Comment	<p>Hydro One Networks is casting a negative vote. Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the proposed draft are minor. The concerns of the industry on several important issues have not been sufficiently addressed in this draft. For detailed comments please refer to our submission through the on-line comment form.</p>
<p>Response: The SDT believes the commenter's response is based on their review of red-line document of the TPL standard which only describe changes made following the Quality Review (QR) team review of the standard which was conducted prior to the last ballot. That red-line was shown as http://www.nerc.com/docs/standards/sar/tpl-001-2_redline_to_last_posted_110415.pdf. A complete and thorough red-line of the TPL standard showing all changes made from the prior 3/01/10 ballot period to the version posted on the most recent ballot (concluded on 5/31/11) was posted during the last comment/ballot period. A number of changes were made in response to industry feedback prior to the last ballot. Those changes can be viewed at: http://www.nerc.com/docs/standards/sar/TPL-001-2_Redline_to_last_balloted.pdf. The SDT's response to input provided by the on-line comment form is addressed in responses to Q1 and Q2 above. No change made.</p>		
Hydro-Quebec TransEnergie	Ballot Comment	<p>These are the two major concerns : * In Table 1 footnote 3 : Again, the definition of EHV facilities should be changed to something like : Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as those representing the backbone of the System, generally at voltage greater than 300 kV, and high voltage (HV) Facilities defined as those not representing the backbone of the System, as determined by the Planning Coordinator and approved by Regional Entity. *</p> <p>In Table 1 b : "Consequential Load Loss as well as generation loss is acceptable as a a consequence of any event excluding P0". We should also add Firm Transmission Services Loss is also acceptable (particularly in P1 Loss of a single pole of a DC line for which the transfer is reduced accordingly to the remaining pole capability). "</p>
<p>Response: In regard to Table 1 footnote 3, the SDT respectfully disagrees and believes the footnote is clear in regards to what subset of Bulk Electric System Facilities are classified as EHV and that the remaining fall to HV Facilities. Anything not deemed Bulk Electric System by a Regional Entity is outside of the scope of footnote 3 and the footnote clarifies that Table 1 sometimes has unique performance requirements depending on the event studied. The SDT believes the categorization is correct. No change made.</p> <p>The SDT disagrees that Firm Transmission Service (FTS) may be interrupted for all events. The events where the interruption of FTS is not permitted are shown with a "No" in the column titled "Interruption of Firm Transmission Service Allowed", however, footnote 9 clarifies that interruption of Firm Transmission Service</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
<p>can be used as both a corrective action and system adjustment as permitted within Table 1. For the specific issue raised, loss of a single pole of a DC line, to the extent the availability of the DC pole is a condition of the transfer being viable, footnote 4 may also address the commenter’s concern. No change made.</p>		
<p>Independent Electricity System Operator</p>	<p>Ballot Comment</p>	<p>IESO is generally supportive of the draft of TPL-001-2 as evidenced by our previous AFFIRMATIVE vote during the last ballot. Further, IESO also supported the revisions to Footnote ‘b’ to Table 1 of the TPL standards under Project 2010-11. That revision was balloted and approved by the ballot pool in February 2011 and filed with FERC for approval in March 2011. The revised footnote has been incorporated into the current draft of TPL-001-2 as Footnotes 9 and 12 but the Commission, by letter to NERC dated May 17, 2011, has requested NERC to provide supplemental information before the revised Footnote ‘b’ could be approved. In light of FERC’s request and the uncertainty regarding the final provisions of these footnotes, coupled with the ongoing work on Project 2010-17 for the revision of the BES definition and development of an Exception Process and the impact that may have, we respectfully suggest that the drafting team delay further work on TPL-001-2 pending FERC’s ruling on NERC’s petition seeking approval of the transmission planning standards that contain the revised Footnote ‘b’ to Table 1.</p>
<p>Response: The SDT believes IESO’s concerns in process efficiency related to this project and FERC’s on-going review of the prior submittal of a revised footnote ‘b’ should not be the sole reason for a negative vote on the new proposed TPL standard and that IESO’s vote should be based on the technical merits of the standard. The SDT encourages IESO to revisit its negative ballot position during the recirculation ballot. As stated in the comment provided, IESO finds footnotes 9 and 12 to be written consistently with footnote ‘b’ and if IESO supported footnote ‘b’, the SDT encourages continued support of the issue in the new proposed TPL-001-2 and doing so shows support of the standard on its technical merits. No change made.</p>		
<p>Lakeland Electric</p>	<p>Ballot Comment</p>	<p>LAK appreciates the hard work of the Standard Drafting team and applauds the significant improvement of clarity of the draft standard. FMPA believes we are almost there, but, there are a number of issues left to resolve. Issues that Cause FMPA to Recommend a Negative Vote A. Spare Equipment, R2.1.5 - The requirement reaches beyond the FERC directive. The directive was: "Accordingly, the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity’s spare equipment strategy." So, the directive is only to address planned outage, not unplanned outages.</p> <p>Also note that the applicability to GSUs is ambiguous. "Transmission" is defined as: "An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems." Is the "point of supply" the generator terminal, or the GSU high side terminal?</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>B. Table 1, under first heading of "Steady State Only", bullet i is open to interpretation. Many utilities use steady state P-V analyses to study voltage stability and design UVLS systems in apart around those steady state analyses. Would this bullet essentially eliminate P-V and Q-V studies and the related use of UVLS?</p>
<p>Response: The SDT respectfully disagrees that the Commission directive regarding a spare equipment strategy is limited to planned outages. In Order 693, Par 1725, the Commission states in its discussion “Thus, if an entity’s spare equipment strategy for the permanent loss of a transformer is to use a “hot spare” or to relocate a transformer from another location in a timely manner, the outage of the transformer need not be assessed under peak system conditions.” The SDT believes FERC clearly intended the spare equipment strategy to cover a catastrophic loss of such long lead-time equipment. Further, the SDT believes it has appropriately limited this review to a small subset of the overall Planning Events – P0, P1, and P2 and for a loss that would be sustained for a year or longer. No change made.</p> <p>The SDT refers the commenter to footnote 5 in regards to the applicability of GSU transformers. The “point of supply” is irrelevant in regards to planning a Transmission system for potential generation loss. The applicable generation is any unit deemed to be BES generation supply by the applicable regional entity. No change made.</p> <p>The SDT points out that Table 1 header note “i” applies to steady-state only and is intended to prevent any reduction in non-consequential Load due to what the planner believes to be sensitive Load loss that may drop out as voltage declines. It is the understanding of the SDT that most utilities only reflect or account for such reduction in Load in the transient timeframe and that planning decisions based on steady-state analysis would appropriately account for serving the non-consequential Load unless subject to interruption per that studied planning event. The bullet does not eliminate P-V or Q-V studies nor does it prohibit use of UVLS as a mitigating action where non-consequential load interruption is permitted. No change made.</p>		
<p>New Brunswick Power Transmission Corporation</p>	<p>Ballot Comment</p>	<p>Foot Note 12: Rather than requiring planning entities to have a open and transparent planning stakeholder process, which could require significant costs and administration, the foot note should focus on ensuring that affected loads/entities are aware of the possible risks of load loss and alternatives and provide for affected stakeholder feedback</p>
<p>Response: The SDT believes the open and transparent stakeholder process described by footnote 12 provides an efficient platform for which the affected end-users and other registered entities would be made aware of instances where non-consequential Load loss is being considered as a Corrective Action Plan and provides the best opportunity for feedback. The process envisioned is already in place in various areas across the various Interconnections in which the NERC Reliability Standards are enforceable. No change made.</p>		
<p>Powerex Corp.</p>	<p>Ballot Comment</p>	<p>Powerex has submitted a negative ballot for Draft #6 of Standard TPL-001 because Powerex has concerns regarding Footnotes 9 and 4 that need to be addressed. Details of our concerns are summarized below.</p>

Organization	Yes/ No	Question 3 Comment
		<p>Background: The work that transmission planners do to ensure Firm Transmission Service is tremendously important for the reliability of the Bulk Electric System and forms a key part of the foundation upon which system operators and energy market participants interact. As a Purchasing-Selling Entity, Powerex is primarily concerned about Footnote 9 that conditions when interruption of Firm Transmission Service may be allowed. We believe that the goals of maintaining system reliability and enhancing market participation will both be best served if the conditions for interrupting Firm Transmission Service become clear and unambiguous in the TPL-001-2 Standard. In our experience, Transmission Providers have different interpretations of the TPL-001 Performance Table and because of latitude previously granted by Footnote B have different perspectives of when Interruptions of Firm Transfers is acceptable. Below we describe the two interpretations using the language of the proposed TPL-001 standard. Interpretation #1: Following loss of the most critical transmission element under stressed conditions, the transmission provider plans to supply the forecast peak loads and Firm Transmission Service indefinitely. o Typically this is achieved by assuming that the System Operators would, within a few minutes of the P1 Single Contingency, curtail all non-firm transmission service and then arm Special Protection Schemes that could result in Interruption of Firm Transmission Service or Non-Consequential Load Loss in the event of a P6 Multiple contingency. Interpretation #2: Following loss of the most critical transmission element under stressed conditions, the transmission provider plans to supply the forecast peak loads indefinitely but may curtail all Firm Transmission Service within 20 minutes if required. o Typically this occurs on systems where there are no Special Protection Schemes to address P6 Multiple contingencies, consequently, the transmission planners assume that curtailment of all non-firm AND as much Firm Transmission Service as required will occur within ~20 minutes of the P1 Single Contingency because the Operators must prepare their transmission system to withstand the next worst contingency. Currently, Purchasing-Selling Entities must plan for situations where they could see their Firm Transmission Service on certain paths curtailed within 20 minutes of a P1 contingency. The less stringent interpretation of the TPL-001 Performance Table that allowed a P1 contingency to change into a P6 contingency within the same operating hour, has resulted in situations where the Firm Transmission Service for inter-regional transfers face significantly greater risks of interruption than the Firm Transmission Service provided to local Load Serving Entities. Powerex recommends that the Standards Drafting Team revise TPL-001 such that all Transmission Planners will know that they should plan for Firm Transmission Service to be sustained indefinitely following P1 contingencies.</p> <p>Specific Comments on TPL-001-2: Footnote 9: Deviation from the Approved Footnote B Powerex believes that the Footnote B, as approved by the NERC Board of Trustees on February 17, 2011, is more stringent than the previous Footnote B and will have the effect of ensuring that Firm Transmission Service can be sustained indefinitely following P1 contingencies. The key difference of the proposed Footnote 9 is that it adds</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>the phrase “as a System adjustment” to the approved version of Footnote B. We believe this addition would cause the practice of curtailing Firm Transmission Service within 20 minutes of P1 contingencies to continue. Consequently, we recommend that the proposed Footnote 9 maintain the approved wording as follows: Footnote 9: An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed (deletion)[as] a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch....</p> <p>For consistency, Table 1 should also be modified to remove the Footnote 9 reference from the Initial Condition Column for the P3-Multiple Contingency and P6 Multiple Contingency Categories.</p> <p>Footnote 9: Clarity on what is meant by “Resources obligated to re-dispatch” It is unclear to many parties what is meant by an obligation to re-dispatch. Some interpret this as a right to direct the Source to curtail energy scheduled on Firm Transmission Service. Our belief is that “an obligation to re-dispatch” should correspond to a formal agreement with a Generation Owner, located on the load side of a transmission constraint, to resupply the load that had been receiving energy from a remote source before the Firm Transmission Service was curtailed. Consequently, we recommend that Footnote 9 be revised as follows: Footnote 9: a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch [to ensure uninterrupted energy supply to the Load-Serving Entity(ies)], where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss....</p> <p>Footnote 4: Conditional Firm Transmission Service Footnote 4: “Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.” In a sense, offering conditional firm transmission service is analogous to selling land in a known flood plane - this can be a perfectly acceptable option provided all parties involved in current and future transactions can quantify the risks and manage them appropriately. There needs to be coordination between the planners, operators and marketers to ensure that the conditions that could lead to curtailment of Conditional Firm Transmission Service are understood and the associated risks properly managed. We are concerned that in the absence of coordination, specifically additional requirements included in the BAL and INT standards, energy that is scheduled on conditional firm could actually be marketed as firm and as a result the counterparties to some transactions may not be aware of the curtailment risks they could face.</p>
<p>Response: Footnote 9 - The SDT believes that footnote 9 appropriately allows interruption of Firm Transmission Service as both a corrective action to the initial event studied and as a permissible intermediate “system adjustment” when evaluating a multiple Contingency event such as P3 or P6. The key is that there must</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
<p>be no loss of Load and the planner must be able to show that the curtailment is supported by a valid re-dispatch of generation that would be “obligated to re-dispatch.” Therefore, the planner cannot simply re-dispatch units outside the area of control for the transmission system for which it is reviewing – the re-dispatch must be valid and realistic. The commenter indicates an opinion that footnote 9 introduces a difference from the revised footnote ‘b’ because footnote 9 is applied to multiple Contingency planning events P3 and P6 as an intermediate step – system adjustment. However, the SDT believes that footnote ‘b’ is consistent as it does not explicitly distinguish between the two – corrective action or system adjustment following the single Contingency event that may precede a multiple Contingency event. No change made.</p> <p>Footnote 4 – The SDT agrees with the commenter that the specifics of Conditional Firm Transmission service including the potential/rights for curtailments need to be well understood by all parties involved but the SDT has not identified any BES reliability gaps. No change made.</p>		
Tucson Electric Power Co.	Ballot Comment	The definition for Near Term Planning Horizon was deleted, but the formal term is used in other sections such as R2.2.1. There should be a linkage to MOD standard (e.g. 028, 029 & 030) definitions such as 13 months, etc.
<p>Response: Two previously proposed definitions that were part of this project were moved to another standard development project – Project 2010-10 titled “FAC Order 729”. The two definitions, “Near-term Transmission Planning Horizon” and “Year One” were approved by the Board of Trustees on January 24, 2011.</p>		
Western Area Power Administration	Ballot Comment	Standard is improved over previous drafts, but would like to see further changes. Please see suggestions and comments provided on the Official Comment Form.
<p>Response: Please see the SDT’s response to your suggestions in Question 1.</p>		
SERC Planning Standards Subcommittee		<p>R1 does not seem to address issues where data errors have been introduced into the latest model data.</p> <p>Also, R1 and its VSL may be interpreted to exclude the use of past studies.</p> <p>The Implementation Plan should include a five-year delay in the effective date for short circuit studies (R2 parts 2.3 and 2.8) since these studies are not required in the current version 0 standards.</p> <p>The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.</p>
<p>Response: Requirement R1 of the new TPL standard requires the Transmission Planner and Planning Coordinator to maintain System models within its</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>respective area of responsibility. The requirement indicates that information received via MOD-010 and MOD-012 shall be “supplemented by other sources as needed” and to the extent errors and omissions were either discovered by, or brought to the attention of, the Transmission Planner or Planning Coordinator Requirement R1 establishes an expectation that these “other sources” would be utilized to accurately “represent the project System conditions” being studied. No change made.</p> <p>Requirement R1 is applicable to models used for both current and past studies. No change made.</p> <p>Implementation Plan, Short Circuit Studies – While short circuit study requirements may be new in the realm of mandatory enforceable standards, the SDT does not believe that they present a significant “raising of the bar” for industry. The SDT believes that prudent short circuit practices are effectively in place today to ensure safe operation of the equipment. Therefore, no extension in the Implementation Plan was made in regard to short circuit studies.</p>
<p>SPP Reliability Standards Development Team</p>		<p>A5 It would seem that 84 months wouldn’t be universally attainable due to different system configurations, terrain, geography, and permitting issues that are required to complete a corrective action plan.</p> <p>In 2.4.1 we would like to see better clarity on what an Aggregate system load model is and how granular it should be. If the answer is a very detailed representation of the load system then it may take a longer time to implement.</p> <p>In section 2.7 we would to see clarification on the sensitivity analysis. Is this in reference to seasonal models and differences in fuel availability? We need more detail on how this is to be done so that it won’t be left up to interpretation. We would like for clarification of the planning assessment and who is performing which tasks. We would also like to utilize a regional assessment due to limited resources. Under which criteria should the assessment fall under the regional entity or the individual companies?</p> <p>In section 3.4.1 this type of coordination could be difficult due to other adjacent entities on different schedules and some possibly couldn’t have the amount of detail to incorporate into another’s processes. We know this is generally covered in coordination of real time operations and wonder if it is appropriate to require this type of coordination in the long term process. Is there already an operational standard that covers this? Would it be better to address this in the operational standards?</p> <p>PC’s between regions are already coordinating for long term studies. Should this standard fall more on the back of the PC’s rather than the TP</p> <p>Can we get a bright line definition of what apparent impedance swings means?</p> <p>R4.3.1 will the detailed amount of data then be incorporated back into the NERC modeling processes and create a more detailed model with better accuracy?</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>R8 We do not agree that we should provide the assessment to every adjacent PC and TP. We do agree however that if requested by these entities we would provide the assessment. We don't mind sharing information with requestors but would like a longer duration than 30 days due to the fact that we would like to know what type of "reliability need" any entity would have considering that some of the information could be considered CEII. Non disclosure agreements may be needed in order to provide this information.</p>
<p>Response: Effective Date (A5) – The SDT believes the 7 year (84 month) transition to areas where the standard significantly raises planning expectations over the existing standard is more than sufficient for the vast majority of the continent and for most Corrective Action Plans. To the extent additional time is required an entity would need to submit a timely mitigation plan with its Regional Entity organization. No change made.</p> <p>The "aggregate" dynamic Load model may include high-level assumptions on Load profiles for industrial, commercial, and residential Loads that are applied generically across the planning area study based on the planner's engineering judgment and system knowledge. The model is not required to be "bus" specific. No change made.</p> <p>In Requirement R2, Part 2.7, it is stated that a Corrective Action Plan is not required solely for a "single sensitivity study". The standard envisions a portfolio of sensitivity analyses being established for a planning area and the standard does not require Corrective Action Plans for single sensitivity results that may have placed the system in a greater stressed analysis (i.e., heavy system transfers) for its initial (P0) sensitivity model over other models that did not identify performance criteria violations for the same Contingency event studied. No change made.</p> <p>If a Regional Entity acts as your "Planning Coordinator" then tasks between the Planning Coordinator and Transmission Planner are to be defined as part of Requirement R7. The standard does not prohibit the use of valid studies performed by 3rd parties for a given planning area. No change made.</p> <p>In regards to Requirement R3, Part 3.4.1, the SDT envisions that knowledge of the applicable Contingencies on neighboring systems would develop over time and be discovered with the results being distributed in Requirement R8. The SDT believes that this is an important improvement to the planning timeframe analysis and that system information learned in the operations environment should most certainly be considered to the extent it improves the robustness of the Planning Assessment. No change made.</p> <p>Both the registered Transmission Planner and Planning Coordinator have functional entity responsibility for Transmission system planning as defined by NERC's Functional Model. The SDT believes the new TPL-001-2 is appropriately aimed at both throughout the standard. Additionally, Requirement R7 should address the commenter's concern and if greater responsibility can be agreed upon for the Planning Coordinator for a particular area of the continent the standard would not prohibit such a determination. No change made.</p> <p>The "apparent impedance swing" is the trajectory of changes in the apparent impedance seen by a distance relay for various system and fault conditions. In the case contemplated in Requirement R4, Part 4.1.2, it is the trajectory seen by the distance relay for the initial fault and the subsequent generator(s) pulling out of synchronism. If that trajectory were to come within the tripping characteristic of the relay for a sufficient length of time, the relay would cause its associated line</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
<p>to trip. No change made.</p> <p>This standard does not address the studies performed by NERC or its model building practices.</p> <p>The SDT and (based on the recent ballot approval of 74%) the majority of industry support Requirement R8 – no change made.</p>		
MRO's NERC Standards Review Forum		<p>The NSRF recommends that the term, “System” be replaced with “BES” in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems, which is the definition of the NERC Glossary term, “System”. These locations are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6</p>
Muscatine Power and Water		<p>MP&W recommends that the term “System” be replaced with “BES” in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems. This is the current definition of the NERC Glossary term “System”. The locations where “System” can be found in the Standard are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6.</p>
<p>Response: Even though the capitalized term “System” includes distribution components, the SDT believes that its usage within this standard is correct because the Reliability Standards apply only to the BES. Therefore, adding additional qualifiers is not needed. No change made.</p>		
BC Hydro		<p>BC Hydro agrees with merging the standards together into one and we feel the new version brings further clarity to the annual planning assessment. BC Hydro would vote Affirmative for bringing clarity, however we do not believe the rewording in Footnote 9 is clear which is why we are voting Negative. Footnote B, as approved by the NERC Board of Trustees on February 17, 2011 was reworded as Foot Note 9 in the proposed TPL 001-2 draft 7 amendment. This rewording still does not clearly define what impact the proposed revision would have on the curtailment of firm transfers in the regional entities.</p>
<p>Response: The equivalent of the revised footnote ‘b’ as approved by the NERC Board of Trustees on February 17, 2011 is addressed by the combination of two footnotes – footnote 9 and footnote 12 – in the new proposed TPL-001-2 standard. The SDT believes that footnote 9 appropriately allows interruption of Firm Transmission Service as both a corrective action to the initial event studied and as a permissible intermediate “system adjustment” when evaluating a multiple Contingency event such as P3 or P6. The reliance on the interruption of Firm Transmission Service in the Planning Horizon is limited in two ways. First, there must be no planned use of firm Load shedding and second, the planner must be able to demonstrate that the curtailment is supported by a valid re-dispatch of generation that would be “obligated to re-dispatch.” Therefore, the planner cannot simply re-dispatch units outside the area of control for the transmission system for which it is reviewing – the re-dispatch must be valid and realistic. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
Entergy Services		Footnote 12 to Table 1 concerning non-consequential load loss should be clarified. The existing language will result in difficulties in proving compliance. Suggested language would be: "Planned or controlled interruption of Demand supplied by Transmission Facilities made temporarily radial as a result of a P1 or P2 event and where the location of the planned loss of Demand is limited to those Transmission Facilities made radial."
<p>Response: The SDT in a separate standards development project - Project 2010-11 TPL Table 1 Order – attempted the radial concept described by the commenter in its revision of footnote 'b' as used in the existing set of TPL standards. The proposed "radial" footnote 'b' was presented for industry ballot from 05/17/10 through 05/27/10 and failed at 63.8%. Following an industry technical conference, the SDT continued to work on footnote 'b' and a revised version was approved by the NERC Board of Trustees on February 17, 2011. The combination of footnotes 9 and 12 consistently apply the industry approved revised footnote 'b' in the new standard. No change made.</p>		
Tri-State Generation and Transmission Assn., Inc.		<p>R1.1 to "System models used for Steady State and Stability Analysis shall represent:" Much of what is in R1.1 is unnecessary for Short Circuit studies. In contrast, there are items not mentioned in R1.1 that are necessary for short circuit studies.</p> <p>R2.1.4 requires sensitivity analysis to study "a range of credible conditions that demonstrate a measurable change". How will the required actions in R2.1.4 be documented or measured, and what is accomplished by performing sensitivity analysis in the context of a system performance assessment?</p> <p>In R2.3, change the first sentence to read "The short circuit analysis portion of the Planning Assessment shall be conducted annually, using one of the cases described in 2.1.1, addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6." There appears to be no reason to perform short circuit studies for all three Near-Term Transmission Planning Horizon cases.</p> <p>R2.4.3 requires sensitivity analysis to study "a range of credible conditions that demonstrate a measurable change". How will the required actions in R2.4.3 be documented or measured, and what is accomplished by performing sensitivity analysis in the context of a system performance assessment?</p> <p>R2.7.1 remove the last bullet. We believe these programs are already factored into the load forecast, as they are associated with resource scheduling and planning load serving, and not transmission planning. In particular, DSM measures would fall under R2.4.1, and the term "new technologies, or other initiatives"</p> <p>The language of Requirement 3 unnecessarily repeats the language of R1 and R2. As now written, R3 states "For the steady state portion of the Planning Assessment, each Transmission Planner and Planning</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1.”</p> <p>R3 We recommend that the introductory language in Requirement R3 be changed to read “The studies in Requirement R2, Parts 2.1, and 2.2 shall be performed using models as defined in Requirement R1 in accordance with the following criteria.”</p> <p>We believe that Requirements 3.1 and 3.4 should be combined into R3.1, eliminating R3.4. It is redundant to have Requirement 3.1 say “perform R3.4”. We recommend that R3.4 be deleted and that R3.1 be replaced with:R3.1 Planning event studies shall be performed in accordance with “Table 1 - Steady State & Stability Performance Planning Events;” and shall be based on a supportable Contingency list.</p> <p>Comment: The content of 3.4.1 was intentionally omitted as it is redundant with R7. Also, the language “...more severe System impacts...” was intentionally omitted as it could be subject to a wide range of interpretations. Similarly, we recommend that R3.5 be deleted and that R3.2 be replaced with:R3.2 Extreme event studies shall be performed in accordance with “Table 1 - Steady State & Stability Extreme Events;” and shall be based on a supportable Contingency list.</p> <p>We recommend the following new requirement be inserted after the revised R3.2 language:Should the extreme event studies identify potential Cascading, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.</p> <p>Comment: As before, the language “...more severe System impacts...” was intentionally omitted as it could be subject to a wide range of interpretations.</p> <p>We recommend removing the second bullet of R3.3.1, “Tripping of Transmission elements where relay loadability limits are exceeded” for the following reasons:1. There is currently no tool to model relay loadability characteristics in Steady State analysis. 2. Requirement R3.3.1 would require inclusion of relay models in modeling data that are not currently provided. MOD-012 does not require impedance or overcurrent relay models to be submitted.3. In Requirement 3.3.1, the second bullet, it is impossible to model complete and accurate relay loadability using present-day steady state simulation tools. At best an individual point could be chosen to model relays based on a selected power factor.</p> <p>We recommend changing the opening text of Requirement R.3.3.2 to say “Simulate the expected automatic or manual operation...”</p> <p>Subrequirement R4.1.2 represents a tremendous increase in dynamic modeling complexity. Modeling relay</p>

Organization	Yes/ No	Question 3 Comment
		<p>action during apparent impedance swings would require inclusion of impedance relay models in modeling data that are not required to be submitted in MOD-012. If such modeling is necessary, then the corresponding data requirements need to be addressed in MOD standards.</p> <p>We believe that Requirements 4.1 and 4.4 should be combined into R4.1 as shown below and R4.4 should be deleted. It is redundant to have Requirement 4.1 say “perform R4.4.” We recommend R4.1 language be revised to read as follows:R4.1 Planning event studies shall be performed in accordance with “Table 1 - Steady State & Stability Performance Planning Events;” and shall be based on a supportable Contingency list.Comment: The content of 4.4.1 should be omitted as it is redundant with R7. Also, the language “...more severe System impacts...” should be omitted as it could be subject to a wide range of interpretations.</p> <p>Similarly, R4.5 should be deleted and R4.2 should be replaced with:R4.2 Extreme event studies shall be performed in accordance with “Table 1 - Steady State & Stability Extreme Events;” and shall be based on a supportable Contingency list.</p> <p>We recommend the following new requirement be inserted after the revised R4.2:Should the extreme event studies identify potential Cascading, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the even(s) shall be conducted.</p> <p>Comment: As before, the language “...more severe System impacts...” was intentionally omitted as it could be subject to a wide range of interpretations. Clarify the first bullet in Requirement R4, part 4.3.1 by changing it to “High-speed (less than 1 second) reclosing, where the fault has cleared, and high-speed reclosing into the permanent fault , but in each case only if high-speed reclosing is utilized”.</p> <p>In Requirement R4, part 4.3.1, third bullet, it is impossible to model complete and accurate relay loadability using present-day steady state simulation tools. Existing applications do have impedance relay models, but these models do not model many relay capabilities- for example, non-circular protection regions and load-encroachment. We recommend removing this bullet.</p> <p>The comment statement we made above referring to R4.1.2 also applies to R4.3.1. MOD-012 does not require reclosing relay model data to be submitted. If such modeling is necessary, then the corresponding data requirements need to be addressed in MOD standards. Furthermore, there is not a standard built-in reclosing relay model in current stability simulation tools.</p> <p>Comments regarding Table 1-We assume the headnote i. to Table 1 - “The response of voltage sensitive Load...” - means that studies must not rely on end-user load tripping to meet the performance requirements defined in TPL-001-2 but that it should be modeled (when known) so that its occurrence would be evident.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>We don't see the need to apply Footnote 12 to only certain contingency categories or certain events in categories. Recommend putting the footnote in the column header just as with Footnotes 1, 2, 3, and 4. Recommend changing "utilized" in Measurement M3 to "performed." Recommend changing "utilized" in Measurement M4 to "performed." Modify Measurement M7 to "Each Planning Coordinator shall provide dated documentation on roles and responsibilities of its Transmission Planners, such as..." The deleted phrase, "in conjunction with each of its Transmission Planners," appears to be unnecessary.</p>
<p>Response: Requirement R1, Part 1.1 – The SDT believes that the planners must have the general information in Requirement R1, Part 1.1 in order to conduct the necessary studies for steady state, stability, and short circuit. The requirement states that the planner shall maintain System models, not to have a single model that covers all three categories. The SDT believes that the planner will need the items in Requirement R1, Part 1.1 to develop the smaller set of items that are necessary for their short circuit models. No change made.</p> <p>Requirement R2, Part 2.1.4 – This item requires the planner to show evidence of one or more sensitivity studies which show appreciable change from the prior projected (P0) system condition (pre-sensitivity adjustment). Measurable changes for the revised P0 system condition could be evidenced by line or transformer flows, voltages, a change in dispatch, load increase, etc., assuming the change places additional stress on a portion of the system being reviewed for the sensitivity studied. The sensitivity analysis is important for the applicable entity to better understand their system's vulnerability to alternate "base (P0)" conditions. The intent is to develop a portfolio of potential credible conditions so that the planner better understands potential vulnerabilities. In the Corrective Action Plans (CAP) area of the standard, Requirement R2, Part 2.7, a CAP may be required if a Planning Event shows performance criteria concerns for one or more sensitivity scenarios. No change made.</p> <p>Requirement R2, Part 2.3 – The standard states that the planner shall maintain System models, not to have a single model that covers all three categories - for steady state, stability, and short circuit. It is common within many organizations that separate models are maintained for short circuit analysis since they require breaker configuration details not contained within steady-state load flows. Additionally, short circuit models may not have end-use Load represented but rather emphasis is on system topology, impedance, generation dispatch, fault location etc. No change made.</p> <p>Requirement R2, Part 2.4.3 – same response as Requirement R2, Part 2.1.4 above.</p> <p>Requirement R2, Part 2.7.1 – The SDT disagrees that the last bulleted item which includes use of a rate application or DSM program would be inclusive to the forecasted Load within the model studied. No change made.</p> <p>Requirement R3 – The SDT clarifies that Requirement R2 refers to an "annual assessment" which collectively includes current or past studies, Corrective Action Plans, etc. required for steady-state, stability, and short circuit analysis. Requirement R3 deals with a portion of the overall assessment and is focused on the</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		steady-state “study” requirements for the Near-Term and Long-Term Transmission Planning Horizons. No change made.
		Requirement R3, Part 3.1 – The SDT did not receive any significant industry objection to having Parts 3.1 and 3.4 separated. The proposed change is based on a formatting and style preference and does not address a reliability gap in the standard. No change made.
		Requirement R3, Part 3.2 – The SDT did not receive any significant industry objection to having Parts 3.2 and 3.5 separated. The proposed change is based on a formatting and style preference and does not address a reliability gap in the standard. No change made.
		Requirement R3, Part 3.4.1 and Requirement R7 are uniquely different and not redundant as suggested by the commenter. No change made.
		Requirement R3, Part 3.5 (proposed new 3.2 by commenter) – The commenter finds the term “more severe System impacts” too open to interpretation and suggests a focus on Cascading conditions. The SDT believes the requirement is clear as written and that the statement “more severe System impacts” is used to describe the latitude in engineering judgment afforded to the planner in developing its extreme Contingency list. Action is only required on the subset of items that show the potential for Cascading. No change made.
		Requirement R3, Part 3.3.1, bullet 2 – this does not require an “automatic” modeling feature but rather it could be further subsequent manual analysis performed as needed for a given Planning Event. For example, if a line flow shows >150% loading the planner may need to trip the circuit to see if a stable condition results and what performance criteria issues may be present. To the extent this could be automated through programming the planner may do so at their discretion. No change made.
		For similar reasons stated in the response to Requirement R3, Part 3.5, the SDT does not find the phrase “more severe System impacts” as vague and open to interpretation. No change made.
		Requirement R3, Part 3.3.1 - The SDT language does not require comprehensive relaying models. No change made.
		Requirement R3, Part 3.3.2 - The SDT does not believe the proposed wording changes provide any clarity and finds the item clear as stated. No change made.
		Requirement R4, Part 4.1.2 – The “apparent impedance swing” is the trajectory of changes in the apparent impedance seen by a distance relay for various system and Fault conditions. In the case contemplated in Requirement R4, Part 4.1.2, it is the trajectory seen by the distance relay for the initial Fault and the subsequent generator(s) pulling out of synchronism. If that trajectory were to come within the tripping characteristic of the relay for a sufficient length of time, the relay would cause its associated line to trip. With that explanation, the SDT does not believe the modeling requirements are overly complex or difficult to achieve. No change

Organization	Yes/ No	Question 3 Comment
		<p>made.</p> <p>Requirement R4, Parts 4.1 and 4.4 - The SDT did not receive any significant industry objection to having Parts 4.1 and 4.4 separated. The proposed change is based on a formatting and style preference and does not address a reliability gap in the standard. No change made.</p> <p>Requirement R4, Part 4.5 - the SDT does not believe the proposed wording changes are warranted and finds the item clear as stated. No change made.</p> <p>Requirement R4, Part 4.3.1, first bullet – the SDT does not believe the proposed wording changes are warranted and finds the item clear as stated. No change made.</p> <p>Requirement R4, Part 4.3.1, third bullet – The SDT language in Requirement R4, Part 4.3.1 states “The analyses shall include the impact of subsequent” and does not require comprehensive relaying models. However, it does require that the planner take into account the effects of System Protection on System performance. No change made.</p> <p>Table 1 header note “i” – The SDT notes that this item only applies to steady-state load flow analysis and no assumed shedding of non-consequential sensitive Load is permitted for the steady-state analysis unless it is to be intentionally dropped as part of a Corrective Action Plan where warranted. No change made.</p>
Hydro One Networks Inc.		<p>A. Regarding Requirement 1.1.2, assessment of “known outages... with a duration of at least 6 months”, are dealt with in the operational studies rather than planning studies. In addition, any adverse impact that these outages might have, are mitigated by operational decisions rather than “planning” decisions within a 6-month horizon. It is suggested to move this requirement out of TPL standards and instead include it a relevant operational standards.</p> <p>B. The statement in R 2.1.4, “must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response”, leaves room for very different interpretations by PCs and TPs as to the number and type of required sensitivity studies. Are all interpretations, based on the engineering judgment of the PC and TP, acceptable?</p> <p>C. The language of R 2.1.4 and 2.4.3 allowing to perform one or more sensitivities appears to be inconsistent with the language in R 2.7.2 which requires multiple sensitivities to determine if actions to resolve performance deficiencies are necessary. Will varying only one measurable quantity several times in multiple simulations constitute multiple sensitivity studies or one sensitivity study?</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>D. The language of Requirement 2.1.5, “spare strategy”, appears to be open-ended regarding the number of permutations to be analyzed. It is suggested to move this requirement out of TPL standard and instead have this issue dealt with in the operational standards.</p> <p>E. In R 2.2, the statement “be supported by the following annual current study, supplemented with qualified past studies” should be replaced with a similar statement in R 2.1 which says: “be supported by current annual studies or qualified past studies”.</p> <p>F. In R 4.1.1, “For planning event P1: No generating unit shall pull out of synchronism” is too restrictive. In many cases a P1 event may result in instability of a small nearby generator without a significant impact on the reliability of BES. The same requirement states that “A generator being disconnected from the System ... by a Special Protection System is not considered pulling out of synchronism”. If rejection of ANY generator by SPS is acceptable, why should instability of a small generator, resulting in its disconnection by its protection without a severe impact on the system, be unacceptable in all circumstances? If this requirement is unchanged, it dictates the addition of an SPS (Generation Rejection) for any unit that might go unstable without any benefit for the reliability of the BES.</p> <p>G. In Table 1, Event 1 of Category P2 and related Footnote 7 (simulation of LEO condition) are not clear (concern with the use of the word “possibly”). If the intension is to simulate LEO condition of tapped lines, this should be clearly stated in the table (without reference to “Opening of a line section” and use of different language in the footnote).</p>
<p>Response: A: The SDT disagrees with the view that outages of 6-months or more should only be reviewed in the operations timeframe. Such an outage could be for an upcoming construction project requiring certain facilities to be removed from service for long durations of time and those situations should be evaluated with sufficient lead time to determine any vulnerabilities and development of sufficient Corrective Action Plans as required. No change made.</p> <p>B. The standard does not mandate the number of sensitivity analyses performed nor the number of adjustments made and engineering judgment of the Transmission Planner and Planning Coordinator is acceptable. No change made.</p> <p>C. Requirement R2, Parts 2.1.4 and 2.4.3 are not inconsistent with Requirement R2, Part 2.7.2. With the various requirements, the planners are required to conduct multiple sensitivities. Therefore, Requirement R2, Part 2.7.2 could be used when the results of these multiple sensitivities identify common concerns. The situation described would could be considered multiple sensitivity studies, if the multiple simulations represent more than one of the studies in Requirement R2, Part 2.1.1 and 2.1.2 or Requirement R2, Part 2.4.1 and 2.4.2. No change made.</p> <p>D. The spare equipment strategy is an important planning aspect to better assist operations. The SDT disagrees that the number of permutations is open-ended. The evaluation is simply a new P0 condition starting with a long lead-time (one year or more) facility removed from service followed by an analysis</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>covering the P0, P1 and P2 studies. No change made.</p> <p>E. The requirement for an annual current steady-state study in the Long-term Transmission Planning Horizon is intentional to drive earlier identification of potential transmission performance limitations and earlier development of Corrective Action Plans. The study results can be used as qualified studies as they advance to later years, including moving to the Near-Term Transmission Planning Horizon. No change made.</p> <p>F. The SDT respectfully disagrees with the commenter. For a P1 single Contingency event, the SDT believes, and a majority of industry stakeholders find it reasonable, that no Bulk Electric System (BES) generation unit be pulled out of synchronism due to the P1 event studied. If the “small” nearby unit is served below threshold kV and MW size limitations set by your Regional Entity to qualify as a BES unit, the unit would not be within scope of the standard. No change made.</p> <p>G. Table 1, footnote 7 – The SDT added the footnote to further explain its intent for P2-1 and to ensure that the planner assess the voltage of a load bus that was on a radial line. The word “possibly” was used since having load on a radial is not always the outcome of opening one end of a line section. No change made.</p>
Arizona Public Service Company		AZPS would like to reiterate its “Affirmative” voting recommendation with regard to the proposed revisions to the Standard. AZPS erroneously entered a “Negative” Standard vote for one of its voting segments.
Transmission Strategies, LLC		The SDT, Observers, and the Industry as a whole have put a tremendous amount of thought and work into the development of this latest draft. While nobody should claim that this latest version is perfect, it is far clearer, more in tune with current industry needs, and much improved compared to the existing approved Standards that it will replace.
Response: Thank you for your support.		
NIPSCO		1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months. This is a little confusing to me. Does this mean the outage must last at least six months? Or does this mean at least model outages that last six months or more. If it is the latter then, I'm not sure that is stringent enough. There may be known critical outages occurring over peak that do not last 6 months. If non-consequential load loss is not allowed for loss of one element, then what about the next contingency? Couldn't that result in having to interrupt Firm service? Is that okay as a corrective action plan in the outage coordination horizon? Does this apply to both near-term and long-term planning? If so, we probably need to model additional unplanned potential outages on top of n-1 conditions.

Organization	Yes/ No	Question 3 Comment
		Lastly, in section 2.1.4 should there be a category for high/low wind conditions?
<p>Response: Requirement R1, Part 1.1.2 is related to known existing conditions or known future conditions of facilities being removed from service; i.e., a construction project that requires an existing facility to be de-energized for a period of 6-months or more. This requirement should not be confused with hypothetical situations that could result in an extended loss of a facility. Those situations are the intended purpose of a sound spare equipment strategy. The standard only requires analysis of known or planned outages of 6-months or greater to be included within a P0 system condition. The planner could review shorter duration planned outages as part of its sensitivity analysis portfolio. No change made.</p> <p>The SDT does not believe there is a need to account for a high/low wind condition situation. The intended purpose of this suggested condition within the sensitivity portfolio is not clear. No change made.</p>		
ReliabilityFirst		<ol style="list-style-type: none"> 1. Requirement 8 and 8.1 uses the language of “Planning Assessment results”. This language is not defined in the section of the standard that defines the terms of use. For consistency “Planning Assessment results” should be replaced with “Planning Assessment”. 2. Requirement 2.1.5 has statements that are ambiguous. What is considered major transmission equipment? What is an entity’s “spare equipment strategy”? The requirement is not clear as to how many power flow models are required (one per piece of “major transmission equipment” without a spare, or one model with every piece of “major transmission equipment” without a spare being out of service)? As written, if an entity has no “spare equipment strategy” they could be exempt from this requirement. 3. We interpret the use of bullet points in Requirement 3.3.1 to mean that either one of the statements can be chosen. This requirement should be written where all the bulleted statements are included in the analyses.
<p>Response:</p> <ol style="list-style-type: none"> 1. The SDT sees no reliability reason or clarity for the change suggested. No change made. 2. Requirement R2, Part 2.1.5 is intended to analyze the removal of a single piece of long lead time equipment (one year or more) to the extent there is no existing spare equipment strategy to provide a means of returning to service (in a less than one year) a comparable replacement. If this condition exists, then the facility (single element) in question must be removed in the model to establish a new P0 system condition and studies must then be run for P0, P1, and P2 for the new system scenario. The spare equipment strategy must be reviewed for the entity’s system exposure to catastrophic failures resulting in the long lead-time facility outages, however, only one facility must be removed at a time if the condition exists for multiple facilities. A Transmission Planner may have no spare equipment strategy if they are able to demonstrate they are not responsible for any facilities which they believe could place them in a “long lead-time” scenario. No change made. 		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>3. The bulleted items of Requirement R3, Part 3.3.1 were meant to be inclusive. This means that the use of bullets here was incorrect and the items should be numbered elements. This same change was made to Requirement R4, Part 4.3.1.</p> <p>3.3.1.1 Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.</p> <p>3.3.1.2 Tripping of Transmission elements where relay loadability limits are exceeded.</p> <p>4.3.1.1 Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.</p> <p>4.3.1.2 Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.</p> <p>4.3.1.3 Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.</p>
ITC		<p>ITC COMMENTS on TPL-001 vote ITC will reluctantly vote to approve the draft standard. While we have concerns, we are voting to approve this standard because we believe the positive elements outweigh the portions of the draft standard that we object to. It is important that the improved requirements that effectively “raise the bar” over the existing standard should become effective sooner rather than later. A negative vote, which might cause a further delay in implementation of the standard, would be the least desirable outcome. However, we still believe that the VSL that would find that an entity had committed a “severe” violation for failure to distribute its planning assessment to an adjacent Transmission Planner or Planning Coordinator has the potential to overly punish a simple error in oversight. We would agree that willfully withholding an assessment from a neighbor or a valid requestor justifies a severe violation but an administrative or clerical oversight does not. For example, it might escape our attention that an entity, particularly a smaller one, registers as a TP or TP. As far as we know, there is no requirement that a registrant, or even one who de-registers, must notify an “adjacent” TP or PC of their change in status. As written, the standard requires you be found in “severe” violation, even if that new entity fails to notify you of their change in status. You would still be in severe violation even if they later ask for your planning assessment. Even if the standard passes, we request that this VSL be fixed to make the distinction between an administrative error and willful neglect. Our response to question 2 offers a suggested method to do this.</p>
<p>Response: Requirement R8 is an important aspect of the new TPL-001-2 standard to communicate results with neighboring systems and those demonstrating a reliability need. The SDT notes that the VSL Guidelines require a Severe VSL for each and every requirement but encourages graded (multiple level) VSLs where</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
<p>possible. In regard to Requirement R8, the SDT has established four VSLs. It is noted that an entity can be up to 120 days (~ 4 months) late in its delivery of the information and remain in the Lower VSL category before being exposed to the Severe VSL category. The 10 day increment in the other VSL categories, above the 120 day Lower VSL, conforms to NERC's VSL Guidelines. See the response to your suggested VSL changes in Question 2, however, it is noted that no changes were made to the Requirement R8 VSLs. No change made.</p>		
<p>South Carolina Electric and Gas</p>		<p>R1 does not seem to address errors in data that have been introduced in the latest model data. In addition, R1 and its VSL may be interpreted to exclude the use of past studies.</p> <p>The Implementation Plan should include a five year delay in the effective date for short circuit studies for parts 2.3 and 2.8 of R2 because these studies are not required in the current Version 0 standards.</p>
<p>Response: Requirement R1 of the new TPL-001-2 standard requires the Transmission Planner and Planning Coordinator to maintain System models within its respective area of responsibility. The requirement indicates that information received via MOD-010 and MOD-012 shall be "supplemented by other sources as needed" and to the extent errors and omissions were to be discovered by, or brought to the attention of, the Transmission Planner or Planning Coordinator Requirement R1 establishes an expectation that these "other sources" would be utilized to accurately "represent the project System conditions" being studied. No change made.</p> <p>Requirement R1 is applicable to models used for both current and past studies. No change made.</p> <p>Implementation Plan, Short Circuit Studies – While short circuit study requirements may be new in the realm of mandatory enforceable standards, the SDT does not believe that they present a significant "raising of the bar" for industry. The SDT believes that prudent short circuit practices are effectively in place today to ensure safe operation of the equipment. Therefore, no extension in the Implementation Plan was made in regard to short circuit studies.</p>		
<p>Manitoba Hydro</p>		<p>-Why was the Near Term Transmission Planning Horizon definition moved to the Glossary prior to TPL-001-2 approval?-</p> <p>The definition of Non-Consequential Load Loss should not contain '(2) the response of voltage sensitive Load' because voltage sensitive</p>
<p>Response: Two previously proposed definitions that were part of this project were moved to another standard development project – Project 2010-10 titled "FAC Order 729". The two definitions, "Near-term Transmission Planning Horizon" and "Year One" were approved by the Board of Trustees on January 24, 2011.</p> <p>The statement related to the "Non-Consequential Load Loss" definition is incomplete. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
National Grid		<p>R 1.1.2 We recommend the known facility outage duration be defined as facility outage durations lasting at least twelve months.</p> <p>R 1.1. (page 4) System models shall represent: 1.1.1. Existing Facilities 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six twelve months. 1.1.3</p> <p>R 2.1.4 We recommend that this requirement be eliminated. We do not see the value of this additional analysis when the number, type and severity of the sensitivity tests are not well defined. These tests are then used to define Corrective Action Plans in cases only where multiple tests show performance deficiencies.</p> <p>R 2.1.5 Spare equipment strategies are typically designed to prevent long outages (possibility a year or more) of equipment with very long lead times. Any such strategy “could” result in these long outages depending upon the number of failures that may be postulated. This requirement is misleading and we thus recommend it be eliminated.</p> <p>R 2.2 We recommend the language for R 2.2 should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study."</p> <p>R 2.6.2 We recommend that the wording of this requirement remain unchanged.</p> <p>R 2.7.1 This portion of the requirement provides a list of “acceptable” Corrective Action Plans. It provides equal weight to infrastructure reinforcements and Special Protection Systems as means to mitigate violations resulting from single or multiple contingencies at both the EHV and HV levels. National Grid’s position is that a national standard should not endorse the use of Special Protection Systems as corrective actions to mitigate single contingency violations. Local Northeast Planning Criteria indicates that special protection systems (SPS) shall be used judiciously and may be used to provide protection for infrequent contingencies, or for temporary conditions that may exist such as project delays, unusual combinations of system demand and equipment outages or availability, or specific equipment maintenance outages. A SPS may also be applied to preserve system integrity in the event of severe facility outages and extreme contingencies. The decision to employ a SPS shall take into account the complexity of the scheme and the consequences of correct or incorrect operation as well as its benefits. We are further of the opinion that specific methods of correcting system performance deficiencies should not be specified in a National Standard. We thus recommend that the Corrective Action List be eliminated from this requirement as illustrated below. 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance.</p> <p>R 2.7.2 We feel that this requirement and requirement R 2.1.4 adds ambiguity to the process as we have</p>

Organization	Yes/ No	Question 3 Comment
		<p>indicated above. We thus recommend that this requirement be eliminated.</p> <p>R 3.3.1 We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded”</p> <p>Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall: 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent: o Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.</p> <p>R 3.4.1 We would recommend the following addition as a clarification to the required information exchange: 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information. 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their respective Systems are included in the Contingency list.</p> <p>R 8.1 National Grid’s concern regarding this requirement stems from the apparent open ended time frame afforded report recipients in their review of the Planning Assessment. This has the potential to stall the review process. National Grid thus recommends that any recipient of the Planning Assessments be given a specific time period for their response as indicated in R 8.1 below. R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, and adjacent Transmission Planners, within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. [Violation Risk Factor: LowMedium] [Time Horizon: Long-term Planning] 8.1. The recipient of the Planning Assessment results shall provide documented final comments on the results within 90 calendar days of receipt of the Planning Assessment. The respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.</p> <p>Table 1 Steady State & Stability Performance Planning Events (Page10). The event description for</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>Category P2 Event 1. along with the accompanying footnote 7 (Page 14) creates some confusion for multi-terminal lines. We recommend that Footnote 7 be eliminated and the event description be changed as follows: Category Initial Conditions Event P2 Normal System 1. Opening of a single load interrupting device at one terminal of a line without a fault.</p> <p>Table 1 (Planning Events and Extreme Events) Footnote 12 (Page 14).We are concerned that additional stakeholder process indicated in Footnote 12 has the potential to stall the Planning Assessment review process. We recommend that reference to this new process be eliminated from the Footnote.Our additional concerns with Footnote 12 are addressed in comments originally provided by ISO-NE. We agree with their following comments : The following language for Footnote 12 is proposed:”Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems.”If Footnote 12 in Table 1 must be retained, the following language is proposed: “An objective of the planning process shall be to minimize the likelihood and magnitude of interruption of Demand, (excluding Interruptible Demand or Demand-Side Management), following Contingency events. However, it is recognized that Demand will be interrupted if it is directly served by the Elements removed from service as a result of the Contingency. Furthermore, in limited circumstances Demand may need to be interrupted to address BES performance requirements. When interruption of Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to: a. Interruptible Demand or Demand-Side Managementb. Circumstances where the uses of Demand interruption not directly interrupted by the contingency are documentedc. Curtailment of firm transfers is allowed to meet BES performance requirements and meet applicable Facility Ratings, where it can be demonstrated it does not result in the interruption of any Demand (other than Interruptible Demand or Demand Side Management)”</p>
<p>Response: Requirement R1, Part 1.1.2 – The SDT and a majority of industry stakeholder support the 6-month period stated in the requirement. No change made.</p> <p>Requirement R1, Part 1.1 – Same comment as above. No change made.</p> <p>Requirement R2, Part 2.1.4 – Requirement R2, Parts 2.1.4 and 2.4.3 are not inconsistent with Requirement R2, Part 2.7.2. With the various requirements, the planners are required to conduct multiple sensitivities. Therefore, Requirement R2, Part 2.7.2 could be used when the results of these multiple sensitivities identify common concerns. No change made.</p> <p>Requirement R2, Part 2.1.5 is intended to analyze the removal of a single piece of long lead time equipment (one year or more) to the extent there is no existing</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>spare equipment strategy to provide a means of returning to service (in less than one year) a comparable replacement. If this condition exists, then the facility (single element) in question must be removed in the model to establish a new P0 system condition and studies must then be run for P0, P1, and P2 for the new system scenario. The spare equipment strategy must be reviewed for the entity's system exposure to catastrophic failures resulting in the long lead-time facility outages, however, only one facility must be removed at a time if the condition exists for multiple facilities. A Transmission Planner may have no spare equipment strategy if they are able to demonstrate they are not responsible for any facilities which they believe could place them in a "long lead-time" scenario. No change made.</p> <p>Requirement R2, Part 2.2 - The requirement for an annual current steady-state study in the Long-Term Transmission Planning Horizon is intentional to drive earlier identification of potential Transmission performance limitations and earlier development of Corrective Action Plans. The study results can be used as qualified studies as they advance to later years, including moving to the Near-Term Transmission Planning Horizon. No change made.</p> <p>Requirement R2, Part 2.6 – The changes made to this requirement in the last draft were essentially style changes and the most substantive change is the introduction of documentation required to support the technical rationale for determining whether or not material changes have occurred. This was a recommendation made by the Quality Review process and agreed to by the SDT. No change made.</p> <p>Requirement R2, R2.7.1 – The SDT respectfully disagrees that actions that could be part of a Corrective Action Plan (CAP) should be eliminated. In regard to the concern of allowing SPS within the CAP, this view is not shared across the continent-wide footprint and National Grid and its Regional Entity always have the ability to go above and beyond the requirements of a NERC standard if they believe such action is warranted. No change made.</p> <p>Requirement R2, Part 2.7.2 - Requirement R2, Parts 2.1.4 and 2.4.3 are not inconsistent with Requirement R2, Part 2.7.2. With the various requirements, the planners are required to conduct multiple sensitivities. Therefore, Requirement R2, Part 2.7.2 could be used when the results of these multiple sensitivities identify common concerns. No change made.</p> <p>Requirement R3, Part 3.3.1 – The SDT appreciates the concern raised; however, it believes the subsequent tripping of "Transmission elements where relay loadability limits are exceeded" is warranted. The TPL studies may earlier identify and flag relay setting concerns based on required Long-Term Transmission Planning Horizon studies. Within the TPL standard, such a concern would have a Corrective Action Plan that would address the issue which would also meet the expectations of PRC-023. The SDT sees this as a defense in depth approach. No change made.</p> <p>Requirement R3, Part 3.4.1 – The additional information suggested was not implemented as it did not add to reliability or clarify the issue beyond the present wording. No change made.</p> <p>Requirement R8, Part 8.1 – The SDT does not see a reliability related need for the suggestion and believes a response regarding a Planning Assessment is warranted no matter when raised by the reviewing party. No change made.</p>

Organization	Yes/ No	Question 3 Comment
		<p>Table 1, footnote 7 – The SDT added the footnote to further explain its intent for P2-1 and to ensure that the planner assess the voltage of a load bus that was on a radial line. The word “possibly” was used since having load on a radial is not always the outcome of opening one end of a line section. No change made.</p> <p>Table 1, Footnote 12 – The SDT believes the stakeholder process provides a level of transparency needed when an entity intends to utilize provisions offered by footnote 12 (and footnote 9). No change made.</p>
TVA TP&C		<p>TVA - has following comments:TVA is concerned about footnote 12 (known as footnote b in existing TPL standards). TVA believes that utilities should be given some freedom in dropping local load in response to N-1 events as long as overall BES reliability is not impacted. Otherwise significant capital improvements will be required that will have no overall reliability gain for the Bulk Electric System.</p> <p>In R4.1.1, TVA is concerned that no generating unit (including distributed generation) shall pull out of synchronism in a local area only (thus not impacting the overall reliability of the BES) for Planning Event P1, while the standard does allow generator runback/tripping for the same event. Thus the generating unit may be tripped by a special protection scheme - but may not be tripped by an out of step relay. TVA believes that out of step relaying should be allowed for this unit tripping as long as this does not affect the overall reliability of the BES.</p> <p>Table 1 contains both planning events and extreme events. Suggest labeling the planning events as Table 1 and the extreme events as Table 2 to help reduce confusion.</p> <p>VSL for R1 does not seem to address issues where data errors have been introduced into the latest model data. Also, R1 and its VSL may be interpreted to exclude the use of past models.</p> <p>The Implementation Plan should include a five-year delay in the effective date for short circuit studies (R2 parts 2.3 and 2.8) since these studies are a new TPL requirement and are not required in the current version 0 standards.</p>
		<p>Response: The SDT has taken care to ensure consistency in footnote 12 (and footnote 9) with the prior footnote ‘b’ revision supported by industry, approved by the NERC Board of Trustees, and submitted for regulatory approval. No change made.</p> <p>Requirement R4, Part 4.1.1 - The SDT respectfully disagrees with the commenter. For a P1 single Contingency event, the SDT believes, and a majority of industry stakeholders find it reasonable, that no Bulk Electric System (BES) generation unit be pulled out of synchronism due to the P1 event studied. If the “small” nearby unit is served below threshold kV and MW size limitations set by the Regional Entity to qualify as a BES unit, the unit would not be within scope of the standard. No change made.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>Desire for Two Tables – This has been vetted within industry in prior comment/ballot periods. The majority of stakeholders support the current format. No change made.</p> <p>Requirement R1 VSL – The requirement indicates that supplied data may have to be supplemented as appropriate. The SDT believes that this covers correcting any data errors. The SDT sees no reason why the current language invalidates the use of past models as long as they meet the requirements. No change made.</p> <p>While short circuit study requirements may be new in the realm of mandatory enforceable standards, the SDT does not believe that they present a significant “raising of the bar” for industry. The SDT believes that prudent short circuit practices are effectively in place today to ensure safe operation of the equipment. Therefore, no extension in the Implementation Plan was made in regard to short circuit studies.</p>
Independent Electricity System Operator		See our response to Q1.
Response: See response to Q1.		
NBSO		<p>Items that, if not addressed, will likely cause a negative vote from NBSO:</p> <p>NBSO believes that R1.1.2 is more appropriately addressed in the operational timeframe. Perhaps more appropriate alternatives could include:-only considering planned outages with durations of one year or more (in-line with typical planning timeframes), or -requiring that facilities with planned outages lasting over the complete duration of time period being studied be modeled out of service.</p> <p>R2.1.5 may significantly increase the demands of the planning assessments with little gain in reliability. Depending on interpretation, R2.1.5 could exponentially increase the work load of the annual planning assessment. NBSO interprets the intent of R2.1.5 to require that entities have, review and evaluate their spare equipment strategies. Perhaps the assessment of a spare equipment strategy would be more appropriately addressed in a separate standard.</p> <p>Further, categories P0, P1 and P2 do not reference footnote 9 in the Initial Condition column. NBSO is unclear if the last sentence of R2.1.5 allows for the curtailment of firm transmission service under the N-1 conditions before the application of category P0, P1 and P2 events. This last sentence states:”...with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.”</p> <p>Table 1, note b should be modified to allow for the loss of Firm Transmission Service. This addresses cases where Firm Transmission Service is lost in direct consequence to the event (e.g. loss of one DC pole, an</p>

Organization	Yes/ No	Question 3 Comment
		<p>interface comprised of a single line, a bus fault that clears multiple lines in an interface, etc...)</p> <p>Individual items that, if not addressed, may not cause NBSO to vote Negative, but in combination may result in a negative vote: The definitions of “near-term transmission planning horizon” and “year one” have been removed from the standard, yet they are still used in draft 7. Further, the definition of these terms is being filed as part of another project. NBSO is concerned with endorsing a standard based on terms whose definitions may change independently of this project.</p> <p>For R7, NBSO is concerned that one entity may be found noncompliant should another entity fail to meet their agreed upon responsibilities. For example, a PC may be relying on the results from a TP’s studies to complete its own planning assessment, but the TP did not meet their responsibilities. In this case, the PC should not be found non-compliant for an incomplete planning assessment due to the failure of the TP to meet their responsibilities. Contingencies on back to back HVDC facilities are not addressed in the standard.</p>
<p>Response: Requirement R1, Part 1.1.2 - The SDT disagrees with the view that outages of 6 months or more should only be reviewed in the operations timeframe. Such an outage could be for an upcoming construction project requiring certain facilities to be removed from service for long durations of time and those situations should be evaluated with sufficient lead time to determine any vulnerabilities and development of sufficient Corrective Action Plans as required. No change made.</p> <p>Requirement R2, Part 2.1.5 is intended to analyze the removal of a single piece of long lead time equipment (one year or more) to the extent there is no existing spare equipment strategy to provide a means of returning to service (in a less than one year) a comparable replacement. If this condition exists, then the facility (single element) in question must be removed in the model to establish a new P0 system condition and studies must then be run for P0, P1, and P2 for the new system scenario. The spare equipment strategy must be reviewed for the entity’s system exposure to catastrophic failures resulting in the long lead-time facility outages, however, only one facility must be removed at a time if the condition exists for multiple facilities. A Transmission Planner may have no spare equipment strategy if they are able to demonstrate they are not responsible for any facilities which they believe could place them in a “long lead-time” scenario. No change made.</p> <p>Requirement R2, Part 2.1.5 & Footnote 9 – Footnote 9 is not applicable to the Initial Condition (Pre-contingency) of P0, P1, and P2 even with a long lead-time device out of service. No change made.</p> <p>Table 1, footnote ‘b’ - The SDT believes the concern should be addressed by footnote 4, Conditional Firm Transmission Service. No change made.</p> <p>Removal of Definitions - Two previously proposed definitions that were part of this project were moved to another standard development project – Project 2010-10 titled “FAC Order 729”. The two definitions, “Near-Term Transmission Planning Horizon” and “Year One” were approved by the Board of Trustees on January 24, 2011.</p> <p>Requirement R7 – The SDT disagrees, having documented clear lines of responsibility should protect against the concern raised. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>Back to Back HVDC – The contingent loss of back to back HVDC facilities is included as a transformer. Footnote 5 states, in part, that “Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers. Therefore, the SDT has not explicitly included back-to-back HVDC as a separate Contingency. No change made.</p>
Xcel Energy		<p>Effective Date: The effective date section seems to imply that Non-Consequential Load Loss will not be permitted after the 84 month implementation period. We do not believe that was the drafting team’s intent and request that it be modified.</p> <p>Footnote # 12 in Table 1, in particular, seems to support our assumption that the team did not intend to disallow it. For reference, the footnote states:”12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.” However, if it was the drafting team’s intent to not allow Non-consequential Load Loss after the 84 month implementation period, we disagree and ask the team to reconsider. Particularly for rural areas, in some cases, this will be the only action possible.</p> <p>R2.1.4: a) We would like to see clarification on the term “sensitivity analysis”. Is this in reference to seasonal models and differences in fuel availability? We would like more detail on how this is to be done so that it won’t be left up to interpretation.</p> <p>b) We would like the drafting team to consider stratification of the tasks needed to perform a Planning Assessment. In our opinion, having both the TP and PC do exactly the same study produces tremendous and unnecessary duplication. Without stratification, the TPL-001 standard will continue to perpetuate the same paradigm used in the existing TPL-001 through TPL-004 standards. The NERC Functional Model makes a clear distinction between PC and TP functions/responsibilities. It is not clear why that distinction is not leveraged in the new TPL-001 standard. This will be particularly troublesome in areas where an ISO or RTO is the Planning Coordinator. In order for the RTO/ISO, as the PC, to be able to do their Planning Assessment, the Transmission Planners would have to provide a lot of detailed input data. So, in effect, both the PC and TP would be performing their assessment from the same data. It would make more sense if the RTO (as the PC) performed the required studies on the 500-345 kV network and the TP performed the required studies on everything below 230 KV.</p>

Organization	Yes/ No	Question 3 Comment
		<p>We also recommend the allowance for utilization of a regional assessment, instead of performing your own, due to individual entity resource constraints.</p> <p>R2.4.1: We would like to see better clarity on what an Aggregate system load model is and how granular it should be. If the intent is for the model to contain a very detailed representation of the load system, then it may take a longer time to implement.</p> <p>R3.4.1: a) This type of coordination could be difficult due to other adjacent entities on different schedules and some may not have the amount of detail to incorporate into another's processes. We know this is generally covered in coordination of real time operations and wonder if it is appropriate to require this type of coordination in the long term process. Is there already an operational standard that covers this? Would it be better to address this in the operational standards? We would like the roles of the coordinators vs. the planners to be clarified in order to ensure that no work is being duplicated.</p> <p>b) PC's between regions, such as RTOs, are already coordinating for long term studies. In these cases, we feel the PC should alone be responsible for the requirements, rather than also the TPs.</p> <p>c) Can we get a clear definition of what apparent impedance swings means? We interpret it as rotor angle stability.</p> <p>R4.3.1: We would like to see that the detailed data is incorporated back into the NERC modeling processes and create a more detailed model with better accuracy.</p> <p>R8: We do not agree with the requirement to provide the assessment to every adjacent PC and TP because we fail to see the reliability benefit in doing so. However, we do agree that the PC and TP should be required to provide the assessment to any of these entities, if requested. Additionally, for entities that make such requests, we would like to have 90 days instead of 30 to respond. In many cases a non-disclosure agreement will have to be executed due to CEII classification of some information, and this can take several months.</p>
<p>Response: Effective Date - The SDT believes the Effective Date section is sufficiently clear. The use of Non-Consequential Load Loss while discouraged by the standard is permitted when justified and presented in a transparent manner to other stakeholders (footnote 12). No change made.</p> <p>Sensitivity Analysis – This analysis should be viewed as a modified study of the Peak or off-peak studies required in Requirement R2, Parts 2.1.1 and 2.1.2. The SDT believes the examples provided in the bulleted list of Requirement R2, Part 2.1.4 are sufficiently clear as examples of what could be modified to create the sensitivity model. No change made.</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>Delineation of tasks between Transmission Planner and Planning Coordinator – The issue raised is addressed by Requirement R7. No change made.</p> <p>Regional Assessments – The standard does not prohibit the use of valid studies performed by 3rd parties for use in the assessment results. No change made.</p> <p>Requirement R2, Part 2.4.1 - The “aggregate” dynamic Load model may include high-level assumptions on Load profiles for industrial, commercial, and residential Loads that are applied generically across the planning area study based on the planner’s engineering judgment and system knowledge. The model is not required to be “bus” specific. No change made.</p> <p>Requirement R3, Part 3.4.1 - The SDT envisions that knowledge of the applicable Contingencies on neighboring systems would develop over time and be discovered with the results being distributed in Requirement R8. The SDT believes that this is an important improvement to the planning timeframe analysis and that system information learned in the operations environment should most certainly be considered to the extent it improves the robustness of the planning assessment. No change made.</p> <p>Planning Coordinator responsibility – NERC’s Functional Model clearly places Transmission planning responsibility both on the Transmission Planner and Planning Coordinator. Requirement R7 should help alleviate any overlap concerns in responsibility. No change made.</p> <p>Apparent Impedance Swings - The “apparent impedance swing” is the trajectory of changes in the apparent impedance seen by a distance relay for various system and Fault conditions. In the case contemplated in Requirement R4, Part 4.1.2, it is the trajectory seen by the distance relay for the initial Fault and the subsequent generator(s) pulling out of synchronism. If that trajectory were to come within the tripping characteristic of the relay for a sufficient length of time, the relay would cause its associated line to trip. No change made.</p> <p>NERC Modeling Process – The standard does not govern NERC actions as they are not a registered entity. To the extent NERC pulls information from a model building process such as MMWG (ERAG) then the models used by NERC will likely contain the information desired. No change made.</p> <p>Requirement R8 – The SDT and a majority of industry support Requirement R8. No change made.</p>
ISO New England Inc.		<p>We feel previous comments have largely been ignored by the Standards Drafting Team leading to a lack of support for the standard. Overall the standard should be more precise in its language. The following comments are provided for serious consideration with respect to revisions:Comments: From Section A.3 - the introduction please strike the word “probable” as shown below Purpose: Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies This is deterministic contingency testing and this word introduces probability into the standard where it does not belong.</p> <p>For R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be acceptable. Duration of known outages should be increased from six months to one year.</p> <p>For R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.</p> <p>REMOVE INTERCHANGE from 1.1.5 - Definition of Interchange - The inclusion of Interchange requires designing for non-Firm service. In the NERC Glossary of Terms Used the term Interchange is defined as "Energy transfers that cross Balancing Authority boundaries." It is meant to refer to energy transaction other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and are deemed highly interruptible and subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability under TPL-001.</p> <p>Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited or no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple condition sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed or revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.</p> <p>We agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study."</p> <p>For 2.7.1 - We don't believe this list provides value nor should it be included in the standard.</p> <p>Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded.”</p> <p>In Table 1 - The fault descriptions must be clear. They must use “3-phase”, “single-phase-to ground”, or “2-phases-to ground” in the descriptions of a fault rather than SLG (a line is not a phase in electrical terms-- single line to ground is not precise enough).</p> <p>In Table 1 - Where two elements are affected by a fault it must be clear whether the requirement is for a single-phase-to ground fault, or a 2-phase-to ground fault. They are different faults that will have different dynamic responses.</p> <p>For Table 1- add a footnote for the term generator to address the treatment of Combined Cycle Generators - “In addition to evaluating the loss of a single generator, the loss of all interrelated generators shall also be considered as a single contingency.” Operating experience has shown that trips of the entire CC facility often occur even on facilities that claim the combined cycle generators are independent.</p> <p>Where a category involves an initial condition representing the loss of a facility followed by an event representing the loss of a facility such as P3, the standard must be clear as to the amount of time assumed between faults. An assumption may be 30 minutes, but the standard must not leave this unsaid. This clarity must be provided in the Table 1</p> <p>Notes. In addition, the standard must be clear on the allowable re-adjustments between contingencies such as P3, or better, must be clearly limit the permissible re-adjustments. For example, it is not realistic to assume an unlimited amount of re-dispatch between faults-e.g. the allowable re-adjustment should be limited to actions that can be effectively implemented in less than 30 minutes, such as a, b, c, d,, and the amount of generation re-dispatch must not exceed the amount of future planned contingency reserve, or similar language. This clarity must be derivable from the Table 1 Notes.</p>
<p>Response: A.3 Purpose Statement – While admittedly “probable” is somewhat in the eye of the beholder the intent is that Bulk Electric System (BES) should operate reliably for the more “probable” or “credible” Contingencies, i.e., Planning Events (Table 1), and that the BES reliability performance expectation is lower for the less “probable” extreme events. The SDT does not see this statement as defining the standard as probabilistic Contingency planning and agrees that the standard is deterministic planning. No change made.</p> <p>Requirement R2, Part 1.1.2 – The SDT disagrees that the duration of known outages should be increased from 6 months to one year. The intent is to ensure review of an upcoming construction project requiring certain facilities to be removed from service for long durations of time and those situations should be evaluated with sufficient lead time to determine any vulnerabilities and development of sufficient Corrective Action Plans (CAP) as required. The SDT believes it is</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>appropriate to study all planning events for the projected system and not limit it to just P0, P1. or P2. Load shedding could be part of a “temporary” CAP when justified by the use of footnote 12. No change made.</p> <p>Requirement R1, Part 1.1.6 - The SDT does not believe the phrase “required for Load” is confusing. Without the statement, in theory, one could have a model with lots of supply resources but none which are dispatched to serve the Load. The term Load does not depict whether it is located internal or external to the Transmission system footprint. No change made.</p> <p>Requirement R1, Part 1.1.5 – Both firm and non-firm transfers of power should be modeled to the extent they are “known commitments” in the Planning Horizon. The short duration transactions described would likely not be known and therefore should not be included in a planning model. No change made.</p> <p>Requirement R2, Part 2.1.4 – the commenter has missed the key phrase “... by a sufficient amount to stress the System ...”. So, by definition of the requirement the sensitivity analysis is not intended to lower the overall stress of the system being analyzed. Additionally, Requirement R2, Parts 2.1.4 and 2.4.3 are not inconsistent with Requirement R2, Part 2.7.2. With the various requirements, the planners are required to conduct multiple sensitivities. Therefore, Requirement R2, Part 2.7.2 could be used when the results of these multiple sensitivities identify common concerns. No change made.</p> <p>Requirement R2, Part 2.2 - The requirement for an annual current steady-state study in the Long-Term Transmission Planning Horizon is intentional to drive earlier identification of potential transmission performance limitations and earlier development of Corrective Action Plans (CAPs). The study results can be used as qualified studies as they advance to later years, including moving to the Near-Term Transmission Planning Horizon. No change made.</p> <p>Requirement R2, R2.7.1 – The SDT respectfully disagrees that example actions that could be part of a Corrective Action Plan (CAP) should be eliminated. If an entity takes issue with the use of one of the stated items as part of a CAP, they are always free to go above and beyond the requirements of a NERC standard if they believe such action is warranted. No change made.</p> <p>Requirement R3, Part 3.3.1 – The SDT appreciates the concern raised; however, it believes the subsequent tripping of “Transmission elements where relay loadability limits are exceeded” is warranted. The TPL studies may earlier identify and flag relay setting concerns based on required Long-Term Transmission Planning Horizon studies. Within the TPL standard, such a concern would have a CAP that would address the issue which would also meet the expectations of PRC-023. The SDT sees this as a defense in depth approach. No change made.</p> <p>Fault Types – Only single line to ground (SLG) and three-phase (3PH) fault types are covered by the standard. See Table 1, footnote 2 for further information on fault types and standard expectations. No change made.</p> <p>Combined Cycle Plants – If the planner believes it is appropriate to model the tripping of the combined cycle generation as a set then they should do so. Recall, in planning assessments, you are analyzing Contingency events based on electrical Faults and the SDT reminds the commenter that adherence to introductory Table 1 note “c” is required. Additionally, to the extent the combined cycle units deliver their power via a common GSU transformer the loss of the GSU should also address the concern. No change made.</p> <p>System Adjustments – The timing between events which are not common mode events (P3, P6) is not defined by the standard. Engineering judgment should</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>prevail and if the planner believes a susceptibility to an N-2 event of quick duration places their system at risk then the use of automatic controls should be considered. The only qualifier on System adjustments is that Facility Ratings must be adhered to during the adjustment. So, if you are adhering to a 30-minute Emergency Rating, but are exceeding a 24-hour Emergency Rating then the adjustment must be completed within the time limitation of the rating. No change made.</p>
Northeast Utilities		<p>The following previous comments that were filed by NU were not addressed by the SDT in the current draft. For NU to support the standard these comments should be addressed or reasons should be provided why they have not been addressed. Repeated below are NU’s comments that were filed for the previous draft.</p> <p>Requirement R1, Part 1.1.2 NU requests that the six month duration stated by Requirement R1, Part 1.1.2 should be modified to one year duration to eliminate outages that occur within the “operational planning timeframe”.</p> <p>Requirement R1, Part 1.1.6The phrase "required for Load" should be deleted as this confuses the issue.Requirement R2, Part 2.2The language of Requirement R2</p> <p>Part 2.2 seems to suggest that current annual studies are always required for the long-term steady state assessment. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1.</p> <p>Requirement R2, Parts 2.1.4 & 2.4.31) The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.</p> <p>2) Requirement R2, Part 2.1.4 and Part 2.4.3 should clarify what is meant by multiple sensitivity studies and one sensitivity study. Will varying only one measurable quantity several times in multiple simulations constitute multiple sensitivity studies or one sensitivity study?</p> <p>Requirement R3, Part 3.3.1NU feels that the last sentence of Requirement R3, Part 3.3.1 should be removed since this is handled by PRC-023. Line ratings are addressed by PRC-023 which requires coordination with the Reliability Coordinator. NU suggests the removal of the following sentence: “Tripping of Transmission elements where relay loadability limits are exceeded.”</p>
<p>Response: Requirement R1, Part 1.1.2 - The SDT disagrees with the view that outages of 6 months or more should only be reviewed in the operations timeframe. Such an outage could be for an upcoming construction project requiring certain Facilities to be removed from service for a long durations of time and those situations should be evaluated with sufficient lead time to determine any vulnerabilities and development of sufficient Corrective Action Plans as required. The</p>		

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>review of known and planned construction items should not be delayed until the operations timeframe. No change made.</p> <p>Requirement R1, Part 1.1.6 - The SDT does not believe the phrase “required for Load” is confusing. Without the statement, in theory, one could have a model with lots of supply resources but none which are dispatched to serve the load. No change made.</p> <p>Requirement R2, Part 2.2 - The requirement for an annual current steady-state study in the Long-term Transmission Planning Horizon is intentional to drive earlier identification of potential Transmission performance limitations and earlier development of Corrective Action Plans (CAP). The study results can be used as qualified studies as they advance to later years, including moving to the Near-Term Transmission Planning Horizon. No change made.</p> <p>Requirement R2, Parts 2.1.4 & 2.4.3 – The “base case” assumption is described in Requirement R1 by the fact that the P0 model “shall represent the projected System conditions” for the study period. That essentially establishes the “base case” condition. The sensitivity analysis in Requirement R2, Part 2.1.4 is intended to address some potential “what if” conditions that the planner should consider as an alternate base P0 condition. The SDT believes Requirement R2, Part 2.1.4 provides sufficient detail and clarity of the intended purpose of a sensitivity study and defers to engineering judgment in how the alternate base (sensitivity) model is established. Varying one variable multiple times would cover multiple sensitivities. For example, one may vary the Load modeled. If the base condition is a 50/50 forecast model, one sensitivity may be an 80/20 forecast, while yet another is a 90/10 forecast model. No change made.</p> <p>Requirement R3, Part 3.3.1 – The SDT appreciates the concern raised; however, it believes the subsequent tripping of “Transmission elements where relay loadability limits are exceeded” is warranted. The TPL studies may earlier identify and flag relay setting concerns based on required Long-Term Transmission Planning Horizon studies. Within the TPL standard, such a concern would have a CAP that would address the issue which would also meet the expectations of PRC-023. The SDT sees this as a defense in depth approach. No change made.</p>
MISO		<p>Overall, we remain concerned that the revisions to the TPL standard are not on balance an improvement to the original. The document is not well organized topically, making it more difficult to navigate and understand. If the primary improvements sought in requirements for reliability planning were to increase system performance levels (no loss of firm demand) for certain multiple contingency events, and to ensure more stressed system sensitivities are analyzed, this can be accomplished in a much simpler revision. We do not believe that this standard as written improves the clarity of what is required, and therefore provides an opportunity for greater disputes between compliance monitors and applicable entities, and this is not a positive outcome. We also believe that the standard is too prescriptive as to what critical system conditions must be modeled, as these conditions vary considerably from system to system and within large systems.</p> <p>Table 1-Steady State and Stability Performance Planning Events, Category P5, now includes “non-redundant” relay in the Event column. What is meant by non-redundant relay? It is unclear if the SDT’s intent is to provide distinction between a back-up relay and a redundant relay. We recommend that the SDT provide a definition for the term “non-redundant”.</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
Consumers Energy	Ballot Comment	We agree with comments submitted by MISO
<p>Response: The SDT and others in industry hold a different opinion in regards to the standard. The SDT refers you to the comments provided by Transmission Strategies, LLC which well articulates what it believe is the opinion of many in industry evidenced by the 74% approval during the last ballot. Transmission Strategies, LLC states “The SDT, Observers, and the Industry as a whole have put a tremendous amount of thought and work into the development of this latest draft. While nobody should claim that this latest version is perfect, it is far clearer, more in tune with current industry needs, and much improved compared to the existing approved Standards that it will replace”. No change made.</p> <p>Redundant Relay – Redundant means duplicate capability resulting in the same outcome. The redundant relay is not the same as a back-up relaying capability which may result in more Facilities being removed for failure of the primary/redundant relay to operate as designed. The SDT believes this concept is widely understood by most in industry and does not see the need for a NERC Glossary Definition. No change made.</p>		
New York Independent System Operator		Requirement R2.4.1The NYISO, along with many other systems, has not determined a need to model dynamic loads, and therefore has not benchmarked any such models. The NYISO recommends that prior to the implementation of this requirement a modeling standard should exist that is specific to dynamic loads, including as assessment for the need for dynamic load models.
<p>Response: Requirement 2, Part 2.4.1 – One focus of the dynamic Load model requirement in Requirement R2, Part 2.4.1 is “considering the behavior of induction motor load”. The areas of concern for induction motor load are the Peak load periods since Fault Induced Delayed Voltage Recovery (FIDVR) is primarily a concern at a high load levels with a high penetration of induction motor loads. The SDT has spelled out this requirement in the Peak Load studies but did not include the explicit requirement, with focus on induction motor load, for the other load periods. Even though the standard doesn’t have the explicit requirement for other load levels, Requirement R1 includes the statement “shall represent projected System conditions”, so the planner cannot ignore the dynamic behavior of the load for those other load periods. No change made.</p>		
Ameren		<p>With respect to Requirement R8, will posting the assessment to a secure web site meet the intent of the requirement? What are the Planning Assessment results identified in R8, and how are they different from the Planning Assessment?</p> <p>It appears that the language for R8 is inconsistent with the VSL for R8. The revised language for the VSL for R8 has removed the word “results”.</p> <p>For Measurements M3 and M4, there is still some question as to what is to be provided as sufficient evidence of a study. It is not clear whether the study results would be sufficient, or whether the entire powerflow,</p>

Consideration of Comments on Assess Transmission Future Needs and Develop Transmission Plans — Project 2006-02

Organization	Yes/ No	Question 3 Comment
		<p>stability, or short circuit effort needs to be documented in a formal study report. For example, it is not clear whether contingency lists used in performing the study work would need to be retained as part of the documentation.</p> <p>The items listed as 4.1.1 through 4.1.3 are not requirements but are performance criteria and should be included in the Table 1 only, consistent with the other performance criteria.</p> <p>Overall, we believe that this standard does not improve the clarity of what is required, and would give additional occasions for disputes between compliance monitors and various registered entities. The standard as written is too prescriptive with regard to critical system conditions which are to be modeled. Such conditions would vary considerably for different systems across the continent.</p>
<p>Response: Requirement R8 – Posting results to a secure website with adequate communication that the results are available for review would suffice for Requirement R8. The “Planning Assessment” and “Planning Assessment results” are one and the same. No change made.</p> <p>Measures M3 and M4 – The evidence could be a combination of summary documented results, the power flow case itself, the Contingency lists, output files showing evidence of the Contingency analysis being performed, etc. No change made.</p> <p>The SDT believes the items in Requirement R4, Parts 4.1.1 through 4.1.3 are properly located. The standard is the sum of the parts – requirements and the Table and the location of the highlighted items is not critical to the desired outcome. No change made.</p> <p>Clarity of the standard - The SDT and others in industry hold a different opinion in regard to the standard. The SDT refers you to the comments provided by Transmission Strategies, LLC which well articulates what it believes is the opinion of many in industry evidenced by the 74% approval during the last ballot. Transmission Strategies, LLC states “The SDT, Observers, and the Industry as a whole have put a tremendous amount of thought and work into the development of this latest draft. While nobody should claim that this latest version is perfect, it is far clearer, more in tune with current industry needs, and much improved compared to the existing approved Standards that it will replace”. No change made.</p>		

A. Introduction

- 1. Title:** Data From the Regional Reliability Organization Needed to Assess Reliability
- 2. Number:** TPL-006-0.1
- 3. Purpose:** To ensure that each Regional Reliability Organization complies with planning criteria, for assessing the overall reliability (Adequacy and Security) of the interconnected Bulk Electric Systems, both existing and as planned.
- 4. Applicability:**
 - 4.1.** Regional Reliability Organization
- 5. Effective Date:** April 1, 2005

B. Requirements

- R1.** Each Regional Reliability Organization shall provide, as requested (seasonally, annually, or as otherwise specified) by NERC, system data, including past, existing, and future facility and Bulk Electric System data, reports, and system performance information, necessary to assess reliability and compliance with the NERC Reliability Standards and the respective Regional planning criteria.

The facility and Bulk Electric System data, reports, and system performance information shall include, but not be limited to, one or more of the following types of information as outlined below:

- R1.1.** Electric Demand and Net Energy for Load (actual and projected demands and Net Energy for Load, forecast methodologies, forecast assumptions and uncertainties, and treatment of Demand-Side Management.)
- R1.2.** Resource Adequacy and supporting information (Regional assessment reports, existing and planned resource data, resource availability and characteristics, and fuel types and requirements.)
- R1.3.** Demand-Side resources and their characteristics (program ratings, effects on annual system loads and load shapes, contractual arrangements, and program durations.)
- R1.4.** Supply-side resources and their characteristics (existing and planned generator units, Ratings, performance characteristics, fuel types and availability, and real and reactive capabilities.)
- R1.5.** Transmission system and supporting information (thermal, voltage, and Stability Limits, contingency analyses, system restoration, system modeling and data requirements, and protection systems.)
- R1.6.** System operations and supporting information (extreme weather impacts, Interchange Transactions, and Congestion impacts on the reliability of the interconnected Bulk Electric Systems.)
- R1.7.** Environmental and regulatory issues and impacts (air and water quality issues, and impacts of existing, new, and proposed regulations and legislation.)

Measures

- M1.** The Regional Reliability Organization shall provide evidence to its Compliance Monitor that it provided Regional system data, reports, and system performance information per Reliability Standard TPL-006-0_R1.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: NERC.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Requested Regional system data, reports, or system performance information were incomplete.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Requested Regional system data, reports, or system performance information were not provided.

D. Regional Differences

- 1.** None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0.1	April 15, 2009	Corrected formatting for M1.	Errata

A. Introduction

1. **Title:** **Regional and Interregional Self-Assessment Reliability Reports**
2. **Number:** TPL-005-0
3. **Purpose:** To ensure that each Regional Reliability Organization complies with planning criteria, for assessing the overall reliability (Adequacy and Security) of the interconnected Bulk Electric Systems, both existing and as planned.
4. **Applicability:**
 - 4.1. Regional Reliability Organization
5. **Effective Date:** April 1, 2005

B. Requirements

- R1.** Each Regional Reliability Organization shall annually conduct reliability assessments of its respective existing and planned Regional Bulk Electric System (generation and transmission facilities) for:
 - R1.1.** Current year:
 - R1.1.1.** Winter.
 - R1.1.2.** Summer.
 - R1.1.3.** Other system conditions as deemed appropriate by the Regional Reliability Organization.
 - R1.2.** Near-term planning horizons (years one through five). Detailed assessments shall be conducted.
 - R1.3.** Longer-term planning horizons (years six through ten). Assessment shall focus on the analysis of trends in resources and transmission Adequacy, other industry trends and developments, and reliability concerns.
 - R1.4.** Inter-Regional reliability assessments to demonstrate that the performance of these systems is in compliance with NERC Reliability Standards TPL-001-0, TPL-002-0, TPL-003-0, TPL-004-0 and respective Regional transmission and generation criteria. These assessments shall also identify key reliability issues and the risks and uncertainties affecting Adequacy and Security.
- R2.** The Regional Reliability Organization shall provide its Regional and Inter-Regional seasonal, near-term, and longer-term reliability assessments to NERC on an annual basis.
- R3.** The Regional Reliability Organization shall perform special reliability assessments as requested by NERC or the NERC Board of Trustees under their specific directions and criteria. Such assessments may include, but are not limited to:
 - R3.1.** Security assessments.
 - R3.2.** Operational assessments.
 - R3.3.** Evaluations of emergency response preparedness.
 - R3.4.** Adequacy of fuel supply and hydro conditions.
 - R3.5.** Reliability impacts of new or proposed environmental rules and regulations.

Standard TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports

R3.6. Reliability impacts of new or proposed legislation that affects, has affected, or has the potential to affect the Adequacy of the interconnected Bulk Electric Systems in North America.

C. Measures

M1. The Regional Reliability Organization shall provide evidence to its Compliance Monitor that annual Regional and Inter-Regional assessments of reliability for seasonal, near-term, and longer-term planning horizons, and special assessments, were developed and provided as requested by other Regional Reliability Organizations or NERC.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: NERC.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Regional, Inter-Regional, and/or special reliability assessments were provided as requested, but were incomplete.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Regional, Inter-Regional, and/or special reliability assessments were not provided.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

A. Introduction

- 1. Title:** System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)
- 2. Number:** TPL-004-1
- 3. Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
- 4. Applicability:**
 - 4.1.** Planning Authority
 - 4.2.** Transmission Planner
- 5. Effective Date:** The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective

B. Requirements

- R1.** The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is evaluated for the risks and consequences of a number of each of the extreme contingencies that are listed under Category D of Table I. To be valid, the Planning Authority’s and Transmission Planner’s assessment shall:
 - R1.1.** Be made annually.
 - R1.2.** Be conducted for near-term (years one through five).
 - R1.3.** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category D contingencies of Table I. The specific elements selected (from within each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1.** Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
 - R1.3.2.** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
 - R1.3.3.** Be conducted annually unless changes to system conditions do not warrant such analyses.
 - R1.3.4.** Have all projected firm transfers modeled.
 - R1.3.5.** Include existing and planned facilities.

R1.3.6. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.

R1.3.7. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.8. Include the effects of existing and planned control devices.

R1.3.9. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Consider all contingencies applicable to Category D.

R2. The Planning Authority and Transmission Planner shall each document the results of its reliability assessments and shall annually provide the results to its entities' respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment for its system responses as specified in Reliability Standard TPL-004-1_R1.

M2. The Planning Authority and Transmission Planner shall provide evidence to its Compliance Monitor that it reported documentation of results of its reliability assessments per Reliability Standard TPL-004-1_R1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: A valid assessment, as defined above, for the near-term planning horizon is not available.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Not applicable.

B. Regional Differences

1. None identified.

1. Generator	3. Transformer					
2. Transmission Circuit	4. Bus Section					

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or System Voltage Limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

A. Introduction

1. **Title:** System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
2. **Number:** TPL-003-1a
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.
4. **Applicability:**
 - 4.1. Planning Authority
 - 4.2. Transmission Planner
5. **Effective Date:** The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission systems is planned such that the network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand Levels over the range of forecast system demands, under the contingency conditions as defined in Category C of Table I (attached). The controlled interruption of customer Demand, the planned removal of generators, or the Curtailment of firm (non-recallable reserved) power transfers may be necessary to meet this standard. To be valid, the Planning Authority and Transmission Planner assessments shall:
 - R1.1. Be made annually.
 - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
 - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1. Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
 - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

- R1.3.3.** Be conducted annually unless changes to system conditions do not warrant such analyses.
 - R1.3.4.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
 - R1.3.5.** Have all projected firm transfers modeled.
 - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system demands.
 - R1.3.7.** Demonstrate that System performance meets Table 1 for Category C contingencies.
 - R1.3.8.** Include existing and planned facilities.
 - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet System performance.
 - R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
 - R1.3.11.** Include the effects of existing and planned control devices.
 - R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those Demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category C.
- R1.5.** Consider all contingencies applicable to Category C.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-003-1_R1, the Planning Authority and Transmission Planner shall each:
 - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
 - R2.1.1.** Including a schedule for implementation.
 - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
 - R2.1.3.** Consider lead times necessary to implement plans.
 - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these Reliability Assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-003-1_R1 and TPL-003-1_R2.

- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-003-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

- 1.** None identified.

Version History

Breaker (failure or internal Fault) <hr/> <ol style="list-style-type: none"> 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization. 	<p>Evaluate for risks and consequences.</p> <ul style="list-style-type: none"> ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.
---	--	--

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2
Received from MISO on August 9, 2007:**

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

A. Introduction

1. **Title:** **System Performance Following Loss of a Single Bulk Electric System Element (Category B)**
2. **Number:** TPL-002-1b
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
4. **Applicability:**
 - 4.1. Planning Authority
 - 4.2. Transmission Planner
5. **Effective Date:** The application of revised Footnote 'b' in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote 'b' remains in effect until the revised Footnote 'b' becomes effective.

B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I. To be valid, the Planning Authority and Transmission Planner assessments shall:
 - R1.1. Be made annually.
 - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
 - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1. Be performed and evaluated only for those Category B contingencies that would produce the more severe System results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
 - R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.
 - R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

- R1.3.4.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
 - R1.3.5.** Have all projected firm transfers modeled.
 - R1.3.6.** Be performed and evaluated for selected demand levels over the range of forecast system Demands.
 - R1.3.7.** Demonstrate that system performance meets Category B contingencies.
 - R1.3.8.** Include existing and planned facilities.
 - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
 - R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
 - R1.3.11.** Include the effects of existing and planned control devices.
 - R1.3.12.** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category B of Table I.
- R1.5.** Consider all contingencies applicable to Category B.
- R2.** When System simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-002-1_R1, the Planning Authority and Transmission Planner shall each:
 - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:
 - R2.1.1.** Including a schedule for implementation.
 - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
 - R2.1.3.** Consider lead times necessary to implement plans.
 - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of its Reliability Assessments and corrective plans and shall annually provide the results to its respective Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-1_R1 and TPL-002-1_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-002-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

1. Generator	3. Transformer					
2. Transmission Circuit	4. Bus Section					

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

- R1.3** Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).
- R1.3.2** Cover critical system conditions and study years as deemed appropriate by the responsible entity.
- R1.3.12** Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

**Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2
Received from MISO on August 9, 2007:**

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed “Planning Coordinator” (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former “Planning Authority” name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

- Under the Functional Model, the Planning Coordinator “Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system” while the Transmission Planner “Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans.” A PC’s selection of “critical system conditions” and its associated generation dispatch falls within the purview of “methodology.”

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2].”

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a “valid assessment” means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term “planned outages” means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a “contingency” as defined in the *NERC Glossary of Terms Used in Standards*.

Appendix 2

Requirement Number and Text of Requirement
<p>R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).</p> <p style="padding-left: 40px;">R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.</p>
Background Information for Interpretation
<p>Requirement R1.3 and sub-requirement R1.3.10 of standard TPL-002-0a contain three key obligations:</p> <ol style="list-style-type: none"> 1. That the assessment is supported by “study and/or system simulation testing that addresses each the following categories, showing system performance following Category B of Table 1 (single contingencies).” 2. “...these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).” 3. “Include the effects of existing and planned protection systems, including any backup or redundant systems.” <p><i>Category B of Table 1 (single Contingencies) specifies:</i></p> <p>Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing:</p> <ol style="list-style-type: none"> 1. Generator 2. Transmission Circuit 3. Transformer <p>Loss of an Element without a Fault.</p> <p>Single Pole Block, Normal Clearing^e:</p> <ol style="list-style-type: none"> 4. Single Pole (dc) Line <p><i>Note e specifies:</i></p> <p>e) Normal Clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.</p> <p>The NERC Glossary of Terms defines Normal Clearing as “A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.”</p>
Conclusion
<p>TPL-002-0a requires that System studies or simulations be made to assess the impact of single Contingency operation with Normal Clearing. TPL-002-0a R1.3.10 does require that all elements expected to be removed from service through normal operations of the Protection Systems be removed in simulations.</p> <p>This standard does not require an assessment of the Transmission System performance due to a Protection System failure or Protection System misoperation. Protection System failure or Protection System misoperation is addressed in TPL-003-0 — System Performance following Loss of Two or More Bulk</p>

Electric System Elements (Category C) and TPL-004-0 — System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).

TPL-002-0a R1.3.10 does not require simulating anything other than Normal Clearing when assessing the impact of a Single Line Ground (SLG) or 3-Phase (3 \emptyset) Fault on the performance of the Transmission System.

In regards to PacifiCorp’s comments on the material impact associated with this interpretation, the interpretation team has the following comment:

Requirement R2.1 requires “a written summary of plans to achieve the required system performance,” including a schedule for implementation and an expected in-service date that considers lead times necessary to implement the plan. Failure to provide such summary may lead to noncompliance that could result in penalties and sanctions.

A. Introduction

1. **Title:** System Performance Under Normal (No Contingency) Conditions (Category A)
2. **Number:** TPL-001-1
3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements with sufficient lead time, and continue to be modified or upgraded as necessary to meet present and future system needs.
4. **Applicability:**
 - 4.1. Planning Authority
 - 4.2. Transmission Planner
5. **Effective Date:** The application of revised Footnote ‘b’ in Table 1 will take effect on the first day of the first calendar quarter, 60 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the effective date will be the first day of the first calendar quarter, 60 months after Board of Trustees adoption. All other requirements remain in effect per previous approvals. The existing Footnote ‘b’ remains in effect until the revised Footnote ‘b’ becomes effective.

B. Requirements

- R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that, with all transmission facilities in service and with normal (pre-contingency) operating procedures in effect, the Network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services at all Demand levels over the range of forecast system demands, under the conditions defined in Category A of Table I. To be considered valid, the Planning Authority and Transmission Planner assessments shall:
 - R1.1. Be made annually.
 - R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.
 - R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category A of Table 1 (no contingencies). The specific elements selected (from each of the following categories) shall be acceptable to the associated Regional Reliability Organization(s).
 - R1.3.1. Cover critical system conditions and study years as deemed appropriate by the entity performing the study.
 - R1.3.2. Be conducted annually unless changes to system conditions do not warrant such analyses.

- R1.3.3.** Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.
 - R1.3.4.** Have established normal (pre-contingency) operating procedures in place.
 - R1.3.5.** Have all projected firm transfers modeled.
 - R1.3.6.** Be performed for selected demand levels over the range of forecast system demands.
 - R1.3.7.** Demonstrate that system performance meets Table 1 for Category A (no contingencies).
 - R1.3.8.** Include existing and planned facilities.
 - R1.3.9.** Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.
- R1.4.** Address any planned upgrades needed to meet the performance requirements of Category A.
- R2.** When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-001-1_R1, the Planning Authority and Transmission Planner shall each:
 - R2.1.** Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon.
 - R2.1.1.** Including a schedule for implementation.
 - R2.1.2.** Including a discussion of expected required in-service dates of facilities.
 - R2.1.3.** Consider lead times necessary to implement plans.
 - R2.2.** Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.
- R3.** The Planning Authority and Transmission Planner shall each document the results of these reliability assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

- M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-001-1_R1 and TPL-001-1_R2.
- M2.** The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its Reliability Assessments and corrective plans per Reliability Standard TPL-001-1_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Time Frame

Annually

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

- a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.
- b) An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
- c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.
- d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.
- e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.
- f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Project 2006-02 Assess Transmission and Future Needs

New Definitions for Approval:

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

Implementation Plan for TPL-001-2

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-2 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-2, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-2 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Note – The changes shown below were done solely to make the effective date language used in the Implementation Plan consistent with that shown in the proposed standard effective date section. No changes were made to the content or context of the dates, durations, or requirements.

Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

TPL-001-1, TPL-002-1b, TPL-003-1a, and TPL-004-1 are being retired at midnight the day before TPL-001-2 becomes effective as they are replaced in their entirety by TPL-001-2. TPL-005-0 and TPL-006-0.1 are being retired at midnight the day before TPL-001-2 becomes effective because their requirements are adequately covered by the revised TPL-001-2 and NERC's Rules of Procedure, Section 800.

However, during this 24-month period, all aspects of the latest enforceable versions of TPL-001 through TPL-006 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-2 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-2 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-1, TPL-002-1b, TPL-003-1a and TPL-004-1 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-2, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon has been provided

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Implementation Plan for TPL-001-2

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-2 — Transmission System Planning Performance Requirements

In revising the TPL standards, the SDT is assuming that planners will receive valid data from the MOD standards link described in TPL-001-2, Requirement R1. Furthermore, there is a tacit assumption that future revisions of the MOD standards will include steps to validate MOD based data.

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-2 — Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Note – The changes shown below were done solely to make the effective date language used in the Implementation Plan consistent with that shown in the proposed standard effective date section. No changes were made to the content or context of the dates, durations, or requirements.

Except as indicated below, all Requirements and associated parts shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

TPL-001-~~0~~1, TPL-002-~~0a~~1b, TPL-003-~~0a~~1a, and TPL-004-~~0~~1 are being retired at midnight the day before TPL-001-2 becomes effective as they are replaced in their entirety by TPL-001-2. TPL-005-0 and TPL-006-0.1 are being retired at midnight the day before TPL-001-2 becomes effective because their requirements are adequately covered by the revised TPL-001-2 and NERC's Rules of Procedure, Section 800. However, during this 24-month period, all aspects of the latest enforceable versions TPL-001-~~0~~ through TPL-006-~~0~~ shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-2 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required,

this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

TPL-001-2 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-01, TPL-002-0a1b, TPL-003-01a and TPL-004-01 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such actions. As shown in Table 1 of TPL-001-2, the performance requirements associated with the following events represent "raising the bar":

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This "raising the bar" is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. To provide stakeholders with sufficient time to implement changes, a timeframe coincident with the end of the Near-Term Transmission Planning Horizon ~~will be has been~~ provided ~~as follows:~~

- ~~For 84 months after the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption, Corrective Action Plans applying to performance elements P1-2 and P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element), P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service (in accordance with Requirement R2.7.3) that would not otherwise be permitted by the requirements of TPL-001-2.~~

Any entity which cannot eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall submit a mitigation plan to its Regional Entity outlining the steps it will take to correct the problem. If the entities follow the established ERO procedure for mitigation, it is the intent of the SDT that no penalties will be assessed.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.
12. Version 5 of the revised standard posted for comment on August 3, 2010.
13. Version 6 of the revised standard posted for information on October 19, 2010.
14. Version 7 posted for a parallel comment and initial ballot ending May 31, 2011.

Proposed Action Plan and Description of Current Draft:

The current draft is the eighth iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-2, replacing TPL-001, TPL-002, TPL-003 and TPL-004. TPL-005 & -006 issues are addressed in this sixth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Conduct recirculation ballot	3Q11
2. Submit standard(s) to BOT.	3Q11
3. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes

Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: Medium]*
[Time Horizon: Long-term Planning]

- 1.1.** System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2.** Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High]* *[Time Horizon: Long-term Planning]*
 - 2.1.** For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies as indicated in Requirement R2, Part 2.6. Qualifying studies need to include the following conditions:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of known Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1,

and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

- 2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
 - 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
 - 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
 - 2.4.2. System Off-Peak Load for one of the five years.
 - 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - 3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - 3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that

Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

- 3.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1.** Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.

 - 4.1.1.** For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
 - 4.1.2.** For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
 - 4.1.3.** For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2.** Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3.** Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :

 - 4.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:

 - 4.3.1.1.** Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
 - 4.3.1.2.** Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
 - 4.3.1.3.** Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
 - 4.3.2.** Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when

such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

- 4.4.** Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.

 - 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5.** Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

 - 8.1.** If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
		3. Internal Breaker Fault ⁸ (non-Bus-tie Breaker)	SLG	EHV	No ⁹	No
HV	Yes			Yes		
4. Internal Breaker Fault (Bus-tie Breaker) ⁸	SLG	EHV, HV	Yes	Yes		

Standard TPL-001-2 — Transmission System Planning Performance Requirements

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency <i>(Fault plus stuck breaker¹⁰)</i>	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie Breaker) attempting to clear a Fault on the associated bus		HV	Yes	Yes
				SLG	EHV, HV	Yes
P5 Multiple Contingency <i>(Fault plus relay failure to operate)</i>	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay ¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes
P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adjustments. ⁹ 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG			

Standard TPL-001-2 — Transmission System Planning Performance Requirements

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:
 - i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
 - ii. Loss of the use of a large body of water as the cooling source for generation.
 - iii. Wildfires.
 - iv. Severe weather, e.g., hurricanes, tornadoes, etc.
 - v. A successful cyber attack.
 - vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
 - b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.
 - f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent three of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, Parts 1.1.1 through 1.1.6. OR The responsible entity's System model did not represent projected System conditions as described in Requirement R1. OR The responsible entity's System model did not use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.
R2	The responsible entity failed to comply with Requirement R2, Part 2.6.	The responsible entity failed to comply with Requirement R2, Part 2.3 or Part 2.8.	The responsible entity failed to comply with one of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, Part 2.5, or Part 2.7.	The responsible entity failed to comply with two or more of the following Parts of Requirement R2: Part 2.1, Part 2.2, Part 2.4, or Part 2.7. OR The responsible entity does not have a completed annual Planning Assessment.
R3	The responsible entity did not identify planning events as described in Requirement R3, Part 3.4 or extreme events as described in Requirement R3, Part 3.5.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in	The responsible entity did not perform studies as specified in Requirement R3, Part 3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
1	03/17/2001	Revision of TPL-001-0 to modify only Table 1 footnote b. Approved by Board of Trustees	Project 2006-02 – revision to address FERC directive
2	To be Determined	Revision of TPL-001-1; includes merging and upgrading requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-2; and retirement of TPL-005-0 and TPL-006-0.	Project 2006-02 – complete revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.
9. Version 3 of the revised standards posted for comment on May 26, 2009.
10. Version 4 of the revised standards posted for comment on September 16, 2009.
11. Initial ballot completed on March 1, 2010.
12. Version 5 of the revised standard posted for comment on August 3, 2010.
13. Version 6 of the revised standard posted for information on October 19, 2010.
14. Version 7 posted for a parallel comment and initial ballot ending May 31, 2011.

Proposed Action Plan and Description of Current Draft:

The current draft is the eighth iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-2, replacing TPL-001, TPL-002, TPL-003 and TPL-004. TPL-005 & -006 issues are addressed in this sixth draft and those standards will also be replaced by TPL-001-2.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Conduct recirculation ballot	3Q11
2. Submit standard(s) to BOT.	3Q11
3. Submit to regulatory authorities for approval.	3Q11

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Non-Consequential Load Loss: Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Planning Assessment: Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-2
3. **Purpose:** Establish Transmission system planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 as well as the definitions shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 and Requirement R8 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

For 84 calendar months beginning the first day of the first calendar quarter following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter 84 months after Board of Trustees adoption, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-2, Table 1 are allowed to include Non-Consequential Load Loss and curtailment of Firm Transmission Service (in accordance with Requirement R2, Part 2.7.3.) that would not otherwise be permitted by the requirements of TPL-001-2:

- P1-2 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P1-3 (for controlled interruption of electric supply to local network customers connected to or supplied by the Faulted element)
- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

B. Requirements

- R1. Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes

Category P0 as the normal System condition in Table 1. *[Violation Risk Factor: Medium]*
[Time Horizon: Long-term Planning]

- 1.1. System models shall represent:
 - 1.1.1. Existing Facilities
 - 1.1.2. Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.
 - 1.1.3. New planned Facilities and changes to existing Facilities
 - 1.1.4. Real and reactive Load forecasts
 - 1.1.5. Known commitments for Firm Transmission Service and Interchange
 - 1.1.6. Resources (supply or demand side) required for Load
- R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or qualified past studies (as indicated in Requirement R2, Part 2.6), document assumptions, and document summarized results of the steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: High]* *[Time Horizon: Long-term Planning]*
 - 2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies ~~←as indicated in Requirement R2, Part 2.6→~~. Qualifying studies need to include the following conditions:
 - 2.1.1. System peak Load for either Year One or year two, and for year five.
 - 2.1.2. System Off-Peak Load for one of the five years.
 - 2.1.3. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled.
 - 2.1.4. For each of the studies described in Requirement R2, Parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in System response :
 - Real and reactive forecasted Load.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Duration or timing of known Transmission outages.
 - 2.1.5. When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), the impact of this possible unavailability on System performance shall be studied. The studies shall be performed for the P0, P1,

and P2 categories identified in Table 1 with the conditions that the System is expected to experience during the possible unavailability of the long lead time equipment.

- 2.2. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, Part 2.6:
 - 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.
- 2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as qualified in Requirement R2, Part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.
- 2.4. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as qualified in Requirement R2, Part 2.6. The following studies are required:
 - 2.4.1. System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.
 - 2.4.2. System Off-Peak Load for one of the five years.
 - 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:
 - Load level, Load forecast, or dynamic Load model assumptions.
 - Expected transfers.
 - Expected in service dates of new or modified Transmission Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- 2.5. For the Planning Assessment, the Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed material generation additions or changes in that timeframe and be supported by current or past studies as qualified in Requirement R2, Part 2.6 and shall include documentation to support the technical rationale for determining material changes.
- 2.6. Past studies may be used to support the Planning Assessment if they meet the following requirements:

- 2.6.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.
- 2.6.2. For steady state, short circuit, or Stability analysis: no material changes have occurred to the System represented in the study. Documentation to support the technical rationale for determining material changes shall be included.
- 2.7. For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:
- 2.7.1. List System deficiencies and the associated actions needed to achieve required System performance. Examples of such actions include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation, modification, or removal of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
 - Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- 2.7.2. Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.
- 2.7.3. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

- 2.7.4. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- 2.8. For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, Part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
 - 2.8.1. List System deficiencies and the associated actions needed to achieve required System performance.
 - 2.8.2. Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.
- R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform studies for the Near-Term and Long-Term Transmission Planning Horizons in Requirement R2, Parts 2.1, and 2.2. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
 - 3.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R3, Part 3.4.
 - 3.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R3, Part 3.5.
 - 3.3. Contingency analyses for Requirement R3, Parts 3.1 & 3.2 shall:
 - 3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
 - 3.3.1.1. Tripping of generators where simulations show generator bus voltages or high side of the generation step up (GSU) voltages are less than known or assumed minimum generator steady state or ride through voltage limitations. Include in the assessment any assumptions made.
 - 3.3.1.2. Tripping of Transmission elements where relay loadability limits are exceeded.
 - 3.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide steady state control of electrical system quantities when such devices impact the study area. These devices may include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.
 - 3.4. Those planning events in Table 1, that are expected to produce more severe System impacts on its portion of the BES, shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3, Part 3.1 created. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 3.4.1. The Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that

Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.

- 3.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R3, Part 3.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4. For the Stability portion of the Planning Assessment, as described in Requirement R2, Parts 2.4 and 2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulation models using data provided in Requirement R1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- 4.1. Studies shall be performed for planning events to determine whether the BES meets the performance requirements in Table 1 based on the Contingency list created in Requirement R4, Part 4.4.
- 4.1.1. For planning event P1: No generating unit shall pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
- 4.1.2. For planning events P2 through P7: When a generator pulls out of synchronism in the simulations, the resulting apparent impedance swings shall not result in the tripping of any Transmission system elements other than the generating unit and its directly connected Facilities.
- 4.1.3. For planning events P1 through P7: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator and Transmission Planner.
- 4.2. Studies shall be performed to assess the impact of the extreme events which are identified by the list created in Requirement R4, Part 4.5.
- 4.3. Contingency analyses for Requirement R4, Parts 4.1 and 4.2 shall :
- 4.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention. The analyses shall include the impact of subsequent:
- 4.3.1.1. Successful high speed (less than one second) reclosing and unsuccessful high speed reclosing into a Fault where high speed reclosing is utilized.
- 4.3.1.2. Tripping of generators where simulations show generator bus voltages or high side of the GSU voltages are less than known or assumed generator low voltage ride through capability. Include in the assessment any assumptions made.
- 4.3.1.3. Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models.
- 4.3.2. Simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when

such devices impact the study area. These devices may include equipment such as generation exciter control and power system stabilizers, static var compensators, power flow controllers, and DC Transmission controllers.

- 4.4. Those planning events in Table 1 that are expected to produce more severe System impacts on its portion of the BES, shall be identified, and a list created of those Contingencies to be evaluated in Requirement R4, Part 4.1. The rationale for those Contingencies selected for evaluation shall be available as supporting information.
 - 4.4.1. Each Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list.
- 4.5. Those extreme events in Table 1 that are expected to produce more severe System impacts shall be identified and a list created of those events to be evaluated in Requirement R4, Part 4.2. The rationale for those Contingencies selected for evaluation shall be available as supporting information. If the analysis concludes there is Cascading caused by the occurrence of extreme events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5. Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- R6. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7. Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall determine and identify each entity's individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]
- 8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
- b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
- c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. Applicable Facility Ratings shall not be exceeded.
- g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
- h. Planning event P0 is applicable to steady state only.
- i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

- j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of a line section w/o a fault ⁷	N/A	EHV, HV	No ⁹	No ¹²
		2. Bus Section Fault	SLG	EHV	No ⁹	No
				HV	Yes	Yes
		3. Internal Breaker Fault ⁸ (non-Bus-tie Breaker)	SLG	EHV	No ⁹	No
HV	Yes			Yes		
4. Internal Breaker Fault (Bus-tie Breaker) ⁸	SLG	EHV, HV	Yes	Yes		

Standard TPL-001-2 — Transmission System Planning Performance Requirements

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ⁹	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶	3Ø	EHV, HV	No ⁹	No ¹²
		5. Single pole of a DC line	SLG			
P4 Multiple Contingency <i>(Fault plus stuck breaker¹⁰)</i>	Normal System	Loss of multiple elements caused by a stuck breaker ¹⁰ (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
		6. Loss of multiple elements caused by a stuck breaker ¹⁰ (Bus-tie Breaker) attempting to clear a Fault on the associated bus		HV	Yes	Yes
				SLG	EHV, HV	Yes
P5 Multiple Contingency <i>(Fault plus relay failure to operate)</i>	Normal System	Delayed Fault Clearing due to the failure of a non-redundant relay ¹³ protecting the Faulted element to operate as designed, for one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁵ 4. Shunt Device ⁶ 5. Bus Section	SLG	EHV	No ⁹	No
				HV	Yes	Yes
P6 Multiple Contingency <i>(Two overlapping singles)</i>	Loss of one of the following followed by System adjustments. ⁹ 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶ 4. Single pole of a DC line	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁵ 3. Shunt Device ⁶	3Ø	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG			

Standard TPL-001-2 — Transmission System Planning Performance Requirements

Category	Initial Condition	Event ¹	Fault Type ²	BES Level ³	Interruption of Firm Transmission Service Allowed ⁴	Non-Consequential Load Loss Allowed
P7 Multiple Contingency <i>(Common Structure)</i>	Normal System	The loss of: 1. Any two adjacent (vertically or horizontally) circuits on common structure ¹¹ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Extreme Events

Steady State & Stability

For all extreme events evaluated:

- a. Simulate the removal of all elements that Protection Systems and automatic controls are expected to disconnect for each Contingency.
- b. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, single pole of a DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, single pole of a different DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹¹
 - b. Loss of all Transmission lines on a common Right-of-Way¹¹.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a generating station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating stations resulting from conditions such as:
 - i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
 - ii. Loss of the use of a large body of water as the cooling source for generation.
 - iii. Wildfires.
 - iv. Severe weather, e.g., hurricanes, tornadoes, etc.
 - v. A successful cyber attack.
 - vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
 - b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, single pole of a DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, single pole of a different DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure¹³ resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault.
 - f. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 – Steady State & Stability Performance Footnotes
(Planning Events and Extreme Events)**

1. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level of the element(s) removed for the analyzed event determines the stated performance criteria regarding allowances for interruptions of Firm Transmission Service and Non-Consequential Load Loss.
2. Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.
3. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruption of Firm Transmission Service and Non-Consequential Load Loss.
4. Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.
5. For non-generator step up transformer outage events, the reference voltage, as used in footnote 1, applies to the low-side winding (excluding tertiary windings). For generator and Generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
6. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
7. Opening one end of a line section without a fault on a normally networked Transmission circuit such that the line is possibly serving Load radial from a single source point.
8. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
9. An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.
10. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) or an independent pole tripping (IPT) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing.
11. Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for 1 mile or less.
12. An objective of the planning process should be to minimize the likelihood and magnitude of Non-Consequential Load Loss following Contingency events. However, in limited circumstances Non-Consequential Load Loss may be needed to address BES performance requirements. When Non-Consequential Load Loss is utilized within the planning process to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss is documented, including alternatives evaluated; and where the utilization of Non-Consequential Load Loss is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.
13. Applies to the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, and 67), voltage (#27 & 59), directional (#32, & 67), and tripping (#86, & 94).

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models within their respective area, using data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide dated evidence such as electronic or hard copies of the documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide dated evidence, such as electronic or hard copies of documentation specifying the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding that was utilized in preparing the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator, in conjunction with each of its Transmission Planners, shall provide dated documentation on roles and responsibilities, such as meeting minutes, agreements, and e-mail correspondence that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies and Assessments in accordance with Requirement R7.
- M8.** Each Planning Coordinator and Transmission Planner shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient and date; or a demonstration of a public posting, that it has distributed its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 days of having completed its Planning Assessment, and to any functional entity who has indicated a reliability need within 30 days of a written request and that the Planning Coordinator or Transmission Planner has provided a documented response to comments received on Planning Assessment results within 90 calendar days of receipt of those comments in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current in-force Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- The Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- The studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R4 and Measure M4.
- The documentation specifying the criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and transient voltage response since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The documentation specifying the criteria or methodology utilized in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding in support of its Planning Assessments since the last compliance audit in accordance with Requirement R6 and Measure M6.
- The current, in force documentation for the agreement(s) on roles and responsibilities, as well as documentation for the agreements in force since the last compliance audit, in accordance with Requirement R7 and Measure M7.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R8 and Measure M8.

If a Transmission Planner or Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or the time periods specified above, whichever is longer.

1.5 Additional Compliance Information

None.

2. Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The responsible entity's System model failed to represent one of the Requirement R1, Parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent two of the Requirement R1, Parts 1.1.1 through 1.1.6. Standards Announcement

Project 2006-02 Assess Transmission and Future Needs

Recirculation Ballot Now Open

July 13-July 22, 2011

Now available at: <https://standards.nerc.net/CurrentBallots.aspx>

A recirculation ballot for the proposed standard, TPL-001-2 — Transmission System Planning Performance Requirements is being conducted through **8:00 pm Eastern on Friday, July 22, 2011.**

The drafting team has made a number of non-substantive changes to address comments from the parallel comment period and successive ballot that concluded on May 31, 2011. No changes were made to the text of any Requirements; however, the team made the following minor modifications to the standard:

- Changed bullets under Requirements R3 and R4 to numbers
- Added more words to the evidence retention for Requirements R5 and R6 to align more closely with the language in the associated requirement
- Rearranged the wording of the third Severe VSL for R1 for clarity
- Added the word, "results" to all VSLs for Requirement R8 for closer alignment with the language in the associated requirement

The team also made the following minor modifications to the Implementation Plan:

- Rearranged content but did not change proposed phasing of requirements
- Added more specificity to the language identifying when the already approved standards will be retired. (Midnight the day before TPL-001-2 becomes effective)
- Corrected some typographical errors.

Documents for this project, including clean and redline versions of TPL-001-2 and the implementation plan are posted at the following site: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>.

Note that because TPL-001-2 incorporates requirements from several standards, it is not practical to produce a redline showing changes to the last approved version. The last approved versions of each of the following standards have been posted for reference: TPL-001-1; TPL-002-1b; TPL-003-1a; TPL-004-1; TPL-005-0; and TPL-006-0.1.

Instructions

In the recirculation ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their prior votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the recirculation ballot window. If a ballot pool member does not

participate in the recirculation ballot, that member's last vote cast in the successive ballot that ended on May 31, 2011 will be carried over.

Members of the ballot pool associated with this project may log in and submit their votes from the following page: <https://standards.nerc.net/CurrentBallots.aspx>.

Next Steps

Voting results will be posted and announced after the ballot window closes. If the standard is approved by a two-thirds majority, it will be submitted for adoption by the NERC Board of Trustees prior to filing with regulatory authorities for approval.

Background

TPL-001-2 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-1; TPL-002-1b; TPL-003-1a; TPL-004-1 and also results in the retirement of TPL-005 and TPL-006. The proposed standard includes several new definitions. The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies.

Additional information about this project is available on the project page at <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>.

Standards Development Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

*For more information or assistance, please contact Monica Benson,
Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.*

**Consideration of Comments on Initial Ballot — Assess Transmission Future Needs and Develop Transmission Plans
 (Project 2006-02)**

Date of Initial Ballot: July 13 – July 22, 2011

Summary Consideration:

If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

Voter	Entity	Segment	Vote	Comment
Brock Ondayko	AEP Service Corp.	5	Affirmative	Comments submitted via electronic form by Thad Ness on behalf of American Electric Power.
Mark B Thompson	Alberta Electric System Operator	2	Affirmative	With respect to R2, Part 2.7.1 which lists system deficiencies and the associated actions needed to achieve System performance, the 3rd and 4th bullet identify the following actions as being acceptable. :Installation or modification of automatic generation tripping as a response to a single or multiple contingency to mitigate Stability performance violations. :Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations. The current Alberta transmission policy does not allow for the tripping or runback of generation for a single contingency; however for multiple contingencies it is acceptable. The AESO will bring TPL-001-2, with any modifications, through the standard development consultation process in Alberta and ultimately to the Alberta Utilities Commission for approval.
Kirit Shah	Ameren Services	1	Negative	(1) Requirement R2.4.1, which addresses dynamic load modeling, has been a cause for concern because of the lack of guidance regarding reasonable induction motor representation as opposed to generic load models. While it is recognized that the effort to simulate the effects of induction motor loads is important, it is premature to include such modeling as part of the requirements for this standard. (2) For Measurements M3 and M4, there is still some question as to what is to be provided as sufficient evidence of a study. It is not clear whether the study results would be sufficient, or whether the entire powerflow, stability, or short circuit effort needs to be documented in a formal study report. For example, it is not clear whether contingency lists used in performing the study work would need to be

¹ The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/files/RSDP_V6_1_12Mar07.pdf.

Voter	Entity	Segment	Vote	Comment
				retained as part of the documentation. (3) The standard as written is too prescriptive with regard to critical system conditions which are to be modeled. Such conditions would vary considerably for different systems across the continent. (4) Overall, we believe that this standard does not improve the clarity of what is required, and would give additional occasions for disputes between compliance monitors and various registered entities.
Paul B. Johnson	American Electric Power	1	Affirmative	Comments submitted by Thad Ness on behalf of American Electric Power
Steven Norris	APS	3	Affirmative	Comments submitted.
Robert Smith	Arizona Public Service Co.	1	Affirmative	Comments submitted.
Edward Cambridge	Arizona Public Service Co.	5	Negative	While AZPS generally supports this standard, AZPS cannot support the violation severity levels that are proposed in the recirculation ballot. AZPS believes the time frames set forth in the proposed security levels are unreasonably short (10 days) and should be extended to 30 days between each elevation in severity level. For these reasons, AZPS has changed its vote to "negative."
John Bussman	Associated Electric Cooperative, Inc.	1	Negative	see comments
Kevin Smith	Balancing Authority of Northern California NCR11118	1	Affirmative	Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', that addressed planned or controlled interruption of electric supply for N-1 conditions. Registered Entity's Board of Directors, state Utilities Commission, and/or its customers should determine what level of service is acceptable with the associated cost. This point is captured in footnote #12 of Table 1 in the TPL Standard and is necessary for maintaining SMUD's Affirmative vote.
Venkataramakrishnan Vinnakota	BC Hydro	2	Negative	Comments submitted.
Patricia Robertson	BC Hydro and Power Authority	1	Negative	Comments submitted
Pat G. Harrington	BC Hydro and Power	3	Negative	Comments Submitted

Voter	Entity	Segment	Vote	Comment
	Authority			
Clement Ma	BC Hydro and Power Authority	5	Negative	Comments submitted.
Donald S. Watkins	Bonneville Power Administration	1	Affirmative	comments submitted
Rebecca Berdahl	Bonneville Power Administration	3	Affirmative	BPA comments submitted separately.
Francis J. Halpin	Bonneville Power Administration	5	Affirmative	Comments have been submitted separately.
Brenda S. Anderson	Bonneville Power Administration	6	Affirmative	Comments have been submitted.
Jeanie Doty	City of Austin dba Austin Energy	5	Affirmative	<p>Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, a Registered Entity's Board of Directors, local public utility commission, and/or its customers should determine what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote. Regarding R2 (2.5): The value of annually assessing system stability for years 6-10 is questionable. The requirement for stability assessment in years 6-10 should be limited to new generation interconnections or planned major transmission system improvements with regional impact. The standard should clarify the 'material changes' that would necessitate stability planning assessments and documentation. Regarding the R8 requirement to distribute all Planning Assessment results to adjacent Planning Coordinators and Transmission Planners is excessive and cumbersome. Regarding R8, we suggest the following language: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners in accordance with the requirements of the applicable Reliability Coordinator. Any Registered Entity with a reliability-related need may submit a written request for the Planning Assessment results and the</p>

Voter	Entity	Segment	Vote	Comment
				Transmission Planner or Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request.
Gregg R Griffin	City of Green Cove Springs	3	Affirmative	R7 is not needed and administrative in nature. Instead is should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures. R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request? Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation)
Bill Hughes	City of Redding	3	Affirmative	Registered Entity's Board of Directors, state Utilities Commission, and/or its customers should determine what level of service is acceptable and with what associated cost. We believe that this is a local load reliability issue and not a BES concern. This view is captured as footnote #12 that allows loss on Non-Consequential load loss under certain circumstances and is essential in maintaining an affirmative vote.
Nicholas Zettel	City of Redding	4	Affirmative	Registered Entity's Board of Directors, state Utilities Commission, and/or its customers should determine what level of service is acceptable and with what associated cost. We believe that this is a local load reliability issue and not a BES concern. This view is captured as footnote #12 that allows loss on Non-Consequential load loss under certain circumstances and is essential in maintaining an affirmative vote.
Paul Cummings	City of Redding	5	Affirmative	Registered Entity's Board of Directors, state Utilities Commission, and/or its customers should determine what level of service is acceptable and with what associated cost. We believe that this is a local load reliability issue and not a BES concern. This view is captured as footnote #12 that allows loss on Non-Consequential load loss under certain circumstances and is essential in maintaining an affirmative vote.
Marvin Briggs	City of Redding	6	Affirmative	Registered Entity's Board of Directors, state Utilities Commission, and/or its customers should determine what level of service is acceptable and with what associated cost. We believe that this is a local load reliability issue and not a BES concern. This view is captured as footnote #12 that allows loss on Non-Consequential load loss under certain circumstances and is essential in maintaining an affirmative vote.

Voter	Entity	Segment	Vote	Comment
Randall McCamish	City of Vero Beach	1	Affirmative	R7 is not needed and administrative in nature. Instead is should say that an entity can use as evidence another entity's study, but not in the requirement and rather in the measures. R8 is ambiguous, does the requirement require submitting the Planning Assessment only after receiving a written request, or automatic distribution to neighboring PCs and TPs without a written request, and to others with a reliability related need following a written request? Table 1, under first heading of "Steady State and Stability", bullet c should be removed since it is duplicative of the standard, and not entirely consistent with the standard (e.g., open to interpretation whereas the standard better clarifies how to study protection system operation).
Jack Stamper	Clark Public Utilities	1	Affirmative	Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, the utility's elected board of commissioners should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote.
Peter T Yost	Consolidated Edison Co. of New York	3	Negative	Requirement R1.1.5: Delete "and Interchange." The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the application of well established reliability standards and criteria that are based on the electrical characteristics of the interconnected system, but without economic considerations. Instead, economic transactions are types of transactions that a TO may enter into once its load obligations are met, and are evaluated based on economic parameters that are markedly different from the aforementioned reliability criteria (e.g. congestion costs). Modeling all types of transactions in a power flow case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).
Willet (Jack) Ng	Consolidated Edison Co. of New York	5	Negative	Requirement R1.1.5: Delete "and Interchange." The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the

Modeling all types of transactions in a power flow case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).
Nickesha P Carrol	Consolidated Edison Co. of New York	6	Negative	Requirement R1.1.5: Delete "and Interchange." The inclusion of other than Firm transactions (e.g. economic transactions in Interchange) in a base power flow case utilized for planning/designing the interconnected system blurs the boundary between reliability issues and purely economic issues. Reliability issues are issues that a Transmission Owner (TO) must address for the purpose of meeting its load demand, and are defined by the application of well established reliability standards and criteria that are based on the electrical characteristics of the interconnected system, but without economic considerations. Instead, economic transactions are types of transactions that a TO may enter into once its load obligations are met, and are evaluated based on economic parameters that are markedly different from the aforementioned reliability criteria (e.g. congestion costs). Modeling all types of transactions in a power flow case without distinction detracts from the accuracy and validity of either assessment (reliability and economic).
David A. Lapinski	Consumers Energy	3	Negative	We agree with the comments of MISO.
David Frank Ronk	Consumers Energy	4	Negative	We agree with comments submitted by MISO
James B Lewis	Consumers Energy	5	Negative	We endorse the comments of MISO.
Sally Witt	East Kentucky Power Coop.	3	Negative	(1) While the Planning Coordinator and Transmission Planner should share the results of their respective Planning Assessments with entities that have a reliability related need, Requirement R8 doesn't have a significant impact on reliability. The Violation Risk Factor should be changed to Lower. (2) Footnote 3, which applies to BES Level in Table 1, draws in non-BES facilities. It states that HV is defined as 300 kV and lower voltage systems, which includes all voltages below the traditional 100-kV cutoff for the BES.

Voter	Entity	Segment	Vote	Comment
				(3) Requirement R1 could be modified unintentionally and fundamentally change the requirement because R1 references MOD-010 and MOD-012 without a version number. Thus, all future updates to these standards directly modify TPL-001-2 Requirement R1 whether it was intended or not.
Stephen Ricker	East Kentucky Power Coop.	5	Negative	Comments on Project 2006-02 Assess Transmission Future Needs and Develop Transmission Plans Recirculation Ballot (1) While the Planning Coordinator and Transmission Planner should share the results of their respective Planning Assessments with entities that have a reliability related need, Requirement R8 doesn't have a significant impact on reliability. The Violation Risk Factor should be changed to Lower. (2) Footnote 3, which applies to BES Level in Table 1, draws in non-BES facilities. It states that HV is defined as 300 kV and lower voltage systems, which includes all voltages below the traditional 100-kV cutoff for the BES. (3) Requirement R1 could be modified unintentionally and fundamentally change the requirement because R1 references MOD-010 and MOD-012 without a version number. Charles B Manning	Electric Reliability Council of Texas, Inc.	2	Negative	ERCOT's comments have been submitted via the online form.
Edward J Davis	Entergy Services, Inc.	1	Affirmative	Comments Submitted
Terri F Benoit	Entergy Services, Inc.	6	Affirmative	'Commits Submitted'.
Lee Schuster	Florida Power Corporation	3	Affirmative	Comments Submitted
Luther E. Fair	Gainesville Regional Utilities	1	Affirmative	I do have one point of concern for your consideration; This standard does raise the bar in some areas, most notably for an entity the size of GVL it applies performance requirements for long lead equipment emergency replacement. For example if we don't have the ability to replace a transformer at Parker within a few months of failure, then we would have to demonstrate that we can meet many (but not all) of the same performance criteria without the transformer that we can with the transformer.

Voter	Entity	Segment	Vote	Comment
Harold Taylor	Georgia Transmission Corporation	1	Affirmative	All of our concerns have been addressed. Regards, Robert Casey Georgia Transmission Corporation
Ajay Garg	Hydro One Networks, Inc.	1	Negative	Hydro One Networks is casting a negative vote. Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the proposed draft are minor. The concerns of the industry on several important issues have not been sufficiently addressed in this draft. For detailed comments please refer to our submission through the on-line comment form.
David Kiguel	Hydro One Networks, Inc.	3	Negative	Hydro One Networks is casting a negative vote. Other than a few changes related to Footnotes 9 and 12 of Table 1 and VSLs, the other changes in the proposed draft are minor. The concerns of the industry on several important issues have not been sufficiently addressed in this draft. For detailed comments please refer to our submission through the on-line comment form.
Bernard Pelletier	Hydro-Quebec TransEnergie	1	Negative	These are the two major concerns : * In Table 1 footnote 3 : Again, the definition of EHV facilities should be changed to something like : Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as those representing the backbone of the System, generally at voltage greater than 300 kV, and high voltage (HV) Facilities defined as those not representing the backbone of the System, as determined by the Planning Coordinator and approved by Regional Entity. * In Table 1 b : "Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0". We should also add Firm Transmission Services Loss is also acceptable (particularly in P1 Loss of a single pole of a DC line for which the transfer is reduced accordingly to the remaining pole capability). "
Tino Zaragoza	Imperial Irrigation District	1	Affirmative	Comments provided
Jesus S. Alcaraz	Imperial Irrigation District	3	Affirmative	IID submits a Affirmative vote with comments.
Kim Warren	Independent Electricity System Operator	2	Affirmative	We thank the drafting team for considering the concerns and suggestions submitted with our previous ballot. We reiterate our view that we have no issues with the standard per se and we agree that the current draft is a significant improvement over the currently approved TPL-001 through TPL-004 standards. We recognize that it is necessary to move forward with this

Voter	Entity	Segment	Vote	Comment
				important work. The uncertainties created as a result of the evolving BES definition and BES Exception Process, as well as regulatory review of the TPL-001-1 Footnote 'b' revision still persist and will not go away for some time to come. These are significant parallel developments that will define applicability of the TPL standard (and all NERC standards) and establish performance requirements. We do however believe that this lingering uncertainty is insufficient grounds for us to vote against a standard we otherwise fully support.
Michael Moltane	International Transmission Company Holdings Corp	1	Affirmative	Comments submitted.
Kathleen Goodman	ISO New England, Inc.	2	Negative	Please see the comments submitted along with this ballot.
Larry E Watt	Lakeland Electric	1	Negative	LAK appreciates the hard work of the Standard Drafting team and applauds the significant improvement of clarity of the draft standard. FMPA believes we are almost there, but, there are a number of issues left to resolve. Issues that Cause FMPA to Recommend a Negative Vote A. Spare Equipment, R2.1.5 - The requirement reaches beyond the FERC directive. The directive was: "Accordingly, the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy." So, the directive is only to address planned outage, not unplanned outages. Also note that the applicability to GSUs is ambiguous. "Transmission" is defined as: "An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems." Is the "point of supply" the generator terminal, or the GSU high side terminal? B. Table 1, under first heading of "Steady State Only", bullet i is open to interpretation. Many utilities use steady state P-V analyses to study voltage stability and design UVLS systems in apart around those steady state analyses. Would this bullet essentially eliminate P-V and Q-V studies and the related use of UVLS?
Martyn Turner	Lower Colorado River Authority	1	Affirmative	1. R2 (2.5): The requirement for stability assessment in years 6-10 should be limited for new generation interconnections or for planned major transmission system improvements that have regional impact. The standard should clarify the 'material changes' that would necessitate stability planning assessments and documentation. 2. R8 requirement to

Voter	Entity	Segment	Vote	Comment
				<p>distribute all Planning Assessment results to adjacent PCs and TPs are excessive and cumbersome. Regarding R8, LCRA TSC suggests the following language: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners in accordance with the overseeing Reliability Coordinator requirements. Any functional entity that has a reliability related need and submits a written request for the Planning Assessment results, the Transmission Planner and Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request.</p>
Tom Foreman	Lower Colorado River Authority	5	Affirmative	<p>Previous TPL Standard balloting included the FERC Order that clarified footnote 'b', regarding the planned or controlled interruption of electric supply for an N-1 situation. In our view, board of directors/Public Utility should have the determination what level of service is acceptable and with what associated cost. This view is captured in footnote #12 of Table 1 in the TPL Standard and will be crucial to maintaining an Affirmative vote. 1. R2 (2.5): The value of assessing system stability for years 6-10 is questionable. Stability studies should be conducted for new generation interconnections or for planned major transmission system improvements that have regional impact. 2. R8 requirement to distribute all Planning Assessment results to adjacent PCs and TPs are excessive and cumbersome. Regarding R8, LCRA suggests the following language: Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners in accordance with the overseeing Reliability Coordinator requirements. Any functional entity that has a reliability related need and submits a written request for the Planning Assessment results, the Transmission Planner and Planning Coordinator shall provide the latest Planning Assessment results within 30 days of such request.</p>
Brad Jones	Luminant Energy	6	Negative	<p>Our most significant concerns are related to the following: (1) The requirements for Sensitivity Analysis are not stringent enough. (2) Studies should include variations in the duration and timing of transmission outages. "Anticipated" outages should be included in the studies and not just "known" transmission outages. It is our experience that only including "known" outages drastically under represents the actual number of transmission outages. (3) Major equipment outages lasting three or more months, as a result of Spare equipment strategies should be included in studies. The time limit of one year as specified in the Standard is too lax. Specific suggested language: 1.1.2. Known outage(s) of generation or</p>

Voter	Entity	Segment	Vote	Comment
				<p>Transmission Facility(ies) with a duration of at least six months or any known outage(s) of generation or Transmission Facility(ies) that will extend into the high stress period of the BES. 2.1. For the Planning Assessment, the Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by current annual studies or qualified past studies (as indicated in Requirement R2, Part 2.6, as follows). Qualifying studies shall include the following conditions: Add language between 2.1.3 and 2.1.4 to account for generation limitations due to Ancillary Services. Suggested wording: All planning studies must recognize and make provision for secure delivery of each of the Ancillary Services (eg Operating Reserve). In no case shall these studies double count capacity as being available for congestion management and Ancillary Services unless processes are in place to allow for location specific deployment of these Ancillary Service reserves for congestion management purposes. 2.1.4 (bullet 7) Duration and timing of anticipated Transmission outages such as required maintenance activities. 2.1.4 (bullet 8 added) Reasonable variations of anticipated generator availability after accounting for equivalent forced outage rate. 2.1.5 If an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that would cause an outage of three months or more, (such as a transformer) the impact of this outage on System performance shall be studied. 2.4.3. For each of the studies described in Requirement R2, Parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:</p> <ul style="list-style-type: none"> o Load level, Load forecast, or dynamic Load model assumptions. o Expected transfers. o Expected in service dates of new or modified Transmission Facilities. o Reactive resource capability. o Generation additions, retirements, or other dispatch scenarios. o Duration or timing of anticipated Transmission outages such as required maintenance activities. o Reasonable variations of anticipated generator availability after accounting for equivalent forced outage rate. <p>2.4.4. P1 events in Table 1, with known outages modeled as in Requirement R1, Part 1.1.2, under those System peak or Off-Peak conditions when known outages are scheduled. 2.4.5 If an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that would cause an outage of three months or more, (such as</p>

Voter	Entity	Segment	Vote	Comment
				a transformer) the impact of this outage on System performance shall be studied.
Joe D Petaski	Manitoba Hydro	1	Negative	Please see Manitoba Hydro's comments submitted in the formal commenting period.
Greg C. Parent	Manitoba Hydro	3	Negative	Please see Manitoba Hydro's comments submitted in the formal commenting period.
S N Fernando	Manitoba Hydro	5	Negative	Please see Manitoba Hydro's comments submitted in the formal commenting period.
Daniel Prowse	Manitoba Hydro	6	Negative	Please see Manitoba Hydro's comments submitted in the formal commenting period.
Terry Harbour	MidAmerican Energy Co.	1	Affirmative	Resolve the conflict between R2 and other requirements in the TPL standards by replacing the term, "System" with "BES" in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems, which is the definition of the NERC Glossary term, "System". These locations are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6
Thomas C. Mielnik	MidAmerican Energy Co.	3	Affirmative	Resolve the conflict between R2 and other requirements in the TPL standards by replacing the term, "System" with "BES" in various places throughout the standard when the reference should not be to the collective generation, transmission, and distribution systems, which is the definition of the NERC Glossary term, "System". These locations are: R2.1.4, R2.1.5, R2.4.3, R2.6.2, R2.7, R2.7.1, R2.7.4, R2.8.1, R2.8.2, R3.5, R4.5, R5, and R6.
Marie Knox	Midwest ISO, Inc.	2	Negative	Comments. Regarding Requirement 8, we still do not believe that there is significant risk to the reliability of the BES if an annual Planning Assessment is not distributed to another entity or if a documented response to Planning Assessment comments is not provided within 90 days of a request. Requirement 8 is an administrative requirement that adds little to improve reliability. We recommend that the VRF for Requirement 8 remain "Low", rather than be changed to "Medium". We also believe that the standard is too prescriptive as to what critical system conditions must be modeled, as these conditions vary considerably from system to system and within large systems. Table 1-Steady State and Stability Performance Planning Events, Category P5, includes "non-redundant" relay in the Event column. It is unclear if the SDT's intent is to provide distinction between a

Voter	Entity	Segment	Vote	Comment
				back-up relay and a redundant relay. We still believe that a definition for the term "non-redundant" should be provided along with the standard.
Richard Burt	Minnkota Power Coop. Inc.	1	Negative	<p>In general, MPC feels that this standard has some organizational issues and is unclear in many areas. General comments include the following: 1. Use of the word "stability" should be qualified as "dynamic stability" or "transient stability" to avoid confusion with small signal stability or voltage stability. 2. The term "Planning Events" should be relabeled. It's not descriptive enough. Somehow it should be identifiable as being "more likely to occur than Extreme Events." 3. There are numerous forward and backward references between the different requirements, e.g. between R4.1 and R4.4. I see no reason why these isolated sections can't be put under the same requirement. For instance, move the text of R4.4 to R4.1, and move the text of R4.5 to R4.2. 4. There are numerous references to "more severe System impacts" e.g. R3.4. This is vague unless there is some sort of definition included to quantify severity of impacts. The following comments correlate to specific requirements in the new TPL standard. R2.1.5 Need a definition of "major Transmission equipment." It is too open-ended otherwise. R2.7 What is meant by "Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with ... 2.1.4 and 2.4.3"? Does it mean that if we can only find one condition that's problematic, we don't need a CAP? R2.7.2 What is meant by "multiple sensitivity studies"? R2.7.3 There should be further explanation of things that qualify as being "beyond the control of the Transmission Planner"? R4.1.2 Need more clarity on "its directly connected Facilities". R5 It's not clear what's meant by "post-Contingency voltage deviations". Why wouldn't they just be voltage limits instead of voltage deviations? Table 1 The notes at the beginning of Table 1 should be labeled as performance requirements or something similar, for convenient reference in discussion and reports. Perhaps they should be in a separate list rather than part of Table 1 itself. The Extreme Events list should be in a separate Table, not part of Table 1. In Table 1 footnote 13, it may be better to describe the protective system functions, such as "protective relays, associated communications, and auxiliary tripping outputs" instead of listing relay types.</p>
Spencer Tacke	Modesto Irrigation District	4	Negative	Both Sections 2.1.4 (seven sensitivities) and 2.4.3 (five sensitivities) require sensitivity studies to be run for all planning events and for all years specified , which increases the number of required studies beyond a reasonable and manageable limit. Also, both Section 2.1.4 and 2.4.3

Voter	Entity	Segment	Vote	Comment
				specify that running studies over "...a range of credible conditions that demonstrate a measurable change in System response (performance)." must be completed, yet using "credible conditions" and also "demonstrating a measurable change in System response (performance)", may be mutually exclusive. "Measurable change in System response (performance)" is open to a broad interpretation, which increases the risk that the auditor may very likely interpret it differently than the utility system planner. The definition of the extreme events that have to be analyzed has been made nebulous, where in the existing standards they are quite specific. Requirement 2.1.5 requires the modeling of the loss of any system element that does not have a back-up or spare available sooner than 1 year, as part of the system normal state. It is not clear why using 1 year of loss of use for a system element is being used as the triggering point requiring further system enhancements. Thank you.

Alan Adamson	New York State Reliability Council	10	Negative	1. In R1.1.5, known commitments for Firm Transmission Service, plus other Interchange that does not violate reliability constraints - it is imperative to model other Interchange after accounting for all existing and planned Firm Transmission Service to ensure that reliability-based transactions are not confused with economic interchange. 2. In R2.2.5, the current requirement language can be interpreted to require evaluation of the simultaneous unavailability of multiple long-lead-time components. Also, as a transformer outage is already evaluated as part of category P6 in Table 1, additional studies should not be required; however, spare equipment strategies could be assessed in the context of the planning assessment. 3. In R2.2, the language in this requirement is materially inconsistent with R2.1, unnecessarily requiring a current study.
Guy V. Zito	Northeast Power Coordinating Council, Inc.	10	Affirmative	NPCC will be submitting a list of comments.
David Boguslawski	Northeast Utilities	1	Negative	Footnote 7 It appears there is a discrepancy between Footnote 7 and Event P2-1. Footnote 7 could be eliminated by rewording Event P2-1 as follows: "Opening one end of a line section w/o a fault". Footnote 12 NU continues to disagree with the language for Footnote 12 (formerly Footnote b) - Specifically NU believes that the revised language of Footnote 12 suggests that non-consequential demand interruption (load that is not directly served by the elements removed from service as a result of the contingency) could be used to mitigate reliability concerns arising from NERC Category B contingency events (i.e., single element contingencies). This language seems to encourage operational workarounds and adds burdens for operators of the system. NU believes this is not consistent with planning a highly reliable bulk electric system and thus does not support this weaker language". Requirement R1, Part 1.1.6 The phrase "required for Load" should be deleted as this confuses the issue. Requirement R2, Part 2.2 The language of Requirement R2 Part 2.2 seems to suggest that current annual studies are always required for the long-term steady state assessment. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1. Requirement R3, Part 3.3.1 NU feels that the last sentence of Requirement R3, Part 3.3.1 should be removed since this is handled by PRC-023. Line ratings are addressed by PRC-023 which requires coordination with the Reliability Coordinator. NU suggests the removal of the following sentence: "Tripping of Transmission elements

Voter	Entity	Segment	Vote	Comment
				where relay loadability limits are exceeded." General comment NU believes that a standard should contain statements and requirements that are direct and measurable. TPL-001-2 should not be an exception to this rule. Therefore, statements like "An objective" which appears in Footnotes 9 and 12 shall not be used.

Daniel W. O'Hearn	Powerex Corp.	6	Negative	Powerex has submitted a negative ballot for Draft #6 of Standard TPL-001 because Powerex has concerns regarding Footnotes 9 and 4 that need to be addressed. Details of our concerns are summarized below. Background: The work that transmission planners do to ensure Firm Transmission Service is tremendously important for the reliability of the Bulk Electric System and forms a key part of the foundation upon which system operators and energy market participants interact. As a Purchasing-Selling Entity, Powerex is primarily concerned about Footnote 9 that conditions when interruption of Firm Transmission Service may allowed. We believe

Voter	Entity	Segment	Vote	Comment
				<p>that the goals of maintaining system reliability and enhancing market participation will both be best served if the conditions for interrupting Firm Transmission Service become clear and unambiguous in the TPL-001-2 Standard. In our experience, Transmission Providers have different interpretations of the TPL-001 Performance Table and because of latitude previously granted by Footnote B have different perspectives of when Interruptions of Firm Transfers is acceptable. Below we describe the two interpretations using the language of the proposed TPL-001 standard.</p> <p>Interpretation #1: Following loss of the most critical transmission element under stressed conditions, the transmission provider plans to supply the forecast peak loads and Firm Transmission Service indefinitely. o Typically this is achieved by assuming that the System Operators would, within a few minutes of the P1 Single Contingency, curtail all non-firm transmission service and then arm Special Protection Schemes that could result in Interruption of Firm Transmission Service or Non-Consequential Load Loss in the event of a P6 Multiple contingency. Interpretation #2: Following loss of the most critical transmission element under stressed conditions, the transmission provider plans to supply the forecast peak loads indefinitely but may curtail all Firm Transmission Service within 20 minutes if required. o Typically this occurs on systems where there are no Special Protection Schemes to address P6 Multiple contingencies, consequently, the transmission planners assume that curtailment of all non-firm AND as much Firm Transmission Service as required will occur within ~20 minutes of the P1 Single Contingency because the Operators must prepare their transmission system to withstand the next worst contingency. Currently, Purchasing-Selling Entities must plan for situations where they could see their Firm Transmission Service on certain paths curtailed within 20 minutes of a P1 contingency. The less stringent interpretation of the TPL-001 Performance Table that allowed a P1 contingency to change into a P6 contingency within the same operating hour, has resulted in situations where the Firm Transmission Service for inter-regional transfers face significantly greater risks of interruption than the Firm Transmission Service provided to local Load Serving Entities. Powerex recommends that the Standards Drafting Team revise TPL-001 such that all Transmission Planners will know that they should plan for Firm Transmission Service to be sustained indefinitely following P1 contingencies. Specific Comments on TPL-001-2: Footnote 9: Deviation from the Approved Footnote B Powerex believes that the Footnote B, as approved by the NERC Board of Trustees on February 17, 2011, is more stringent than the previous Footnote B and</p>

Voter	Entity	Segment	Vote	Comment
				<p>will have the effect of ensuring that Firm Transmission Service can be sustained indefinitely following P1 contingencies. The key difference of the proposed Footnote 9 is that it adds the phrase “as a System adjustment” to the approved version of Footnote B. We believe this addition would cause the practice of curtailing Firm Transmission Service within 20 minutes of P1 contingencies to continue. Consequently, we recommend that the proposed Footnote 9 maintain the approved wording as follows: Footnote 9: An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed (deletion)[as] a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch.... For consistency, Table 1 should also be modified to remove the Footnote 9 reference from the Initial Condition Column for the P3-Multiple Contingency and P6 Multiple Contingency Categories. Footnote 9: Clarity on what is meant by “Resources obligated to re-dispatch” It is unclear to many parties what is meant by an obligation to re-dispatch. Some interpret this as a right to direct the Source to curtail energy scheduled on Firm Transmission Service. Our belief is that “an obligation to re-dispatch” should correspond to a formal agreement with a Generation Owner, located on the load side of a transmission constraint, to resupply the load that had been receiving energy from a remote source before the Firm Transmission Service was curtailed. Consequently, we recommend that Footnote 9 be revised as follows: Footnote 9: a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch [to ensure uninterrupted energy supply to the Load-Serving Entity(ies)], where it can be demonstrated that Facilities, internal and external to the Transmission Planner’s planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non-Consequential Load Loss....</p> <p>Footnote 4: Conditional Firm Transmission Service Footnote 4: “Curtailment of Conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the Conditional Firm Transmission Service.” In a sense, offering conditional firm transmission service is analogous to selling land in a known flood plane - this can be a perfectly acceptable option provided all parties involved in current and future transactions can quantify the risks and manage them appropriately. There needs to be coordination between the planners, operators and marketers to ensure that the conditions that could lead to curtailment of Conditional Firm Transmission Service are understood and the associated</p>

Voter	Entity	Segment	Vote	Comment
				risks properly managed. We are concerned that in the absence of coordination, specifically additional requirements included in the BAL and INT standards, energy that is scheduled on conditional firm could actually be marketed as firm and as a result the counterparties to some transactions may not be aware of the curtailment risks they could face.

James Jones	Southwest Transmission Cooperative, Inc.	1	Negative	Requirement R1 puts registered entities at compliance risk for failure of a Regional Entity to take action and presents a conflict of interest for the Regional Entity. TPL-001-2 references MOD-010 and MOD-012 in Requirement R1. MOD-010 and MOD-012 require applicable registered entities to supply steady-state and dynamics data, respectively, per the Regional Reliability Organizations (RRO) procedures. MOD-011 and MOD-013 specify the RROs to establish procedures but are "fill-in-the-blank" standards that were not approved by the Commission. Thus, they are not enforceable. Since RROs were the predecessors to the Regional Entities (RE), it is commonly understood the standards that apply to the RRO would now apply to the RE. In summary, the TP and PC/PA are dependent on the

Voter	Entity	Segment	Vote	Comment
				<p>RE to have the procedures but there are not penalties for the RE if it does not have them. Since the RE would be enforcing the penalty, it could directly contribute to a penalty that is used to offset its compliance budget. While the Planning Coordinator and Transmission Planner should share the results of its Planning Assessment with entities that have a reliability related need, Requirement R8 is purely administrative, does not have any direct impact on reliability, and, therefore, should be removed. At the very least, the VRF should be changed to Lower. This standard is full of double jeopardy issues. Based on the definition of Planning Assessment, Requirement R2 appears to be intended to document Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon studies and the evaluation and meaning of those study results. R3 and R4 require the TP and PC to conduct the steady-state and dynamic planning studies. Given the document/evidence centric ERO enforcement process, Requirement R3 and R4 have implicit obligations to document the study results. Otherwise, how do you prove you complied with R3 and R4? Thus, failure to have a planning assessment documenting your results will result in a simultaneous violation of R2, R3 and R4. In fact, both R3 and R4 even require studies to be completed according to Parts 2.1 and 2.2 for R3 and Parts 2.4 and 2.5 for R4. This further contributes to double jeopardy potential and blurs the line between assessment and study. Footnote 3 which applies to BES Level in Table 1 draws in non-BES facilities. It states that HV is defined as 300 kV and lower voltage systems which includes all voltages below the traditional 100-kV cutoff for the BES. TPL-001-2 Requirement R1 could be modified unintentionally and fundamentally change the requirement because R1 references MOD-010 and MOD-012 without a version number. Thus, all future updates to these standards directly modifies TPL-001-2 Requirement R1 whether it was intended or not. Generally, it is bad form to reference another standard for these reasons.</p>
Larry Akens	Tennessee Valley Authority	1	Negative	<p>1. TVA is concerned about the additional studies, modeling, and projects that must be performed to meet this proposed standard. TVA believes that this amount of work will have little overall improvement on the reliability of the BES. 2. TVA believes that the 7 year implementation plan allowed for "Raising the bar" facilities does not allow sufficient time for TVA to construct the required new facilities. TVA average time for constructing a new 500-kV line can be up to 10 years, given the lead time on ROW and following all NEPA requirements. TVA does understand that the team has language (R2.7.3) regarding the TP or PC inability to get the projects</p>

Voter	Entity	Segment	Vote	Comment
				<p>completed through no fault of its own; however, there is no safeguard that the entity will be found non-compliant if all the work cannot be accomplished in this time frame. 3. TVA believes that the footnotes b and c that allow for local load drop in the current TPL standards should still be allowed. TVA understands that this is addressed in FERC Order 693; however, the capital improvements to fix many of these issues will have little overall reliability gain for the Bulk Electric System. TVA believes that this is a local load reliability issue and not a BES concern. 4. TVA is concerned that no generating unit shall pull out of synchronism for Planning Event P1, while the standard does allow generator runback/tripping for the same event. TVA believes that this requirement is overly burdensome without providing any material improvement in system reliability. Does distributed generation have to meet the same requirements for not pulling out of synchronism as a large nuclear unit? 5. The Implementation Plan should include a five-year delay in the effective date for short circuit studies (R2 parts 2.3 and 2.8) since these studies are a new TPL requirement and are not required in the current version 0 standards.</p>
Ian S Grant	Tennessee Valley Authority	3	Negative	<p>TVA appreciates the work of the ATFN drafting team over the last several years in drafting this new standard. TVA does have concerns on several issues we believe should be corrected as we move forward with this standard. Therefore TVA is voting "Negative" on this proposed standard due to the following issues: 1. TVA is concerned about the additional studies, modeling, and projects that must be performed to meet this proposed standard. TVA believes that this amount of work will have little overall improvement on the reliability of the BES. 2. 	Inc.			
Janelle Marriott	Tri-State G & T Association, Inc.	3	Negative	Comments submitted formally on Comment Form
John Tolo	Tucson Electric Power Co.	1	Negative	The definition for Near Term Planning Horizon was deleted, but the formal term is used in other sections such as R2.2.1. There should be a linkage to MOD standard (e.g. 028, 029 & 030) definitions such as 13 months, etc.
Brandy A Dunn	Western Area Power Administration	1	Negative	Standard is improved over previous drafts, but would like to see further changes. Please see suggestions and comments provided on the previously submitted Official Comment Form.
Peter H Kinney	Western Area Power Administration - UGP Marketing	6	Negative	See comments from WAPA made on official comment form.
Steven L. Rueckert	Western Electricity Coordinating Council	10	Affirmative	It is unknown at this time what the outcome of the FERC request for additional information related to footnote B will be, but if it results in changes to the language of footnote B, that may change our support for this standard.
Liam Noailles	Xcel Energy, Inc.	5	Negative	Xcel Energy's concerns are detailed in the formal comment submission
David F. Lemmons	Xcel Energy, Inc.	6	Negative	Xcel Energy's concerns are detailed in the formal comment submission.
Roger C Zaklukiewicz		8	Negative	Footnote #7: There appears to be a discrepancy between Footnote 7 and Event P2-1; therefore, I recommend the elimination of Footnote 7. Footnote #12: I interpret Footnote 12 to suggest that non-consequential demand interruption could be used to mitigate reliability concerns arising from a NERC Category B contingency event (a single element contingency). The approval of such a reliability policy is inconsistent with a inter- or intra-regional or Area transmission plan than ensure the development of a reliable transmission grid. Such wording is unacceptable as it will lead to large scale inter-regional blackouts, similar to experienced in August, 2003. R1- Part 1.1.6: Delete the words "required for load". R2-Part 2.2: Clarify whether the current annual studies must always be performed as part of the long-term steady-state transmission assessment studies. The wording conveys such a requirement; however, it is not clear whether such studies

Voter	Entity	Segment	Vote	Comment
				are in fact required. Such a requirement would not always be necessary and an unwise use of valuable planning resources. R3-Part 3.3.1: Remove the last sentence since it is already addressed by PRC-023; therefore, it is not required in this document.

Standards Announcement

Project 2006-02 Assess Transmission and Future Needs Recirculation Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

Ballot Results for Revisions to TPL-001-2

A recirculation ballot on revisions to TPL-001-2 — Transmission System Planning Performance Requirements concluded on Friday, July 22, 2011. The revised standard, TPL-001-2, was approved by the associated ballot pool.

Voting statistics are listed below, and the [Ballot Results](#) Web page provides a link to the detailed results:

Quorum: 94.33%

Approval: 75.37%

Next Steps

TPL-001-2 will be presented to the NERC Board of Trustees for adoption and filed with regulatory authorities.

Background

TPL-001-2 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-1; TPL-002-1b; TPL-003-1a; TPL-004-1 and also results in the retirement of TPL-005 and TPL-006. The proposed standard includes several new definitions. The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies.

Additional information about this project is available on the project page at <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>.

Standards Development Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Standard Drafting Team Roster and Biographical Information

Drafting Team Roster
Project 2006-02 Assess Transmission and Future Needs

Name and Title	Company and Address	Contact Info	Bio
John Odom, Chair Vice President of Planning and Operations	Florida Reliability Coordinating Council, Inc. 1408 N. Westshore Blvd., Suite 1002 Tampa, FL 33607-4512	(813)207-7985 jodom@ frcc.com	John Odom is Vice President of Planning and Operations at the Florida Reliability Coordinating Council (FRCC). John joined FRCC in May 2005 after 26 years at Progress Energy Corporation (PEF). He is responsible for oversight of all Member Services Activities, including the FRCC standing committees, FRCC Reliability Coordinator, and Planning Authority function. Additionally, he oversees the Regional Entity functions of reliability assessment, situational awareness, training, certification of system operators, and event analysis. From 2001 – 2007, John was the FRCC Representative on the NERC Reliability Assessment Subcommittee (RAS). John is currently the chair of the Assess Future Transmission Needs Standards Drafting Team (AFTNSDT), which is re-writing the existing TPL-001 through TPL-006.
Douglas Hohlbaugh, Vice Chair Standards Development Manager	FirstEnergy Corp. 76 South Main Street 10th Floor Akron, Ohio 44308	(330) 384-4698 hohlbaughdg@ firstenergycorp. com	Doug Hohlbaugh holds a Bachelor of Science in Electrical Engineering from Akron University (1989) and a Professional Engineering license in the state of Ohio. His 20 plus years experience in the electric utility industry has involved the transmission business of FirstEnergy with a focus on transmission planning. His work experience includes various technical positions in transmission and distribution, as well as sales and marketing experience with FirstEnergy's (FE)unregulated energy services. His existing responsibilities include the Reliability Standards Development Lead of the FirstEnergy FERC Compliance Department including oversight of newly proposed and/or revised Reliability Standards governing the bulk electric transmission system. The responsibilities include overseeing and ensuring timely implementation of all new Reliability Standard development projects at both the North American Electric Reliability Corporation (NERC) and Reliability First Corporation (RFC) having impact on a variety of FE business units which support the reliable operation of the bulk transmission system.
D. Darrin Church Principal Engineer Bulk Transmission Planning	Tennessee Valley Authority 1101 Market Street MR 5G-C Chattanooga, Tennessee 37402-2801	423) 751-6899 (423) 751-3453 Fx ddchurch@tva. gov	Darrin Church is a Principal Bulk Planning Engineer in TVA's Transmission Planning Department. Darrin has 15 years experience in Bulk Transmission Planning along with 5 years previous experience in planning relaying and protection schemes. Responsibilities include ensuring reliability of TVA's 500 kV, 230 kV, 161 kV, and 115 kV transmission systems which include initiating capital projects required to maintain an adequate and reliable transmission system per NERC Reliability Standards.

Drafting Team Roster
Project 2006-02 Assess Transmission and Future Needs

<p>William Harm Senior Consultant</p>	<p>PJM Interconnection, L.L.C. 955 Jefferson Ave Valley Forge Corporate Center Norristown, Pennsylvania 19403-2497</p>	<p>(610) 666-8868 harm@pjm.com</p>	<p>Bill Harm has over 35 years of industry experience with PJM through various assignments involving real time operation, operations planning, and transmission planning. Mr. Harm's current responsibilities involve performance assessment and policy development responsibilities. He either has or continues to represent PJM in various industry forums and groups, including RFC, NERC, and the ISO/RTO forums. He earned a Bachelor and Masters of Science Degree in Electrical Engineering from Drexel University and is a registered professional Engineer in the Commonwealth of PA.</p>
<p>Julius Horvath Director System Planning</p>	<p>Lone Star Transmission, LLC</p>	<p>(512)236-3135 julius.horvath@lonestar-transmission.com</p>	<p>Julius Horvath is currently the Director of System Planning at Lone Star Transmission, LLC, in Austin, Texas. Julius has over ten years of utility experience at the Bonneville Power Administration, Wind Energy Transmission Texas, LLC and the Lower Colorado River Authority in Transmission Planning prior to Lone Star. Julius is a Registered Professional Engineer in the State of Texas.</p>
<p>Robert A. Jones Project Manager, Stability Studies</p>	<p>Southern Company Services P.O. Box 2641 Birmingham, Alabama 35291</p>	<p>(205) 257-6148 rajones@southernco.com</p>	<p>Robert Jones obtained a BSEE degree from the University of Alabama in 1973 and a MSEE degree from University of Alabama – Birmingham in 1978. He has worked for 37 years for Southern Company Services. Eighteen of those years have been in Transmission Planning. The last 15 years, he has been responsible for stability studies for Southern Company.</p>
<p>Brian K. Keel Manager, Transmission System Planning</p>	<p>Salt River Project MS POB100 PO Box 52025 Phoenix, Arizona 85072</p>	<p>602-236-0970 brian.keel@srpnet.com</p>	<p>Brian Keel has a Bachelor and Master Degrees in Electrical Engineering, specializing in power systems, from the University of Illinois. Brian was employed by Duke Power for over one year and PSI Energy for 8 years. Brian has been at SRP since 1998 and is currently the Manager of Transmission System Planning. Brian has Chaired four groups within WECC mainly concentrating on transmission reliability. Brian is a current member of the NERC TADS Work Group.</p>
<p>R. W. Mazur Manager System Planning Department</p>	<p>Manitoba Hydro 12-1146 Waverly Street P.O. Box 815 Winnipeg, Manitoba R3C 2P4</p>	<p>(204) 474-3113 rwmazur@hydro.mb.ca</p>	<p>Ronald W. Mazur obtained his Bachelor of Science in Electrical Engineering degree in 1971, and his Masters of Science in Electrical Engineering degree in 1989, both from the University of Manitoba. Ron Mazur is a registered professional engineer with the Association of Professional Engineers and Geoscientists of Manitoba. Ron joined Manitoba Hydro in 1974, where he worked in station design for 5 years, and in system performance (operations) for 6 years, and in system planning since 1986. He is currently the Manager of the System Planning Department responsible for the expansion planning of Manitoba Hydro's transmission system (100 kV and above) and the HVDC system. Ron is a Canadian representative on the NERC Planning Committee, and Chair of the Planning Committee of the Midwest Reliability Organization.</p>

Drafting Team Roster
Project 2006-02 Assess Transmission and Future Needs

<p>Thomas C. Mielnik Manager Electric System Planning</p>	<p>MidAmerican Energy Co. 106 East Second Street Davenport, Iowa 52808</p>	<p>(563) 333-8129 tcmielnik@ midamerican.co m</p>	<p>Thomas Mielnik has over 37 years experience in Electric Utility Planning. He has been the Manager of Electric System Planning for MEC from 1995 to the present. He was a member of the NERC ATC Working Group from 1996 to 1999 and is a Registered Professional Engineer.</p>
<p>Bernie M Pasternack, President, P.E.</p>	<p>Transmission Strategies 4347 Harborough Rd Upper Arlington, Ohio 43220</p>	<p>(614) 459-5806 bmpasternack@ att.net</p>	<p>Bernie Pasternack was employed by the AEP Service Corporation for over 41 years, where he spent his entire career in various aspects of transmission planning and asset management. After retiring from AEP in June 2010, he formed his own consulting practice, providing services to the electric utility industry. He holds BEE and MSEE degrees from Rensselaer Polytechnic Institute and an MBA from Fairleigh Dickinson University. Before retiring from AEP, Bernie was responsible for the planning and management of AEP's transmission assets. Bernie was also responsible for providing input to policy making decisions relative to AEP's transmission strategy and business plan. During his career, Bernie has made significant contributions to a variety of industry organizations including IEEE, CIGRE, EPRI, EEI, ECAR/RFC, and NERC. He was a member of the EEI Transmission Policy TF and AEP's representative on the Reliability First Corporation Reliability Committee. Bernie has also played an active role in many NERC activities over the past twenty years, including its Planning Committee and a number of its subcommittees, working groups, and standards drafting teams.</p>
<p>Bob Pierce Senior Engineer</p>	<p>Duke Energy 526 South Church Street MC EC10Q Charlotte, North Carolina 28201-1006</p>	<p>(980) 373-6480 bob.pierce@ duke- energy.com</p>	<p>Robert (Bob) Pierce is a Consulting Engineer at Duke Energy where he specializes in Bulk System Planning, NERC standards, and FERC regulations. He holds a B.S. in Nuclear Engineering from Pennsylvania State University and a M.S. in Electrical Engineering from the University of North Carolina-Charlotte. Mr. Pierce is a registered Professional Engineer with 13 years Transmission Planning experience and a total of 31 years of power system experience.</p>

Drafting Team Roster
Project 2006-02 Assess Transmission and Future Needs

<p>Chifong L. Thomas Principal Transmission Planning Engineer</p>	<p>Pacific Gas and Electric Company (now at Bright Source Energy)</p>		<p>Chifong Thomas is currently the Senior Director, Energy Markets and Strategy at Bright Source Energy, Inc. However, during the drafting of this standard, she was a Principal Transmission Planning Engineer at Pacific Gas and Electric Company (PG&E). She has more than 39 years of electric utility experience, more than 37 of which is in electric transmission planning. She has both conducted and supervised transmission planning studies to develop plans for the PG&E transmission system from 60 kV to 500 kV. She has participated in developing methodologies, policies and strategic plans, and in contract negotiations. Ms Thomas has also served as an expert witness in various regulatory and judicial forums. She has served on various technical organizations and work groups, including WECC, NERC Standards Drafting Teams, and Industry Advisory Committees of the California Energy Commission and of EPRI. She has also served on the Technical Advisory Committee (Electrical Engineering) to the California Board of Registration for Professional Engineers and Land Surveyors. Ms. Thomas holds a Bachelor of Science Degree in Electrical Engineering from Washington State University and is a registered Electrical Engineer in the State of California. She is also a senior member of the IEEE.</p>
<p>Dana Walters Manager Transmission Planning, Process, & Policy</p>	<p>National Grid 40 Sylvan Road Waltham, Massachusetts 01581</p>	<p>781-907-2501 dana.walters@ us.ngrid.com</p>	<p>Dana Walters is a Manager in the Transmission Planning group at National Grid. Mr. Walters has 34 year of experience in the Electric Utility industry. Most of his experience involves various aspects of Transmission Planning. This includes topics such as analytical studies of thermal, stability, short circuit, generator interconnections, and lightning protection. Other areas of experience include involvement in Investment Planning, tariff design, Consulting, Production Cost analysis, and Distribution Planning. In his role as a Transmission Planner, Mr. Walters has been involved in numerous committees and working groups at the NERC, NPCC, and ISO levels. Mr. Walters has a Masters in Engineering Management from Northeastern University and a Bachelor in Electrical Engineering with a focus in Power Systems also from Northeastern University. Mr. Walters is a registered professional engineer in New Hampshire and is a member of IEEE.</p>
