SMUD	Yes and No	<p>We agree. However, the conditions listed in R3.5.1, R3.5.2 and R3.5.3 are applicable to the overall TPL Standard. Their specific listing in R3.5 gives the impression that these Requirements are only applied to R3.5 and not to the other Requirements in this Standard. In other words, are there any Requirements in this Standard that R3.5.1, R3.5.2 and R3.5.3 do not apply to? Therefore, we suggest TPL-001-1 be silent on this issue and move R3.5.1 through R3.5.3, (and the equivalent in the stability study R5.4.3.1 through R5.4.3.3) to a Requirement applicable to Assessment studies in general, such as the bullet points in the Performance Tables .Added Reference 3.5.1: In cases where an SPS is deployed to reduce thermal overloads such that flows are brought within established facility ratings, but, for a short duration (seconds) until it is fully executed, the facility flows exceed the established rating, is that considered a violation or an acceptable engineering judgment that facilities are judiciously being brought to operate within ratings? Or, should the facility owner ensure establishment of a documented rating even for the short duration of seconds? Q10:TSS response: We generally agree with the concept of the sensitivity analysis since this is standard practice in understanding system performance risks and the effectiveness of improvements. It is ambiguous from a criteria perspective, however, what role is played by the sensitivities in developing Corrective Action Plans and what risks are created by misapplication of the intent of such sensitivity analyses. Clarification of the following is needed along with examples of applicable sensitivities and how these would be factored into Corrective Action Plans. If a Transmission Planner performs studies on the "base case" of which the loads represented are 1 in 10 year adverse weather condition (10% chance that the actual load may exceed the projected load), does this constitute a sensitivity analysis. If so, will the Transmission Planner have to then perform additional less stringent studies at the load levels representing 1 in 2 year adverse weather conditions (50% chance that the actual load may exceed the projected load) to demonstrate compliance?</p> <p>R2.1.4 requires explanation of performing additional sensitivities that are not listed in the R2.1.3. This would discourage entities from performing additional sensitivities. In addition, in the above example, the Transmission Planners should not have to explain why they feel that this higher level (1 in 10 year adverse weather) of load is the "base case" condition.</p> <p>R2.7 also states that "Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities". Consider a Transmission Planner that has built transmission based on the 1 in 10 year adverse weather load assumed in the "base case", will the judgment of the Transmission Planner be then questioned because the "base case" used is equivalent to a sensitivity case and not a 1 in 2 year adverse weather base case? Is some Non-Consequential Load Loss for an N-1 contingency on a sensitivity case using an extremely high load forecast acceptable as a Corrective Action Plan in the planning phase?</p>
<p>Response: The SDT agrees with your comment and has deleted Requirements R3.5.1, R3.5.2 and R3.5.3. Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the</p>

Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities <u>run in accordance with Requirements R2.1.3 and R2.4.3</u>. The Corrective Action Plan shall:</p>
Progress Energy Florida, Inc.	No	<p>PEF has significant concerns with each of the sub-Requirements listed in R2.1.3. Each is ambiguous, vague and open to variations in interpretation. It therefore makes no sense that "documentation of the technical rationale for why each of the conditions was or was not selected" is a requirement. Indeed, given that all of the sub-Requirements of R2.1.3 are vague, unspecific, unwieldy concepts, PEF is not sure how said documentation could be accomplished. Concerning R2.1.4, PEF has the same concerns that were expressed regarding the modified requirements mentioned in Question 2, and similarly here would suggest a substitute to the language in R2.1.4. Significant concerns with the previous sub-Requirements notwithstanding, PEF suggests either returning to the language in each existing Standard's R1.3.2, or adding an R2.1.3.8 that states "Other known critical system conditions specific to the system studied by the Transmission Planner or Planning Coordinator."</p>
		<p>Response: The SDT did not want to be more prescriptive because of the huge number of possible variances that can occur. It is up to the planning entity to determine which and how much of a variance is appropriate for its studies. In addition, Requirements R2.1.3 and R2.4.3 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run. Since these are sensitivities, any and all variances provide some level of information as to how the System responds to such variances.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical</p>

Lafayette Utilities System	No	<p>As to the performance of sensitivity analyses under R2.1.3, Lafayette believes that insufficient detail is provided to define with clarity cases that involve ?modification of expected transfers? (per R2.1.3.2). For example, it is unclear whether the phrase ?modification of expected transfers? is intended to refer to a change in directional bias in the model, a reduction in flows due to variation between reservations and schedules, or something else. Additional definition should be provided to ensure that sensitivity cases performed pursuant to R2.1.3.2 are meaningful and useful.</p>
<p>Response: The SDT did not want to be more prescriptive because of the huge number of possible variances that can occur. It is up to the planning entity to determine which and how much of a variance is appropriate for its studies</p>		
Ameren	No	<p>Similar to our comment above for R2.4.3, there should not be a requirement to explain why sensitivities were not selected. Also, it is not clear if R2.1.4 is a requirement or an option. While we agree that the system cannot be adequately planned based on a single snapshot of expected system conditions, these items in R2.1.3.1-7 are too prescriptive and are inappropriate for inclusion here. The sensitivities listed appear to be options and not sub-requirements, and may result in over-focusing on the particular issues listed to the detriment of overall system reliability. Some sensitivity studies are in effect adding an additional level of contingency to the analysis work (n-2 or n-3). Outages of reactive sources and generation should already be included in studies of multiple contingencies. The process of planning new generation (system impact studies) will include studies of the future system with and without the proposed new equipment. Engineering judgment should be used to develop the sensitivity scenarios, and it should be encouraged that the same scenarios should not be performed every year so that a portfolio of sensitivity scenarios would be developed over time. The standard should not include an enumerated list of required sensitivities. If two sensitivities are required to be performed each year, then the standard should state so, but we believe that more than one sensitivity scenario for each peak and off-peak case per year for assessment is too burdensome to run complete contingency analyses. Proposed alternative wording for R2.1.3 which addresses above concerns is as follows: R2.1.3. "For each of the studies described in Requirement R2.1.1 and Requirement R2.1.2, sensitivity case(s) that stress the System to reflect one or more conditions such as variation in load assumptions, modification of expected transfers, variability and outages of reactive resources, generation additions, retirements, or other dispatch scenarios are integral to a thorough assessment of reliability. Document how and why appropriate sensitivities were selected."</p>
<p>Response: Requirements R2.1.3 and R2.4.4 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
		<p>Requirements R2.1.3 and R2.4.3 have been revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”. The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”. In addition, as written, the standard is requiring at a minimum, one case run for each required current year for steady state and Stability. This translates into three cases for steady state. The entity may run as many additional cases as it deems appropriate to understand how the System responds to the variances.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>
Florida Power and Light	No	The words “documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied” should be removed from R2.4.3. The sensitivity selection is necessarily subjective and judgmental. It is not clear what constitutes a valid rationale document. Compliance assessment of such a document would be subjective and is not needed.
		<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run. The SDT believes that documentation of why a sensitivity was selected for study should be provided.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>
Exelon Transmission Planning	No	We support efforts to improve load and dynamic load modeling, however we have concerns in being able to do so in an accurate manner - See comments to question #2. The state of industry development is such that this is not ready for inclusion in a standard such as R2.4.1 and R2.4.3.1.
		<p>Response: As with all planning models, assumptions must be made that the entity feels are representative of how the system will respond and perform. Models can only attempt to simulate the System based on expected conditions. The standard has been modified to explain that “an aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable”.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
		<p>R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. <u>An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable</u></p>
CenterPoint Energy and CPS Energy	No	<p>We believe R2.1.3 and R2.1.4 are overly prescriptive and should be deleted. It requires engineering judgment and experience to know whether a planning analysis is materially impacted by certain assumptions and, if so, which sensitivity analyses should be performed. Literally interpreted by an auditor, R2.1.3 would require at least one sensitivity analysis for each one of the contingencies shown in Tables 1 and 2 for each study specified in R2.1.1 and R2.1.2 and documentation for each contingency of each study why each sensitivity specified in R2.1.3 was or was not selected. The likely result is not value-added engineering analysis of actual reliability concerns. Instead, the likely outcome is unnecessary and burdensome additional analysis and documentation that is impractical, creating confusion and uncertainty as to what the practical interpretation of impractical requirements might ultimately be.</p>
SERC Dynamics Review Subcommittee	No	<p>These requirements are very prescriptive. Many examples of sensitivities are already inherent in the existing requirements. Some sensitivity studies are in effect adding an additional level of contingency (N-2 or N-3). Sensitivity studies of load variation are already inherent in the fact that several different study years and conditions are already being required. Outages of reactive sources and generation should already be included in studies of multiple contingencies. The process of planning new generation (system impact studies) will include studies of the future with and without the proposed new equipment. The TP and PC can better select the most appropriate sensitivities for their system. In general we believe that breaking these requirements into specific sub requirements, focusing on specific sensitivities, is too prescriptive and inappropriate. It will lead to over focus on these particular issues to the detriment of system reliability. There should be no enumerated list of required sensitivities. Engineering judgment needs to be permitted.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”. The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”. In addition, as written the standard is requiring at a minimum one case run for each required current year for steady state and Stability. This translates into three cases for steady state. Midwest ISO	No	This reminds us of Category D from original table--requiring us to study something but take no action. Sensitivities are not appropriate nor effective in a planning world in which you require an array of sensitivity studies but require no action will be taken. While running sensitivities enables us to better understand system limits, why have it as a requirement if there is no action plan obligation.
<p>Response: The requirement was added to ensure that the entities do run certain variances that would stress the System. Requirement R2 requires that such studies are documented as part of the Planning Assessment. The entity is to determine the risk associated with not modifying the Corrective Action Plan to consider these studies. The documentation puts the entity on record as stating that the variance was considered but may or may not have been incorporated in the Plan makes the entity liable for its decision.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
Tri-State Generation and Transmission Association, Inc.	No	<p>We appreciate the extra detail describing sensitivity cases, but do not think it is reasonable to require explanations of why each condition suggested in R2.1.3.1-R2.1.3.7 was or was not studied. It should be sufficient that sensitivity studies are considered appropriate by the individual utility.</p> <p>R2.1.4 should be demoted to R2.1.3.8 (and the "shall include rationale" clause removed).</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run. The SDT believes that documentation of why a sensitivity was selected for study should be provided. Requirements R2.1.4 and R2.4.4 have been deleted.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>		
Lakeland Electric	No	<p>R2.1.3.1 requires other than peak sensitivity studies while R2.1.2 requires Off peak studies. Recommend further defining of R2.1.2 to specific load level or points on forecast demand curves to eliminate any overlap between two requirements.</p>
<p>Response: The SDT has used the defined term "Off-Peak" and believes that this is sufficient.</p>		
Southern Company Transmission	No	<p>R 2.1.3 One should only have to explain why sensitivity was performed, not why it was not performed. In general we believe that breaking these requirements into specific sub requirements focusing on specific sensitivities is too prescriptive and inappropriate. It will lead to over focus on these particular issues to the detriment of system reliability. There should be no list of sensitivities enumerated as subrequirements. Engineering judgment needs to be permitted. A specific proposal for R2.1.3 which addresses the above concerns is provided as follows:R2.1.3. For each of the studies described in Requirement R2.1.1 and Requirement R2.1.2, sensitivity case(s) shall be run and documented that stress the System to reflect one or more conditions such as higher or lower Load than forecasted with variability of Load/demand and Load power factors due to season, weather, or time of day; modification of expected transfers; unavailability of long lead time Facilities; variability and outages of reactive resources; generation additions, retirements, or other dispatch scenarios; decreased effectiveness of controllable Loads and Demand Side Management; modification of planned Transmission outages. Document why each sensitivity was selected.</p>
<p>Response: Requirements R2.1.3 and R2.4.4 have been revised to remove the requirement you reference. In addition, Requirements R2.1.3 and R2.4.3 have been</p>

Organization	Question 10:	Question 10 Comments:
		<p>revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”. The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>
Brazos Electric Power Cooperative, Inc.	No	2.1.3 should have been left alone. We have a real problem with the addition of 'technical' and documenting why things were NOT selected. We would also like to see more leeway provided to the TP and PC by adding language similar to that mentioned above such as "as deemed necessary by the TP or PC".2.1.4 should be incorporated into 2.1.3 in a similar fashion as our suggested changes for 2.4.3.
		<p>Response: Requirements R2.1.3 and R2.4.4 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run.</p> <p>In addition, Requirements R2.1.3 and R2.4.3 have been revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”. The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”. In addition, Requirements R2.1.4 and R2.4.4 have been deleted.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>
NERC and Regional Coordination	No	The standard as worded:? Implies all tests are run for a given sensitivity the standard should be revised to read applicable testing for the applicable sensitivity.? Requires proof of negative o Why a sensitivity was not selected? Requires that expansion plans identify the impact of sensitivity o Many sensitivities may have varying impacts on an expansion plan. Suggested changes:R2.1.3 - For each of the studies described in Requirement R2.1.1 and Requirement R2.1.2, sensitivity case(s) that reflect one or more of the following conditions shall be incorporated into the assessment. Documentation of the

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
		<p>technical rationale for why each of the conditions was selected and the portion of the assessment that included each selected sensitivity shall be supplied. R2.1.4, R2.4.3, and R2.4.4 - need to be modified accordingly.</p> <p>Delete R2.1.4 as it is superfluous. If a PC runs a sensitivity study and includes that analysis in its Plan, then why would NERC mandate that the PC explain why the non-mandated sensitivity study was run. If a study is required then it should be mandated. If a study is not mandated then he PC should not be held accountable for explaining the un-mandated study.R2.4.3.1 ? Variation in load model.</p> <p>Specific numbers should be included. R2.4.3.2 - Modification of expected transfers ? Be more specific. Firm or non-firm transfer and amount of MWR2.4.3.3 - Unavailability of long lead time Facilities. How many years out we are looking at and for how long it must be out of service.R2.4.3.4 - Variability of Reactive Source ? need to be more specific (give me MVARs). We already test this under FAC 010 for lost of shunt capacitor.R2.4.3.5 - This should already been taken into account when we do studies. So be more specific.R2.7.2 - Include a description of how results of the sensitivities selected in accordance with Requirements R2.1.3, R2.1.4, R2.4.3, and R2.4.4 impacted the list of actions developed in accordance with R2.7.1.R2.1 - Revise wording - The annual assessment of the of the NT Planning Horizon shall include: then go into the sub-bullets. The SDT must clarify exactly explicitly how many studies (in terms of numbers) must be done each planning horizon for short term and long term and how much sensitivity study for term.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”. The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”.</p> <p>Also, Requirements R2.1.3 and R2.4.3 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>The SDT agrees with the commenter and has deleted Requirements R2.1.4 and R2.4.4.</p> <p>The SDT did not want to be more prescriptive and provide specific details and number for variances that the entity may select because of the huge number of possible variances that can occur. It is up to the planning entity to determine which and how much of a variance is appropriate for its studies.</p> <p>Requirement R2, along with its sub-requirements, requires the sensitivities run are to be documented. Requirement R2.6 requires that the Corrective Actions be listed. The entity can add the details and further explanation of how the sensitivities were incorporated into the Plans.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
<p>Since the basis of the standard is to allow the entity to support the Planning Assessment using current and past studies, the standard cannot dictate the specific number of studies to be made. The standard does specify the current cases that must be run in Requirements R2.1.1, R2.1.2, R2.2, R2.4.1 and R2.4.2.</p>		
IESO	No	<p>As we commented on R2.4.3, we continue to express our disagreement to include sensitivity testing in R2.1.3 and R2.1.4. We are disappointed that despite disagreements by the majority of the commenters and their suggestions to leave sensitivity testing to the TP's and PC's discretion, the SDT continues to stipulate detailed requirements for sensitivity testing. The SDT in its summary response to comments indicates that these testing are intended as "providing some guidance on what could be included in the sensitivity studies without being too prescriptive." If these are indeed intended as guidance rather than enforceable requirements, then they should be provided in a technical document or a reference document that supports the standard, not in the standard itself.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as "sensitivities". In addition, as written, the standard is requiring at a minimum, one case run for each required current year for steady state and Stability. This translates into three cases for steady state. The entity may run as many additional cases as it deems appropriate to understand how the System responds to the variances.</p>		
North Carolina Electric Membership Corp	Yes and No	<p>Sensitivities to base assumptions for studies are always good utility practice. But we agree with others that these may be overly prescriptive in requiring each and every one. Allow the TP and PC to select the appropriate sensitivities for the annual assessments with input from customers and affected stakeholders. We are concerned that the requirement for every sensitivity each and every year would result in excessive burden to existing PCs and TPs doing this analysis with no resulting improvement to reliability.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as "sensitivities". In addition, as written the standard is requiring at a minimum one case run for each required current year for steady state and Stability. This translates into three cases for steady state. The entity may run as many additional cases as it deems appropriate to understand how the System responds to the variances.</p>		
E.ON U.S. Transmission Planning	Yes and No	<p>2. R2.1.3.2 refers to modification of expected transfers as a sensitivity test. Does this include transfers across the system, such as a transfer from Cinergy to TVA?</p>
<p>Response: The SDT did not want to be more prescriptive because of the huge number of possible variances that can occur. It is up to the planning entity to determine which and how much of a variance is appropriate for its studies</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
ERCOT System Planning		<p>The sensitivity cases suggested are unnecessary and unfeasible. For example, generation additions to cases that can already meet the load under contingency conditions do not create a reliability problem as the new generator can always be turned off. On the other extreme, sensitivity analysis of possible, unknown and uncontrollable generation retirements along with the Table 1 requirements of P3 (Generator + 1) contingency analysis presents an overwhelming study and documentation burden that will not add a corresponding benefit to the study and the results would be meaningless.</p>
<p>Response: The SDT believes that planners must consider these possible variances and reinforce the System so that when it comes to Real-time operation, the TOP will have a system sufficiently robust to operate around any of the conditions. Commenters generally agree that these are the responsibility of planning. Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as "sensitivities".</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities- variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>		
American Transmission Company	No	<p>For R2.1.3, we would like further explanation of what technical rationale is expected and how it should be provided as to why each condition sensitivity was or was not used. In the subrequirements, we are unsure of what is exactly meant by "variability of load demand and load power factors", "modification of expected transfers", "long lead time Facilities", and "modification of planned outages". For R2.1.4, it is unclear what specific performance requirements must be met for these other sensitivities. We would also like some explanation of what technical rationale is expected and how it should be provided as to why each condition sensitivity was or was not used.</p>
<p>Response: Requirements R2.1.3 and R2.4.4 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run. Since these are sensitivities, any and all variances provide some level of information as to how the system responds to such variances.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities- variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
		<p>conditions was or was not selected shall be supplied <u>included in the Assessment:</u></p> <p>The SDT did not want to be more prescriptive because of the huge number of possible variances that can occur. It is up to the planning entity to determine which and how much of a variance is appropriate for its studies.</p> <p>Also, Requirements R2.1.4 and R2.4.4 have been deleted.</p>
Duke Energy	No	<p>Although we agree with the perceived intent of R2.1.3, we believe the wording should be revised to make it very clear that it is not necessary to perform studies to substantiate your technical rationale for choosing not to perform any particular sensitivity study. Documented engineering judgment to support the decision not to perform the particular sensitivity studies should be sufficient. Recommend renumbering R2.1.4 to R2.1.3.8 and reword as follows: Any other sensitivity, as deemed appropriate by the Transmission Planner or Planning Coordinator for their individual systems.</p>
Florida Reliability Coordinating Council, inc	No	<p>R2.1.3 and R2.1.4 as written can create issues during the compliance assessment. These requirements place the burden of justifying the inclusion / exclusion of the sensitivities on the TP or PC. Thus, only a sensitivity deem appropriate by the TP or PC and not performed can be found non-compliant. R2.1.4 can be eliminated by modifying the wording in R2.1.3 as follows: For each of the studies described in Requirement R2.1.1 and Requirement R2.1.2, at least one sensitivity shall be performed that stress the system based on one or more of the following conditions, plus any additional conditions determined by the Transmission Planer and Planning Coordinator. The Planning Assessment will also include the technical rationale for why each of the conditions was or was not selected for study that year.?</p>
<p>Response: Requirements R2.1.3 and R2.4.4 have been revised to remove the requirement to explain why sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run. Since these are sensitivities, any and all variances provide some level of information as to how the system responds to such variances.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment:</u></p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment:</u></p>		
Central Maine Power Company	No	<p>a. With respect to R2.1.3 delete "that Stress the System with sensitivities".</p> <p>b. R2.1.3 should be revised to clarify that if a TP/PC conducts the studies specified in R2.1.1 and R2.1.2 with one or more of the sensitivities which stress the system in the normal course of study, then additional studies of a less-stressed system are not required.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
		c. The intention of Paragraph R2.1.4 is unclear and appears to be unnecessary; therefore, it should be removed.
ISO New England Inc.	No	<p>a. With respect to R2.1.3 delete " that Stress the System with sensitivities".</p> <p>b. R2.1.3 should be revised to clarify that if a TP/PC conducts the studies specified in R2.1.1 and R2.1.2 with one or more of the sensitivities which stress the system in the normal course of study, then additional studies of a less-stressed system are not required.</p> <p>c. The intention of Paragraph R2.1.4 is unclear and appears to be unnecessary; therefore, it should be removed.</p>
ColumbiaGrid	Yes	<p>We generally agree with the concept of the sensitivity analysis since this is standard practice in understanding system performance risks and the effectiveness of improvements. R2.1.4 requires explanation of performing additional sensitivities that are not listed in the R2.1.3. This would discourage entities from performing additional sensitivities. In addition, in the above example, the Transmission Planners should not have to explain why they feel that this higher level (1 in 10 year adverse weather) of load is the "base case" condition.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as "sensitivities".</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>The SDT agrees and has deleted R2.1.4.</p>		
NSTAR Electric	No	<p>1. With respect to R2.1.3 delete "that Stress the System with sensitivities".2. R2.1.3 should be revised to clarify that if a TP/PC conducts the studies specified in R2.1.1 and R2.1.2 with one or more of the sensitivities which stress the system in the normal course of study, then additional studies of a less-stressed system are not required.3. The intention of Paragraph R2.1.4 is unclear and appears to be unnecessary; therefore, it should be removed.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment".</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to stress the System with</u></p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
		<p>sensitivities variations that reflect in one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>Requirements R2.1.4 and R2.4.4 have been deleted.</p>
New York Independent System Operator	No	If a TP/PC conducts the studies specified in R2.1.1 and R2.1.2 with one or more of the sensitivities which stress the system in the normal course of study, we assume that fulfills the requirements of R2.1 completely, without additional studies of a less-stressed system. Is that correct?
		<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>The standard expects that at least one more of those variances listed in Requirement R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”. In addition, as written the standard is requiring at a minimum one case run for each required current year for steady state and Stability. This translates into three cases for steady state. The entity may run as many additional cases as it deems appropriate to understand how the System responds to the variances.</p>
Oncor Electric Delivery	Yes	Generally agree with modifications although would again stress that detailed load modeling for stability analysis may be as revealing as some of the sensitivity studies recommended in R2.1.3 if they were only run with steady state analysis.
		<p>Response: As with all planning models, assumptions must be made that the entity feels are representative of how the System will respond and perform. Models can only attempt to simulate the System based on expected conditions. The standard has been modified to explain that “an aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable”.</p> <p>R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. <u>An aggregate system Load model which represents the overall dynamic</u></p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
	behavior of the Load is acceptable.	
FirstEnergy Corp.	No	<p>The requirements related to sensitivity cases as written in draft 2 are an improvement over draft 1 as they now allow flexibility in choosing sensitivities, compared to what use to be a fixed list of options. However, we do not agree with the need to document the technical rationale for why each listed condition was or was not selected. This seems to create a needless paper trail from an auditing viewpoint. If any documentation is needed, it should be limited to why the sensitivity was selected and it should not be required to indicate why others were not selected. Therefore, we suggest rewording 2.3.1 as follows: "For each of the studies described in Requirement R2.1.1 and Requirement R2.1.2, sensitivity case(s) that stress the System with sensitivities that reflect one or more of the following conditions shall be run and documentation of the technical rationale for why each of the conditions was selected shall be supplied." R2.1.4 - This is an optional requirement and should be worked into the list of options within 2.1.3. As a stand alone requirement, what type of measure or VSL would be applicable for this requirement? We suggest re-numbering this requirement as a new 2.1.3.8 and reword it as follows: "Any other sensitivities, as deemed appropriate by the Transmission Planner or Planning Coordinator for their individual systems". R2.1.3.3 ? This requirement indicates sensitivity is needed for "Unavailability of long lead time facilities." Why is this required in a near-term planning horizon? How long is long? Doesn't the N-1-1 (Planning Event P6) test already account for this related to the outage of existing equipment which may present long lead times? Same comments apply for R2.4.3 and R2.4.4 in the stability study section.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>The STD agrees. Requirements R2.1.4 and R2.4.4 have been deleted.</p> <p>The near-term horizon extends from one to five years. Equipment scheduled for installation in five years requires ordering today. Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as "sensitivities".</p>		
Orlando Utilities	Yes and No	I generally agree with the intent of requiring studies beyond just one load level and system condition; however I have some

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 10:	Question 10 Comments:
Commission		<p>specific suggestions, questions and comments. R2.1.3: As worded I have several concerns:</p> <ol style="list-style-type: none"> 1. This would make any study performed that did not include sensitivities useless for performing the assessment. I recommend identify sensitivities and studies separately, with sensitivities just being smaller versions of studies. (Our usual definition is that a study demonstrates specific solutions to problems identified, whereas a sensitivity merely comments on the presence or lack of problems and how they relate to what is seen in the more formal studies. Obviously a problem found in a sensitivity not seen in a regular study receives additional focus.) 2. This would force the study to look only at the sensitivities listed rather than allow one or more of the conditions, plus additional conditions all in one run. This would force an entity to run additional studies if they wished to exceed the requirements rather than a single study that meets and exceeds the requirements. I suggest the following wording instead to still require the sensitivities, but allow flexibility in how they are performed. "R 2.1.3: At least one sensitivity shall be performed that stress the system based on one or more of the following conditions, plus any additional conditions determined by the transmission planner and planning coordinator. The Planning Assessment will also include the technical rationale for why each of the conditions was or was not selected for study that year. <p>R.2.1.3.1- Suggest adding system growth, for example "season, weather, unpredicted system growth, or time of day". As written it does not seem to allow a study based on the long range load growth prediction being off, but instead only on a change in season, weather or time of day.</p> <p>R2.1.4: What was intended by using the phrase "Documentation of the technical rationale" instead of simply saying "shall include technical rationale"? I suggest dropping the "documentation of the" as this could cause confusion on an audit as to what is the difference between the "technical rationale" and "documentation of the technical rationale" unless the drafting team plans to define what "documentation of technical rationale is" other then the rationale itself.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as "sensitivities". In addition, as written, the standard is requiring at a minimum, one case run for each required current year for steady state and Stability. This translates into three cases for steady state. 		<p>and how much of a variance is appropriate for its studies.</p> <p>Requirements R2.1.3 and R2.4.4 have been revised to remove the requirement to explain why a sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run. Since these are sensitivities, any and all variances provide some level of information as to how the system responds to such variances.</p> <p>Requirements R2.1.4 and R2.4.4 have been deleted</p>
<p>Entergy Services, Inc.</p>	<p>No</p>	<p>R2.1.3.2 - Modification of expected transfers: Modification of expected transfers infers that non-firm transmission use would be estimated based on historical data or perhaps an economic outlook. To plan the system for such non-firm use is an imprudent burden on rate payers. Economic tools are available to ascertain the benefits of system upgrades and prudently allocate the costs of such upgrades. Generation assets and the future plans of those assets is market sensitive information that could easily be extracted from such sensitivity analyses. Results of these sensitivity studies should be used to aid in reliably operating the system. They should not be a basis for constructing transmission facilities for reliability. These types of studies are aligned with the operating horizon. See also comments made above regarding 2.1.3.4 and 2.1.3.7. In general, we believe that breaking these requirements into specific sub requirements, focusing on specific sensitivities, is too prescriptive and inappropriate. It will lead to over focus on these particular issues to the detriment of system reliability. There should be no enumerated list of required sensitivities. Engineering judgment needs to be permitted. Many examples of sensitivities are already inherent in the existing requirements. Some sensitivity studies are in effect adding an additional level of contingency (N-2 or N-3). Sensitivity studies of load variation are already inherent in the fact that several different study years and conditions are already being required. Outages of reactive sources and generation should already be included in studies of multiple contingencies. The process of planning new generation (system impact studies) will include studies of the future with and without the proposed new equipment. The TP and PC can better select the most appropriate sensitivities for their system. We recommend that engineering judgment continue to be recognized as a vital component of planning.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to make it clear that “sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment”. The standard expects that at least one more of those variances listed in Requirements R2.1.3 and R2.4.3 that have not been integrated into the required studies are at least considered as “sensitivities”. In addition, as written, the standard is requiring at a minimum, one case run for each required current year for steady state and Stability. This translates into three cases for steady state. The entity may run as many additional cases as it deems appropriate to understand how the system responds to the variances.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>

Organization	Question 10:	Question 10 Comments:
<p>The SDT believes that planners must consider these possible variances and reinforce the System so that when it comes to Real-time operation, the TOP will have a System sufficiently robust to operate around any of the conditions. Commenters generally agree that these are the responsibility of planning.</p> <p>The SDT did not want to be more prescriptive because of the huge number of possible variances that can occur. It is up to the planning entity to determine which and how much of a variance is appropriate for its studies.</p>		
BPA Transmission Reliability Program	No	<p>For those conditions that are "not" studied, it makes sense to explain why that particular condition was not selected. However, we do not agree with R2.1.3 that a rationale needs to be provided for why a particular sensitivity "is" selected for study. Running additional sensitivities provides a better understanding of system performance and doesn't need further justification. Requirement R2.1.4 is not needed and should be removed. It should be up to the Transmission Provider's discretion whether they run additional sensitivity studies beyond what the standard requires in R2.1.3, and it should not be necessary to justify why they chose to run them. What a sensitivity study consists of, needs further clarification. For example, if a system assessment is performed using a case with transmission paths stressed near their limits, is this considered the baseline or a sensitivity? If it is considered the baseline, would a sensitivity be required at reduced stress levels and what purpose would this serve when the original case produced the more severe system impacts? This needs further clarification.</p>
<p>Response: Requirements R2.1.3 and R2.4.3 have been revised to remove the requirement to explain why sensitivity was not run since it would be necessary to run the study regardless to provide proof why it was not run.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in one or more of the following conditions not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in one or more of the following conditions not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>Requirements R2.1.4 and R2.4.4 have been deleted.</p> <p>Requirements R2.1.3 and R2.4.3 have been revised to make it clear that "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment". 11. In response to industry comments, the SDT modified Table 1 requirements for Planning Event P6. Planning Event P6 involves independent overlapping single contingencies (n-1-1) involving two Transmission Facilities excluding generators. This Planning Event generally correlates to P5 of the first draft and now includes shunt devices. The P6 event was also revised to permit loss of Non-Consequential Load to meet performance requirements for Systems above 300 kV.

Do you concur with the modifications? If not, please state why and/or suggest specific changes.

Summary Consideration:

A substantial majority of the industry respondents agree with the revision to permit loss of Non-Consequential Load to meet performance requirements for P6 Events involving systems above as well as below 300 kV, considering the low probability of such Events.

There are concerns that this change would make it difficult for scheduling maintenance outages because the existing TPL-003-0 allows shedding of Non-Consequential Load after the next outage. However, in the proposed standard, if a facility is scheduled out of service for maintenance, the next outage would be considered a single Contingency Event, and loss of Non-Consequential Load is not permitted.

There are concerns expressed by numerous respondents that after the first single Contingency and System adjustment, curtailment of Firm Transmission Services (or firm transfers) and shedding of firm Load would not be allowed in preparation for the second Contingency. The SDT added Footnote # 10 to the end of Table 1 to reflect that Curtailment or Interruption of Firm Transmission Service in preparation for the next Contingency will be allowed. However, until the next Contingency occurs, System performance will need to meet the requirements for a single Contingency Event. As such, the proposed standard will not allow loss of any firm Non-Consequential Load, except for contracted Interruptible Loads, in preparation for the next Contingency. Nonetheless, the SDT has provided an exception (Requirement R2.6.4) to address those situations, which may arise that are beyond the control of the Transmission Planner or Planning Coordinator, and, which can prevent the implementation of the relevant Corrective Action Plan in the required timeframe.

Some respondents requested that System adjustment be defined. The SDT believes that Header note 'e' and the new Footnote # 10 provides the description of the System adjustments allowed after a first Contingency Event.

There were also requests for clarification between a P1 Event, which occurred after another Facility has been out of service, for example, for scheduled maintenance, and a P6 Event, since the former will not allow loss of Non-Consequential Load, while the latter would allow it. The SDT believes that the difference between these two Events is whether the prior outage was planned (such as maintenance) or anticipated (such as extended outage). Therefore, if the Prior outage is planned or anticipated, then the next N-1 is a single Contingency Event, otherwise, it would be a P6 Event.

Concerns were also expressed that the TP and PC should have discretion on the Contingencies (for example, shunt devices) to study and analyze. One response suggests that the P6 Event to be studied should have a common reason to occur. The SDT modified Requirement R3.3 (now R3.4) to allow the PC and TP to determine the single and multiple Contingencies to be included in the planning analyses. This would give the TP and the PC the discretion to study the Contingency most suited to the area of study, and they can choose not to study loss of shunt devices, or those P6 Events that do not have a common reason to occur, if these are less severe than the Events studied.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Some responses suggest that there should be a specific limit to the amount of Load loss allowed. While the SDT does not disagree with having some specific limits below which Load loss would be allowed, arriving at such an amount may be too case-specific and too prescriptive for a Continent-wide Standard.

One response disagrees that the requirement should be so much more severe for an internal breaker fault as opposed to two single line outages for elements over 300 kV. The SDT believes that an internal breaker fault would remove from service all Facilities connecting to the faulted breaker simultaneously, which would likely be more severe than outage of two single lines.

As a result of industry comments, the following requirements were changed:

R3.3.3 (now R3.4) Those Planning Event Contingencies in Table 1 ~~—Steady State Performance not covered in Requirement R3.3.2~~ that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created, ~~and t~~The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall ~~include~~include an explanation of why the remaining Contingencies would produce less severe System results.

Header note 'e' - For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Footnote #10 – Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.

Organization	Question 11:	Question 11 Comments:
Dominion - Electric Transmission Planning	No	For Bulk Electric System (BES) Elements out of Service above 300 kV, interruption of Firm Transmission Service and Non-Consequential Load Loss should not be allowed. We favor the language proposed in the previous draft.
ITC Holdings: ITC, METC, ITC Midwest	No	Allowing load loss for shutdown plus contingency might seriously jeopardize maintenance outages when you actually encounter this situation in real-time. It's easy to say these things in the "planning horizon" but it might be politically unacceptable for "real-time". This is particularly true for higher voltage systems above 300kV. We understand that there could be "load-pocket" situations at lower voltages where this might be allowed but EHV systems are back-bone systems. This would set a bad precedent if allowed.
Lafayette Utilities	No	Lafayette does not agree that the loss of Non-Consequential Load should be permitted as a corrective action. See also

Organization	Question 11:	Question 11 Comments:
System		paragraph (b) in response to Question 15.
Arkansas Electric Coop. Corp.	No	Non-Consequential Load Loss should not be allowed. See comments to question 7.
<p>Response: Thank you for your comments but the majority of the industry respondents agree with the revision to permit loss of Non-Consequential Load to meet performance requirements for P6 Events involving Systems above as well as below 300 kV considering the low probability of such Events.</p>		
City Water, Light & Power - Springfield, Illinois	Yes and No	Shunt devices should only need to be included in contingency analysis at the discretion of the TP or PC.
CenterPoint Energy and CPS Energy	No	We believe P6 should be deleted. As noted earlier, we believe credible multiple contingencies should be studied as planning events, with incredible multiple contingencies possibly considered as extreme events. If P6 is retained, we believe loss of shunt devices should not be studied and believes the ability to systematically study the contingency loss of every individual switched shunt device is not supported by commercially available PTI software because up to this point it has not generally been recognized as a necessary or desirable analysis to perform. Also, if P6 is retained, we believe loss of Non-Consequential Load should be permitted at any voltage level for this type of extreme event.
<p>Response: Requirement R3.3.3 (now Requirement R3.4) was modified to allow the PC and TP to determine the single and multiple Contingencies to be included in the planning analyses. This would give the TP and the PC the discretion to study the Contingencies most suited to the study area, including whether to include shunt devices in the analyses.</p> <p>R3.4 Those Planning Event Contingencies in Table 1 — Steady State Performance not covered in Requirement R3.3.2 that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created,</u> and † The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include <u>include</u> an explanation of why the remaining Contingencies would produce less severe System results.</p>		
Progress Energy Carolinas	No	While we agree interruption of firm transmission service and non-consequential load loss should not be allowed to meet the planning requirements for the first system contingency (defined as initial system condition in the table), these system adjustments should be allowed to prepare for the second event so that the system will meet the requirements following the second event. We recommend that clarifying changes be made to ensure that this is clearly understood. One suggestion would be to include the following footnote to P6 in both the Steady State and Stability Tables.? Foot note: Interruption of firm transmission service and/or non-consequential load loss is allowed after the first event as a System adjustment to prepare

Organization	Question 11:	Question 11 Comments:
		for and meet the requirements of the second event. See also our related response to question 15.
Gainesville Regional Utilities	Yes and No	I believe some clarification is needed to specify that you can or can not curtail firm transmission service prior to the next event, because as written it could lead to compliance audit issues. I don't believe the intent of order 693 was to cause a need for utilities to be exposed to large cost increases for their customers while very little to no improvement in reliability is provided as it deals with very low probability conditions which would yield no increase in transfer capability.
JEA	Yes and No	JEA agrees with the changes on the surface, but still does not agree with the concept that it can not curtail Firm Transmission Service after the first N-1 event in preparation for the second N-1 event. JEA's existing Firm Transmission Service customers understand the need to maintain these existing transmission loading relief procedures in order to maintain security of the BES. The only JEA system element that causes this concern has a very high availability and would have a very costly infrastructure improvement to meet this requirement resulting in all of JEA's Firm Transmission Service Customers experiencing increased service cost or in the worst case having their service opportunities permanently curtailed.
Florida Power and Light	No	<p>The P6 Planning Event is not clearly defined. It appears that the Initial System Condition is the Planning Event of P1, with the "System Adjustments" allowed under P1 to keep facilities within the applicable ratings. R3.5.3. requires that a sustainable, stable, operating condition is maintained.</p> <p>This does not state prepared for the next contingency?.</p> <p>Given FERC's interpretation of TPL-002-0 Category B (see paragraphs below for excerpts from Order 693) that the system is not required to be able to withstand another N-1 contingency, the proposed new standard appears to require that this state be "sustained" indefinitely after a P1 event, or until the P6 Event, which is loss of the second element, with no mention of the time duration between the initial system condition and the event. The performance criteria for a P1 event can be met as long as it does not contemplate another event that would change the event to a P6 event. However, a P6 event is a TPL-003-0 Category C event which must contemplate a second contingency after the first. The existing TPL standards accomplished this with footnote b) in the Tables for all of the TPL standards, allowing system adjustments including curtailment of contracted firm transfers to prepare for the next contingency. Since FERC clearly states that this is not a requirement under TPL-002-0, but that it is addressed in TPL-003-0, they directed the ERO to modify the footnote for TPL-002-0. In TPL-003-0 the Category C3 event refers to a "Category B contingency, manual system adjustments, followed by another Category B contingency", however since the footnote for Category B contained the "To prepare for the next contingency?." language, and it is contained in the Table for TPL-003-0, that language must apply to the C3 event. Further, in Order 693, on TPL-003-0, FERC (1) did not direct the ERO to modify the same footnote which is contained in TPL-003-0, (2) recognizes that these are low probability events, and (3) stated that it "does not intend to recommend action on this issue [the appropriateness and value of including the ability of the system to withstand two simultaneous Category B contingencies for major load pockets] at</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
		<p>this time and, instead, directs the ERO to consider the comments in possible future revisions to the Reliability Standard.? The SDT has inappropriately applied the direction of FERC on TPL-002-0 to the P6 event (which is similar to TPL-003-0 C3) without regard to its implications on the industry, the ratepayers, or even its own standards, as the impact of the team's interpretation would require changes in the methods of determining TTC's, ATC's, and SOL's. The additional costs (both monetary and intangible) incurred by ratepayers for no gain in the ability to transfer firm electric power, far outweigh any gain in reliability benefits for these low probability events. Just to provide one example to illustrate this point, if the SDT's current interpretation for a P6 event is not modified, FPL would have to spend in excess of \$ 1 Billion dollars, in order to meet this performance criteria for 500 kV facilities, for an event with a probability of less than 0.07 per hundred mile-years (based on FPL's 500 kV facilities), which would be passed on to its ratepayers. There are many other examples on the FPL system, as well as other systems. This interpretation is fatally flawed and makes no sense from a reliability or cost perspective, not to mention the intangible impacts of siting, right-of-way acquisition, EMF, NIMBY, etc. Further, assuming the SDT interpretation, how could one justify the need before state commissions, and exercise eminent domain in the courts to take someone's land for right-of-way, a process that could take as long as 8-10 years, for minimal increase in reliability, and no increase in transfer capability. In order to assist the SDT, these paragraphs are included with references to FERC Order 693, to show that it has misinterpreted Order 693. The following captions stated below should help clarify this point. Order 693 states: P.1788 ?Under TPL-002-0 the system is not required to be able to withstand another N-1 contingency. That N-1 requirement is a Category C contingency which is addressed by TPL-003-0.? Therefore, the end state of P1 is not a ?secure? state, but a ?normal operating state?, as stated in P. 1796 ?The Commission, therefore, directs the ERO to modify the second sentence of footnote (b) to clarify that manual system adjustments other than shedding of firm load or curtailment of firm transfers are permitted to return the system to a normal operating state after the first contingency, provided these adjustment can be accomplished within the time period allowed by the short term or emergency ratings.? These two determinations by FERC together show that their interpretation of normal operating state is not the secure, ready for the next contingency state, rather, it is the state in which the performance criteria have been met for that planning event. With regard to the FERC direction of Order 693 on TPL-003 and ?the appropriateness and value of including the ability of the system to withstand two simultaneous Category B contingencies for major load pockets?, FERC states in P. 1824, ?Many commenters indicated that this was a very low probability event and the costs for addressing such an event would be significant. As a result, EEI states that a dialogue must first be initiated within the industry and with state public utility commissions to identify such load pockets, to target the required potentially significant transmission investments and to develop plans for allocating the costs of such investments. In light of these comments, the Commission does not intend to recommend action on this issue at this time and, instead, directs the ERO to consider the comments in possible future revisions to the Reliability Standard.?FPL agrees with the increased performance requirement for the P3 multiple contingency event that assumes the loss of a generator as the first contingency. Firm transfers should not depend upon specific generators being on line, however firm transfers must depend upon transmission lines being in-service.</p>
SERC Dynamics	Yes	The changes are more practical. If two or more 500kV lines are lost, it makes complete sense to allow loss of non-consequential load so long as cascading outages are not triggered. While we agree interruption of firm transmission service

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
Review Subcommittee		and non-consequential load loss should not be allowed to meet the planning requirements for the first system contingency (defined as initial system condition in the table), these system adjustments should be allowed to prepare for the second event so that the system will meet the requirements following the second event. We recommend that clarifying changes be made to incorporate this concept. We recommend that the statement above be included as modification or as a footnote for the P6 portion of the table as follows:Foot note: Interruption of firm transmission service and non-consequential load loss should be allowed after the first event as a system adjustment to prepare for the second event and meet the requirements following the second event.See our related response to question 15.
Southern Company Transmission	Yes and No	The requirements are more practical now. If two or more 500kV lines are lost, it makes complete sense to allow loss of non-consequential load so long as cascading outages are not triggered. While we agree interruption of firm transmission service and non-consequential load loss should not be allowed to meet the planning requirements for the first system contingency (to get loadings back within normal ratings), these system adjustments should be allowed to prepare for the second event so that the system will meet the requirements following the second event. We recommend that clarifying changes be made to incorporate this concept. We recommend that the statement below be included as modification or as a footnote for the P6 portion of the table as follows: Interruption of firm transmission service and non-consequential load loss are allowed after the first event as a system adjustment to prepare for the second event in order to meet the requirements following the second event.
Duke Energy	Yes	The changes are more practical. If two or more 500kV lines are lost, it makes complete sense to allow loss of non-consequential load so long as cascading outages are not triggered.? While we agree interruption of firm transmission service and non-consequential load loss should not be allowed to meet the planning requirements for the first system contingency (defined as initial system condition in the table), these system adjustments should be allowed to prepare for the second event so that the system will meet the requirements following the second event.? We recommend that clarifying changes be made to incorporate this concept. We recommend that the statement above be included as a modification or as a footnote for the P6 portion of the Steady State and Stability tables as follows: "For P6 multiple contingency events, Transmission configuration changes and redispatch of generation are allowed provided that all Facilities shall be operating within their Facility Ratings and within their thermal and voltage limits. Permissible Transmission configuration changes include dropping of load and firm transfers needed to prepare for the second contingency. See our related response to question 15.
SERC Reliability Review Subcommittee and Planning Standards	Yes	Since Event P6 is essentially a sub-set of the existing Category C.3 Contingency events, we support these modifications which make the system performance requirements for P6 consistent with what exist today for Category C.3. While we agree interruption of firm transmission service and non-consequential load loss should not be allowed to meet the planning requirements for the first system contingency, these system adjustments should be allowed to prepare for the second event so that the system will meet the requirements following the second event. We recommend that clarifying changes be made to incorporate this concept. We recommend that the statement below be included as modification or as a footnote for the P6 portion of the table as follows: Interruption of firm transmission service and non-consequential load loss are allowed after the

Organization	Question 11:	Question 11 Comments:
Subcommittee		first event as a system adjustment to prepare for the second event in order to meet the requirements following the second event.
Orlando Utilities Commission	Yes and No	As written the standard does not seem to forbid the adjustment of firm transfers and non-consequential load in preparation for the second part of an N-1-1, however that conflicts with the teams statements on the recent national call. If the intent is to forbid the adjustment of firm transfers and non-consequential load in preparation for the second part of an n-1-1 that needs to be made explicitly clear in the standard. This is especially important since one of the current understandings of the standards relating to Transmission Planning and System Operating Limits clearly allow such adjustments, and to not make it clear is building a compliance trap for the unwary. While I do not support the creation of this n-1-1 threshold if it is going to be established it needs to be abundantly clear.
Entergy Services, Inc.	Yes and No	Since Event P6 is essentially a sub-set of the existing Category C.3 Contingency events, we support these modifications which make the system performance requirements for P6 consistent with what exist today for Category C.3. While we agree interruption of firm transmission service and non-consequential load loss should not be allowed to meet the planning requirements for the first system contingency (to get loadings back within normal ratings), these system adjustments should be allowed to prepare for the second event so that the system will meet the requirements following the second event. We recommend that clarifying changes be made to incorporate this concept. We recommend that the statement below be included as modification or as a footnote for the P6 portion of the table as follows: Interruption of firm transmission service and non-consequential load loss are allowed after the first event as a system adjustment to prepare for the second event in order to meet the requirements following the second event. As the requirement is now implemented in the table, transmission service would need to be made available only if they can be accommodated for N-2 events. This would place these services on equal footing from a reliability perspective but would virtually eliminate the firm transmission market.
<p>Response: Footnote #10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for Event P1. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted Interruptible Loads, in preparation for the next Contingency. Nonetheless, the SDT has provided an exception (R2.6.4) to address those situations, which may arise that are beyond the control of the Transmission Planner or Planning Coordinator, and, which can prevent the implementation of the relevant Corrective Action Plan in the required timeframe.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Transmission	Yes	We agree with revising P6 to permit loss of Non-Consequential Load to meet performance requirements for Systems above

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
Agency of Northern California		300kV. However, we are concerned that with the loss of the first N-1 in P6, curtailment of firm transmission service or firm transfers would not be allowed as part of system adjustment in preparation for the next N-1. Allowing curtailment of transmission service or firm transfers for such system adjustments should be added to R3.3.2.2. Otherwise, the power transfer under normal condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1, or transmission facilities, which would have otherwise been unnecessary, would have to be built. Either would adversely impact customers. We also have questions on Event P6 in both Performance Tables 1 and 2: We would like some clarification on the overlapping single contingencies as denoted in Event P6 (N-1-1), and one where a single contingency, say Event P1 (N-1), follows a prior "planned" outage of a Facility (N-1). The former would allow the Non-consequential Load Loss, while the latter would prohibit it.
Pacific Gas and Electric Co.	Yes	We agree with revising P6 to permit loss of Non-Consequential Load to meet performance requirements for Systems above 300kV. However, we are concerned that with the loss of the first N-1 in P6, curtailment of firm transmission service or firm transfers would not be allowed as part of system adjustment in preparation for the next N-1. Allowing curtailment of transmission service or firm transfers for such system adjustments should be added to R3.3.2.2. Otherwise, the power transfer under normal condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1, or transmission facilities, which would have otherwise been unnecessary, would have to be built. Either would adversely impact customers. We also have questions on Event P6 in both Performance Tables 1 and 2: We would like some clarification on the overlapping single contingencies as denoted in Event P6 (N-1-1), and one where a single contingency, say Event P1 (N-1), follows a prior "planned" outage of a Facility (N-1). The former would allow the Non-consequential Load Loss, while the latter would prohibit it.
Public Service Company of New Mexico	Yes	We agree with revising P6 to permit loss of Non-Consequential Load to meet performance requirements for Systems above 300kV. However, we are concerned that with the loss of the first N-1 in P6, curtailment of firm transmission service or firm transfers would not be allowed as part of system adjustment in preparation for the next N-1. Allowing curtailment of transmission service or firm transfers for such system adjustments should be added to R3.3.2.2. Otherwise, the power transfer under normal condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1, or transmission facilities, which would have otherwise been unnecessary, would have to be built. Either would adversely impact customers. We also have questions on Event P6 in both Performance Tables 1 and 2: We would like some clarification on the overlapping single contingencies as denoted in Event P6 (N-1-1), and one where a single contingency, say Event P1 (N-1), follows a prior "planned" outage of a Facility (N-1). The former would allow the Non-consequential Load Loss, while the latter would prohibit it.
BPA Transmission	Yes and No	We agree with the revision to permit the loss of Non-Consequential Load to meet performance requirements for Systems above 300 kV. However, a better definition is needed for "system adjustments". For example, are curtailments permitted as

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
Reliability Program		<p>part of "system adjustments"? Within category P6, there needs to be a common reason for the overlapping outage to occur, such as lines on a common tower, and the appropriate reasons need to be clearly identified in the requirements. In general, we believe that performance category P6 should be part of the Operating Standards rather than the Planning Standards. For these types of events, it is the responsibility of Operations to determine the necessary system adjustments to prepare for the next contingency within the operating horizon prior to year one as defined in the Planning Standards. Therefore, the performance requirements for this category of contingencies, do not belong in the Planning Standards.</p>
<p>Response: Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>Regarding the difference between overlapping single Contingencies as denoted in Event P6 (N-1-1), and one where a single Contingency, say Event P1 (N-1), follows a prior "planned" outage of a Facility (i.e., N-1), the difference would be whether the prior outage was planned (such as maintenance) or anticipated (such as extended outage). If the Prior outage is planned or anticipated, then the next N-1 is a P1 Event, otherwise, it is a P6 Event.</p>		
Progress Energy Florida, Inc.	No	<p>PEF is pleased that between the 1st and 2nd drafts, the "no" was changed to "yes" concerning allowance of curtailment of Firm Transmission Service or curtailment of Non-Consequential Load for Event P6. PEF has significant concerns, however, regarding the issue of "System Adjustments" associated with P6 and P6's direct association with P1, and thus must check "no" on this Question despite the improvements that have been made. A major misstep has been made with regard to development of P6. Every P1 event is by default the first half of a P6 event. Given that fact, PEF sees several concerns with this issue. First, for P1 events, neither curtailment of Firm Transmission Service nor curtailment of Non-Consequential Load are allowed, regardless of voltage. Both are allowed, however, for a P6 event. In order for the two events to not contradict each other, the conclusion that must be reached is that curtailment of Firm Transmission Service and curtailment of Non-Consequential Load are not allowed as part of System Adjustments, i.e. they are not allowed in between the two steps of P6, only after the 2nd step of P6 (Note: this is not clear partly due to the fact that the term "System Adjustments" is not defined anywhere in the Standard, and PEF therefore requests that the SDT define the term, and that the term should include the allowance of curtailment of Firm Transmission Service and the loss of Non-Consequential Load). PEF has two very serious concerns with that conclusion:</p> <p>a) FERC in its Order 693 stated that the BES is not required to have to withstand another N-1 contingency. Specifically, in Paragraph 1788 of Order 693 FERC states that "Under TPL-002-0 the system is not required to be able to withstand another N-1 contingency. That N-1 requirement is a Category C contingency which is addressed by TPL-003-0." Thus FERC clearly made a distinction between N-1 events for which a 2nd N-1 event never happens and N-1-1 events. The SDT, however, has</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
		<p>not written the draft TPL Standard in such a way that Transmission Owners can reasonably and fairly plan for the 2nd N-1 event as TPL-003-0 has done.</p> <p>b) PEF has several 1st N-1 events on their 500 kV system for which "System Adjustments" are necessarily going to have to include either the curtailment of Firm Transmission Service or the curtailment of Non-Consequential Load in order to prepare for the 2nd N-1 event. The draft TPL Standard, while far from definitive on this matter, appears to allow neither as part of System Adjustments. PEF will thus be forced to i) construct redundant 500 kV facilities, at a cost to our ratepayers that will doubtless run into the range of billions of dollars, or ii) significantly reduce the posted levels of ATC/TTC of the various transmission paths available. Option (ii) is not a better option than option (i), for two main reasons: reducing ATC/TTC essentially puts marketing entities out of business, and forces utilities to build more generation sites to compensate for the loss of energy brought in using the previously higher ATC values. Either option results in prohibitively high costs to be passed on to the ratepayers for no measurable increase in BES reliability. This discussion also brings up additional concerns that include the lack of consideration of State government jurisdiction, the lack of public involvement, and ultimately, the lack of sufficient reason to construct such redundancy. PEF has never had a 500 kV N-1-1 event on its system. For this draft Standard to require redundancy projects costing billions of dollars for events that to date have never occurred is preposterous (note: additional comments concerning public outreach, no State government involvement, etc., are contained in the response to Question 15).</p>
<p>Response: Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for a single Contingency Event. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted Interruptible Loads, in preparation for the next Contingency. Header note 'e' provides the System adjustments allowed after a first Contingency Event.</p> <p>Header note 'e' -- <u>For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>		
Ameren	No	<p>Please clarify that the shunt devices to be considered for outage are those that are directly connected to the transmission system. For the P6 events involving a transmission facility and a shunt device, local voltage instability issues may result in dropping of load in the vicinity of the outaged facilities, but the concern should be that the load dropped is not wide-spread.</p> <p>The words "Voltage instability" should be removed from Header Note 3 of Table 1 so that it becomes "Cascading outages and uncontrolled islanding shall not occur."</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
<p>Response: Requirement R3.3.3 (now Requirement R3.4) was modified to allow the PC and TP to determine the single and multiple Contingencies to be included in the planning analyses. This would give the TP and the PC the discretion to study the Contingency most suited to the study area.</p> <p>R3.4 Those Planning Event Contingencies in Table 1 —Steady State Performance not covered in Requirement R3.3.2 that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created,</u> and <u>†</u> The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall includ<u>include</u> an explanation of why the remaining Contingencies would produce less severe System results.</p> <p>However, “voltage instability” has not been removed from the Header Note 3 (now Note a) because voltage instability in a local area can spread to the rest of the System if not arrested in time, and a planning analysis is needed to ascertain if there is a voltage stability problem, and, if so, the corrective actions needed.</p>		
Exelon Transmission Planning	No	We do not agree that the requirement should be so much more severe for an internal breaker fault as opposed to two single line outages for elements over 300 kV.
<p>Response: An internal breaker fault is a single event covered in FERC Order 693. In addition, an internal breaker fault would remove from service all Facilities connecting to the faulted breaker simultaneously, which would likely be more severe than the outage of two single lines.</p>		
MidAmerican Energy Company	No	MEC suggests that there be more explanation of what system adjustments are permitted. There should be some specific limit like 100MW below which load loss is allowed. Otherwise, very high cost solutions will be required for very low probability events.
MRO NERC Standards Review Subcommittee	No	The MRO suggests that there be more explanation of what system adjustments are permitted. There should be some specific limit like 100MW below which load loss is allowed. Otherwise, very high cost solutions will be required for very low probability events.
<p>Response: Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. While the SDT does not disagree with having some specific limits below which load loss would be allowed, arriving at such an amount may be too case-specific and too descriptive for a Continent-wide Standard.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
Austin Energy	No	It should be left to the Transmission Planner and/or Planning Coordinator (ISO or RTO) to select the credible multiple contingencies to be studied as planning events. Therefore P6 should be deleted.
Brazos Electric Power Cooperative, Inc.	No	P6 should be incorporated back into P5. Up to this point, studying all shunt devices has not been considered to have a significant impact on the BES. In addition these are picked up when studying other contingencies. Certain type devices should be reviewed individually, FACTS devices, etc? but this should be at the discretion of the TP or PC. Currently adding shunt devices as a category would require modification to case data or software to be able to automatically run through them all and we are not convinced this is worth the effort.
<p>Response: Requirement R3.3.3 (now Requirement R3.4) was modified to allow the PC and TP to determine the single and multiple Contingencies to be included in the planning analyses. This would give the TP and the PC the discretion to study the Contingency most suited to the study area, and can choose not to study P6 Events if they are less severe than the Events studied. Therefore, P6 is not deleted.</p> <p>R3.4 Those Planning Event Contingencies in Table 1 —Steady State Performance not covered in Requirement R3.3.2 that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created,</u> and <u>†</u>The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall includ<u>include</u>e an explanation of why the remaining Contingencies would produce less severe System results.</p>		
AEP	Yes	Table 1 does not specify a maximum amount of allowable non-consequential load loss for those categories (including P6) that have a "Yes" listed under the "Non-Consequential Load Loss Allowed" (last) column. See load loss definition under Attachment D of PJM Manual 14B for an example of a maximum amount specification.
<p>Response: While the SDT does not disagree with having some specific maximum amount of allowable Non-Consequential Load loss for these events, arriving at such an amount may be too case-specific and too descriptive for a Continent-wide Standard</p>		
ERCOT System Planning	No	The former P5 of the first draft only required transmission circuits of 300 kV and above to be simulated out of service followed by loss of transmission circuit or transformer. P6 of the second draft requires all BES (100 kV and above) transmission circuits, transformers, dc lines, and shunt devices in combination of another BES circuit, transformer, dc line, and shunt device. The number of contingencies that have to be simulated increased dramatically to an impractical level and would require days of uninterrupted computer run time to complete. This, in combination with other contingencies and sensitivities required in this draft of the standard, is not feasible for large entities. ERCOT recommends that this planning event P6 retain the verbiage regarding transmission lines and transformer low side windings above 300kV.
<p>Response: The previous draft P5 set requirements for N-1-1 300 kV and above; P8 sets requirements for N-1-1 below 300 kV. P6 in this draft combines both P5 and P8 from the previous draft. So, the work load for both drafts would be the same. In addition, Requirement R3.3.3 (now Requirement R3.4) was modified to allow the PC and TP to determine the single and multiple Contingencies to be included in the planning analyses. This would give the TP and the PC the discretion</p>

Organization	Question 11:	Question 11 Comments:
		<p>to study the Contingency most suited to the study area, and can choose not to study P6 Events if they are less severe than the events studied.</p> <p>R3.4 Those Planning Event Contingencies in Table 1 – Steady State Performance not covered in Requirement R3.3.2 that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created,</u> and <u>the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include</u> an explanation of why the remaining Contingencies would produce less severe System results.</p>
American Transmission Company	Yes	<p>We suggest that there be more explanation of what system adjustments are permitted. We understand that the revised P6 allows loss of Non-Consequential Load for Systems below 300 kV as well.</p>
		<p>Response: Header note 'e' provides the System adjustments allowed after a first Contingency Event. In addition, Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of firm Transmission Service will be allowed in preparation for the next Contingency.</p> <p>Header note 'e' -- <u>For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>
Florida Reliability Coordinating Council, inc	No	<p>For P6 events (and all other events that allow system adjustments after the loss of a transmission device), this draft does not clearly define when the requirements in the columns marked as ?Interruption of Firm Transmission Service? or ?Non-consequential Load Loss Allowed? apply. The SDT should clearly state that the requirements in these columns are only applicable after the Event occurs from the Initial System Condition. In addition, the SDT should make it clear whether Interruption of Firm Transmission Service and Non-consequential Load Loss is allowed in preparation for the 2nd Event. On the NERC conference call for the 2nd draft, the SDT chair indicated that Interruption of Firm Transmission Service and Non-consequential Load Loss is not acceptable in preparation for the next event. In Order 693, Para. 1788 - Para. 1796, FERC distinguished between ?preparing for the next contingency? and returning to a system normal state. The SDT removed the allowance that was made in footnote c of TPL-003-0 to ?To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.? (emphasis added) for Category C3 events (now P6 for facilities greater than 300kV). This change in the standard is not directed by the FERC Order 693 and is not a reliability improvement that is cost justified. Forced outage rates for equipment greater than 300kV is very low and the impact on markets is very large. Many utilities have granted long term transmission service to entities with the expectation that the service can be curtailed if required in preparation for the next event. If this is not allowed, entities</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 11:	Question 11 Comments:
		<p>within FRCC will have to greatly reduce the long term firm imports into FRCC or construct additional EHV transmission lines from a location well into Georgia down to a point in the southeastern portion of FRCC. While an in-depth cost has not been completed for a project of this size in many years, it is reasonable to expect that a cost in excess of \$1.5 - \$2.0 Billion. This investment will only slightly increase the amount of firm imports into FRCC (and replace the imports allowed before this change) for an event that may only occur only once every 20+ years. If this event happens, the Transmission Owners will re-dispatch their own generation to curtail their transactions in addition to curtailing the firm transmission service of others, per their OATT. The SDT should clearly state for these Planning Events, all system adjustments including Interruption of Firm Transmission Service and Non-consequential Load Loss is acceptable in preparation for the second Event where system adjustments are allowed between events.</p>
<p>Response: The SDT believes that Table 1 is clear that the events occur from P0 as the starting condition. Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for event P1. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted Interruptible Loads, in preparation for the next Contingency.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>		
FirstEnergy Corp.	Yes	<p>We agree with the change that now permits the loss of Non-Consequential Load for N-1-1 to meet performance requirements regardless of the voltage level studied. It is well understood that following a single contingency (N-1) that no Non-Consequential Load loss or interruption of Firm Transmission service is permitted. The SDT needs to clarify for industry if interruption of Firm Transfers is permitted pre-contingency to prepare for the 2nd (over-lapping) contingency. This is presently permissible in the existing TPL standards as Table 1 footnote 'b' reads ?? To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.?</p>
<p>Response: Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Los Angeles Department of Water and Power	Yes	yes, only because there is no discrimination among different and arbitrary voltage classes.
IESO	Yes	We concur with the need to test N-1-1 contingencies involving transmission facilities allowing interruptions to firm transmission services and non-consequential load loss to meet performance requirements, for any voltage levels as long as adverse reliability impacts on the BES are exhibited.
<p>Response: Thank you for your response.</p>		

12. Comments from some entities received from the posting of the 1st draft standard indicated that significant additional costs will be required to meet the proposed requirements and performance tables. Commenters also indicated that it would take several years to install the additional facilities needed to meet the change in requirements. The SDT has attempted to adjust and clarify the proposed requirements and performance in light of these initial comments; however, the SDT needs more specific information on these concerns so that it can put the proposed requirements in perspective and make more adjustments as appropriate. Questions 12, 13 & 14 address these concerns.

What do you estimate will be your additional approximate costs, if any, to support the proposed requirements and performance tables over and above what you are currently doing for the following: Analysis:

One time cost to supplement past study portfolio and analyze the supplemental studies (depending on the extent of supplemental work needed, this may be an accumulated cost over more than one year):

How many years do you estimate that it will take to complete supplemental studies and associated analysis?

On-going additional cost for expanded studies and analysis:

Summary Consideration:

The SDT has reviewed the responses and will use the data as background information in making any further decisions with regard to this standard. No direct changes were made to any of the requirements at this time based on this information.

Organization	1 - Question 12 Comments:	2 - Question 12 Comments:	3 - Question 12 Comments:
Dominion - Electric Transmission Planning	It is extremely difficult, if not impossible, to accurately determine the costs required to perform supplemental studies in order to become compliant with these proposed standards. It will take time to just become familiar with the proposed changes as well as developing the necessary documentation to show compliance. What is obvious is that increased staffing levels will be required to perform the assessments. Furthermore, it will take significant time to become fully compliant. Therefore, a grace	As stated above, this is difficult to predict but a grace period of 2 to 3 years should be considered.	At this point we are estimating at least 2 to 3 additional resources may be required to perform the additional studies on an ongoing basis. For Dominion, three (3) additional engineers to perform this analysis is approximately \$500,000 per year (including benefits and overheads).

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 12 Comments:	2 - Question 12 Comments:	3 - Question 12 Comments:
	<p>period of 2 to 3 years should be granted in order to perform the required assessments and become compliant.</p>		
NPCC	<p>NPCC Participating Members believe some additional cost for analysis and study may be required in order to meet the final requirements of the standard and the associated performance tables. However, the ability to accurately estimate the costs of these studies, how long the analysis may take and how much additional effort may need to be made to compile the documentation is not possible at this time. Many believe posing this question is premature and cannot be quantified at this time, and it may hold questionable value without a better understanding of the complete final requirements of the standard. Many believed that the sensitivity language, although currently being performed to some extent within NPCC, that now appears in the standard, could have a drastic effect on the extent to which this additional analysis is conducted and the associated costs.</p>		
TVA System Planning	<p>One component of these costs is based on modification to the load flow database. A massive effort would need to be undertaken to model bus sections and breaker codes in order to simulate the planning events needed to stay current with the proposed standards. Also, man-power to perform the extra analysis was considered. Additional man-power of 5 engineers (2 years) would</p>	<p>The majority of the time would be spent modifying the load flow database so that the new planning event simulations could be analyzed. ? Time duration estimate of 2 years would be required.</p>	<p>Additional man-power of 4 engineers at costs of \$400,000 per year would be required.</p>

	purpose of planning studies verses operating studies.		
National Grid	The comment period was not long enough to develop a thoughtful response to the impact that the new standards might have. Therefore costs can be speculated to be incrementally hundreds of thousands per year.	The comment period was not long enough to develop a thoughtful response to the impact that the new standards might have on the planning studies, but a very rough thought would be that any additional needs would be captured within the normal planning studies, which would likely occur within two study cycles of the effective date of the standard.	If the new requirements are included in the normal study cycle and the costs are the incremental costs required by additional study requirements, then the annual costs will be less than the first year costs, but we still will need additional staffing, which will cost hundreds of thousands per year. In addition to cost, there is a significant concern over whether or not the labor market can provide enough qualified staff to complete the required work.
Pacific Gas and Electric Co.	We expect supplemental studies to be needed for the entire 500 kV system and most of the 230 kV system. We estimate the one time cost for supplemental studies to be around \$100,000.	Assuming that the supplemental studies would be added to the on-going work, we estimate the time to complete the supplemental studies to be about 2 to 3 years.	We estimate that the additional cost for the expanded studies and analysis would be about \$50,000/year.
Gainesville Regional Utilities	\$50,000. I don't feel this is needed for smaller utilities.	3 years. Again, I don't feel this is needed for smaller utilities.	\$60,000. Again, I don't feel this is needed for smaller utilities.
JEA	\$80,000 per year.	3 years	\$80,000 per year.

	the standard, could have a drastic affect on the extent to which this additional analysis is conducted and the associated costs		
Progress Energy Florida, Inc.	Given that a) PEF has never performed analysis to the extent that the draft TPL Standard is requiring and b) the draft is going through an iterative process and is at present considered a "moving target", a reasonably accurate estimate, or even a wild guess, cannot be provided for this answer. Having said that, it can be reasonably said that any estimate that could safely claim a reasonable degree of accuracy would require analysis performed full-time by several individuals over a period of several months (or possibly a period greater than one year). Just the cost of the assessment analysis alone would present an O&M challenge to PEF's Transmission department.	PEF has assessed this question and determined that any period of time less than 10 years would be inadequate to assess the supplemental nature of the requirements of the draft TPL Standard, to say nothing of the time required to construct the required facilities.	PEF, again stating that this cannot be considered an accurate estimate for the reasons stated in 12a, would estimate the burdened labor cost to perform such supplemental analysis on an ongoing basis to be at least \$1M annually.
Sierra Pacific Power Comapny / Nevada Power Company	\$400,000	2 Man Years	\$250,000/year
Lafayette Utilities System	Lafayette has not analyzed in any detail the resource requirements addressed in this question. Based on available information, we estimate that supplementing existing studies would require at least 1 FTE familiar with stability analysis to be able to complete this portion of TPL. The new steady-state analysis will require the addition of 1 FTE to be able to complete the additional P5-P7	See response to part 1 of Question 12.	See response to part 1 of Question 12.

	requirements. These will be ongoing expenses whether accomplished by hiring new staff or relying on external service providers.		
Arizona Public Service Co.	Two person-year.	2-years.	one person year.
Ameren	One component of cost is to model in more detail all straight busses and bus-tie breakers at all transmission voltage levels. Contingency scenarios would also need to be developed and/or modified to correspond with the new powerflow models. The sensitivities presently specified will greatly increase the cost and time needed for updating all plant stability studies.	One-time costs to provide additional modeling detail and modify and test the revised contingency lists would be approximately 1 man-month or about \$8000. Updating all plant stability studies would take approximately 5 man-years, at an estimated cost of approximately \$500,000 (including benefits). Given existing regional requirements to complete the annual assessment by July 1 of the calendar year, additional staffing would likely be needed to complete this work, unless compliance were phased in over a number of years, similar to the MOD-024 and MOD-025 standards with respect to generator testing.	A review of the studies required for R2.1 indicates that at least 6 powerflow modeling scenarios would need to be completed to cover the base cases and sensitivities, which would be a 50% increase in the amount of work presently performed to meet the existing TPL-001 through 004 requirements for the near-term assessment. A review of the studies required for R2.4 indicates that at least 4 stability scenario models would need to be completed, which would be a 100% increase in the amount of work presently performed. Our present compliance performance and analyses activities take approximately 30 man-months to complete. We would expect the additional study analyses to add an additional 20 man-months of work and require 4-5 additional engineers at an annual cost of \$400,000 to \$500,000 (including benefits), given the regional requirement to complete the annual assessment by July 1.
City of Tallahassee, FL	we estimate a cost of \$100,000 minimum since the City would likely have to outsource some of this analysis in addition to the work done by in-house system	hard to give a good estimate since the full ramifications of the required studies is not clear in the current draft. I would estimate 2 years at least.	similar costs to what was estimated above for the supplemental study cost, since staffing level is such that much of this ongoing work will likely be outsourced.

	planning staff.		
Florida Power and Light	<p>These costs cannot be determined without having experience with the new standard and its analysis requirements. Analysis of existing studies will undoubtedly uncover substantial additional study that would need to be performed, but the costs of such analysis and studies could not be reasonably estimated beyond stating that the costs would be significant resulting from 1000's of man-hours spent on supplemental work that would only determine if we were in compliance, not including any work necessary to determine what would be necessary to bring deficiencies in to compliance.</p>	<p>It would not be unreasonable to find that it takes one full planning horizon (10 years) to complete supplemental studies and analysis for the draft standard, because it is so prescriptive. Requirements such as R2.2.1 that requires that the planning assessment be extended for longer lead time projects (such as the multiple new nuclear projects being considered across the U.S.) and R2.4.1 that specifies "...including the behavior of induction motor loads" will likely invalidate past studies that took considerable time to perform and would have to be reproduced with the newly required considerations. Requirements such as R2.6 (and subrequirements) invalidate many existing studies, because of subjective terms such as "material changes" and "would impact the study area" without definitions of "material" or "impact". Re-analyzing all existing studies and re-writing the results and conclusions using the new terminology (P0, P1, P5 etc. instead of Category A, B or C2, C3, C5 etc.) used in the new performance tables will also add substantially to the effort needed to insure compliance and make the information auditable.</p>	<p>\$ 5 million dollars annually is perhaps very conservative.</p>
CenterPoint Energy and CPS Energy	<p>We have no analysis to support an answer to this question, and we believe any such analysis would be speculative. We believe the reality of the situation is that the requirements are not practically achievable</p>	<p>3-4 years, assuming reasonably practical interpretation of the impractical requirements.</p>	

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 12 Comments:	2 - Question 12 Comments:	3 - Question 12 Comments:
	at any cost, so the ultimate cost would depend on practical interpretations of impractical requirements. Even if the cost could be reasonably estimated, we oppose detracting valuable expertise away from necessary, value-added analyses to unnecessary, over-reaching theoretical analyses and documentation for audit purposes.		
SRP	The additional study work associated with this Standard could cost up to SRP \$100k.	1 to 2 years to complete these additional studies.	Estimate addition on-going costs of \$50k.
MidAmerican Energy Company	MEC estimates that the total cost for one-time software licenses would be about \$100,000.	MEC estimates that the lead time to perform supplemental studies and analyses to meet the new requirements would be 2 years.	MEC estimates that the on-going additional cost of expanded studies and analyses to meet the new requirements would be about \$150,000 to \$200,000 for additional staff and continuing software fees.
Tucson Electric Power Company	\$200,000	6 month study performed by consultant	1 man-year
SERC Dynamics Review Subcommittee	The sensitivities will greatly increase the cost and time need for planning because the work is directly proportional to the number of sensitivities.		
MRO NERC Standards Review Subcommittee	The MRO estimates that the additional one-time costs of supplemental studies and analysis to meet the new requirements might be spread over five years because some analysis only has to be updated every five years. The MRO estimates that the total cost over five years for additional staff, consulting services, or software fees would be about \$200,000 to \$300,000 per	The MRO estimates that the lead time to perform supplemental studies and analysis to meet the new requirements would be up to 5 years.	The MRO estimates that the on-going additional cost of expanded studies and analysis to meet the new requirements would be about \$150,000 to \$200,000 for additional staff and continuing software fees per responsible entity.

A massive effort would need to be undertaken to model bus sections and breaker codes in order to simulate the planning events needed to stay current with the new standards. Also, man-power to perform the extra analysis was considered. Additional man-power: 5 engineers (2 years) Cost: \$1,000,000	The majority of the time would be spent modifying the loadflow database so that the new planning event simulations could be analyzed. Time: 2 years	enough staff to complete the required work. Additional man-power: 4 engineers Costs: \$400,000 / year The following analysis was performed by one large integrated utility in SERC. The results are not representative of all utilities in the SERC region, but would be multiplied many times over to fully represent the SERC region as a whole. A comprehensive study of the impact of these proposed and incomplete standards is not feasible until they are finalized. Regarding manpower, aside from the estimated costs there is the very real situation that the number of qualified engineers available in the industry is nowhere near what would be necessary to carry out the studies (including sensitivities) called for by the proposed standard. This reality needs to be taken into consideration by the Standards Drafting Team when it makes its implementation plan recommendations.
Oncor Electric Delivery	Cost to supplement past study portfolio would be between \$250,000 to 750,000.	3 to 5 years with added resources (staff)	\$500,000 annually
ISO New England Inc.	The comment period was not long enough to develop a thoughtful response to the impact that the new standards might have. Therefore cost can not be reasonably speculated.	The comment period was not long enough to develop a thoughtful response to the impact that the new standards might have on the planning studies, but a very rough thought would be that any additional needs would be captured within the normal planning studies, which would likely occur within two study cycles of the effective date of the standard.	The comment period was not long enough to develop a thoughtful response to the impact that the new standards might have on study effort and the associated cost. In addition to cost, there is a significant concern over whether or not there will be enough staff to complete the required work.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 12 Comments:	2 - Question 12 Comments:	3 - Question 12 Comments:
Orlando Utilities Commission	\$75,000 to supplement past study portfolio. (We have a fairly small system, only 1400 MW)	Two years, one year to recruit additional planner, the second to perform the baseline studies. This assumes there are sufficient trained personnel in the industry and they can be recruited.	\$75,000 each year.
Entergy Services, Inc.	Cost will be covered by the on-going study costs as indicated below.	18 to 24 months	\$1,200,000 / year
BPA Transmission Reliability Program	This information is not available.	This information is not available.	This information is not available.
<p>Response: The SDT thanks all who responded to this survey question.</p>			

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

13. Documentation: One time cost to prepare reporting documentation associated with studies needed to supplement past study portfolio (depending on the time required to complete the supplemental work, this may be an accumulated cost over more than one year) – and on-going additional cost for documentation of expanded studies and analysis:

Summary Consideration:

The SDT has reviewed the responses and will use the data as background information in making any further decisions with regard to this standard. No direct changes were made to any of the requirements at this time based on this information.

Organization	1 - Question 13 Comments:	2 - Question 13 Comments:
Dominion - Electric Transmission Planning	The initial process development and documentation will be the most difficult and time consuming portion. Dominion - Electric Transmission recommends a period of 3 to 5 years be given for this initial period of becoming compliant and preparing the documentation. As noted above, it is difficult to provide cost estimates, but we expect at least 2 to 3 additional resources will be required, at a minimum.	See response above.
NPCC	See above	
TVA System Planning	Additional man-power of 1 engineer (1 year) would be required at cost of \$100,000	Additional man-power of 1 engineer at costs of \$100,000 / year
Progress Energy Carolinas	\$60,000	\$20,000/year
BCTC	Included in the above. We do not do analysis without documentation.	Included in the above. We do not do studies without documenting them
Manitoba Hydro	\$200,000	\$100,000
Los Angeles Department of Water and Power	This assumes that past studies are inadequate and supplemental studies are needed. The standard does add a lot of duplicative and unnecessary operating scenarios that are already required	

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 13 Comments:	2 - Question 13 Comments:
	under TOP and MOD; but they should be deleted because they serve no useful purpose under TPL, why even spend an extra penny if it is for naught.	
National Grid	See response to question 12.	See response to question 12.
Pacific Gas and Electric Co.	This cost would be included in the cost of performing the supplemental studies.	This cost would be included in the cost of performing the expanded studies and analysis
Gainesville Regional Utilities	Probably would be covered in the previously provided annual cost. Again, I don't feel this is needed for smaller utilities.	Probably would be covered in the previously provided annual cost. Again, I don't feel this is needed for smaller utilities.
JEA	Included in Question 12 estimates.	Included in Question 12 estimates.
PacifiCorp	\$250,000 over two years	\$125,00
Puget Sound Energy, Inc.	\$150,000 for the STD in its current form.	\$50,000
ITC Holdings: ITC, METC, ITC Midwest	While we recognize that the standards might require us to garner a little more manpower and will take a little more time, we believe that running these studies is important.	While we recognize that the standards might require us to garner a little more manpower and will take a little more time, we believe that running these studies is important.
Idaho Power Company	Appx \$50k	Appx \$50k
Hydro-Quebec TransEnergie (HQT)	See Q12	
Progress Energy Florida, Inc.	Again, these costs cannot be reasonably estimated given the difficulties stated in the answer to Question 12a. It would reasonable to expect that the number of individuals in PEF's Transmission Planning group would have to dramatically increase, at least doubling in size or possibly significantly more	Documentation cannot be separated from the actual analysis itself, and thus would be included as part of the \$1M estimate stated in the answer to Question 12b above.

Arizona Public Service Co.	\$200,000.00	\$100,000.00
Ameren	Documentation preparation to include the short-circuit assessment, the amount of consequential load dropped for single contingencies, the expanded requirements of the Corrective Action Plan, and how the sensitivities affect the Corrective Action Plan would take a man-week or two at most (no significant cost increase or manpower increase).	Our present documentation activities to develop the assessment and the corrective action plan take approximately 2 man-months to complete. We would expect the documentation to cover the additional study analyses to add an additional 2 man-months of work. The additional documentation for the Consequential Load Loss, short-circuit analysis, expanded requirements of the Corrective Action Plan, and documentation of how the sensitivities studied affect the corrective plan are estimated to double the existing reporting requirements, resulting in an increase of 3.5 man-months and require 2 additional engineers at an annual cost of \$200,000 (including benefits), given the regional requirement to complete the assessment by July 1.
City of Tallahassee, FL	documentation cost was included in the cost estimates for #12, since development of the documentation is part of the study work scope.	
Florida Power and Light	These costs cannot be determined without having experience with the new standard and its documentation requirements. Analysis of existing studies will undoubtedly uncover substantial additional documentation that would need to be produced, but the costs of such document production could not be reasonably estimated beyond stating that the costs would be significant resulting from 1000's of man-hours spent on supplemental work	This would be included in the \$5 million dollar estimate provided above.

<p>Response: The SDT thanks all who responded to this survey question.</p>		

14. System Reinforcement: One time cost, capital investment, to expand your system reinforcement program (due to lead times associated with different types of facilities, this will probably be an accumulated cost over several years). How many years do you estimate that it will take to complete this initial expanded system reinforcement program:

Summary Consideration:

The SDT has reviewed the responses and will use the data as background information in making any further decisions with regard to this standard. No direct changes were made to any of the requirements at this time based on this information.

Organization	1 - Question 14 Comments:	2 - Question 14 Comments:
Dominion - Electric Transmission Planning	Difficult to estimate the investment required, but it will be in the millions if not hundreds of millions of dollars.	Siting new transmission in Virginia can take a minimum of 5 to 7 years if new right-of-way acquisition is required. It is difficult to provide an estimate of time, but it will be quite extensive.
NPCC	NPCC participating members have expressed compliance concerns that this standard, and in particular this question, imply NERC has the ability to "force" transmission reinforcements and construction. It should be emphasized and clarified that the standard should require transmission studies only, and per the Energy Policy Act, NERC does not have this authority as the ERO as granted by FERC in the US and NO authority allowing this in Canada. Also NPCC participating members expressed concern that a validly conducted assessment which shows that criteria are not met (in the 5 or 10 year horizon) could result in non-compliance with the Standard. If NERC believes that it can issue monetary penalties for 5 or 10 year assessments that show that performance criteria will not be met under future system conditions, there is a key question that requires explanation: What behavior is NERC attempting to incent through fining parties for conducting assessments which identify problems in a 5 to 10 year horizon? Also, NERC should further explain how it would view the relevance of a State or Provincial decision not to permit new facilities when issuing such a potential penalty such as preclusive siting issues with Generating Plants.	See above

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 14 Comments:	2 - Question 14 Comments:
TVA System Planning	Costs would include the implementation of redundant protection schemes for the P5 planning event (fault + failure of protection scheme), additional 500-kV facilities for P2.2 (single contingency - bus section outage) and P4 (fault + stuck breaker) events, and additional 161-kV facilities for the P3 (Generator +1) events. Estimated cost of \$1 billion	Time duration of 10 years would be required
Progress Energy Carolinas	\$100,000,000	10 years
BCTC	We do not believe that this cost is not relevant for determining the applicable standards and have not estimated it. The reinforcement costs are orders of magnitude greater than the costs of alternatives the changes in this standard propose to prohibit (e.g. use of RAS, curtailment in anticipation of the next contingency). We believe it is very unlikely that we would get approval for the projects that would be required to meet the proposed changes.	It is highly unlikely that we would be able to get funding approval for the system reinforcements required to meet the proposed changes in these standards.
Manitoba Hydro	An estimate of the cost to Manitoba Hydro is \$1.0 Billion.	The licensing and construction of facilities to achieve compliance will require at least 10 years.
Los Angeles Department of Water and Power	If this question is referring to discriminatory treatment between different voltage classes that is arbitrary; the effort should be directed to either treat all the voltage classes equally or do come up with a scientific or historical basis to support the requirement. This is an engineering standard, all the criteria should have some scientific/engineering rationale that can be supported either by physics or historical data.	
National Grid	The comment period was not long enough to develop a thoughtful response to the impact that the new standards might have on the construction requirements. Therefore cost can not be reasonably speculated.	At least 5 beyond the study period. Lines requiring new Rights-of-Way may require 10.
Pacific Gas and	The capital investments would be dependent on the system	Any transmission facilities that would require a certification of

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 14 Comments:	2 - Question 14 Comments:
Electric Co.	reinforcements needed due to the added requirements. For example, if after the first contingency, redispatch to curtail firm transfers is not allowed in anticipation of the next single contingency, the system reinforcements could easily include more 500 kV lines and related facilities. The costs of such reinforcements could be a few Billion dollars.	public convenience and necessity could take more that five years for permitting, engineering and construction. Transmission Planning could take a few more years depending on the transmission reinforcements to be constructed.
Gainesville Regional Utilities	\$50 Million. Again, I don't feel this is needed for smaller utilities.	7 years. Again, I don't feel this is needed for smaller utilities.
Public Service Company of New Mexico	This ultimately depends on the degree to which the local area issues addressed by footnote b of Table 1 of the existing TPL are maintained. Without the local area concepts of the existing TPL, costs could run into the hundreds of millions of dollars.	This ultimately depends on the degree to which the local area issues addressed by footnote b of Table 1 of the existing TPL are maintained. Without the local area concepts of the existing TPL, permitting requirements would result in some projects exceeding 10-years.
JEA	Could be up to \$1 Billion and would depend on the physical ability to terminate at existing 500 kV substations and the ability to acquire 500 kV ROW outside of JEA's and Florida's jurisdiction.	Minimum of 7 years if DOE declares a Corridor of National Interest. Otherwise it could be longer and more costly.
PacifiCorp	\$100,000,000 + Will not be able to estimate the total cost until after the studies are complete.	10 years
Puget Sound Energy, Inc.	\$800,000,000 to recover Firm Transmission capacity with no adjustment following N-1.	15 years
ITC Holdings: ITC, METC, ITC Midwest	Since we have been following the NERC Planning Standards, at this point we do not expect an additional one time system reinforcement cost.	Since we have been following the NERC Planning Standards, at this point we do not expect an additional time-frame for a system reinforcement program.
Idaho Power Company	Not sure	5 years
SMUD	A field test of the revised standard would be the appropriate way to arrive at the approximate costs to support the new/modified	A field test would be the time to get an educated estimate.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	1 - Question 14 Comments:	2 - Question 14 Comments:
	requirements.	
Hydro-Quebec Transenergie (HQT)	<p>HQT and NPCC participating members have expressed compliance concerns that this standard, and in particular this question, imply NERC has the ability to "force" transmission reinforcements and construction. It should be emphasized and clarified that the standard should require transmission studies only, and per the Energy Policy Act, NERC does not have this authority as the ERO as granted by FERC in the US and NO authority allowing this in Canada. Also HQT and NPCC participating members expressed concern that a validly-conducted assessment which shows that criteria are not met (in the 5 or 10 year horizon) could result in non-compliance with the Standard. If NERC believes that it can issue monetary penalties for 5 or 10 year assessments that show that performance criteria will not be met under future system conditions, there is a key question that requires explanation: What behavior is NERC attempting to incent through fining parties for conducting assessments which identify problems in a 5 to 10 year horizon? Also, NERC should further explain how it would view the relevance of a State or Provincial decision not to permit new facilities when issuing such a potential penalty such as preclusive siting issues with Generating Plants.</p>	
Progress Energy Florida, Inc.	<p>Again, due to the difficulties described in the answer to Question 12a, given that the amount of analysis cannot be reasonably estimated, neither can the one-time capital cost. PEF did state in the answer to Question 11 that the cost to our 500 kV system alone would easily run in to the range of costing billions of dollars. How many billions, we are not sure, but we have sufficient experience through presently planned 500 kV projects on our system to know that the cost for such expansion is in the range of billions of dollars. Given that PEF has not been able to comprehensively assess the costs to its 230 kV and 115 kV system, it is likely that the total cost of implementing the draft TPL Standard would be many, many billions of dollars. As stated earlier, this concern is reinforced in the answer to Question 15, but</p>	<p>PEF does not believe the undertaking required in the present draft of the TPL Standard, questionably described here as an "initial" program, could reasonably be implemented in our lifetime. As stated in our answers to Questions 12 and 13, the planning time would run at least 10 years, or one complete long-term planning cycle. Implementation, particularly given the scope of 500 kV projects and challenges with operating the existing system while constructing such large projects, will take an additional 10 years. An estimate of 20 years, however, assumes that the industry is in place to make such projects feasible continent-wide. Just a cursory assessment of the limited resources of the Transmission Construction industry, combined with the global demand for concrete and steel, leads us to conclude that implementation of</p>

Organization	1 - Question 14 Comments:	2 - Question 14 Comments:
	we are extremely concerned that our ratepayers will potentially be burdened with such exorbitant cost for so little benefit, and are certain that our PSC and our ratepayers will agree.	the draft Standard's requirements is not feasible short of a World War II-scale re-tooling of our entire economy. Given the significant challenges the U.S. economy is already facing, the prudence of such a colossal undertaking with minimal benefit becomes even more questionable.
Sierra Pacific Power Company / Nevada Power Company	\$800 Million	10 years
Lafayette Utilities System	See response to part 1 of Question 12.	See response to part 1 of Question 12.
Arizona Public Service Co.	Hard to quantify without studying.	5 years
Ameren	Our present interpretation is that the proposed revised standard would have a minimum impact on the reinforcement of the Ameren system. The modification to remove the requirement that bus-tie circuit breakers must have the same performance requirements as non-bus-tie breakers significantly reduces our issues of non-compliance, and particularly for circuit breakers 300 kV and above.	Our present interpretation is that the proposed revised standard would have a minimum impact on the reinforcement of the Ameren system.
City of Tallahassee, FL	depending on the interpretation of the standard as currently drafted, this cost could be substantial (at least \$20M) over a 5-year capital budget period (consistent with the City's current practice). It's doubtful this level of funding could be achieved/maintained given other financial pressures for local governments.	Unable to develop an answer to this question, since it depends on the ability to successfully site and permit generation and transmission facilities (which is becoming increasingly harder to complete), and the requirements of any successful siting effort may make the costs prohibitive (ie, underground transmission facilities and/or stringent controls on generating facilities).
Florida Power and Light	These costs cannot be determined without having experience with the new standard and its performance requirements. The costs of such investment could be in the 10's of billions of dollars for FPL because of the increased level of performance contemplated by the draft standard.	If we knew what was needed today, it could conceivably take up to 10 years to complete, if the projects are all feasible. Without knowing what is necessary, a fair estimate would be 20 years. This does not take into consideration that the entire industry would be competing for the same limited resources of material and manpower to complete this reinforcement. Justification would be

15. (A) Do you generally support the revised standard? (B) Are you unsure whether you generally support the revised standard? or (C) Do you definitely not support the revised standard? Please check the appropriate box below. If your response is either (B) or (C), please explain your single biggest concern with the revised standard, including which specific requirement or set of requirements causes you the most concern and why.

- A – Generally support the revised standard
- B – Unsure about supporting the revised standard
- C – Definitely do not support the revised standard

Summary Consideration: 50% of the commenters voted that they did NOT support the revised standard at this time. 35% are unsure. Some of the major issues that were raised by the industry for Question 15 include:

1. System Adjustment in event P6 - Many commenters believe that after the first N-1 in P6, curtailment of Firm Transmission Service or firm transfers should be allowed as part of System adjustment in preparation for the next N-1, citing that this is presently allowed in footnote b in existing Table 1. Otherwise, the Firm Transmission Service under normal System intact condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1. Many believe this would in effect be imposing an N-2 criterion for offering Firm Transmission Service.

SDT response: The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in Revision 3 of the Standard provides clarification.

2. Dropping local load - Many commenters opposed not being able to drop some local network Load for a single Contingency event as long as Bulk Electric System reliability was not impacted. This is presently allowed in footnote b of the existing TPL-002. However, there is no such allowance any longer for losing Non-Consequential Load for a single Contingency in the proposed draft. Many commenters suggested that orderly dropping of local network Load could limit the spread of the disturbance beyond the local area and allow BES reliability to be maintained. Some local network customer curtailments or local area Load loss has been allowed by local regulatory authorities as long as the overall reliability of the interconnected System was not impacted. This is a result of tradeoffs between providing a higher level of reliability in a local area and the cost and environmental impacts of providing that service.

SDT response: Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of the TPL-001-1

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement. As an alternative, an entity could seek an Entity Variance for the situation described through their Regional Entity organization. In paragraph 1794 FERC clarified that "...an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances". The process described by FERC as a regional difference is described in detail in the "NERC Standards Development Procedure" document under the subsection titled "Variances to NERC Reliability Standards".

3. Raising the bar for 300 kV and above - Many commenters believe that the SDT has not yet justified raising the bar on Facilities above 300 kV. Some pointed out that the higher performance requirements for Facilities >300 kV are tied to very low probability events, so the enhanced reliability is not worth the cost. Some also pointed out that disruptions on lower voltage circuits can cause real and reactive power flow fluctuations across, and eventual separation of, higher-voltage networks. Many believe that there should be no distinction in voltage classes for allowing or not allowing controlled Load shed for applicable events.

SDT response: The SAR for this standard recognized FERC orders which indicated a need to "raise the bar" for the industry. The SDT agrees and is attempting to do this in a reasonable fashion. There is significant flexibility in the Corrective Action Plans allowed for any additional performance requirements which must be met. Industry consensus, through approval of the SAR, is that revision of the existing TPL standards is appropriate.

4. Load modeling for dynamics - Many commenters believe that Load modeling is a significant open issue, such as the models for dynamic studies have yet to be developed and the data is not yet in hand. Many find this conflicting with implementation of the TPL standards due to modeling details being a gating item to completing some System studies.

SDT response: The SDT agrees and believes that industry guidance is needed to capture the appropriate dynamic behavior of Loads. In response to comments, the SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments. Any comments received from the industry on MOD standards will be forwarded to NERC for inclusion into NERC Reliability Standards Development Projects 2010-04 Modeling Data and 2010-05 Demand Data. Requirement R2.4.1 has been modified to include the following: "An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable."

5. Sensitivity analysis - Another concern of commenters is the prescriptive nature of sensitivity scenarios, listed within Requirement R2.1.3 for steady-state and Requirement R2.4.3 for Stability, and the volume of associated study work. Some commenters feel that the Transmission Planner and Planning Coordinator can better select the most appropriate sensitivities for their System. Commenters also feel that examples of sensitivities are already inherent in the existing requirements, such that some sensitivity studies are in effect adding an additional level of Contingency (N-2 or N-3). Many commenters feel that the additional analyses proposed by the revised standard are not warranted and are already covered adequately in the existing studies and TPL standards.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

SDT response: The intent of the SDT in requiring performance of sensitivity studies is to identify critical System conditions and to expand the planners' portfolio of knowledge about vulnerabilities on their System. This is also an expectation from FERC Order 693 paragraphs 1704 - 1706.

As a result of industry comments, the following changes have been made to TPL-001-1:

Consequential Load Loss: ~~Load that is no longer connected to a source as a result of the event being studied or which is lost as a result of the load's response to the transient conditions of the event (other than through the action of UVLS or UFLS schemes). Although Load which is lost as a result of the Load's response to the transient conditions of the event is considered Consequential Load Loss and is permitted when Consequential Load Loss is allowed, Transmission planning entities are not allowed to rely upon the expectation of such Load loss to meet steady state performance requirements. All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.~~

Non-Consequential Load Loss: ~~Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. For example, non-Interruptible Load loss that occurs through manual (operator initiated) or automatic operations such as under-voltage Load shedding, under-frequency Load shedding, or Special Protection Systems would be considered Non-Consequential Load Loss.~~

Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the ~~completion of the previous annual Planning Assessment~~ current calendar year.

R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data consistent with the data provided in accordance with Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.

R1.1.1 Planned outages of generation and Transmission Facilities, if specifically known.

R2 Each Transmission Planner and Planning Coordinator shall ~~conduct and document the results of~~ prepare its annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, document results, and shall cover steady state analyses, short circuit analyses, and Stability analyses ~~including both System and Generating Unit Stability.~~

R2.1.3 For each of the studies described in Requirements R2.1.1 and ~~Requirement~~ R2.1.2, sensitivity case(s) that are intended to stress the System with ~~sensitivities variations that reflect in~~ one or more of the following conditions not already included in the studies shall be ~~run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied~~ included in the Assessment:

- ~~Variability and outages of r~~ Reactive resources ~~s~~ capability

R2.1.4 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience due to the unavailability of the long lead time equipment.

R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable.

R2.4.3 For each of the studies described in Requirements R2.4.1 and ~~Requirement~~ R2.4.2, sensitivity case(s) that are intended to stress the System with variations to reflect in one or more of the following conditions not already included in the studies shall be ~~run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied~~ included in the Assessment:

R2.6.1 (now R2.5.1) For steady state, short circuit, or ~~System~~ Stability analysis: the study shall be five calendar years old or less.

R2.6.2 (now R2.5.2) For steady state, short circuit, ~~Generating Plant Stability,~~ or ~~System~~ Stability analysis: the ~~study present~~ System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include:

R2.7 (now R2.6) For Planning Events shown in Table 1—~~Steady State Performance~~ and Table 2—~~Stability Performance~~, when the analysis indicates an inability of the System to meet the performance requirements in ~~the t~~ Tables 1, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3. The Corrective Action Plan shall:

Under Requirement R2.6.1:

- Installation or modification of Protection Systems or Special Protection Systems
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.
- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate Steady State performance violations.

R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. ~~The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to cContingencies in Table 1—Steady State Performance.~~ The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.

R3.1 Studies shall be performed to determine whether the BES meets the performance requirements in Table 1—~~Steady State Performance.~~ based on the lists created in Requirement R3.4.

R3.3.2 For all generators, studies shall consider the minimum steady state voltage limitations ~~of all generators~~ and identify how the generators are ~~treated~~ analyzed in the steady state simulation

R3.3.3 For all Transmission lines, studies shall consider relay loadability and identify how loadability is ~~treated~~ analyzed in the steady state simulation.

R3.4 Those Planning Event Contingencies in Table 1 ~~—Steady State Performance not covered in Requirement R3.3.2~~ that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created, and ~~†~~ the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall ~~include~~ include an explanation of why the remaining Contingencies would produce less severe System results.

R4 For the Stability portion of the Planning Assessment, as described in Requirement R2.4 ~~and Requirement R2.5~~, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 —Stability Performance. The studies shall be based on computer simulations using models utilizing data provided in Requirement R1. ~~The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted:~~

R4.3.2 ~~Studies shall consider~~ Simulate generator performance under anticipated conditions including how the voltage ride through capability ~~of all generators and identify how the generators are treated~~ is analyzed in the simulation.

R4.4 ~~At a minimum,~~ † Those Planning Event Contingencies in Table 21 – Stability Performance that ~~would~~ are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4.1 created, and ~~†~~ the rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results.

R7. Each Planning Coordinator shall coordinate the distribution of Planning Assessment results among ~~neighboring systems~~ adjacent Planning Coordinators and any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890.

Header note 'e' - For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Extreme Event 2b (steady state) - Loss of all Transmission lines on a common ~~†~~ Right-of-Way.

Footnote 1.a.ii - For all other Planning Events: No generating unit or units totaling more than the Contingency ~~†~~ Reserve of the Balancing Authority (or Reserve Sharing Group if applicable) shall be allowed to pull out of synchronism. Generators that pull out of synchronism must have out-of-step protection or some other means to trip the generator for this condition and the resulting apparent impedance swings must not pass through relay characteristics that would result in the tripping of any Transmission System elements other than the generating unit and its direct connection Facilities.

Footnote 3 - Unless specified otherwise, simulate Normal Clearing faults. Single line to ground (SLG) or three phase (3Ø) are the fault types, that must be evaluated in Stability simulations for the event described. A 3Ø fault study indicating criteria are being met shall provide sufficient evidence that a SLG condition would also meet criteria.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Footnote 5 - [When the conditions and/or event\(s\) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.](#)

Footnote #10 – [Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment \(as identified in the column titled ‘Initial System Conditions’\) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.](#)

Footnote #12 - [Excludes circuits that share a common structure for 1 mile or less.](#)

Organization	Question 15:	Question 15 Comments:
<p>El Paso Electric Company</p>	<p>B — Unsure about supporting the revised standard</p>	<p>While this 2nd draft TPL standard has some positive changes, notably: The allowance to use RAS to trip generation for N-1 (see R3.5 Manual and automatic generation run-back/tripping is allowed as a response to a single or multiple Contingency ...) with some rather generic conditions. The allowance for Non-consequential Load Loss for loss of a transmission Facility, followed by system adjustment, followed by loss of a second transmission Facility (see P6 in draft performance Tables 1 and 2). This is the same as Category C3 in the existing TPL-003-0. On the down side, as proposed, Standard TPL-001-1:1. Will not allow curtailment of firm transfer (or firm transmission service) after the first N-1, in preparation for the next N-1 regardless of transmission voltage level. This is a major issue. Curtailment of firm transfer after the first N-1 has always been a part of system adjustment in preparation for the next N-1 as stated in foot note b of the existing TPL-002-0:"b. Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Not allowing this could mean reduction of firm transfer capability pre-contingency unless new circuits are built.2. The existing standard (http://www.nerc.com/files/TPL-003-0.pdf) does not distinguish between voltage classes, curtailment of firm transfer and, planned and controlled load shedding are allowed regardless of voltage class for Category C events. The proposed standard will not allow curtailment of firm transmission service, or planned and controlled load shedding for loss of Facilities with operating voltage above 300 kV involving the following in the proposed Performance Tables 1 and 2:P2-2: Bus Section fault (Category C1) P2-3: Breaker fault (Category C2) P4: SLG Fault + stuck breaker (Categories C6 - C9) P5: SLG Fault + protection system failure (Categories C6 - C9)The number of Facilities lost would depend on the bus configuration for above 300 kV. If you have a ring-bus, breaker and a half or double breaker double bus, you would lose at the most 2 Facilities. But if you have Main-Aux or single breaker double bus, you will lose all Facilities connecting to the faulted Facility.</p>
<p>Response: In response to your comment and those of others in the industry on allowing curtailment of Firm Transmission Service as System adjustment after</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>an N-1 Contingency, the SDT has added footnotes 5 and 10 to Table 1 - Steady State & Stability Performance.</p> <p>Footnote 5 - When the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.</p> <p>Footnote 10 - Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</p>		
<p>Dominion - Electric Transmission Planning</p>	<p>B — Unsure about supporting the revised standard</p>	<p>(1) Unsure about cost/effort necessary to meet requirements</p> <p>(2) Uncertain that compliance with the proposed requirements in this standard would significantly improve reliability</p> <p>(3) R2.6.2: The entire sentence is confusing as it is modified. The original sentence in the previous draft made more sense. Please check and correct accordingly.</p> <p>(4) R 5.3: This requirement considers voltage ride-through capability of all generators. Nowhere in this TPL standard or in the MOD standards are Generator Owners specifically required to provide such data to Transmission Planners and Planning Coordinators. Stating the requirements for generator dynamics data and dynamic load characteristics in general terms, as listed below (from the MOD Standards), are vague. (a) shall provide appropriate equipment characteristics (b) shall provide dynamics system modeling and simulation data (c) Shall develop comprehensive dynamics data requirements to model and analyze the dynamic behavior...</p> <p>(5) In Table-2 Stability Performance, several places refer to "SLG or 3-phase Faults" . Since it states "or", does this mean we can get by with studying only SLG faults? We do not think that is the intent of this phrase; thus, a clarification is warranted.</p> <p>(6) One of our comments on the previous draft was with respect to a second-zone fault clearing due to protection system failure for a fault beyond zone 1 coverage of primary relies. The SDT's response was (Specific 1): "The SDT agrees with your concern and is working on a solution for a future draft." The question is repeated below, as a pending "to do" item, using the revised 'Table-2 Stability Performance' as reference: Category 5 in 'Table-2 Stability Performance' refers to a protection system failure event. We interpret this as, among other things, having a fault beyond the first-zone coverage of the primary protection scheme with the carrier equipment failure (or the carrier cut-off switch left in "OFF" position by a technician - a human error) resulting in a second-zone trip of the faulted line. The second-zone trip time is generally in the range of 30-35 cycles. This may be critical from the stability aspect for the terminal end at a generating plant even though only one element will be lost. Also, the second-zone trips may need to be studied for transmission lines out of next terminal from the generator end if the next terminal is connected to the generator terminal via a short line. We think that an</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		additional single contingency Category should be added to this Table to cover the "Event" of second-zone trip scenario.
		<p>Response: 1. The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors and additional efforts involved and has taken them into consideration in its deliberations in the development of this draft.</p> <p>2. The SAR for this standard recognized FERC orders which indicated a need to "raise the bar" for the industry. The SDT agrees and is attempting to do this in a reasonable fashion. There is significant flexibility in the Corrective Action Plans allowed for any additional performance requirements which must be met. Industry consensus, through approval of the SAR, is that revision of the existing TPL standards is appropriate.</p> <p>3. The SDT has revised the language of Requirement R2.6.2 (now R2.5.2).</p> <p>R2.5.2 For steady state, short circuit, Generating Plant Stability, or System-Stability analysis: the study <u>present System model</u> shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p> <p>4. The SDT understands that the Transmission Planner and the Planning Coordinator need data from the Generator Owners. However, revising the MOD standards is beyond the scope of this standard revision. Further, we note that one of the requirements of FERC Order 890 for long-term Transmission planning involves formal data exchange between stakeholders and the Transmission Planner and the Planning Coordinator. It is our understanding that these data exchange processes have been successful in providing better planning information about stakeholders such as independent Generator Owners. Also, we note that there is an ongoing standards development project, Generation Verification Project 2007-2009. You may wish to submit your comment to that SDT about the need for the Generator Owner providing this information to the Transmission Planner and the Planning Coordinator.</p> <p>5. The SDT has combined the tables into a single table and clarified the "SLG or 3_{phase}" designations. In addition, the SDT has added footnote 3 to provide clarity.</p> <p>Footnote 3 - <u>Unless specified otherwise, simulate Normal Clearing faults. Single line to ground (SLG) or three phase (3Ø) are the fault types, that must be evaluated in Stability simulations for the event described. A 3Ø fault study indicating criteria are being met shall provide sufficient evidence that a SLG condition would also meet criteria.</u></p> <p>6. The SDT has revised the language in the P5 category to clearly identify the required performance for an event with a Protection System failure. The current draft requires the planner to recognize the equipment that will be removed from service and the timing (including delays with back-up Protection Systems if the primary is out of service) during their Stability studies. The scenario you described is therefore covered by P5. The SDT does not see a need to have a separate event for that scenario.</p>
NPCC	C — Definitely do not support the revised standard	This standard as drafted does not allow exceptions for small parts of the system as long as interconnected system reliability is maintained, which is allowed in the existing TPL standards in footnotes b) and c) in Table 1. Unless such exceptions are allowed significant transfer restrictions or large reinforcements must be made. The applicable TPL footnotes are: Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall

Organization	Question 15:	Question 15 Comments:
		<p>reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers. Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (nonrecallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems. This comment form did not allow for the following items to be addressed:</p> <ul style="list-style-type: none"> a. Definition of the Long-Term Planning Horizon. The planning horizon, for assessment purposes should be limited to 10 years. Such an assessment should be sufficient to identify requirements that may take an extended time to implement. b. Definition of Planning Coordinator is part of the NERC Functional Model, For consistency it should be removed from the Standard. c. Put headings on each section to identify requirements of section. Add headings to the tops of the subsequent pages in the performance tables. Headings only appear on the first page at the beginning of the Table. d. With respect to R2.2 - Delete "current" from the phrase "current System Peak Load study" and replace "study" with "assessment." e. Remove R2.2.1, the requirement to extend the assessment beyond 10 years. What does the length of the project have to do with the assessment? If it takes 15 years to build something, why does this require a review of year 15? What is the purpose of this assessment? f. R3.3.2 requires clarification - This standard needs to permit discretion regarding the single contingencies that need to be tested, similar to R 3.3.3 and R3.4. It is unnecessary to test all events. For example, contingencies may be limited to relevant disturbances that are contained within or directly impact the studied system. g. With respect to R3.2.1 - Clarify whether the intent of the standard is to address station service minimum voltage limitation, maximum leading VAR absorption capability or both at steady state. h. Remove R3.2.2 - Relay loadability is addressed in PRC-023 standard. i. With respect to R3.3.2.1 - Recommend the removal of the requirement to assess the expected duration of Consequential Load loss. It's not considered anywhere else in the standard. j. With respect to R3.3.3 - The paragraph refers to Table 1 Contingencies P3 through P7; this should be explicitly stated. Rationale for inclusion of testing should not be required; should only need to explain why certain Contingencies were not tested. This discretion should be applicable to all contingencies. k. With respect to section R5 - The concept of planned and long-term outages should apply to the general Planning Assessment, or not at all. It should not be specific to the Stability Assessment.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>l. The provisions of Section R.5.3 should have a corresponding MOD standard apply a requirement to provide information regarding all direct and indirect protective and control actions that could result in the inadvertant trip of the generator. Northeast Utilities	C — Definitely do not support the revised standard	Northeast Utilities has participated with ISO-NE and NPCC and supports the comments filed by those organizations.
<p>Response: Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of the TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement. As an alternative, an entity could seek an Entity Variance for the situation described through their Regional Entity organization. In paragraph 1794 FERC clarified that "...an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances". The process described by FERC as a regional difference is described in detail in the "NERC Standards Development Procedure" document under the subsection titled "Variances to NERC Reliability Standards".</p> <p>A. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted. FERC Order 693 requires that the planning horizon take into account the lead times for siting and permitting of new long-distance Transmission lines and other long lead time solutions. The SDT has received industry comments regarding the need to exceed a 10-year horizon to account for longer lead time projects. Establishing planning horizons that are shorter than Transmission lead times may create gaps where the identification of a reliability need to which Transmission may be the best solution occurs too late to avert the identified reliability violation. Further, Operating Procedures or alternative short-term capital projects may be needed to limit the impact of the planning event until the planned Facilities can be completed. This information needs to be included in the Assessment.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>B. Planning Coordinator has been defined in another project and as such has been deleted here.</p> <p>C. The SDT also feels that the Tables need to be as clear and concise as possible. To that end, this version combined Tables 1 and 2 into one table with a revised format. The Planning Events are shown on one page so repeating the headings will not be needed.</p> <p>D. The SDT believes that the existing language is appropriate. No change made.</p> <p>E. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted under some circumstances. For example, if it takes 15 years to build a Transmission line, then the need for that line would have to be determined 15 years ahead of the in-service date. Therefore, Requirement R2.2.1 requires you to perform an Assessment on year 15 if it takes you 15 years to build a line.</p> <p>F. The SDT has removed Requirement R3.3.2 and replaced it with additional language in Requirement R3.1. The SDT agrees with your interpretation that it does not require evaluation of all single Contingencies. Rather, the SDT specifically states in Requirement R3.4 that those Contingencies that are expected to produce the more severe System impacts shall be identified, evaluated for System performance, and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe results.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady State Performance, based on the lists created in Requirement R3.5.</p> <p>G. The SDT has not limited the purpose of this requirement to either minimum acceptable station service voltages or maximum Mvar absorption. The SDT believes that the purpose of Requirement R3.2.1 (now R3.3.2) is to determine if generators will be able to operate or trip off following the Contingency.</p> <p>H. The SDT believes that relay load limits or loadability needs to be considered in the Contingency analyses. The studies should determine if Transmission line loadings could reach the relay loadability level which may add to the existing Contingency and perhaps, result in an unbounded cascading event. No change made.</p> <p>I. By definition, Consequential Load Loss is allowed. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R2.-8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>J. The SDT agrees that the rationale should be for all Planning Events but not for Extreme Events.</p> <p>K. The SDT agrees and has moved this concept within Requirement R1 (see Requirement R1.1.1) so that it is applicable to all planning assessments. Further, both Requirements R3 and R5 (now R4) have been revised to make reference to Requirement R1.</p> <p>R1.1 <u>1 Planned outages of generation and Transmission Facilities, if specifically known.</u></p> <p>R3 For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to cContingencies in Table 1 — Steady State Performance. <u>The studies shall be</u></p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p><u>based on computer simulations using models utilizing data provided in Requirement R1.</u></p> <p>R4 For the Stability portion of the Planning Assessment, as described in Requirement R2.4 and Requirement R2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 – Stability Performance. <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u> The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted.</p> <p>L. Requirement R5.3. has been modified (now R4.3.2) to address simulation of how generators perform under conditions being studied to address these concerns. "Other equipment" is addressed in Requirement R5.4.</p> <p>R4.3.2 Studies shall consider <u>Simulate generator performance under anticipated conditions including how</u> the voltage ride through capability of all generators and identify how the generators are treated is analyzed <u>in the simulation</u></p> <p>M. While planned outages are addressed in the operating horizon, it is important that a Transmission Planner review the ability of its System to accommodate planned (maintenance) outages. Additionally, any specific known Facility outages need to be appropriately modeled for the planning horizon studied.</p>
TVA System Planning	C — Definitely do not support the revised standard	<p>TVA's main concern is that no technical justification for "raising the bar" on facilities above 300-kV has yet been demonstrated such as required on P2, P4, and P5 for 300 kV and above. TVA is very concerned that "raising the bar" would be a financial burden on TVA's ratepayers. TVA would also like to provide the following additional comments to this second draft as follows:</p> <ol style="list-style-type: none"> 1. In R2.4.1, load models that appropriately represent the dynamic behavior of motor loads are required. TVA believes that industry guidance is needed on how to properly model these loads. Does this requirement mandate the use of specific load models for each bus, or would an aggregate load model which represents the system as a whole be sufficient? It should be clearly stated whether the load model in R2.4.3.1 refers to system load or the dynamic load model at individual busses. 2. In R3.2.1 and R5.3, need industry guidance on how to actually determine the minimum steady state voltage limitations of generators. Is there a MOD or FAC requirement for generation owners to provide this information? 3. Which single contingency events should be included in calculations for Available Transfer Capacity? Should P2 events be included in addition to P1 events since P2 events are also defined as single contingency events in Tables? 4. Would like further clarification from the team on what does P5 exactly includes? For instance, does it include battery failures, CT failures, etc? 5. The existing TPL 002-0 allows for some local load to be dropped for a single contingency event as long as the Bulk system reliability was not impacted. However there is no such allowance any longer for losing such load for a single contingency in the proposed draft. It would be very expensive for TVA to fix all such events in several remote areas that

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>would have very little impact on the overall reliability of the TVA bulk system. TVA believes that the capital spent for these fixes could be used to better strengthen the overall bulk system in much better ways.</p> <p>6. Suggest rewording R2.2.1 from "To accommodate any known longer lead time projects" to "To identify any potential longer lead time projects".</p> <p>7. Can operational guides be used indefinitely in R2.7.1 or does the team propose a limit on how long operational guides can be used until a capital fix is implemented?</p> <p>8. In R3.3.2.1, what is the purpose for needing the expected duration of consequential load loss? There is a concern that this requirement will be very burdensome to keep track of the quantity of consequential load loss as well as expected duration. Who is requesting this info? It appears that this may be a local regulatory issue, not a reliability issue.</p> <p>9. Suggest changing definition of "Planning Events" in the Definitions to say "Events that have a higher probability of occurrence and require Transmission system performance requirements to be met."</p> <p>10. Should the proposed standard mention that utilities should run contingencies outside their system that could impact their own internal system? TVA believes that additional documentation be included in the new standard to address this.</p> <p>11. Functional entity in 4.1.4 should be "LSE" instead of "DP"</p> <p>12. In the Definitions for "Year One", suggest replacing "previous" with "most recent" to help clarify when the planning window should begin.</p> <p>13. Should "peak" in R2.1.1 be replaced with "On Peak" as shown in the NERC glossary of terms? Also the requirements in this requirement are too prescriptive - should allow some flexibility to allow the TP which years to study as long as a minimum number of cases are studied.</p> <p>14. Suggest replacing "Plant" in R2.6.2 with "Unit" to match terms used in Definitions.</p> <p>15. In R2.7.1.1, what is meant by "project initiation date"? Is it when engineering starts, construction starts, etc?</p> <p>16. Suggest rewording requirements R3.3.3 and R3.4 to be more clear - such as breaking each of these into several sentences each. Existing wording is very confusing.</p> <p>17. There is a concern with R5.6.1 with the requirement to perform simulation on 20 MW generators (to be consistent with the Registration Criteria). We recommend a 75 MW generator cutoff for required simulations. Also in R5.6.2, should last word in sentence be "greater" or "lesser"?</p> <p>18. In the Tables under Extreme Events, is 3.b. (loss of two TLs on different ROWs actually already covered under 1 (loss of two elements prior to system adjustments)? Also in the Tables under Extreme Events, it may be difficult for a TP to know enough about nuclear plant design to perform studies mentioned under 3.a.vi.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>19. In the notes under Extreme Events, we suggest that notes #2 and #3 be combined together since they are very similar in nature.</p> <p>20. Should the P3 planning event descriptor (G+1) in the performance tables be (G+N-1) or (G-1, N-1)? The existing descriptor (G+1) tends to note that an element is being added to the system instead of being removed.</p> <p>21. Should the new standard address specific voltage limit requirements that must be maintained during these planning events? Since different utilities have different voltage limits on their buses, should there be some consolidation to ensure the standard is applied equally at all utilities?</p> <p>22. The note for Planning Event P1 states that “No generating unit or units shall be allowed to pull out of synchronism. A generator being disconnected from the System by Fault clearing action or by a Special Protection System is not considered pulling out of synchronism.” The standard does not allow consideration for small units with a Zone 2 fault. It is not practical to add pilot relaying on all lines from a plant with a small unit that would be stable for close-in three phase faults, and could be adequately protected when a Zone-2 fault would cause a small generator to trip off with out-of-step (OOS) protection. The table for P1 should allow small units (<75 MW) to trip using SPS or OOS protection.</p>

Response: The SDT is attempting to raise the bar by developing a standard that appropriately supports BES reliability and has industry consensus. The majority of the SDT believes that 300 kV is an appropriate cutoff and that Transmission Systems above this level represent backbone Systems and are part of regional "grids". The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations and has provided for flexibility in Corrective Action Plans. FERC has noted in their orders that many of the concerns about raising the bar show more concern about economics than reliability (examples, Order 890, paragraph 423; Order 693, paragraph 1792, etc.).

1. The SDT agrees and believes that industry guidance is needed to capture the appropriate dynamic behavior of Loads. In response to comments, the SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments. Any comments received from the industry on MOD standards will be forwarded to NERC for inclusion into NERC Reliability Standards Development Projects 2010-04 Modeling Data and 2010-05 Demand Data. Requirement R2.4.1 has been modified to include the following: "An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable."

2. The SDT believes that FAC-009-1, Requirements R1 and R2 require that generators provide these low voltage limitations as part of their Facility Ratings. Also, PRC-024, which is under development, will attempt to require generators to meet voltage ride-through criteria.

FERC Order 693, paragraph 1773 regarding FERC Commission directed changes to TPL-002 states "...requires all generators to ride through the same set of Category B and C contingencies as required by wind generators in Order No. 661, or to simulate those generators that cannot ride through as tripping".

The current MOD standards that address steady-state and dynamic simulation data requirements do not explicitly require the Generator Operators to provide voltage ride-through capability. These standards are set to be addressed by Project 2010-04 within NERC's Standards Development Work Plan. Based on the proposed TPL requirement, Requirement R5.3 (now R4.3.2), it is expected that the Transmission Planner would contact Generator Operators applicable to their System to obtain such data. If the data is not provided, it would be expected that a Transmission Planner state its assumption on the Vmin used for a generator

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>terminal voltage for assessing ride-through capability. It's likely such information could be obtained through generator manufacturers.</p> <p>3. Questions related to ATC calculations are beyond the scope of this standard. Please see NERC Reliability Standard MOD 001-1, Requirement R7 & Measure M7 for additional information on ATC calculations.</p> <p>4. The description of the P5 event has been clarified in this Revision of the Standard.</p> <p>5. Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of the TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement.</p> <p>6. The SDT believes that the existing language is appropriate. An assessment of year 15 would be needed to accommodate a Transmission line if it takes 15 years to build a line.</p> <p>7. The SDT has not established a limit as to how long Operating Procedures may be used to meet System performance requirements and has left that decision for the Transmission Planner/Planning Coordinator.</p> <p>8. By definition, Consequential Load Loss is allowed. To meet industry concern, as well as FERC Order 693, the SDT has added Requirement R2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p><u>R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>9. The definition of Extreme Events already states that these events have a lower probability of occurrence than Planning Events. The SDT did not make the change suggested by the commenter as there was no industry consensus to alter the definition.</p> <p>10. The list of Contingencies is expected to cover the Transmission Planner's or Planning Coordinator's System for which they are responsible, including any tie-lines to adjacent Transmission Systems. The standard does not preclude the Transmission Planner or Planning Coordinator to expand the list of Contingencies to include some Contingencies of interest or known impact for adjacent System(s). It is expected that through peer reviews, the Transmission Planner or Planning Coordinator may initially learn of any new event within an adjacent System that impacts their own System.</p> <p>11. Applicability 4.1.4 has been deleted due to the deletion of Requirements R9 – 14.</p> <p>12. The SDT believes that it is not necessary to replace "previous" with "most recent" since Planning Assessments are required on an annual basis.</p> <p>13. The SDT believes that the term "System peak Load" is appropriate. The SDT does not believe that Requirement R2.1.1 is too prescriptive, but is the minimum needed to gauge the timing for System reinforcements in the near-term horizon.</p> <p>14. This draft of standard has been revised to remove word "plant" from Requirement R2.6.2 (now R2.5.2). Requirement R2.5.2 from the last draft of the</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>standard has been deleted.</p> <p>R2.5.2 For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study <u>present System model</u> shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p> <p>15. The SDT has not defined a project initiation date and will leave that definition to be determined by the Transmission Planner and/or Planning Coordinator.</p> <p>16. Most of the industry did not seem to find Requirements R3.3.3 and R3.4 unclear or confusing. Therefore, the SDT has decided to not undertake any rewording. Requirements R3.3.3 and R3.4 have been relabeled as Requirements R4.4 and R4.5 respectively.</p> <p>17. The requirement for study has been changed to 20 MW for a single generator or for an aggregate of generators. This language is now in Requirement R2.5.2. Requirement R5.5.2 was deleted.</p> <p>18. The SDT agrees and has removed the redundancy found with Extreme Event 3.b. Having multiple nuclear units out of service simultaneously is an Extreme Event, but it has occurred. The SDT recommends that the Transmission Planner consider sensitivities with different combinations of nuclear plants being out of service, including the possibility that they are all shut down simultaneously. To reinforce the more apparent combinations, the Transmission Planner may discuss the operational requirements and the equipment and design similarities of the nuclear plants with the appropriate Resource Planner or Generator Operator to determine credible scenarios which could commonly affect the nuclear plants.</p> <p>19. The SDT discussed the combining of notes 2 & 3 but felt they wanted them separate for clarity. Note 2 is focusing on interruptions of Firm Transmission Service and Non-Consequential Load and Note 3 refers to transformer outage events.</p> <p>20. The SDT has deleted the parenthetical to provide clarity.</p> <p>21. The SDT has addressed this issue by the Header note 'b' for Steady State Only in Table 1 - Steady State & Stability Performance, where the Planning Coordinator sets the acceptable voltage deviations. The SDT believes that adjacent Planning Coordinators can adequately address this concern.</p> <p>22. The SDT believes that any unit that is tripped by out of synchronism protection is actually in an "out of synchronism" condition and this should not occur for a P1 event regardless of generator size.</p>
City Water, Light & Power - Springfield, Illinois	A — Generally support the revised standard	
Response: Thank you for your response.		
Omaha Public	B — Unsure	Event 1 of Category P2 in Tables 1 and 2 addresses events consisting of "Breaker(s) opening without a Fault resulting in a

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
Power District	about supporting the revised standard	<p>single ended line." Category P2 is labeled as a "single contingency" category, yet it seems like an event consisting of the opening of more than one breaker would actually be a multiple contingency. Please consider whether the "(s)" should be removed after the word "breaker" in the event description so that it addresses only a single breaker opening without a Fault.</p> <p>Table 1 does not address multiple contingencies consisting of loss of a transmission circuit, transformer, single pole of a DC line, or shunt device, followed by System adjustments, followed by the loss of a generator. It seems like Table 1 should be modified to address this type of multiple contingency.</p> <p>In the description of Event 1 of Category P2 in Table 1, remove the text "Loss of one of the following:".</p> <p>In the description of Event 2 of Category P2 in Table 1, replace "Bus section" by "Loss of a bus section".</p> <p>Assuming that this does not change the intent of the drafting team, in R3.3.2.2, R3.5.1, R5.4.3.1, change "shall be operating" to "are operating". In R3.3.2.2, consider removing the phrase "and within their thermal and voltage limits", because it seems like it may be redundant given the definition of the term "Facility Rating".</p> <p>In the event descriptions of Categories P1, P3, and P6 of Table 2, does the term "3-phase fault" apply to DC lines? If not, consider using a separate introductory phrase with the event descriptions of Categories P1, P3, and P6 of Table 2 that involve DC lines.</p> <p>Also consider removing the words "Loss of" in the description of Event 4 of Category P6 in Table 2.</p> <p>Since a definition was developed for "Bus-tie Breaker", capitalize the terms "bus-tie" and "bus tie" wherever they appear in the standard.</p>
<p>Response: The SDT believes that events which can result in a single line or line section being fed radially from one end must be analyzed to ensure that Load served from the line can be reliably served from either end regardless of station configuration.</p> <p>The SDT expanded the existing Table 1 description to include the requirement to study the loss of any generator followed by the loss of a transmission element. The SDT made this decision based on the fact that generator outages are more probable and in many cases have longer outage durations than transmission element outages. The SDT considered a requirement to study any outage of a transmission element followed by a generator outage but decided that this would be very burdensome for a lower probability event and therefore, decided not to add it in Table 1 of the draft standard.</p> <p>P2 - The tables have been combined and the words "Loss of" have been removed.</p> <p>The SDT agrees. Event 2 in P2 has been modified for clarity.</p> <p>Requirement R3.3.2.2 has been deleted in favor of Header note 'e' in the Table. Please note that the two tables in the second draft have been reduced to one table in the third draft. Requirements R3.5.1 and R5.4.3.1 have been deleted from the Standard.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>The "3-phase faults" does not apply to DC lines. The SDT has revised the Table accordingly.</p> <p>P6 - The tables have been combined and the words "Loss of" have been removed.</p> <p>The final draft will have all defined terms capitalized.</p>		
<p>Progress Energy Carolinas</p>	<p>C — Definitely do not support the revised standard</p>	<p>While we believe that in many ways the proposed draft standard represents an improvement of the current standard, we have a number of significant concerns that preclude our endorsement for the proposed standard as currently drafted. These include those discussed in the comments to above questions and the below additional comments. 1) In both the Steady State and Stability Tables, Category P6 is the loss of a system element, following system adjustments, followed by the loss of another element. The table columns for this category say that interruption of firm transmission service is allowed. The table, however, is not clear whether the interruption of firm service is allowed as part of the system adjustment (between the outages) or whether it is only allowed after the second outage. It was stated in the NERC TPL SDT WebEx that the interruption is not allowed as part of the system adjustment. If this is the interpretation, this would be a dramatic change from the existing standard and would result in the unintended consequence of significantly reducing transfer capability of interfaces to a fraction of their currently reported capability. This would in effect be imposing an n-2 criteria for offering firm transmission service. This would not be an acceptable situation for the users, owners and operators of the bulk power system.</p> <p>2) The proposed sensitivities create significant amount of additional work for the sole purpose of demonstrating compliance to this standard without any demonstratable benefit towards improving system reliability. While sensitivities should be appropriately considered in studies, this standard should not be overly prescriptive with respect to specific sensitivities or study methodologies.</p>
<p>Response: 1. The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in Draft 3 of the Standard provides this clarification.</p> <p>Footnote #10 – <u>Curtailed firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>2. The SDT agrees with the respondent that the sensitivities evaluated should be based on the individual situations and therefore, the SDT has not required specific sensitivities, but rather, required that at least one sensitivity should be evaluated for an Assessment to be complete.</p>		
<p>Platte River Power</p>	<p>A — Generally</p>	<p>In Tables 1 and 2, Categories P1 and P3, under the column heading "Interruption of Firm Transmission Service Allowed," change the note in the performance box to read "Yes, if transfer is dependent on the outaged Element." (Not just for a DC</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
Authority	support the revised standard	line Element.) This conditional statement applies to most Firm Point-To-Point Transmission Service (Firm PTP) applications where an outaged Element reduces the Transfer Capability of the PTP service if the Element cannot be restored to service after an allowable time frame (30 minutes or so) and the Transfer Capability is reduced to a Prior Outage System Conditions level. This "extended Contingency situation" could cause an interruption or curtailment to the firm service. The interruption and curtailment responses to a Contingency might be different between Firm PTP and Network Integration Transmission Service.
<p>Response: The SDT has removed the "Yes if transfer is dependent on the outaged DC line" comments from the Table to ensure that AC and DC lines are treated equally. The draft standard does not allow interruption of Firm Transmission Service as a System response to Event P1. However, the SDT added Footnotes # 5 and 10 to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service in preparation for the next Contingency will be allowed provided there is no shedding of firm Load.</p> <p>Footnote 5 - <u>When the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.</u></p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>		
BCTC	C — Definitely do not support the revised standard	BCTC appreciates the efforts of the SDT to explore ways to improve our planning standards. We understand that some of the proposed enhancements may assist Transmission Planners with justifying the need for system reinforcements. Many areas of our system already meet the proposed improvements, for example, most (but not all) of our 500 kV system already meets the proposed standards for systems above 300 kV. We have planned our system without support from a standard. The proposed changes do not really help us in any way and have a number of undesirable consequences. Consequently, BCTC does not support a number of the proposed additions and is uncertain about supporting some of the other changes. Our concerns are summarized below under headings of System Issues and Study Issues. System Issues:1. BCTC plans, manages and operates 18,000 km of transmission in British Columbia. This includes 5700 km of 500 kV transmission lines. For the BCTC system, the proposed definitions for Consequential Load Loss and Non-consequential Load Loss, specifically that load loss due to RAS/SPS is Non-Consequential Load Loss, will provide no reliability benefits for our 500 kV transmission backbone system providing wholesale open access service and interconnecting to the rest of the western interconnection relative to what we have today. No reinforcements of this 500 kV transmission will be required as a result of these more stringent definitions. Any potential reliability benefits of any additional facilities built to comply with these definitions would be at the local service level, primarily in rural areas currently served by radial lines. The possible benefits would be small. There is a very low probability that we would get funding approval for these facilities. For most of our system including most of our backbone 500 kV and local networks in

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>metropolitan and urban areas BCTC already meets the requirements for these definitions. As noted in our comments at item 3, a portion of the BCTC system above 300 kV cannot meet the proposed P1(A) > 300 kV. We require further clarification of these definitions such as allowing load shedding in local networks. Otherwise, we will not be planning a doable/plausible set of actions, but rather just generating a list of projects that will not be approved. Our resulting subsequent corrective plan will be to use load shedding RAS, which will conflict with the definitions. Order 693 does not require NERC to prohibit load shedding, only clarify the amount and duration of load shedding that is permitted (paragraphs 1795 and 1797). BCTC's concerns can be addressed by including the local network component of Footnote (b) - modify the definition of Consequential Load Loss to permit the use of RAS in local networks (including local networks interconnecting generation), by allowing Non-Consequential Load Loss for local networks in Tables 1 and 2, or by modifying the definition of BES to exempt local networks from the definition of BES. BCTC could also consider a limit on load shedding if the industry would develop one. BCTC raised these issues in our comments on the first draft. The SDT response (page 332) does not address our concerns. We also note FPL comment 7 (page 359) regarding removal of localized load reduction provided in Footnote (b). We do not believe that the SDT has addressed FPL's issue. Unless the local network component of Footnote (b) is included and we can get a clarification to address our concern with P1 (A), the proposed standard is not suitable for the BCTC system and we do not support the standard.</p> <p>2. Contingency P1 needs to permit curtailment of firm service for flow through firm transmission service to prepare for the next contingency. If it does not, some flow through open access transmission customers may have less ATC available if RAS is not available to meet the new restrictions on the P6 contingency, while this ATC will be available for services sourcing or sinking within the transmission provider's system. P6 allows the use of RAS in response to the second contingency (Event). For firm service originating or sinking in our system, we can use RAS and have many RAS systems already in place. However, for flow throughs it may not be possible to implement RAS or there may be a time delay until RAS can be installed. If RAS cannot be implemented, it would be preferable to provide the firm service and curtail in preparation for the second contingency rather than deny the firm service (or require that the system be built for N-2 capability, which also may not be possible), which is what we will have to do to adhere to the new standard. The result is that flow through transactions will have to use non-firm service while non-flow-through may use exactly the same transmission for firm. Also keep in mind that while P4 and P5 are only those multiple contingencies initiated by a common mode failure, P6 is any two elements not necessarily common mode. Therefore, P6 can be more limiting than P4 or P5. For P4 and P5 contingencies the BCTC system has less dependence on RAS than does the second event of a P6. Consequently P6 will be more limiting on flow throughs than P4 and P5. Order 693 contains direction to NERC to address Footnote (b). Some commenters have taken issue with the SDT interpretation of Order 693 (e.g. FRCC item 2, page 365). Given the different interpretations and the potential for impacts on ATC, we suggest that the SDT review this issue with FERC and find out if what the SDT is proposing is what they really want. Without this change or clarification we do not support the standard.</p> <p>3. Regarding Q30 in the Comments on First Draft, BCTC believes that DC and AC lines should have the same performance requirements with respect to interruption of firm transmission service. This relates to our concern above</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>regarding flow through transactions. We do not understand why interruption of firm service would be an acceptable response to the loss of a single pole of a DC line (i.e. response to the contingency) but not an acceptable step to prepare for the next contingency of an AC line. We would ask that the SDT provide further explanation of its response that "many of the transfers over DC lines are automatically curtailed when the DC line is outaged" (page 220). We can do the same with AC lines for transfers sinking or sourcing within our system. Is the SDT assuming that RAS/SPS is used? We agree with the comments of FPL, FRCC, Southern Transmission and Manitoba Hydro (pages 219 and 221) and FPL (page 360, item 11). We disagree with the SDT decision to allow different performance for DC than AC lines. We do not support this element of this standard.</p> <p>4. Contingency P3 should have the same performance requirement as P6. In two recent CPCN approvals for reinforcements of the BCTC backbone system, approval was granted based on generator contingencies being treated the same as transmission contingencies. We believe it highly unlikely that we would have received funding to approval to meet contingency P3. In our local service areas relying on generation for firm supply and for our bulk system, we consider dependable generator capacity on a case by case basis. We do not arbitrary assume a generator N-1 as a preexisting planning condition. We consider firm generator capability as a sensitivity case, not a planning criteria. We disagree with requiring a generator initial system condition having a more stringent performance requirement than other initial conditions. Without this change we do not support this standard.</p> <p>5. BCTC is concerned that including the generator runback/tripping requirement in this standard will encourage more use of generator runback and tripping and will make it more difficult to get regulatory approval for transmission reinforcements. If retained, there needs to be a tie into reserves requirements. While we agree with permitting generator runback/tripping, at this time we are unsure about supporting this standard with this permissive requirement included.</p> <p>Study Issues:6. R2.5 and R5.5 on Generating Unit Stability studies are adequately addressed by FAC-001 and 002. Triggering events such as increased output or new existers need to go through our generator interconnection process and be paid for by the customer. In fact, we would not be aware of any of these triggering events unless a request comes from a customer. Without clarification of which generator studies are addressed through FAC-001 first, we do not support this standard.</p> <p>7. We request that the SDT provide an explanation of why it believes it is important to maintain a distinction between system and generating unit stability studies.</p> <p>8. Table 1 Steady State Performance lists 6 items above the Planning Events title. Should these be listed below the Planning Events title?</p>
<p>Response: 1. The SDT has added footnote 10 and clarified that for a P1 event, Transmission service could be interrupted as long as all of the Non-Consequential Load continued to be served. This draft does not allow "local network" Load to be shed for a P1 event, however, the conditions that you describe could warrant a regional difference.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Footnote #10 – <u>Curtailement of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>2. Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for Event P1. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted interruptible Loads, in preparation for the next Contingency.</p> <p>3. The SDT has removed this differentiation in the Table such that AC and DC lines will be treated equally. See footnote #10.</p> <p>4. The SDT believes that the loss of a generator unit is a much more likely to occur than the loss of other major BES elements and thus the P3 event warrants more stringent performance requirements than the P6 event. The performance requirements for P3 have been clarified by addition of footnote 10 in Revision 3 of the Standard.</p> <p>5. By a nearly unanimous response the Industry favors manual and automatic generation run-back and tripping as a response to a single or multiple Contingency. The SDT has eliminated the conditions in Sub-requirements R3.5.1, R3.5.2, and R3.5.3 for Contingency events as well as similar conditions in Sub-requirements R5.4.3.1, R5.4.3.2, and R5.4.3.3 for Stability events in the third draft. Accordingly, the SDT has modified Sub-requirement R3.5 for Contingency events and relocated it under Requirement R2.6.1. Likewise, the SDT has modified Sub-requirement R5.4.3 for Stability events and relocated it to become a bullet under R2.6.1. The resource adequacy issues are not directly included in this standard. In addition, with the creation of P3, the SDT has addressed the issue of the reduction of generation resources by treating the loss of one generator unit, followed by System adjustment, as the initial condition for all other single Contingencies. Therefore, the SDT does not believe that generation tripping as a corrective action needs to be tied to resource adequacy issues.</p> <p><u>Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate Steady State performance violations.</u></p> <p><u>Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations</u></p> <p>6. Both Requirement R2.5 and Requirement R5.5 have been deleted since, in response to industry comments, Generating Unit Stability is no longer separately addressed in the standard.</p> <p>7. Based on comments from others, the SDT has removed the requirements for separate Generating Unit Stability analysis and System Stability analysis.</p> <p>8. The SDT has reformatted and combined the two Tables into a single Table for this draft to address these types of problems.</p>
Manitoba Hydro	C — Definitely do	Manitoba Hydro can not accept the standard due to the requirements imposed on Firm Transmission Service and on facilities >300 kV. The standard would have to allow Firm Transmission Service to be curtailed in situations where Non-

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
	not support the revised standard	<p>consequential Load is not lost.</p> <p>The higher performance requirements for facilities >300 kV are tied to very low probability events, so the enhanced reliability is not worth the cost.</p> <p>TPL-001-1 Other Comment Action Plan: Schedule of Anticipated Actions needs to be revised. - Action 3 shows rev 3 out for ballot in 2Q09.</p> <p>TPL-00101 Purpose: Is the purpose to ?Establish Transmission System planning performance requirements? or to ?Establish planned Transmission System performance requirements? The term ?probable contingencies? is not defined or used in the standard ? use of the term may cause confusion.</p> <p>R7: The TP and PC are required to determine the responsibilities for performing the assessment. Are the responsibilities to be documented as part of the assessment?</p> <p>R8: This requirement should avoid reference to a FERC order as the order does not apply to all entities. The requirement should just require the planner to demonstrate that the assessment was distributed to potentially impacted stakeholders. The last sentence is incomplete.</p>

Response: In response to your comment and those of others in the industry on allowing curtailment of Firm Transmission Service as a System adjustment after an N-1 Contingency, the SDT has added footnotes 5 and 10 to Table 1 - Steady State & Stability Performance.

Footnote 5 - [When the conditions and/or event\(s\) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.](#)

Footnote #10 – [Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment \(as identified in the column titled 'Initial System Conditions'\) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.](#)

The schedule has been updated.

The SDT believes the Purpose is accurate as written because it defines planning practices and conditions to be studied. As per A.3, the purpose of Standard TPL-001-1 is to "Establish Transmission System planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies." In this definition, the word probable is left up to the Transmission Planner/Planning Coordinator to determine so that they can set System performance requirements locally based on experience.

R7 (now R6). There is no requirement to document the responsibilities as part of the Assessment but Measure M6 in the new draft clearly states that a document must be produced as evidence that Requirement R6 has been successfully completed. This could be a standalone document or part of the Assessment at the discretion of the responsible entity.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>R8 (now R7): The SDT believes the addition of the reference to the FERC Order 890 adds clarity to the expectations of the requirement without making the requirements of the Order applicable to all NERC entities. The incomplete sentence has been deleted.</p>		
<p>Los Angeles Department of Water and Power</p>	<p>C — Definitely do not support the revised standard</p>	<p>I do not support the standard as currently written. There are too many requirements that are discriminatory, duplicative, and arbitrary/punitive. The unintended consequence of this standard would be forcing companies and planners to plan the system to take advantage of some requirements that will result in a future system that is less robust (a single line serving multiple radial loads instead of network, for example) if not to entirely discourage any further expansion of the transmission system above 300kV (the discriminatory treatment of two classes without any rational justification).</p>
<p>Response: The SDT believes that the appropriate justifications have been made. The SDT changes made after the first draft were due to industry consensus. The SDT believes that these changes are justified by the various comments received from industry.</p>		
<p>Transmission Agency of Northern California</p>	<p>B — Unsure about supporting the revised standard</p>	<p>- We agree that the Standard as presented is clearer, but there are numerous issues that still need resolution, Measures, VSLs, Implementation Plan, etc., before we can give a full approval of this Standard. - There is no mention in the purpose of the Sta</p>
<p>Response: Measures, VSL's and the Implementation Plan have been addressed in the third draft of the standard.</p>		
<p>National Grid</p>	<p>B — Unsure about supporting the revised standard</p>	<p>Aside from the comments to the prior questions, there are several issues of concern that prevent us from supporting the present draft of the revised standard. We offer the following constructive comments in an effort to support the worthwhile effort that is being pursued so that we can reach a point of satisfaction that we could vote to support the revised standard. Our concerns are listed in a rough order of priority.</p> <p>a. This standard as drafted does not allow exceptions for small parts of the system as long as interconnected system reliability is maintained, which is allowed in the existing TPL standards in footnotes b) and c) in Table 1. Unless such exceptions are allowed significant transfer restrictions or large reinforcements must be made. The applicable TPL footnotes are: Existing TPL footnote b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers. Existing TPL footnote c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (nonrecallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>b. This standard does not address base conditions. Without defining base conditions the initial status of generation dispatch and transfers across the system is ill defined. Therefore the contingency analysis doesn't have a predictable basis for a consistent and repeatable study.</p> <p>c. The reference to Special Protection Systems is completely permissive. Although there are good applications for Special Protection Systems, their use must be constrained to have a reliable system and to promote construction of needed infrastructure.</p> <p>d. This standard does not provide flexibility to shed load, which restricts the ability to control post contingency response for low impact events. This may result in advancing need for upgrades in response to low impact events. This is in conflict with FERC's directive to have the Transmission Provider waiting for market response to transmission needs and having the Transmission Provider provide a role to back stop the market.</p> <p>e. Definition of the Long-Term Planning Horizon. The planning horizon, for assessment purposes should be limited to 10 years. Such an assessment should be sufficient to identify requirements that may take an extended time to implement.</p> <p>f. Definition of Planning Coordinator is part of the NERC Functional Model, Remove from Standard.</p> <p>g. Put headings on each section to identify requirements of section.</p> <p>h. With respect to R2.2 - Delete "current" from the phrase "current System Peak Load study" and replace "study" with "assessment."</p> <p>i. Remove R2.2.1, the requirement to extend the assessment beyond 10 years. What does the length of the project have to do with the assessment? If it takes 15 years to build something, why does this require a review of year 15? What is the purpose of this assessment?</p> <p>j. R3.3.2 requires clarification - This standard needs to permit discretion regarding the single contingencies that need to be tested, similar to R 3.3.3 and R3.4. It is completely unnecessary to test all events. For example, contingencies may be limited to relevant disturbances that are contained within or directly impact the studied system.</p> <p>k. With respect to R3.2.1 - Clarify whether the intent of the standard is to address station service minimum voltage limitation, maximum leading VAR absorption capability or both at steady state.</p> <p>l. Remove R3.2.2 - Relay loadability is addressed in PRC-023 standard.</p> <p>m. With respect to R3.3.2.1 - Recommend the removal of the requirement to assess the expected duration of Consequential Load loss. It's not considered anywhere else in the standard.</p> <p>n. With respect to R3.3.3 - The paragraph refers to Table 1 Contingencies P3 through P7; this should be explicitly stated. Rationale for inclusion of testing should not be required; should only need to explain why certain Contingencies were not tested. This discretion should be applicable to all contingencies.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>o. With respect to section R5 - The concept of planned and long-term outages should apply to the general Planning Assessment, or not at all. It should not be specific to the Stability Assessment.</p> <p>p. The provisions of Section R.5.3 should have a corresponding MOD standard apply a requirement to provide information regarding all direct and indirect protective and control actions that could result in the inadvertent trip of the generator. Such a provision should include "other equipment (e.g. HVDC, SVC's, Statcoms)", and identify how these devices are treated in the simulation.</p> <p>q. Planned outages should be addressed in the operating horizon unless otherwise defined in the planning horizon.</p> <p>r. What is a "current" study?</p>
<p>Response: A. Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement. As an alternative, an entity could seek an Entity Variance for the situation described through their Regional Entity organization. In paragraph 1794, FERC clarified that "...an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances". The process described by FERC as a regional difference is described in detail in the "NERC Standards Development Procedure" document under the subsection titled "Variances to NERC Reliability Standards".</p> <p>B. The SDT has modified Requirement R1 to include additional details on what should be modeled in the cases. However, the SDT intentionally provides flexibility for the Transmission Planner/Planning Coordinator to decide which "base case" to use since initial conditions for a System will vary from region to region and will need to be established on a local level, not via a national standard. The required studies and sensitivity analysis ensures that sufficient study is performed to cover an appropriate range of System conditions.</p> <p>C. The SDT does not believe that it would be appropriate to attempt to specify limitations to the use of Special Protection Systems in this standard. The proposed TPL-001-1 and existing standards provide adequate guidance to the industry on application of Special Protection Systems.</p> <p>D. The SDT has made clarifications regarding Firm Transmission Service and Non-Consequential Load Loss. Footnote # 10 has been added to the end of Table 1. The standard does not preclude the possibility of obtaining contractually interruptible load. It is the general opinion of the SDT that dropping of Non-Consequential Load should not be allowed for the Planning Events involving only one element as described in Table 1 of the proposed Standard, and to meet the intent of FERC Order 693. Further, this Standard is proposed to "raise the bar" to improve System reliability, which would require responses (Corrective Action Plans) to address those so-called low-impact events that may have been overlooked or ignored with the existing Standard TPL-002-0.</p> <p>Footnote #10 – <u>Curtailed firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon,</u></p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p><u>Facility Ratings in those regions must be considered.</u></p> <p>E. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted. FERC Order 693 requires that the planning horizon take into account the lead times for siting and permitting of new long-distance Transmission lines and other long lead time solutions. The SDT has received industry comments regarding the need to exceed a 10-year horizon to account for longer lead time projects. Establishing planning horizons that are shorter than Transmission lead times may create gaps where the identification of a reliability need to which Transmission may be the best solution occurs too late to avert the identified reliability violation. Further, Operating Procedures or alternative short-term capital projects may be needed to limit the impact of the Planning Event until the planned facilities can be completed. This information needs to be included in the Assessment.</p> <p>F. The definition for Planning Coordinator was deleted because the term has already been defined and added to the NERC Glossary by another SDT.</p> <p>G. The SDT also feels that the Tables need to be as clear and concise as possible. To that end, the next version will combine Tables 1 and 2 into one table with a revised format.</p> <p>H. The SDT believes that the existing language is appropriate.</p> <p>I. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted under some circumstances. For example, if it takes 15 years to build a Transmission line, then the need for that line would have to be determined 15 years ahead of the in-service date. Therefore, Requirement R2.2.1 requires you to perform an Assessment on year 15 if it takes you 15 years to build a line.</p> <p>J. The SDT has removed Requirement R3.3.2 and replaced it with additional language in Requirement R3.1. The SDT does agree with your interpretation that it does not require evaluation of all single Contingencies. The SDT specifically states in Requirement R3.4 that those Contingencies that are expected to produce the more severe System impacts shall be identified, evaluated for System performance, and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe results.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady State Performance— <u>based on the lists created in Requirement R3.4.</u></p> <p>K. The SDT has not limited the purpose of this requirement to either minimum acceptable station service voltages or maximum Mvar absorption. The SDT believes that the purpose of Requirement R3.2.1 (now R3.3.2) is to determine if generators could continue to operate or if they would trip off following the Contingency.</p> <p>L. The SDT believes that relay load limits or loadability need to be considered in the Contingency analyses. The studies should determine if Transmission line loadings could reach the relay loadability level, which may add to the existing Contingency and perhaps, result in an unbounded cascading event.</p> <p>M. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>N. The SDT has re-written Requirement R3.3 (now Requirement R3.4) to address your initial concern. Although the language and format of the proposed Standard have been revised from earlier versions, the SDT continues to believe that the Transmission Planners should evaluate the System performance for the events that are expected to produce the more severe System impacts, including both single and multi-Contingency events. The wording of new Requirement R3.4 (the old Requirement R3.3.3) now requires a listing of the Contingencies to be evaluated, the rationale for their selection and why the remaining Contingencies would be expected to produce less severe results. This will provide a complete evaluation of the potential Contingencies to be studied – those selected and those excluded.</p> <p>R3.4 Those Planning Event Contingencies in Table 1 —Steady State Performance not covered in Requirement R3.3.2 that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created, and the</u> rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include <u>include</u> an explanation of why the remaining Contingencies would produce less severe System results.</p> <p>O. The SDT agrees and has moved this concept within Requirement R1 (see Requirement R1.1.1) so that it is applicable to all planning Assessments. Further, both Requirement R3 and Requirement R5 (now R4) have been revised to make reference to Requirement R1.</p> <p>R1.1.1 <u>Planned outages of generation and Transmission Facilities, if specifically known.</u></p> <p>R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to cContingencies in Table 1—Steady State Performance. <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u></p> <p>R4 For the Stability portion of the Planning Assessment, as described in Requirement R2.4 and Requirement R2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 <u>—Stability Performance.</u> <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u> The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted.</p> <p>P. Requirement R5.3 (now R 4.3.2) has been modified to address simulation of how generators perform under conditions being studied. The current MOD standards that address steady-state and dynamic simulation data requirements do not explicitly require the Generator Operators to provide voltage ride-through capability. These standards are set to be addressed by Project 2010-04 within NERC's Standards Development Work Plan. It is expected that the Transmission Planner would contact Generator Operators applicable to their System to obtain such data. If the data is not provided, it would be expected that a Transmission Planner state its assumption on the Vmin used for a generator terminal voltage for assessing ride-through capability. It's likely such information could be obtained through generator manufacturers. The "Other equipment" is addressed in the revised Requirement R4.3.3.</p> <p>Q. The SDT agrees and therefore has changed R1.1.1 to state "if specifically known."</p> <p>R. The SDT believes that a current study is a study that has been completed for the latest Assessment, as opposed to a past study that may have been completed up to five years ago.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
Tenaska, Inc.	A — Generally support the revised standard	<p>A few issues that may need some thought include: Are reactive power devices a responsibility of Resource Planners in R13?</p> <p>On the Extreme Events description for local area, what is a load center?</p> <p>Does the loss of a large body of water as a cooling source result in the immediate loss of generation such that it is a contingency which affects steady state, stability, or short circuit studies?</p>
<p>Response: In response to industry comments, the SDT has removed Requirements R9-R14 and thus eliminated the responsibility of a Resource Planner. The SDT believes that a Load center is a location where energy is delivered by Transmission or sub-Transmission Systems to end-use customers. The loss of a large body of water as a cooling source could cause an immediate loss of generation or could only cause some generation reduction. The Transmission Planner or Planning Coordinator would need to analyze their System in order to determine the proper simulation(s).</p>		
Pacific Gas and Electric Co.	B — Unsure about supporting the revised standard	<p>We agree that the Standard as presented is clearer, but there are numerous issues that still need resolution, Measures, VSLs, Implementation Plan, etc., before WECC can give a full approval of this Standard. ?</p> <p>There is no mention in the purpose of the Standard about minimizing loss of load for more probable unplanned contingencies. Maybe there needs to be some definition around what is meant by reliability. ?</p> <p>We believe that with the loss of the first N-1 in P6, curtailment of firm transmission service or firm transfers should be allowed as part of system adjustment in preparation for the next N-1. This should be added to R3.3.2.2. Otherwise, the power transfer under normal condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1. This will unnecessarily impede commerce. Or, to maintain the same firm power transfer under normal conditions, construction of transmission facilities will be required. Either way, this would impose a much stricter standard than exists today resulting in very costly unnecessary system improvements and invalidate terms of many transmission service contracts that allow for implementation of pro-rate curtailments of firm transmission rights during forced and planned outage conditions.?</p> <p>We disagree with the application of the proposed definitions of Consequential Load Loss and Non-Consequential Load Loss in conjunction with “raising the bar”. Local Network load should be included in Consequential Load and the loss should be allowed for single contingencies. The TPL standard is to maintain reliability of the BES. Under certain conditions orderly dropping of local network load could limit the spread of the disturbance beyond the local area and allow BES reliability to be maintained. This would minimize the total amount of load loss and allow for quicker load restoration. The proposed definitions for Consequential Load Loss and Non-consequential Load Loss will provide no reliability benefits for high voltage (>300 kV) transmission backbone system providing wholesale open access service and interconnecting to the rest of the western interconnection. Any potential reliability benefits of any additional facilities built to comply with these definitions would be at the local service level. As mention in comments to Q3 above, some local network customer</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>curtailments or local area load loss has been allowed by local regulatory authorities as long as the overall reliability of the interconnected system was not impacted. This is a result of tradeoffs between providing a higher level of reliability in a local area and the cost and environmental impacts of providing that service. Such tradeoffs are subject to local regulatory authority or contract negotiated between the transmission provider and its transmission customers.</p> <p>Regarding the terms interruption of firm transmission service?, there needs be clarification on what Interruption means. Since it is referring to firm transmission service, we would interpret this to mean curtailment needed after a particular contingency and adjustments. There also needs to be clarification on what Firm Transmission Service? means. Two points, 1) the NERC definition states ?highest quality service offered to customers under a filed rate schedule that anticipates no planned interruption.? The Standard implies anticipation of ?unplanned? interruption for certain contingencies. 2) Is this referring to a transmission product as defined in FERC Order 890, or firm transfers modeled for the conditions being studied? One way to interpret the intent is the firm transfers being modeled for the conditions in the powerflow to meet demand that would result in load not being served if that firm transfer were curtailed. If there is other generation in the system that could increase to meet the load if the transfer being modeled is interrupted, then interruption of firm transmission service should also be allowed for P1 through P5 contingencies in the table.</p> <p>In addition, we believe that DC and AC lines should have the same performance requirements with respect to interruption of firm transmission service. We do not understand why interruption of firm service would be an acceptable response to the loss of a single pole of a DC line (i.e. response to the contingency) but not an acceptable response to prepare for the next contingency of an AC line. The transfers over both AC and DC lines can automatically be curtailed when the line is outaged.</p>
Public Service Company of New Mexico	C — Definitely do not support the revised standard	<p>We agree that the Standard as presented is clearer, but there are numerous issues that still need resolution, Measures, VSLs, Implementation Plan, etc., before WECC can give a full approval of this Standard. ?</p> <p>There is no mention in the purpose of the Standard about minimizing loss of load for more probable unplanned contingencies. Maybe there needs to be some definition around what is meant by reliability. ?</p> <p>We believe that with the loss of the first N-1 in P6, curtailment of firm transmission service or firm transfers should be allowed as part of system adjustment in preparation for the next N-1. This should be added to R3.3.2.2. Otherwise, the power transfer under normal condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1. This will unnecessarily impede commerce. Or, to maintain the same firm power transfer under normal conditions, construction of transmission facilities will be required. Under certain conditions orderly dropping of local network load could limit the spread of the disturbance beyond the local area and allow BES reliability to be maintained. This would minimize the total amount of load loss and allow for quicker load restoration. The proposed definitions for Consequential Load Loss and Non-consequential Load Loss will provide no reliability benefits for high voltage (>300 kV) transmission backbone system providing wholesale open access service and interconnecting to the rest of the western interconnection. Any potential reliability benefits of any additional facilities built to comply with these definitions would be at the local service level. ? As mention in comments to Q3 above, some local network customer curtailments or local area load loss has been allowed by local regulatory authorities as long as the overall reliability of the interconnected system was not impacted. This is a result of tradeoffs between providing a higher level of reliability in a local area and the cost and environmental impacts of providing that service. Such tradeoffs are subject to local regulatory authority or contract negotiated between the transmission provider and its transmission customers.</p> <p>Regarding the terms ?interruption of firm transmission service?, there needs be clarification on what Interruption means. Since it is referring to firm transmission service, we would interpret this to mean curtailment needed after a particular contingency and adjustments. There also needs to be clarification on what "Firm Transmission Service" means. Two points, 1) the NERC definition states ?highest quality service offered to customers under a filed rate schedule that</p>

<p>Response: Measures, VSL's, and the Implementation Plan will be addressed in the next draft of the standard.</p> <p>The NERC standards are based on deterministic principles. Probability is considered in a high level perspective as a means of rationalizing the inclusion of various deterministic events; however it is difficult to discuss probability in this context without creating misunderstandings. The SDT recommends that you review the NERC definition of Adequate Level of Reliability (ALR), which is the reliability goal for all NERC standards. In response to your comment and those of others in the industry, the SDT has proposed differentiating between loss of firm Load and loss of Firm Transmission Service. This differentiation is provided in footnotes 5 and 10 to Table 1 - Steady State & Stability Performance. In the event that loss of Firm Transmission Service is inadequate, the SDT believes that there are alternatives to loss of Load or construction. For example, companies may contract with interruptible Load and shed customers voluntarily.</p> <p>Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>permitted for single Contingency events. This position was vetted in draft 1 of TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement.</p> <p>Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for Event P1. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted interruptible Loads, in preparation for the next Contingency. "Firm Transmission Service" is a NERC defined term and is also addressed by FERC in OATT.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>The SDT has removed this differentiation in the Table such that AC and DC lines will be treated equally.</p>
Gainesville Regional Utilities	C — Definitely do not support the revised standard	<p>First, a starting point for the study process (base case) needs to be better defined even if the intent was to allow the TP's & PC's to make the decision. The standard should describe the rules to properly conduct a base case study within each region. This should support any following analysis studies and their finding since you will be starting from the same set of system elements operating at a base condition.</p> <p>Secondly, this standard should focus on what is best for the customer considering 1) the probability of the contingency events, 2) the potential expense to the customer for practically NO improvement in BES reliability, and 3) the extraordinary added burden on the smaller utilities to run additional, no added value studies with documentation to meet an exhausted detailed audit with the potential for penalties probably not proportioned to the utilities revenue stream.</p>
		<p>Response: The SDT has modified Requirement R1 to include additional details on what should be modeled in the cases. However, the SDT intentionally provides flexibility for the Transmission Planner/Planning Coordinator to decide which "base case" to use since initial conditions for a system will vary from region to region and will need to be established on a local level, not via a national standard. The required studies and sensitivity analysis ensures that sufficient study is performed to cover an appropriate range of System conditions.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data <u>consistent with the data</u> provided in <u>accordance with Requirements R9 through R14</u>, the MOD-010 and MOD-012 standards, and other data sources, <u>and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>The SDT has retained the basis of the previous standard and raised the bar in some respects. While the performance requirements must be met, they do not necessarily mandate a solution. Considerable flexibility in Corrective Action Plans allows for economic considerations. The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors (including ROW) involved here and is</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
taking them into consideration in its deliberations.		
Lakeland electric	B — Unsure about supporting the revised standard	<p>Suggested changes listed below to more directly address what I think is the intent of the item:</p> <p>Planning Events: Events that require Transmission system performance requirements to be met. Comment: I think that this suggested revision better defines a Planning Event and how they may be used in a study or assessment. Revision to: Planning Events Planning Events: Simulated events that are modeled to test the Transmission system's ability to meet performance requirements.</p> <p>R2.6.2. For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Comment: the requirement as stated leaves one guessing about the usability of a study that may have included the changes that occurred in the intervening period. Changes that were studied but not implemented could also invalidate a study they were included in. Revision to R2.6.2R2.6.2. For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that were not included in the original study but have occurred in the intervening period and would impact the study area results.</p>
<p>Response: The SDT did not incorporate the commenter's suggested change and the Planning Event definition remains the same as in Draft 2. The SDT believes the stated definition more correctly indicates the intent that for Planning Events the performance requirements must be met, not simply that simulations need to be completed to indicate if the performance requirements are met or not.</p> <p>The SDT does not agree with your comment and believes that the cancellation of a planned Facility that was included in prior models would be a material change to the network model and therefore would not allow the past study to support the Planning Assessment. The key phrase within the requirement is "the study", therefore, the intent is model simulation changes and not limited only to real physical System changes. Therefore, the SDT believes the instance raised by the commenter is adequately covered.</p>		
JEA	C — Definitely do not support the revised standard	<p>The inability to curtail Firm Transmission Service under P6 assessments in preparation for the next N-1 event. Also, under P1 and lower probability contingency events,</p> <p>JEA recommends a standard requirement that allows for the loss of Non-Consequential load during short term periods (suggest allowing up to 3 year minimum) where the system load growth has caused post-contingency remedial action plans to not be completely affective in bringing the Facility(ies) within normal operating limits. As a specific theoretical example, lets say a 10 year assessment shows load growth causing this situation in year 5, but in year 7 generators are added to the area of concern and the issue is resolved, but in year 6, Non-consequential load is required to be shed, do we still need to propose a capital improvement project?</p>
<p>Response: The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>necessary. Footnote 10 in the Revision 3 of the Standard provides clarification.</p> <p>Footnote #10 – <u>Curtailed of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>The proposed standard does not require capital improvements, but it does require the performance metrics to be achieved. Certainly there will be circumstances where the addition of Transmission or generation facilities may be the only practical solution. For the specific example that you described, if there were no acceptable Operating Procedures to bridge the time period before the generator comes on line, entering into interruptible Load contracts would be another option. The standard does not preclude such actions.</p>		
PacifiCorp	A — Generally support the revised standard	<p>We generally agree with the Standard as presented so far, but there are numerous issues that still need resolution, Measures, VSLs, Implementation Plan, etc., before WECC can give a full approval of this Standard.</p> <p>We believe that with the loss of the first N-1 in P6, curtailment of firm transmission service or firm transfers should be allowed as part of system adjustment in preparation for the next N-1. This should be added to R3.3.2.2. Otherwise, the power transfer under normal condition (before the first N-1) will have to be significantly curtailed in anticipation for meeting performance requirements after N-1-1. This will unnecessarily impede commerce.</p>
<p>Response: Measures, VSL's, and the Implementation Plan will be addressed in the next draft of the standard.</p> <p>The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in the Revision 3 of the Standard provides clarification. Requirement R3.3.2.2 has been deleted in favor of Header note 'e' in the Table.</p> <p>Footnote #10 – <u>Curtailed of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. ITC Holdings: ITC, METC, ITC Midwest	B — Unsure about supporting the revised standard	<p>ITC and ITC Midwest biggest concerns are some missed opportunities to "raise the bar". We believe the draft standard is a significant improvement over existing standards which are largely fill-in-the-blank. However, we have some concerns regarding some of the language wherein CAPs are not required, even though a performance requirement has been violated. For example, providing for a bare minimum sensitivity study and not requiring a CAP based on a performance violation may increase operational awareness but does not ?raise the bar? or improve transmission performance. Allowing for non-consequential load loss following a shutdown and contingency might be an acceptable real time operating</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>procedure but is not a significant advancement on a transmission planning basis. Frequently, operating procedures like this should lead to a planning solution, particularly above 300kV</p>
<p>Response: The SDT translated the existing TPL standards, added clarity, and “raised the bar” in areas where the SDT believes are merited. Even though the existing TPL standards do not address sensitivities, the SDT has added a requirement to complete at least one additional sensitivity. The SDT believes that it is important and valuable for the Transmission Planner and Planning Coordinator to run significant sensitivities and share the results with their neighbors. The SDT did not limit when Operating Procedures, other than Non-Consequential Load loss, could be utilized. The SDT believes that it is important for the Transmission Planner and Planning Coordinator to determine when an Operating Procedure can be utilized and when new Facilities need to be constructed. A Corrective Action Plan is required for all performance violations of all Planning Events in Table 1, except, as you have noted for sensitivity study performance violations. The SDT concurred with the FERC orders that sensitivity study results do not necessarily result in a Corrective Action Plan. From paragraph 1704 of Order 693: “The Commission notes that it is not the purpose of sensitivity studies to identify remedial actions, but, as stated in the NOPR, if different scenarios that lead to criteria violations are probable they require mitigation plans..... In any case, we are not requiring the construction of additional facilities.” While the standard does not “require” a Corrective Action Plan, it does not preclude a Corrective Action Plan, particularly if it meets FERC requirements for a “mitigation” plan if the Planning Events are “probable”. The majority of the SDT, based on industry comments, did not feel that Non-Consequential Load loss should be precluded from N-1-1 events. A Corrective Action Plan is not required if Non-Consequential Load loss is allowed under local criteria but the standard does not prevent local criteria from prohibiting Non-Consequential Load loss for N-1-1 events.</p>		
<p>Hydro-Quebec Transenergie (HQT)</p>	<p>C — Definitely do not support the revised standard</p>	<p>This standard as drafted does not allow exceptions for small parts of the system as long as interconnected system reliability is maintained, which is allowed in the existing TPL standards in footnotes b) and c) in Table 1. Unless such exceptions are allowed significant transfer restrictions or large reinforcements must be made. The applicable TPL footnotes are: ? Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.? Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (nonrecallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.? This comment form did not allow for the following items to be addressed:?</p> <p>a. Definition of the Long-Term Planning Horizon. The planning horizon, for assessment purposes should be limited to 10 years. Such an assessment should be sufficient to identify requirements that may take an extended time to implement.?</p> <p>b. Definition of Planning Coordinator is part of the NERC Functional Model, For consistency it should be removed from the Standard.?</p> <p>c. We propose that the Standard be subdivided by subjects into 4 different Standards : ? TPL-001-1: Modeling and System Assessment (R1, R2, R9 to R14)? TPL-002-1: Short circuit and Steady State Performance (R3, R4)? TPL-003-1: Stability Performance (R5)? TPL-004-1: Coordination (R6, R7, R8)? If the previous proposition is not retained, at least the Standard</p>

Remove R2.2.1, the requirement to extend the assessment beyond 10 years. What does the length of the project have to do with the assessment? If it takes 15 years to build something, why does this require a review of year 15? What is the purpose of this assessment??</p> <p>f. R3.3.2 requires clarification - This standard needs to permit discretion regarding the single contingencies that need to be tested, similar to R 3.3.3 and R3.4. It is unnecessary to test all events. For example, contingencies may be limited to relevant disturbances that are contained within or directly impact the studied system.?</p> <p>g. With respect to R3.2.1 - Clarify whether the intent of the standard is to address station service minimum voltage limitation, maximum leading VAR absorption capability or both at steady state.?</p> <p>h. Remove R3.2.2 - Relay loadability is addressed in PRC-023 standard.?</p> <p>i. With respect to R3.3.2.1 - Recommend the removal of the requirement to assess the expected duration of Consequential Load loss. It's not considered anywhere else in the standard.?</p> <p>j. With respect to R3.3.3 - The paragraph refers to Table 1 Contingencies P3 through P7; this should be explicitly stated. Rationale for inclusion of testing should not be required; should only need to explain why certain Contingencies were not tested. This discretion should be applicable to all contingencies.?</p> <p>k. With respect to section R5 - The concept of planned and long-term outages should apply to the general Planning Assessment, or not at all. It should not be specific to the Stability Assessment. ?</p> <p>l. The provisions of Section R.5.3 should have a corresponding MOD standard apply a requirement to provide information regarding all direct and indirect protective and control actions that could result in the inadvertent trip of the generator. Such a provision should include "other equipment (e.g. HVDC, SVC's, Statcoms)", and identify how these devices are treated in the simulation.?</p> <p>m. Planned outages should be addressed in the operating horizon unless otherwise defined in the planning horizon. ?</p> <p>n. In both Table 1 and Table 2, note 3, "variable frequency transformers" should be removed from the last sentence. A new sentence should be added for reference voltage as it applies to "variable frequency transformers" and "back-to-back" facilities.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Response: Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of the TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement.</p> <p>A. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted. FERC Order 693 requires that the planning horizon take into account the lead times for siting and permitting of new long-distance Transmission lines and other long lead time solutions. The SDT has received industry comments regarding the need to exceed a 10-year horizon to account for longer lead time projects. Establishing planning horizons that are shorter than Transmission lead times may create gaps where the identification of a reliability need to which Transmission may be the best solution occurs too late to avert the identified reliability violation. Further, Operating Procedures or alternative short-term capital projects may be needed to limit the impact of the planning event until the planned Facilities can be completed. This information needs to be included in the Assessment.</p> <p>B. The definition for Planning Coordinator was deleted because the term has already been defined and added to the NERC Glossary by another SDT.</p> <p>C. The SDT agrees with FERC Order 693 in aggregating all of the planning requirements into a single standard. The SDT also feels that the Tables need to be as clear and concise as possible. To that end, this version combined Tables 1 and 2 into one table with a revised format. The Planning Events are shown on one page so repeating the headings will not be needed.</p> <p>D. The SDT believes that the existing language is appropriate. No change made.</p> <p>E. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted under some circumstances. For example, if it takes 15 years to build a Transmission line, then the need for that line would have to be determined 15 years ahead of the in-service date. Therefore, Requirement R2.2.1 requires you to perform an Assessment on year 15 if it takes you 15 years to build a line.</p> <p>F. The SDT has removed Requirement R3.3.2 and replaced it with additional language in Requirement R3.1. The SDT agrees with your interpretation that it does not require evaluation of all single Contingencies. Rather, the SDT specifically states in Requirement R3.4 that those Contingencies that are expected to produce the more severe System impacts shall be identified, evaluated for System performance, and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe results.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1—Steady State Performance. <u>based on the lists created in Requirement R3.5.</u></p> <p>G. The SDT has not limited the purpose of this requirement to either minimum acceptable station service voltages or maximum Mvar absorption. The SDT believes that the purpose of Requirement R3.2.1_(now R3.3.2) is to determine if generators will be able to operate or trip off following the Contingency.</p> <p>H. The SDT believes that relay load limits or loadability needs to be considered in the Contingency analyses. The studies should determine if Transmission line loadings could reach the relay loadability level which may add to the existing Contingency and perhaps, result in an unbounded cascading event. No change made.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>I. By definition, Consequential Load Loss is allowed. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R2.-8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p><u>R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>J. The SDT agrees that the rationale should be for all Planning Events but not for Extreme Events.</p> <p>K. The SDT agrees and has moved this concept within Requirement R1 (see Requirement R1.1.1) so that it is applicable to all planning assessments. Further, both Requirements R3 and R5 (now R4) have been revised to make reference to Requirement R1.</p> <p><u>R1.1.1 Planned outages of generation and Transmission Facilities, if specifically known.</u></p> <p>R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to cContingencies in Table 1 — Steady State Performance. The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</p> <p>R4 For the Stability portion of the Planning Assessment, as described in Requirement R2.4 and Requirement R2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 — Stability Performance. The studies shall be based on computer simulations using models utilizing data provided in Requirement R1. The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted.</p> <p>L. Requirement R5.3 (now R4.3.2) has been modified to address simulation of how generators perform under conditions being studied. "Other equipment" is addressed in Requirement R5.4.</p> <p><u>R4.3.2 Studies shall consider Simulate generator performance under anticipated conditions including how the voltage ride through capability of all generators and identify how the generators are treated is analyzed in the simulation</u></p> <p>M. While planned outages are addressed in the operating horizon, it is important that a Transmission Planner review the ability of its System to accommodate planned (maintenance) outages. Additionally, any specific known Facility outages need to be appropriately modeled for the planning horizon studied.</p> <p>N. Tables 1 and 2 have been combined into one table for the next posting. The SDT believes that it has adequately addressed "variable frequency transformers" as well as "back-to-back" facilities by including it in the same note as other transformers (Note #3).</p>
Progress Energy Florida, Inc.	C — Definitely do not support the revised	PEF considers the draft TPL Standard in its present state to be infeasible, unnecessary, burdensome and inferior to the existing Standards. The basic approach to equate reliability of the BES to whether or not Firm Transmission Service and/or Non-Consequential Load Loss can be sustained is an erroneous approach, is not justifiable, infringes upon

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
	standard	<p>regulation already in place as part of dealings with the Florida Public Service Commission (PSC), and infringes upon requirements in the OATT. Given the numerous concerns PEF has with the revised draft Standard, expounding on those concerns requires extensive documentation. We therefore cannot reduce our concerns down to a single issue, nor can we single out a single requirement or set of requirements as the top concern, other than to say that the entire Standard development process either needs to be discontinued or the SDT should provide detail as to how much consideration would be given to transmission systems with historically excellent reliability via a variance process. The following is a list of PEF's primary concerns with the revised draft Standard and explanation as to why the Standard development process should be discontinued:</p> <ol style="list-style-type: none"> 1. PEF has planned to, and demonstrated compliance with, the existing TPL Standards for several years now. PEF is intimately familiar with the existing Standards, and has done an excellent job in planning the PEF system, in conjunction with the other Transmission Owner members of FRCC, non-FRCC adjacent Transmission Owners, and all requestors of Transmission or Generator Interconnection Service using the existing TPL Standards. PEF thus believes that history has shown, particularly within the realm of PEF's Transmission Planning boundaries, that the existing four TPL Standards are not inadequate or inferior in any way. Statements in recent months alluding to the existing Standards' inferiority, confusing language or language subject to opposing interpretations, do not hold up when applied to the PEF and FRCC systems. PEF thus does not believe the Standards require modification. 2. PEF, through its aforementioned participation with FRCC and through its interaction and compliance with regulation by the Florida PSC, has historically demonstrated excellent Transmission Reliability, and can provide documentation to that effect through FRCC and Florida PSC channels. PEF therefore again asserts that modification or increased stringency in the TPL Standards is not merited. 3. The development of TPL-001-1 stems from a fundamental misinterpretation of the intent of FERC Order 693. NERC for the most part, rather than "clarify" or "consider" various matters raised by FERC, chose to accept all suggestions. Specifically, PEF notes the following misinterpretations regarding Order 693:a) In Paragraph 1692, the Commission agreed with one particular utility's assertion that integrating the four existing TPL Standards into a single standard would be an improvement, and directed NERC to "consider" this. NERC, rather than considering this, formed the SDT, which appears to have spent little considering the issue but rather have deemed it a foregone conclusion that the four existing TPL standards must be abolished and a new standard must be written. <ol style="list-style-type: none"> b) In Paragraphs 1694 and 1706, the Commission recognizes the significant differences in the various transmission systems, and the impossibility of developing a standardized list of "sensitivities" of critical operating conditions that every Transmission Planner and Planning Coordinator must analyze, regardless of their applicability. The Commission therefore stated that it is reasonable for planning entities to have a means to identify an appropriate range of critical operating conditions, without having to anticipate every conceivable critical operating condition.? They furthermore state that their conclusion on the whole matter is that ?only those deemed to be significant need to be assessed?. PEF agrees, and thus is perplexed by the erroneous developments in Requirements R2.4, R2.5, R5.4, R5.5, R2.1.3 and R2.1.4. PEF has

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>addressed the inadequacies of these Requirements in the answers to Questions 2 and 10.</p> <p>c) In Paragraph 1704, the Commission, amongst other statements, states that they "are not requiring the construction of additional facilities?". This general statement made by the Commission is demonstrated to be untrue upon examining the realities of the Standard development process. FERC, by directing NERC to consider various clarifications and/or improvements to the TPL Standards, has set in motion a process which will prohibit either Interruption of Firm Transmission Service or the loss of Non-Consequential Load for various outage scenarios, effectively necessitating the construction of redundant facilities. FERC's statement conflicts with the ongoing process in a major way, and PEF respectfully requests that the SDT confer with appropriate FERC personnel to get clarification on this matter.</p> <p>d) In Paragraph 1725, the Commission directs the ERO to modify the planning Reliability Standards to require the assessment of planned outages consistent with the entity's spare equipment strategy. PEF does not disagree with the specifics of analyzing events with respect to spare equipment, except to the extent that the Commission appears to think that such analysis is not adequately covered in the existing TPL Standards. PEF believes that the existing TPL Standards adequately address this issue and all other issues pertaining to the planning of a transmission system. Furthermore, the process is to be followed "consistent with the entity's spare equipment strategy?", thus deferring to the processes and judgment of the individual Transmission Owners, which calls into question the need to include it in the draft Standard. For additional discussion on this issue, see the answer to Question 5 with regard to Requirement R11.</p> <p>e) In Paragraph 1782, PG&E points out the contradiction that FERC creates in Paragraph 1796 by directing NERC to remove the 2nd sentence of footnote (b). The contradiction also involves key statements made by the Commission in Paragraph 1788. For a more detailed explanation of this contradiction, see the answer to Question 11.</p> <p>f) Paragraph 1794 is part of the Commission Determination section. The Commission states its belief that no TPL Standard should allow an entity to plan for the loss of non-consequential load in the event of a single contingency. The Commission then directs NERC to "clarify the Reliability Standard.", and furthermore state that any Transmission Planners or Planning Coordinators seeking to plan for the loss of non-consequential load in the event of a single contingency can make their comments known through a) filing comments in the standards development process, or b) filing for a regional difference for case-specific circumstances. PEF points out that the Commission merely stated their belief and directed NERC to clarify the Standard. They did not order NERC to change the Standard to reflect its beliefs. NERC, while having the leeway to question FERC's approach in this Paragraph, did not question the approach, but rather deferred to the suggestion in Paragraph 1794 (as well as nearly every other suggestion or request for clarification) that FERC made. PEF is concerned that NERC and the SDT appear to be limiting the extent to which they question or make suggestions to FERC. PEF at present will take the approach of stating the prudence and need to plan for the curtailment of Firm Transmission Service and loss of non-consequential load in the event of a single contingency through the comments process. PEF, however, reserves the right to consider the variance approach or legal approaches, depending on further iterations in the development of the Standard.</p> <p>g) In Paragraph 1795, "The Commission" suggests that the ERO consider developing a ceiling on the amount and duration</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>of consequential load loss that will be acceptable. If the ERO determines that such a ceiling is appropriate, it should be developed through the ERO's Reliability Standards development process.? To this effect, the SDT drafted Requirement R.3.3.2.1, which at present states ?Consequential Load loss (expected maximum demand and expected duration) following a single Contingency shall be identified in the Planning Assessment.? PEF asserts that this issue is under the jurisdiction of the State Public Service Commissions, who are already doing an excellent job in regulating Consequential Load Loss as part of SAIDI/CMI requirements. FERC and NERC are overstepping their bounds of jurisdiction by attempting to essentially ?double-regulate? an issue that is already adequately regulated via the States. PEF furthermore objects to Requirement R.3.3.2.1 on the grounds that duration of events cannot be estimated with any reasonable degree of accuracy. To handle the challenges of this issue by stating a long-duration worst-case scenario for each outage would be inaccurate, and would tend to foster needless scrutiny and concern on any and all outages associated with Consequential Load Loss.</p> <p>h) In Paragraph 1796, "The Commission" directs the ERO to modify the second sentence of footnote (b) to clarify that manual system adjustments other than shedding of firm load or curtailment of firm transfers are permitted to return the system to a normal operating state after the first contingency, provided these adjustment can be accomplished within the time period allowed by the short term or emergency ratings.? The Commission directed the ERO only to make modifications on the 2nd sentence of footnote (b). The SDT in the draft TPL Standard has eliminated footnote (b) altogether. PEF is surprised and disappointed at the response by FERC to PG&E's very correct assertion that eliminating the allowance of shedding of firm load or curtailment of firm transfers from footnote (b) contradicts the allowance made in footnote (c) regarding C.3 events. FERC's only response was to state that ?manual adjustments referred to in both cases [i.e. Category B and Category C.3 events] apply after the first N-1 contingency?. The fallacy of this statement is that shedding of firm load or curtailment of firm transfers is allowed by footnote (c) for C.3 events, and that every Category B event is by default the first part of a Category C.3 event. PEF asserts that FERC, and consequently the NERC SDT, has created a draft Standard that contradicts direction and suggestion in Order 693 regarding this issue. PEF furthermore asserts that curtailment of Firm Transmission Service or Non-Consequential Load are not valid benchmarks for assessing the reliability of the BES. For additional comments on this issue, see the answer to Question 11.</p> <p>i) Regarding Paragraph 1833, the paragraph in its entirety states: ?MidAmerican states that it supports the proposal to modify TPL-004-0 to require identification of options for reducing the probability or impacts of extreme events that cause cascading. Accordingly, for the reasons cited in the NOPR, the Commission directs the ERO to modify the Reliability Standard to make this modification to the Reliability Standard.? PEF does not understand what FERC has directed on this matter. Furthermore, PEF does not understand the meaning or requirements behind the entire ?Extreme Events? section in the draft Standard, which appears to have resulted from the direction in this particular Paragraph. FERC wants NERC to modify the Standard to ?require identification of options for reducing the probability or impacts of extreme events that cause cascading.? This statement is vague, confusing and does not appear to mandate anything. PEF therefore requests that language in TPL-001-1 to this effect be removed. Furthermore, in Paragraph 1834, the Commission, regarding its preference to expand TPL-004-0 to include analysis of more events such as hurricanes, ice storms, successful cyber</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>attacks, etc., directs NERC to ?expand the list of events with examples of such events identified above.? This request, similar to Paragraph 1833, does not appear to direct NERC to make specific directions in a Standard. If it was FERC's intent that TPL-004 or its successor be modified to include some or all of FERC's suggested events, and to expand the list further, PEF has many concerns concerning this. The direction in Paragraph 1834 has resulted in the aforementioned Extreme Events section, which contains a note 1 referring to Requirement R3.4. PEF has multiple questions and concerns with the language in this Requirement. The Requirement as worded appears to mandate that Transmission Planners and Planning Coordinators must find the most severe Extreme Event scenarios that can be conceived. Such wording would define any reasonable limit as to which Extreme Events are likely and worthy of analysis, and which are not. Furthermore, many of the events suggested by FERC, such as loss of a large gas pipeline, wildfires, hurricanes, tornadoes, cyber attacks, etc., cannot reasonably be studied. To make any assessment of these events that even approached a level of thoroughness is infeasible, and furthermore has no significant benefit. PEF requests that the SDT point out to FERC that these events cannot be studied, and therefore need to be excluded from any TPL Standard.</p> <p>4. The main approach of the draft TPL Standard consists of whether to allow or disallow load loss for certain outage scenarios (the most problematic Event categories being P1, P2.2, P2.3, P3, P4, P5 and P6), an approach to which PEF is opposed, and furthermore believes that level of service to retail load is not an issue that NERC/FERC should be regulating. The local utility commissions (the Florida PSC, etc.) have already set in place processes for reviewing/approving the level of transmission built to support the level of service to load, and thus FERC and NERC inappropriately attempt to regulate an issue which the States already adequately regulate. PEF can, and has demonstrated in its internal planning assessments and in assessments performed with FRCC that load curtailment and/or Firm Transmission Service curtailment do not adversely impact the reliability of the BES. In fact, certain post-contingency scenarios can be shown to demonstrate that such curtailments actually promote reliability and a speedier, safer, more efficient recovery of the BES after an event.</p> <p>5. Several Event categories as presently defined in the draft TPL Standard present outage scenarios on the PEF system for which implementation of redundant transmission facilities would be required, at an exorbitant cost to ratepayers. The redundancy requirements at PEF's 500 kV, 230 kV and 115 kV Substations are numerous, and have not yet been comprehensively quantified, although this analysis is underway. One scenario for which PEF is already certain that redundancy of the 500 kV system would be required is the apparent disallowance of curtailment of Firm Transmission Service or Non-Consequential Load as part of ?System Adjustments? in between the two events of P6. PEF again would point out that no definition of ?System Adjustments? exists at present, and the SDT therefore must define it if compliance is expected. Be that as it may, PEF's 500 kV redundancy projects would clearly cost many billions of dollars, with extremely little benefit. PEF would furthermore point out that this is but one example requiring unnecessary Transmission upgrades, and that further analysis will potentially reveal several more Event categories in Tables 1 and 2 for which additional cost-prohibitive and unneeded projects would be mandated.</p> <p>6. PEF is surprised and disappointed that neither FERC nor NERC have accepted any responsibility to alert the public or the State and local governments to this process. The public have not been involved in the development of the draft</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>standard, nor have they been informed that they would bear the financial impact of the increased stringency. In fact, The SDT on p. 369 of the 1st draft Comments Document has stated that "This is a performance based reliability standard and does not and should not consider economics." PEF considers this statement to be reckless and irresponsible, and does not accept FERC's and NERC's apparent position that they have no responsibility in this matter. The fact that the draft Standard and FERC Order 693 can be downloaded by anyone from FERC's and NERC's websites does not constitute a sufficient good-faith notice of this process to the public. PEF requests that FERC and NERC specifically address this issue by explaining their failure to involve and inform the public. Assigning this responsibility to each Transmission Planner and Planning Coordinator is not acceptable. FERC and NERC have set this process in motion, and as creators of the process owe an explanation to those who would "foot the bill" for the process.</p> <p>7. The low voltage threshold of jurisdiction of the draft Standard, previously defined in NERC's definition of the BES as 100 kV, is not specified in the draft Standard. This is a significant misstep by NERC in that a change to NERC's Glossary Definition of the BES, which would ostensibly be done outside the boundaries of this Standard, could profoundly change the requirement for complying with TPL-001-1 without changing a single word of the Standard. PEF is particularly concerned that this Standard must never have jurisdiction over local load-serving transmission systems, regardless of voltage. Any TPL Standard, existing or future, must focus on the reliability of the BES, i.e. the bulk grid, NOT the local load-serving portions of the transmission system. The draft Standard at present does not address this issue at all and leaves Transmission Planners and Planning Coordinators vulnerable to non-compliance with a mere change in the wording of a Definition outside of the Standard.</p> <p>8. PEF strenuously objects to the allowance of interruption of Firm Transmission Service in Events P1 and P3 for DC lines, while disallowing the same for AC lines. PEF asserts that the determination should be "Yes" for both, and that disallowance for AC lines a) puts DC systems into an elite class of transmission for no explicable reason and b) encourages owners of AC Transmission Systems to replace them with DC, cost concerns notwithstanding. Furthermore, this differentiation fails to recognize or give consideration to the fact that AC systems support Firm Transmission Service; some areas of the AC transmission system carry significant amounts of Firm Transmission Service, and thus a "No" determination for P1 and P3 essentially mandates either implementing redundancy for those parts of the AC system carrying significant amounts of Firm Transmission Service, or severely curtailing Firm Transmission Service on the existing AC systems.</p>
<p>Response: The SAR for this standard recognized FERC orders which indicated a need to "raise the bar" for the industry. The SDT is attempting to do this in a reasonable fashion. There is significant flexibility in the Corrective Action Plans allowed for any additional performance requirements which must be met. Industry consensus, through approval of the SAR, is that revision of the existing TPL standards is appropriate.</p> <p>1 & 2. Industry consensus, through approval of the SAR, is that revision of the existing TPL standards is appropriate.</p> <p>3A. The SDT and industry consensus, at this point in the development process, is that consolidation in a single standard is the best course of action. The SDT did not start out with a preconceived idea that there should only be one TPL standard. The SDT started the drafting process by reviewing all of the available</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>documents. This included the existing TPL standards, the SAR, FERC Order 693, and other NERC documents. After reviewing this material, the SDT determined that the majority of the language in the individual standards was in all four of the standards. After much discussion, the SDT determined that the industry would be better served with a single standard instead of staying with four individual standards.</p> <p>B. Please see the responses provided in questions 2 and 10.</p> <p>C. The revised TPL-001-1 standard itself does not require construction of additional Facilities although that may be a consequence of application of the standard. Additional operating guides or changes in dispatch are other possible consequences. Footnotes 5 and 10 have been added that provide further clarification regarding interruption of Firm Transmission Service. FERC staff has been available to the SDT for consultation throughout the process.</p> <p><u>Footnote 5 - When the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.</u></p> <p><u>Footnote #10 – Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>D The SDT has removed Requirement R11 from the proposed standard and Requirement R2.1.4 has been included to help clarify the spare equipment strategy issue.</p> <p><u>R2.1.4 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience due to the unavailability of the long lead time equipment.</u></p> <p>E. Please see response to your comments on question 11.</p> <p>F. FERC direction provided in Order 693, SDT expertise, and industry input are all being considered in development of the standard.</p> <p>G. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been removed from the draft.</p> <p><u>R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>H. The SDT is being responsive to FERC direction in paragraph 1796 and agrees that clarification regarding Non-Consequential Load Loss and Firm Transmission Service requirements is necessary. Table 1 specifies the specific events when Loss of Non-Consequential Load is allowed. Footnotes #5 & 10 have been added to the end of Table 1 to explain Firm Transmission Service requirements. Also, please see response to your comments on question 11.</p> <p>I The SDT believes that the requirement to study Extreme Events in the existing TPL-004-0 must remain in this standard. The SDT has not expanded the number of Extreme Events that must be studied but rather gave examples of how the events may occur. The only significant change in the analysis of Extreme</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Events is the new requirement for the Transmission Planner or Planning Coordinator to evaluate whether there are cost effective ways to reduce the likelihood or the impact of a particular event and document those findings. The SDT believes that this is a very reasonable approach to ensuring that these major events, even with a small probability, are reviewed and prudent decisions are made.</p> <p>4. The issues raised on NERC/FERC regulations are beyond the scope of the SDT. However, changes have been made to the 3rd draft of the standard to further clarify the SDT's position on curtailments and service to Loads. Also, Load curtailments are allowed if those customers have signed an Interruptible Load contract arrangement.</p> <p><u>Footnote 5 - the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.</u></p> <p><u>Footnote #10 – Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>5. The SDT has made the following changes to address the concerns raised by you and others: 1) Added Header note 'e' to the table to show that System adjustments can be made following a single Contingency event, in preparation for the next event; 2) Added footnote 5 to address conditional firm issues, and 3) Added footnote 10 to address re-dispatching resources while continuing to serve firm Load.</p> <p><u>Header note 'e' - For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p><u>Footnote 5 - When the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.</u></p> <p><u>Footnote #10 – Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>6. NERC is following the officially sanctioned standards development process with regard to this project just as it follows the process for all standards development work. This is an open, transparent process which has been approved by FERC. Any member of the public is free to participate and/or comment. State regulators are included in the process (Segment 9) and comments are welcome from them just as they are from any other segment of the public or industry. Comments are frequently received from state agencies during the lifetime of a project and two regulatory agencies did provide comments on the second posting. As for the comments on economics, it was not reckless but a statement of fact. However, costs are being considered as should be evident by the questions raised (Q12 thru Q14) in the second posting. The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>7. Revisions to definitions in the NERC Glossary of Terms must be approved in accordance with the standards process and issues with application to existing standards would be considered. In addition, each Regional Entity has the ability to establish its own unique definition of the BES.</p> <p>8 The SDT has removed this differentiation in the Table such that AC and DC lines will be treated equally.</p>		
<p>Lafayette Utilities System</p>	<p>C — Definitely do not support the revised standard</p>	<p>Lafayette’s single biggest concern is that the second draft version of TPL-001 imposes performance requirements that are less stringent than those imposed in the previous draft. As the SDT stated in its response to comments on Draft 1: “The SDT modified the performance requirements relative to Non-Consequential Loss of Load and revised Tables 1 & 2 to add greater detail and provide for more situations where it is acceptable to lose Non-Consequential Load.” This “watering down” of the standard appears to result from complaints about the costs that certain commenting parties claimed would be necessary to achieve compliance with the performance requirements set forth in Draft 1. This is evident from the SDT’s statement in the foreword to the comments form for Draft 2 that the SDT has “attempted to adjust and clarify the proposed requirements and performance in light of these initial comments,” and that the SDT needs additional information about cost and other compliance issues so that it can “make more adjustments as appropriate.” Lafayette questions whether it is appropriate for the SDT to shape the performance standards to alleviate certain commenters’ cost concerns. The SDT should be focused on developing performance requirements that are judged to be optimal from the standpoint of protecting reliability consistent with sound engineering and planning. Striking a balance between reliability and cost is a policy determination for which responsibility lies elsewhere than in the SDT. Claims that the standards would impose excessive costs are more properly addressed to FERC when the revised TPL-001 is filed for approval because Congress assigned to FERC the responsibility to make judgments of this sort. The SDT should not be “adjusting” (that is, watering down) the performance requirements in response to transmission owner arguments about the costs of compliance. The dilution of the performance requirements is manifest in a number of elements contained in the proposed draft, including (but not limited to) the following:</p> <p>a) Table 1 (Steady State Performance) would permit the interruption of Firm Transmission Service and the loss of Non-Consequential Load in three P1 (Single Contingency) scenarios involving AC lines. In Order 693 (at paragraph 1794), however, FERC emphasized that loss of Non-Consequential Load in single contingency situations is not permissible.</p> <p>b) Adopting less stringent performance requirements for loss of elements below 300kV may be discriminatory. Most wholesale customer loads are served from delivery facilities that operate at voltages lower than 300kV. The outage of facilities operating at less than 300kV therefore may encompass 100% of a wholesale customer’s load, while it is likely to impact a much smaller portion of the total load served by the owner of the affected transmission facilities. Therefore, adopting less stringent performance requirements for facilities operating at less than 300kV would impose a disproportionate burden on affected wholesale customers, as compared to the transmission owner.</p> <p>c) In addition to its potentially discriminatory effect, the notion of imposing difference performance standards based on operating voltage would incent transmission owners to scrimp on needed improvements to lower voltage facilities. Presumably, the distinction originates from a belief that outages on 300kV and lower facilities will have less impact on the</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Bulk Electric System. As the August 2003 blackout demonstrated, however, disruptions on lower voltage circuits can cause real and reactive power flow fluctuations across, and eventual separation of, higher-voltage networks.</p> <p>d) Regarding the SDT's elimination of the requirement to re-test cases to ascertain the efficacy of additions included in a Corrective Action Plan (sub-requirement 2.7.2 in Draft 1), it is unclear why this requirement was deleted since very few commenters complained that it would be burdensome. It is hard to see how such a re-testing obligation would impose a significant burden, at least insofar as the steady state analysis is concerned. Eliminating the re-testing requirement seems likely to provide minimal savings, but could be important to verifying that appropriate Corrective Action Plan decisions are made.</p>
<p>Response: There are no intentions by the SDT to "water down" reliability. In fact the SDT has raised the bar in many places; e.g., above 300 kV requirements. Resources and expenditures versus adequate level of reliability are being given due consideration throughout the process and will ultimately be determined by the industry through the ballot process.</p> <p>a Table 1 does <i>not</i> permit the interruption of Firm Transmission Service or the loss of Non-Consequential Load in three P1 (Single Contingency) scenarios involving AC lines.</p> <p>b & c. The majority of the SDT believed the 300 kV and higher Systems (EHV) generally represent the backbone of many Systems in the various Interconnections and that the more stringent requirements were appropriate when considering N-1-1 Contingencies of two EHV Facilities. Systems operated above 300 kV generally do not directly serve end-use Load customers but rather act as the medium for moving large amounts of power from production to various Load centers where the energy is then delivered by other Transmission or sub-Transmission Systems to end use customers. It is the desire of NERC and various stakeholders that the backbone of the electric power grid be robust and held to a higher degree of reliability.</p> <p>d. The retesting of the cases was deleted due to the SDT believing that this requirement was too burdensome; however, any utility may exceed the requirements listed and perform this retesting if they so desire.</p>		
Arizona Public Service Co.	A —Generally support the revised standard	We generally agree with the Standard as presented so far, but there are numerous issues that still need resolution, Measures, VSLs, Implementation Plan, etc., before WECC can give a full approval of this Standard.
Compliance Elements Development Resource Pool (CEDRP)		With regard to Violation Severity Levels for this standard, the CEDRP doesn't believe the version that has be posted for comment can be commented on from a VSL perspective for two reasons 1) it does not have any measures listed and 2) there are so many "sub-requirements" the VSLs would be quite unmanageable, unless each sub-requirement is of equal importance to fulfilling the objective of the standard. Because there are no measures we can't achieve any insight into importance. The SDT may want to consider trimming the standard down to its most basic elements and providing the details (sub-requirements) in a reference document.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>Response: Measures, VSL's, and the Implementation plan will be addressed in the next draft of the standard.</p>		
<p>Ameren</p>	<p>C — Definitely do not support the revised standard</p>	<p>From an engineering perspective, the biggest concerns are the additional requirements, including prescribed sensitivity studies, associated with R2 for both steady-state and stability scenarios. We believe that we already cover the needs of our system with the existing NERC standards and Ameren Transmission Planning Criteria & Guidelines. The additional analyses proposed by the revised standard are not warranted and any upgrades identified by the additional analyses will not provide any significant increase in system reliability. For 2008 compliance, Ameren performed the following steady-state contingency analyses on each of four near-term models and one long-term model: 617 Category B single contingencies involving lines and transformers. 30 Category B single contingencies involving generators 50 MW and above. 1699 Category B single branch outages. 135 Category C-1 bus faults. 260 Category C-2 breaker failures. 112,575 Category C-3 double contingencies involving lines and transformers. 18,510 Category C3 contingencies involving 617 lines and transformers and 30 generating units. 73 Category C-5 double-circuit tower outages. For 2008 compliance, Ameren performed 496 stability scenarios of four near-term models and one long-term model: Assuming that we can acquire the qualified manpower, which is presently not available, we estimate that proposed new requirements will increase our compliance activity time by approximately 24 man-months or 2 man-years in a six-month window (January-June) to produce the same quality studies that we produce now. Consequently, we view these proposed additional study efforts as excessively burdensome. Further, we do not see how the additional study work and documentation required by the proposed standard will lead to any significant improvements in reliability.</p> <p>Additional comments: The question of expected Consequential Load Loss magnitude and duration, as specified in R3.3.2.1, is not germane to the reliability of the Bulk Electric System, and is a matter for Distribution Planners and local regulatory authority and is not needed in this reliability standard.</p>
<p>Response: The SDT has received many comments regarding the increased planning requirements to meet the proposed standard. The SDT has reviewed the study work required to comply with the proposed standard as compared to the existing TPL standards. The SDT believes that we have added some additional study work and asked a question about the additional man-hours required to complete any new analysis. However, after this review, the SDT still believes that the requirements for sensitivity studies must remain to document the selection of critical System conditions and study years used in assessing System conditions (see paragraph 1704 of Order 693) and that System conditions are as important as Contingencies in evaluating the performance of present and future Systems (paragraph 1705). The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations.</p> <p>To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
City of Tallahassee, FL	C — Definitely do not support the revised standard	<p>The requirement regarding non-interruption of firm transmission service in the steady state performance table for Category P1 events does not properly take into consideration the flexibility necessary for utilities with limited interconnections or interconnections with limited transfer capability. This flexibility, which currently exists in the TPL-001 standard (footnote b in the table), allows a utility to curtail firm transactions to prepare for the next contingency. As drafted, in the circumstance where the single element outage in Category P1 was a tie line, even if this line were critical to supporting the transaction (or were required to be in service by the terms of the power contract), interruption of firm service would be a violation of the proposed standard even though such interruption would be either required or appropriate to ensure the reliability of the bulk electric system. For utilities where tie line capacity is constrained or limited, this requirement for Category P1 will require substantial investment in duplicate facilities to ensure that firm transfers would not be interrupted, and the cost of that investment would likely not offer ratepayers a commensurate benefit (presuming such a duplicate facility could even be sited and permitted). For utilities with just a few large generating units (such as a small municipal utility), the requirements for Category P3 in Table 1 set a threshold for compliance that may not be achievable without substantial investment in additional/duplicate transmission facilities and possibly generating units. The concern relates to the restriction about limiting interruption of firm transmission service or non-consequential load following a G-1/N-1 event; the particular scenario is outlined in the bullets below: Presume a utility with only two large units and some small gas turbines? Under P3, one of these large units is forced out of service? Reserves are called for and delivered along with replacement power using available import capability? Then presume that the N-1 outage in P3 is a major tie line that is critical to the support of the firm power imports? Under the proposed standard, the utility would be unable to curtail the firm purchase or shed any non-consequential load and remain compliant, even though there would be a significant generation/load imbalance & the appropriate response for the reliability of the grid in the region would be to interrupt the transaction and possibly shed load. The flexibility afforded in the existing TPL-001 standard would in fact allow the utility to respond to this event in a more appropriate way while avoiding a very expensive expansion/duplication of facilities (notwithstanding the considerable challenges that the utility would face for siting and permitting of the necessary facilities).</p>
<p>Response: The SDT has made clarifications regarding Firm Transmission Service and Non-Consequential Load Loss. Footnote # 10 has been added to the end of Table 1. The standard does not preclude the possibility of obtaining contractually interruptible load in lieu of system upgrades in the scenario described.</p> <p>Footnote #10 – Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.</p>		
Florida Power and Light	C — Definitely do not support the revised	<p>The standard, as currently drafted, is unacceptable. Without the ability to curtail firm transfers to prepare for a next contingency, a “super-firm” priority of transmission service is created for non-native load customers. This goes contrary to the intent of the Open Access Transmission Tariff (OATT) that curtailments be comparable and non-discriminatory. – From</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
	standard	<p>the OATT: – Curtailment of Firm Transmission Service: In the event that a Curtailment on the Transmission Provider's Transmission System, or a portion thereof, is required to maintain reliable operation of such system, Curtailments will be made on a non-discriminatory basis to the transaction(s) that effectively relieve the constraint. If multiple transactions require Curtailment, to the extent practicable and consistent with Good Utility Practice, the Transmission Provider will curtail service to Network Customers and Transmission Customers taking Firm Point-To-Point Transmission Service on a basis comparable to the curtailment of service to the Transmission Provider's Native Load Customers. All Curtailments will be made on a non-discriminatory basis, however, Non-Firm Point-To-Point Transmission Service shall be subordinate to Firm Transmission Service. When the Transmission Provider determines that an electrical emergency exists on its Transmission System and implements emergency procedures to Curtail Firm Transmission Service, the Transmission Customer shall make the required reductions upon request of the Transmission Provider. However, the Transmission Provider reserves the right to Curtail, in whole or in part, any Firm Transmission Service provided under the Tariff when, in the Transmission Provider's sole discretion, an emergency or other unforeseen condition impairs or degrades the reliability of its Transmission System. The Transmission Provider will notify all affected Transmission Customers in a timely manner of any scheduled Curtailments. The SDT has drafted language contrary to FERC specific requirements on comparability. The FERC has consistently directed Transmission Providers to treat all firm transaction on a comparable basis, yet the SDT, in its latest draft is creating a "super-firm" category for only firm transmission service. By creating a higher priority ("super-firm", non-comparable service) for non-native load customers than for native load, native load customers bear a higher cost burden. This and the costs to the ratepayers for negligible increase in already high reliability due to the performance requirements of the standard makes this draft completely unacceptable for FPL to support. FPL will vote against acceptance of this draft standard unless significant changes are made to comport what FPL believes was the intent of FERC Order 693 with regard to the TPL standards.</p>
<p>Response: The SDT agrees that clarification regarding Firm Transmission Service and Non-Consequential Load Loss is necessary. Footnote # 10 has been added to the end of Table 1:</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>		
Exelon Transmission Planning	C — Definitely do not support the revised standard	We appreciate the effort involved in improving this planning standard, and believe in this goal. We are not yet able to support this revised at this time due to the concerns expressed above.

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
Response: Thank you for your comments.		
CenterPoint Energy and CPS Energy	C — Definitely do not support the revised standard	Without re-iterating previous comments, we will summarize that we find this proposed standard to be an overly prescriptive and unrealistic paper chase that does not add value to the planning process. We also are concerned that this standard demonstrates an unhealthy, one sided approach to planning that does not balance reliability goals against other public policy goals, such as cost and landowner impact.
Austin Energy	C — Definitely do not support the revised standard	The proposed standard is overly burdensome and too prescriptive. It will only result in a marginal improvement in reliability and its primary effect will be to devolve into a paper-chase for auditors.
Response: The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus.		
SRP	B — Unsure about supporting the revised standard	SRP is concerned about what actions will be allowed to meet the higher performance requirements in the transition period and how long will these transition periods last for the different Requirements?
Response: The SDT has developed the Implementation Plan which is included in the 3 rd draft of the standard.		
MidAmerican Energy Company	C — Definitely do not support the revised standard	<p>MEC commends the SDT for significantly improving the standard, MEC believes that the standard still must be improved significantly. Probably the most important improvement would be to completely reformat the standard to provide for more organization and clearer VSLs. MEC recognizes that this may result in some initial confusion during the standard writing process, but if such organization results in less confusion over the next decade of applying the standard, the reorganization is well worth it. If the SDT does nothing else, it should reorganize the standard. Here are some suggestions for improvement:</p> <p>R1.1 is not clear. What does this mean? Surely the SDT does not expect that any time the data is modified a rationale is required. Shouldn't this data be updated as necessary? Wouldn't a requirement for providing a rationale each time such changes are made potentially discourage improvements to the models? This requirement should be clarified and limited to a few specific cases that were there are real reliability concerns</p> <p>R2.5.2 - the SDT should revise the material transmission system changes. Addition of a new substation in one of the transmission lines connected to the plant should be revised to specifically refer to a switching station or to a non-</p>

Organization	Question 15:	Question 15 Comments:
		<p>distribution substation. A substation directly serving load is not a good example of a material transmission system change in the context of Generation Unit Stability studies.</p> <p>R2.6.2 - The SDT should revise the material transmission system changes because as presently defined, studies will need to be conducted every year for every year in the assessment period. This is because apparently the SDT has defined any system change as a material change. Since it is rare for there to be a system that does not exhibit some system change from year to year, this will mean ten-year and more studies every year. MEC recommends that the SDT revise this requirement to make clear that only significant system changes are material changes.</p> <p>R2.7.1 - The SDT has written this requirement to include a requirement that the responsible entity must indicate how long Operating Procedures apply. This implies that Operating Procedures should be interim measures. MEC believes that reliability can be maintained with permanent Operating Procedures and recommends that the need to indicate "how long the Operating Procedures will be needed" be deleted from this requirement.</p> <p>R3.3.2.1 - The SDT should delete the need to provide the expected duration of the Consequential Load Loss in this requirement because this requirements a probabilistic calculation and probabilistic planning is not the state-of-the art of the industry. This is reflected in the standard which has been written to continue deterministic planning criteria. As a result, it is a contradiction to require this probabilistic quantity in the middle of this deterministic planning standard.</p> <p>R3.3.2.2 - clarify that the single contingency events are the events in the table.</p> <p>R3.4 and R5.4.4 - MEC urges that the SDT delete or revise the words "why the remaining Contingencies would produce less severe System results." Given the expansive nature of the Extreme events it is virtually impossible to comply with this requirement. It is more likely that the responsible entity could show that the more likely and more severe Extreme events were studied. It would be better yet if the SDT would merely require that the responsible entity provide the rationale for the selection of Extreme Events that were studied.</p> <p>R5.5.1 provides an exclusion for changes in individual generating units that require study. Yet R2.6.2 has a broader definition of when Generating Plant Stability is required. These definitions need to be consistent. The definition in R5.5.1 seems to narrow to be a good definition for "material changes." MEC believes that the R5.5.1 should be expanded.</p> <p>Year One definition - MEC suggests that the Standards Drafting Team's (SDT's) Year One definition unnecessarily constrains the time between the completion of assessments as compared to the study period to begin no more or no less than 12 to 18 months. There is no reliability benefits derived by constraining the period between the completion of an assessment and the study period for the next study period. In fact, this may encourage a Transmission Planner to unnecessarily delay "completing" a study just to ensure that the 12 to 18 month requirement is met. For example, lets assume that a Transmission Planner's 2008 Assessment is complete as of May 2008. By the definition of Year One, then the study period for the 2009 Assessment will need to begin from May 2009 through November 2009. This means that the 2009 Assessment must include the 2009-2010 Winter Peak and cannot start with the 2010 Calendar Year. Why??? If a Transmission Planner wants to have a study period that begins with the calendar year, then the Transmission Planner</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>would need to delay completing the study until July 2009. Why??? What is the reliability benefits for delay???</p> <p>MidAmerican suggests that the definition of Year One be changed to allow the study period to begin no later than 24 months after the completion of the previous year's study.?</p> <p>Accountability: We suggest that Transmission Service Provider be added because we also suggest that the Transmission Service Provider be responsible for R10.?</p> <p>R2.1 - We suggest that this requirement involves too much study work and we ask that the SDT reduce the number of current studies needed for all subrequirements. ?</p> <p>R2.7.1 - We agree with the requirement, but suggest a slight text change replace "? or Special Protection Schemes,?" with ". . . or Special Protection Systems, . . ."? </p> <p>R2.7.1.1 - We disagree with the "include project initiation date" portion of this requirement. The initiation date is often uncertain and subject to change, which may add considerable work to investigate, monitor and update the date. In addition, we do not know why this information is required to assure BES reliability.?</p> <p>R3.3.2.1 - We agree with the requirement, but suggest a slight text change of: ". . . shall be allowed in the Planning Assessment".?</p> <p>R3.3.2.2 - We agree with the requirement, but suggest a slight text change of: ". . . within their Facility Ratings and within the time period allowed by the applicable time limited ratings.".?</p> <p>R5.4.3.1 - We agree with the requirement, but suggest a slight text change of: ". . . within their Facility Ratings and within the time period allowed by the applicable time limited ratings.".?</p> <p>Table 1? Planning Events ? Header: We suggest that the header be repeated on every applicable page to be more reader-friendly.?</p> <p>Superscripts: The superscripts do not refer clearly to the respective notes (e.g. there are number notes in the beginning of the table, in the extreme events evaluation requirements section, in extreme event description section, and at the end of the table). Perhaps the notes at the end of the table should have unique numbering to make the superscript references clearer.?</p> <p>Shunt device: To avoid the need for future interpretation or clarification, we suggest that the meaning of shunt device be explained or defined somewhere in the standard (e.g. cap bank, inductor bank, SVC, STATCOM, etc.). We need to find out how shunt device outages can (or could in the future) be automatically included in the ACCC routine. We interpret that if each stage of a capacitor bank has a circuit switcher, then the outage would be of the largest cap bank stage.?</p> <p>Extreme Event Evaluation Requirements? 3 Extreme Event Descriptions? 2b & 3b - We agree with the descriptions, but suggest referring to the defined term: "Right-of-Way".?</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Note 4 - We agree with the description, but the acronym FACTS should be explained in the standard or a definition be added for "FACTS". Table 2 Header: We suggest that the header be repeated on every applicable page to be more reader-friendly. Other numbering and format changes suggested for Table 1 should also be considered for Table 2.</p>
<p>Response: A. The SDT agrees and has removed the need for documentation of the technical rationale for modification of any data.</p> <p>B Requirement R2.5 and its sub-requirements have been removed from the proposed standard. Guidelines for the use of past studies to support the Planning Assessment have been added to what is now Requirement R2.5.2. The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general. It is up to the Transmission Planner and Planning Coordinator to provide specificity as to what type of topology changes constitutes a change sufficient to warrant re-evaluation.</p> <p>R2.5 For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study <u>present System model</u> shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p> <p>C The SDT does not agree that studies are required for every year of the Assessment period. However, please note that Requirement R2.5 and its sub-requirements have been removed from the proposed standard. Guidelines for the use of past studies to support the Planning Assessment have been added to what is now Requirement R2.5.2. The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general. It is up to the Transmission Planner and Planning Coordinator to provide specificity as to what type of topology changes constitutes a change sufficient to warrant re-evaluation.</p> <p>D The SDT has retained this requirement and believes that this information should be included in the Planning Assessment.</p> <p>E To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been removed from the draft.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>F The SDT has deleted Requirement R3.3.2 and has replaced it with additional language in Requirement R3.1 which will hopefully clarify things.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady State Performance. <u>based on the lists created in Requirement R3.4.</u></p> <p>G. The SDT disagrees with your comment. The SDT believes that this language is needed to ensure that the worst possible situation is studied based on engineering judgment and knowledge of the System.</p> <p>H. To address industry comments such as yours, Generating Unit Stability is no longer explicitly addressed in the standard and the definitions of Consequential and Non-Consequential Load Loss have been modified.</p> <p>Consequential Load Loss: Load that is no longer connected to a source as a result of the event being studied or which is lost as a result of the load's response to the transient conditions of the event (other than through the action of UVLS or UFLS schemes).— Although Load which is lost as a result of the Load's</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>response to the transient conditions of the event is considered Consequential Load Loss and is permitted when Consequential Load Loss is allowed, Transmission planning entities are not allowed to rely upon the expectation of such Load loss to meet steady state performance requirements. All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, <u>Supplemental Load Loss, and Load Reduction.</u> For example, non-Interruptible Load loss that occurs through manual (operator initiated) or automatic operations such as under-voltage Load shedding, under-frequency Load shedding, or Special Protection Systems would be considered Non-Consequential Load Loss.</p> <p>I. The SDT has changed the definition for Year One to accommodate industry concerns.</p> <p>Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the completion of the previous annual Planning Assessment <u>current calendar year.</u></p> <p>In response to industry comments, the SDT has removed Requirements R9-R14.</p> <p>R2.1 – The SDT has received many comments regarding the increased planning requirements to meet the proposed standard. However, the SDT believes that the requirements for sensitivity studies must remain to satisfy FERC Order 693. FERC has stated that the sensitivity studies would be used to document the selection of critical System conditions and study years used in assessing System conditions (see paragraph 1704) and that System conditions are as important as Contingencies in evaluating the performance of present and future Systems (paragraph 1705).</p> <p>R2.7.1 (now R2.6.1) – The SDT agrees and had replaced "schemes" with "systems".</p> <p style="padding-left: 40px;"><u>Installation or modification of Protection Systems or Special Protection Systems</u></p> <p>R2.7.1.1 (now R2.6.2) - The SDT believes that a project initiation date is an effective measure to track a functional entity's planning and engineering activities and its efforts to provide and maintain a reliable BES.</p> <p>R3.3.2.1 - To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p>R3.3.2.2 - Based on your comment, the SDT has addressed the applicable time-limited rating in what was Header note 'a' for Steady State Only in Table 1 - Steady State & Stability Performance. Requirement R3.3.2.2 has been deleted in favor of Header note 'e' in the revised Table. Please note that the two tables in the second draft have been reduced to one table in the third draft.</p> <p>Header note 'e' - <u>For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p>R5.4.3.1 - The SDT has deleted Requirement R5.4.3.1.</p> <p>Headers - The SDT also feels that the Tables need to be as clear and concise as possible. To that end, Tables 1 and 2 have been combined into one table with</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>a revised format. The Planning Events are shown on one page so repeating the headings will not be needed.</p> <p>Superscripts – As part of the change to a single table, the SDT has attempted to clean up various items such as superscripts.</p> <p>Shunt device - The SDT believes that shunt devices are commonly used in the electric utility industry and does not require any further explanation. The SDT recommends contacting the software manufacturer for additional information about the ACCC routine. The SDT believes that the cap bank outage would be based on what elements would need to trip in order to clear the simulated fault condition.</p> <p>Extreme Events - The SDT agrees with your comments and has made the change. The SDT has removed item 3.b. from Extreme Events since this was already covered in Extreme Event 1.</p> <p>Extreme Event 2b - Loss of all Transmission lines on a common RRight-of-wWay.</p> <p>Note 4 - The SDT believes that "FACTS" is commonly used in the electric utility industry and does not require any further explanation.</p>
<p>SERC Dynamics Review Subcommittee</p>	<p>B — Unsure about supporting the revised standard</p>	<p>SERC is in category BA ? Generally support the revised standard ? B ? Unsure about supporting the revised standard ? See three specific concerns below C ? Definitely do not support the revised standard ?</p> <p>1) Load Modeling is a significant open issue. The models for dynamic studies have yet to be developed and the data is not in hand. This is conflicting with implementation of the TPL standards because modeling details are a gating item to completing some system studies.</p> <p>2) The proposed sensitivities create significant amount of additional work making the compliance aspect more burdensome and less clear.</p> <p>3) Category P6 is the loss of a system element, following system adjustments, followed by the loss of another element. The table columns for this category say that interruption of firm transmission service is allowed. The table, however, is not clear whether the interruption of firm service is allowed as part of the system adjustment (between the outages) or whether it is only allowed after the second outage. It was stated in the NERC TPL SDT WebEx that the interruption is not allowed as part of the system adjustment. If this is the interpretation, this will cause many SERC members to not support the revised standard. This would be a dramatic change from the existing standard and would result in the unintended consequence of significantly reducing transfer capability of interfaces to a fraction of their currently reported capability. This would in effect be imposing an n-2 criteria for offering firm transmission service. This would not be an acceptable situation for the users, owners and operators of the bulk power system.</p>
<p>Response: 1. The SDT agrees and believes that industry guidance is needed to capture the appropriate dynamic behavior of Loads. In response to comments from you and others in the industry, the SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments. Any comments received from the industry on MOD standards will be forwarded to NERC for inclusion into NERC Reliability Standards Development Projects 2010-04, Modeling Data and 2010-05, Demand Data. Requirement R2.4.1 has been modified</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>to clarify expectations regarding load modeling for dynamics studies.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data <u>consistent with the data</u> provided in <u>accordance with Requirements R9 through R14</u>, the MOD-010 and MOD-012 standards, and other data sources, <u>and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. <u>An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable.</u></p> <p>2. The intent of the SDT in requiring performance of sensitivity studies is to identify critical System conditions and to expand planners' portfolio of knowledge about vulnerabilities on their System. This is also an expectation from FERC Order 693 paragraphs 1704 - 1706. Requirement R2.1.3 has been reworded to account for sensitivity studies already performed by the planner.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to</u> stress the System with sensitivities variations that reflect in one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>3. The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in the Revision 3 of the Standard provides clarification.</p> <p>Footnote #10 – <u>Curtailement of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>
MRO NERC Standards Review Subcommittee	C — Definitely do not support the revised standard	<p>While the MRO commends the SDT for significantly improving the standard, the MRO believes that the standard still must be improved significantly. Here are some suggestions for improvement:</p> <p>a. R1.1 is not clear. What does this mean? Surely the SDT does not expect that any time the data is modified a rationale is required. Shouldn't this data be updated as necessary? Wouldn't a requirement for providing a rationale each time such changes are made potentially discourage improvements to the models? This requirement should be clarified and limited to a few specific cases that were there are real reliability concerns.</p> <p>b. R2.5.2 - the SDT should revise the material transmission system changes. Addition of a new substation in one of the transmission lines connected to the plant should be revised to specifically refer to a switching station or to a non-distribution substation. A substation directly serving load is not a good example of a material transmission system change in the context of Generation Unit Stability studies.</p> <p>c. R2.6.2 - The SDT should revise the material transmission system changes because as presently defined, studies will</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>need to be conducted every year for every year in the assessment period. This is because apparently the SDT has defined any system change as a material change. Since it is rare for there to be a system that does not exhibit some system change from year to year, this will mean ten-year and more studies every year. The MRO recommends that the SDT revise this requirement to make clear that only significant system changes are material changes.</p> <p>d. R2.7.1 - The SDT has written this requirement to include a requirement that the responsible entity must indicate how long Operating Procedures apply. This implies that Operating Procedures should be interim measures. The MRO believes that reliability can be maintained with permanent Operating Procedures and recommends that the need to indicate "how long the Operating Procedures will be needed" be deleted from this requirement.</p> <p>e. R3.3.2.1 - The SDT should delete the need to provide the expected duration of the Consequential Load Loss in this requirement because this requirements a probabilistic calculation and probabilistic planning is not the state-of-the art of the industry. This is reflected in the standard which has been written to continue deterministic planning criteria. As a result, it is a contradiction to require this probabilistic quantity in the middle of this deterministic planning standard.</p> <p>f. R3.3.2.2 - clarify that the single contingency events are the events in the table.</p> <p>g. R3.4 and R5.4.4 - the MRO urges that the SDT delete or revise the words "why the remaining Contingencies would produce less severe System results." Given the expansive nature of the Extreme events it is virtually impossible to comply with this requirement. It is more likely that the responsible entity could show that the more likely and more severe Extreme events were studied. It would be better yet if the SDT would merely require that the responsible entity provide the rationale for the selection of Extreme Events that were studied.</p> <p>h. R5.5.1 provides an exclusion for changes in individual generating units that require study. Yet R2.6.2 has a broader definition of when Generating Plant Stability is required. These definitions need to be consistent. The definition in R5.5.1 seems to narrow to be a good definition for "material changes." The MRO believes that the R5.5.1 should be expanded.</p> <p>i. Year One definition - The MRO suggests that the Standards Drafting Team's (SDT's) Year One definition unnecessarily constrains the time between the completion of assessments as compared to the study period to begin no more or no less than 12 to 18 months. There are no reliability benefits derived by constraining the period between the completion of an assessment and the study period for the next study period. In fact, this may encourage a Transmission Planner to unnecessarily delay "completing" a study just to ensure that the 12 to 18 month requirement is met. For example, let's assume that a Transmission Planner's 2008 Assessment is complete as of May 2008. By the definition of Year One, then the study period for the 2009 Assessment will need to begin from May 2009 through November 2009. This means that the 2009 Assessment must include the 2009-2010 Winter Peak and cannot start with the 2010 Calendar Year. Why? If a Transmission Planner wants to have a study period that begins with the calendar year, then the Transmission Planner would need to delay completing the study until July 2009. Why? What are the reliability benefits for delay? The MRO suggests that the definition of Year One be changed to allow the study period to begin no later than 24 months after the completion of the previous year's study.? Definitions: The MRO agrees with the removal of the "Base Case" definition and</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>the revisions to the other definitions, except as noted below or elsewhere.? Long Term Planning Horizon definition: The MRO suggests a slight text change of: "Transmission planning period that covers years six through ten. Studies beyond ten years are required to accommodate . . .".?</p> <p>Accountability: The MRO suggests that Transmission Service Provider be added because we also suggest that the Transmission Service Provider be responsible for R10.?</p> <p>Requirements: The MRO agrees with the revisions to the Requirements, except as noted below or elsewhere.?</p> <p>R1.1 - The MRO agrees with the requirement, but would like more description of what to provide in the technical rationale.?</p> <p>R2.1 - The MRO suggests that this requirement involves too much study work and we ask that the SDT reduce the number of current studies needed for all subrequirements. ?</p> <p>R2.6.2 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . short circuit, Generating Unit Stability or System Stability analysis . . .".?</p> <p>R2.7 - The MRO agrees with the requirement, as long as it is really required by FERC Order 693 paragraph 1704.?</p> <p>R2.7.1 - The MRO agrees with the requirement, but suggest a slight text change replace "? or Special Protection Schemes,?" with ". . . or Special Protection Systems, . . .".?</p> <p>R2.7.1.1 - The MRO disagrees with the "include project initiation date" portion of this requirement. The initiation date is often uncertain and subject to change, which may add considerable work to investigate, monitor and update the date. In addition, we do not know why this information is required to assure BES reliability.?</p> <p>R2.7.2 - The MRO agrees with the requirement, as long as it is really required by FERC Order 693 paragraph 1704.?</p> <p>R3.2.2 - The MRO agrees with the requirement, but suggest a slight text change of: "For all BES Transmission lines . . .". ?</p> <p>R3.3.2.1 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . shall be allowed in the Planning Assessment".?</p> <p>R3.3.2.2 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . within their Facility Ratings and within the time period allowed by the applicable time limited ratings.".?</p> <p>R5.1 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . the response of the applicable portion of the BES".?</p> <p>R5.2 - This clarifying requirement should also be included in the steady state and short circuit analysis sections.?</p> <p>R5.3 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . capability of all generators that may have a significant adverse effect on the BES."?</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>R5.4.3.1 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . within their Facility Ratings and within the time period allowed by the applicable time limited ratings."?</p> <p>R6 - The MRO agrees with the requirement, but suggest a slight text change of: ". . . shall provide the rationale for and document . . .".?</p> <p>R8 - The MRO disagrees with the requirement, but suggest a text change of: "Each Planning Coordinator shall establish a list of neighboring system and coordinate the distribution of Planning Assessment results among affected entities the listed neighboring systems, coordinating analysis of these results through an open and transparent peer review process."?</p> <p>Table 1? Planning Events ? Header: The MRO suggests that the header be repeated on every applicable page to be more reader-friendly.?</p> <p>Superscripts: The superscripts do not refer clearly to the respective notes (e.g. there are number notes in the beginning of the table, in the extreme events evaluation requirements section, in extreme event description section, and at the end of the table). Perhaps the notes at the end of the table should have unique numbering to make the superscript references clearer.?</p> <p>Shunt device: To avoid the need for future interpretation or clarification, we suggest that the meaning of shunt device be explained or defined somewhere in the standard (e.g. cap bank, inductor bank, SVC, STATCOM, etc.). We need to find out how shunt device outages can (or could in the future) be automatically included in the ACCC routine. We interpret that if each stage of a capacitor bank has a circuit switcher, then the outage would be of the largest cap bank stage.?</p> <p>P2.2 (>300 kV), P2.3(>300 kV), P3 (>300 kV), P4 (>300 kV), P5 (>300 kV), P6 (>300 kV) - This requirement is raising the bar above the existing standards. In the existing standards, this is a Category C event in which load shedding was allowed. A higher criteria for >300 kV may not be appropriate at this time. The new requirement may require the installation of facilities that are costly and have a very long implementation timeframe. We should consider what the cost of this higher requirement might be for ATC and other utilities. If the new >300 kV requirement is not reduced, then we would want the implementation timeframe to be long enough to allow reasonable time to transition from a system built to the old requirement to a system built for the new requirement. The time needed for planning, design engineering, regulatory approvals, and construction of >300 kV facilities can be very long (e.g. up to 10 or more years).?</p> <p>P6 - Why isn't the generator listed as a one of the possible subsequent element outages??</p> <p>P7 - The MRO disagrees with this requirement. Wisconsin statues require giving preference to using existing ROW for new transmission circuits, but this requirement discourages building multiple circuits on common ROW. Should there be an exclusion in this standard similar to the TLP-503-MRO-1 standard (e.g. could be slightly more than 1 mile due to review)?.?</p> <p>Extreme Event Evaluation Requirements? 2 - The MRO agrees with the requirement, but perhaps a definition be added for "System Controls", since one exists for "System Protection".?</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>3 - The MRO agrees with the requirement, but suggest a slight text change of: "Simulate Normal Clearing unless otherwise specified in the Extreme Event Descriptions."?</p> <p>Extreme Event Descriptions? 2a - The MRO agrees with the description, but suggest a slight text change of: "Loss of a structure or tower line with three or more circuits.."? </p> <p>2b & 3b - The MRO agrees with the descriptions, but suggest referring to the defined term: "Right-of-Way."?</p> <p>2e, 3.a.i, & 3.a.ii - The MRO agrees with the descriptions, but how large is "large" and how major is "major"??</p> <p>3.a.v - What is meant by successful cyber attack? Is it a type of cyber attack that is documented to have been successful? ?</p> <p>3c - The MRO agrees with the description, but suggest a slight text change of: "Other events based upon actual operating experience such as:" ?</p> <p>Note 4 - The MRO agrees with the description, but the acronym FACTS should be explained in the standard or a definition be added for "FACTS".?</p> <p>Table 2? 1 - The MRO disagrees with this note. We suggest that it be expanded to include the applicable part as Table 1. "The System shall remain stable. In addition, Facility Equipment Ratings shall not be exceeded. Planned System adjustments are allowed, unless precluded in the Requirements, to keep Facilities within the Facility Ratings, if such adjustments are executable within the time duration applicable to the Facility Ratings."?</p> <p>3 - The MRO disagrees with this note. We suggest that it be expanded to include the applicable part as Table 1. "Dynamic voltage instability, Cascading outages, and uncontrolled islanding shall not occur."?</p> <p>Between 3 & 4 - The MRO disagrees with omitting Note 4 of Table 1 from Table 2. We suggest including: "Consequential Load and consequential generation loss is allowed for all events shown."?</p> <p>Planning Events? Same comments on Header, Superscripts, and Shunt Device as in Table 1.?</p> <p>Same comments about stricter requirements for P2.2 (>300 kV), P2.3(>300 kV), P3 (>300 kV), P4 (>300 kV), P5 (>300 kV), P6 (>300 kV) as in Table 1.?</p> <p>Same comment about P7 as in Table 1.? Extreme Event Evaluation Requirements?</p> <p>Same comment about Requirement 2 and 3 as in Table 1.?</p> <p>3 - The MRO agrees with the requirement, but suggest a slight text change of: "Simulate Normal Clearing unless otherwise specified in the Extreme Event Descriptions."?</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		Notes5 - The MRO disagrees with limiting this requirement to just Category P1 category. We suggest that the synchronism requirement be applied to more categories.
<p>Response: A. The SDT agrees and has removed the need for documentation of the technical rationale for modification of any data.</p> <p>B Requirement R2.5 and its sub-requirements have been removed from the proposed standard. Guidelines for the use of past studies to support the Planning Assessment have been added to Requirement R2.6.2 (now R2.5.2). The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general. It is up to the Transmission Planner and Planning Coordinator to provide specificity as to what type of topology changes constitutes a change sufficient to warrant re-evaluation.</p> <p>R2.5 For steady state, short circuit, Generating Plant Stability, or System-Stability analysis: the study <u>present System model</u> shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p> <p>C The SDT does not agree that studies are required for every year of the Assessment period. However, please note that Requirement R2.5 and its sub-requirements have been removed from the proposed standard. Guidelines for the use of past studies to support the Planning Assessment have been added to what is now Requirement R2.5.2. The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general. It is up to the Transmission Planner and Planning Coordinator to provide specificity as to what type of topology changes constitutes a change sufficient to warrant re-evaluation.</p> <p>D The SDT has retained this requirement and believes that this information should be included in the Planning Assessment.</p> <p>E To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been removed from the draft.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>F The SDT has deleted Requirement R3.3.2 and has replaced it with additional language in Requirement R3.1 while adding Header note 'e' and deleting the reference to single Contingencies which will hopefully clarify things.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady State Performance. <u>based on the lists created in Requirement R3.4.</u></p> <p>Header note 'e' - <u>For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p>G. The SDT disagrees with your comment. The SDT believes that this language is needed to ensure that the worst possible situation is studied based on engineering judgment and knowledge of the System.</p> <p>H. To address industry comments such as yours, Generating Unit Stability is no longer explicitly addressed in the standard and the definitions of Consequential</p>		

Organization	Question 15:	Question 15 Comments:
		<p>and Non-Consequential Load Loss have been modified.</p> <p>Consequential Load Loss: Load that is no longer connected to a source as a result of the event being studied or which is lost as a result of the load's response to the transient conditions of the event (other than through the action of UVLS or UFLS schemes). Although Load which is lost as a result of the Load's response to the transient conditions of the event is considered Consequential Load Loss and is permitted when Consequential Load Loss is allowed, Transmission planning entities are not allowed to rely upon the expectation of such Load loss to meet steady state performance requirements. All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. For example, non-Interruptible Load loss that occurs through manual (operator initiated) or automatic operations such as under-voltage Load shedding, under-frequency Load shedding, or Special Protection Systems would be considered Non-Consequential Load Loss.</p> <p>I. The SDT has changed the definition for Year One to accommodate industry concerns.</p> <p>Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the completion of the previous annual Planning Assessment <u>current calendar year</u>.</p> <p>Accountability - In response to industry comments, the SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data <u>consistent with the data</u> provided in <u>accordance with</u> Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, <u>and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>R1.1 – The SDT agrees and has removed the need for documentation of the technical rationale for modification of any data.</p> <p>R2.1 – The SDT has received many comments regarding the increased planning requirements to meet the proposed standard. However, the SDT believes that the requirements for sensitivity studies must remain to satisfy FERC Order 693. FERC has stated that the sensitivity studies would be used to document the selection of critical System conditions and study years used in assessing System conditions (see paragraph 1704) and that System conditions are as important as Contingencies in evaluating the performance of present and future Systems (paragraph 1705).</p> <p>R2.6.2 – Based on comments from others, the SDT has removed the requirements for separate Generating Unit Stability analysis and System Stability analysis.</p> <p>R2.7.1 (now R2.6.1) – The SDT agrees and had replaced "schemes" with "systems".</p> <p style="padding-left: 40px;"><u>Installation or modification of Protection Systems or Special Protection Systems</u></p> <p>R2.7.1.1 (now 2.6.2) - The SDT believes that a project initiation date is an effective measure to track a functional entities' planning and engineering activities and their efforts to provide and maintain a reliable BES.</p> <p>R2.7.2 – The old Requirement R2.7.2 has been deleted.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>R3.2.2 – The Purpose section of the Standard states that this Standard is to develop requirements for the Bulk Electric System, BES.</p> <p>R3.3.2.1 - To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p>R3.3.2.2 - Based on your comment, the SDT has addressed the applicable time-limited rating in what was Header note 'a' for Steady State Only in Table 1 - Steady State & Stability Performance. Requirement R3.3.2.2 has been deleted in favor of Header note 'e' in the revised Table. Please note that the two tables in the second draft have been reduced to one table in the third draft.</p> <p><u>Header note 'e' - For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p>R5.1 & R5.2 (now R4.1 and R4.2) – Most of the industry did not have difficulty understanding that the analysis is limited to the Transmission Planner's or Planning Coordinator's portion of the BES. Therefore, the SDT is not persuaded by your comment to add extra wording.</p> <p>R5.3 (now R4.3) – The SDT disagrees with the suggested change due to the additional studies that would be required to determine which generators would have an adverse impact.</p> <p>R5.4.3.1 - The SDT has deleted Requirement R5.4.3.1.</p> <p>R6 – The SDT believes "define and document" as written are more appropriate than "rationale for and document". The SDT did not revise Requirement R6 (now R5) as proposed – but did make other modifications to this requirement based on other stakeholder comments..</p> <p>R8 – The SDT has clarified this in a revised Requirement R7.</p> <p><u>R7 Each Planning Coordinator shall coordinate the distribution of Planning Assessment results among neighboring systems adjacent Planning Coordinators and any functional entity who has indicated a reliability need</u>, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890.</p> <p>Headers - The SDT also feels that the Tables need to be as clear and concise as possible. To that end, Tables 1 and 2 have been combined into one table with a revised format. The headings are repeated on subsequent pages.</p> <p>Superscripts – As part of the change to a single table, the SDT has attempted to clean up various items such as superscripts.</p> <p>Shunt device - The SDT believes that shunt devices are commonly used in the electric utility industry and does not require any further explanation. The SDT recommends contacting the software manufacturer for additional information about the ACCC routine. The SDT believes that the cap bank outage would be based on what elements would need to trip in order to clear the simulated fault condition.</p> <p>P2.2 – The majority of the SDT believed the 300 kV and higher Systems (EHV) generally represent the backbone of many Systems in the various Interconnections and that the more stringent requirements were appropriate when considering N-1-1 Contingencies of two EHV Facilities. Systems operated above 300 kV generally do not directly serve end-use Load customers but rather act as the medium for moving large amounts of power from production to various Load centers where the energy is then delivered by other Transmission or sub-Transmission Systems to end use customers. It is the desire of NERC</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>and various stakeholders that the backbone of the electric power grid be robust and held to a higher degree of reliability. The Implementation Plan will address any need for transition and will be included in the next revision.</p> <p>P6 – This is already covered in P3.</p> <p>P7 – The SDT is cognizant of the concerns surrounding the construction of new Transmission lines, including the desire by many to fully utilize existing Right-of-Ways. In its consideration of Footnote 12 (exclusion for common structures less than 1 mile), the SDT considered the impact that this requirement could have on construction of new Facilities. However, after deliberations the SDT believes that the 1 mile exclusion should be maintained for the reliability of the BES and that individual exceptions can be addressed within the NERC process.</p> <p>Extreme Events 2 - The SDT agrees that "Protection System" is defined in the Glossary of Terms Used In Reliability Standards. However, the SDT believes that these "System Control" issues should be addressed by the NERC SPCTF drafting team.</p> <p>Extreme Events 3 – The SDT has already included "For all Extreme Events Evaluated" at the beginning of the Evaluation Requirements under Extreme Events.</p> <p>Extreme Events 2a – The SDT believes that the Extreme Events #2.a. is already sufficient.</p> <p>Extreme Events 2b & 3b - The SDT agrees with your comments and has made the change. The SDT has removed item 3.b. from Extreme Events since this was already covered in Extreme Event 1.</p> <p>Extreme Event 2b - Loss of all Transmission lines on a common fRight-of-wWay.</p> <p>Extreme Event 2e – The SDT suggests that the terms "large", "major", and "successful" be defined between the TP and PC.</p> <p>Extreme Event 3a – A successful cyber attack would be any attack where an unauthorized person gained access to the systems described in the event.</p> <p>Extreme Event 3c – The SDT believes that the wording of 3b (was 3c) is already sufficient.</p> <p>Note 4 - The SDT believes that "FACTS" is commonly used in the electric utility industry and does not require any further explanation.</p> <p>Tables 2 – As part of the 3rd draft of the revised standard, the 2 tables have been merged into a single table and a general clean-up of the text has been made.</p> <p>Table 2, note 1 – The SDT has reviewed your comment and feels that your request to add "Facility Equipment Ratings shall not be exceeded. Planned System adjustments are allowed, unless precluded in the Requirements, to keep Facilities within the Facility Ratings, if such adjustments are executable within the time duration applicable to the Facility Ratings." apply to Stability is not appropriate. For the purposes of this standard, Facility Equipment ratings refer to steady state calculated values and planned System adjustments refer to the time frame associated with returning the thermal flow within the applicable steady state Facility Rating.</p> <p>Table 2, note 3 – The SDT agrees with your comment on making general note 3, located at the beginning of Table 1, "Voltage instability, cascading outages, and uncontrolled islanding shall not occur" applicable to both Steady State and Stability and has made that change in the next version.</p> <p>Note 4 – The SDT also agrees that the general note 4, at the beginning of Table 1, applicable to both Steady State and Stability and has made that change in the next version.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>Note 3 – The SDT has already included "For all Extreme Events Evaluated" at the beginning of the Evaluation Requirements under Extreme Events.</p> <p>Note 5 – The SDT also feels that the synchronism requirement should apply to more than just the P1 Category but under certain conditions. As stated in Note 1.a.ii, for planning events other than P1, no generating unit or units totaling more than the Contingency reserve of the Balancing Authority shall be allowed to pull out of synchronism. If less than the Contingency reserve, then the resulting apparent impedance swings must not pass through relay characteristics that would result in the tripping of any Transmission System elements other than the generating unit and its direct connection Facilities</p>		
<p>Modesto Irrigation District</p>	<p>B — Unsure about supporting the revised standard</p>	<p>Concerns about the following: attempt to introduce interconnection stability studies into TPL studies, and redefinition of Consequential and Non-Consequential Load Loss.</p>
<p>Response: The SDT believes that there is no significant distinction between generator and System Stability and has modified the definitions and Requirements R2, R2.6.1 (now R2.5.1), R2.6.2 (now R2.5.2), R5 (now R4), and R5.5 (now R4.4) in the third draft.</p> <p>R2 Each Transmission Planner and Planning Coordinator shall conduct and document the results of <u>prepare its an</u> annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, <u>document assumptions, document results,</u> and shall cover steady state analyses, short circuit analyses, and Stability analyses including both System and Generating Unit Stability.</p> <p>R2.5.1 For steady state, short circuit, or System Stability analysis: the study shall be five calendar years old or less.</p> <p>R2.5.2 For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study present <u>System model</u> shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p> <p>R4. For the Stability portion of the Planning Assessment, as described in Requirement R2.4 and Requirement R2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table <u>21 – Stability Performance.</u> <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u> The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted.</p> <p>R4.4 At a minimum, <u>Those</u> Planning Event Contingencies in Table <u>21 – Stability Performance</u> that would <u>are expected to</u> produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be</u> evaluated for System performance <u>in Requirement R4.1 created,</u> and <u>and</u> the rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results.</p> <p>In response to numerous concerns, the following changes were made to the draft standard regarding Consequential and Non-Consequential Load Loss</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>definitions.</p> <p>Consequential Load Loss: Load that is no longer connected to a source as a result of the event being studied or which is lost as a result of the load's response to the transient conditions of the event (other than through the action of UVLS or UFLS schemes). Although Load which is lost as a result of the Load's response to the transient conditions of the event is considered Consequential Load Loss and is permitted when Consequential Load Loss is allowed, Transmission planning entities are not allowed to rely upon the expectation of such Load loss to meet steady state performance requirements. All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.</p> <p>Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. For example, non-Interruptible Load loss that occurs through manual (operator initiated) or automatic operations such as under-voltage Load shedding, under-frequency Load shedding, or Special Protection Systems would be considered Non-Consequential Load Loss.</p>
<p>Arkansas Electric Coop. Corp.</p>	<p>B — Unsure about supporting the revised standard</p>	<p>I have a growing concern that the NERC Reliability Standards are not going far enough to ensure adequate and reliable service to customers and users of the BES. Each revision of the standards seem to be driven by the need to preserve the integrity of the grid and preventing cascading blackouts but stop short of ensuring that load continues to be served under contingency conditions and adequate grid capacity is available. For the customers and end users of the system if their load is allowed to be dropped or can not be served because of the lack of capacity then the BES is not reliable. The definitions of Consequential Load Loss and Non-Consequential Load Loss concern me the most. How these definitions are then applied in the tables is also a great concern. Hopefully my previous comments to the other questions in the comment form provide explanation.</p> <p>Another concern I have is the fact that I tried to provide comments last fall to draft 1 of the standards and they were not allowed. After following the instructions provided I provided my comments before the deadline. I later discovered they were not posted. After repeated attempts asking NERC to determine why my comments were not received and posted and showing evidence that they had been provided by the deadline, the only response I received was pretty much "sorry Charlie". Mistakes happen. NERC should be big enough to admit when they make a mistake instead of just blowing them off. I have no way of knowing if or how many times this may have happened before. I am not trying to say that anything malicious was intended, however it does leaves me with concern that fair treatment is being given to all comments and cast a shadow over confidence in the standards approval process.</p>
		<p>Response: The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT believes that your concerns are mostly addressed by the revised Table 1 - Steady State and Stability Performance, along with the revised definitions of Non-Consequential Load Loss and Consequential Load Loss in the updated draft of TPL-001 standard.</p> <p>Consequential Load Loss: Load that is no longer connected to a source as a result of the event being studied or which is lost as a result of the load's response to the transient conditions of the event (other than through the action of UVLS or UFLS schemes). Although Load which is lost as a result of the Load's response to the transient conditions of the event is considered Consequential Load Loss and is permitted when Consequential Load Loss is allowed,</p>

Midwest ISO	C — Definitely do not support the revised standard	<p>We appreciate the hard work of the SDT and understand the difficulty of this task. We applaud the efforts to improve the standard. However, in its present state, in general the revised standard fails in one if its primary stated goals: create a "clear and concise standard". While some of the ideas are an improvement, overall the standard is very meandering and it makes it difficult to figure out what the requirements are for a particular analysis type without flipping back and forth between the scattered requirements. For example R2 addresses various aspects of both Near and long term studies, steady state, short circuit, stability, on peak, off peak and other topics. Then there are separate sections (R3, 4, 5) that speak to the various analysis types again. It probably makes sense to the SDT that has evolved with the drafts and discussions, but when you pick it up it is very confusing. One thing that would help greatly would be to label the major Requirements sections to convey the organization of the document. If the SDT made a topical outline of the standard by major Requirement this could help the team organize the standard better. Resulting topical headers may look something like the following for example, R1: ModelingR2: Study Types and Assessment RequirementsR3: Steady State Analysis MethodsR4: Short Circuit Analysis MethodsR5: Stability Analysis Methods Etc. If it has not been done (and it looks like it has not), the SDT should consider having the language reviewed by the NERC or other legal team. Language that seems clear to experienced engineers may not be precise as is critical for standards that carry monetary penalties. An independent review by a non-engineer lawyer would help greatly. Of course, the SDT would then have to undo some damage that would undoubtedly be done to context by the lawyers - but the pass through legal would be a good step.??</p> <p>Other concerns:? P5 requires testing for a single component failure within a Protection System. What is this referencing? How can a PC/TP be expected to be intricately aware of protection systems and effects of single component failures?</p> <p>Under 2.7.2, there is a generic requirement to expand a list of possible corrective actions under 2.7.1 for any sensitivities under R2.1.3, 2.1.4, 2.4.3 and 2.4.4. This is very open ended and subject to interpretation. How can an auditor review such requirements with consistency?</p>
<p>Response: The SDT has attempted to make the latest draft more clear and concise - such as condensing Table 1 and 2 into a single table. The SDT has considered having headers/labels in the document and these are strongly discouraged by NERC's legal staff. The overall format of the tables has been modified to make it more reader friendly.</p> <p>NERC is following the officially sanctioned standards development process with regard to this project just as it follows the process for all standards development</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>work. This is an open, transparent process which has been approved by FERC. Review and comment by any entity's legal staff is welcome, but not a required part of the process.</p> <p>The description of the P5 event has been clarified in draft 3 to address your concern.</p> <p>Requirement R2.7.2 has been removed. The SDT has modified Requirement R2.7 (now R2.6) to clarify that Correction Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3.</p> <p>R2.6 For Planning Events shown in Table 1—Steady State Performance and Table 2—Stability Performance, when the analysis indicates an inability of the System to meet the performance requirements in the Tables 1, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities <u>run in accordance with Requirements R2.1.3 and R2.4.3</u>. The Corrective Action Plan shall:</p>
<p>Tri-State Generation and Transmission Association, Inc.</p>	<p>A — Generally support the revised standard</p>	<p>We appreciate the efforts of the SDT, considering the difficulty of the task that was and is before them. Our biggest concern is potential confusion regarding sensitivity studies.</p> <p>Secondly, we absolutely must make the Performance Table completely clear and concise. Additional work now will pay big dividends later.</p> <p>Thirdly, there is some ambiguity of several terms used in the Standard that prevents exact interpretation of significant portions of the Standard.</p> <p>Here are a few additional comments we hope the SDT will find helpful: It may simplify considerations of assessments and modeling work to define "assessment" as including written documentation. Then the Standard would not need to separately include "and shall include written documentation" in the body of the standard titles. Also, the SDT should make it clear that "assessment" is what is required; that annual re-study analysis may not necessarily be required. Thanks to the SDT for keeping this feature. It will greatly simplify our work, and should speed the audit process as well.</p> <p>There seems to be some ambiguity between either 1) requiring specific years to be studied and 2) leaving timeframe selection to the TP. Assessment for year One or Two (R2.1.1) may be performed by either the TOP or the TP. Studies of year One or year Two are generally considered to be operating studies and should probably not be required in TPL-001-1. Also in R2.1.1, year Five is specified as a required study year. No matter what the requirement says, the TP will need to assess performance for critical timeframes. This would lead to additional study if year four were the critical year for example. And for sensitivity studies of delayed facilities (R2.1.3.3) additional study years might be required. Perhaps a reasonable compromise would be to require something in the 2 to 5-year timeframe, and something in the 6 to 10-year timeframe. For coordination with regional study groups in our area, one would logically choose year 5 and year 10, but the specific choice should be up to the TP (and PC if any).</p> <p>Sole-Customers on radial service who are responsible for facility upgrades should be allowed to elect a lower reliability</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>than the rest of the system.</p> <p>It seems that operating scenarios required to be studied by TOP should not need study in the planning horizon by the TP, and should be excluded from this standard.</p> <p>Specific comments concerning other sections of the draft standard:</p> <ol style="list-style-type: none"> 1. In the definition of Generating Stability Study, we suggest "the lack of damping" be changed to "damping" 2. In R2.1 title, please move listed requirements in the second sentence to sub-requirements (they are already there). 3. In R2.1 title sentence, the term "annual current" presents two additional requirements. We suggest those words be deleted. 4. In R2.1, delete the end of the title sentence, ending the sentence with "the following studies" 5. In R2.1.3.2, the meaning of "transfer" is not clear. 6. In R2.1.3.4, the term "variability" is not clear. do you mean "Operating Capability"? 7. In R2.1, R2.2 and 2.4, the phrase "Near Term (or Long Term) Transmission Planning Horizon portion of the" could be omitted. "Near Term" and "Long Term" study horizons should just be specified as sub-requirements of Steady State, Stability, and Short Circuit 8. In R2.7.3, the term "identified System Facilities" is not clear. System Additions? 9. Heading R3.3 is not needed. Renumber section sub headings to 3.2.3, etc.
<p>Response: In response to industry comments regarding sensitivity studies, the SDT has made changes to Requirements R2.1.3 and R2.4.3 and each of their sub-requirements to clarify expectations related to sensitivity studies.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>The SDT also feels that the Tables need to be as clear and concise as possible. To that end, the next version will combine Tables 1 and 2 into one table with a revised format.</p> <p>The SDT crafted the definition of Planning Assessment using the term "documented" instead of "written" such that an assessment can be either in written or</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>electronic format. Requirement R2 states that the assessment is to be performed annually.</p> <p>The SDT chose the Year One definition such that this would be out of the operational planning horizon and into the planning horizon. The SDT chose the years to be studied such that both the Near-Term and Long-Term Planning Horizons would be adequately studied and has not seen a sufficient number of comments to warrant changing the requirements. .</p> <p>Sole-customers who are responsible for facility upgrades are allowed to elect lower reliability than the rest of the system if those customers have signed an Interruptible Load contract arrangement.</p> <p>The SDT believes that all significant probable Contingencies over a wide range of operating conditions should be studied.</p> <p>1. The definitions for both Generating Unit Stability Study and System Stability Study have both been removed and these Stability areas have been combined into just one Stability area.</p> <p>2, 3, and 4. The SDT disagrees with the proposed changes and believes that compliance with Requirement R2.1 can be shown through the use of both current and past studies.</p> <p>5. The SDT believes that "transfers" is generally understood to mean electric power that is transferred or moved from one area to another, and as such, has not added a definition of transfers.</p> <p>6. The SDT has revised the language to replace "variability" with reactive resources "capability".</p> <p style="text-align: center;">Variability and outages of rReactive resources <u>capability</u>.</p> <p>7. The SDT believes that the format and the language of these requirements are appropriate and no additional changes are needed.</p> <p>8.,The SDT received only a single comment regarding use of the terms "identified System Facilities" and therefore believes the proposed language is clear and appropriate. "Identified System Facilities" are those new or modified facilities which were identified in previous Corrective Action Plans.</p> <p>9. Requirement R3.3 has been removed and replaced with additional language in Requirement R3.1.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady State Performance. <u>based on the lists created in Requirement R3.5.</u></p>
Lakeland Electric	B — Unsure about supporting the revised standard	<p>Curtailing firm transmission should explicitly be a viable option when preparing for the next contingency if the previous contingency and a credible next contingency call for curtailing firm transactions for reliabilities sake. Not allowing for firm transmission curtailment in this case seems to be a market requirement driving a reliability requirement.</p> <p>Determining the duration of consequential load loss (R3.3.2.1) is impractical as the root cause of the event vice the defined event type (e.g. - loss of line) determines the duration of the outage. A line can be outaged by a temporary lock out of protection device or 15 spans of a line might be destroyed by fire. The difference between the two make determination of duration impractical.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>System peak Load (R2.1.1) needs to specify if it is the specific year, season or historical peak demand. Forecasting methodologies affect the system peak load that is projected. Differences between a 50/50 and 80/20 case will result in different forecast peak data.</p>
<p>Response: Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for Event P1. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted Interruptible Loads, in preparation for the next Contingency.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>To meet industry concern as well as FERC Order 693, the SDT has added Requirement R2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been removed from the draft.</p> <p><u>R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>The SDT intentionally provides flexibility for the Transmission Planner/Planning Coordinator to decide which Load forecasting methodology to use. The required studies and sensitivity analysis ensures that sufficient study is performed to cover an appropriate range of System conditions.</p>		
Southern Company Transmission	C — Definitely do not support the revised standard	<p>Category P6 is the loss of a system element, followed by system adjustments, followed by the loss of another element. The table columns for this category say that interruption of firm transmission service is allowed. The table, however, is not clear whether the interruption of firm service is allowed as part of the system adjustment (between the outages) or whether it is only allowed after the second outage. It was stated in the NERC TPL SDT WebEx (August 26, 2008) that the interruption is not allowed as part of the system adjustment. If this is the interpretation, this will cause Southern Company to not support the revised standard. This would be a dramatic change from the existing standard and would result in the unintended consequence of significantly reducing transmission system capability to accommodate firm transmission service including reduction of transfer capability of interfaces to a fraction of their currently reported capability. This would in effect be imposing an n-2 criteria for offering firm transmission service. This would not be an acceptable situation for the users, owners and operators of the bulk power system. In addition, the standard should clarify the accommodation of Conditional Firm Service as defined by FERC Order 890.</p>
<p>Response: The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>necessary. Footnote 10 in draft 3 of the Standard provides clarification.</p> <p>Footnote #10 – <u>Curtailed of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>
<p>Brazos Electric Power Cooperative, Inc.</p>	<p>C — Definitely do not support the revised standard</p>	<p>Our biggest concern is the apparent lack of experience or understanding in the repercussions of including so many required studies and detailed documentation. And to what end? The amount of data that would be required to be saved will be so voluminous no one could go through it all to make any meaningful determination in a timely fashion. It's one thing to study every possible combination of outage but you then have to do something with the results, not just record them somewhere because a standard requires it.</p> <p>On the other hand some progress is being made in removing some of the more ambiguous or useless items so we are getting there to some degree. Deleting 1.1.2, 1.1.3, 2.7.3, 2.7.4, and 5.4 are good starts. However it appears some things were added that are just confusing or are unnecessary.</p> <p>5.5.2 seems to simply restate the obvious intent of the section, to meet the performance requirements so its not really needed.</p> <p>Phrases such as "document why categories were NOT selected" are intuitively obvious. Categories were not selected because, in the judgment of the TP or PC, they were not deemed useful to study so why document this each time.</p> <p>R6 is also a confusing addition to this Standard and we aren't sure what it's intended to require. Use of the word "proxies" is probably not the best substitute for what was intended. We suggest R6 be deleted as well.</p>
<p>Response: The SDT has received many comments regarding the increased planning requirements to meet the proposed standard. However, the SDT believes that the requirements for sensitivity studies must remain to satisfy FERC Order 693. FERC has stated that the sensitivity studies would be used to document the selection of critical System conditions and study years used in assessing System conditions (see paragraph 1704) and that System conditions are as important as Contingencies in evaluating the performance of present and future Systems (paragraph 1705). Neither FERC, nor the SDT, believes that every possible combination outage needs to be analyzed for every System condition, but FERC expects those that produce the most severe reliability impacts should be documented (paragraph 1706).</p> <p>In response to industry comments, Requirement R5.5 has been deleted since Generating Unit Stability is no longer explicitly addressed in the standard.</p> <p>The SDT agrees and has deleted the phrase from Requirements R2.1.3 and R2.4.3.</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to</u> stress the System with sensitivities variations that reflect in one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>rationale for why each of the conditions was or was not selected shall be supplied included in the Assessment:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that are intended to stress the System with variations to reflect in one or more of the following conditions not already included in the studies shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied included in the Assessment:</p> <p>The industry did not seem to find usage of "proxies" in Requirement R6 (now R5) unclear or confusing. Therefore, the SDT has determined that no change to Requirement R6 is needed with regard to the use of proxies.</p>		
LCRA TSC	A — Generally support the revised standard	<p>LCRA had a comment on the first posting stating that the loss of any two Transmission circuits on a common structure should be viewed as a single contingency as a single component failure (tower, shield wire, conductor, hardware) could in fact lead to the loss of two circuits. In the second draft, this outage is still being viewed as a Multiple Contingency (P7). At the same time, the loss of a tower line with three or more circuits is being viewed as an Extreme Event, when the same single failure could lead to the loss of multiple circuits. So, even if a double circuit outage is viewed as a Multiple Contingency, shouldn't a multiple circuit outage be viewed the same.</p> <p>In the Definitions of Terms Used in Standard, Extreme Event is defined as Events which are more severe and have a lower probability of occurrence than Planning Events. What is a "lower probability of occurrence"? Is this to be determined by each TP or TO? How is this probability determined? Are we to assume from this definition that we can use probabilistic planning to determine which Events should be studied even at the N-1 level?</p>
<p>Response: The SDT does not believe that the loss of a tower line with three or more circuits is similar in probability to two circuits on a common structure. Therefore, it is appropriate to classify the events differently.</p> <p>The SDT views "lower probability of occurrence" events as those events that occur much less often than Planning Events. The SDT does not intend for this probability to be determined by each utility. The SDT desires that Extreme Events be studied - but do not necessarily have to have Corrective Action Plans.</p>		
NERC and Regional Coordination	C — Definitely do not support the revised standard	<p>Changes should be made to the sensitivity analysis. See question 10 above.</p> <p>R2.6 - The need to restudy previously studied years should be left to the transmission planner when in their judgment there is a material change. Based on the material change the TP should be responsible for determining what aspects of the performance requirements need to be proven</p>
<p>Response: Please see the response to question 10.</p> <p>The SDT believes that past studies must be five calendar years old or less to be relevant and the associated models should not have had material changes. Requirement R2.5 and its sub-requirements have been removed from the proposed standard. Guidelines for the use of past studies to support the Planning Assessment have been added to what is now Requirement R2.5.2. The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general. It is up to the Transmission Planner and Planning Coordinator to provide specificity as to what type of</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
<p>topology changes constitutes changes sufficient to warrant re-evaluation.</p> <p>R2.5.2 For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study <u>present System model</u> shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p>		
IESO	A — Generally support the revised standard	<p>(i) We generally support the direction and principle of the revised standard. It is a step in the right direction to more clearly stipulate the types of events and expected performance requirements with inclusion of multiple element contingencies and multiple single contingencies, and allowance for interruptions to firm transmission services and non-consequential load loss.</p> <p>(ii) More details and refinements are expected to be provided that address the issue of sensitivity testing, reduce the number of layers in the subrequirements (to facilitate ease of developing Measures and Violation Severity Levels), more clearly specify the responsible entities, etc. We look forward to seeing these improvements in the next revision, along with the first draft of Violation Risk Factors, Time Horizons, Measures, Data Retention Periods, and Violation Risk Factors when the requirements approach their near final draft form.</p> <p>(iii) We suggest the SDT review the development plan with the Standard Process Manager, especially the timing for posting the standard for balloting, responding to comments and conducting recalculating ballot. The timing between the initial ballot and recirculation ballot is usually short, and the balloted standard is not supposed to change. The proposed development plan appears to allow a long lead time between the two ballots, and for making changes to the standard between them.</p>
<p>Response: i. Thank you for your comments.</p> <p>ii. The SDT has streamlined the document and the tables to add clarity and has added the elements that were missing from the previous drafts. VRF, tec., have been added to the 3rd draft.</p> <p>iii. All development plans are reviewed with the Process Manager prior to finalization as per established procedure.</p>		
North Carolina Electric Membership Corp	B — Unsure about supporting the revised standard	While we are satisfied that the changes are moving in the right direction, we share concerns that are being expressed by other SERC TPs and PCs that the standard may be overly prescriptive in some areas such as the sensitivities being required.
<p>Response: The SDT agrees and has clarified the language to allow the Transmission Planner and Planning Coordinator to choose the sensitivities (Requirements R2.1.3 & R2.4.3).</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
	<p>R2.1.3 For each of the studies described in Requirements R2.1.1 and Requirement R2.1.2, sensitivity case(s) that <u>are intended to stress the System with sensitivities variations that reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>	
<p>E.ON U.S. Transmission Planning</p>	<p>C — Definitely do not support the revised standard</p>	<p>It is confusing that single Contingency and multiple Contingency are used throughout the document when the Categories in Tables 1 and 2 are Single Contingency and Multiple Contingency. Also System normal, normal conditions and Normal System are spread throughout the document. If they all mean the same, use the same wording. If not, explain the difference.</p> <p>R2.4.1. - Does this apply only to motors directly connected to the BES? Is there a size (hp/MW) limit? Who is responsible to provide this data to the Planning Coordinator? I would think it would both the Distribution Providers or the Generator Owners but R9 & R12 do not mention this.</p> <p>R2.4.1 refers to ?the dynamic behavior of Loads? and induction motor loads. How would this model data be developed, and by who?</p> <p>R2.5.2. - Define "Material". Is an addition of a load tap point material?</p> <p>R2.6.2. ? Define ?study area?. Does a topology change over 300 miles away trigger a stability study for a generating plant?</p> <p>R2.7.1.1. ? Define ?project initiation date?. Would this include going to the PSC to get approval or just when construction begins?</p> <p>R3.2.1 states ?? and identify how the generators are treated in the steady state simulation.? What is meant by ?treated?? I request the use of more descriptive wording.</p> <p>R3.2.2 states ?? and identify how loadability is treated in the steady state simulation.? What is meant by ?treated?? I request the use of more descriptive wording.</p> <p>R3.3.1 "System normal" is a Planning Event included in Table 1.</p> <p>R3.3.2 capitalize ?Single? if you referring to P1 and P2 events. If not, this is confusing.</p> <p>R3.3.2.1 states ?Consequential Load loss (expected maximum demand and expected duration) following a single Contingency shall be identified in the Planning Assessment.? Quantification of expected duration requires a probability analysis of load cycles, repair time, and potentially of other factors that will be difficult, if not impossible, to develop with any confidence. The Planning Assessment is based on a deterministic evaluation. Requiring the expected duration is</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>inconsistent and useless.</p> <p>R3.3.2.2 Is this the intent? ? Following Single Contingency events, Transmission configuration changes and redispatch of generation can be simulated to return the system to Normal Rating provided that all Facilities shall be operating within their Emergency Rating.</p> <p>R5.3 states ?? and identify how the generators are treated in the simulation.? What is meant by “treated”? I request the use of more descriptive wording.</p> <p>R5.5.1 and R5.5.2 should be moved to 2.5. These requirements outline the generators and the sensitivities to be analyzed. R5 appears to focus on Tables 1 and 2.</p> <p>R5.5.2 states ?Shall be performed for changes in the real power output?? What types of ?changes?, or ?changes? due to what? Is intention of the requirement, that Generating Unit Stability be assessed at two levels of real power output that differ by more than 10% of the existing capability or more than 20 MW, whichever is greater?</p> <p>R6 states ?? and document the proxies used in the simulation?..? What is meant by ?proxies?? I request the use of more descriptive wording.</p> <p>R8 ends with ?This distribution shall include:? Include what? Table 1 There used to be limits on multiple circuit towers and common ROW greater than 1 mile. Is this left to the Transmission Planner and Planning Coordinator ?</p> <p>Extreme Events ? Item 3b is the same as Item 1, this should be removed.</p> <p>Table 2 Note 5.a.ii How can this be applied when the largest unit in the Balancing Authority Area is larger than the contingency reserve of the Balancing Authority. This requirement is excessive. At some level, subsequent trips of generators and/or lines should be allowed as long as Cascading does not occur.</p>
<p>Response: The row headers are capitalized in the Table. Please note that the two Tables have been changed to just one Table in this draft.</p> <p>R2.4.1 – The SDT does not believe the requirement applies only to motors directly connected to the BES, nor is there a specific hp/MW limit. In response to comments from you and others in the industry, the SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data <u>consistent with the data</u> provided in <u>accordance with Requirements R9 through R14</u>, the MOD-010 and MOD-012 standards, and other data sources, <u>and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>R2.4.1 – Requirement R2.4.1 has been modified to clarify expectations regarding load modeling for dynamics studies.</p> <p>R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. <u>An aggregate system Load model which represents the overall dynamic</u></p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>behavior of the Load is acceptable.</p> <p>R2.5.2 – Requirement R2.5 and its sub-requirements have been removed from the proposed standard.</p> <p>R2.6.2 (now R2.5.2) –The SDT believes that it is up to the Planning Coordinator and Transmission Planner to define the study area and to determine which System changes could impact the study area</p> <p>R2.7.1.1 (now R2.6.2)– The SDT has not defined a project initiation date and will leave that definition to be determined by the Transmission Planner and Planning Coordinator.</p> <p>R3.2.1 – "Identify how generators are treated" means that you identify at what voltage you would believe that the generator would trip. Any time you run a dynamic simulation or a steady state simulation and you don't trip the generator, you are implicitly assuming that it will ride through the voltage excursion obtained in the simulation. The requirement is to identify what you are assuming for voltage ride-through criteria for the generators you have modeled.</p> <p>R3.2.2 – The SDT has changed 'treated' to analyzed'. .</p> <p>R3.3.2 For all generators, studies shall consider the minimum steady state voltage limitations of all generators and identify how the generators are treated analyzed in the steady state simulation.</p> <p>Requirement R3.3.1 has been removed and replaced with additional language in Requirement R3.1.</p> <p>R3.1 Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 –Steady State Performance. based on the lists created in Requirement R3.5.</p> <p>R3.3.2 – This requirement was deleted.</p> <p>R3.3.2.1 - To meet industry concern as well as FERC Order 693, the SDT has added Requirement R2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8.</p> <p>R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</p> <p>R3.3.2.2 - Based on your comment, the SDT has addressed the applicable time-limited rating in what was Header note 'a' for Steady State Only in Table 1 - Steady State & Stability Performance. Requirement R3.3.2.2 has been deleted in favor of Header note 'e' in the revised Table. Please note that the two tables in the second draft have been reduced to one table in the third draft.</p> <p>Header note 'e' - For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</p> <p>R5.3 - The SDT agrees that the word "treated" is vague and has revised Requirement R5.3 (now Requirement R4.3.2) and Requirement R3.2.2 (now R3.3.3) to clarify the requirement.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>R3.3.3 For all Transmission lines, studies shall consider relay loadability and identify how loadability is treated <u>analyzed</u> in the steady state simulation.</p> <p>R4.3.2 Studies shall consider <u>Simulate generator performance under anticipated conditions including how</u> the voltage ride through capability of all generators and identify how the generators are treated <u>is analyzed</u> in the simulation.</p> <p>R5.5.1 & R5.5.2 - In response to industry comments, both Requirement R2.5 and Requirement R5.5 have been deleted since Generating Unit Stability is no longer explicitly addressed in the standard.</p> <p>R6 (now R5) - Most of the industry did not find usage of "proxies" in Requirement R6 unclear or confusing. Therefore, the SDT has determined that no change to Requirement R6 is needed with regard to proxies.</p> <p>R8 - The incomplete sentence was a typo and has been deleted from Requirement R8. Footnote 12 has been added to Table 1 to address your comment on the exclusion criterion for multiple circuit towers.</p> <p>Footnote 12 - <u>Excludes circuits that share a common structure for 1 mile or less.</u></p> <p>The SDT agrees with removing the redundancy found with Extreme Event 3.b.</p> <p>Please see footnote 1.a.ii for clarification.</p> <p>Footnote 1.a.ii - For all other Planning Events: No generating unit or units totaling more than the Contingency Reserve of the Balancing Authority (<u>or Reserve Sharing Group if applicable</u>) shall be allowed to pull out of synchronism. Generators that pull out of synchronism must have out-of-step protection or some other means to trip the generator for this condition and the resulting apparent impedance swings must not pass through relay characteristics that would result in the tripping of any Transmission System elements other than the generating unit and its direct connection Facilities.</p>
ERCOT System Planning	C — Definitely do not support the revised standard	<p>The NERC reliability standard requirements should represent the minimum studies necessary to achieve reliability given the broad range of entities of various sizes and capabilities. Instead, the standards seem to represent the gold standard of the kind of studies that could be accomplished (steady-state, short circuit, and stability) given infinite time and resources with the number and variety of contingencies and sensitivities necessary. This level of steady state and stability studies can only be undertaken by the larger entities with a deep and experienced engineering staff.</p> <p>Why are most of the requirements applicable to a Transmission Planner and Planning Coordinator? Unless they are the same entity, this is an unnecessary duplication of effort. If a Planning Coordinator has a number of Transmission Planners in its region, then these requirements have to be fulfilled by each Transmission Planner for its individual area and the Planning Coordinator for the region made up of the individual areas? What is the Planning Coordinator coordinating if it is duplicating the work of the Transmission Planner?</p>
<p>Response: The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations. This standard does not represent the gold standard, but rather the SDT is developing a standard based on consensus industry support.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>The SDT recognizes that the Transmission Planner and Planning Coordinator must work closely together as defined in the NERC functional model. The Transmission Planner and Planning Coordinator should closely coordinate all work to avoid any unnecessary duplication. Requirement R6 has been included in the standard to ensure that Planning Assessments are complete and coordinated in situations where the Transmission Planner and Planning Coordinator are not the same entity.</p>
<p>American Transmission Company</p>	<p>B — Unsure about supporting the revised standard</p>	<p>We agree with most of the requirements of revised standard. However, the following list of suggestions and comments are given for consideration.</p> <p>Definitions: We agree with the removal of the "Base Case" definition and the revisions to the other definitions, except as noted above or below.</p> <p>Long Term Planning Horizon definition: We suggest a slight text change of: "Transmission planning period that covers years six through ten. Studies beyond ten years are required to accommodate . . .".</p> <p>Accountability: We suggest that Transmission Service Provider be added because we also suggest that the Transmission Service Provider be the responsible entity for R10.</p> <p>Requirements: We agree with the revisions to the Requirements, except as noted above or below.</p> <p>R1.1 - We agree with the requirement, but would like more description of what to provide in the technical rationale.</p> <p>R2.1 - We agree with the requirement, but suggest this text change, ". . . by the following annual studies . . .".</p> <p>R2.6.1 - We agree with the requirement, but suggest a slight text change of: ". . . short circuit, Generating Unit Stability or System Stability analysis . . .".</p> <p>R2.6.2 - We agree with the requirement, but suggest a slight text change of: ". . . short circuit, Generating Unit Stability or System Stability analysis . . .".</p> <p>R2.7 - We agree with the requirement, as long as it is really required by FERC Order 693 paragraph 1704.</p> <p>R2.7.1 - We agree with the requirement, but suggest a slight text change of: ". . . or Special Protection Systems, . . ."</p> <p>R2.7.1.1 - We disagree with the "include project initiation date" portion of this requirement. The initiation date is often uncertain and subject to change, which may add considerable work to investigate, monitor and update the date. In addition, we do not know why this information is required to assure BES reliability.</p> <p>R2.7.2 - We agree with the requirement, as long as it is really required by FERC Order 693 paragraph 1704.</p> <p>R3.2.2 - We agree with the requirement, but suggest a slight text change of: "For all BES Transmission lines . . .".</p> <p>R3.3.2.1 - We agree with the requirement, but suggest a slight text change of: ". . . shall be allowed in the Planning</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Assessment".</p> <p>R3.3.2.2 - We agree with the requirement, but suggest a slight text change of: ". . . within their Facility Ratings and within the time period allowed by the applicable time limited ratings."</p> <p>R5 - Is the text referring to "known planned outages" and "known long term outages"? What is the distinction that is meant to be made between the two specified types of outages?</p> <p>R5.1 - We agree with the requirement, but suggest a slight text change of: ". . . the response of the applicable portion of the BES".</p> <p>R5.2 - This clarifying requirement should also be included in the short circuit analysis section.</p> <p>R5.3 - We agree with the requirement, but suggest a slight text change of: ". . . capability of all generators that may have a significant adverse effect on the BES."</p> <p>R5.4.3.1 - We agree with the requirement, but suggest a slight text change of: ". . . within their Facility Ratings and within the time period allowed by the applicable time limited ratings."</p> <p>R8 - We disagree with the requirement, but suggest a text change of: "Each Planning Coordinator shall establish a list of neighboring system and coordinate the distribution of Planning Assessment results among affected entities the listed neighboring systems, coordinating analysis of these results through an open and transparent peer review process."</p> <p>Table 1Planning Events Header: We suggest that the header be repeated on every applicable page to be more reader-friendly.</p> <p>Superscripts: The superscripts do not refer clearly to the respective notes (e.g. there are number notes in the beginning of the table, in the extreme events evaluation requirements section, in extreme event description section, and at the end of the table). Perhaps the notes at the end of the table should have unique numbering to make the superscript references clearer.</p> <p>Shunt device: To avoid the need for future interpretation or clarification, we suggest that the meaning of shunt device be explained or defined somewhere in the standard (e.g. cap bank, inductor bank, SVC, STATCOM, etc.). We need to find out how shunt device outages can (or could in the future) be automatically included in the ACCC routine. We interpret that if each stage of a capacitor bank has a circuit switcher, then the outage would be of the largest cap bank stage.</p> <p>P2.2 (>300 kV), P2.3(>300 kV), P3 (>300 kV), P4 (>300 kV), P5 (>300 kV) - We recognize that the addition of this requirement is an attempt top raise the bar above the existing standards. However, the more stringent performance criteria should only be adopted if there is sufficient evidence to demonstrate the expected reliability risk (i.e. system impact x probability of occurrence) is high enough to warrant the cost of the system modifications that would be needed to meet the criteria. System modifications that involve the installation of line and substation facilities >300 kV will likely take years and cost tens to hundreds of millions to build. It would be helpful to have a reliability risk analysis that justifies the application of</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>this performance criteria before it is adopted. If the proposed >300 kV performance requirement is retained, then we would want the implementation timeframe to be long enough to allow reasonable time to transition from a system built to the old requirement to a system built for the new requirement. The time needed for planning, design engineering, regulatory approvals, and construction of >300 kV facilities can be very long (e.g. up to 10 or more years).</p> <p>P7 - We disagree with this requirement. Wisconsin statues require giving preference to using existing ROW for new transmission circuits, but this requirement discourages building multiple circuits on common ROW. Should there be a waiver in this standard similar to the TLP-503-MRO-1 standard for lines slightly more than 1 mile based on a review?</p> <p>Extreme Event Evaluation Requirements2 - We agree with the requirement, but perhaps a definition be added for "System Controls", since one exists for "System Protection".</p> <p>3 - We agree with the requirement, but suggest a slight text change of: "Simulate Normal Clearing unless otherwise specified in the Extreme Event Descriptions."</p> <p>Extreme Event Descriptions2a - We agree with the description, but suggest a slight text change of: "Loss of a structure or tower line with three or more circuits.."</p> <p>2b & 3b - We agree with the descriptions, but suggest referring to the defined term: "Right-of-Way."</p> <p>2e, 3.a.i, & 3.a.ii - We agree with the description a, but how large is "large" and how major is "major"?</p> <p>3.a.v - What is meant by successful cyber attack? Is it a type of cyber attack that is documented to have been successful?</p> <p>3c - We agree with the description, but suggest a slight text change of: "Other events based upon actual operating experience such as:"</p> <p>Note 4 - We agree with the description, but the acronym FACTS should be explained in the standard or a definition be added for "FACTS".</p> <p>Table 21 - We disagree with this note. We suggest that it be expanded to include the applicable part as Table 1. "The System shall remain stable. In addition, Facility Equipment Ratings shall not be exceeded. Planned System adjustments are allowed, unless precluded in the Requirements, to keep Facilities within the Facility Ratings, if such adjustments are executable within the time duration applicable to the Facility Ratings."</p> <p>3 - We disagree with this note. We suggest that it be expanded to include the applicable part as Table 1. "Dynamic voltage instability, Cascading outages, and uncontrolled islanding shall not occur."</p> <p>Between 3 & 4 - We disagree with omitting Note 4 of Table 1 from Table 2. We suggest including: "Consequential Load and consequential generation loss is allowed for all events shown."</p> <p>Planning Events Same comments on Header, Superscripts, and Shunt Device as in Table 1. Same comments about stricter requirements for P2.2 (>300 kV), P2.3 (>300 kV), P3 (>300 kV), P4 (>300 kV), P5 (>300 kV) as in Table 1. Same comment</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>about P7 as in Table 1. Extreme Event Evaluation Requirements Same comment about Requirement 2 and 3 as in Table 1.</p> <p>3 - We agree with the requirement, but suggest a slight text change of: "Simulate Normal Clearing unless otherwise specified in the Extreme Event Descriptions."</p> <p>Notes5 - We disagree with limiting this requirement to just Category P1 category. We suggest that the synchronism requirement be applied to more categories.</p>
<p>Response: The SDT believes that a review of system conditions beyond the 10-year horizon is warranted. FERC Order 693 requires that the planning horizon take into account the lead times for siting and permitting of new long-distance Transmission lines and other long lead time solutions. The SDT has received industry comments regarding the need to exceed a 10-year horizon to account for longer lead time projects. Establishing planning horizons that are shorter than Transmission lead times may create gaps where the identification of a reliability need to which Transmission may be the best solution occurs too late to avert the identified reliability violation. Further, Operating Procedures or alternative short-term capital projects may be needed to limit the impact of the Planning Event until the planned Facilities can be completed. This information needs to be included in the Assessment.</p> <p>In response to industry comments, the SDT has removed Requirements R9-R14 thus eliminating any need to add the Transmission Service Provider.</p> <p>R1.1 - The SDT agrees and has removed the need for documentation of the technical rationale for modification of any data.</p> <p>R2.1 - The SDT believes that the existing language is appropriate and there needs to be a distinction between current and past studies that would allow both to support compliance with the requirement.</p> <p>R2.6.1 & R2.6.2 - Based on comments from others, the SDT has removed the requirements for separate Generating Unit Stability analysis and System Stability analysis.</p> <p>R2.7 (now R2.6) – The SDT believes that it is.</p> <p>R2.7.1 (now R2.6.1) - The SDT agrees with the proposed change.</p> <p style="padding-left: 40px;">Installation or modification of Protection Systems or Special Protection Systems.</p> <p>R2.7.1.1 (now R2.6.2) - The SDT believes that a project initiation date is an effective measure to track a functional entity’s planning and engineering activities and their efforts to provide and maintain a reliable BES.</p> <p>R2.7.2 – Requirement R2.7.2 has been deleted.</p> <p>R3.2.2 - The Purpose section of the Standard states that this Standard is to develop requirements for the Bulk Electric System, BES. No change required.</p> <p>R3.3.2.1 – Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.8 which includes the term ‘Planning Assessment’.</p> <p>R2.8 The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>R3.3.2.2 - Based on your comment, the SDT has addressed the applicable time-limited rating in what was Header note 'a' for Steady State Only in Table 1 - Steady State & Stability Performance. Requirement R3.3.2.2 has been deleted in favor of Header note 'e' in the revised Table. Please note that the two tables in the second draft have been reduced to one table in the third draft.</p> <p><u>Header note 'e' - For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</u></p> <p>R5 - The SDT agrees and has moved this concept within Requirement R1 (see Requirement R1.1.1) so that it is applicable to all Planning Assessments. Further, both Requirements R3 and R5 (now R4) have been revised to make reference to Requirement R1.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data <u>consistent with the data provided in accordance with Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to contingencies in Table 1—Steady State Performance. <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u></p> <p>R4. For the Stability portion of the Planning Assessment, as described in Requirement R2.4 and Requirement R2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 —Stability Performance. <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u> The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted.</p> <p>R5.1 - Most of the industry did not have difficulty understanding that the analysis is limited to the Transmission Planner's or Planning Coordinator's portion of the BES. Therefore, the SDT is not persuaded by your comment to add extra wording.</p> <p>R5.2 - The SDT has moved the short circuit analysis from Requirement R4 to Requirement R2.7 and R2 already references BES.</p> <p>R5.3 - The SDT disagrees with the suggested change due to the additional studies that would be required to determine which generators would have an adverse impact.</p> <p>The SDT has deleted R5.4.3.1.</p> <p>The SDT has clarified this issue in Requirement R8 (now R7).</p> <p>R7 Each Planning Coordinator shall coordinate the distribution of Planning Assessment results among neighboring systems <u>adjacent Planning Coordinators and any functional entity who has indicated a reliability need</u>, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Header - The SDT also feels that the Tables need to be as clear and concise as possible. To that end, the next version will combine Tables 1 and 2 into one table with a revised format. The Planning Events are shown on one page so repeating the headings will not be needed.</p> <p>Superscripts - All the notes from both tables have been combined and listed numerically.</p> <p>Shunt device - The SDT believes that shunt device is commonly used in the electric utility industry and does not require any further explanation. The SDT recommends contacting the software manufacturer for additional information about the ACCC routine. The SDT believes that the cap bank outage would be based on what elements would need to trip in order to clear the simulated fault condition.</p> <p>P2 - The SDT is attempting to raise the bar by developing a standard that appropriately supports BES reliability and has industry consensus. The majority of the SDT believes that 300 kV is an appropriate cutoff and that Transmission Systems above this level represent backbone Systems and are part of regional "grids". The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations and has provided for flexibility in Corrective Action Plans. The Implementation Plan will be addressed in the next posting of the standard.</p> <p>P7 - The SDT is cognizant of the concerns surrounding the construction of new Transmission lines, including the desire by many to fully utilize existing Right-of-Ways. In its consideration of Footnote 12 (exclusion for common structures less than 1 mile), the SDT considered the impact that this requirement could have on construction of new Facilities. However, after deliberations, the SDT believes that the 1 mile exclusion should be maintained for the reliability of the BES and that individual exceptions can be addressed within the NERC process.</p> <p>Extreme Events 2 - The SDT agrees that "Protection System" is defined in the Glossary of Terms Used In Reliability Standards. However, the SDT believes that this issue should be more properly addressed by the NERC SPCTF drafting team.</p> <p>3 - The SDT has previously included "For all Extreme Events evaluated" at the beginning of the Evaluation Requirements for Extreme Events. No change required.</p> <p>2a - The SDT believes that the Extreme Events #2.a. is already sufficient.</p> <p>2b - The SDT will use the defined term of "Right-of-Way" as suggested (see 2b steady state and 2 g Stability).</p> <p>2e et al - The SDT suggests that the terms "large", "major", and "successful" be defined between the Transmission Planner and Planning Coordinator.</p> <p>3a - The SDT believes that the wording (was 3c) is already sufficient. No change required.</p> <p>Note 4 - The SDT believes that "FACTS" is commonly used in the electric utility industry and does not require any further explanation.</p> <p>Table 21 - The SDT has reviewed your comment and feels that your request to add "Facility Equipment Ratings shall not be exceeded. Planned System adjustments are allowed, unless precluded in the Requirements, to keep Facilities within the Facility Ratings, if such adjustments are executable within the time duration applicable to the Facility Ratings." apply to Stability is not appropriate. For the purposes of this standard, Facility Equipment Ratings refer to steady state calculated values and planned System adjustments refer to the time frame associated with returning the thermal flow within the applicable steady state Facility Rating.</p> <p>3 - The SDT agrees with your comment and has made that change in Header note 'a' in the next version. Also, the next version will combine Tables 1 and 2</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>into one table with a revised format.</p> <p>3 & 4 - The SDT has reformatted and combined the two Tables into a single Table for the next draft.</p> <p>3 – The SDT has already included "For all Extreme Events Evaluated" at the beginning of the Evaluation Requirements for Extreme Events.</p> <p>5 - The SDT also feels that the synchronism requirement should apply to more than just P1 Category but under certain conditions and has adjusted the notes accordingly.</p> <p>Footnote 1.a.ii - For all other Planning Events: No generating unit or units totaling more than the Contingency Reserve of the Balancing Authority (<u>or Reserve Sharing Group if applicable</u>) shall be allowed to pull out of synchronism. Generators that pull out of synchronism must have out-of-step protection or some other means to trip the generator for this condition and the resulting apparent impedance swings must not pass through relay characteristics that would result in the tripping of any Transmission System elements other than the generating unit and its direct connection Facilities.</p>
Duke Energy	B — Unsure about supporting the revised standard	<p>While we generally support the revised standard, we are unsure of the total cost impact, and whether the additional costs are justified by increased reliability.</p> <ol style="list-style-type: none"> 1) Load Modeling is a significant open issue. The models for dynamic studies have yet to be developed and the data is not in hand. This standard should allow for the use of the best available information. 2) Category P6 is the loss of a system element, following system adjustments, followed by the loss of another element. The table columns for this category say that interruption of firm transmission service and non-consequential load loss is allowed. The table, however, is not clear whether the interruption of firm service and non-consequential load loss is allowed as part of the system adjustment (between the outages) or whether it is only allowed after the second outage. It was stated in the NERC TPL SDT WebEx that the interruption is not allowed as part of the system adjustment. This would be a dramatic change from the existing standard and would result in the unintended consequence of significantly reducing transfer capability of interfaces to a fraction of their currently reported capability. This would in effect be imposing an n-2 criteria for offering firm transmission service. Duke Energy does not believe this would be an acceptable situation for the users, owners and operators of the bulk power system. 3) The statement in R2.7 "Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities," implies that there are performance requirements for sensitivity studies. Recommend rewording to clarify that there are no performance requirements for sensitivity studies. 4) Recommend rewording R3.3.2.1 as follows: "The single highest consequential load loss and its expected duration following a single contingency shall be documented in the Planning Assessment." 5) In R5.3 the statement, "and identify how the generators are treated in the simulation," should be deleted. The word "treated" is vague and typically specific equipment modeling is not identified in studies. The implementation schedule should also take into account the Standard to develop and provide this data is not approved. Since this data is not yet available, please revise the statement as follows: "Studies shall use the best available information to consider the voltage

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>ride through capability of all generators."</p> <p>6) In Table 1, Category P2 Event 1 needs to be revised to recognize the impact of this event on Bulk Electric System reliability for events on the system that are > 300 kV vs. events on the system that are <= 300 kV. P2.1 should not allow for interruption of firm transmission service or loss of non-consequential load for > 300kV; however, it should allow for interruption of firm transmission service or loss of non-consequential load for <= 300 kV. The requirement as currently written would require expenditures for the <= 300 KV system where such an event has minimal impact on Bulk Electric System reliability. In addition, the likelihood of events needs to be considered as requirements are developed. A review of Duke Energy Carolinas data shows that the likelihood of a P2.1 event on Duke's 100 kV system is an order of magnitude less than for a P1 event on the same 100 kV system. This is another indicator that the requirement as written would result in the need for expenditures that provide minimal value to enhancing the reliability of the Bulk Electric System.</p>
<p>Response: The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors involved here and has taken them into consideration in its deliberations in the development of this draft.</p> <p>1. The SDT agrees and believes that industry guidance is needed to capture the appropriate dynamic behavior of loads. In response to comments from you and others in the industry, the SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments. Requirement R2.4.1 has been modified to clarify expectations regarding Load modeling for dynamics studies.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data <u>consistent with the data</u> provided in <u>accordance with Requirements R9 through R14</u>, the MOD-010 and MOD-012 standards, and other data sources, <u>and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. <u>An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable.</u></p> <p>2. The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in the Revision 3 of the Standard provides clarification.</p> <p>Footnote #10 – <u>Curtailement of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>3. The SDT has modified the language dealing with the sensitivities in Requirement R2.7 (now R2.6) and added the phrase "run in accordance with Requirements R2.1.3 and R2.4.3." However, the performance requirements for sensitivity studies are the same as the performance requirements for the base study. The difference is that a Corrective Action Plan is required when performance requirements are not met in the base study. A Corrective Action Plan is not</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>necessarily required when the performance requirements are not met for a sensitivity study.</p> <p>R2.6 For Planning Events shown in Table 1 — Steady State Performance and Table 2 — Stability Performance, when the analysis indicates an inability of the System to meet the performance requirements in the t<u>Tables 1</u>, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities <u>run in accordance with Requirements R2.1.3 and R2.4.3</u>. The Corrective Action Plan shall:</p> <p>4. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been removed from the draft.</p> <p><u>R2.8</u> <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>5. The SDT has revised Requirement R5.3 (now R4.3.2) to provide clarification in this area.</p> <p>R4.3.2 Studies shall consider Simulate generator performance under anticipated conditions including how the voltage ride through capability of all generators and identify how the generators are treated is analyzed in the simulation</p> <p>6. The SDT feels that for this event (explained in detail in footnote 8 of draft 3 of this Standard) interruption of neither firm nor Non-Consequential Load should be allowed for any BES voltage level, i.e., above or below 300 kV. This is consistent with FERC Order 693 that does not allow dropping of Non-Consequential firm Load following any single Contingency.</p>
<p>Florida Reliability Coordinating Council, inc</p>	<p>C — Definitely do not support the revised standard</p>	<p>The SDT should consider and allow, for all planning events, , loss of Non-Consequential load as an interim measure for a period of up to 5 years in the situation where system load growth has caused post-contingency action plans to not effectively bring Facilities within normal operating limits due to unexpected or unforeseen regulatory requirements, equipment capability* and/or the installation of large industrial/commercial customers. *Equipment Capability is added to address unforeseen industry changes in the methodology used to calculating the rating of equipment.</p>
		<p>Response: Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an Interruptible Load contract arrangement.</p>
<p>Central Maine Power</p>	<p>B —Unsure about supporting the</p>	<p>Aside from the comments to the prior questions, there are several issues of concern that prevent us from supporting the present draft of the revised standard. We offer the following constructive comments in an effort to support the worthwhile effort that is being pursued so that we can reach a point of satisfaction that we could vote to support the revised standard.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
Company	revised standard	<p>Our concerns are listed in a rough order of priority.</p> <p>a. This standard as drafted does not allow exceptions for small parts of the system as long as interconnected system reliability is maintained, which is allowed in the existing TPL standards in footnotes b) and c) in Table 1. Unless such exceptions are allowed significant transfer restrictions or large reinforcements must be made. The applicable TPL footnotes are: Existing TPL footnote b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers. Existing TPL footnote c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (nonrecallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.</p> <p>b. This standard does no address base conditions. Without defining base conditions the initial status of generation dispatch and transfers across the system is ill defined. Therefore the contingency analysis doesn't have a predictable basis for a consistent and repeatable study.</p> <p>c. The reference to Special Protection Systems is completely permissive. Although there are good applications for Special Protection Systems, their use must be constrained to have a reliable system and to promote construction of needed infrastructure.</p> <p>d. This standard does not provide flexibility to shed load, which restricts the ability to control post contingency response for low impact events. This may result in advancing need for upgrades in response to low impact events. This may result in advancing need for upgrades in response to low impact events. This is in conflict with FERC's directive to have the Transmission Provider waiting for market response to transmission needs and having the Transmission Provider provide a role to back stop the market.</p> <p>e. Definition of the Long-Term Planning Horizon. The planning horizon, for assessment purposes should be limited to 10 years. Such an assessment should be sufficient to identify requirements that may take an extended time to implement.</p> <p>f. Definition of Planning Coordinator is part of the NERC Functional Model, Remove from the standard.</p> <p>g. Put headings on each section to identify the requirements of the section.</p> <p>h. With respect to R2.2 - Delete "current" from the phrase "current System Peak Load Study" and replace "study" with "assessment."</p> <p>i. Remove R2.2.1, the requirement to extend the assessment beyond 10 years. What does the length of the project have to do with the assessment? If it takes 15 years to build something, why does this require a review of year 15? What is the</p>

What is a "current" study?</p>
<p>Response: A. Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an interruptible Load contract arrangement.</p> <p>B. The SDT has modified Requirement R1 to include additional details on what should be modeled in the cases. However, the SDT intentionally provides flexibility for the Transmission Planner/Planning Coordinator to decide which "base case" to use since initial conditions for a System will vary from region to region and will need to be established on a local level, not via a national standard. The required studies and sensitivity analysis ensures that sufficient study is performed to cover an appropriate range of System conditions.</p> <p>C. The SDT does not believe that it would be appropriate to attempt to specify limitations to the use of Special Protection Systems in this standard. The proposed TPL-001-1 and existing standards provide adequate guidance to the industry on application of Special Protection Systems.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>D. The SDT has made clarifications regarding Firm Transmission Service and Non-Consequential Load Loss. Footnote # 10 has been added to the end of Table 1. The standard does not preclude the possibility of obtaining contractually interruptible load. It is the general opinion of the SDT that dropping of Non-Consequential Load should not be allowed for the Planning Events involving only one element as described in Table 1 of the proposed Standard, and to meet the intent of FERC Order 693. Further, this Standard is proposed to "raise the bar" to improve System reliability, which would require responses (Corrective Action Plans) to address those so-called low-impact events that may have been overlooked or ignored with the existing Standard TPL-002-0.</p> <p>Footnote #10 – <u>Curtailed firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>E. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted. FERC Order 693 requires that the planning horizon take into account the lead times for siting and permitting of new long-distance Transmission lines and other long lead time solutions. The SDT has received industry comments regarding the need to exceed a 10-year horizon to account for longer lead time projects. Establishing planning horizons that are shorter than Transmission lead times may create gaps where the identification of a reliability need to which Transmission may be the best solution occurs too late to avert the identified reliability violation. Further, Operating Procedures or alternative short-term capital projects may be needed to limit the impact of the Planning Event until the planned facilities can be completed. This information needs to be included in the Assessment.</p> <p>F. The definition for Planning Coordinator was deleted because the term has already been defined and added to the NERC Glossary by another SDT.</p> <p>G. The SDT also feels that the Tables need to be as clear and concise as possible. To that end, the next version will combine Tables 1 and 2 into one table with a revised format.</p> <p>H. The SDT believes that the existing language is appropriate.</p> <p>I. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted under some circumstances. For example, if it takes 15 years to build a Transmission line, then the need for that line would have to be determined 15 years ahead of the in-service date. Therefore, Requirement R2.2.1 requires you to perform an Assessment on year 15 if it takes you 15 years to build a line.</p> <p>J. The SDT has removed Requirement R3.3.2 and replaced it with additional language in Requirement R3.1. The SDT does agree with your interpretation that it does not require evaluation of all single Contingencies. The SDT specifically states in Requirement R3.4 that those Contingencies that are expected to produce the more severe System impacts shall be identified, evaluated for System performance, and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe results.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1—Steady State Performance. <u>based on the lists created in Requirement R3.5.</u></p> <p>K. The SDT has not limited the purpose of this requirement to either minimum acceptable station service voltages or maximum Mvar absorption. The SDT believes that the purpose of Requirement R3.2.1 is to determine if generators could continue to operate or if they would trip off following the Contingency.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>L. The SDT believes that relay load limits or loadability need to be considered in the Contingency analyses. The studies should determine if Transmission line loadings could reach the relay loadability level, which may add to the existing Contingency and perhaps, result in an unbounded cascading event.</p> <p>M. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R 2.9 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been deleted in favor of new Requirement R2.9.</p> <p>R2.9 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>N. The SDT has re-written Requirement R3.3 (now Requirement R3.5) to address your initial concern. Although the language and format of the proposed Standard have been revised from earlier versions, the SDT continues to believe that the Transmission Planners should evaluate the System performance for the events that are expected to produce the more severe System impacts, including both single and multi-Contingency events. The wording of new Requirement R3.5 (the old Requirement R3.3.3) now requires a listing of the Contingencies to be evaluated, the rationale for their selection and why the remaining Contingencies would be expected to produce less severe results. This will provide a complete evaluation of the potential Contingencies to be studied – those selected and those excluded.</p> <p>R3.5 Those Planning Event Contingencies in Table 1 – Steady State Performance not covered in Requirement R3.3.2 that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created,</u> and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include <u>include</u> an explanation of why the remaining Contingencies would produce less severe System results.</p> <p>O. The SDT agrees and has moved this concept within Requirement R1 (see Requirement R1.1.1) so that it is applicable to all planning Assessments. Further, both Requirement R3 and Requirement R5 have been revised to make reference to Requirement R1.</p> <p>R1.1.1 <u>Planned outages of generation and Transmission Facilities, if specifically known.</u></p> <p>R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to cContingencies in Table 1 – Steady State Performance. <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u></p> <p>R5 For the Stability portion of the Planning Assessment, as described in Requirement R2.4 and Requirement R2.5, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 – Stability Performance. <u>The studies shall be based on computer simulations using models utilizing data provided in Requirement R1.</u> The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise noted.</p> <p>P. Requirement R5.3 has been modified to address simulation of how generators perform under conditions being studied. The current MOD standards that address steady-state and dynamic simulation data requirements do not explicitly require the Generator Operators to provide voltage ride-through capability.</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>These standards are set to be addressed by Project 2010-04 within NERC's Standards Development Work Plan. It is expected that the Transmission Planner would contact Generator Operators applicable to their System to obtain such data. If the data is not provided, it would be expected that a Transmission Planner state its assumption on the Vmin used for a generator terminal voltage for assessing ride-through capability. It's likely such information could be obtained through generator manufacturers. The "Other equipment" is addressed in the revised R5.4.</p> <p>Q. The SDT agrees and therefore has changed R1.1.1 to state "if specifically known."</p> <p>R. FERC order 693 (see paragraphs 342, 1792, 1794) suggests that Non-Consequential Load loss for single Contingencies is unacceptable. Note from paragraph 1792 of order 693: "We view these arguments as based largely on the matter of economics, not reliability, with the underlying premise that it is not economically feasible to invest in the bulk electric system to the point that it can continue service to all firm load customers under some specific N-1 scenarios." The fact that the table allows Load loss for some "lower probability" N-1 events (some P2 events) for any Transmission voltage is recognition by the SDT that probability impacts both costs and practicality.</p> <p>S. The SDT believes that a current study is a study that has been completed for the latest Assessment, as opposed to a past study that may have been completed up to five years ago.</p>
<p>NSTAR Electric</p>	<p>B — Unsure about supporting the revised standard</p>	<p>Aside from the comments to the prior questions, listed below are several others issues:</p> <ol style="list-style-type: none"> 1. This standard does not address base conditions regarding generation dispatch and transfers across the system. Initial condition guidelines would be very important to establishing consistent application of the performance standards. 2. This standard should allow exceptions for loss of small parts of the system as long as reliability is maintained on the interconnected BES. There is such an allowance in the existing TPL standards in Table 1, footnotes b) and c). 3. The reference to Special Protection Systems is too permissive. The use of Special Protection Systems and their inherent complexity should be restricted to ensure a reliable system and to promote construction of needed infrastructure. 4. The Long-Term Planning Horizon should be limited to 10 years, a sufficient timeframe to identify requirements that may take an extended time to implement. 5. Definition of Planning Coordinator is part of the NERC Functional Model. It should be removed from the TPL standard. 6. Put headings on each section to identify the requirements of the section. 7. With respect to R2.2, delete "current" from the phrase "current System Peak Load Study" and replace "Study" with "Assessment." 8. R3.3.2 should be changed to permit discretion regarding the single contingencies that need to be tested, similar to R3.3.3 and R3.4. It is unnecessary to test all possible events. 9. R3.2.1 should be clarified as to whether the intent of the standard is to address station service minimum voltage

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>limitation, maximum leading VAR absorption capability or both.</p> <p>10. Remove R3.2.2. Relay loadability is addressed in the PRC-023 Standard.</p> <p>11. In R3.3.2.1, remove the requirement to assess the expected duration of Consequential Load loss. This requirement is unnecessary and not considered anywhere else in the standard.</p> <p>12. With respect to R3.3.3, the paragraph refers to Table 1 Contingencies P3 through P7; this should be explicitly stated. Also, the rationale for inclusion of testing should not be required. It only makes sense to explain why certain Contingencies were not tested. This discretion should be applicable to all contingencies in all sections of the standard.</p>
<p>Response: 1. The SDT has modified Requirement R1 to include additional details on what should be modeled in the cases. However, the SDT intentionally provides flexibility for the Transmission Planner/Planning Coordinator to decide which "base case" to use since initial conditions for a System will vary from region to region and will need to be established on a local level, not via a national standard. The required studies and sensitivity analysis ensures that sufficient study is performed to cover an appropriate range of System conditions.</p> <p>2. Some commenters expressed concern with the inability to shed Non-Consequential Load in response to a single Contingency event. It was indicated that some stakeholders rely on an SPS to drop local area network Load in response to some single Contingency events and that these System designs are permissible under the presently approved TPL-002-0 standard. FERC in Order 693 was clear in paragraph 1794 that that interruption of Non-Consequential Load is not permitted for single Contingency events. This position was vetted in draft 1 of TPL-001-1 and most stakeholders and the SDT support this position. The use of an SPS design would be permitted for a single Contingency event if the SPS design interrupts service to customers involved in an Interruptible Load contract arrangement. As an alternative, an entity could seek an Entity Variance for the situation described through their Regional Entity organization. In paragraph 1794 FERC clarified that "...an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances". The process described by FERC as a regional difference is described in detail in the "NERC Standards Development Procedure" document under the subsection titled "Variances to NERC Reliability Standards".</p> <p>3. The SDT does not believe that it would be appropriate to attempt to specify limitations to the use of Special Protection Systems in this standard. The proposed TPL-001-1 and existing standards provide adequate guidance to the industry on application of Special Protection Systems.</p> <p>4. The SDT believes that a review of System conditions beyond the 10-year horizon is warranted. FERC Order 693 requires that the planning horizon take into account the lead times for siting and permitting of new long-distance Transmission lines and other long lead time solutions. The SDT has received industry comments regarding the need to exceed a 10-year horizon to account for longer lead time projects. Establishing planning horizons that are shorter than Transmission lead times may create gaps where the identification of a reliability need to which Transmission may be the best solution occurs too late to avert the identified reliability violation. Further, Operating Procedures or alternative short-term capital projects may be needed to limit the impact of the Planning Event until the planned Facilities can be completed. This information needs to be included in the Assessment.</p> <p>5. The definition for Planning Coordinator was deleted because the term has already been defined and added to the NERC Glossary by another SDT.</p> <p>6. The SDT has considered this action but NERC's legal staff advised against using headings in the body of standards.</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>7. The SDT believes that the existing language is appropriate.</p> <p>8. The SDT has removed the Requirement R3.3.2 and replaced it with additional language in Requirement R3.1. The SDT does agree with your interpretation that it does not require evaluation of all single Contingencies. The SDT specifically states in Requirement R3.4 that those Contingencies that are expected to produce the more severe System impacts shall be identified, evaluated for System performance, and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe results.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady State Performance— <u>based on the lists created in Requirement R3.4.</u></p> <p>9. The SDT has not limited the purpose of this requirement to either minimum acceptable station service voltages or maximum Mvar absorption. The SDT believes that the purpose of Requirement R3.2.1 (now R3.3.2) is to determine if generators could continue to operate or if they would trip off following the contingency.</p> <p>10. The SDT believes that relay load limits or loadability need to be considered in the Contingency analyses. The studies should determine if Transmission line loadings could reach the relay loadability limits, which may add to the existing Contingency and perhaps, result in an unbounded cascading event.</p> <p>11. To meet industry concern as well as FERC Order 693, the SDT has added Requirement R2.8 to identify the event causing the single largest Consequential Load Loss Demand and its value and eliminate the reporting of the expected duration. Requirement R3.3.2.1 has been removed from the draft.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>12. Although the implied assumption that the more severe impacts would be identified in the P3 through P7 Contingencies, there may be exceptions and the SDT does not believe it necessary to modify the language in this regard. The wording of new Requirement R3.5-4 (the old Requirement R3.3.3) now requires a listing of the Contingencies to be evaluated, the rationale for their selection and why the remaining Contingencies would be expected to produce less severe results. This will provide a complete evaluation of the potential Contingencies to be studied – those selected and those excluded.</p> <p>R3.4 Those Planning Event Contingencies in Table 1 —Steady State Performance not covered in Requirement R3.3.2— that are expected to produce more severe System impacts shall be identified, <u>and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created,</u> and <u>and</u> the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall includ<u>include</u> an explanation of why the remaining Contingencies would produce less severe System results.</p>
<p>SERC Reliability Review Subcommittee and Planning Standards Subcommittee</p>		<p>C. Definitely do not support the revised standard. A majority of SERC technical experts do not support the revised standard. The primary concern is that the need for additional requirements for planning 300kV systems and above has not been demonstrated. We do not believe that a sufficient case for ?raising the bar? has been provided and that this requirement can have a huge impact on utilities and ratepayers.</p> <p>R2.1.3 and R2.4.3 requirements are very prescriptive. Many examples of sensitivities are already inherent in the existing requirements. Some sensitivity studies are in effect adding an additional level of contingency (N-2 or N-3). Sensitivity studies of load variation are already inherent in the fact that several different study years and conditions are already being</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>required. Outages of reactive sources and generation should already be included in studies of multiple contingencies. The process of planning new generation (system impact studies) will include studies of the future with and without the proposed new equipment. The TP and PC can better select the most appropriate sensitivities for their system. We recommend that engineering judgment continue to be recognized as a vital component of planning.</p> <p>Category P6 is the loss of a system element, followed by system adjustments, followed by the loss of another element. The table columns for this category say that interruption of firm transmission service is allowed. The table, however, is not clear whether the interruption of firm service is allowed as part of the system adjustment (between the outages) or whether it is only allowed after the second outage. It was stated in the NERC TPL SDT WebEx (August 26, 2008) that the interruption is not allowed as part of the system adjustment. This would be a dramatic change from the existing standard and would result in the unintended consequence of significantly reducing transmission system capability to accommodate firm transmission service including reduction of transfer capability of interfaces to a fraction of their currently reported capability. This would in effect be imposing an n-2 criteria for offering firm transmission service. This would not be an acceptable situation for the users, owners and operators of the bulk power system.</p> <p>Additional Comments: There is concern with load modeling requirements (use of word "appropriately" in R2.4.1). Does this requirement mandate the use of specific load models for each bus, or would an aggregate load model which represents the system as a whole be sufficient? Does the use of the PSS/E CONL function satisfy the requirements for a load model?</p> <p>There is a concern that R3.3.2.1 is burdensome regarding the need to keep track of the quantity of consequential load loss and expected duration. Who is collecting this information and why is it needed? It appears that this is a local regulatory issue, not a reliability issue.</p> <p>There is a concern with R5.6.1 with the requirement to perform simulations on 20 MW generators (to be consistent with the Registration Criteria). We recommend a 75 MW generator cutoff for required simulations.</p>
<p>Response: The SDT is attempting to raise the bar by developing a standard that appropriately supports BES reliability and has industry consensus. The majority of the SDT believes that 300 kV is an appropriate cutoff and that Transmission Systems above this level represent backbone Systems and are part of regional "grids". The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations and has provided for flexibility in corrective action plans. FERC has noted in their orders that many of the concerns about raising the bar show more concern about economics than reliability (examples, Order 890, paragraph 423; Order 693, paragraph 1792, etc.).</p> <p>The SDT agrees and have clarified the language to allow the Transmission Planner and Planning Coordinator to chose the sensitivities (Requirements R2.1.3 & R2.4.3)</p> <p>R2.1.3 For each of the studies described in Requirements R2.1.1 and RequirementR2.1.2, sensitivity case(s) that <u>are intended to</u> stress the System with sensitivities variations that reflect in one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>R2.4.3 For each of the studies described in Requirements R2.4.1 and Requirement R2.4.2, sensitivity case(s) that <u>are intended to stress the System with variations to reflect in</u> one or more of the following conditions <u>not already included in the studies</u> shall be run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied <u>included in the Assessment</u>:</p> <p>The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in the Revision 3 of the Standard provides clarification.</p> <p>Footnote #10 – Curtailed of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</p> <p>The SDT does not believe that specific Load models for each bus are necessary. An aggregate Load model which represents the System behavior as a whole may be used. Requirement R2.4.1 has been revised. The SDT does not believe that the use of PSS/E Activity CONL by itself provides the appropriate representation for dynamic Loads. For example, the SDT believes that using PSS/E Activity CONL is not sufficiently robust to appropriately model summer peak Loads with high concentrations of induction motors during for low voltage/motor stall conditions. A dynamic Load model such as CLOD, in conjunction with Activity CONL to model the non-induction motor load would be required to more accurately assess the system for FIDVR - Fault Induced Delayed Voltage Recovery.</p> <p>R2.4.1 System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. <u>An aggregate system Load model which represents the overall dynamic behavior of the Load is acceptable.</u></p> <p>To meet industry concern as well as FERC Order 693, the SDT has deleted Requirement R3.3.2.1 and replaced it with Requirement R 2.8. The SDT believes that quantifying the single largest Consequential Load Loss and identifying the event causing it provides a useful metric for system performance and reliability.</p> <p>R2.8 <u>The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.</u></p> <p>The requirement for study has been changed to 20 MW for a single generator or for an aggregate of generators. This language is now in Requirement R2.5.2.</p> <p>R2.5.2 For steady state, short circuit, Generating Plant Stability, or System Stability analysis: the study present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. <u>Material generation changes could include:</u></p>
Oncor Electric Delivery	B — Unsure about supporting the revised	Initially performing outstanding tasks as well as annual maintenance of documentation and regular updates would require extreme significant resources both personal and financial. Transmission Planning to this level requires high level subject matter experts with both specific transmission system knowledge as well as overall industry experience. Considerable expense would also be required to train personal and track activities. The procurement documents necessary to interface

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
	standard	with consultants in this area where "in house" expertise is not available would also be required. Time would also be spent on evaluating new software and analysis tools such as EPRI dynamic models. A phased in approach would be taken to complete the tasks while still performing essential Oncor and ERCOT related activities associated with System Planning.
<p>Response: The SDT has received many comments regarding the increased planning requirements to meet the proposed standard. However, the SDT believes that the requirements for sensitivity studies must remain to satisfy FERC Order 693. FERC has stated that the sensitivity studies would be used to document the selection of critical System conditions and study years used in assessing System conditions (see paragraph 1704) and that System conditions are as important as Contingencies in evaluating the performance of present and future Systems (paragraph 1705). The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors involved and has considered them in its deliberations. The SDT is developing the Implementation Plan and will include it in the next draft of the standard</p>		
FirstEnergy Corp.	A — Generally support the revised standard	<p>1) For this standard, "Protection System" failure should be limited to only relay event failures.</p> <p>2) R1 ? As stated in our response to Question 5, FE does not support the modeling requirements within the TPL standard and suggest that the SDT remove these requirements. This standard should be viewed on a premise that a valid and appropriate system model exist so that the fundamental focus of the standard is as stated in its purpose statement "Establish Transmission System planning performance requirements... to develop a Bulk Electric System that will operate reliably over a broad spectrum of System conditions." If R1 remains, the phrase "and other data sources" should be removed.</p> <p>3) R1.1 ? this requirement requires the documentation of ANY data modification. Do you really mean ANY? How much detail is needed in the documentation? Is a line by line comparison of all data values before/after needed or is a general overview discussion sufficient? For instance, FE replaces its system model as shown in the MMWG representation with a more detailed system representation model when performing planning studies. This can included many differences from the MMWG system equivalent. How much documentation is needed in this situation?</p> <p>4) R2.6 ? This is not a requirement and should be removed and shown as explanatory text (footnote).</p> <p>5) R3 - Requirement R3.1 is redundant to statements in the text of R3 and R3.3 and R3.4. We suggest that R3.1 be removed. It is suggested that R3.4 be indented and become a R3.3 sub-requirement. R3.5 would be better placed ahead of R3.3 along with the existing R3.2.</p>
<p>Response: 1. The SDT believes that these protection issues will be further clarified by the NERC SPCTF drafting team. The spirit of the TPL standard will remain that Load loss must not be planned for any single failure.</p> <p>2. The SDT has removed Requirements R9-R14 and enhanced Requirement R1 to more clearly specify the modeling information needed to support accurate Planning Assessments.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning</p>		

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>Assessment. The models shall use data <u>consistent with the data</u> provided in <u>accordance with Requirements R9 through R14</u>, the MOD-010 and MOD-012 standards, and other data sources, <u>and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations.</u></p> <p>3. The SDT agrees and has removed the need for documentation of the technical rationale for modification of any data.</p> <p>4. The SDT disagrees and believes that the format and language of Requirement R2.6 (now R2.5) and its new sub-requirements are appropriate.</p> <p>5. The SDT has modified the language of Requirement R3.1 and deleted Requirement R3.3 to eliminate the redundancy.</p> <p>R3.1 Studies shall <u>be performed to</u> determine whether the BES meets the performance requirements in Table 1 —Steady-State Performance. <u>based on the lists created in Requirement R3.5.</u></p>
Orlando Utilities Commission	C — Definitely do not support the revised standard	<p>This standard is a definite improvement over the current set of standards. The majority of my comments are on details rather than the overall concept. My single biggest concern is the handling of n-1-1. This represents a significant expense to transmission customers and serious restriction on making firm transmission available, but due to the low probability of these events it would represent little if any practical improvement in customer reliability or grid security.</p>
		<p>Response: Please see footnote #10 with regard to N-1-1. The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>
Entergy Services, Inc.	C — Definitely do not support the revised standard	<p>No cost-benefit studies have been completed to justify the significant investment and no detailed analysis of the expected reliability impact has been conducted for the Eastern Interconnection. Some research suggests that infrastructure expansion will reduce the number of large BES events, but that each event would impact larger areas with longer restoration times. http://eceserv0.ece.wisc.edu/~dobson/PAPERS/complexsystemsresearch.html</p> <p>Additionally, there is a fatal disconnect between the enhanced reliability standard and the FERC's current standard for selling firm transmission service. A utility cannot be required to build to an N-1-1 standard to satisfy reliability requirements and also be required to sell additional firm transmission service using a lower N-1 reliability standard. Such a situation would create an untenable situation where reliability standards force construction that the utility is then required to make available for sale pursuant to the provisions of the OATT and, once sold in accordance with the OATT, results in the utility being out of compliance with the reliability requirement.</p> <p>Requirement P2.1 in the table will have direct impact on local load reliability but not grid reliability. For example, a long line</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>in a radial configuration due to a single contingency would only impact the reliability in a local area. Any implementation plan should consider all aspects of obstacles that Transmission owners will encounter including, ROW and land acquisition delays, inflationary impact on raw materials and other resources, capital funding constraints and associated regulatory lag, etc.</p> <p>Category P6 prescribes what is effectively an n-2 criteria for offering firm transmission service by not allowing the curtailment of firm transmission service as a system adjustment. Many areas are limited in how much local generation is available for re-dispatch as a system adjustment and thus compliance would be realized only by costly transmission construction by TPs.</p>
<p>Response: The SDT is striving to develop a standard that appropriately supports BES reliability and has industry consensus. The SDT is cognizant of the cost factors involved here and is taking them into consideration in its deliberations.</p> <p>The SDT agrees that clarification regarding Firm Transmission Service and Non-Consequential Load Loss is necessary. Footnote # 10 has been added to the end of Table 1:</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner’s planning region are relied upon, Facility Ratings in those regions must be considered.</u></p> <p>The SDT agrees that the Implementation Plan should consider matters you have listed. Nevertheless, the SDT feels that for this event (explained in detail in the footnote 8 of draft 3 of this Standard) interruption of neither firm nor Non-Consequential Load should be allowed for any BES voltage level, i.e., above or below 300 kV. This is consistent with FERC Order 693 that does not allow dropping Non-Consequential firm Load following any single Contingency.</p> <p>The SDT agrees that clarification regarding treatment of Firm Transmission Service and Non-Consequential Load Loss during adjustment is necessary. Footnote 10 in draft 3 of the Standard provides clarification.</p>		
BPA Transmission Reliability Program	B — Unsure about supporting the revised standard	<p>We are unsure about supporting the revised standard. A couple of additional concerns are described below.</p> <p>The purpose of the Standard is not clearly defined. There should be more clarity given to what reliability means in the context of these standards (e.g. minimize load loss for more probable contingencies, etc.).</p> <p>Regarding the terms "interruption of firm transmission service", there needs to be clarification of what "Interruption" means. Does it include curtailment needed after a particular contingency and adjustments? There also needs to be clarification on what "Firm Transmission Service" means. Two points: 1) the NERC definition states "highest quality of service offered to customers under a filed rate schedule that anticipates no planned interruption." The Standard implies anticipation of "unplanned" interruption for certain contingencies. 2) Is this referring to a transmission product as defined in FERC Order</p>

Comments for 2nd Draft of Standards for Backup Facilities (Project 2006-04)

Organization	Question 15:	Question 15 Comments:
		<p>890, or firm transfers modeled for the conditions being studied? One way to interpret the intent, is the firm transfers being modeled for the conditions in the powerflow, to meet demand that would result in load not being served if that firm transfer were curtailed. If there is other generation in the system that could increase to meet the load, if the transfer being modeled is interrupted, then interruption of firm transmission service should be allowed for P1 through P5 contingencies in the table.</p>
<p>Response: The SDT believes that the Purpose under A.3 adequately captures the main intent which is to develop a "Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies."</p> <p>Footnote # 10 has been added to the end of Table 1 to reflect that curtailment or interruption of Firm Transmission Service will be allowed in preparation for the next Contingency. However, until the next Contingency occurs, System performance will need to meet the requirements for Event P1. As such, the proposed standard will not allow loss of any Non-Consequential Load, except for contracted Interruptible Loads, in preparation for the next Contingency. "Firm Transmission Service" is a NERC defined term and is also addressed by FERC in OATT.</p> <p>Footnote #10 – <u>Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.</u></p>		
PPL EnergyPlus	A — Generally support the revised standard	
<p>Response: Thank you for your support.</p>		

Implementation Plan for TPL-001-1

Prerequisite Approvals

There are no other Reliability Standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

TPL-001-1 – Transmission System Planning Performance Requirements

Revision to Sections of Approved Standards and Definitions

There are multiple new definitions in the proposed standard.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.

Extreme Events: Events which are more severe and have a lower probability of occurrence than Planning Events.

Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions following a Planning or Extreme Event.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction.

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Planning Events: Events that require Transmission system performance requirements to be met.

Supplemental Load Loss: Load that is disconnected from the network by end-user equipment responding to post-Contingency System conditions.

Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current calendar year.

Compliance with Standards

Standard	Functions That Must Comply With the Associated Requirements	
	Transmission Planner	Planning Coordinator
TPL-001-1 – Transmission System Planning Performance Requirements	X	X

Effective Dates

The effective date is the date entities are expected to meet the performance identified in this standard.

Except as indicated below, all Requirements and associated sub-requirements shall become effective 24 months after the first day of the first calendar quarter following applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect 24 months after Board of Trustees adoption.

TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-1. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-1 and NERC’s Rules of Procedure, Section 800. However, during this 24-month period, all aspects of TPL-001-0 through TPL-006-0 shall remain in effect for compliance monitoring. This 24 month period is to allow entities to develop, perform and/or validate new and/or modified studies, methodologies, assessments, procedures, etc. necessary to implement and meet the TPL-001-1 requirements. The specified effective dates are expected to allow sufficient time for proper assessment of the available options necessary to create a viable Corrective Action Plan that is compliant with the new Standard.

R1. This Requirement is related to maintaining System models and the data needed to do so. This requirement shall become effective 12 months after the first day of the first calendar quarter following applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect 12 months after Board of Trustees adoption.

R7. This Requirement identifies an obligation to determine individual and joint responsibilities for performing studies needed to do the Planning Assessment. This requirement shall become effective 12 months after the first day of the first calendar quarter following applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this requirement goes into effect 12 months after Board of Trustees adoption.

TPL-001-1 ‘raises the bar’ in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by many to allow such

actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent “raising the bar”:

- P2-1
- P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

This “raising the bar” is beyond the control of the Transmission Planner and Planning Coordinator and may have significant budget, siting, permitting, and construction impacts on many Transmission Owners. The SDT requested input from industry on the amount of time required to implement the Corrective Action Plans needed to address the ‘raise the bar’ issues. The SDT has studied the responses and determined that a timeframe coincident with the end of the Near-Term Transmission Planning Horizon would be the appropriate amount of time to implement the changes. Therefore, for 60 months after the first day of the first calendar quarter following applicable approval, Corrective Action Plans applying to performance elements P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2.7.4) that would not otherwise be permitted by the requirements of TPL-001-1.

Any entity that cannot fully implement its Corrective Action Plan to eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for these performance elements by that date shall self report itself as being unable to meet the performance requirements of the Reliability Standard. The entity will submit a mitigation plan to its Regional Entity outlining the steps it will take to become compliant and the date it anticipates becoming compliant. The Regional Entity and NERC will review the mitigation plan and the Regional Entity/NERC will either approve it or remand it back for changes (this could include dates, steps, etc.). If the mitigation plan is approved by the Regional Entity and NERC and the entity completes the mitigation plan by the date contained within the mitigation plan, no penalties will be assessed. Those entities that do not meet the date outlined in the mitigation plan will begin settlement proceedings at that date.

Please **DO NOT** use this form to submit comments. Please use the [electronic form](#) located at the site below to submit comments on the 3rd draft of the TPL-001-1 standard for Assess Transmission Future Needs (Project 2006-02). This comment form must be completed by **July 9, 2009**.

<http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

If you have questions please contact Ed Dobrowolski at ed.dobrowolski@nerc.net or by telephone at 609-947-3673.

Background Information

TPL-001-1 Transmission System Planning Performance Requirements

Comments on the second draft of the TPL-001-1 Transmission System Planning Performance Requirements standard were received from the industry through September 29, 2008. The Drafting Team sought and received feedback to 15 questions, and the team appreciates the tremendous industry participation that generated over 500 pages of comments from over 100 organizations. Below is a brief overview of the 3rd draft of the standard highlighting areas where the SDT made changes based on stakeholder feedback from the second posting. The SDT is presenting several new questions to seek the industry's position related to the changes made and to obtain clarifying data that will provide further direction for improvements. The team's objectives remain unchanged - to create a single Transmission planning standard: 1) with clear, concise requirements set at an appropriate level to ensure reliability, and 2) that fully addresses all issues raised by FERC Orders 693 and 890, and industry inputs, including the SAR scope document.

3rd Draft Overview:

1. At first glance the third draft of the standard seems to have been substantially changed; however, this is not the case as the SDT has maintained its vision throughout the process and the changes shown are primarily clarifying in nature.
2. The flow and organization of the standard remain similar to the 2nd draft. However, some changes are noteworthy:
 - a. Several definitions were revised or deleted based on industry feedback.
 - b. Requirement R1 has been re-constituted to include all modeling/data issues needed for the assessment of Transmission System performance issues within this single Requirement. This change eliminates the need for Requirements R9 through R14.
 - c. Assessment of spare equipment strategy has been clarified and merged into Requirement R2.
 - d. The short circuit analysis has been moved back into Requirement R2.
 - e. The use of an aggregate system Load model has been clarified in Requirement R2.4.1.
 - f. How sensitivity studies fit into the overall assessment has been clarified in Requirement R2.4.3.
 - g. The separate requirements for generating plant and System Stability have been consolidated into one Stability section.

- h. Qualifications for “past” studies have been further refined.
 - i. Requirement R2.6.4 has been added to address situations beyond the control of the planner.
 - j. Performance Tables – In response to industry comments, there is now one consolidated Table.
3. Violation Risk Factors (VRF) and Time Horizons were added to the requirements.
 4. Measures have been added.
 5. Data retention requirements have been added.
 6. Violation Severity Levels (VSLs) have been added.
 7. An Implementation Plan has been provided.

To facilitate the ability of industry respondents to comment in an orderly fashion and to ease the coordination burden on the SDT in responding to comments, the SDT is asking an all encompassing question for each requirement. This question solicits comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and the VSL associated with the requirement. Please note the numbering below refers to the clean copy of the third posting.

1. Requirement R1 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

2. Requirement R2 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

3. Requirement R3 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

4. Requirement R4 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

5. Requirement R5 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

6. Requirement R6 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

Comment Form for 3rd Draft of Standard TPL-001-1 (Project 2006-02)

7. Requirement R7 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Comments:

The SDT is posing several other questions for industry consideration not related to the specific requirement questions above.

8. The SDT changed several definitions in response to industry comments to the second posting. Do you agree with these changes? If not, please clearly indicate which definition you disagree with and provide specific comments.

Yes

No

Comments:

9. Do you agree with the changes in the performance elements and notes in Table 1? If not, please provide specific comments by note number, note alpha character, or performance category. Please note that footnotes 5 and 10 are handled separately in question 10.

Yes

No

Comments:

10. The changes to the Table include the addition/revision of footnotes 5 and 10 that address curtailment of Firm Transmission Service and conditional Firm Transmission Service. Do you agree with the footnotes? If not, please provide specific comments.

Yes

No

Comments:

11. The SDT has provided an Implementation Plan as part of this posting. The plan includes the retirement of TPL-005-0 and TPL-006-0. Do you agree with the elements of the Plan? If not, please provide specific comments.

Yes

No

Comments:

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 will be addressed later in the project.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments from second posting of standard(s) and submit revision 3 of the standard(s).	4Q08
2. Respond to comments from third posting and submit revision 4 of the standard.	2Q09
3. Submit standard(s) for balloting.	3Q09
4. Submit standard(s) to BOT.	4Q09
5. Submit to regulatory authorities for approval.	1Q10

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual substation bus configurations.

Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.

Extreme Events: Events which are more severe and have a lower probability of occurrence than Planning Events.

Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions following a Planning or Extreme Event.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. .

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Planning Events: Events that require Transmission system performance requirements to be met.

Supplemental Load Loss: Load that is disconnected from the network by end-user equipment responding to post-Contingency System conditions.

Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current calendar year.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-1
3. **Purpose:** Establish Transmission System planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.
5. **Effective Date:** Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

- For 60 calendar months after the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-1, Table 1 are allowed to include tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2.6.4) that would not otherwise be permitted by the requirements of TPL-001-1:
 - P2-1, P2-2 (above 300 kV)
 - P2-3 (above 300 kV)
 - P3-1 through P3-5
 - P4-1 through P4-5 (above 300 kV)
 - P5 (above 300 kV)

Any entity that cannot fully implement its Corrective Action Plan to eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for the above listed performance elements within 60 calendar months of the compliance date for Requirements R2 through R4 shall self report itself as being unable to meet performance requirements of this Reliability Standard. Any such entity shall submit a mitigation plan to its Regional Entity outlining the steps it will take to become compliant and the date it anticipates becoming compliant. The Regional Entity and NERC shall review the mitigation plan and the Regional Entity/NERC will either approve it or remand it for changes (this could include dates, steps,

etc.). If the mitigation plan is approved by the Regional Entity and NERC and the entity completes the mitigation plan by the date contained within the mitigation plan, no penalties will be assessed. Those entities that do not meet the date outlined in an approved mitigation plan will begin settlement proceedings at that date.

B. Requirements

R1. Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other data sources, and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R1.1. Models for the Planning Assessment shall represent:

R1.1.1. Planned outages of generation and Transmission Facilities, if specifically known.

R1.1.2. New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon, such as:

- Transmission Lines
- Generators
- Circuit breakers
- Reactive Power devices
- Protection System equipment
- Control devices
- New technologies.

R1.1.3. Real and reactive Demand of Load

R1.1.4. Firm Transmission Service

R1.1.5. Interchange

R1.1.6. Network resources required to supply Load

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, document results, and shall cover steady state analyses, short circuit analyses, and Stability analyses. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R2.1. The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current studies, supplemented with qualified past studies as indicated in Requirement R2.6:

- R2.1.1.** System peak Load for either Year One or year two, and for year five.
- R2.1.2.** System Off-Peak Load for one of the five years.
- R2.1.3.** For each of the studies described in Requirements R2.1.1 and R2.1.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment:
 - Forecasted Load and power factor.
 - Expected transfers.
 - Timing of the installation of new or modified Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
 - Controllable Loads and Demand Side Management.
 - Planned duration or timing of Transmission outages.
- R2.1.4.** When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience due to the unavailability of the long lead time equipment.
- R2.2.** For the Long-Term Transmission Planning Horizon portion of the steady state analysis, a current System peak Load study is required annually for one of the years in the assessment period to support the annual Planning Assessment.
 - R2.2.1.** To accommodate any known longer lead time projects that may take longer than ten years to complete, the Planning Assessment shall be extended accordingly.
- R2.3.** The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies. The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study area.
- R2.4.** The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies. The following studies are required:
 - R2.4.1.** System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

- R2.4.2.** System Off-Peak Load for one of the five years.
- R2.4.3.** For each of the studies described in Requirements R2.4.1 and R2.4.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment:
- Load model assumptions.
 - Expected transfers.
 - Timing of the installation of new or modified Facilities.
 - Reactive resource capability.
 - Generation additions, retirements, or other dispatch scenarios.
- R2.5.** Past studies may be used to support the Planning Assessment if they meet the following requirements:
- R2.5.1.** For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less.
- R2.5.2.** For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include:
- The addition/deletion/change of individual generating unit capability of 20 MW or greater.
 - An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater.
- R2.6.** For Planning Events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3. The Corrective Action Plan shall:
- R2.6.1.** List System deficiencies and the associated actions needed to achieve required System performance. Such actions may include:
- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
 - Installation or modification of Protection Systems or Special Protection Systems
 - Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.

- Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate Steady State performance violations.
 - Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
 - Use of rate applications, DSM, new technologies, or other initiatives.
- R2.6.2.** For the Near-Term Transmission Planning Horizon, include both a project initiation date as well as an in-service date.
- R2.6.3.** For the Long-Term Transmission Planning Horizon, provide an in-service year.
- R2.6.4.** If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking prudent actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.
- R2.6.5.** Be reviewed in subsequent annual Planning Assessments as to implementation status of identified System Facilities and Operating Procedures.
- R2.7.** For short circuit analysis, if the short circuit current interruption duty on fault interrupting devices determined in Requirement R2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:
- R2.7.1.** List System deficiencies and the associated actions needed to achieve required System performance.
- R2.7.2.** Be reviewed in subsequent annual Planning Assessments as to implementation status.
- R2.8.** The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.
- R2.9.** The Planning Assessment shall identify the maximum permissible Non-Consequential Load Loss (megawatt Demand) for those Planning Events where Non-Consequential Load Loss is allowed in Table 1.
- R3.** For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. The studies shall be based on computer simulations using models utilizing data

provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- R3.1.** Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the lists created in Requirement R3.4.
- R3.2.** Studies shall be performed to assess the impact of the Extreme Events identified in Requirement R3.5.
- R3.3.** Contingency analyses shall:
 - R3.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention.
 - R3.3.2.** For all generators, studies shall consider the minimum steady state voltage limitations and identify how the generators are analyzed in the steady state simulation.
 - R3.3.3.** For all Transmission lines, studies shall consider relay loadability and identify how loadability is analyzed in the steady state simulation.
 - R3.3.4.** Simulate the expected operation of existing and planned devices designed to provide Steady State control of electrical system quantities. These devices include equipment such as phase-shifting transformers, load tap changing transformers, capacitors, and inductors.
- R3.4.** Those Planning Event Contingencies in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created. The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe System results.
- R3.5.** Those Extreme Events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R3.2 created. The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe System results. If the analysis concludes there are cascading outages caused by the occurrence of Extreme Events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be conducted.
- R4.** For the Stability portion of the Planning Assessment, as described in Requirement R2.4, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 1. The studies shall be based on computer simulations using models utilizing data provided in Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning*]

- R4.1.** Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the lists created in Requirement R4.4.
- R4.2.** Studies shall be performed to assess the impact of the Extreme Events identified in Requirement R4.5.
- R4.3.** Contingency analyses shall:
 - R4.3.1.** Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention.
 - R4.3.2.** Simulate generator performance under anticipated conditions including how the voltage ride through capability is analyzed.
 - R4.3.3.** Simulate the expected operation of existing and planned devices designed to provide dynamic control of electrical system quantities. These devices include equipment such as generation exciter control and power system stabilizers, static VAR compensators, power flow controllers, and DC Transmission controllers.
- R4.4.** Those Planning Event Contingencies in Table 1 – that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4.1 created. The rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results.
- R4.5.** Those Extreme Events in Table 1 that are expected to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R4.2 created. The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe System results. If the analysis concludes there are cascading outages caused by the occurrence of Extreme Events, an evaluation of possible actions designed to reduce the likelihood or mitigate the consequences of the event(s) shall be conducted.
- R5.** Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, any proxies used in the analysis to identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R6.** Each Transmission Planner and Planning Coordinator shall determine and identify individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]
- R7.** Each Planning Coordinator shall coordinate the distribution of Planning Assessment results among adjacent Planning Coordinators and any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and

transparent peer review process such as described in FERC Order 890. [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]

C. Measures

- M1.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as the System model with the specified data in electronic or hard copy format, that it is maintaining System models, using data consistent with MOD-010 and MOD-012, simulating projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- M4.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment in accordance with Requirement R4.
- M5.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment in accordance with Requirement R5.
- M6.** Each Transmission Planner and Planning Coordinator shall provide evidence, such as a dated document, that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies for the Planning Assessment in accordance with Requirement R6.
- M7.** Each Planning Coordinator shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient, date, and contents, or a demonstration of a public posting, that it has coordinated the distribution of Planning Assessment results among adjacent Planning Coordinators and any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890 in accordance with Requirement R7.

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

Regional Entity.

1.2 Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting
Complaints

1.4 Data Retention

The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.
- All Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.
- All studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.
- All studies performed in support of its Planning Assessment since the last compliance audit in accordance with Requirement R4 and Measure M4.
- All studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The current, in force agreement on identified responsibilities, as well as all such agreements in force since the last compliance audit, in accordance with Requirement R6 and Measure M6.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R7 and Measure M7.

1.5 Additional Compliance Information

None.

2 Violation Severity Levels

	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner or Planning Coordinator’s System model failed to represent one of the sub-requirements R1.1.1 through R1.1.6.	The Transmission Planner or Planning Coordinator’s System model failed to represent two of the sub-requirements R1.1.1 through R1.1.6. OR The System model did not use data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other data sources.	The Transmission Planner or Planning Coordinator’s System model failed to represent three of the sub-requirements R1.1.1 through R1.1.6.	The Transmission Planner or Planning Coordinator’s System model failed to represent four or more of the sub-requirements R1.1.1 through R1.1.6. OR The System model did not simulate projected System conditions as described in Requirement R1.
R2	The Transmission Planner or Planning Coordinator failed to comply with one or both of the following sub-requirements: R2.8 or R2.9.	The Transmission Planner or Planning Coordinator failed to comply with one of the sub-requirements: R2.3 or R2.7.	The Transmission Planner or Planning Coordinator failed to comply with one of the sub-requirements: R2.1, R2.2, R2.4, or R2.6.	The Transmission Planner or Planning Coordinator failed to comply with two or more of the sub-requirements: R2.1, R2.2, R2.4, or R2.6.
R3	The Transmission Planner or Planning Coordinator did not identify Planning Events as described in Requirement R3.4 or Extreme Events as described in Requirement R3.5.	The Transmission Planner or Planning Coordinator did not perform studies as specified in Requirement R3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1. R7	N/A	N/A	The Planning Coordinator failed to coordinate the analysis of its Planning Assessment results through an open and transparent peer review process.	The Planning Coordinator failed to distribute the results of its Planning Assessment.

E. Regional Variances

None.

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. Voltage instability, cascading outages, and uncontrolled islanding shall not occur.
- b. Consequential Load Loss, Supplemental Load Loss, Load Reduction, and consequential generation loss are acceptable as a consequence of any Planning or Extreme Event excluding P0. However, Supplemental Load Loss associated with an event shall not be used to meet steady state performance requirements.
- c. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- f. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator (or Transmission Planner if more restrictive).
- g. Planning Event P0 is applicable to steady state only.

Stability Only:

- h. The System shall remain stable. ¹
- i. Transient voltage response shall be within acceptable limits established by the Planning Coordinator (or Transmission Planner if more restrictive).

Category	Initial System Condition	Event ²	Fault Type ³	BES Level ⁴	Interruption of Firm Transmission Service Allowed ⁵	Non-Consequential Load Loss Allowed
P0 No Contingency	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷	3Ø	EHV, HV	No	No
		5. Single Pole of a DC line	SLG			
P2 Single Contingency	Normal System	1. Opening of Breaker(s) w/o fault ⁸	N/A	EHV, HV	No	No

Planning Events**

Category	Initial System Condition	Event ²	Fault Type ³	BES Level ⁴	Interruption of Firm Transmission Service Allowed ⁵	Non-Consequential Load Loss Allowed
P3 Multiple Contingency	Loss of generator unit followed by System adjustments ¹⁰	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷	3Ø	EHV, HV	No ¹⁰	No
		5. Single pole of a DC line	SLG	EHV, HV	No ¹⁰	No
P4 Multiple Contingency (<i>Fault plus stuck breaker ¹¹</i>)	Normal System	Stuck breaker ¹¹ (non-bus-tie) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷ 5. Bus Section	SLG	EHV	No ¹⁰	No
		6. Stuck breaker (bus-tie) attempting to clear a Fault on the associated bus	SLG	HV	Yes	Yes
		6. Stuck breaker (bus-tie) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes
P5 Multiple Contingency (<i>Fault plus Protection System failure</i>)	Normal System	Loss of multiple elements caused by the failure of a single Protection System while clearing a fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷ 5. Bus Section	SLG	EHV	No ¹⁰	No
		1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷ 5. Bus Section	SLG	HV	Yes	Yes
P6 Multiple Contingency (<i>Two overlapping</i>)	Loss of one of the following followed by System adj. ¹⁰ : 1. Transmission Circuit 2. Transformer ⁶	Loss of one of the following: 1. Transmission Circuit 2. Transformer ⁶ 3. Shunt Device ⁷	3Ø	EHV, HV	Yes	Yes

Standard TPL-001-1 — Transmission System Planning Performance Requirements

<i>singles)</i>	3. Shunt Device ⁷ 4. Single pole of a DC line	4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency (<i>Common Structure</i>)	Normal System	The loss of: 1. Any two circuits on common structure ₁₂ 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

**Table 1 — Steady State & Stability Performance
Extreme Events**

Steady State & Stability

For all Extreme Events evaluated:

1. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect for each Contingency.
2. Simulate Normal Clearing unless otherwise specified.

Steady State

1. Loss of a single generator, Transmission Circuit, DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, DC Line, shunt device, or transformer forced out of service prior to System adjustments.
2. Local area events affecting the Transmission System such as:
 - a. Loss of a tower line with three or more circuits.¹²
 - b. Loss of all Transmission lines on a common Right-of-Way.
 - c. Loss of a switching station or substation (loss of one voltage level plus transformers).
 - d. Loss of all generating units at a station.
 - e. Loss of a large Load or major Load center.
3. Wide area events affecting the Transmission System based on System topology such as:
 - a. Loss of two generating plants resulting from conditions such as:
 - i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation.
 - ii. Loss of the use of a large body of water as the cooling source for generation.
 - iii. Wildfires.
 - iv. Severe weather, e.g., hurricanes, tornadoes, etc.
 - v. A successful cyber attack.
 - vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants.
 - b. Other events based upon operating experience that may result in wide area disturbances.

Stability

1. With an initial condition of a single generator, Transmission circuit, DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, DC line, shunt device, or transformer prior to System adjustments.
2. Local or wide area events affecting the Transmission System such as:
 - a. 3Ø fault on generator with stuck breaker¹¹ or a Protection System failure resulting in Delayed Fault Clearing.
 - b. 3Ø fault on Transmission circuit with stuck breaker¹¹ or a Protection System failure resulting in Delayed Fault Clearing.
 - c. 3Ø fault on transformer with stuck breaker¹¹ or a Protection System failure resulting in Delayed Fault Clearing.
 - d. 3Ø fault on bus section with stuck breaker¹¹ or a Protection System failure resulting in Delayed Fault Clearing.
 - e. 3Ø internal breaker fault¹¹.
 - f. 3Ø fault on two or more circuits on a common structure¹².
 - g. SLG fault on all Transmission lines on a common Right-of-Way.
 - h. 3Ø fault on switching station or substation (loss of one voltage level plus transformers)
 - i. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances

**Table 1 — Steady State & Stability Performance
Footnotes
(Planning Events and Extreme Events)**

1. System stable means:
 - a. Angular Stability:
 - i. For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
 - ii. For all other Planning Events: No generating unit or units totaling more than the Contingency Reserve of the Balancing Authority (or Reserve Sharing Group if applicable) shall be allowed to pull out of synchronism. Generators that pull out of synchronism must have out-of-step protection or some other means to trip the generator for this condition and the resulting apparent impedance swings must not pass through relay characteristics that would result in the tripping of any Transmission System elements other than the generating unit and its direct connection Facilities.
 - b. For all Planning Events evaluated: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator (or Transmission Planner if more restrictive).
2. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level for stated performance criteria applies regarding allowances for interruptions of Firm Transmission Service and loss of Non-Consequential Load.
3. Unless specified otherwise, simulate Normal Clearing faults. Single line to ground (SLG) or three phase (3 \emptyset) are the fault types, that must be evaluated in Stability simulations for the event described. A 3 \emptyset fault study indicating criteria are being met shall provide sufficient evidence that a SLG condition would also meet criteria.
4. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruptions of Firm Transmission Service and Non-Consequential Load.
5. When the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.
6. For non-Generator Step Up transformer outage events, the reference voltage applies to the low-side winding (excluding tertiary windings). For generator and generator Step Up transformer outage events, the reference voltage applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
7. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
8. Inadvertent tripping of breakers on one end of a normally networked Transmission circuit such that the line is now open at that end and possibly serving Load radial from a single source point.
9. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
10. Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.
11. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) breaker,

**Table 1 — Steady State & Stability Performance
Footnotes
(Planning Events and Extreme Events)**

only one pole is assumed to remain closed. A stuck breaker introduces a delayed clearing mode.

12. Excludes circuits that share a common structure for 1 mile or less.

Version History

Version	Date	Action	Change Tracking
1	TBD	Revision of TPL-001-0 as per Project 2006-02; includes merging requirements of TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0 into one, single, comprehensive, coordinated standard: TPL-001-1	Not employed due to scope of revision

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Version 1 of SAR posted for comment from April 2, 2002 through May 3, 2002.
2. Version 2 of SAR posted for comment from May 5, 2004 through June 5, 2004.
3. Version 3 of SAR posted on November 18, 2005.
4. SAR approved on April 30, 2006.
5. Version 1 of Supplemental SAR posted for comment from February 15, 2007 through March 16, 2007.
6. Version 2 of Supplemental SAR posted on April 9, 2007.
7. Version 1 of revised standard(s) posted for comment on September 17, 2007.
8. Version 2 of the revised standards posted for comment on August 15, 2008.

Proposed Action Plan and Description of Current Draft:

The SDT has established a schedule of meetings and conference calls that allows for steady progress through the standards development process in anticipation of completing their assignment in 1Q10. The current draft is the second iteration of the revision of existing standards TPL-001 through TPL-006 and includes one revised standard, TPL-001-1, replacing TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0. TPL-005 & -006 will be addressed later in the project.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments from third posting and submit revision 4 of the standard.	2Q09
2. Submit standard(s) for balloting.	3Q09
3. Submit standard(s) to BOT.	4Q09
4. Submit to regulatory authorities for approval.	1Q10

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Bus-tie Breaker: A circuit breaker that is positioned to connect two individual **straight bus** substation **bus** configurations. ~~(Substation configurations such as ring bus, breaker and a half, or double bus double breaker protection schemes do not use bus-tie breakers.)~~

Consequential Load Loss: ~~Load that is no longer connected to a source as a result of the event being studied or which is lost as a result of the load's response to the transient conditions of the event (other than through the action of UVLS or UFLS schemes). Although Load which is lost as a result of the Load's response to the transient conditions of the event is considered Consequential Load Loss and is permitted when Consequential Load Loss is allowed, Transmission planning entities are not allowed to rely upon the expectation of such Load loss to meet steady state performance requirements. All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions.~~

Extreme Events: Events which are more severe and have a lower probability of occurrence than Planning Events.

~~**Generating Unit Stability Study:** Study that focuses on an individual generating unit's or electrically closely coupled generating units' Stability for various Contingencies on the Transmission Facilities connected to that generating unit(s) point(s) of interconnection or one bus away from that point. This study is concerned with the loss of synchronism and the lack of damping of the generating units' power oscillations.~~

Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions following a Planning or Extreme Event.

Long-Term Transmission Planning Horizon: Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.

Near-Term Transmission Planning Horizon: Transmission planning period that covers Years One through five.

Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. ~~For example, non-Interruptible Load loss that occurs through manual (operator initiated) or automatic operations such as under voltage Load shedding, under frequency Load shedding, or Special Protection Systems would be considered Non-Consequential Load Loss.~~

Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies.

Planning Events: Events that require Transmission system performance requirements to be met.

Planning Coordinator: ~~The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.~~

Supplemental Load Loss: Load that is disconnected from the network by end-user equipment responding to post-Contingency System conditions.

System Stability Study: ~~Study that focuses on portions of the System, which may include many generating units, to determine whether angular Stability is maintained, inter-area power oscillations are damped, and voltages during the dynamic simulation stay within acceptable performance limits.~~

Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the ~~completion of the previous annual Planning Assessment~~ current calendar year.

A. Introduction

1. **Title:** Transmission System Planning Performance Requirements
2. **Number:** TPL-001-1
3. **Purpose:** Establish Transmission System planning performance requirements within the planning horizon to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies.
4. **Applicability:**
 - 4.1. **Functional Entity**
 - 4.1.1. Planning Coordinator.
 - 4.1.2. Transmission Planner.

5. **Effective Date:** ~~As per Implementation Plan (to be supplied later).~~ Requirements R1 and R7 shall become effective on the first day of the first calendar quarter, 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 and R7 become effective on the first day of the first calendar quarter, 12 months after Board of Trustees adoption.

Except as indicated below, Requirements R2 through R6 shall become effective on the first day of the first calendar quarter, 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements, except as noted below, go into effect on the first day of the first calendar quarter, 24 months after Board of Trustees adoption.

- For 60 calendar months after the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to the following categories of Contingencies and events identified in TPL-001-1, Table 1 are allowed to include tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2.6.4) that would not otherwise be permitted by the requirements of TPL-001-1:

- P2-1, P2-2 (above 300 kV)
- P2-3 (above 300 kV)
- P3-1 through P3-5
- P4-1 through P4-5 (above 300 kV)
- P5 (above 300 kV)

~~5.~~ Any entity that cannot fully implement its Corrective Action Plan to eliminate the need to trip Non-Consequential Load or curtail Firm Transmission Service for the above listed performance elements within 60 calendar months of the compliance date for Requirements R2 through R4 shall self report itself as being unable to meet performance requirements of this Reliability Standard. Any such entity shall submit a mitigation plan to its Regional Entity outlining the steps it will take to become compliant and the date it anticipates becoming compliant. The Regional Entity and NERC shall review the mitigation plan and the Regional Entity/NERC will either approve it or remand it for changes (this could include dates, steps, etc.). If the mitigation plan is approved by the Regional Entity and

NERC and the entity completes the mitigation plan by the date contained within the mitigation plan, no penalties will be assessed. Those entities that do not meet the date outlined in an approved mitigation plan will begin settlement proceedings at that date.

B. Requirements

R1. Each Transmission Planner and Planning Coordinator shall maintain System models for performing the studies needed to complete their Planning Assessment. The models shall use data consistent with the data provided in accordance with Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, and shall simulate projected System conditions including requirements of regulatory authorities and other legal obligations. [*Violation Risk Factor: ~~TBD~~Medium*] [*Time Horizon: ~~TBD~~Long-term Planning*]

~~R1.1.~~

~~The Planning Assessment shall include documentation of the technical rationale for modification of any data that was provided in Requirement R9 through R14, MOD-010, and MOD-012.~~

R1.1. Models for the Planning Assessment shall represent:

R1.1.1. Planned outages of generation and Transmission Facilities, if specifically known.

R1.1.2. New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon, such as:

- -Transmission Lines
- -Generators
- -Circuit breakers
- -Reactive Power devices
- -Protection System equipment
- -Control devices
- -New technologies.

R1.1.3. Real and reactive Demand of Load

R1.1.4. Firm Transmission Service

R1.1.5. Interchange

R1.1.6. Network resources required to supply Load

R2. Each Transmission Planner and Planning Coordinator shall ~~conduct and document the results of~~ prepare its annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, document results, and shall cover steady state analyses, short circuit analyses, and Stability analyses ~~including both System and Generating Unit Stability.~~ [*Violation Risk Factor: ~~TBD~~Medium*] [*Time Horizon: ~~TBD~~Long-term Planning*]

R2.1. The Near-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported ~~at a minimum~~ by the following annual current studies, supplemented with qualified past studies as indicated in Requirement R2.6:

R2.1.1. System peak Load for either Year One or year two, and for year five.

R2.1.2. System Off-Peak Load for one of the five years.

R2.1.3. For each of the studies described in Requirements R2.1.1 and ~~Requirement~~ R2.1.2, sensitivity case(s) that are intended to stress the System with ~~sensitivities variations that reflect in~~ one or more of the following conditions not already included in the studies shall be ~~run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied~~ included in the Assessment:

~~P.2.1.3.1. • Higher or lower Load than forecasted with variability of Load/demand and Load power factors due to season, weather, or time of day~~ Forecasted Load and power factor.

~~P.2.1.3.2. • Modification of e~~Expected transfers.

~~P.2.1.3.3. • Unavailability of long lead time Facilities~~ Timing of the installation of new or modified Facilities.

~~P.2.1.3.4. • Variability and outages of r~~Reactive resources capability.

~~P.2.1.3.5. •~~ Generation additions, retirements, or other dispatch scenarios.

~~P.2.1.3.6. • Decreased effectiveness of e~~Controllable Loads and Demand Side Management.

~~P.2.1.3.7. • Modification of p~~Planned duration or timing of Transmission outages.

R2.1.4. ~~In addition to those sensitivities mentioned in Requirement R2.1.3, any other sensitivities, as deemed appropriate by the Transmission Planner or Planning Coordinator for their individual systems, shall be run and the Planning Assessment shall include documentation of the technical rationale for why each was selected shall be supplied.~~ When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience due to the unavailability of the long lead time equipment.

R2.2. For the Long-Term Transmission Planning Horizon portion of the steady state analysis, ~~at a minimum~~, a current System peak Load study is required annually for one of the years in the assessment period to support the annual Planning Assessment.

R2.2.1. To accommodate any known longer lead time projects that may take longer than ten years to complete, the Planning Assessment shall be extended accordingly.

R2.3. The short circuit analysis portion of the Planning Assessment shall be conducted annually [addressing the Near-Term Transmission Planning Horizon](#) and [can be supported by current or past studies. The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study area.](#)

R2.4. The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies. The following studies are required:

R2.4.1. System peak Load for one of the five years. For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads. [An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.](#)

R2.4.2. System Off-Peak Load for one of the five years.

R2.4.3. For each of the studies described in Requirements R2.4.1 and ~~Requirement~~ R2.4.2, sensitivity case(s) that [are intended to stress the System with variations to reflect in](#) one or more of the following conditions [not already included in the studies](#) shall be ~~run and documentation of the technical rationale for why each of the conditions was or was not selected shall be supplied~~ [included in the Assessment](#):

- ~~Variations in~~ Load model assumptions.
- ~~Modification of e~~ Expected transfers.
- ~~Unavailability of long lead time Facilities~~ [Timing of the installation of new or modified Facilities.](#)
- ~~Variability and outages of r~~ Reactive resources [capability.](#)
- Generation additions, retirements, or other dispatch scenarios.

~~**R2.4.4.**In addition to those sensitivities mentioned in Requirement 2.4.3, any other sensitivity, as deemed appropriate by the Transmission Planner or Planning Coordinator for their individual systems, shall be run and the Planning Assessment shall include documentation of the technical rationale for why each was selected shall be supplied.~~

~~**R2.5.**The Generating Unit Stability analysis portion of the Planning Assessment shall be analyzed consistent with Requirement R5.5 with studies for the year when the following changes that could affect stability margins occur:~~

~~**R2.5.1.**New generator(s) are added or generation modifications are made such as changes in generation capability or replacing the exciter.~~

~~**R2.5.2.**Material Transmission System changes are made at or near the point of Interconnection of existing Generation such as the removal of a~~

~~Transmission Line or the addition of a new substation in one of the Transmission Lines connected to the plant.~~

~~R2.6.R2.5.~~ Past studies may be used to support the Planning Assessment if they meet the following requirements:

~~R2.6.1.R2.5.1.~~ For steady state, short circuit, or ~~System~~ Stability analysis: the study shall be five calendar years old or less.

~~R2.6.2.R2.5.2.~~ For steady state, short circuit, ~~Generating Plant Stability,~~ or ~~System~~ Stability analysis: the ~~study present System model~~ shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include:

- -The addition/deletion/change of individual generating unit capability of 20 MW or greater.
- -An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater.

~~R2.7.R2.6.~~ For Planning Events shown in Table 1—~~Steady State Performance~~ and Table 2—~~Stability Performance~~, when the analysis indicates an inability of the System to meet the performance requirements in ~~the~~ Tables 1, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3. The Corrective Action Plan shall:

~~R2.7.1.R2.6.1.~~ List System deficiencies and the associated actions needed to achieve required System performance. Such actions may include: ~~installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment such as protective or Special Protection Schemes, rate applications, DSM, or other initiatives, new technologies, or Operating Procedures including how long the Operating Procedures will be needed as part of the Corrective Action Plan.~~

- Installation, modification, retirement, or removal of Transmission and generation Facilities and any associated equipment.
- Installation or modification of Protection Systems or Special Protection Systems
- Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations.

- -Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate Steady State performance violations.
- -Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan.
- -Use of rate applications, DSM, new technologies, or other initiatives.

R.2.7.1.1.R2.6.2. For the Near-Term Transmission Planning Horizon, include both a project initiation date as well as an in-service date.

R.2.7.1.2.R2.6.3. For the Long-Term Transmission Planning Horizon, provide an in-service year.

~~**R2.7.4.** Contain a description of how and why the consideration of the sensitivities selected in accordance with Requirements R2.1.3, R2.1.4, R2.4.3, and R2.4.4 in the Planning Assessment did or did not result in a modification or expansion of the list of actions developed in accordance with Requirement R2.7.1.~~

R2.6.4. If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking prudent actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

R2.7.3.R2.6.5. Be reviewed in subsequent annual Planning Assessments as to implementation status of identified System Facilities and Operating Procedures.

R2.8.1.R2.7. For short circuit analysis, if the short circuit current interruption duty on fault interrupting devices determined in Requirement R2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

R2.7.1. List System deficiencies and the associated actions needed to achieve required System performance.

R2.7.2. Be reviewed in subsequent annual Planning Assessments as to implementation status.

R2.7.R2.8. The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1.

R2.9. The Planning Assessment shall identify the maximum permissible Non-Consequential Load Loss (megawatt Demand) for those Planning Events where Non-Consequential Load Loss is allowed in Table 1.

R3. For the steady state portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term and Long-Term Transmission Planning Horizon studies in Requirement R2.1 and Requirement R2.2. ~~The studies shall be based on computer power flow simulations that analyze BES normal performance (n-0) and System response to cContingencies in Table 1—Steady State Performance.~~ The studies shall be based on computer simulations using models utilizing data provided in Requirement R1. [Violation Risk Factor: ~~TBD~~Medium] [Time Horizon: ~~TBD~~Long-term Planning]

R3.1. Studies shall be performed to determine whether the BES meets the performance requirements in Table 1—~~Steady State Performance.~~ based on the lists created in Requirement R3.4.

R3.2. Studies shall be performed to assess the impact of the Extreme Events identified in Requirement R3.5.

~~R3.2.~~R3.3. Contingency analyses shall: ~~simulate the removal of all elements including those that System protection is expected to disconnect for each Contingency without operator intervention.~~

R3.3.1. Simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention.

~~R3.2.1.~~R3.3.2. For all generators, studies shall consider the minimum steady state voltage limitations ~~of all generators~~ and identify how the generators are ~~treated~~ analyzed in the steady state simulation.

~~R3.2.2.~~R3.3.3. For all Transmission lines, studies shall consider relay loadability and identify how loadability is ~~treated~~ analyzed in the steady state simulation.

R3.3.4. Simulate the expected operation of existing and planned devices designed to provide Steady State control of electrical system quantities. These devices include equipment such as phase-shifting transformers, load tap changing transformers, capacitors, and inductors.

~~R3.2.~~For Steady State studies:

~~R3.2.1.~~Performance criteria for System normal conditions and for Planning Events in Table 1—Steady State Performance shall be met.

~~R3.2.2.~~Evaluations shall be performed for single Contingencies (identified in Table 1—Steady State Performance).

~~R.3.2.2.1.~~ Consequential Load loss (expected maximum demand and expected duration) following a single Contingency shall be ~~identified in the Planning Assessment.~~

~~R.3.2.2.2. Following single Contingency events, Transmission configuration changes and redispatch of generation are allowed provided that all Facilities shall be operating within their Facility Ratings and within their thermal and voltage limits.~~

~~R3.3.3.R3.4.~~ R3.4. Those Planning Event Contingencies in Table 1 —~~Steady State Performance not covered in Requirement R3.3.2~~ that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created., ~~and~~ †The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall ~~includ~~include an explanation of why the remaining Contingencies would produce less severe System results.

~~R3.4.R3.5.~~ R3.5. Those Extreme Events in Table 1 —~~Steady State Performance~~ that are expected to produce more severe System impacts shall be identified, and a list of those events to be evaluated for System performance in Requirement R3.2 created., ~~and~~ †The rationale for the Contingencies selected for evaluation shall be available as supporting information and shall ~~includ~~include an explanation of why the remaining Contingencies would produce less severe System results. If the ~~Extreme Events~~ analysis concludes there are cascading outages caused by the occurrence of Extreme Events, an evaluation of implementing a change possible actions designed to reduce ~~or mitigate~~ the likelihood or mitigate of suchthe consequences and adverse impacts of the event(s) shall be conducted.

~~R3.5. Manual and automatic generation run back/tripping is allowed as a response to a single or multiple Contingency if the following conditions are met:~~

~~R3.5.1. All Facilities shall be operating within their Facility Ratings.~~

~~R3.4.1. Such action would not violate safety, equipment, regulatory or statutory requirements.~~

~~R3.4.2. A sustainable, stable, operating condition is maintained.~~

~~R4. For the short circuit portion of the Planning Assessment, as described in Requirement R2.3, each Transmission Planner and Planning Coordinator shall assess the short-circuit capability of its equipment under normal conditions and following any single Contingency condition that would result in greater circuit breaker interrupting duties. [Violation Risk Factor: TBD] [Time Horizon: TBD]~~

R5.R4. For the Stability portion of the Planning Assessment, as described in Requirement R2.4 ~~and Requirement R2.5~~, each Transmission Planner and Planning Coordinator shall perform the Contingency analyses listed in Table 21 —Stability Performance. The studies shall be based on computer simulations using models utilizing data provided in Requirement R1. ~~The studies shall be based on computer simulations using models utilizing data provided in Requirements R9 through R14, the MOD-010 and MOD-012 standards, and other data sources, to include known planned and long term outages of Transmission or generation equipment. The studies shall cover both System Stability and Generating Unit Stability. The following requirements apply to both System Stability and Generating Unit Stability studies unless otherwise~~

~~noted:~~ [Violation Risk Factor: ~~TBD~~Medium] [Time Horizon: ~~TBD~~Long-term Planning]

R4.1. Studies shall be performed to determine whether the BES meets the performance requirements in Table 21 — ~~Stability Performance~~ based on the lists created in Requirement R4.4 ~~shall use computer Stability simulations that analyze the response of the BES.~~

R4.2. Studies shall be performed to assess the impact of the Extreme Events identified in Requirement R4.5.

R4.3. Contingency analyses shall:

R4.3.1. ~~s~~Simulate the removal of all elements ~~including those~~ that the Protection System ~~protection~~ and other automatic controls are expected to disconnect for each Contingency without operator intervention.

~~R5.3.~~**R4.3.2.** ~~Studies shall consider~~ Simulate generator performance under anticipated conditions including how the voltage ride through capability ~~of all generators and identify how the generators are treated is analyzed~~ in the simulation.

R4.3.3. Simulate the expected operation of existing and planned devices designed to provide dynamic control of electrical system quantities. These devices include equipment such as generation exciter control and power system stabilizers, static VAR compensators, power flow controllers, and DC Transmission controllers.

~~R5.2.~~For the System Stability study:

~~R5.4.1.~~**R4.4.** At a minimum, ~~t~~Those Planning Event Contingencies in Table 21 — ~~Stability Performance~~ that ~~would~~are expected to produce more severe System impacts shall be identified, ~~and a list of those Contingencies to be~~ evaluated for System performance in Requirement R4.1 created; ~~and t~~The rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results.

~~R5.3.1.~~Performance shall meet the requirements for Planning Events in Table 2 — ~~Stability Performance.~~

~~R5.3.2.~~Automatic generation tripping is allowed to mitigate Stability violations if the following conditions are met:

~~R.5.3.2.1.~~ All Facilities shall be operating within their Facility Ratings.

~~R.5.3.2.2.~~Such action would not violate safety, equipment, regulatory or statutory requirements.

~~R.5.4.3.3.~~A sustainable, stable, operating condition is maintained.

~~R5.4.4.~~**R4.5.** At a minimum, ~~t~~Those Extreme Events in Table 21 — ~~Stability Performance~~ that ~~would~~are expected to produce more severe System impacts shall be identified ~~and a list of those events to be~~; evaluated for System performance in Requirement R4.2 created; ~~and t~~The rationale for the

Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe System results. If the ~~Extreme Events~~ analysis concludes there are cascading outages caused by the occurrence of Extreme Events, an evaluation of ~~implementing a change possible actions~~ designed to reduce ~~or mitigate~~ the likelihood or mitigate of ~~such~~the consequences of the event(s) shall be conducted.

~~R5.5.~~For the ~~Generating Unit Stability~~ studies:

~~R5.5.1.~~Shall be performed for individual generating units 20 MW or greater directly connected through a step-up transformer to the BES and for generating units at the same location which total 75 MW or greater, directly connected through their step-up transformer(s) to the BES.

~~R5.5.2.~~Shall be performed for changes in the real power output of a generating unit by more than 10% of the existing capability or more than 20 MW whichever is greater.

~~R5.5.3.~~Shall be performed and evaluated for those Planning Events that would produce more severe System impacts and the rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would produce less severe System results.

~~R5.5.4.~~Shall meet Performance requirements for Planning Events in Table 2— Stability Performance.

R6.R5. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, ~~the~~any proxies used in ~~simulation studies~~ the analysis to identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding. [*Violation Risk Factor: ~~TBD~~Low*] [*Time Horizon: ~~TBD~~Long-term Planning*]

R7.R6. Each Transmission Planner and Planning Coordinator shall determine and identify individual and joint responsibilities for performing the required studies for the Planning Assessment. [*Violation Risk Factor: ~~TBD~~Low*] [*Time Horizon: ~~TBD~~Long-term Planning*]

R8.R7. Each Planning Coordinator shall coordinate the distribution of Planning Assessment results among ~~neighboring systems~~ adjacent Planning Coordinators and any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890. [*Violation Risk Factor: ~~TBD~~Low*] [*Time Horizon: ~~TBD~~Long-term Planning*] ~~This distribution shall include:~~

~~R9.~~Each Distribution Provider shall provide its respective Planning Coordinator with modeling information for real and reactive load forecast data for each year of the Transmission planning horizon at Transmission nodes based on expected or historical System performance including the expected mix of industrial, commercial, and residential Loads, within ninety days of a request for such information. [*Violation Risk Factor: TBD*] [*Time Horizon: TBD*]

- ~~R10.~~ Each Transmission Planner shall provide its respective Planning Coordinator with modeling information for Firm Transmission Service data, Interchange Schedules and resources required to supply Load for each of its Balancing Authorities for each year of the Transmission planning horizon, within ninety days of a request for such information. *[Violation Risk Factor: TBD] [Time Horizon: TBD]*
- ~~R11.~~ Each Transmission Owner shall provide its respective Planning Coordinator with modeling information for known planned outages and long-term outages for Transmission equipment for each year of the Transmission planning horizon with consideration given to spare equipment strategy, within ninety days of a request for such information. *[Violation Risk Factor: TBD] [Time Horizon: TBD]*
- ~~R12.~~ Each Generator Owner shall provide its respective Planning Coordinator with modeling information for known planned outages and long-term outages for generation equipment for each year of the Transmission planning horizon, within ninety days of a request for such information. *[Violation Risk Factor: TBD] [Time Horizon: TBD]*
- ~~R13.~~ Each Resource Planner shall provide its respective Planning Coordinator with the modeling information for new planned facilities for each year of the Transmission planning horizon including but not limited to generators, Reactive Power devices, and new technologies, within ninety days of a request for such information. *[Violation Risk Factor: TBD] [Time Horizon: TBD]*
- ~~R14.~~ Each Transmission Planner shall provide its respective Planning Coordinator with modeling information for new planned facilities for each year of the Transmission planning horizon including but not limited to Transmission Lines, circuit breakers, Reactive Power devices, Protection System equipment and control devices, and new technologies, within ninety days of a request for such information. *[Violation Risk Factor: TBD] [Time Horizon: TBD]*

C. Measures

- M1. Each Transmission Planner and Planning Coordinator shall provide evidence, such as the System model with the specified data in electronic or hard copy format, that ~~they~~ ~~it~~ ~~are~~ ~~is~~ maintaining System models, using data consistent with MOD-010 and MOD-012, simulating projected System conditions, and that the models represent the required information in accordance with Requirement R1.
- M2. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies of its annual Planning Assessment, that it has prepared an annual Planning Assessment of its portion of the BES in accordance with Requirement R2.
- M3. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment, in accordance with Requirement R3.
- ~~M1.~~ ~~Requirement R4 to be deleted.~~
- ~~M5.~~ M4. Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment in accordance with Requirement R54.

M5. [Each Transmission Planner and Planning Coordinator shall provide evidence, such as electronic or hard copies, of the studies utilized in preparing the Planning Assessment in accordance with Requirement R65.](#)

~~M7.~~**M6.** [Each Transmission Planner and Planning Coordinator shall provide evidence, such as a dated document, that identifies that agreement has been reached on individual and joint responsibilities for performing the required studies for the Planning Assessment in accordance with Requirement R76.](#)

M7. [Each Planning Coordinator shall provide evidence, such as email notices, documentation of updated web pages, postal receipts showing recipient, date, and contents, or a demonstration of a public posting, that it has coordinated the distribution of Planning Assessment results among adjacent Planning Coordinators and any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890 in accordance with Requirement R87.](#)

D. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

[Regional Entity.](#)

1.2 Compliance Monitoring Period and Reset Timeframe

[Not applicable.](#)

1.3 Compliance Monitoring and Enforcement Processes:

[Compliance Audits](#)

[Self-Certifications](#)

[Spot Checking](#)

[Compliance Violation Investigations](#)

[Self-Reporting](#)

[Complaints](#)

1.4 Data Retention

[The Transmission Planner and Planning Coordinator shall each retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:](#)

- [The models utilized in the current Planning Assessment and one previous Planning Assessment in accordance with Requirement R1 and Measure M1.](#)
- [All Planning Assessments performed since the last compliance audit in accordance with Requirement R2 and Measure M2.](#)
- [All studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R3 and Measure M3.](#)

- All studies performed in support of its Planning Assessment since the last compliance audit in accordance with Requirement R4 and Measure M4.
- All studies performed in support of its Planning Assessments since the last compliance audit in accordance with Requirement R5 and Measure M5.
- The current, in force agreement on identified responsibilities, as well as all such agreements in force since the last compliance audit, in accordance with Requirement R6 and Measure M6.

The Planning Coordinator shall retain data or evidence to show compliance as identified unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Three calendar years of the notifications employed in accordance with Requirement R7 and Measure M7.

1.5 Additional Compliance Information

None.

2 Violation Severity Levels

Standard TPL-001-1 — Transmission System Planning Performance Requirements

	Lower VSL	Moderate VSL	High VSL	Severe VSL
<u>R1</u>	<u>The Transmission Planner or Planning Coordinator’s System model failed to represent one of the sub-requirements R1.1.1 through R1.1.6.</u>	<u>The Transmission Planner or Planning Coordinator’s System model failed to represent two of the sub-requirements R1.1.1 through R1.1.6.</u> <u>OR,</u> <u>The System model did not use data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other data sources.</u>	<u>The Transmission Planner or Planning Coordinator’s System model failed to represent three of the sub-requirements R1.1.1 through R1.1.6.</u>	<u>The Transmission Planner or Planning Coordinator’s System model failed to represent four or more of the sub-requirements R1.1.1 through R1.1.6.</u> <u>OR,</u> <u>The System model did not simulate projected System conditions as described in Requirement R1.</u>
<u>R2</u>	<u>The Transmission Planner or Planning Coordinator failed to comply with one or both of the following sub-requirements: R2.8 or R2.9.</u>	<u>The Transmission Planner or Planning Coordinator failed to comply with one of the sub-requirements: R2.3 or R2.7.</u>	<u>The Transmission Planner or Planning Coordinator failed to comply with one of the sub-requirements: R2.1, R2.2, R2.4, or R2.6.</u>	<u>The Transmission Planner or Planning Coordinator failed to comply with two or more of the sub-requirements: R2.1, R2.2, R2.4, or R2.6.</u>
<u>R3</u>	<u>The Transmission Planner or Planning Coordinator did not identify Planning Events as described in Requirement R3.4 or Extreme Events as described in Requirement R3.5.</u>	<u>The Transmission Planner or Planning Coordinator did not perform studies as specified in Requirement R3.1 to determine that the BES meets the performance requirements for one of the categories (P2 through P7) in Table 1.</u> <u>OR,</u> <u>The Transmission Planner or Planning Coordinator did not perform studies as specified in</u>	<u>The Transmission Planner or Planning Coordinator did not perform studies as specified in Requirement R3.1 to determine that the BES meets the performance requirements for two of the categories (P2 through P7) in Table 1.</u> <u>OR,</u> <u>The Transmission Planner or Planning Coordinator did not perform Contingency analysis as</u>	<u>The Transmission Planner or Planning Coordinator did not perform studies as specified in Requirement R3.1 to determine that the BES meets the performance requirements for three or more of the categories (P2 through P7) in Table 1.</u> <u>OR,</u> <u>The Transmission Planner or Planning Coordinator did not perform studies to determine that</u>

	Lower VSL	Moderate VSL	High VSL	Severe VSL
		<p><u>Requirement R3.2 to assess the impact of Extreme Events.</u></p> <p><u>OR,</u></p> <p><u>The Transmission Planner or Planning Coordinator did not base its studies on computer simulations using models utilizing data provided in Requirement R1.</u></p>	<p><u>described in Requirement R3.3.</u></p>	<p><u>the BES meets the performance requirements for the P0 or P1 categories in Table 1.</u></p>

None.

Standard TPL-001-1 — Transmission System Planning Performance Requirements

Table 1 – Steady State & Stability Performance Planning Events

Steady State & Stability:

- a. Voltage instability, cascading outages, and uncontrolled islanding shall not occur.
- b. Consequential Load Loss, Supplemental Load Loss, Load Reduction, and consequential generation loss ~~is allowed for all events shown~~ are acceptable as a consequence of any Planning or Extreme Event excluding P0. However, Supplemental Load Loss associated with an event shall not be used to meet steady state performance requirements.
- c. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect for each event.
- d. Simulate Normal Clearing unless otherwise specified.
- e. For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

- ~~b.f. Facility Ratings shall not be exceeded. Unless precluded in the Requirements, planned System adjustments are allowed, unless precluded in the Requirements, to keep Facilities within the Facility Ratings, if such adjustments are executable within the time duration applicable to the Facility Ratings.~~ System steady state voltages and post-~~transient~~ Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator (or Transmission Planner if more restrictive).
- g. Planning Event P0 is applicable to steady state only.

Stability Only:

- h. The System shall remain stable. ¹
- ~~f. Dynamic voltages~~ Transient voltage response shall be within acceptable limits established by the Planning Coordinator (or Transmission Planner if more restrictive).
- i. ~~Simulate Normal Clearing unless otherwise specified.~~

Category	Initial System Condition	Event ²	Fault Type ³	BES Level ⁴	Interruption of Firm Transmission Service Allowed ⁵	Non-Consequential Load Loss Allowed
P0 No Contingency Normal System Conditions	Normal System	None	N/A	EHV, HV	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷	3Ø	EHV, HV	No	No
		<u>5. Single Pole of a DC line</u>	SLG			
P2 Single Contingency	Normal System	Loss of one of the following: 1. <u>Opening of Breaker(s) w/o fault</u> ⁸	N/A	EHV, HV	No	No
		2. Bus Section <u>Fault</u>	SLG	EHV HV	No Yes	No Yes
		3. Internal Breaker Fault ⁹	SLG	EHV	No	No

Standard TPL-001-1 — Transmission System Planning Performance Requirements

		(Non bus-tie)	SLG	HV	Yes	Yes
		4. Internal Breaker Fault (bus-tie) ⁹	SLG	EHV, HV	Yes	Yes
P3 Multiple Contingency (Generator + I)	Loss of generator <u>unit</u> followed by System adjustments ^{10,5}	Loss of one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷ 5. Single pole of a DC Line	SLG <u>3Ø</u>	EHV, HV	No ¹⁰	No
		5. Single pole of a DC line	SLG	EHV, HV	No ¹⁰	No
P4 Multiple Contingency (Fault plus stuck breaker ¹¹)	Normal System	Stuck breaker ¹¹ (non-bus-tie) attempting to clear a Fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷ 5. Bus Section	SLG	EHV	No ¹⁰	No
			SLG	HV	Yes	Yes
		6. Stuck breaker (bus-tie) attempting to clear a Fault on the associated bus	SLG	EHV, HV	Yes	Yes

Table 1 – Steady State & Stability Performance Planning Events, Continued

Category	Initial System Condition	Event ²	Fault Type ³	BES Level ⁴	Interruption of Firm Transmission Service Allowed ⁵	Non-Consequential Load Loss Allowed
P5 Multiple Contingency (Fault plus Protection System failure)	Normal System	Loss of multiple elements due to a single component caused by the failure within of a single Protection System associated with while clearing a fault on one of the following: 1. Generator 2. Transmission Circuit 3. Transformer ⁶ 4. Shunt Device ⁷ 5. Bus Section	SLG	EHV	No ¹⁰	No
			SLG	HV	Yes	Yes
P6 Multiple Contingency (Two overlapping singles)	Loss of one of the following followed by System adj. ^{10s} : 1. Transmission Circuit 2. Transformer ⁶ 3. Shunt Device ⁷ 4. Single pole of a DC line	Loss of one of the following followed by System adjustments : 1. Transmission Circuit 2. Transformer ⁶ 3. Shunt Device ⁷ 4. Single pole of a DC line	SLG <u>3Ø</u>	EHV, HV	Yes	Yes
		4. Single pole of a DC line	SLG	EHV, HV	Yes	Yes
P7 Multiple Contingency (Common Structure)	Normal System	The loss of: 1. Any two circuits on common structure ¹² 2. Loss of a bipolar DC line	SLG	EHV, HV	Yes	Yes

**Table 1 – Steady State & Stability Performance
Extreme Events**

Table 1 – Steady State & Stability Performance Extreme Events	
<p>Steady State & Stability For all Extreme Events evaluated:</p> <ol style="list-style-type: none"> 1. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect for each Contingency. <ul style="list-style-type: none"> 2. Simulate Normal Clearing unless otherwise specified. 3. See Requirement R3.4 4.2. See Requirement R5.5.4 	
<p>Steady State</p> <ol style="list-style-type: none"> 1. Loss of a single generator, Transmission Circuit, DC Line, shunt device, or transformer forced out of service followed by another single generator, Transmission Circuit, DC Line, shunt device, or transformer forced out of service prior to System adjustments. 2. Local area events affecting the Transmission System such as: <ol style="list-style-type: none"> a. Loss of a tower line with three or more circuits.¹² b. Loss of all Transmission lines on a common RRight-of-Way. c. Loss of a switching station or substation (loss of one voltage level plus transformers). d. Loss of all generating units at a station. e. Loss of a large Load or major Load center. 3. Wide area events affecting the Transmission System based on System topology such as: <ol style="list-style-type: none"> a. Loss of two generating plants resulting from conditions such as: <ol style="list-style-type: none"> i. Loss of a large gas pipeline into a region or multiple regions that have significant gas-fired generation. ii. Loss of the use of a large body of water as the cooling source for generation. iii. Wildfires. iv. Severe weather, e.g., hurricanes, tornadoes, etc. v. A successful cyber attack. vi. Shutdown of a nuclear power plant(s) and related facilities for a day or more for common causes such as problems with similarly designed plants. b. Loss of two Transmission lines in different rights of way prior to System adjustments for conditions such as: <ol style="list-style-type: none"> i. Wildfires. ii. Severe weather, e.g., hurricanes, tornadoes, etc. e.b. Other events based upon operating experience that may result in wide area disturbances. 	<p>Stability</p> <ol style="list-style-type: none"> 1. With an initial condition of a single generator, Transmission circuit, DC line, shunt device, or transformer forced out of service, apply a 3Ø fault on another single generator, Transmission circuit, DC line, shunt device, or transformer prior to System adjustments. 2. Local or wide area events affecting the Transmission System such as: <ol style="list-style-type: none"> a. 3Ø fault on generator with stuck breakerbreaker¹¹ or a Protection System failure due to a single component failure within the protection systemresulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breakerbreaker¹¹ or a Protection System failure due to a single component failure within the protection systemresulting in Delayed Fault Clearing. e. 3Ø fault on transformer with stuck breaker or a protection system failure due to a single component failure within the protection system. c. 3Ø fault on bus section with stuck breaker or a protection system failure due to a single component failure within the protection system. 3Ø fault on transformer with stuck breaker¹¹ or a Protection System failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker¹¹ or a Protection System failure resulting in Delayed Fault Clearing. e. 3Ø internal breaker fault¹¹. f. 3Ø fault on two or more circuits on a common structure¹². g. SLG or 3Ø fault on all Transmission lines on a common Right-of-Way right of way. h. 3Ø fault on switching station or substation (loss of one voltage level plus transformers) i. Other events based upon operating experience, such as consideration of initiating events that experience suggests may result in wide area disturbances.

**Table 1 – Steady State & Stability Performance
Footnotes
(Planning Events and Extreme Events)**

1. System stable means:
 - a. Angular Stability:
 - i. For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism. A generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism.
 - ii. For all other Planning Events: No generating unit or units totaling more than the Contingency + Reserve of the Balancing Authority (or Reserve Sharing Group if applicable) shall be allowed to pull out of synchronism. Generators that pull out of synchronism must have out-of-step protection or some other means to trip the generator for this condition and the resulting apparent impedance swings must not pass through relay characteristics that would result in the tripping of any Transmission System elements other than the generating unit and its direct connection Facilities.
 - b. For all Planning Events evaluated: Power oscillations shall exhibit acceptable damping as established by the Planning Coordinator (or Transmission Planner if more restrictive).
2. If the event analyzed involves BES elements at multiple System voltage levels, the lowest System voltage level for stated performance criteria applies regarding allowances for interruptions of Firm Transmission Service and loss of Non-Consequential Load.
3. Unless specified otherwise, simulate Normal Clearing faults. Single line to ground (SLG) or three phase (3Ø) are the fault types, that must be evaluated in Stability simulations for the event described. A 3Ø fault study indicating criteria are being met shall provide sufficient evidence that a SLG condition would also meet criteria.
4. Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems. The designation of EHV and HV is used to distinguish between stated performance criteria allowances for interruptions of Firm Transmission Service and Non-Consequential Load.
5. When the conditions and/or event(s) being studied form the basis for conditional Firm Transmission Service, curtailment of that conditional Firm Transmission Service is allowed.
6. For non-Generator Step Up transformer outage events, the reference voltage applies to the low-side winding (excluding tertiary windings) ~~and excluding generator step up transformers~~. For generator and generator Step Up transformer outage events, the reference voltage ~~apply~~ applies to the BES connected voltage (high-side of the Generator Step Up transformer). Requirements which are applicable to transformers also apply to variable frequency transformers and phase shifting transformers.
7. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground.
8. Inadvertent tripping of breakers on one end of a normally networked Transmission circuit such that the line is now open at that end and possibly serving Load radial from a single source point.
9. An internal breaker fault means a breaker failing internally, thus creating a System fault which must be cleared by protection on both sides of the breaker.
10. Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered.
11. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated

Standard TPL-001-1 — Transmission System Planning Performance Requirements

(IPO) breaker, only one pole is assumed to remain closed. ~~The~~ stuck breaker event introduces a delayed clearing mode. ~~Normal Clearing is when the Protection System operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Breaker fail relay operation is a predetermined time that occurs after the Protection System operates and the breaker has failed. Breaker fail relaying will also isolate a predetermined portion of the electric system to isolate the failed breaker. Delayed clearing of a Fault is due to failure of any Protection System component that prevents the Protection System from operating normally.~~

12. Excludes circuits that share a common structure for 1 mile or less.

Table 1—Steady State Performance

~~h. Facility Ratings shall not be exceeded. Planned System adjustments are allowed, unless precluded in the Requirements, to keep Facilities within the Facility Ratings, if such adjustments are executable within the time duration applicable to the Facility Ratings.~~

~~i. System steady state voltages and post transient voltage deviations shall be within acceptable limits as established by the Planning Coordinator (or Transmission Planner if more restrictive).~~

~~j. Voltage instability, cascading outages, and uncontrolled islanding shall not occur.~~

~~k. Consequential Load and consequential generation loss is allowed for all events shown.~~

~~l. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect for each event.~~

~~m. Simulate Normal Clearing unless otherwise specified.~~

Planning Events

Category	Initial System Condition	Event ³	BES Elements out of Service ^{2,3}		Interruption of Firm Transmission Service Allowed	Non-Consequential Load Loss Allowed
			(A) > 300 KV	(B) <= 300 KV		
P0 Normal System conditions	Normal System	None	X	X	No	No
P1 Single Contingency	Normal System	Loss of one of the following: 1. Generator 2. Transmission circuit 3. Transformer 4. Shunt device 5. Single pole of a DC line	X	X	No Yes, if transfer is dependent on the outaged DC line.	No

Standards Announcement

Comment Period Open

May 26–July 9, 2009

Now available at: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Project Name:

2006-02 — Assess Transmission Future Needs

Due Date and Submittal Information:

The comment period is open **until 8 p.m. EDT on July 9, 2009**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at Lauren.Koller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page: <http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Content for Comment Period:

- Draft three of TPL-001-1 — Transmission System Planning Performance Requirements
- A revised implementation plan

TPL-001-1 is designed to be a single, comprehensive, and coordinated standard that merges the requirements of four existing standards: TPL-001-0, TPL-002-0, TPL-003-0, and TPL-004-0. The proposed standard includes several new definitions.

Other Materials Posted:

- The drafting team's consideration of industry comments received during the second comment period

Project Background:

The purpose of the proposed standard is to establish transmission system planning performance requirements within the planning horizon to develop a bulk electric system that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies. The project includes updating and consolidating the following standards:

- TPL-001-0 — System Performance under Normal Conditions
- TPL-002-0 — System Performance Following Loss of a Single BES Element
- TPL-003-0 — System Performance Following Loss of Two or More BES Elements
- TPL-004-0 — System Performance Following Extreme BES Events
- TPL-005-0 — Regional and Interregional Self-Assessment Reliability Reports

- TPL-006-0 — Data from the Regional Reliability Organization Needed to Assess Reliability

This part of the project addresses TPL-001-0 through TPL-004-0. TPL-005 and TPL-006 will be addressed later in the project.

Applicability of Standards in Project:

- Transmission Planner
- Planning Coordinator

Standards Development Process

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Individual
John Allen
City Utilities of Springfield, MO
No
City Utilities of Springfield, Missouri does not agree with the restrictions placed on the Category P3 contingencies. Since this will simulate a multiple contingency similar to a Category P4, loss of firm transmission service and/or loss of non-consequential load should be allowed. We suggest that the drafting team expand the allowable mitigating measures for a Category P3 to be consistent with a Category P4, where loss of firm transmission service and/or loss of non-consequential load is allowed for HV levels.
Group
Dominion - Electric Transmission
R1 – Dominion questions the legal authority NERC has to include the recently inserted language “including requirements of regulatory authorities and other legal obligations.” This language is

too broad and far exceeds the jurisdiction of NERC’s mission. R1.1.5 - Dominion has seen base case models built by other transmission entities which do not include area interchanges for all areas and must be solved with area interchange “turned off”. Would these base case models be in violation of R.1.1.5?

R2.1.3 - Dominion suggests that SDT needs to be more specific on which of the variations to include. Also for the last bullet, the SDT needs to clarify the duration or timing of planned transmission outages (in relation to Planning horizon). R2.4.1 - While we appreciate the intent of introducing induction motor modeling in simulations, this is a difficult proposal in actual practice. The question of how much of the load is comprised of induction motors and what is a reasonable/practical model has been around now for over twenty years yet is still not resolved satisfactorily. For example, we have heard several experts declare the CLOAD model is inadequate for study. NERC needs to take the lead in developing appropriate models for the widely used simulation software and a methodology for determining load composition prior to requiring induction Load modeling in dynamic simulation studies. Additionally, this requirement states that Aggregate System Load model is acceptable to represent the dynamic behavior of induction motor Loads. Our interpretation is that such aggregate models shall be inserted by the Planners at the time of study, over a specific study area as determined by TP, and these models are not to be represented in the interconnection-wide (i.e. ERAG/MMWG) dynamics base cases. If ERAG/MMWG dynamics base cases are populated with such aggregate load models, the dynamic simulation cases could become very difficult to solve, if not impossible. R2.8 - Dominion does not see any purpose in reporting largest consequential load loss. This is not easily calculated, and would vary from year by year, season by season. R2.9 - Dominion requests further clarification. Is the intent of this requirement to develop criteria for maximum allowable non-consequential load loss prior to requiring a corrective action plan or to just calculate such a load loss where it is permitted in Table 1?

No comments.

R4.4 - Dominion believes that creating a master list of all contingencies a planner must take is burdensome and provides no planning value. In addition the contingencies will vary based on the loading configuration and the specific study case. In general, we start out with the very worst contingencies. If these cause hard rotor swings, we know we will probably have to do most of the possible contingencies in the station until we get down to contingencies that do not swing the generator much. But if the swings are light, then that particular load/topology situation probably does not need in-depth exploration. Creating a master list could create unnecessary study. However, we do support a list of the extreme contingencies in R4.5.

R.5 - What is meant by proxies?

No comments.

No comments.

Yes

Yes

No

Table 1 – Interruption of Firm Transmission Service is not allowed for many of the events listed. Doesn’t this imply that firm point-to-point service can’t be interrupted even when the service is provided across points that are connected only by a radial facility? If so, does NERC have the authority to determine how transmission service providers calculate firm ATC? Dominion is also concerned that transmission service providers appear subject to ‘double jeopardy’ I.E, NERC fine for violations of applicable reliability standard and FERC sanctions if OATT is violated.

No

Dominion agrees with the retirement of TPL-005-0 and TPL-006-0. However, Dominion has some concern over the implementation period and believes that 60 months to implement corrective action plans may not be enough. This standard has more stringent requirements (“raising the bar”) than the current TPL standards. Having to assess the system for these new standards as well as implementing corrective action plans within 60 months could be difficult to get approval to site and construct new transmission. Dominion suggests that an additional 12 to 24 months be given to allow time for the assessments to determine violations, solicit input from all stakeholders through RTO process (As required by FERC 890) to determine the most appropriate corrective action plans.

Group

Northeast Power Coordinating Council

R1--There needs to be some direction provided on the initial conditions used in the assessment. This guidance should include discussion as to whether or not representations of generator forced outages are to be represented in the base case or if they are addressed through the sensitivity testing (Could add R1.1.7 Reasonable representations of unplanned generator outages.) Additionally, the standard is also silent on the treatment of system transfers, both internal and

external, as to how they should be modeled in the base case. For some areas, their current practice is to include heavy system stresses in their base case, which leaves little for sensitivity testing. It is unclear if this practice works within the purview of this standard. Guidance is needed on how to treat base case generation dispatch and system transfers. The inclusion of "requirements of regulatory authorities and other legal obligations" is not understood. Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1. "Simulate" should be changed to "incorporate". R1.1.1 Priority comment – Only known long-term outages of generation and transmission should be required to be modeled. R1.1.2 comment - Do we need to have the list of equipment to model? How are circuit breakers, and other equipment modeled? Also, what should be the level of detail and the form that Protection System Equipment and Control Devices be modeled? We recommend deleting the list. Make R1.1.2 simply read as follows: R1.1.2--Projected system configuration, taking into account new planned Facilities and changes to existing Facilities, for each year of the Near-Term and Long-Term Transmission Planning Horizon. R1.1.5 comment – What specifically needs to be modeled under Interchange? R1.1.6 comment – This needs further definition or it should be deleted. It is not clear what a "network resource required to supply load" is. Does this refer to Network Resource per FERC LGIP?

It is recommended to replace the phrase "prepare" with "conduct and document" in the first sentence. R2.1.1 Comment – The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2. R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment. R2.1.4 – With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Remove the wording "(such as a transformer)". What constitutes "spare equipment strategy"? Would a strategy that involves out-of-merit dispatch or operational restrictions be considered a valid "spare equipment strategy". If a transformer is lost, could a reconfiguration of the transmission system constitute a valid "spare equipment strategy"? R2.2 Comment – We suggest replacing the phrase "a current System peak Load study" with "a valid System peak Load study" in the first sentence. The word current is confusing as some read the word current to mean "today's" rather than "valid". R2.3 Comment – Please provide guidance as to what year should be represented when performing short circuit studies. R2.4.1 Comment – Change to read: "For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load." R2.5.1 Comment – We suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 Comment – To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the latest Transmission Planning Horizon System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include:

- The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study]
- An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner.

R2.6 Priority Comment – As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read "Provide documentation that explains the reasoning for the sensitivities considered and selected." R2.6 Comment – At the end of the second sentence, the phrase "in the tables" is used. We suggest using more definitive language such as "in Table 1". R2.6.2 Comment – The phrase "Project Initiation Date" needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase "as well as an in-service date" should be modified to read "as well as a target in-service date". R2.6.3 Comment – Plans can provide a target in-service year but not an actual in-service year. R2.6.4 Priority Comment – There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions.

R2.8 Comment –Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. R2.9 Comment – This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment. It is strongly recommended that the standard should consider not allow non-consequential load loss to resolve any violation arising from the planning events in Table 1. Therefore, this requirement would then be deleted. The use of "System Off-Peak Load" is too general. Is the intention to have the system minimum load used here? Because of the seasonal differences in equipment ratings, seasonal peak and off peak (minimum) loads should be analyzed.

R3.3.2 – Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R3.3.3 – PRC-023 requires relay loadability to be reflected in facility ratings. Therefore this additional requirement is unnecessary and should be deleted. R3.5 – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events - Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered." For Requirements R3.4 and R3.5, what defines "more severe System impacts"?

R4.3.2 - Traditionally transmission planners have assumed that generators would ride through low voltages associated with Planning Events which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R4.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events - Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered." For Requirements R4.4 and R4.5, what defines "more severe System impacts"?

It is unclear as to what is meant by the term "proxy used in the analysis" used in this requirement. Does this mean Planning Coordinator established practices, thresholds or guidelines used to gauge when simulations suggest an event such as cascading outages occurs? If so the Requirement should be revised to read: R5. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, when established practices, thresholds or guidelines identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding. The VRF should be "Medium".

We do not feel that this requirement belongs in this standard and it should be deleted. The standard defines requirements for the assessment not who does what.

This standard should not be reiterating FERC Order 890. We do not feel that this requirement belongs in this standard and it should be deleted.

No

Revise the Load Reduction and Non-Consequential Load Loss definitions as follows. Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions resulting from following a Planning or Extreme Event. Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. Intended post contingency loss of load (other than Interruptible Load, Supplemental Load or Load Reduction) caused by operator or SPS (RAS) action. (Priority Comment) For Drafting Team consideration: What types of non-interruptible load loss would be considered non-consequential load loss--manual load shedding for example? With this in mind, can the definition be simplified, maybe to read: Non-Consequential Load Loss: Operator action taken to deliberately remove load from service in response to adverse system conditions.

No

For Steady State & Stability: Steady State & Stability: a. Transmission voltage instability, cascading outages, and uncontrolled islanding shall not occur. b. Consequential Load Loss, Supplemental Load Loss, Load Reduction, and consequential generation loss are acceptable as a consequence of any Planning or Extreme Event excluding PO. However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance

requirements P5 Priority Comment – As written, this requirement is overly severe. This would require the simulation of a “dead” station if only one battery is present (use of NERC Glossary Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. P7 Priority Comment – Event 1 - This requirement requires the evaluation of the loss of two circuits on a multiple circuit tower. We recommend that this be modified so that only the loss of two adjacent (vertically or horizontally) circuits need be evaluated. We also recommend that the Planning Coordinator be allowed to evaluate and if appropriate exempt specific locations from this contingency based on acceptable risk. Comments on Extreme Events – Table 1- We recommend renumbering the Extreme Events table to be Table 2. Stability Condition 2 Note a - Priority Comment - As written, this requirement is overly severe. This would require the simulation of a “dead” station if only one battery is present (use of NERC Glossary’s Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. Stability Condition 2 Note h – Eliminate this requirement or change to loss of station following three-phase fault. This note is confusing. Without providing a better defined scenario, it is unclear as to what clearing times should be used in this simulation. Comments on Footnotes – Table 1- We recommend renumbering the Footnotes table to be Table 3. Footnote 1.a.i – Should clarify that this requirement refers to generator units that are connected to the BES system. Footnote 1.a.ii – Contingency Reserve is dependent on the generation on-line. We suggest changing the first sentence to say that you can’t lose more than that permissible by the Planning Coordinator. Also change “pull out of synchronism” to “lose synchronism” in this sentence and in the second sentence. (Is “Lose synchronism” a more commonly used term?). Footnote 1.a.i, states “For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism.” There is the potential for this requirement to be taken too far. Does this mean that someone’s 4 kW generator at home needs to remain synchronized? Therefore, there needs to be some sort of qualifier on this requirement. Suggested wording: “For Planning Event P1: No generating unit or units greater than 20 MW and directly interconnected at 100 kV or above shall be allowed to lose synchronism. Note that synchronism applies to conventional synchronous generators and may not apply to other generation technology.” Footnote 3 – We recommend revising the wording of the last sentence to “A three phase fault study indicating criteria are being met is sufficient evidence that a SLG condition would also meet criteria.” Footnote 4 – We recommend that a lower bound be put on the HV electric systems (such as 100 kV), rather than just saying “and lower”. As has been commented on in a previous draft, the Drafting Team should also consider not having a prescribed voltage definition of BES, be it called EHV or HV. Studies should determine what facilities should be part of the BES because of their impact on reliability. A proposal is to modify Footnote 4 to replace the phrase “...(EHV) Facilities defined as greater than 300 kV...” with “...(EHV) Facilities defined as having a significant impact on the reliability of the System, generally at voltages greater than 300 kV as determined by the Planning Coordinator...” In using such language, the more stringent requirements could apply to BES/EHV but not globally for Facilities operating at voltages greater than 300 kV. Using this methodology the extra investment required would go towards real improvement of the reliability of the System. EHV and HV should be added to the Definitions of Terms Used in Standard. Footnote 12 – We recommend adding an alternative modifier to the end of the sentence, “or for 5 towers or less.” This is consistent with NPCC criteria.

No

Capitalize Firm Transmission Service in footnote 10 and instead of saying firm Load use Firm Demand to be consistent with the NERC Glossary.

No

Please clarify, since R2 through R6 should become effective before results could be distributed to adjacent Planning Coordinators and any functional entity. However, by the wording of the effective date of R1 and R7 it appears R7 becomes effective before R2 to R6. That is, 24 months are allowed by the standard to complete the planning assessments after regulatory approval. The results may not be ready for distribution by the planning coordinator after the first twelve months. The term “Planning Coordinator” is not defined in the NERC Glossary of Terms used in Reliability Standards and, therefore, this standard should indicate whether this term is the same as the “Planning Authority” defined in the glossary. Otherwise the definition of the Planning Coordinator should be included in the NERC Glossary of Terms used in Reliability Standards. With regard to the many changes/modifications from the previous draft and from the previous TPL standards being replaced by TPL-001-1, another posting of this Standard will be necessary to fully evaluate the impact (on reliability and also cost of implementation) of such changes. The decision to allow the use of all type of RAS or SPS (particularly generator tripping and run-back) as a common practice for single contingency does not “raise the bar” in the planning standard, and should be reviewed. How can higher system performance be required that involves substantial infrastructure investment to prevent events with a very low probability of occurrence, and allow use of a less reliable measure (SPS failure or misoperation having a higher probability of occurrence) to reduce the investment for more probable events?

Group

TVA System Planning

The phrase, "for each year of the Near-Term and Long-Term Transmission Planning Horizon", should be revised to remove "each year" because there may not be studies actually required in each year. The SDT stated during its June 30th Webinar that protection system equipment need not be explicitly represented in models, but had difficulty in determining adequate wording for the proposed sub-requirement. Because protection system action is described in R3.3.1, R3.3.4, R4.3.1, and R4.3.3 we suggest that protection system equipment be removed from the list in R1.1.2. If R1.1.2 is not removed, TVA is concerned about the level of resources that will be required to model these additional relay requirements in the one year allowed in the Implementation Plan. In bullet three of R1.1.2, are bus-tie circuit breakers to be represented in the models? Typically circuit breakers are included in the contingency definitions along with the protection system equipment used in the powerflow models. In bullet seven of Requirement R1.1.2, what "new technologies" are to be represented in the models?

Do not understand the rationale for being so prescriptive in requiring specific years to be studied in R2.1.1. Why not allow the TP and/or PC to decide on the three years to be studied in the Near Term? Since R2.3 short circuit analysis is a new "raising the bar" requirement, should the implementation plan for this be for 5 years like the other new "raising the bar" requirements? Further clarification is needed in R2.4.1 concerning load models that appropriately represent the dynamic behavior of loads. Is a NERC drafting team addressing these issues to determine an industry standard? If contingencies occur inside one utility that affect facilities in another utility, which utility is responsible for running these studies during the annual assessments? In R2.6.1, is there any limit to the time duration that a SPS and/or operating procedures can be used in the CAP? In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. In R2.6.1, installation or modification of Protection Systems or Special Protection Systems are now allowed as part of the Corrective Action Plan. Should undervoltage and underfrequency load shed also be allowed in the Corrective Action Plan? In R2.9, does the requirement require the maximum non-consequential load that can occur for contingencies in Table 1 or does it require just the maximum that a utility will allow on its system? Suggest clarifying "permissible" or perhaps using similar language as found in R2.8. Please explain the reason why Requirement R2.9 is needed in the Assessment. Reporting the largest Non-Consequential Load Loss does not impact reliability. In R2.1, change the reference to requirement R2.6 (at the end of the last line) to R2.5. With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: "unless justification can be provided to demonstrate that the results of an older study are still valid." In Requirement R2.6.2, what constitutes a "project initiation date," and how will it be used? Please clarify. Please explain the reason why Requirement R2.8 is needed in the Assessment. Reporting the largest Consequential Load Loss does not impact reliability. R2.1 – What's the value in being able to use "qualified past studies" if you have to use "annual current studies"? Strike the words "supplemented with" and insert the word "or". R2.3 – Insert the phrase "one year of" after the word "addressing". In the subrequirements of 2.1.3 and 2.4.3, the use of the word "timing" is unclear. Consider using "in service date" or "schedule for". In R2.6, does the Corrective Action Plan need to show all possible alternatives to fix a problem that has been identified - or does only one solution need to be shown for a problem?

In R3.3.2, need guidance on how to consider minimum steady state voltage limitations. Is there a NERC team addressing this? It is not clear if it is referring to the ability of plants to meet their voltage schedule, or to their ability to stay connected during post contingencies. In R3, should the "and" in the first sentence actually be "or"? especially for same footprint? Perhaps the "and" should be replaced by "and/or". Can the PC satisfy this requirement by reviewing studies performed by differing TPs or is separate analysis really required especially when the TP and PC have the same footprint? In the VSL for R3, a severe VSL is listed as failing to meet performance requirement for P0 or P1. We do not understand why a severe VSL would be applied to an all ties closed event which should have little if any problems. We believe that this should be a lower or moderate VSL instead of severe. In R3.3.3 is the relay loadability required for all HV and EHV voltage levels? Previously NERC had required this for 230-kV and above only. This would be massive requirement for our TLs between 100 and 200-kV.

In R4, should the "and" in the first sentence actually be "or"? R4.3.2 requires that voltage ride through capability be analyzed. It is not clear what should be analyzed (e.g. auxiliary loads, generator protection, generator capability, etc.) This requirement needs more clarity. By in large, the industry does not have the input data or the methods to do this. It would seem necessary to have PRC-024 approved before this can be met.

In the VSL associated with R5, we believe that failure to define and document one of the proxies should be a moderate VSL, failure to define and document two proxies should be a high VSL, while failure to define and document three proxies should be a severe VSL. Otherwise failing to document only one proxy would result in a severe VSL. The word "proxies" in this context is confusing and subject to various interpretations. Recommend changing the word "proxies" to "criteria." There is no requirement that the Planning Coordinator (PC) must use the same proxies

as the Transmission Planner (TP). Since differences in proxy assumptions may lead to different study results, R5 should be revised to require the PC and TP to coordinate the use of proxies.

In the VSL associated with R6, we believe that failure to determine and identify one responsibility should be a moderate VSL, failure to determine and identify two responsibilities should be a high VSL, while failure to determine and identify three responsibilities should be a severe VSL. Otherwise failing to document only one responsibility would result in a severe VSL.

In the VSL associated with R7, we believe that the PC failing to coordinate analysis should be a moderate VSL, the PC failing to distribute should be a high VSL, and failing to do both of these tasks should be a severe VSL.

No

TVA suggests adding back the following to the Bus-tie breaker definition that was contained in Posting #2: "Substations configurations such as ring bus, breaker and a half, or double bus double breaker protection schemes do not use bus tie breakers". TVA believes that this additional wording helps explain this definition much more clearly. In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. Are these now no longer considered to be Non-Consequential Load Loss but instead now considered to be Load Reduction, Supplemental Load Loss, or something else? Should Supplemental Load Loss be further defined as load that is disconnected from the network by end-user equipment responding during duration of the fault as well as to post contingency system conditions? Also the definition of Supplemental Load Loss may benefit from some examples in the definition to further help clarify. Please clarify how Supplemental Load Loss would be included in the stability analysis. The second sentence in the Year One definition is rather confusing. We would suggest changing "calendar year" to "date". Otherwise it may be interpreted that Year One would begin 12 to 18 months from the end of the current calendar year. Suggest from "beginning". Load Reduction – Please clarify whether this includes both load response and operator initiated action, such as in changes to transformer LTC. Should definition also include that this load is continuing to be served? Consequential Load Loss must include load that is lost due to the inherent response of the particular type of load. Some motors, lighting and processes will naturally trip during an event, although not as a result of the protection system. It may have been the intent of the SDT to include this phenomenon in the Supplemental Load Loss definition. However, this definition includes the phrase, "by end-user equipment", and that makes one think that there are devices at the end-user location that is removing this equipment (and conversely, load that is not disconnected "by" end-user equipment cannot be included). Also, the term "post-Contingency" can be confusing because in the case of faults, this phrase is not clear if it means conditions after the fault initiation itself or only after the clearing of the fault. Revise Supplemental Load Loss to read, "End-user Load that inherently disconnects from the System as a consequence of (or "in response") to the conditions created by the System event."

No

The existing TPL 002-0 allows for some local load to be dropped for a single contingency event as long as the Bulk system reliability was not impacted. However there is no such allowance any longer for losing such load for a single contingency in the proposed draft. It would be very expensive for TVA to fix all such events in several remote areas that would have very little impact on the overall reliability of the TVA bulk system. TVA believes that the capital spent for these fixes could be used to better strengthen the overall bulk system in much better ways. P5 should not be a planning event. PRC standards address protection system failures. The complexity associated with identifying and simulating such events is unknown and the defense of assumptions made and events simulated will lead to inconsistency in compliance and enforcement. Industry accepted proxies for such events could be developed that would allow for efficient identification of areas needing further study. Attempting to intermingle protection system operation with BES performance will be nearly impossible to implement given current technologies. Stability Extreme 2.g, and Steady State 2.b. both need a note like footnote number 12 that excludes short distances. Suggest footnote #12 be modified to include right-of-way in addition to structures.

Yes

No

TVA is concerned that the 5 year window for meeting the "raising the bar" requirements is still not adequate. For instance, it typically takes TVA 7 to 10 years to build a new 500-kV transmission line - including time required for such processes as federally mandated NEPA environmental reviews. Strongly suggest increasing this time window to 10 years. Also trying to construct enough facilities within the 5 year implementation period will result in multiple outages at same time - possibly affecting TVA's bulk reliability during this construction period. Also TVA is concerned that EHV equipment manufacturers will not be able to meet all the equipment orders that will be required to meet the "raising the bar" requirements. Thus TVA believes that these additional concerns strengthen the need to have a 10 year implementation period. Since breaker duty is a new "raising the bar" issue - should there also be a 5 year implementation plan for this as well? TVA is also concerned that the costs to meet the new requirements contained in this TPL

will amount to between \$1 billion to \$2 billion with very little impact overall on the reliability of the Bulk transmission system. TVA is also very concerned about the increase in rates that will be required to support these new facilities. When will the Implementation Plan be removed from the standard after it is officially approved? Will a revised TPL standard need to be prepared to omit this implementation language? If contingencies in one utility's system results in issues within another utility, who is responsible for studying the contingencies and who would be responsible for documenting the CAP? More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective.

Blake Williams

CPS Energy

As written, is it the intent of Requirement R2.1.4. to escalate the contingencies in Table 1 from "N-1" to "N-2" and "N-2" to N-3" for long lead-time replacement equipment, such as autotransformers and GSUs? If so, we feel that this requirement is overly burdensome that will result in unnecessary expense to the customers. In Requirement R2.4.1., what is the intent of the second sentence if an aggregate system load model is acceptable? We feel that the second sentence should be removed. In Requirement R2.6.2., we feel that statement of the project initiation date has no benefit and should be removed as a requirement. The required in-service date should be adequate. We do not believe that there is any benefit to reliability by documenting the Consequential and Non-Consequential Load Loss data required by Requirements R2.8. and R2.9.

Requirement R3.3.2. needs clarification.

Tom Mielnik

MidAmerican Energy Company

MidAmerican commends the SDT for all its hard work on this standard. MidAmerican offers the following comments on R2: • MidAmerican believes that the second sentence of R2.3 as written will result in unnecessary modeling for the required short circuit analysis. MidAmerican recommends that the sentence "The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study area." MidAmerican recommends that R2.3 be changed by deleting the words "any" and "could" and replace with the words "materially". In this way, the sentence would read, "They analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with generation and Transmission Facilities in service which materially impact the study area." • Requirement 2.5 is too confining and is complicated and unnecessary. MidAmerican asks that the requirement be deleted in its entirety. Alternatively, if the SDT does not agree with deleting all of R2.5, then MidAmerican asks that the SDT consider deleting the R2.5.1. MidAmerican believes R2.4 will ensure that analysis is fresh by requiring a certain number of studies be conducted for certain years in the planning horizon. Why add the requirement for no older than 5 calander years? With the R2.4 and the material requirements in R2.5.2 shouldn't that be more than enough to ensure that the analysis is fresh enough to support the assessment? • If R2.5.2 is not deleted, the words "and interconnected to the Bulk Electric System" should be added behind 20 MW or greater. • Requirement 2.6.2 requires the "project initiation date". MidAmerican recommends that the SDT delete the requirement to provide this date as an initiation date is not related to system reliability. If the SDT believes it is critical to get this date, then the SDT should define it. Does it mean when engineering starts, when it is decided to proceed, or something else? • At a minimum, MidAmerican believes that the SDT should add the word "expected" behind largest to avoid unnecessary compliance issues for an unexpected event, and clarify that R2.8 and R2.9 are not required for sensitivity cases.

MidAmerican commends the SDT for it hard wok on this standard and specifically its R3.3.1

wording. MidAmerican has suggestions for the following parts of R3: • R3.3.2 – delete the words “For all generators” at the beginning. It is unnecessary in that later in the requirement it states specifically that the responsible entity is to “identify how the generators are analyzed in the steady state limitation”. • R3.3.3 – use a similar construction to R3.3.2 but delete the words “For all transmission lines”. In other words, replace “For all Transmission lines, studies shall consider relay loadability and identify how loadability is analyzed in the steady state limitations.” With “Studies shall consider relay loadability and identify how loadability for transmission lines is analyzed in the steady state simulations.” • R3.4 and R3.5 – change “remaining Contingencies” to “remaining unselected Contingencies”.

MidAmerican commends the SDT for its hard work on this standard. MidAmerican suggests that R4.5 be revised by changing “remaining Contingencies” to “remaining unselected Contingencies.”

MidAmerican commends the SDT for its hard work on this standard. MidAmerican recommends changing R7 by changing “FERC Order 890” to “FERC Order No. 890”.

No

MidAmerican commends the SDT for its hard work on this standard. MidAmerican believes the SDT improved several of the definitions and believes additional changes are needed: • For the bus-tie definition, what does “individual substation bus configurations” mean? • The consequential load loss states that it is load that “removed from service by a planned Protection System operation to isolate fault conditions”. This implies that a contingency that does not involve a fault could never have consequential load loss. MidAmerican suggests that the words “to isolate fault conditions” be replaced with “in response to a contingency event”. Alternatively, consider using the words in R3.3.1 which defines the same information but without referring to fault conditions. • The definition of Long-Term Transmission Planning Horizon is confusing because it is not clear which term the words “when required to accommodate any known longer lead time projects that may take longer than ten years to complete” are meant to modify. MidAmerican believes the intent is that these words only apply to the years ten or beyond and not the entire period years six to ten and beyond. Therefore, we recommend that the words be changed by starting a new sentence in the definition and putting it in parentheses “(Years beyond ten years are required to accommodate any known longer lead time projects that may take longer than ten years to complete.)” • MidAmerican commends the SDT for improving the Year One definition. MidAmerican still believes the Year One definition is too confining. It indicates that the first year is defined as the planning window that begins 12-18 months from the current calendar year. This means if the regional entity provides models during the current calendar year in April, the responsible entity cannot use those models in conducting planning until a year that begins in May of the next year. Why delay the start of Year One? What is gained by this delay? MidAmerican recommends that Year One NOT be a defined term. This definition clarifies a term that does NOT need to be clarified for any reason. MidAmerican believe this is a fix for a problem that does not exist. Does the SDT have evidence of lack of compliance in this regard? • Modify the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” • Modify the Planning Events definition more explicitly apply to the TPL-001 requirements. We suggest text of: “Planning Events: Events that are identified in the steady state and stability performance requirements set forth in the TPL-001 standard.”

No

MidAmerican commends the SDT for its hard work on this standard. MidAmerican commends the SDT for most of the changes to Table 1. MidAmerican does have a few comments: • MidAmerican suggests that Footnote 11 be added to the sixth item under P4. The note 11 clarifies the meaning of a stuck breaker yet this footnote isn’t applied to item 6 under P4 which is a stuck-breaker item. • MidAmerican believes that it is confusing having a set of explanations for Extreme Events that are 1 through 3 under Steady State and 1 and 2 under Stability and yet have later footnotes listed that are 1 through 11. MidAmerican suggests that the items 1 through 3 under Steady State and 1 and 2 under Stability for Extreme Events be changed to some other designation such as bullets or letters so that it is easy to see that the numerical footnotes start after these explanations of the extreme events. • Further clarify the applicable shunt devices in Footnote 7 with the suggested text “7. Requirements which are applicable to shunt devices also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arrestors.”

Yes

No

MidAmerican commends the SDT for its hard work on this standard. MidAmerican does not support the paragraph that states “Any entity that cannot fully implement its Corrective Action

Plan....shall self report itself..." MidAmerican believes that the Energy Policy Act of 2005 does not provide NERC or FERC the authority to require construction of facilities. Therefore, MidAmerican believes that this paragraph should be deleted in its entirety from the implementation plan as requiring responsibility to build facilities or else self report non-compliance. This is in direct contradiction to federal law.

Individual

James Tucker

Deseret Generation & Transmission

Comments: The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. I disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

R2.5.2 For Past studies to be used in the Planning Assessment, the suggestion that the addition of a 20 MW generator would disqualify those past studies is way too restrictive. It should be left up to the Transmission Planner to evaluate the applicability of past studies and the two sub bullets should be removed and replace with a general statement about past studies should adequately represent the present system to be used in the Planning Assessment. Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why

remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

I believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clairification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

Yes

No

I agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. I question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

Individual

Michael R. Lombardi

Northeast Utilities

R1 Priority Comment- There needs to be some direction provided on the initial conditions used in the assessment. This guidance should include discussion as to whether or not representations of generator forced outages are to be represented in the base case or if they are addressed through the sensitivity testing (Could add R1.1.7 Reasonable representations of unplanned generator outages.) Additionally, the standard is also silent on the treatment of system transfers, both internal and external, as to how they should be modeled in the base case. For some areas, their current practice is to include heavy system stresses in their base case, which leaves little for sensitivity testing. It is unclear if this practice works within the purview of this standard. Guidance is needed on how to treat base case generation dispatch and system transfers. R1 Comment – We do not understand what it means to include "requirements of regulatory authorities and other legal obligations". Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1. R1.1.1 Priority comment – R1.1.1 should be removed. It seems like there is an overlap between the requirements of this standard and Operational Planning studies with respect to known outages. Planned outages are addressed by our Operational Planning processes and Transmission Operating Procedures removing the need for this to be incorporated into Planning Assessments. In addition, outages are not generally known years in advance R1.1.2 comment - Do we need to have the list of equipment to model? How do we model circuit breakers, etc? Also, what should be the level of detail and the form that Protection System Equipment and Control Devices be modeled? We recommend deleting the list. Make R1.1.2 simply read as follows: R1.1.2 Projected system configuration, taking into account new planned Facilities and changes to existing Facilities, for each year of the Near-Term and Long-Term Transmission Planning Horizon. R1.1.5 comment – What specifically needs to be modeled under Interchange? R1.1.6 comment – This needs further definition or it should be deleted. It is not clear what a "network resource required to supply load" is. Does this refer to Network Resource per FERC LGIP?

R2 Comment – We recommend replacing the phrase "prepare" with "conduct and document" in the first sentence. R2.1.1 Comment – The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2. R2.1.2 Comment – The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which

would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments. R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity study just to meet the requirement of the standard does not add value to the assessment. R2.1.3 Comment - What should be the time duration for the bullet that reads "Planned duration or timing of Transmission outages" R2.1.4 Priority Comment – With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard needs to allow Non-Consequential load loss for P3 & P6 events when spare equipment strategy is incorporated in the testing. An example of such an event, that non-consequential load loss should be acceptable, would be a long-term outage of one transformer at a station which would be modeled in the base, followed by event P6 testing on initial system condition of a transformer out of service then followed by a 2nd transformer outage. This would be three transformers out at the same station and this could approach Extreme Events Contingency. R2.2 Comment – We suggest replacing the phrase "a current System peak Load study" with "a valid System peak Load study" in the first sentence. The word current is confusing, as some read the word current to mean "today's" rather than "valid". R2.3 Comment – Please provide guidance as to what year should be represented when performing short circuit studies. R2.4.1 Comment – Change to read: "For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load." R2.5.1 Comment– We suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 Comment – To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: •The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MW generator is fairly small in a 30,000 MW system and system concerns would already be addressed through the System Impact Study] •An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner. R2.6 Priority Comment – As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read "Provide documentation that explains the reasoning for the sensitivities considered and selected." R2.6 Comment – At the end of the second sentence, the phrase "in the tables" is used. We suggest using more definitive language such as "in Table 1". R2.6.2 Comment – The phrase "Project Initiation Date" needs to be defined. It is unclear if this is the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase "as well as an in-service date" should be modified to read "as well as a target in-service date". R2.6.3 Comment – Plans can provide a target in-service year but not an actual in-service year. R2.6.4 Priority Comment – There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions. R2.8 Comment –Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. R2.9 Priority Comment – We highly recommend that the standard should not allow non-consequential load loss to resolve any violation arising from the planning events in Table 1. Therefore, this requirement should be deleted.

R3.3.2 Comment – Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to inclusion of R3.3.2 as a requirement in this standard. R3.3.3 Comment – PRC-023 requires relay loadability to be reflected in facility ratings. Therefore this additional requirement is unnecessary and should be deleted. R3.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: -Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events -It should be clear that an evaluation does not require solution development for all Extreme Events -Change "an evaluation of possible actions..." to "where appropriate,

reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered."

R4.3.2 Priority Comment – Traditionally, transmission planners have assumed that generators would ride through low voltages associated with Planning Events, which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R4.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: -Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events -It should be clear that an evaluation does not require solution development for all Extreme Events -Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered."

Comments: It is unclear as to what is meant by the term "proxy used in the analysis" as it is used in this requirement. Does this mean Planning Coordinator established practices, thresholds, or guidelines used to gauge when simulations suggest an event such as cascading outages occurs? If so the language should state: R5. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, when established practices, thresholds or guidelines identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding.

We do not believe that this requirement belongs in this standard and it should be deleted. The standard defines requirements for the assessment not who does what.

This standard should not be reiterating FERC Order 890. We do not believe that this requirement belongs in this standard and it should be deleted.

No

Refine load loss definitions as follows. Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions resulting from a Planning or Extreme Event. Non-Consequential Load Loss: Intended post contingency loss of load (other than Interruptible Load, Supplemental Load or Load Reduction) caused by operator or SPS (RAS) action. (Priority Comment)

No

Steady State & Stability are as follows: Steady State & Stability: a. Transmission voltage instability, cascading outages, and uncontrolled islanding shall not occur. b. Consequential Load Loss, Supplemental Load Loss, Load Reduction, and consequential generation loss are acceptable as a consequence of any Planning or Extreme Event excluding P0. However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance requirements Non-Consequential Load Loss Allowed Comment (priority comment): We highly recommend that the standard as written should not allow non-consequential load loss to resolve any violation arising from the planning events in Table 1 (except when considering spare equipment strategy together with events P3 or P6). We believe that planning for reliable power should discourage load loss mitigation. Therefore, the column for the "Non-Consequential Load Loss Allowed" in Table 1 should all have entries of "No". P5 Priority Comment – As written, this requirement is overly severe. This would require the simulation of a "dead" station if only one battery is present (use of NERC Glossary's Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. P7 Priority Comment – Event 1 - This requirement requires the evaluation of the loss of two circuits on a multiple circuit tower. We recommend that this be modified so that only the loss of two adjacent (vertically or horizontally) circuits need be evaluated. We also recommend that the Planning Coordinator be allowed to evaluate and, if appropriate, exempt specific locations from this contingency based on acceptable risk. Comments on Extreme Events – Table 1- We recommend renumbering the Extreme Events table to be Table 2. Stability Condition 2 Note a - Priority Comment - As written, this requirement is overly severe. This would require the simulation of a "dead" station if only one battery is present (use of NERC Glossary's Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. Stability Condition 2 Note h – Eliminate this requirement or change to loss of station following three-phase fault. This note is confusing. Without providing a better defined scenario, it is unclear as to what clearing times should be used in this simulation. Comments on Footnotes – Table 1- We recommend renumbering the Footnotes table to be Table 3. Note 1.a.i – Should clarify that this requirement refers to generator units that are connected to the BES system. Note 1.a.ii – Contingency Reserve is dependent on the generation on-line. We suggest changing the first sentence to say that you can't lose more than that permissible by the Planning Coordinator. Also change "pull out of synchronism" to "lose synchronism" in this sentence and in the second sentence. (Is "Lose synchronism" a more commonly used term?). Note 3 – We recommend revising the wording of the last sentence to "A three-phase fault study indicating criteria are being met is sufficient

evidence that a SLG fault condition would also meet criteria.” Note 4 – We recommend that a lower bound be put on the HV electric systems (such as 100 kV), rather than just saying “and lower”.
Yes
Capitalize Firm Transmission Service in footnote 10 and instead of saying firm Load use Firm Demand to be consistent with the NERC Glossary.
Yes
Other Comments: Comment 1 – Please clarify, since R2 through R6 should become effective before results could be distributed to adjacent Planning Coordinators and any functional entity. However, by the wording of the effective date of R1 and R7 it appears R7 becomes effective before R2 to R6. That is, 24 months are allowed by the standard to complete the planning assessments after regulatory approval. The results may not be ready for distribution by the planning coordinator after the first twelve months. Comment 2 – The term “Planning Coordinator” is not defined in the NERC Glossary of Terms used in Reliability Standards and, therefore, this standard should indicate whether this term is the same as the “Planning Authority” defined in the glossary. Otherwise the definition of the Planning Coordinator should be included in the NERC Glossary of Terms used in Reliability Standards.
Individual
Brian Keel
SRP
The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words “including requirements of regulatory authorities and other legal obligations” at the end of R1. Entities already are required to do this. It does not need to be included in the standard.
Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as “material change” for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area’s installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the “largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event” if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.
As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant

RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.
As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.
The term proxy is unclear. Please provide an example or an explanation of proxy.
We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.
No
Clairification is needed on the use of UVLS. Is it acceptable or not? Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?
No
P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.
We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?
Individual
L. Earl Fair
Gainesville Regional Utilities
Concerning the effective dates of R1 & R7, I suggest that you move them to be effective at the same time as R2 through R6 so you will not have to try to meet two standards during the same time period. Effective Date: Clarify how the effective date impacts which version of the standard (and its reference numbering) is to be used in an assessment just before (in cycle) a scheduled compliance audit. Suggest that the term "Corrective Action Plan" be retitled to "Improvement Action Plan" because the first implies that the situation is "wrong or incorrect" which may not be the case.
R2.1.1- References a "system peak Load" for each of the referenced years. Some utilities are summer peaking and some are winter peaking and others may have a history of having one or the other in any given year. So can you clarify which peak you are referring to or change to statement to perform studies involving both seasonal peaks? R.2.4.1- I suggest quantifying the reference to the behavior of induction motor loads to single motors greater than 1000 hp or multi motors at one bus totalling more than 2000 hp or so, since smaller induction motors probably will not have any significant impact of the BES. I feel this is best handled as a sensitivity issue determined by the PC who is familiar with this area. R2.5.1- If the system has not had any significant changes of the last ten years, then a study going back to that change should be acceptable for the assessment. R2.5.2- Should the "shall not include" really read as "shall include"? R2.6- The reference to "tables" in line 6 should be "table" since there is only a Table 1 in the standard. R2.6.1-R2.6.3- Question-- Why is the font size of the bullet text smaller than the other bullet segments?

Please provide a definition of "cascading outages" since the FERC and NERC removed their approval of the definition. Or use the definition of "cascading" found in the NERC Glossary of Terms. This term is also used in R3.5, R4.5, and Table 1.a. without any definition provided. NOTE: On December 27, 2007, the Federal Energy Regulatory Commission remanded the definition of "Cascading Outage" to NERC. On February 12, 2008, the NERC Board of Trustees withdrew its November 1, 2006 approval of that definition, without prejudice to the ongoing work of the FAC standards drafting team and the revised standards that are developed through the standards development process. Therefore, the definition is no longer in effect. Please provide a definition of "voltage instability" since the NERC Glossary of Terms does not provide one. This term is also used in Table 1.a. without any definition provided. Please provide a definition of "uncontrolled islanding" since the NERC Glossary of Terms does not provide one. This term is also used in Table 1.a. without any definition provided.

Yes

But as referenced in question 5, I believe you need a good definition for the following terms; "cascading outages", "voltage instability", and "uncontrolled islanding".

Yes

Yes

Yes, Yes

Reword R1.1.2. New planned Facilities and changes to existing and old planned Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon where such Facilities affect the electric connectivity and topology of the system or affects the accurate simulation of system disturbance response where practical. [Delete bulleted list] Add R1.2. Where it is not practical to model all Facilities composing the electric system connectivity and topology, consideration of those Facilities and their affect on the model simulations shall be documented in detail in the annual Planning Assessment where appropriate. This addition may not be necessary with rewording of R3.

R2.1.4 It is not clear if this spare equipment strategy excludes Generator Owner's obligations for their generation plant equipment and only includes Transmission Owner's equipment. It is also not clear what Measurable document is required to back up a position of no vulnerabilities. I recommend that we limit the spare equipment strategy to TO equipment and not include GO equipment which excludes step-up transformers, turbines, generators, rotors, etc. Also, it does seem unreasonable to assess the long-term loss of a transformer to the "Extreme Events" of Table 1 or any other event other than the P3 events unless substituted in the assessment by a more extreme and probable event. An event from P3 alone should be sufficient to expose a weakness of a spare equipment strategy based on historical industry statistics for such likelihood. Propose changing "The analysis shall reflect the Contingencies identified in Table 1..." to "An analysis shall be performed that as a minimum assesses the impact of the long term outage of Transmission Owner equipment under either a P3 event that could occur in the absence of the subject equipment" or a more stressful event as deemed appropriate by the Functional Entity performing the assessment. R2.6.4 First of all, some level of expected Non-consequential load loss is always prudent to balance customer expectations on cost and reliability subject to Local and State Authority's guidance. Second, load development and gneration development are the major drivers for transmission development needs. Generation plans are more dependable and manageable as to timing and impact. Load development is not very dependable and manageable relative to transmission system improvement needs. It is not unusual for new load forecast to either expose a transmission weakness or on the other hand to eradicate a transmission weakness in the Near Term horizon. Without guidance, it could be assumed that affects from load forecast are beyond the control of the Transmission Planner and Transmission Coordinator. In addition, it is not unusual to have the load forecast lead the generation plan by a few years causing a need for Non-Consequential Load Loss until such time the additional generation is in-service providing generation balance to the load area and mitigating the transmission improvement needs. This occurs frequently as generation development lags load development in fast growing communities. Propose establishing a cap on Non-Consequential Load Loss for all Corrective Action Plans where the Table 1 events currently do not allow at all. An additional option for the SDT to consider could be to add an allowance of lag time (maybe 4-5 years) to cover the gap while the generation addition is being developed.

R3. Change wording from "The studies shall be based on computer simulations using models utilizing data provided in Requirement R1." to "The studies shall be based on computer simulations using models that are the best representation of the future planned system and its associated use as provided by Requirement R1. The studies shall detail the effects of all future equipment connectivity and topology arrangements and their associated Protection system responses to Contingency events regardless of model details." R3.3.2. I assume the concern here is on voltage ride through of generators and generator auxillary equipment. Propose changing language from "For all generators..." to "Include analysis of how generator and generator auxillary equipment over and under voltage protection and ride through capability were considered for the post-contingency steady state bus voltage levels." R3.3.3. I assume the concern here is ensuring consideration is given to how system protection relays could respond to post-contingency circuit emergency loadings. Protection systems that could limit the emergency ratings of transmission circuits should be considered in the Facility Rating standard and therefore not necessary to include in the TPL standard. However, if requirement does remain in the TPL standard, propose changing language from: "For all transmission lines..." to "Include analysis of how implemented relay protection systems and their potential automatic response prior to timely corrective actions are considered for the post-contingency steady state circuit loadings".

Yes

No

Footnote 8 relative to P2.1 seems to imply that all of the single contingency assessments for circuits should include assessment of (1) both ends of the circuit disconnecting as in P1 and (2) either end of the circuit disconnecting as in P2. This results in 3 separate single contingency assessments for the one circuit. I am not sure of the benefit other than trying to identify a high voltage situation or in the case of tap loads, a thermal loading issue. Recommend changing Footnote 8 to "For circuits with tapped load, a separate analysis shall be performed for an outage of each end of the circuit where the load is tapped."

No

Footnote 10: First of all, the term firm Load is used instead of the term Non-Consequential load. Are these the same? If so, maybe we need to be consistent here. Assuming they are the same and in reference to previous comment on use of Non-Consequential load shedding: "Propose establishing a cap on Non-Consequential Load Loss for all Corrective Action Plans where the Table 1 events currently do not allow at all. The cap could also be accompanied by an allowance of lag time (maybe 4-5 years)." To be consistent, some level of Non-Consequential load shedding should be allowed where Generation redispatch falls short for a few years until new planned generation is added to the system.

Group

Transmission Planning

R1.1. COMMENT: Should read: "Models for performing the studies needed to complete the Planning Assessment shall represent:" instead of "Models for the Planning Assessment shall represent:" R1.1.1. COMMENT: Should the requirement specify which known outages should be modeled? For example, would it be considered incomplete and therefore a violation if a known generator maintenance outage with a one week duration is not included (not modeled off-line) in a case that represents a full summer season at peak conditions? Please provide guidelines as to what duration outages should be modeled in representative planning horizon cases. (i.e. one day, several days, one week, one month, in a case that represents a significantly longer time period.) R1.1.2. COMMENT: Should add Transformers to this list; COMMENT: What is meant by "represent" - Planning models do not typically include explicit Circuit breaker modeling. The planning models used for power flow, dynamics and short circuit analysis represent the power system with busses and branches. The effect of circuit breakers is taken into account as part of contingency modeling. Including circuit breakers as a sub-requirement is likely to result in transmission planners being required to demonstrate that circuit breakers are modeled. Explicit representation of circuit breakers with existing software would result in major convergence problems due to large number of low impedance branches. COMMENT: Should clarify "Protection System equipment" to apply only to system stability models. Does this mean all relays on the system must be included in the dynamics modeling? While a certain limited number of protective relays can be modeled with the software used for dynamics, it is not practical to model more than a very small percentage of the protection systems used in the BES. Including protective relays as a sub-requirement is likely to result in transmission planners being required to demonstrate that all protective relays are modeled which is an impossible task. The modeling of

protective relays should be caveated with "as deemed appropriate." COMMENT: "Control devices" Should be specific. Is this for Phase Angle Regulators (PAR), Synchronous Condensers, Static Var Compensators (SVC), exciters, governors etc? Control devices should be specifically defined as the following: PAR, SVC, HVDC. COMMENT: "New technologies" seems too broad. Needs to be better defined. Planning models may not have the capability to adequately model "new technologies". R1.1.4. Firm Transmission Service COMMENT: Should add "that is expected to be utilized in the study case scenario" because not all Firm Transmission Service can be included in every study case model. Some firm transmission reservations (Network Resources that could be Reserves) are used optionally depending upon the availability of other Network resources. The following apply to all VRF, Time Horizon, Measure, Data Retention, and VSL for all requirements in the standard. VRF: Agree. No comment. Time Horizon: COMMENT: Long-Term Planning – This is confusing. Is it only the newly defined Long-Term Transmission Planning Horizon? Shouldn't it include the Near-Term Transmission Planning Horizon? Suggest "Long-Term and Near-Term Transmission Planning Horizon" as used in definitions. Measure: Agree. No comment. Data Retention: Agree. No comment. VSL: Are bullets in requirements all required? (i.e. If circuit breakers are not explicitly modeled, as the bullet list in R1.1.2 seems to indicate, is it a violation?) What is meant by "...did not simulate projected System conditions as described in R1. ..." How are projected System conditions criteria described in R1?

R2.1.4. COMMENT: For the analysis to reflect the contingencies in Table 1 (P0 through P7 plus Extreme Events) is excessive. R2.5.2. COMMENT: The 20 MW change listed in bullet items are extremely small to larger transmission systems and by themselves would be unlikely to change BES response. As drafted, requirement 2.5 may be interpreted to preclude the use of any previous study in which the base case is not identical to the current planning case. It is recommended 2.5.2 be rewritten as follows; "For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period that would impact the study area." R2.6.2. COMMENT: What is considered a project initiation date ... is it implying a construction start date, or the first time that it was identified as a mitigation plan? Additionally, R2.6.2 and R2.6.3 are not necessary because a Corrective Action Plan, by definition, includes an "associated timetable for implementation". Recommend deleting this requirement. R2.8. COMMENT: Why is this data collection a requirement? The effort required to determine this data is substantial and the value of this data is questionable. Recommend deleting this requirement. R2.9. COMMENT: Why is this data collection a requirement? The effort required to determine this data is substantial and the value of this data is questionable. Recommend deleting this requirement.

R3.3.1. COMMENT: This would make sense for 3-terminal lines which we are including in contingency files, but for normal 2-terminal lines, very unnecessary. Suggested language at the end would say "Simulation of individual element outages is allowed if it produces an effect more severe than the entire circuit outage". This implies that by modeling individual branch outages would represent more severe conditions than entire circuit outages due to the fact that there would be consequential load loss. R3.4. COMMENT: Table 1 as drafted is very confusing and could be interpreted incorrectly. Recommend revising the header for "Table 1 – Steady State & Stability Performance Extreme Events" Should be changed to "Table 2 - Steady State & Stability Performance Extreme Events" because the expected performance requirements associated with Planning Events could be interpreted to be applicable to Extreme Events as well. Alternatively, the performance requirements at the top of Table 1 need to include a statement that they are applicable to Planning Events only.

R4.3.2. COMMENT: The inability to survive a given low voltage transient is often dependent on motor performance within the generating facility's auxiliary load distribution system and is not a specific relay setting. Determination of specific generating plant low voltage ride through capability requires extensive modeling of the plant distribution system and is outside the scope of this standard.

Yes

No

COMMENT: P2-1. Opening of Breaker(s) w/o fault Event: Does the modeling of this event require that the line remains energized up to the breakers? This will require adding a bus at each end with a zero impedance branch connection to "open" representation of breakers. Explicit modeling of a circuit breaker opening would require a substantial modeling effort and would not produce results more adverse than any of the other P2 contingencies. Why is this necessary? Recommend deletion of this planning event. The threshold of higher performance for facilities above 300 kV may wrongly influence decisions on project alternatives in favor of facilities with less stringent requirements. We do not agree that such a threshold is necessary or warranted.

No

It appears that the reference callout to footnote 5 should be placed on every “No” in the “Interruption of Firm Transmission Service column instead of in the header, as was done with reference callouts to footnote 10. In footnote 5 “conditional” should be capitalized since it refers to a specific product defined under the OATT. Also, this only covers the specific condition form of the product, but does not address the specified number of hours form of the product. If the second form of the product is the basis for the service and the transaction is modeled in the case, and curtailment will mitigate an overload, it should also be allowed. Footnote 10 is too long and subjective. There is no purpose in adding the phrase “when coupled with the appropriate re-dispatch of resources obligated to re-dispatch” because if there is an obligation to re-dispatch, it is done, and if there is no obligation to do so, then curtailment is the only alternative – no coupling necessary, therefore, this phrase should be deleted. In addition, the last two sentences end in “must be considered”. What is the appropriate amount of “consideration” and what defines whether the consideration is acceptable or not? The last sentence should be a stand alone performance requirement in the Steady State and Stability notes at the top of Table 1 (in the list a through e) and should end in “must be adhered to” instead of “must be considered”. Suggested revision: 10. Curtailment of firm transmission service is allowed both as a System adjustment (as identified in the column titled ‘Initial System Conditions’) and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load.

Yes

Individual

Catherine Mathews

NorthWestern Corporation NorthWestern Energy (NWE) (NWMT)

The system models that are described in MOD-010 Requirement 1, MOD-011 Requirement 1, MOD-012 Requirement 1, and MOD-013 Requirement 1 do not address all the bulleted items under R.1.2. Circuit breakers, protection system equipment and control devices are not modeled. Rather, the effect of these devices, such as circuit breaker misoperation, thermal overload, etc., on the transmission system are modeled. The wording of these bullets should be corrected to match what is actually modeled. Firm Transmission Service, listed in R.1.1.4, is not specifically addressed in MOD-010. Requirement 1 of MOD-010 states “existing and future Interchange Schedules” as data requirements for steady-state modeling and simulation. Models in the West do not model Firm Transmission Service as such. It is difficult to know what the Firm Transmission Service will be in the future. This is particularly true in regions where there is a predominance of merchant generation and proposals for the interconnection of new merchant generation. It is more reasonable to estimate the expected interchanges. The definition for Interchange – “Energy transfers that cross Balancing Authority boundaries” describes the modeling requirement better than the definition of Firm Transmission Service – “The highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruptions”. The wording “Expected Transfers” is used in R2.1.3 and R2.4.3. To maintain consistency, this term could be used in R.1.1.4 and could also be substituted in Table 1 for “ Firm Transmission”. From a Planning perspective, since Firm Transmission cannot be determined from a study model. R1.1.4 and R1.1.5 should be deleted and replaced with a requirement to model expected transfers on interconnections with neighboring Balancing Authorities. For study purposes R.1.1.6 is not needed either. In the models, the load represented is served by the generators modeled. Network Resources are more in tune with local area studies that ensure that the network load can be served by the network resources over available transmission. The words “including requirements of regulatory authorities and other legal obligations” at the end of R1. does not need to be in the standard.

Short circuit analysis is a local issue. The reliability of the BES does not depend on the regular assessment of short circuit duty. Therefore, we believe short circuit analysis should be deleted from R2. R2.1.4 needs more clarification as to what constitutes major Transmission equipment. This would require a separate analysis (study) for each transformer (or any long lead-time equipment) for which a spare is not available, which could result in numerous additional cases. Major Transmission equipment could be limited to voltage levels greater than 200 kV. An exception should be made for phase-shifting transformers. As the system changes, with new generation and transmission lines being added, these analyses could become outdated very quickly. If a transformer were to fail, the Planning Department would immediately study the current system with this transformer removed. As stated in R2.4.1, the requirement to include induction motor loads is too prescriptive. At this time, with all of the unknown or estimated variables in the system model, accuracy of the model would not be improved. If a highly industrialized section were to develop within the NWE footprint, induction motor load could be added to the system model. The 20 MW threshold identified as “material change” for generation in R2.5 is too small. A better number for material generation changes would be 100 MW or a limit based on a percentage of the study area’s installed generating capacity. Also, an aggregate of 20 MW addition/deletion generation would depend on the location of the individual generators to determine whether the overall system would be affected or not. The statement at the end of

R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. R2.8 should be deleted. It is not necessary for reliability. R2.9 should be deleted. It is not necessary for reliability.

R3.3 is unclear. Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. In R3.3.3 the term "loadability" needs to be defined. R3.5 needs to be modified. It would be better to combine R3.2 with R3.5. The first part of the requirement requires identification of events that produce more severe System impacts. The presumed reason that the other contingencies were not selected is because they were deemed to be less severe or non-credible. In any case, theoretically, there can always be examples of more severe Extreme Contingencies than the one selected for study. This can be achieved by simply choosing events that are even less credible. For example, if the Extreme Contingency studied was a simultaneous loss of 3 transmission lines with the failure of a redundant RAS (SPS), then an event resulting in the simultaneous loss of 4 lines with the failure of 2 sets of redundant RASs would be even more severe. Listing all possible extreme events could result in a limitless list.

R4.3 is unclear. Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets R4.3.2 is unclear. It appears to be a broken sentence. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. It is our understanding that the voltage ride through standard is not complete at this time. R4.5 needs to be modified. It would be better to combine R4.2 and R4.5. The first part of the requirement requires identification of events that produce more severe System impacts. The presumed reason that the other contingencies were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be examples of more severe Extreme Contingencies than the one selected for study. This can be achieved by simply choosing events that are even less credible. For example, if the Extreme Contingency studied was a simultaneous loss of 3 transmission lines with the failure of redundant RAS (SPS), then an event resulting in the simultaneous loss of 4 lines with the failure of 2 sets of redundant RASs would be even more severe. Listing all possible extreme events could result in a limitless list.

In R5 the term "proxy" needs to be defined. In addition, an example of a proxy should be given.

No comment.

In R7 the references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

In R7 the references to FERC Orders should not be included in requirements of standards. This comment also applies to M7

No

P6 on the table seems to be less severe than either P4 or P5, yet it allows loss of Firm Transmission Service and Non-consequential Load which are not allowed for EHV in P4 or P5. Interruption of Firm Transmission Service and Non-Consequential Load Loss should be allowed for P4, P5, and P6. Transmission lines should have the same requirements regardless of the voltage. Also, if not able to model Firm Transmission Service, how will one know if it is interrupted? The column labeled "Interruption of Firm Transmission Service Allowed" should be eliminated since it is not a clearly defined test of performance. It is not clear how to use the present definition of "Firm Transmission Service" for a planning horizon study. P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV.

No

NWE has provided comments above concerning Firm Transmission Service and the foot notes should address the issues that we have raised above.

No Comment

Exelon Transmission Planning

There are large amounts of resources required to perform the volume of studies required, including the dynamic and steady state sensitivities, extreme studies, and one-year lead time equipment spares. Many of these studies ultimately do not require additional consideration or reinforcement and have low threshold triggers, such as a 20 MW generation change. Performing

these studies will be very burdensome to many TPs and result in few, if any, reliability benefits. We believe that the TP should be given more flexibility to allocate planning resources to areas of maximum benefit. The Spare Strategy in R2.1.4 is still not well defined. What types of equipment are included? How would a one-year lead time element be determined for consideration in this requirement? In R2.4.1, we recommend changing 'appropriately represents' to 'a dynamic model appropriate for the type of stability study being performed' The TP should be allowed to perform only those specific stability studies needed and pertinent to its system. The same can be said about the dynamic load model. Differing interpretations are possible. We suggest changing the last sentence in R2.4.1 to – "....., a Load model shall be used which appropriately represents.....An aggregate System "Dynamic" Load model which represents the overall dynamic behavior of the Load is acceptable." In 2.1.3 and 2.4.3 strike 'Expected' from the phrase 'Expected transfers'. Expected transfers should already be in the base case. In R2.5.2, the determination of a 'Material change' is an engineering judgment issue and it should not be categorically defined here. There may be more significant material changes than a 20 MW increase in generation that would be better to study. In the phrase, "For steady state...such as generation or transmission additions/removals, or topology changes... and would impact the study area", it is suggested to change 'would' to 'could' and 'impact the study area' to 'significantly change the previous study results'. The term should not be 'Corrective Action Plan', which implies a violation of a requirement. Suggest changing this term to 'Future Reliability Plan'. What is the intended use for reporting the largest consequential and maximum non-consequential load loss amount and event? This would be a potential security concern if made public. There is a similar concern with the extreme event analysis. In 2.6.2 please define 'Initiation Date'. While we appreciate your previous consideration of this comment, it is still not clear what this means. Is this the date of mitigation identification, regulatory approval date, construction start date, equipment procurement date, etc? If this is a commonly understood term not requiring a formal definition, could you then please provide that definition in your response? If there is going to be a requirement to report on each contingency that results in non-consequential load loss it should be specified.

In R3.3.2 it should be clear that the TP / TO is not required to provide whatever voltage that the unit desires and that the intent of this requirement is to ensure that if a generator is going to trip due to low voltage that the simulation will include the generator tripping. 3.3.2 and 3.3.3. are somewhat redundant with 3.3.1 – suggest rewording 3.3.1 to say including transmission lines with respect to relay loadability and generators with respect to minimum operating voltage. If 3.3.3 is targeting the low voltage ride through capability of the wind generators it should be clear.

See comment in response to question 9 regarding the lack of definition related to the failure of a 'single Protection System'.

The determination of a failure to document a single proxy should not be categorized as 'severe'.

Yes

No

Table 1 comments in general: Even after modification from the previous version, it is still not clear if the 'BES Voltage Level' applies to the contingency element voltage level or to the monitored element voltage level. For example, If there is a 345 kV bus section fault that causes an overload on a 138 kV line, is non-consequential load loss allowed on the 138 kV system? There is a concern about the lack of definition related to the failure of a 'single Protection System' – this could be widely interpreted. Would over tripping for line faults fall into this definition?

Yes

Yes

Group

SERC Engineering Committee Planning Standards Subcommittee

R1.1.2: In bullet three of R1.1.2, are bus-tie circuit breakers to be represented in the models? Typically circuit breakers are included in the contingency definitions along with the protection system equipment used in the power flow models. The number of zero impedance branches which can presently be modeled using PSS/E software is limited to 4000. Also, the number of buses included in the power flow models would increase with additional breaker modeling. Protection System Equipment: The SDT stated during its June 30th Webinar that protection system equipment need not be explicitly represented in models, but had difficulty in determining adequate wording for the proposed sub-requirement. Because protection system action is described in R3.3.1, R3.3.4, R4.3.1, and R4.3.3 we suggest that protection system equipment be removed from the list in R1.1.2.

R2.1: In R2.1, change the reference to requirement R2.6 (at the end of the last line) to R2.5.
 R2.1.4: In Requirement R2.1.4, recommend that the requirement be revised as follows: "When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment." R2.4.1: In Requirement R2.4.1, it is suggested that it be reworded to the following: "System peak Load for one of the five years, including Load models which appropriately represents the dynamic behavior of Loads, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable." R2.5.1: With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: "unless justification can be provided to demonstrate that the results of an older study are still valid." R2.6.2: In Requirement R2.6.2, what constitutes a "project initiation date," and how will it be used? Please clarify. R2.8: Please explain the reason why Requirement R2.8 is needed in the Assessment. Reporting the largest Consequential Load Loss does not impact reliability. R2.9: Please explain the reason why Requirement R2.9 is needed in the Assessment. Reporting the largest Non-Consequential Load Loss does not impact reliability.

R3.1: In Requirement R3.1, it is suggested that the word "contingency" be added to describe the lists created in R3.4.: "Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R3.4." R3.3.1: Recommend that it be clarified that simulation of the more conservative case of a single branch (bus-to-bus) outage is acceptable, as opposed to always simulating the full breaker-to-breaker outage. R3.3.2 The requirement needs to be clarified. It is not clear if it is referring to the ability of plants to meet their voltage schedule, or to their ability to stay connected during post contingencies. R3.3.4: In Requirement R3.3.4, it is suggested adding the words "and switched" to capacitors and reactors: "Simulate the expected operation of existing and planned devices designed to provide Steady State control of electrical system quantities. These devices include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors."

R4.1: In Requirement R4.1, it is suggested that the word "contingency" be added to describe the lists created in R4.4 "Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R4.4." R4.4: Regarding Requirement R4.4, it is suggested that a rewording be considered such as described below: "For each category of the Planning Events in Table 1, those Planning Event Contingencies that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4.1 shall be created. The rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results." R4.3.2: R4.3.2 requires that voltage ride through capability be analyzed. It is not clear what should be analyzed (e.g. auxiliary loads, generator protection, generator capability, etc.) This requirement needs more clarity. Footnote #3: Footnote #3 needs to be revised to include 2LG faults in addition to 3-Phase faults indicating that the SLG criteria is met.

Use of Proxies: There is no requirement that the Planning Coordinator (PC) must use the same proxies as the Transmission Planner (TP). Since differences in proxy assumptions may lead to different study results, R5 should be revised to require the PC and TP to coordinate the use of proxies.

no comments on this question

FERC Order 890: The reference to FERC Order 890 as it is currently written makes it seem like a suggestion to follow Order 890. If Order 890 explicitly describes this process then the sentence should read "as described in FERC Order 890." If not, this should not be mentioned at all.

No

Definitions: Revised Definitions are generally better than those from the previous version, but additional clarity could be provided. Load Reduction – Please clarify whether this includes both load response and operator initiated action, such as in changes to transformer LTC. Supplemental Load Loss - From a utility perspective, this would be considered as load response. Please clarify how Supplemental Load Loss would be included in the stability analysis. Bus tie breaker – A statement in the previous version which listed examples was removed from this version of the definition. The statement was helpful and should be re-inserted. The statement was: "Substation configurations such as ring bus, breaker and a half, or double-bus double-breaker do not use bus tie breakers."

No

Table 1 titles: The word "Requirements" needs to be added to the Table 1 titles in the existing tables. Table 1 – Steady State & Stability Performance Requirements Planning Events Table 1 – Steady State & Stability Performance Requirements Extreme Events Table 1 – Steady State & Stability Performance Requirements Footnotes (Planning Events and Extreme Events) Steady-state vs. stability analysis: We recommend that Table 1 be split back as was done in the previous draft to handle the 1) steady-state and 2) stability performance requirements. This is needed to provide clarity on which contingencies apply to steady-state and which apply to stability analysis. Table I, P7.1: It would not be likely to lose the two outside circuits on a vertically configured structure and not lose the middle circuit. Change the wording to: "Any two adjacent circuits on a common structure."

No

Footnote 5: Suggest rewording of footnote 5 to: Curtailment of conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the conditional Firm Transmission Service. Footnote 10: Footnote 10 is definitely an improvement from previous versions. It is suggested that the word "also" be added to the last line: "Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must also be considered."

No

Construction activities: 60 months effective date seems acceptable for planning activities, but may not adequate for all construction activities. Typical times to construct a transmission line in various areas of SERC can range between 7 to 10 years. Accordingly, we recommend the effective date for construction projects be changed to at least 84 months. Dynamic load models: More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective.

SMUD

R1: The requirement should end after the words "...shall simulate projected System conditions.". The following words should be deleted as it results in a clause that is overly broad and does not specify clear and concise reliability requirements: "...including requirements of regulatory authorities and other legal obligations".

R2.1.3 and R2.4.3 The sentence, "...sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment: ...", should be modified by changing the second 'included' to 'considered'. R2.1.4 Since there is no NERC reliability standard requirement for a 'spare equipment strategy', what is the standing of a requirement that is based on having one? R2.5.2 There is no example given for 'Transmission additions/removals' ? Recommend that the wording of this requirement be made more discretionary with a requirement that the Transmission Planner include language explaining the reasons for using past studies.

R3.5 Listing all possible scenarios for studying extreme contingencies will result in a limitless list. Discretion should be given to the transmission planner on the selection of the contingencies without a requirement to list why other extreme contingencies have not been included. R3.3.2: When the word, 'consider' is used, it can be read as a guidance and not a requirement. The requirement is unclear.

R4.3: R4.3.2 – The requirement is unclear. If it is to cover modeling issues, then it should be under MOD series. If it is to cover voltage ride through performance, then performance metrics should be provided. R4.5 Listing all possible scenarios for studying extreme contingencies will result in a limitless list. Discretion should be given to the transmission planner on the selection of the contingencies without a requirement to list why other extreme contingencies have not been included.

R5: Guidelines for identifying proxies for unstable conditions would be helpful.

Requirement R7 should end after the words '...who has indicated a reliability need'. R7: The requirement should not invoke another document for compliance. The words, ", coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890", should be deleted. This comment also applies to M7.

No

The allowed corrective actions in Table 1 to meet performance standards do not explicitly state

how DSM solutions should be treated [there is a potential for 20% of national peak demand to be met by "demand response"] . If it is allowed to be used, and since this is a fairly significant amount, it would help if it is explicitly addressed in Table 1.

The VSLs for Requirement R1 incorporates several sub-requirements but neglects one of the three components of the main requirement. Consider that R1 requires the TP and RC to (a) maintain System models, (b) use data consistent with certain MOD standards, and (c) simulate projected System conditions. Because the first component is not a part of the proposed VSL and the purpose of this standard mentions a "broad spectrum of System conditions," the recommendation is to add maintaining the system model into the VSLs for R1. R1.1.3 uses the terminology real and reactive "Demand" of Load. We suggest striking the word "Demand" because it refers only to real power. We recommend the the SDT limit R1 to load flow and stability models. Does R1 apply to short circuit models? If so does this imply that the short circuit model must be the same as the load flow model?

The Lower VSL describes a scenario where the TP or PC fails "one or both" of two particular sub-requirements. This language does not reconcile how failure of two sub-requirements is consistent with failure of only one of the same requirements. The recommendation is to restructure the VSL such that it is invoked when "either" sub-requirement is violated (not when both are violated). Generating unit stability has now been combined with system stability to be just one category - Stability. Previously, the shelf life of generating unit stability studies was indefinite -only needed to be restudied when system changes required it. Now the maximum shelf life of Stability studies is five years. Does this mean that generating unit stability studies must be repeated every five years whether system changes make it necessary or not? Requirement 2.3 stating that "the short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon." It is not clear if the intent of the requirement is to study every year within Year One and year five. A statement similar to R2.1.1 Year One or two and year five for steady state analysis would be helpful. Some clarification is needed for R2.3 on the term "Near-Term." Requirement 2.3 stating that "the analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study area." What interrupting devices are included? Would the circuit breakers be enough? Moreover, the term "System short circuit model" is used for the first time (and the only time) here for the entire document. It is very common to use a different short circuit model for short circuit analysis while the steady state and stability analysis use different System models (power flow models). Some clarification is needed. R2.8 and R2.9 use the term megawatt "Demand". This is redundant. We suggest striking the word demand.

R3.3.3 applies to "all Transmission lines." To be consistent with the relay loadability standard, this should only apply to lines above 230 kV and lines between 100 kV and 230 kV identified as critical. R3.2 and R3.5 are both addressing the Extreme Events. However, R3.2 is referring to R3.5 while R3.5 is referring to R3.2. We suggest deleting the reference back to R3.2 which is in R3.5. A similar situation exists for R3.1 and R3.4. R3 seems to use the words studies and analyses interchangeably. Did the SDT intend for them to be the same? Using one term or the other would be better understood. There are two tables labeled table 1. It would be much clearer to mark them table 1 Planning Events and table 2 Extreme Events.

Generating unit stability should be separated from system stability like in previous drafts. R4.2 and R4.5 are both addressing the Extreme Events. However, R4.2 is referring to R4.5 while R4.5 is referring to R4.2. We suggest deleting the reference back to R4.2 which is in R4.5. A similar situation exists for R4.1 and R4.4.

We recommend using an alternate term for proxies such as criteria, guidelines, etc. to clarify what is meant.

We recommend the following wording for R7. Each Planning Coordinator shall coordinate the distribution of Planning Assessment results among adjacent Planning Coordinators and any functional entity who has indicated a reliability need. Each Planning Coordinator shall coordinate analysis of these results through an open and transparent peer review process such as described in FERC Order 890.

No

We disagree with deleting the definition of system stability and generating unit stability. The proposed definition for Year One reads as follows – Year One: The first year that a Transmission

Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current year. Please clarify if this refers to the first "calendar" year when a Transmission Planner becomes responsible for assessments. If so, then add the word "Calendar" so that it reads "Year One: The first calendar year".

Yes

No

Footnote 10 should not be applied to P3. The curtailment of firm service should not be allowed for a unit out / line out contingency.

No

More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective. Other than that, the SDT has done a good job in allowing time for entities to get into compliance with the requirements where the bar has been raised.

Group

Modesto Irrigation District

Comment: Are all bullets under R1.1.2 required to be explicitly modeled or are the effect of the devices or the effect of the removal of the devices to be modeled? We don't explicitly model circuit breakers or explicitly model protection system equipment in the steady state model. R1.1.4 should refer to expected transfers to be consistent with the bullet under R2.1.3. Please explain the difference between R1.1.4 and R1.1.5

On pages 6 and 7 under sections R2.1.3 and R2.4.3, I think the magnitude of the "variations" in the conditions asked for in the sensitivity cases, should be defined and not left to the analyst to decide. On page 8 under Section R2.5.2, examples of "material changes" for generation are given, but no examples for transmission changes. Shouldn't we include examples of material transmission changes, too ? Comments: Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES R2.8 and R2.9 load loss comment. We don't agree with R2.8 & R2.9. What reliability purpose is served by these requirements?

On page 10 under Section R3.3.3, I believe more specifics on what is meant by "relay loadability" need to be given in regard to the requirement of "identify how loadability is analyzed in the steady state simulation". For example, does the analyst need to state that the maximum loading allowed on any system element is less than or equal to 150% of the element's maximum seasonal rating ? We believe that R3.3.1-R3.3.4 should be bullets under R3.3

Comments: We believe that R4.3.1-R4.3.3 should be bullets under R4.3

On page 13 under Section R5, can the term "proxies" be defined and clarified, and examples given, in this context ?

No

On page 2 under "Definitions of Terms Used in Standard", the red-lined out example used to clarify the definition of "Non-Consequential Load Loss" seems valuable to me, and I think they should not remove it but leave it in.

No

On page 20 under Table 1, why are "SLG" (i.e., single line to ground) type faults still specified when footnote 3 on page 24 indicates that analyzing three phase faults is sufficient ? On page 20 under Table 1 part f, changing "post transient" to "post Contingency" may be confusing to most analysts as post-transient is a well defined term that has been in use for many years, and is even referenced in Table W-1 of the WECC supplemental planning standard TPL - (001 thru 004) - WECC - 1 - CR. On page 20 under Table 1 part g, does that mean that for Planning Event P0 the analyst is not required to simulate a fault with normal clearing without a loss of any system element, in order to demonstrate system stability ? On page 24 under Footnote 1 a ii, I would like to suggest that we add the phrase "(unless the relays are equipped with blinders and timers)" right after the phrase "...must not pass through relay characteristics...". This is because the blinders (i.e., straight line characteristic of a distance relay) and timers can be used to prevent distance relays from tripping when power angle swings cause the apparent impedance the distance relays see to cross into the distance relay's zone of protection.

Individual

Bart White

Progress Energy Florida, Inc.

For R1.1.2, PEF has the following comments: T-T Transformers, as major components of the BES, should be on this list. PEF does not object to the inclusion of Circuit Breakers on this list,

provided that representation is not required in steady state load flow cases. Breaker failure scenarios can be extensively studied in the steady state and stability realms by removing from service the transmission facilities that such a breaker event would initiate. PEF assumes that the inclusion of Protection System Equipment applies only to Stability Analysis. As for breakers, relay failure scenarios can be extensively studied in the steady state realm by removing from service the transmission facilities that such a relay event would initiate. Additionally, PEF also assumes that a comprehensive modeling of all Protection System Equipment (e.g. Transformer Sudden Pressure Relays, Bus Diff Relays, etc.) in Stability Analysis is not required, since only a limited amount of relaying in dynamic modeling is needed to adequately model the system with respect to what transmission/generation components would trip for a given event. A lack of specificity on the term "Control devices" leaves it open to wide interpretation. The SDT should, in detail and/or with examples, state what is intended. The term "New technologies" is only acceptable for inclusion if provision is made for the fact that Planning analysis software often lags behind the design industry in getting new technologies modeled such that Planners can analyze them. For R1.1.4 on Firm Transmission Service: PEF assumes that the SDT understands that some firm transmission service is not always modeled in every case, depending upon the economics and availability of alternate resources.

Concerning R2.1.4, this sub-requirement is overly burdensome for two primary reasons: a) It amounts to a system-wide N-2 and N-3 analysis, which goes against FERC's policy of separation and distinction between types of events as stated in Paragraph 1788 of Order 693: "Under TPL-002-0 the system is not required to be able to withstand another N-1 contingency. That N-1 requirement is a Category C contingency which is addressed by TPL-003-0." b) The requirement to perform system-wide analysis for such a scenario is a significant workload issue, and will take time away from analysis of more probable events. Concerning the issue of material changes in past studies in sub-requirement R2.5.2, PEF objects to the specification of changes in units "of 20 MW or greater", due to the fact that a change (or even deletion) of a 20 MW unit in a case modeling a large BES does not truly constitute a material change. The SDT in its response to Question 15 in the comments for draft 2 stated that "The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general." PEF suggests that the SDT take its own advice, making the language in R2.5.2 more general in nature and leaving such modeling details to the discretion of the Transmission Owner. In R2.6.2, PEF assumes that the term "project initiation date" is intended to mean the Construction Move-In date. If the term means the first date at which Planners had identified it as a mitigation, PEF would object to this as it would appear to preclude the right to develop superior mitigations, or to cancel a project if it can be demonstrated as no longer needed. Concerning R2.8 and R2.9, PEF strenuously objects to such requirements. These requirements have no bearing on demonstrating the reliability (or lack thereof) of the BES, and therefore should be removed from the Standard.

Concerning R3.3.1, PEF believes that, in virtually every conceivable scenario, contingency analyses show that analysis of individual elements will reveal overloading or undervoltages, whereas the same event modeled according to protection system design (i.e. simulating the event as the actual "breaker-to-breaker" operation would occur) may not. Analysis of individual elements is therefore a more conservative method for studying the BES. PEF is not opposed to analysis of entire circuit outages; PEF therefore suggests that in addition to the existing language of R3.3.1, an additional sentence be added as follows: "Simulation of the loss of individual elements is acceptable in lieu of simulating the loss of all elements in a protection zone if it produces greater overloads or lower voltages." This approach would allow for more efficient coordination with Transmission Operators as they schedule planned outages or make system adjustments in outage scenarios.

For R4.3.2, PEF assumes that the SDT understands that the extent of analyzing generation voltage ride-through capability does not extend to modeling of individual inductive loads on the Distribution side, as this does not fit the definition of the BES. Motor loads on the Distribution system do have an effect on generation voltage ride-through capability, however, and PEF therefore is perplexed as to what extent the SDT expects concerning analysis for this sub-requirement.

PEF does not presently have any concerns with R5.

PEF does not presently have any concerns with R6.

PEF does not presently have any concerns with R7.

No

PEF continues to disagree strenuously with differentiating between Consequential Load Loss and Non-Consequential Load Loss. PEF does not believe that load loss has anything whatsoever to do with demonstrating the robustness of the BES. The approach the SDT is taking with TPL-001-1 is essentially "Feeder Reliability", rather than BES Reliability. Should the SDT decide that they must continue with this approach, PEF will explore options for expressing concern about this at the FERC level. PEF is perplexed by the definition of Supplemental Load Loss. PEF, as a Transmission Owner, considers its "end-user" to be the Distribution System. PEF would therefore use this definition to design Distribution-side controlled load curtailment schemes that essentially qualify

as Consequential Load Loss. If this is not the intent of the SDT, PEF suggests that the SDT modify this definition to make its meaning clearer.

No

PEF has multiple concerns with Table 1, the most fundamental of these concerns being that the existing Table in the existing TPL Standards is far superior to the new table. PEF suspects that the large blackout/brownout events in the Northeast and West have been the primary impetus behind devising a new Standard that will allegedly improve BES reliability. PEF strongly feels that proper planning, operation and maintenance under existing NERC Standards could have prevented all of the aforementioned events, and thus a new TPL Standard and a new Table 1 is not necessary. PEF's specific concerns with Table 1 as it exists in this 3rd draft of TPL-001-1 are as follows: As a general concern, PEF, as has been stated already, does not believe that organizing a Reliability table according to whether or not loss of Firm Transmission Service or loss of Non-Consequential Load can occur is appropriate. The BES can be demonstrated to be robust and can even be continually improved under the existing TPL Standards. PEF fails to see how FERC's and NERC's desire to eliminate Footnote (b) as stated in the existing TPL Standards has anything to do with the desire to improve the reliability of the BES. Indeed, as TPL-001-1 exists at present, PEF suspects that many Transmission Owners will a) reduce posted ATC values to reduce risk of loss of Firm Transmission Service or b) remove breakers to convert Non-Consequential Load into Consequential Load. Both of these actions fly in the face of what FERC desires for the BES of the future. FERC certainly desires for power markets to open up further and thereby encourage lower energy prices, but at present TPL-001-1 and the accompanying Table 1 is in opposition to enhancing the power marketing industry. In addition, removing breakers is in opposition to reliability and customer service. An additional general concern involves the continued differentiation between HV and EHV. EHV by its very nature carries significantly larger amounts of power than HV, and therefore an EHV event inherently causes a greater disparity between Generation and Load than a HV event, making the loss of Firm Transmission Service or loss of Non-Consequential Load necessary for even a single contingency. Should all utilities be therefore required to make their EHV systems redundant? Such a suggestion is preposterous. Given this fact, and the fact that EHV events hardly ever occur (and, as outlined in the draft Table 1, have never occurred on PEF's system), PEF believes holding EHV to a higher standard is inappropriate, and will result in no more than a negligible reliability improvement at tremendous cost. Based on the above concerns, PEF believes for all event scenarios (P0 – P7), analysis according to whether or not loss of Firm Transmission Service or loss of Non-Consequential Load can occur is inappropriate and should be deleted from the Standard. Concerning event P2-1, PEF assumes that "opening of breaker w/o fault" means opening breakers from both sides of the circuit. PEF therefore does not understand the difference between event P2-1 and events P1-1 through P1-4, and therefore suggests deleting P2-1 and combining the remainder of P2 with P1. Given the concerns above, voicing additional concerns about the Footnotes, short of reinstating the existing Footnote (b), is irrelevant.

No

Again, given the fundamental concerns that PEF has stated in previous Questions, PEF sees voicing detailed concerns for these footnotes as irrelevant, short of suggesting the reinstatement of the existing Footnote (b).

No

While the Implementation Plan is extremely vague at present, making a specific enforcement date impossible to determine, PEF is concerned that the language at present will not allow enough time for Transmission Owners to prepare for the increased stringency.

Xcel Energy

R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.

R2.1.3 – is this indicating that only one of the variations need to be studied? (“...in one or more of the following conditions...”). Recommend having the planner work with the load to determine what sensitivity studies to perform. R2.1.4 – it is unclear as to what should be done with the analysis that incorporates the company's spare equipment strategy. Is this requirement inferring that a company's spare equipment strategy need to ensure that it can still operate to within the requirements for contingencies of Table 1 without the component? R2.2.1 – is the intent to have the study for the 10 year horizon or to include any project that is started within the next 10 years and thus the study must be extended to the forecasted completion of the project (conceivably as long as 20 years or more?) R2.6.4 – recommend clarifying how “situations beyond the control of the TP or PC” are determined. It is unclear if this is to imply that if something is outside of the control of the department who conducts the planning studies or if it is outside the control of the registered function's legal entity (i.e. corporation). R2.8 – appears to

be nonessential information for reliability; for what purpose does this requirement exist? R2.9 - appears to be nonessential information for reliability; for what purpose does this requirement exist?

R3.3.3: Relay loadability has no bearing beyond the near term horizon. Loadability is not determined several years out. R3.5 – does this imply that mitigation plans must be implemented? If not, then this is highly subjective and the last sentence of this requirement should be deleted.

R4.3 – requires very labor intensive and detailed studies to be conducted; there are concerns about being able to accomplish the required studies within the 24 month implementation period; additionally, while there may be some reliability benefit to requiring these studies, have the costs of this requirement been studied?; an alternative could be some sort of phased implementation (x% completed by 24months, etc.) R4.3.3 – to what degree is generator relaying factored into the model/study?

The term “proxies” is somewhat confusing; recommend the use of “assumptions” if that is an acceptable substitute.

Why is this needed if both entities must comply with the standard? At a minimum the requirement should include language to state that the one party must provide to the other with enough notice to comply with a required study if there is a shift or assignment of a responsibility.

Recommend deleting the portion of the requirement that states: “coordinating analysis of these results through an open and transparent review process such as described in FERC Order 890.”

No

Clarification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements.

ISO New England, Inc.

R1 Priority Comment- There needs to be some direction provided on the initial conditions used in the assessment. This guidance should include discussion as to whether or not representations of generator forced outages are to be represented in the base case or if they are addressed through the sensitivity testing (Could add R1.1.7 Reasonable representations of unplanned generator outages.) Additionally, the standard is also silent on the treatment of system transfers, both internal and external, as to how they should be modeled in the base case. For some areas, their current practice is to include heavy system stresses in their base case, which leaves little for sensitivity testing. It is unclear if this practice works within this standard. R1.1.1 Priority comment – R1.1.1 should be removed. It seems like there is an overlap between the requirements of this standard and Operational Planning studies with respect to known outages. Planned outages are addressed by our Operational Planning processes and Transmission Operating Procedures removing the need for this to be incorporated into Planning Assessments. In addition, outages are not generally known years in advance R1 Comment – We do not understand what it means to include “requirements of regulatory authorities and other legal obligations”. Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1. R1.1.2 comment - Do we need to have the list of equipment to model? How do we model circuit breakers, etc? We recommend deleting the list. Make R1.1.2 simply read: R1.1.2 New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon. R1.1.5 comment – What specifically needs to be modeled under Interchange? R1.1.6 comment – This needs further definition or it should be deleted. It is not clear what a “network resource required to supply load” is. Does this refer to Network Resource per FERC LGIP?

R2 Comment – We recommend replacing the phrase “prepare” with “conduct and document” in the first sentence. R2.1.1 Comment – The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2. R2.1.2 Comment – The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments. R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be

used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment. R2.1.4 Priority Comment – With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Why doesn't the standard state "(such as a transformer, generator or power electronic device)" and not just "(such as a transformer)". R2.2 Comment – We suggest replacing the phrase "a current System peak Load study" with "a valid System peak Load study" in the first sentence. The word current is confusing as some read the word current to mean "today's" rather than "valid". R2.3 Comment – Please provide guidance as to what year should be represented when performing short circuit studies. R2.4.1 Comment – Change to read: "For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load." R2.5.1 Comment – We suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 Comment – To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: • The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study] • An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner. R2.6 Priority Comment – As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read "Provide documentation that explains the reasoning for the sensitivities considered and selected." R2.6 Comment – At the end of the second sentence, the phrase "in the tables" is used. We suggest using more definitive language such as "in Table 1". R2.6.2 Comment – The phrase "Project Initiation Date" needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase "as well as an in-service date" should be modified to read "as well as a target in-service date". R2.6.3 Comment – Plans can provide a target in-service year but not an actual in-service year. R2.6.4 Priority Comment – There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions. R2.8 Comment – Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. R2.9 Comment – This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.

R3.3.2 Comment – Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R3.3.3 Comment – PRC-023 requires relay loadability to be reflected in facility ratings. Therefore this additional requirement is unnecessary and should be deleted. R3.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events - Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered."

R4.3.2 Priority Comment - Traditionally transmission planners have assumed that generators would ride through low voltages associated with Planning Events which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary

information prior to its inclusion as a requirement in this standard. R4.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events - Change “an evaluation of possible actions...” to “where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered.”

It is unclear as to what is meant by the term “proxy used in the analysis” used in this requirement. Does this mean Planning Coordinator established practices, thresholds or guidelines used to gauge when simulations suggest an event such as cascading outages occurs? If so the language should state: R5. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, when established practices, thresholds or guidelines identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding.

We do not feel that this requirement belongs in this standard and it should be deleted. The standard defines requirements for the assessment not who does what.

This standard should not be reiterating FERC Order 890. We do not feel that this requirement belongs in this standard and it should be deleted.

No

Refine load loss definitions as follows. Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions resulting from following a Planning or Extreme Event. Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. Intended post contingency loss of load (other than Interruptible Load, Supplemental Load or Load Reduction) caused by operator or SPS (RAS) action. (Priority Comment)

No

Priority Comment – As written, this requirement is overly severe. This would require the simulation of a “dead” station if only one battery is present (use of NERC Glossary Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. Priority Comment – Event 1 - This requirement requires the evaluation of the loss of two circuits on a multiple circuit tower. We recommend that this be modified so that only the loss of two adjacent (vertically or horizontally) circuits need be evaluated. We also recommend that the Planning Coordinator be allowed to evaluate and if appropriate exempt specific locations from this contingency based on acceptable risk. Comments on Extreme Events – Table 1- We recommend renumbering the Extreme Events table to be Table 2. Stability Condition 2 Note h – Eliminate this requirement or change to loss of station following three phase fault. This note is confusing. Without providing a better defined scenario, it is unclear as to what clearing times should be used in this simulation. Note 1.a.ii – Contingency Reserve is dependent on the generation on-line. We suggest changing the first sentence to say that you can't lose more than that permissible by the Planning Coordinator. Also change “pull out of synchronism” to “lose synchronism” in this sentence and in the second sentence. (Is “Lose synchronism” a more commonly used term?). Note 3 – We recommend revising the wording of the last sentence to “A 3 phase fault study indicating criteria are being met is sufficient evidence that a SLG condition would also meet criteria.” Note 4 – We recommend that a lower bound be put on the HV electric systems (such as 100 kV), rather than just saying “and lower”.

It is not clear what a “network resource required to supply load” is. Does this refer to Network Resource per FERC LGIP?

R2 Comment – We recommend replacing the phrase “prepare” with “conduct and document” in the first sentence. R2.1.1 Comment – The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2. R2.1.2 Comment – The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments. R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment. R2.1.4 Priority Comment – With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Why doesn't the standard state “(such as a transformer, generator or power electronic device)” and not just “(such as a transformer)”. R2.2 Comment – We suggest replacing the phrase “a current System peak Load study” with “a valid System peak Load study” in the first sentence. The word current is confusing as some read the word current to mean “today's” rather than “valid”. R2.3 Comment – Please provide guidance as to what year should be represented when performing short circuit studies. R2.4.1 Comment – Change to read: “For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.” R2.5.1 Comment– We suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 Comment – To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: • The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study] • An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner. R2.6 Priority Comment – As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read “Provide documentation that explains the reasoning for the sensitivities considered and selected.” R2.6 Comment – At the end of the second sentence, the phrase “in the tables” is used. We suggest using more definitive language such as “in Table 1”. R2.6.2 Comment – The phrase “Project Initiation Date” needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase “as well as an in-service date” should be modified to read “as well as a target in-service date”. R2.6.3 Comment – Plans can provide a target in-service year but not an actual in-service year. R2.6.4 Priority Comment – There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions. R2.8 Comment –Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. R2.9 Comment – This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.

R3.3.2 Comment – Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R3.3.3 Comment – PRC-023 requires relay loadability to be reflected in facility ratings. Therefore this additional requirement is unnecessary and should be deleted. R3.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events - Change “an evaluation of possible actions...” to “where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered.”

R4.3.2 Priority Comment - Traditionally transmission planners have assumed that generators would ride through low voltages associated with Planning Events which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R4.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Arizona Public Service Co

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices only where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard. VSL: Under Severe VSL Column: The last sentence "The System model did not simulate projected System Conditions as described in Requirement R1" is vague and should be clarified. What is meant by "did not simulate." Is it referring to gross errors or something else? We recommend that Sever VSL be assigned only if the Transmission Planner failed to do the planning assessment. Hence it should not apply to R1 at all since R1 is only related to modeling accuracy.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity with a minimum of 100 MW change. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automotive voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more

severe. Listing all possible extreme events could result in a limitless list.
As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.
The term proxy is unclear. Please provide an example or an explanation of proxy. If this is related to Note "i" in Table 1, it should be so stated. If it is related to assumptions or criteria, please state so.
We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.
No
Clairification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column has a No entry, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?
No
P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4. We do not agree with Note "i" which requires establishing transient voltage response limits. There is no solid basis for such limits. In the past such limits were used as proxies for VAR margin and are not needed anymore. This will also result into non-uniform criteria throughout the interconnection. If such a limit were to be established, it should be based upon quantifiable reliably impact and should be supported by firm technical basis. Note 1b: Acceptable damping should not be defined by Planning coordinator and should be left to the Transmission Planner. Otherwise it would result into non-uniform criteria for the interconnections.

Louisiana Energy and Power Authority
R2.5. This basic requirement intends, as we understand it, to require that earlier studies not be used for a current assessment if they are no longer accurate. But the phrasing is potentially confusing, and would be clearer if revised. Since the requirement deals with the use of past studies, we suggest that R2.5.2 be revised to state that "the study may be used only if there have been no material changes," so that R2.5 reads in full: "R2.5. Past studies may be used to support the Planning Assessment if they meet the following requirements: "R2.5.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less. "R2.5.2. For steady state, short circuit, or Stability analysis: the study may be used only if there have been no material changes, such as generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: "The addition/deletion/change of individual generating unit capability of 20 MW or greater. "An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater." With respect to footnote 10 to Table 1, we fear that the flexibility suggested by those provisions may be excessive for a planning standard. The ambiguity occasioned by stating emergency actions that can properly be taken in a planning standard can be utilized by those who plan the system in a manner which plans to drop non-consequential loads just as footnote b has been used in the past. If this is intended to "raise the bar" as stated these provisions do not belong in a planning standard, at least as now stated. It may be appropriate to remove the reference to footnote 10, at least in the Initial System Condition entry in P3, where it

suggests that it can be invoked after loss of a single generator, and we request the SDT to review that footnote to assure that it is appropriate in the other entries to which it is applied.

No

LEPA is in the area which is impacted by Entergy transmission planning. Entergy is one of the few NERC transmission owners which has for some years now relied upon its interpretation of "footnote b" in the previous TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 as permitting planning for the loss of Non-Consequential Load or interruption of firm transfers as a way of planning and building less transmission than other utilities would have considered themselves obligated to build for reliability. That Entergy interpretation, and the consequent lower investment in transmission planning and construction, has been a matter of some concern among Entergy regulators at both State and Federal levels, as well as Entergy transmission customers, and has been rejected by the SPP, which has been given the authority to develop the base plan for transmission additions on the Entergy system. It was the Entergy rejection of that base plan that most recently led to a day long technical conference among regulators at the recent SEARUC conference in Charleston, SC. The proposed Implementation Plan for TPL-001-1 is drafted to make the new standard, which the proposed Implementation Plan describes as one that "raises the bar in several areas," effective only after the passage of 60 months from the first day of the first calendar quarter following applicable approval. That time for implementation is also embodied in A.5 of the proposed standard. This time lag is chosen, according to the proposed Implementation Plan, because of the "significant budget, siting, permitting, and construction impacts on many transmission owners." There are significant problems and costs for those whose electric service is dependent upon an inadequate transmission system, which would argue for a lesser period of time to reach compliance. This is especially true when the existing system is planned on an assumption as to the meaning of footnote b which assumption was clearly recognized as being controversial and a minority view. In recent years there have been repeated Entergy TLRs at quite high levels, which have repeatedly required emergency EEA-3s to keep firm load on line. And there has been an ongoing dispute between Entergy and the ICT as to footnote b and whether there should be limits on consequential load to be shed which has led the SPP (as the Entergy ICT) to have a complete base case for Entergy transmission construction already developed which is, by FERC direction, the basis for the Entergy construction plan. In its construction plan, however, Entergy dropped some 20 of the projects in the ICT base plan because of the Entergy view that it could go ahead and plan to drop non-consequential load as a means of remaining in compliance with Standards rather than building the transmission projects that would have been required in accordance with the ICT base plan. While not all of the proposed changes embodied in TPL-001-1 may have been incorporated in the SPP base plan development, certainly the footnote b issues were. The costs of the failure of reliability and congestion resulting from the Entergy failure have been quite high, for Entergy retail customers as well as for others, and will continue to be high so long as there is no obligation to comply. Firm transmission obligations are simply not met while there is no obligation to comply. While it is certainly true that transmission cannot be planned and constructed overnight, it is also true that those who relied upon the minority interpretation of footnote b have been on notice for years both that that interpretation was challenged, and also that it was a minority viewpoint, as NERC itself advised FERC in its response to the NOPR that preceded Order 693. In 2007 FERC directed that NERC clarify the intended meaning of footnote b in its Order 693, and pointed out at that time that the interpretation permitting loss of load was "based largely on the matter of economics, not reliability." *Id.*, P 1792. At that time, only Entergy and NIPSCO would even admit to this less reliable interpretation of footnote b. NERC agreed that such an interpretation was incorrect in its filings leading up to Order 693. In its June 26, 2006 Comments of North American Electric Reliability Council and North American Electric Reliability Corporation on Staff Preliminary Assessment, at p. 57-58, NERC noted that load shedding in a single contingency event is not acceptable: "footnote b to TPL-002-0 is intended to provide a limited exception to the general rule for serving load from a radial transmission line and should only be applied in unique circumstances, as described above. NERC recognizes that looped configurations are key to the reliable operation of the interconnection, and to meet reasonable expectations for reliable service to loads. . . . NERC standards, including footnote b, are not intended to endorse or approve planning the interconnection using radial configurations as a preferred method for reliably serving load, nor do NERC standards consider load shedding acceptable for single contingency events." Hence, those recalcitrant transmission owners who intentionally failed to expend the money and effort that the responsible transmission owners did expend, have been rewarded at the expense

of those who rely on the transmission system to do its basic job. Order 693, P 1794, "strongly discourage[d] an approach that reflects the lowest common denominator." Many of those transmission owners and planners for whom this change constitutes "raising the bar" presumably had plenty of time to consider what their options would be if their interpretation was incorrect, and should be expected to have reserve plans on hand pretty close to being ready to go when the dispute was lost. In the Entergy case, the plan has been in its hands for some time, and it has chosen to reject the ICT plan based on its own minority interpretation of footnote b. LEPA asks that at least as to the changes tied to footnote b interpretation, and other excuses for dropping non-consequential load, the time for compliance be shortened to no more than two years following regulatory approval of the standard. R2.6 already provides for the development of a Corrective Action Plan, and it would not encourage reliability if five years were taken to develop a Corrective Action Plan, as opposed to complying with the standard. Second, LEPA suggests that, whether or not NERC chooses to stick with its 5-year time period to permit those entities which may have used a similar interpretation of footnote b, it not try to influence FERC and the courts as to legal questions that may develop during that period. We recognize that the changes made in what will be TPL-001-1 go well beyond the clarification of footnote b, so that for some changes there may be a reason for the 5 year phase in. But whether or not the 5 year phase in is going to be applicable to all of those changes, we suggest that it would be improper to mischaracterize what is being done in a way that appears to have been drafted to influence legal questions that may come up. Specifically, as currently drafted, the descriptive modifier "many" should not be used in describing the entities which had chosen to use the lower bar interpretation of footnote b. While we recognize that a number of commenters have looked to one interpretation or another of footnote b in a few extreme situations, a review of comments does not show other transmission owners who have relied on the extreme interpretation used by Entergy on a systematic basis, And we think it inappropriate for the description in the paragraph beginning at the bottom of p.1 of that draft Implementation Plan to focus on the footnote b issue, as it now does. We suggest a modification which makes the description accurate, and which avoids the kind of misinterpretation which led to the footnote b controversy in the first place. We suggest that that first part of that paragraph be revised to read as follows: "TPL-001-1 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0. Among other things, loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by some to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent 'raising the bar'..."

New Brunswick System Operator

It is not clear how TP and PC are to coordinate activities. If R6 provided direction on individual and joint responsibilities then R6 should be referred to in each of the requirements which require TP and PC coordination. The VSL and Measurement for requirement R1 appears focused the number of subrequirements represented in the model. Ideally the focus should be the impacts or error of the results if something is not properly represented. This shift in thinking will allow the planner to assess and focus on those subrequirements which are important to the study results. R1.1.1 Planned outage duration needs to be defined. For example, a planned outage for a year or more should be included in the Near term assessment.

R2.1.4 Major transmission element needs to be defined. For example, what about sync condenser, or generator step up transformer? R2.2 Clarity required. Example: What is meant by "current System peak load" It is not clear what supplemental load loss is. Would load tripped due to undervoltage or SPS as a result of a contingency be considered supplemental load? As a follow up what then is Non-consequential load (provide examples). How would this load be lost? The requirements appear the same regardless of the amount of Non-consequential load loss. Is there any consideration of applying thresholds both on supplemental and non-consequential load loss where these loads are defined as (or applied as) "...exceeding xxx amount of MW". Regarding Table 1 b, what does the following mean: "However, Supplemental Load Loss associated with an event shall not be used to meet steady state performance requirements." Please clarify the definition of Year One. This definition also does not include Planning coordinator. Was that intentional?

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.
We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.
No
Clairification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?
No
P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.
Yes
We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

Lafayette Utilities System
R2.5. This basic requirement intends, as we understand it, to require that earlier studies not be used for a current assessment if they are no longer accurate. But the phrasing is potentially confusing, and would be clearer if revised. Since the requirement deals with the use of past studies, we suggest that R2.5.2 be revised to state that "the study may be used only if there have been no material changes," so that R2.5 reads in full: "R2.5. Past studies may be used to support the Planning Assessment if they meet the following requirements: "R2.5.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less. "R2.5.2. For steady state, short circuit, or Stability analysis: the study may be used only if there have been no material changes, such as generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: "The addition/deletion/change of individual generating unit capability of 20 MW or greater. "An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater." With respect to footnote 10 to Table 1, we fear that the flexibility suggested by those provisions may be excessive for a planning standard. The ambiguity occasioned by stating emergency actions that can properly be taken in a planning standard can be utilized by those who plan the system in a manner which plans to drop non-consequential loads just as footnote b has been used in the past. If this is intended to "raise the bar" as stated these provisions do not belong in a planning standard, at least as now stated. It may be appropriate to remove the reference to footnote 10, at least in the Initial System Condition entry in P3, where it suggests that it can be invoked after loss of a single generator, and we request the SDT to review that footnote to assure that it is appropriate in the other entries to which it is applied. In addition to the foregoing, we are concerned that the language of footnote 10 to Table 1 is unclear and subject to at least one interpretation that would seriously undermine reliability. Specifically, the first sentence of footnote 10 permits "[c]urtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch" The reference to an "obligat[ion] to re-dispatch" is ambiguous at best and should be clarified. For example, footnote 10 should not be read as permitting Balancing Authority A to rely on curtailment of firm transmission service coupled with re-dispatch of generation by adjacent Balancing Authority B during a Level 5 TLR event, based on the theory that, if a Level 5 TLR is declared and the Reliability Coordinator assigns to Balancing Authority B an NNL reduction responsibility that compels it to reload its resources, Balancing Authority B is therefore "obligated to re-dispatch" within the meaning of footnote 10. We suspect the intent of the first sentence of footnote 10 was to recognize and give effect to arrangements in which (following the example) Balancing Authority A has made a prior contractual arrangement with Balancing Authority B (or another generation owner) to provide redispatch services when requested by Balancing Authority A. In that circumstance, Balancing Authority A would be allowed to couple the curtailment of firm transmission with redispatch provided by Balancing Authority B (or another generation owner)

pursuant to its contractual obligation. We suggest that this limitation be reflected by revising the first sentence of footnote 10 to read as follows: "Curtailed of firm transmission service, when coupled with the appropriate re-dispatch of resources subject to a contractual obligation to provide re-dispatch service to the operator of the system for which the Transmission Planner is responsible, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load." Without the limitation reflected in the foregoing revision, an entity could interpret footnote 10 as allowing it to rely on the redispach of generation by other systems that may be (in effect) mandated by a Reliability Coordinator during a Level 5 TLR event. That sort of "leaning" on adjacent systems should not be permitted as a System adjustment or corrective action under TPL-001, especially where it imposes uncompensated burdens and costs on the system(s) forced to redispach under these circumstances.

No

Lafayette is in the area which is impacted by Entergy transmission planning. Entergy is one of the few NERC transmission owners which has for some years now relied upon its interpretation of "footnote b" in the previous TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 as permitting planning for the loss of Non-Consequential Load or interruption of firm transfers as a way of planning and building less transmission than other utilities would have considered themselves obligated to build for reliability. That Entergy interpretation, and the consequent lower investment in transmission planning and construction, has been a matter of some concern among Entergy regulators at both State and Federal levels, as well as Entergy transmission customers, and has been rejected by the SPP, which has been given the authority to develop the base plan for transmission additions on the Entergy system. It was the Entergy rejection of that base plan that most recently led to a day long technical conference among regulators at the recent SEARUC conference in Charleston, SC. The proposed Implementation Plan for TPL-001-1 is drafted to make the new standard, which the proposed Implementation Plan describes as one that "raises the bar in several areas," effective only after the passage of 60 months from the first day of the first calendar quarter following applicable approval. That time for implementation is also embodied in A.5 of the proposed standard. This time lag is chosen, according to the proposed Implementation Plan, because of the "significant budget, siting, permitting, and construction impacts on many transmission owners." There are significant problems and costs for those whose electric service is dependent upon an inadequate transmission system, which would argue for a lesser period of time to reach compliance. This is especially true when the existing system is planned on an assumption as to the meaning of footnote b which assumption was clearly recognized as being controversial and a minority view. In recent years there have been repeated Entergy TLRs at quite high levels, which have repeatedly required emergency EEA-3s to keep firm load on line. And there has been an ongoing dispute between Entergy and the SPP as to footnote b and whether there should be limits on consequential load to be shed which has led the SPP (as the Entergy ICT) to have a complete base case for Entergy transmission construction already developed which is, by FERC direction, the basis for the Entergy construction plan. In its construction plan, however, Entergy dropped some 20 of the projects in the SPP base plan because of the Entergy view that it could go ahead and plan to drop non-consequential load as a means of remaining in compliance with Standards rather than building the transmission projects that would have been required in accordance with the SPP base plan. While not all of the proposed changes embodied in TPL-001-1 may have been incorporated in the SPP base plan development, certainly the footnote b issues were. The costs of the failure of reliability and congestion resulting from the Entergy failure have been quite high, for Entergy retail customers as well as for others, and will continue to be high so long as there is no obligation to comply. Firm transmission obligations are simply not met while there is no obligation to comply. While it is certainly true that transmission cannot be planned and constructed overnight, it is also true that those who relied upon the minority interpretation of footnote b have been on notice for years both that that interpretation was challenged, and also that it was a minority viewpoint, as NERC itself advised FERC in its response to the NOPR that preceded Order 693. In 2007 FERC directed that NERC clarify the intended meaning of footnote b in its Order 693, and pointed out at that time that the interpretation permitting loss of load was "based largely on the matter of economics, not reliability." Id., P 1792. At that time, only Entergy and NIPSCO (certainly not "many" Transmission Owners— a word that appears twice in the draft Implementation Plan) would even admit to their interpretation of footnote b to weaken the grid. NERC agreed that such

an interpretation was incorrect in its filings leading up to Order 693. In its June 26, 2006 Comments of North American Electric Reliability Council and North American Electric Reliability Corporation on Staff Preliminary Assessment, at p. 57-58, NERC noted that load shedding in a single contingency event is not acceptable: "footnote b to TPL-002-0 is intended to provide a limited exception to the general rule for serving load from a radial transmission line and should only be applied in unique circumstances, as described above. NERC recognizes that looped configurations are key to the reliable operation of the interconnection, and to meet reasonable expectations for reliable service to loads. . . . NERC standards, including footnote b, are not intended to endorse or approve planning the interconnection using radial configurations as a preferred method for reliably serving load, nor do NERC standards consider load shedding acceptable for single contingency events." It thus seems strange for NERC, an organization whose very existence was intended to assure the reliability of the grid, to reward those recalcitrant transmission owners who intentionally failed to expend the money and effort that the responsible transmission owners did expend, and at the expense of those who rely on the transmission system to do its basic job. Order 693, P 1794, "strongly discourage[d] an approach that reflects the lowest common denominator." Many of those transmission owners and planners for whom this change constitutes "raising the bar" presumably had plenty of time to consider what their options would be if their interpretation was incorrect, and should be expected to have reserve plans on hand pretty close to being ready to go when the dispute was lost. In the Entergy case, the plan has been in its hands for some time, and the fact that it has chosen to reject the SPP plan based on its own minority interpretation of footnote b is no one's fault but its own. And it certainly does not have to start from scratch to develop the plan; it consciously chose to reject the plan that the ICT developed for it. Lafayette asks that at least as to the changes tied to footnote b interpretation, and other excuses for dropping non-consequential load, the time for compliance be shortened to no more than two years following regulatory approval of the standard. R2.6 already provides for the development of a Corrective Action Plan, and it would not encourage reliability if five years were taken to develop a Corrective Action Plan, as opposed to complying with the standard. Second, Lafayette suggests that, whether or not NERC chooses to stick with its 5-year "lowering of the bar" to permit those entities which may have used a similar interpretation of footnote b to avoid building a sturdy grid, it not try to influence FERC and the courts as to legal questions that may develop during that period. We recognize that the changes made in what will be TPL-001-1 go well beyond the clarification of footnote b, so that for some changes there may be a reason for the 5 year phase in. But whether or not the 5 year phase in is going to be applicable to all of those changes, we suggest that it would be improper to mischaracterize what is being done in a way that appears to have been drafted to influence legal questions that may come up. Specifically, as currently drafted, the descriptive modifier "many" should not be used in describing the entities which had chosen to use the lower bar interpretation of footnote b. While we recognize that a number of commenters have looked to one interpretation or another of footnote b in a few extreme situations, a review of comments does not show other transmission owners who have relied on the extreme interpretation used by Entergy on a systematic basis. And we think it inappropriate for the description in the paragraph beginning at the bottom of p.1 of that draft Implementation Plan to focus on the footnote b issue, as it now does. We suggest a modification which makes the description accurate, and which avoids the kind of misinterpretation which led to the footnote b controversy in the first place. We suggest that that first part of that paragraph be revised to read as follows: "TPL-001-1 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0. Among other things, loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by some to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent 'raising the bar'..."

Western Area Power Administration

General, all-encompassing comment: The change in TPL Standards, while well intended, will be difficult to administer since it has taken a simple Performance Table and translated it into a legal-type document that is very complex to relate to the physical system for the planning and operations staff. The performance requirements must be related to the physical response characteristics of the interconnected system operation without depending on a legal advise for training my new transmission system planning staff. The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and

one should be deleted. I disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). The last bullet under R2.1.3 - "Planned duration or timing of Transmission Outages." does not belong in a long-term planning standard. These-type of seasonal outages are studied and implemetation plans are derived as part of the TOP Standard requirements. In the WECC - this is also covered by the seasonal studies carried out by the Operating Transfer Capability Policy Committee (OTCPC) study groups. Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement - OR simply delete this spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. This requirement is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets. R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automotive voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 - I disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 - It is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 - I disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term "proxy" is unclear. Please provide an example or an explanation of proxy.

None.

I believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Claification is needed on the use of UVLS. Is it acceptable or not? Typically UVLS relays are

modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column, it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential Load should be allowed for EHV. I disagree with raising the bar for EHV for P4.

Yes

I agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so it is added here. I question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

Mississippi Delta Energy Agency

R2.5. This basic requirement intends, as we understand it, to require that earlier studies not be used for a current assessment if they are no longer accurate. But the phrasing is potentially confusing, and would be clearer if revised. Since the requirement deals with the use of past studies, we suggest that R2.5.2 be revised to state that "the study may be used only if there have been no material changes," so that R2.5 reads in full: "R2.5. Past studies may be used to support the Planning Assessment if they meet the following requirements: "R2.5.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less. "R2.5.2. For steady state, short circuit, or Stability analysis: the study may be used only if there have been no material changes, such as generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: "The addition/deletion/change of individual generating unit capability of 20 MW or greater. "An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater." With respect to footnote 10 to Table 1, we fear that the flexibility suggested by those provisions may be excessive for a planning standard. The ambiguity occasioned by stating emergency actions that can properly be taken in a planning standard can be utilized by those who plan the system in a manner which plans to drop non-consequential loads just as footnote b has been used in the past. If this is intended to "raise the bar" as stated these provisions do not belong in a planning standard, at least as now stated. It may be appropriate to remove the reference to footnote 10, at least in the Initial System Condition entry in P3, where it suggests that it can be invoked after loss of a single generator, and we request the SDT to review that footnote to assure that it is appropriate in the other entries to which it is applied.

No

MDEA is in the area which is impacted by Entergy transmission planning. Entergy is one of the few NERC transmission owners which has for some years now relied upon its interpretation of "footnote b" in the previous TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0 as permitting planning for the loss of Non-Consequential Load or interruption of firm transfers as a way of planning and building less transmission than other utilities would have considered themselves obligated to build for reliability. That Entergy interpretation, and the consequent lower investment in transmission planning and construction, has been a matter of some concern among Entergy regulators at both State and Federal levels, as well as Entergy transmission customers, and has been rejected by the SPP, which has been given the authority to develop the base plan for transmission additions on the Entergy system. It was the Entergy rejection of that base plan that most recently led to a day long technical conference among regulators at the recent SEARUC conference in Charleston, SC. The proposed Implementation Plan for TPL-001-1 is

drafted to make the new standard, which the proposed Implementation Plan describes as one that "raises the bar in several areas," effective only after the passage of 60 months from the first day of the first calendar quarter following applicable approval. That time for implementation is also embodied in A.5 of the proposed standard. This time lag is chosen, according to the proposed Implementation Plan, because of the "significant budget, siting, permitting, and construction impacts on many transmission owners." There are significant problems and costs for those whose electric service is dependent upon an inadequate transmission system, which would argue for a lesser period of time to reach compliance. This is especially true when the existing system is planned on an assumption as to the meaning of footnote b which assumption was clearly recognized as being controversial and a minority view. In recent years there have been repeated Entergy TLRs at quite high levels, which have repeatedly required emergency EEA-3s to keep firm load on line. And there has been an ongoing dispute between Entergy and the SPP as to footnote b and whether there should be limits on consequential load to be shed which has led the SPP (as the Entergy ICT) to have a complete base case for Entergy transmission construction already developed which is, by FERC direction, the basis for the Entergy construction plan. In its construction plan, however, Entergy dropped some 20 of the projects in the SPP base plan because of the Entergy view that it could go ahead and plan to drop non-consequential load as a means of remaining in compliance with Standards rather than building the transmission projects that would have been required in accordance with the SPP base plan. While not all of the proposed changes embodied in TPL-001-1 may have been incorporated in the SPP base plan development, certainly the footnote b issues were. The costs of the failure of reliability and congestion resulting from the Entergy failure have been quite high, for Entergy retail customers as well as for others, and will continue to be high so long as there is no obligation to comply. Firm transmission obligations are simply not met while there is no obligation to comply. While it is certainly true that transmission cannot be planned and constructed overnight, it is also true that those who relied upon the minority interpretation of footnote b have been on notice for years both that that interpretation was challenged, and also that it was a minority viewpoint, as NERC itself advised FERC in its response to the NOPR that preceded Order 693. In 2007 FERC directed that NERC clarify the intended meaning of footnote b in its Order 693, and pointed out at that time that the interpretation permitting loss of load was "based largely on the matter of economics, not reliability." *Id.*, P 1792. At that time, only Entergy and NIPSCO (certainly not "many" Transmission Owners— a word that appears twice in the draft Implementation Plan) would even admit to their interpretation of footnote b to weaken the grid. NERC agreed that such an interpretation was incorrect in its filings leading up to Order 693. In its June 26, 2006 Comments of North American Electric Reliability Council and North American Electric Reliability Corporation on Staff Preliminary Assessment, at p. 57-58, NERC noted that load shedding in a single contingency event is not acceptable: "footnote b to TPL-002-0 is intended to provide a limited exception to the general rule for serving load from a radial transmission line and should only be applied in unique circumstances, as described above. NERC recognizes that looped configurations are key to the reliable operation of the interconnection, and to meet reasonable expectations for reliable service to loads. . . . NERC standards, including footnote b, are not intended to endorse or approve planning the interconnection using radial configurations as a preferred method for reliably serving load, nor do NERC standards consider load shedding acceptable for single contingency events." It thus seems strange for NERC, an organization whose very existence was intended to assure the reliability of the grid, to reward those recalcitrant transmission owners who intentionally failed to expend the money and effort that the responsible transmission owners did expend, and at the expense of those who rely on the transmission system to do its basic job. Order 693, P 1794, "strongly discourage[d] an approach that reflects the lowest common denominator." Many of those transmission owners and planners for whom this change constitutes "raising the bar" presumably had plenty of time to consider what their options would be if their interpretation was incorrect, and should be expected to have reserve plans on hand pretty close to being ready to go when the dispute was lost. In the Entergy case, the plan has been in its hands for some time, and the fact that it has chosen to reject the SPP plan based on its own minority interpretation of footnote b is no one's fault but its own. And it certainly does not have to start from scratch to develop the plan; it consciously chose to reject the plan that the ICT developed for it. MDEA asks that at least as to the changes tied to footnote b interpretation, and other excuses for dropping non-consequential load, the time for compliance be shortened to no more than two years following regulatory approval of the standard. R2.6 already provides for the development of a Corrective Action Plan, and it would not encourage reliability if five years were taken to develop a Corrective Action Plan, as opposed to complying with the standard. Second, MDEA suggests that, whether or not NERC chooses to stick with its 5-year "lowering of the bar" to permit those entities which may have used a similar interpretation of footnote b to avoid building a sturdy grid, it not try to influence FERC and the courts as to legal questions that may develop during that period. We recognize that the changes made in what will be TPL-001-1 go well beyond the clarification of footnote b, so that for some changes there may be a reason for the 5 year phase in. But whether or not the 5 year phase in is going to be applicable to all of those changes, we suggest that it would be improper to mischaracterize what is being done in a way that appears to have been drafted to influence legal questions that may come up. Specifically, as currently drafted, the descriptive modifier "many"

should not be used in describing the entities which had chosen to use the lower bar interpretation of footnote b. While we recognize that a number of commenters have looked to one interpretation or another of footnote b in a few extreme situations, a review of comments does not show other transmission owners who have relied on the extreme interpretation used by Entergy on a systematic basis, And we think it inappropriate for the description in the paragraph beginning at the bottom of p.1 of that draft Implementation Plan to focus on the footnote b issue, as it now does. We suggest a modification which makes the description accurate, and which avoids the kind of misinterpretation which led to the footnote b controversy in the first place. We suggest that that first part of that paragraph be revised to read as follows: "TPL-001-1 'raises the bar' in several areas where performance requirements have been changed in the new Standard versus those in existing TPL-001-0, TPL-002-0a, TPL-003-0a and TPL-004-0. Among other things, loss of Non-Consequential Load or interruption of firm transfers is no longer allowed for certain events, whereas the existing Standards were interpreted by some to allow such actions. As shown in Table 1 of TPL-001-1, the performance requirements associated with the following events represent 'raising the bar'..."

Footnote 4 – We recommend that a lower bound be put on the HV electric systems (such as 100 kV), rather than just saying "and lower". As has been commented on in a previous draft, the Drafting Team should also consider not having a prescribed voltage definition of BES, be it called EHV or HV. Studies should determine what facilities should be part of the BES because of their impact on reliability. A proposal is to modify Footnote 4 to replace the phrase "... (EHV) Facilities defined as greater than 300 kV..." with "... (EHV) Facilities defined as having a significant impact on the reliability of the System, generally at voltages greater than 300 kV as determined by the Planning Coordinator..." In using such language, the more stringent requirements could apply to BES/EHV but not globally for Facilities operating at voltages greater than 300 kV. Using this methodology the extra investment required would go towards real improvement of the reliability of the System. EHV and HV should be added to the Definitions of Terms Used in Standard.

Footnote 12 – We recommend adding an alternative modifier to the end of the sentence, "or for 5 towers or less." This is consistent with NPCC criteria.

No

With regard to the many changes/modifications from the previous draft and from the previous TPL standards being replaced by TPL-001-1, another posting of this Standard will be necessary to fully evaluate the impact (on reliability and also cost of implementation) of such changes. The decision to allow the use of all type of RAS or SPS (particularly generator tripping and run-back) as a common practice for single contingency does not "raise the bar" in the planning standard, and should be reviewed. How can higher system performance be required that involves substantial infrastructure investment to prevent events with a very low probability of occurrence, and allow use of a less reliable measure (SPS failure or misoperation having a higher probability of occurrence) to reduce the investment for more probable events?

Phil Sanchez

Western Area Power Administration

General Comment: The Change in TPL Standards, while well intended, will be difficult to administer since it has taken a simple Performance table and translated it into a legal-type document that is very complex to relate to the physical system for the planning and operations staff. The performance requirements must be related to the physical response characteristics of the interconnected system operation without depending on legal advice for training my new transmission system planning staff. The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service

is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. I disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automotive voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

no comment.

I believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clairification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss

Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

I agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, I will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. I question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

Group

System Protection and Transmission Planning Department

R1 the requirement to maintain System models for performing the studies is redundant with MOD-010, and should be moved to MOD-010. The phrase that requires model data used in Studies used for Annual Assessments be consistent with data submitted under MOD-010 seems OK. R1.1.2, a sub-requirement of R1.1, states that models for Planning Assessments shall represent "new planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon". Is this a requirement for maintaining a case representing every year of the near-term and long-term planning horizons (i.e. 10 cases)? We do not think that is what the SDT had in mind. If all that is required to remain cognizant of Facility In-Service dates so that topology is reliable, please so state. To make this read clearer, we suggest you take out the phrase "for each year". Regarding bullet 5 of R1.1.2, does inclusion of Protection System equipment require modeling of all relays in dynamic studies? The NERC definition of Facility pertains to equipment energized at primary voltages, not Protective System equipment. We suggest the Protective Systems be eliminated from this list. To make this read clearer, we suggest you delete text and bullet items following "Transmission Planning Horizon". Regarding R1.1.2 bullet items: The bullets list examples of Facilities. This list is not needed, since the term Facility is already defined in the NERC Glossary. If you do not remove all bullets, then we warn you that the bullet "New Technologies" can be interpreted to cover a broad range of topics by an auditor and is not clearly defined by NERC, so we cannot visualize measurable documentation.

R2 - The term "Stability Analysis" is used frequently in the standard, but is not clearly defined. Based on an IEEE paper ("Definition and Classification of Power System Stability," Kundar, et al) there are 5 different categories of stability analysis: 1) small signal angle stability; 2) transient angle stability; 3) frequency stability; 4) large disturbance voltage stability; and 5) small disturbance voltage stability. Does the writing committee intend to make the analysis of all these types of stability issues mandatory? I recommend inserting a new definition into the standard for stability as follows: "Stability Analysis - The study of the bulk electric power system's ability, for a given initial operating condition, to regain a state of operating equilibrium after being subjected to a physical disturbance." There are 5 accepted categories of power system stability: 1) small signal angle stability; 2) transient angle stability; 3) frequency stability; 4) large disturbance voltage stability; and 5) small disturbance voltage stability. While there are situations that exist that require small signal angle and voltage stability analysis, only transient angle stability, frequency stability, and large disturbance voltage stability analysis are generally relevant to system planning performance assessments. R2.1.4 is a new requirement directing studies to consider impacts of spare equipment strategy. Does this require the TP to run scenario analysis without certain transformers? It is not clear what is required. How many spare transformers are required? What reliability level is acceptable? R2.1.4 The one year cut-off seems arbitrary. One MONTH may be unacceptably long in some cases. Instead of "one year or more", we suggest the requirement state "an extended time period". R2.2. The wording on this requirement is not clear. Is it trying to say that a long-term (5-10 year) peak loading study is required to be performed annually? R2.2: What is meant by the term "current System peak Load study"? A powerflow study performed under expected peak-load conditions? Or a forecast of peak loads? R2.3 A short circuit analysis requirement is now added to Planning Assessment requirements. Short circuit analysis appears to be in the standard to document adequate ratings for interrupting equipment. That would be the purpose of short circuit studies we perform. If there are other intended meanings, then additional detail is needed. R2.3 We do not agree that a short circuit analysis needs to be conducted annually. The requirement for a new short circuit duty study should be driven by changes in the system, as is done for powerflow study work. In short, until system changes are made, we would not anticipate higher fault duties, and there would be no reason to rerun studies. R2.4.1 requires dynamic load models. Development of dynamic load models is ongoing, and therefore will need a much longer implementation period

than the steady state portions of the standard. We are not sure two years will be enough. It depends partly on pending work that is not under our control. R1.1.2, R2.1.4, R2.5.2, R3.3.4, R4.3.3, R5 – When text of a Standard Requirement includes the phrase “such as” or “could include”, then gives a list of possible choices, we take it to mean “just one of these items, or none of these, or something not listed here”. In other words, “such as” lists are really non-required, non-interpretable, non-measurable options. They should not be included in requirements. Lists “such as” these belong in transmittal notes and associated SDT commentary, not in Compliance Standard Requirements. R2.5.2 Limits such as “addition/deletion/change to a group of generating units . . . which total 20 MW or greater.” are not always appropriate. Appropriateness of Generation netting with load should depend on system size and engineering judgment, not artificial limits. The suggestion list following “generation changes could include:” should be eliminated. R2.6.2. “For the Near-Term Transmission Planning Horizon, include both a project initiation date as well as an in-service date” – The assessment report should not require a full project development – just a description of what is required to provide adequate service within specified operating criteria. The term “project initiation” is not clear. Requirement R2.6.2 should be eliminated. R2.8. “The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1. “ is complicated, and may require new modeling software capability to comply. Software vendors would develop this capability. Why is this required? What is the expected benefit to system reliability?

R3 appears to require redundant studies by TP and PC. If the TP and PC participate in the same studies, would this meet the intent of this requirement? This would include studies that are RRO sponsored, or performed by sub-regional planning groups.

Comments under R1 apply here as well. The requirement to “utiliz[e] data provided in Requirement R1” is redundant with MOD-012, and should be moved to MOD-012. To conform with R1, we suggest a phrase be inserted that requires model data used in Stability Studies used for Annual Assessments be consistent with data submitted under MOD-012.

“Proxies” is not defined. We take “proxy” to mean a procedure used to model system response that is outside the capability of system modeling tools used in the analysis. For example, a powerflow model might not be able to model cascading events with built-in capabilities. As a proxy, the engineer would run follow-up studies that would mimic expected system response. Please define the term “proxy”.

no comment

The phrase “coordinating analysis of these results” seems to indicate potential second-guessing by other entities. We suggest “coordinating REVIEW of these results” may be clearer. The term “such as described in FERC Order 890” allows non-jurisdictional utilities to establish an appropriate process. This is good. However, we still have the same misgivings about the term “such as” used here.

Yes

We appreciate the effort of the SDT to clarify “Consequential load loss”, and think references to this term are clearer in this draft. “Proxies”, used in R5, should be defined. See R5 comments for our suggestion.

No

The order of scenarios listed in the table should reflect the relative probability of events. Did the SDT intend to order listed contingencies by relative severity? Could it do so? Planning Events - SLG fault simulation should not be required. They should only be performed if more severe than 3-phase faults. A SLG fault with delayed breaker clearing could have more system impact than a 3-phase fault. The “Extreme Events” portion of the table is confusing – partly because the form differs from the Planning Event portion. The difference between contingencies in the Planning portion and the Extreme portion is not clear. Perhaps the Extreme Event portion could be a separate Table. Extreme Events / Stability section - Why specifically require “g. SLG fault on all Transmission lines on a common Right-of-Way.”?

Yes

These concepts seem too important to relegate to footnotes. Could this discussion of how to handle Firm transactions and redispatch be moved to a more prominent place? Perhaps these concepts should be removed from this standard entirely. A more appropriate place for these concepts would be in ATC standards.

Yes

We concur with SDT intent to retire TPL-005 and TPL-006. As there is no comment form entry to accept comments on MEASURES, we add one note here, related to “such as” lists - as noted above for R1.1.2, R2.1.4, R2.5.2, R3.3.4, R4.3.3, and R5. As written now, all measures include “such as” lists. We strongly suggest you remove “such as electronic or hard copies” from all measure statements.

Group

PPL Energy Plus

PPL agrees with the requirement that regulatory and legal requirements need to be respected in

planning studies. Also, Requirement R1.1.6 appears to conflict with FERC Pro-forma OATT Section 30.4 in that Network Resource output should not be limited as this Requirement states.

The standard appropriately recognizes that the planning horizon must be as long as the longest lead-time system upgrade, typically 8+ years for a new line. However, while Requirement 2.2.1 states this, it could be more clearly stated. Requirement R2.5.2 should be clarified to point out if the TP has discretion or if the 20 MW is binding. Requirement R2.6.4 should require TP's and PC's to post on an OASIS to assure easy access by affected parties to information on what is "beyond the control" of these organizations. Please retain Requirements 2.8 and 2.9 as these are good measures of the quality of the plan produced by the planners.

It appears there is a 24 month grace period to allow modeling updates to meet R 3.3.1. This is a good idea since the powerflow computer models may not include the required data and will need to be updated.

It should be pointed out that Breaker Failure (i.e. fail to open) and Breaker Fault (internal fault in breaker) are two different events.

Please clarify how the term "Proxies" is used in this requirement.

Please continue to mention relevant FERC Orders (such as 890) in the standards since the FERC orders are the source of many of the planning standards. Planners need to acknowledge, respect, and design processes and systems around the FERC rulings.

No

The WECC suggests P4 penalizes EHV and if this is true, please re-write P4 to eliminate the penalty.

Group

OPUC

1. Requirement R1 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments: A: Language in R1.1.2 still needs further clarification. Base case models do not clarify modeling required for the effect or absence of circuit breakers, protection system equipment and control devices. B: Clarity would be increased were R1.1.4 to refer to expected transfers rather than Firm Transmission Service, permitting the elimination of then redundant R1.1.5 C: Removing "including requirements of regulatory authorities and other legal obligations" at the end of R1 would also eliminate redundant text.

2. Requirement R2 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments: A: Short circuit of over-stressed breakers is already addressed in Table 1. Ex1: P2-3,4 (Internal Breaker Fault), Ex2: P4 (Stuck Breaker while attempting to clear a fault). B: In R2.1.4 Table 1, it is unclear how transformer contingency analysis can be aggregated or batched. It is also still unclear whether corrective action plans are required solely to meet performance requirements for sensitivities.

3. Requirement R3 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments: A: R3.3 should be modified to become the requirement to conduct contingency analyses with R3.3.1 thru 4 presented as bullets there-under.

4. Requirement R4 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments: A: R4.3 should be modified to become the requirement to conduct contingency analyses with R4.3.1 thru 3 presented as bullets there-under. B: R4.3.2 should clarify whether all relay protection must be modeled

5. Requirement R5 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments: A: An example should be added for proxy use.

<p>Individual</p> <p>Chifong Thomas</p> <p>Pacific Gas and Electric Co,</p> <p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.</p> <p>Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.</p> <p>As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.</p> <p>As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.</p> <p>The term proxy is unclear. Please provide an example or an explanation of proxy. Perhaps a</p>
--

different term, such as metric, may better describe this requirement to more people.
We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.
No
Clarification is needed on the use of UVLS. Is it acceptable or not? We understand from the discussion in the webinar that in the proposed TPL-001-1, Table 1, if there is a "no" in the column for allowable load loss, you are still allowed to have UVLS set up to drop the load, but cannot plan on meeting the standard with the load shedding. Therefore, if the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation, given that you can lose the load but cannot plan on it? Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. What about the treatment of Supplemental Load Loss or UVLS?
No
P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.
Yes
We support the concept. However, we are unclear about the last sentence of Footnote 10, which reads "where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered." For resources from areas external to the Transmission Planner's planning regions, would identification of the need to, for example, increase System Operating Limits into the his/her Transmission Planning Area as part of the Corrective Action Plan be counted as having "considered" the "Facility Ratings in those impacted regions"? Otherwise, it may be difficult for the Transmission Planner to assess and identify all the Facility Ratings that may be impacted in a region external to his/her Transmission Planning Area.
Yes
We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?
Individual
Kirit Shah
Ameren
There may be a potential conflict between MOD-010 and MOD-012 and legal documents such as Interconnection Agreements e.g. IA may specify a capacity level that exceeds the reported test levels. In the case of such conflicts, it is not clear which one should rule. Suggest replacing 'circuit breakers' in R1.1.2 with 'terminal equipment' since circuit breakers are covered by Protection System Equipment. Consider adding a reference in R1 to NERC Reliability Assessment Guidebook version 1.2, pp 17-18 for use of a particular load forecast level for inclusion in the planning models. In R1.1.2, revise the language to show that we need to also represent the existing transmission system, and not just changes to the existing system. In R1.1.2, Clarification is needed for the phrase 'for each year' should signify only those years for which assessment work was performed, rather than each year of the Near-Term and Long-Term Transmission Planning Horizon. There typically is not a model built for each year of the Near-Term and Long-Term Transmission Planning Horizon. In bullet three of R1.1.2, it is not clear whether bus-tie circuit breakers to be represented in the models. Typically circuit breakers are included in the contingency definitions along with the protection system equipment used in the powerflow models. The number of zero impedance branches which can presently be modeled using PSS/E software is limited to 4000. Also, the number of buses included in the powerflow models would increase with additional breaker modeling. In bullet seven of Requirement R1.1.2, what "new technologies" are to be represented in the models? R1.1.4 Firm Transmission Service - a single source can have transmission service to multiple sinks, and can be associated with transmission service in excess of the capacity of the source. There is a lack of clarity regarding the means by which Firm Transmission Service, a marketing term, is to be included in planning models. For example, should the standard define how to model wind farms (100% - off-peak and 20% on-peak, based on firm capacity from the wind generators, or other dispatch levels)?
In R2, The phrase "document results" should be changed to "summarize results". While results will be documented, the Planning Assessment should just include a summary. In R2.1, the reference to requirement R2.6 (at the end of the last line) should be changed to R2.5. In R2.1.3, it is suggested that the studies be referred to as the "base studies" to avoid confusion with the

sensitivity studies. Also it is suggested that another phrase be added at the end for clarity. The entire R2.1.3 would then be as follows: For each of the base studies described in Requirements R2.1.1 and R2.1.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment. Sensitivity studies would include changes to: In Requirement R2.1.4, it is suggested that language be added to reflect the possible unavailability of the equipment, such as: When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment. It is not clear how adequate lead times for equipment would be determined. In Requirements R2.3 and R2.4, consider adding a reference to Requirement R2.5 for the past studies. In Requirement R2.4.1, it is suggested that it be reworded to the following: System peak Load for one of the five years, including Load models which appropriately represents the dynamic behavior of Loads, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable. Load models referenced in R2.4.1 should be confined to the consideration of transient stability study work. With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. We suggest adding the following to the end of R2.5.1: "unless justification can be provided to demonstrate that the results of an older study are still valid." In Requirement R2.4.3, it is suggested that this sub-requirement be reworded to the following: For each of the base studies described in Requirements R2.4.1 and R2.4.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the base studies shall be included in the Assessment. Sensitivity studies would include changes to: In bullet three of Requirement R2.6.1, would we allow automatic generation tripping for a single (P1) event if it is not consequential? It seems that tripping of generation should be restricted to P2 events 2 or 3 at a minimum. In bullet five of Requirement R2.6.1, is there a maximum duration that operating procedures can be used before a capital project must be included (or completed) in the Corrective Action Plan? In Requirement R2.6.2, it is not clear what constitutes a "project initiation date". Please clarify. Please explain the reason why Requirement R2.8 is needed in the Assessment. Reporting the largest Consequential Load Loss does not impact reliability. Please explain the reason why Requirement R2.9 is needed in the Assessment. Reporting the largest Non-Consequential Load Loss does not impact reliability. The proposed standard not only raises the bar for system performance requirements, but also raises the bar for reporting and documentation. We need to employ almost as many librarians and technical writers as engineers to develop and keep track of the documentation. Engineers need to spend more time performing the studies and spend less time documenting studies keeping track of documentation for multiple years.

In Requirement R3.1, it is suggested that the word "contingency" be added to describe the lists created in R3.4. Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R3.4. R3.3.2 "For all generators, studies shall consider the minimum steady state voltage limitations and identify how the generators are analyzed in the steady state simulation." The above wording needs to be changed, as the intent of this sentence is unclear. It is not clear whether Transmission Planners need to ensure that generating plants can meet their voltage schedule under Base Case (N-0) conditions, or whether this would be the same as the generator underexcited operation limit. R3.3.3 "For all Transmission lines, studies shall consider relay loadability and identify how loadability is analyzed in the steady state simulation." The above wording needs to be changed, as the intent of this sentence is unclear, whether the intent is that Transmission Planners ensure that relay loading limits are included in the facility ratings, or whether this reflect some rule of thumb, such as 130% of conductor rating. In Requirement R3.3.4, it is suggested adding the words "and switched" to capacitors and reactors: Simulate the expected operation of existing and planned devices designed to provide Steady State control of electrical system quantities. These devices include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

In Requirement R4.1, it is suggested that the word "contingency" be added to describe the lists created in R4.4. Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R4.4. Regarding Requirement R4.4, it is suggested that a rewording be considered such as described below: For each category of the Planning Events in Table 1, those Planning Event Contingencies that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4.1 shall be created. The rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results. R4.3.2 requires that voltage ride through capability be analyzed. It is not clear what should be analyzed. e.g. auxiliary loads, generator protection, generator capability, etc. We

would like to see more clarity on this requirement. It seems that the stuck breaker scenarios would always be more severe than the internal breaker failure scenario since they would be clearing in delayed clearing time and thus make P2.3 redundant. Are there is some question on whether P3 contingencies would be necessary for stability analysis. Revise wording in VSL from "categories" to "applicable categories". e.g. some entities may not have common tower facilities and thus there would be no P7 category contingencies to evaluate. Footnote #3 needs to be revised to include Double-Line-To-Ground faults in addition to Three-Phase faults indicating that the SLG criteria is met.

There is no requirement that the Planning Coordinator must use the same proxies as the Transmission Planner. Differences in proxy assumptions may lead to different study results. R5 needs to be modified to require coordination of proxies between Planning Coordinators and Transmission Planners.

In absence of these agreements, it is assumed that both Transmission Planners and Planning Coordinators would be responsible for performing the studies. It is not clear how the Corrective Action Plans get resolved between these entities if there is no agreement on the study results.

Requirement R7 describes that the Planning Coordinator is to share Planning Assessments with adjacent Planning Coordinators. It is not clear whether this needs to be expanded for the Transmission Planners to share their Planning Assessments with the Planning Coordinators. The reference to FERC Order 890 as it is currently written makes it seem like a suggestion to follow Order 890. If Order 890 explicitly describes this process then the sentence should read "as described in FERC Order 890." If not, maybe this should not be mentioned at all.

No

Extreme Events definition references severity and probability. These terms should be included in the definition of Planning Events. Add a definition of Planned and Proposed facilities. Planned facilities address the near term deficiencies and have been approved with a financial commitment while proposed facilities address long term deficiencies for which no commitment is required today since they may change based on future evaluation. Revised Definitions are generally better than those from the previous version, but additional clarity could be provided. Consequential Load Loss – Would an SPS to trip load qualify as a planned protection system? Load Reduction – Please clarify whether this includes both load response and operator initiated action, as in changes to transformer LTC. Supplemental Load Loss - From a utility perspective, this would be considered as load response. Please clarify how Supplemental Load Loss would be included in the stability analysis. Table 1 suggests that it cannot be included to meet steady-state performance. Suggest that the following be added to the definition: Supplemental Load Loss associated with an event shall not be used to meet steady state performance requirements.

No

The word "Requirements" needs to be added to the Table 1 titles in the existing tables. Table 1 – Steady State & Stability Performance Requirements Planning Events Table 1 — Steady State & Stability Performance Requirements Extreme Events Table 1 — Steady State & Stability Performance Requirements Footnotes (Planning Events and Extreme Events) Since it appears that the Table 1 cannot fit on a single page, it is suggested that multiple tables be developed to handle the 1) steady-state and 2) stability performance requirements. Footnotes may be included on a second page if needed. Comments were provided in early versions regarding the issues associated with raising the bar, and it was suggested that the marginal reliability benefits associated with these changes were not worth the marginal costs. We have not seen any significant changes from the earlier performance requirements. The question still remains, are we directing the resources where they need to be allocated to address and improve system reliability? So far the answer is believed to be "No".

No

Suggest rewording of footnote 5, though we do not use conditional firm service: Curtailment of conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the conditional Firm Transmission Service. Footnote 10 is definitely an improvement from previous versions. It is suggested that the word "also" be added to the last line: Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must also be considered.

No

At least 36 months would be needed for R1 compliance, should inclusion of explicit modeling of protection system equipment be required in dynamic model representations, and if all breakers would need to be explicitly modeled. More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective. 60 months effective date seems acceptable for planning

activities, but may not adequate for all construction activities. Typical times to construct a transmission line in various areas of SERC can range between 7 to 10 years. Accordingly, we recommend the effective date for construction projects be changed to at least 84 months. 12 months appears reasonable for R7.

Individual

Joe Seabrook

Puget Sound Energy, Inc.

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.7 should be deleted, see comment on R2 above. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clarification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS? Provide clear explanations of the load definitions.

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker).

We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

No

P2, P3, P4, and P5 - The change allowing no load shedding or interruption of firm transmission service for the types of events and faults listed will lead to the construction and installation of more transmission plant. These expensive plant additions have not, however, been preceded or justified by any evidence that the reliability of the current system - using current planning standards which allow load shedding and interruption of firm transmission service - is lacking. The August 2003 blackout, to the extent utilities and other industry stakeholders have cited it for this purpose, was not caused by the lack of such planning standards; it was an event that should not have occurred and would not have but for the utter failure of First Energy to pay attention to operations and vegetation management. The Joint US/Canada Report makes this clear. These proposed changes are not needed and will cause unreasonable increases in rates that are not justified by the putative increases in reliability. There is currently too much emphasis on reliability and not enough emphasis on costs. Utilities are spurred, of course, by the FERC's ROE incentive. NERC should not allow this incentive to influence the reasonableness of any of its standards, particularly this one which can only lead to unneeded redundancy in the high voltage transmission system and resulting higher costs.

It is not clear that Requirement R1 requires ALL existing generators, substations, transmission line, transformers, etc. to be explicitly modeled for steady state and stability studies. In fact, Requirement 1.1.6 could be interpreted to exclude various generators from the models if they are not contracted to supply load. A suggestion is to re-word R1.1 to read as follows: R1.1 Models for the Planning Assessment shall represent all existing generators, substations (including specific busses within a substation), transmission lines, loads, capacitors, reactors, and other equipment connected to the transmission system and shall further represent the following: (continue with R1.1.1 through R1.1.6) A further refinement to R1.1.6 should also be considered as follows: R1.1.6 Commitment and dispatch schedules of resources expected to serve Load for the specific model.
Individual

Requirement Text: R1: What is meant by "including requirements of regulatory authorities and other legal obligations"? This phrase should be deleted. Can NERC make it an obligation in a standard to follow regulatory authority and other legal obligations? The planner has scope to determine the "projected system conditions", and if a local regulator mandated a requirement, the planner would be able to include it without this statement. R1.1.1: Only long duration known planned or scheduled outages that are expected to last over a system peak should be included in the scope of this standard. Known planned or scheduled maintenance outages should not be a part of the planning scope as they are short duration and are planned to be taken when system conditions allow. Suggest wording change to "Planned outages of generation and Transmission Facilities with an expected duration of 6 months or longer, if specifically known." R1.1.2: Suggest deleting new technologies as it is unknown as to what this is. If the SDT wants to make the list all inclusive, add words such as "shall include but not be limited to" in the requirement wording. Circuit breakers are not specifically represented in the planning models in order to keep the number of buses within the program capabilities. However, the effect of the circuit breaker configuration is normally considered in the creation of contingency files. Can the drafting team confirm that circuit breakers do not have to be specifically represented in the model? The same comment can be said about protection system equipment. Some generic zone 1 modeling may be included but in general the effect of protection equipment is included in contingency files. R1.1.4 & R1.1.5: Firm Transmission Service represents a contract that the planner is obligated to include. Based on the NERC definition, Interchange is defined as "Energy transfers that cross Balancing Authority boundaries". Including it as a requirement mandates system expansion for non-firm system usage. Interchange is already covered in the sensitivities (Expected Transfers) and should not be a specific sub requirement of R1.1.2. Perhaps simply documenting the value of the Interchange used in the Model is sufficient. This value may change in the sensitivity analysis conducted in R2.1.3 and the TP/PA will decide the level that they will plan on protecting. Measure: The measure requires the planner to provide evidence such as the System model. What further evidence is required to ensure the planner is using data consistent with the MOD standards, is simulating projected system conditions, and that the models represent the "required information in accordance with Requirement R1? It is suggested to remove "and shall simulate projected System conditions" from the main paragraph of R1 and reword R1.1 to "System models and contingency files for the Planning Assessment shall represent projected System Conditions including:" Requirement R1 is very vague, and the Measure refers back to R1. The MOD standards deal with the building of the model. Most planners provide data in accordance with the MOD standards for a regional model building process. These models form

the basis for the models the TPs and the PC use. The R1 could be more specific by requiring the PC/TP to provide rationale for the projected system conditions used, which might include the generation schedule assumed, the transfer conditions, why peak or off-peak is important, etc.. VSLs: The requirement is very generic in nature and leans on the MOD requirements. Verification of compliance to this requirement will be problematic. What will be required to prove that the data "is consistent with the data provided in accordance with the MOD-010 and MOD-012 and other data sources"? What are these other data sources"? R1 only stipulates that the planner shall "simulate expected system conditions", so how does one decide that the "model did not simulate projected System Conditions as described in R1" (severe VSL)?

Requirement Text: R2.1: Reference of past studies should be to R2.5, not R2.6 (typo). R2.1.3: The sensitivity to "Planned duration or timing of Transmission Outages" should be modified to only include "Planned long duration Transmission outages that span multiple seasons, if known". Short duration planned maintenance outages should not be included in a planning assessment. R2.1.4 - The second sentence doesn't read right - the sentence should be changed to read: "The analysis shall reflect the Contingencies identified in Table 1 under the conditions that the System is expected to experience during the unavailability of the long lead time equipment." R2.2.1 - This sub-requirement should be deleted. Why do extra assessments beyond the 10 year period? Any items beyond 10 years will be covered when they fall into the 10 year period. For example, if we assess the 10 year horizon, then the project due to be complete in 12 years will be part of the assessment in 2 years when it is 10 years out. We will have to show every year how our system meets compliance regardless of this extra analysis, so what's the point. Every year we have to show how we comply in the short and long term so what difference does it make when each project is completed as long as we are in compliance or identify Corrective Action Plans (CAPs) along the way. R2.4.1: The statement "a Load model shall be used which appropriately represents the dynamic behavior of Loads" is not very crisp. What will "appropriate" be interpreted to mean by the NERC auditor? Does a MOD standard exist that covers gathering data and validating loads models? This should be a first step. The SDT should add a statement that the application of detailed induction motor modeling can be limited to areas where poor voltage recovery is expected due to a high concentration of such load. The requirement should be modified to require the PC/TP to provide a rationale for the load models used in its specific planning area. R2.5: A "Past Study" is a definition and should be moved to the definition section. The definition only identifies power changes as possible material changes, but should also include machine control (exciters/governors) changes. We suggest the bulleted list of "Material Generation changes" be expanded. R2.6.1: Can the SDT clarify how a rate application qualifies as a CAP action? R2.9 - The sentence should refer to "maximum Non-Consequential Load Loss" not "maximum permissible Non-Consequential Load Loss".

R3.1: The requirement text should be changed to read "studies shall be performed for Planning Events to determine whether the BES meets the performance requirements in Table 1 based on the contingency list of events created in Requirement R3.4.". R3.2: Requirement wording should be similar to R3.4 for consistency. R3.4 & R3.5: The selection of the contingency list is based on the knowledge of the PC/TP. How do you produce "an explanation of why the remaining Contingencies would produce less severe System results." without proving this with a study? If the explanation is "that based on engineering judgment, the remaining contingencies would produce less severe system results" then the explanation is implied and not necessary. VSLs: Under the moderate to severe VSL, the performance requirements currently refer to P2 through P7. We believe this is a typo and should be P1 through P7.

R4.1: The requirement text should be changed to read "studies shall be performed for Planning Events to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists of events created in Requirement R4.4.". R4.2: Requirement wording should be similar to R4.4 for consistency. R4.3: We agree that consideration of generator voltage ride through is important. However, we also suggest that frequency ride through capability be analyzed. R4.4 & R4.5: The selection of the contingency list is based on the knowledge of the PC/TP. How do you produce "an explanation of why the remaining Contingencies would produce less severe System results." without proving this with a study? If the explanation is "that based on engineering judgment, the remaining contingencies would produce less severe system results" then the explanation is implied and not necessary.

Data Retention: The 5th bullet should refer to "proxies" instead of "studies".

None

It is unclear as to what is meant by "coordinating analysis of these results"? Does this imply an obligation to conduct joint studies or just an obligation to distribute the assessment and respond to feedback? We suggest that the wording "such as described in FERC Order 890" be replaced with "such as may be required by a regulator in its PC/TP area". The SDT is posing several other questions for industry consideration not related to the specific requirement questions above.

No

Consequential Load Loss: the wording "by a planned Protection System operation to isolate fault conditions" is awkward wording. The wording should be changed to "by a Protection System operation designed to isolate fault conditions". Load Reduction: This definition is not needed and

load reduction is not prohibited in the standard. It will take some effort to even measure such a load reduction in simulation. Given that there are four load related definitions, the standard would be simplified by deleting this term. Any voltage dependent load will be reduced for a low voltage condition. In steady state (P0), load is normally modeled as constant MVA load so load is constant. In the steady state period after a contingency, transformer taps and voltage control devices will restore voltage, and consequently, any load modeled as voltage dependent will be restored to pre-contingency level. The term is not used anywhere in the requirements of the standard - it is only included in Table 1 Note b in the definition of Non-Consequential Load Loss. We do not think it is needed. Supplemental Load Loss: Why did the drafting team decide to include Supplemental load loss? In Table 1, it is stated under "note b" that Supplemental Load Loss cannot be used to meet steady state performance requirements. Does this imply that it is acceptable for "non-consequential" induction motor load to trip off as a result of undervoltage during the disturbance due to its protection setting? It is possible that this load loss during a stability simulation may avoid the need to add dynamic reactive support. Can the drafting team clarify the intent of the standard or delete Supplemental Load Loss. At minimum, the TP/PA should identify the minimum transient voltage that they are planning the system for. In that way, any load loss for unplanned events that cause lower transient voltages or load loss that occurs at a higher transient voltage wouldn't be a violation. Also, unless the end-user load is modeled in detail, or a proxy is used, the planner will not know if such load exists or would be lost in the simulation.

No

Note b should be reworded to "However, Supplemental Load Loss associated with a P2 through P5 event shall not be used to meet post-contingency steady-state performance requirements." Also we do not see a need for Load Reduction (see Q8 comment) Note b also implies that voltage dependent load is not permitted to be modeled for P0. This in turn means that the model must have all load represented as constant MVA. The load representation can change for categories P1 through P7. Is this the intent of the language? Note e: Are the planned System adjustments and redispatch allowed following all Planning Events if they result in curtailment of Firm Transmission Service? Should Note 10 also be referenced here? Footnote 7 applies to FACTS devices that are connected to ground. It is possible to have an ungrounded FACTS device (eg. Delta connected) or a series connected FACTS device (UPFC, SSSC, etc.). I would recommend deleting "that are connected to ground" so that the note is more general. Series connected FACTS will likely be separated via circuit breakers in a similar way as a transformer or phase shifter. Other series FACTS device, like a TCSC also typically self protect via a bypass breaker and should be considered as a separate element. Extreme Events: Steady State 1: Does the loss of a DC line refer to a bipole line? Steady State 2e: The loss of a large load could result from a Planning Event, perhaps even a P1 or P2 event - likely not an extreme event - compared to the loss of a major load center.

Yes

Note 10: The drafting team is to be congratulated for including the ability to curtail Firm Transmission Service as long as generation is available to redispatch to prevent firm load loss. Note 5: Firm transmission service can also be curtailed when the service is conditioned on the element is being available (note 5). It is recommended to add note 10 to contingencies P1 and P2. This would allow for curtailment of Firm Transmission Service via redispatch without dropping load when re-adjusting the system following these single contingency events, or automatically adjusting the system via an SPS action initiated by the P1 or P2 event, consistent with note b of the existing TPL standards. The consequence of not including Note 10 could mean extensive new transmission line construction without any increase in transfer capability. In Note 10, the SDT is assuming that the Firm transmission Service is Network Service to load. Does Note 10 also apply if the Firm Transmission Service is firm point-to-point service?

No

TPL-005-0 is a Regional and Interregional Self-Assessment Reliability Report. Such an assessment is beyond the capability of an individual PC or TP. While the new TPL-001-1 can and should include a requirement on the PC and TP to include in their assessments the interconnections with their adjacent systems, it does not make sense to mandate an individual TP or PC to conduct an interregional assessment. Consequently, TPL-005-0 should be retained and mandated on the regions via the NERC delegation agreements with the regions.

Group

PacifiCorp

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5

would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automotive voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

: Claification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnectd from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

: We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

Individual

Brent Ingebrigtsen

E.ON U.S.

R1. Delete "and other data sources". Consistency with MOD-010 and MOD-012 standards is measurable and should suffice. Delete "including requirements of regulatory authorities and other legal obligations". The term: "shall simulate projected System conditions" does not exclude the above. If there is some significance to this statement it should be an item in R1.1. R1.1.4. Firm Transmission Service is often sold for less than one year on an as available basis. Also, Firm Transmission Service may be sold on one system without a complete path. As stated, it appears necessary to include these examples in the Planning models. E.ON U.S. believes that there should be some limitations put on this requirement such as Long-Term Firm Transmission Service for a period of 5 or more years.

R2.1.3 Change "For each of the studies ..." to "For at least one of the studies" R2.1.1 and R2.1.2 require that 3 studies be performed each year. As written, the requirement indicates that the transmission planner has to perform at least one sensitivity study for the 3 studies required by R2.1.1 and R2.1.2. This means that the transmission planner would also have to perform 3 or more sensitivity studies each year. One sensitivity study for one of the 3 studies required by R2.1.1 and R2.1.2 should suffice. R2.1.4. Delete "The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience due to the unavailability of the long lead time equipment." This statement is redundant since R3 requires this analysis for all of R2.1. Including this statement in R2.1.4 and not in R2.1.1 and R2.1.2 makes it appear that this requirement has different performance requirements. R2.4.3 R2.4 does not require studies annually. However, if the transmission planner chooses to study a System Peak Load or a System Off-Peak Load condition R2.4.3 requires that the planner also study sensitivity to that same condition in the current year. E.ON U.S. believes it sufficient that the assessment include a sensitivity study for some System Peak Load and some System Off-Peak Load condition. R2.6 The third sentence should be modified to include R2.1.4., so that it reads "Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3, R2.1.4 and R2.4.3." The annual studies performed for Category P6 alert the Transmission Planner to the risks of transformer failure. The Transmission Planner is required to design the system to limit those risks. If the delivery time for a piece of equipment is 11 months, then P6 allows Interruption of Firm Transmission Service and Non-Consequential Load Loss. If the delivery time for a piece of equipment is 12 months, then P1 requires that the system be designed for no Interruption of Firm Transmission Service and Non-Consequential Load Loss. This is a significant increase in performance requirements for an event that will most likely not extend beyond to a second System Peak Load period. If R2.1.4 is not included in the requirement the transmission planners would essentially be designing for an Extreme Event, i.e., events which are more severe and have a lower probability of occurrence than Planning Events. R2.6.1 Operating Procedures, by NERC definition, require significantly more detail than is appropriate for a Corrective Action Plan. It is not appropriate that Transmission Planners write Operating Procedures to be used by NERC Certified System Operators. E.ON U.S. suggests that "Operating Procedures" be changed to "mitigation plans". R2.6.5 Planning Assessments and System Facilities are not NERC defined terms. Operating Procedures, by NERC definition, require significantly more detail than is appropriate for a Corrective Action Plan. It is not appropriate that Transmission Planners write Operating Procedures to be used by NERC Certified System Operators. E.ON U.S. suggests that "Operating Procedures" be changed to "mitigation plans". R2.8 There are no requirements to limit Consequential Load Loss. Impacted customers are typically aware of the customary level of service and have chosen not to pay for extraordinary levels of service. E ON US questions the purpose and benefit of this requirement. While continuity of service to end use customers is an important measure of service reliability for which utilities answer to state authorities, BES reliability requires that the system remain balanced and that local failures not result in cascading BES events NERC standards should, pursuant to FPA Section 215, focus solely on BES reliability

No

Year One: The calendar year contains 12 months. As written, Year One could start as early as January 2010 (1/1/2009 plus 12 months) or as late as July 2011 (12/31/2009 plus 18 months). E.ON U.S. believes that the statement should be modified to: read " ... that begins 12-18 months from the beginning of the current calendar year". This would limit the beginning of the current window to be January 2010 or July 2010.

Table 1 Extreme Events Comments Steady State 2.b Right-of-Way should include a reference to footnote 12. 2.d. Item 2.d. references loss of all generating units at a "station" but Item 3 references generating plants and nuclear power plants. It is unclear whether Item 2.d requires an outage of all generating units connected to a single transmission station (all voltages) or an outage of all generating units at a generating plant (although they may be connected to multiple transmission stations). 2.g Right-of-Way should include a reference to footnote 12. Footnotes 12 E ON U.S. suggests the definition be expanded to: Exclude circuits that share common structure for 1 mile or less and Transmission lines that share common Right-of-Way for 1 mile or less.

Individual

LCRA Transmission Services Corporation

In R2.6.2, it is stated that a project initiation date is required as well as an in-service date. What is considered the project initiation date, the point at which the project plan is approved or the time at which construction is to begin? If it is the time at which construction is to begin, then LCRA TSC believes this requirement does not belong in the TPL-001-1 standard as the construction timeframe for a project is developed by groups outside of Planning based on resources and outage availability.

In R3.3.4, what is meant by the term "electrical system quantities"? Quantities is typically an amount and its use here would indicate that a term such as parameters would be better suited.

In R4.3.3, what is meant by the term "electrical system quantities"? Quantities is typically an amount and its use here would indicate that a term such as parameters would be better suited.

In R5, what is meant by the term "any proxies"? Please clarify. This comment also pertains to this terms use in the VSL as well.

Individual

National Grid

Comments: R1: A. Priority Comment- There needs to be some direction provided on the initial conditions used in the assessment. This guidance should encourage the use of initial conditions that reasonably stress transfers across interfaces between companies, areas, regions, into load pockets, and out of constrained areas. The expectation that transfers are reasonably stressed for a variety of interface conditions will require the consideration of different generation dispatches, which goes beyond the single generator out of service requirement of the standard. If initial conditions consider reasonably stressed conditions, then sensitivity analysis is embedded in the process. If sensitivity is embedded in the process, it is unclear if additional sensitivity is still required by the standard. B. In the reference to regulatory authorities and other legal obligations it is suggested that the phrase be changed from "simulate projected System conditions including requirements of regulatory authorities and other legal obligations" to "include projected System conditions and requirements of regulatory authorities and other legal obligation." In common usage of terms, models are used to simulate system response, but models alone do not simulate the system. Violation Severity Levels: R1 – Suggest changing the phrase "simulate projected System conditions as described in Requirement R1" to "include projected System as described in Requirement R1," consistent with the recommended change to Requirement R1. Errata: Delete the period after "R1" in the first bullet in the Data Retention section. R1.1.1 Priority comment – R1.1.1 should be removed. - Planned outages are addressed by Operational Planning processes and Transmission Operating Procedures for up to two years ahead removing the need for this to be incorporated into Planning Assessments. - If outages are planned, but Operations can not

accommodate them in real time, then the outages are cancelled. - Outages are not generally known beyond one to two years in advance. R1.1.2 Comment - We recommend deleting the list of facilities: - Circuit breakers are not modeled as elements in a power flow nor are Control Devices and Protection Systems - The list of facilities is not consistent with the definition of 'Facilities' in the NERC Glossary R1.1.2 should simply read: R1.1.2 New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon. R1.1.3 Comment - The use of "real and reactive power" is prevalent within the industry, but R1.1.3 should be changed to "Active and reactive Demand of Load." When load is expressed as a complex quantity, active power is the real portion and reactive power is the imaginary portion. Thus for consistency, we should refer to active and reactive. R1.1.5 Comment - What specifically needs to be modeled under Interchange? R1.1.6 Comment - This needs further definition or it should be deleted. It is not clear what a "network resource required to supply load" is. Does this refer to Network Resource per FERC LGIP?

R2 Comment - In the first sentence, replace the phrase "prepare" with "conduct and document" and in the second sentence replace "This Planning Assessment shall use current or past studies, document assumptions, document results, and shall cover steady state analyses, short circuit analyses, and Stability analyses" with "The Planning Assessment shall review assumptions of current and past studies and assess the continuing validity of the steady state, short circuit, and stability results. The review of assumptions, supplemental analysis, and updated results shall be documented." R2.1 Comment - A. The terms assess and annual study are referenced in the same requirement. It is unclear what constitutes either. Is an annual study required for every area or is an annual assessment required for every area, which may include some supporting study to address changes to the conditions? B. Requirement R2.1 should refer to R2.5 rather than R2.6 R2.1.1 Comment - A. Year One and year two do not provide enough time to implement Corrective Action Plans and are better suited for Operations studies. The requirement to evaluate Year One or year two should be removed. B. Is a year 5 study required annually for every area of a system? R2.1.2 Comment - The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments. Need to define conditions for assessment. R2.1.3 Comment - A. The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on the expected accuracy of the assumptions. The assessment should have to include a discussion of accuracy of the assumptions. Having a requirement to perform one more sensitivity not already included is vague and does not add value to the assessment or the standard. B. Planned Transmission Outages are not known in the Planning horizon. Also the release of the outage on any given day is controlled by operations based on the conditions. The conditions are not known for the Planning assessment. The last bullet referring to Planned Transmission Outages should be deleted. C. Delete the phrase "are intended to." It is difficult to measure intent and what is important is whether the system has been stressed, not whether the responsible entity intended to stress the system. D. What is expected from a sensitivity analysis? Is it to change the base case and see how the case responded, is it to create a new base case and rerun all of the events, or is it to change the base case and rerun a select number of events. It is anticipated that the answer will vary based on what is changed. R2.1.4 Priority Comment - With respect to spare equipment strategy, this requirement potentially imposes a requirement to plan for three events, which is overly severe. After experiencing a major contingency of a long lead time facility, there should be some change in the acceptability of risk. This change in risk could include an allowance for the loss of non-consequential load or some of the multiple events from Table 1 should be evaluated as Extreme Contingency events. R2.2 Comment - We suggest replacing the phrase "a current System peak Load study" with "a valid System peak Load study" in the first sentence. The word current is confusing as some read the word current to mean "today's" rather than "valid". R2.3 Comment - A. The requirement to "conduct annually" isn't consistent with "support". We suggest "Conducted annually" should be replaced with the phrase "assessed annually". B. "Interruption duty" should be changed to "interrupting duty." All terms in the IEEE dictionary related to breaker opening use the word "interrupting," while terms related to loss of supply to customers use the word "interruption." R2.4.1 Comment - A. The two sentences are describing an 'or' condition and they should be merged to read: "For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load." R2.4.3 Comment - Delete the phrase "are intended to." It is difficult to measure intent and what is important is whether the system has been stressed, not whether the responsible entity intended to stress the system. R2.5 Comment - If past studies only support, then a new study is still required. We suggest changing "Past studies may be used to support the Planning Assessment if they meet the following requirements:" to "Past studies may be used to fulfill all or a portion of the Planning Assessment provided they meet the following requirements:" Violation Severity Levels: R2 - There is no VSL associated with R2.5. A VSL should be added, perhaps under Moderate, that "past studies were utilized to fulfill all or a portion of the requirement, but the studies did not meet the requirements in R2.5." R2.5.1 Comment - We suggest deleting this requirement, and

incorporating it into R2.5.2. R2.5.2 Comment – To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or stability analysis the study shall be less than five calendar years old from the date of completion. The present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. A material change does not require the whole study to be redone. It only requires that the affected portion of the study be reassessed. Material generation changes include:

- The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner.
- An aggregated addition/deletion/change to a group of generating units directly connected to the BES at one point of interconnection through one or more transformers and determined to be material by the Planning Coordinator or Transmission Planner.

The reference to the step-up transformer may not capture a wind farm that could have transformers to step-up to a collection voltage and transformer that wouldn't be labeled a GSU to connect to the system. R2.6 Priority Comment – A. As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read "Provide documentation that explains the reasoning for the sensitivities considered and selected." B. At the end of the second sentence, the phrase "in the tables" is used. We suggest using more definitive language such as "in Table 1". R2.6.1 Comment -In the last bullet, the reference to "rate application" is unclear. R2.6.2 Comment – The phrase "Project Initiation Date" needs to be defined. It is unclear if this is the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase "as well as an in-service date" should be modified to read "as well as a target in-service date". R2.6.3 Comment – Plans can provide a target in-service year, but not an actual in-service year. R2.6.4 Priority Comment – There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions. R2.7 Comment – A. "Interruption duty" should be changed to "interrupting duty." All terms in the IEEE dictionary related to breaker opening use the word "interrupting," while terms related to loss of supply to customers use the word "interruption." B. The requirement would be clearer if it were restructured as follows: "For short circuit analysis, if the short circuit interrupting duty determined in Requirement R2.3 exceeds the Equipment Rating of fault interrupting devices, the Planning Authority . . ." R2.8 Comment – A. Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. B. If it is not deleted, do we have to prepare one number for P1 and a separate number for P2? The phrase "any P1 event and any P2 event in Table 1" could also be read as the worst loading for each event within P1 and P2, which could be hundreds of values depending on how many events are analyzed. We recommend that the requirement be modified to require documentation of the maximum amount of consequential load loss that was relied upon during the assessment of the P1 and P2 events. C. If it is not deleted, "shall provide" should be changed to "shall identify" for consistency with R2.9 R2.9 Comment – A. Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. B. If it is not deleted, this requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? Including the word "permissible" implies the responsible entity must decide how much Non-Consequential Load Loss is allowed. We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment of the P1 and P2 events.

R3 Comment – "Planning Assessment" and "shall perform analysis" are contradictory. R3 and its sub-requirements then reference study requirements. If this is an assessment, then the standard shouldn't be requiring a study. R3.1 Comment – A. It is not clear what should be included in the list related to R3.4. Events P0 through P4 should include analysis of all BES facilities for which the Transmission Planner is responsible. Events P5 and higher should be limited to contingency events that are deemed the most significant by the Transmission Planner. B. R3.1 refers to 'lists'. Is R3.4 creating one list or multiple lists? Suggest changing 'lists' to 'list' R3.2 Comment - Since R3.4 and R3.5 both require the responsible entity to create a list, the words in R3.2 be should be revised to be more similar to the words in R3.1. Suggest changing "Studies shall be performed to assess the impact of the Extreme Events identified in Requirement R3.5. to "Studies shall be performed to assess the impact of the Extreme Events, which are identified by the list created in Requirement R3.5." R3.3.2 Comment – A. Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. B. Voltage limitations are for both minimum and maximum. If this requirement is kept, then "minimum" should be deleted. C. Is this requirement really looking at "voltage limits" or generator "reactive capability"? R3.3.3 - This requirement should be deleted. Each reliability issue should be addressed in one standard and relay loadability is

addressed in PRC-023. If requirements of PRC-023 are met, the relay loadability does not constitute a limitation. If this requirement is intended to apply to modeling relay characteristics in stability simulations, which is not addressed by PRC-023, then the requirement should be more explicit. However, as written it appears that the intent was to be in-line with Blackout Recommendation 8a which relates to steady-state loadability, which is covered by PRC-023. R3.4 Comment - Table 1 includes both Steady State and Stability events. R3.4 needs to indicate that it only applies to the Steady State portion of the Table. R3.5 Priority Comment – It is recommended that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences and the requirements are too vague to have auditable value. If the requirement is not deleted, the following is recommended: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events. If not, it will be difficult to utilize the results to obtain projects approvals. - It should be clear that an evaluation does not require solution development for all Extreme Events - Change “an evaluation of possible actions...” to “where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered.” - The statement “and shall include an explanation of why the remaining Contingencies would produce less severe System results” is too open and should be deleted. Violation Severity Levels: R3.4 Since this is a binary requirement, should this have a Severe VSL? R3.5 Since this is a binary requirement, should this have a Severe VSL?

R4 Comment – “Planning Assessment” and “shall perform analysis” are contradictory. R4 and its sub-requirements, then reference study requirements. If this is an assessment, then the standard shouldn't be requiring a study. R4.1 Comment – A. It is not clear what should be included in the list related to R4.4. Events P0 through P4 should include analysis of all facilities BES facilities for which the Transmission Planner is responsible. Events P5 and higher should be limited to contingency events that are deemed the most significant by the Transmission Planner. B. R4.1 refers to ‘lists’. Is R4.4 creating one list or multiple lists? Suggest changing ‘lists’ to ‘list’ R4.2 Comment - Since R4.4 and R4.5 both require the responsible entity to create a list, the words in R4.2 be should be revised to be more similar to the words in R4.1. Suggest changing “Studies shall be performed to assess the impact of the Extreme Events identified in Requirement R4.5. ” to “Studies shall be performed to assess the impact of the Extreme Events, which are identified by the list created in Requirement R4.5.” R4.3.2 Priority Comment - Traditionally transmission planners have assumed that generators would ride through low voltages associated with Planning Events which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R4.5 Priority Comment – It is recommended that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. If the requirement is not deleted, the following is recommended: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events. If not, it will be difficult to utilize the results to obtain projects approvals. - It should be clear that an evaluation does not require solution development for all Extreme Events - Change “an evaluation of possible actions...” to “where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered.” - The statement “and shall include an explanation of why the remaining Contingencies would produce less severe System results” is too open and should be deleted. Violation Severity Levels: R4.4 Since this is a binary requirement, should this have a Severe VSL? R4.5 Since this is a binary requirement, should this have a Severe VSL?

It is unclear as to what is meant by the term “proxy used in the analysis” used in this requirement. Is a ‘proxy’ a ‘criteria’?

None

This standard should not be reiterating FERC Order 890. We do not feel that this requirement belongs in this standard and it should be deleted.

No

Comments: Can the definitions of the ‘Planning Horizon’ in the FAC, the ‘Long-term Planning’ Time Horizon (italicized and in parentheses next to the Violation Risk Factor), and the ‘Near-Term’ and ‘Long-Term Transmission Planning’ be included in the definitions section to avoid confusion? Refine load loss definitions as follows. Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions. Comment – It is not clear if Consequential load includes load that is connected to transmission within an island. Suggest revising the definition to “..load no longer served by the Transmission System (or perhaps by the BES?) as a result of Transmission Facilities being removed...” Load Reduction: Quantity of Load that is reduced due to lower voltage conditions resulting from a Planning or Extreme Event. Comment – ‘Load Reduction’ as written is the load remaining after the reduction. This should be rewritten to indicate it is the change in load from the previous value to that still connected. Also, the defined term ‘Load Reduction’ is counter to what most engineers consider to

be a load reduction and as written it does not seem necessary to define this term. Most engineers associate Load Reduction as a manual or automatic action by a customer to reduce demand. As defined it appears that Load Reduction refers only to the voltage sensitivity of load which should be captured in the system model if it is necessary to model this effect. Therefore the reference should be changed from "Load Reduction" to "Voltage Sensitive Load Loss". Non-Consequential Load Loss: Non-Interruptible Load loss other than Consequential Load Loss, Supplemental Load Loss, and Load Reduction. Comment – The definition is indirect. Suggest to revise the definition to be direct by stating "Intended post contingency loss of load (other than Interruptible Load, Supplemental Load or Load Reduction) caused by operator or SPS (RAS) action." Planning Events: Events that require Transmission system performance requirements to be met. Comment - Suggest "Events for which Transmission system performance requirements shall be met". Supplemental Load Loss: Load that is disconnected from the network by end-user equipment responding to post-Contingency System conditions. Comment - Suggest rewording last phrase to "...responding to System Contingency conditions." - or perhaps just "...responding to System conditions." Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current calendar year. Comment - Suggest rewording second sentence to "This is further defined as beginning 12-18 months from the current calendar year." - This avoids the awkwardness in present draft of seeming to define Year One as a planning window as well as a particular year.

No

Steady State & Stability comments are as follows: Steady State & Stability: a. Transmission voltage instability, cascading outages, and uncontrolled islanding shall not occur. How does this apply to Steady State testing? b. Consequential Load Loss, Supplemental Load Loss, Load Reduction, and consequential generation loss are acceptable as a consequence of any Planning or Extreme Event excluding P0. However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance requirements The second sentence re: Supplemental Load Loss implies need to test without end-user's actions and then assess whether action of separating end-user needs to be taken by Transmission system? B. Event P2-3 and P4 have the same impact; also events P2-4 and P4-6 have the same impact. Can these be consolidated? P5 Priority Comment – As written, this requirement is overly severe. This would require the simulation of a "dead" station if only one battery is present (use of NERC Glossary Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. P7 Priority Comment – Event 1 - This requirement requires the evaluation of the loss of two circuits on a multiple circuit tower. We recommend that this be modified so that only the loss of two adjacent (vertically or horizontally) circuits need be evaluated. Or allow the Planning Coordinator to evaluate and if appropriate exempt specific locations from this contingency based on acceptable risk. Comments on Extreme Events – Table 1- We recommend renumbering the Extreme Events table to be Table 2. Stability Condition 2 Note a - Priority Comment - As written, this requirement is overly severe. This would require the simulation of a "dead" station if only one battery is present (use of NERC Glossary Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. Stability Condition 2 Note h – Eliminate this requirement or change to loss of station following three phase fault. This note is confusing. Without providing a better defined scenario, it is unclear as to what clearing times should be used in this simulation. Note 1.a.i - For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism." There needs to be some sort of qualifier on this requirement. We suggest the following, "For Planning Event P1: No generating unit or units, directly interconnected at 100 kV or above, shall be allowed to lose synchronism." Note 1.a.ii – Contingency Reserve is dependent on the generation on-line. We suggest changing the first sentence to say that you can't lose more than that permissible by the Planning Coordinator. Also change "pull out of synchronism" to "lose synchronism" in this sentence and in the second sentence. (Is "Lose synchronism" a more commonly used term?). Note 3 – We recommend revising the wording of the last sentence to "A 3 phase fault study indicating criteria are being met is sufficient evidence that a SLG condition would also meet criteria." Note 11. Reference is made to Independent Pole Operation (IPO) – Can this be clarified by referencing it as IPO or Independent Pole Trip (IPT) as opposed to single-pole switching. Note 4 – We recommend that a lower bound be put on the HV electric systems (such as 100 kV), rather than just saying "and lower". Extreme Events: Steady State 3a - loss of two generating plants - This can be considered in two ways - one which results in loss of source (e.g. from fuel, cooling water, or nuke design shutdown) OR the second which could result in loss of stations including lines and breakers (e.g. from wildfires, weather, cyber attack, etc) - which is meant here? Both?

Yes

Capitalize "Firm Transmission Service" in footnote 10 and instead of saying firm Load use Firm Demand to be consistent with the NERC Glossary

Yes

Group

Bonneville Power Administration

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). R2.1.1: Peak load modeled for the near term planning horizon may not be Year one or year two. Therefore, R2.1.1 should be revised to say "System peak load for one of the five years". Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

R3.1 should be clarified. Suggested clarification: R3.1 - "Studies shall be performed to determine whether the BES meets the performance requirements in Table 1. A reduced set of contingencies can be simulated based on a list created in requirement R3.4." As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. Requirement R3.4 also needs to be clarified as follows: R3.4 - "A reduced list of Contingencies can be developed for System Performance evaluation in Requirement R3.1 that includes those Planning Event Contingencies that are expected to produce more severe System impacts based on system performance as required in Table 1. " The Statement at the end of R3.4 and R4.4 says "rationale for the Contingencies selected for evaluation shall be available as supporting information and shall include an explanation of why the remaining Contingencies would exhibit better system performance." The statement does not make sense and should be deleted since the contingencies selected are those to produce more severe system performance. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

Requirement R4 should be consistent with R3. Suggested edit for R4. - "For the Stability portion of the Planning Assessment, each Transmission Planner and Planning Coordinator shall perform analysis for the Near-Term Transmission Planning Horizon studies in Requirement R2.4. The studies shall be based on computer simulations using models developed from the data provided in Requirement R1." R4.1 should be clarified consistent with comments to R3.1. Suggested

clarification for R4.1 - "Studies shall be performed to determine whether the BES meets the performance requirements in Table 1. A reduced set of contingencies can be simulated based on a list created in requirement R4.4." As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. Requirement R4.4 also needs to be clarified as follows: R4.4 - "A reduced list of Contingencies can be developed for System Performance evaluation in Requirement R4.1 that includes those Planning Event Contingencies that are expected to produce more severe System impacts based on system performance as required in Table 1. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clarification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we've added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years? OTHER COMMENTS: Would like to see TPL-001-1 more specifically address system performance required for radial load areas served by multiple transmission circuits (unequal capacity) from a single source substation. For example, a radial load served by a single circuit 115-kV line and a single circuit 230-kV line. For a single contingency loss of the 230-kV circuit, cannot serve peak load area demand. Is this situation meant to be covered by Category P1 in TPL-001-1? I don't see anything similar to TPL-002-0a, Category B, Note b under Loss of Demand.

Group

Western Area Power Administration

Since the modeling data used for the Planning Assessment is initially created and governed per Mod-10 & Mod-12 Standards, this requirement should be clarified to include "maintain revisions of the modeling data required to perform the Planning Assessment" and not just "maintain system models for performing the studies needed to complete their Planning Assessment".

Short-circuit studies as related to maintaining adequate protection devices and systems are normally performed either by a specific System Protection Group/Department or System Maintenance Department and should not be in this requirement, but Post-Transient Analysis to mitigate voltage collapse scenarios should be included (includes R2.5.1 & R2.5.2). Also, System Protection including mitigation of short-circuit duty above installed facilities capabilities or for new planned facilities are already covered by the PRC Standards and need not be included and duplicated in the TPL Planning Standard such as in R2.3 & R2.7.

R3.3.3 should be covered in the PRC Standards. While R3.3 is labeled as "Contingency analysis", R3.3.4 is related to Steady State control and therefore should not be within R3.3.

R4.3.3 need not include the operation of exciters and power system stabilizers as modeling of

these parts of a generation system is already covered in Mod-12 & Mod-13 Standards and therefore are inherent in the dynamic analysis conducted using a program such as the GE PSLF or PTI power system simulation programs.

Yes

Yes

There is information within the notes that is not required to correctly understand and apply the TPL Standard. Examples are: 1. Note 1.a.i – the 2nd sentence is not needed to say what is not an out-of-step occurrence. 2. Note 9 is not needed to clarify what “internal” means.

Yes

Yes

Individual

Edward J Davis

Entergy Services, Inc

- Planned facilities and planned changes to existing facilities should be further defined to ensure facilities or changes that are unlikely to be constructed are not included in the models. See the proposed definition of “planned facilities” in the comments provided to question #8. Facilities included in the models should be only those projects that are committed to by the Transmission Owner or other users of the transmission grid. Consistent with the standard’s requirement to include only “firm transmission service”(R1.1.4), uncommitted facilities should not be included because an oversubscription of the grid could occur.
- R1.1: Please clarify what the SDT means by “models for the Planning Assessment shall present”, especially for facilities such as circuit breakers, protection system equipment, and new technologies. Models also need to represent existing facilities.
- R1.1.2: The phrase, “for each year of the Near-Term and Long-Term Transmission Planning Horizon”, should be revised to remove “each year” because there may not be studies in each year.
- R1.1.4: Firm Transmission Service - a single source can have transmission service to multiple sinks, and can be associated with transmission service in excess of the capacity of the source. There is a lack of clarity regarding the means by which Firm Transmission Service, a marketing term, is to be included in planning models. Not sure if this is applicable to Requirement 1 or 2.

- The “study area” referred to in R2.3 should be defined. Does it mean external contingency events should be evaluated, or, the effects of internal contingency events on external parties.
- It should be clarified that generating facilities are not included in R2.1.4. The strategy may include agreements to share spare equipment among facilities, generation owners, and transmission owners.
- In R2.6.4 what is “prudent”? Who decides what is prudent? Recommend that the word be stricken.
- R2.6.4 is in conflict with the Implementation Plan. The Implementation plan omits P1 as an event where the “bar has been raised” but R2.6.4 allows the use of non-consequential load and firm transmission service curtailment. Clearly, the bar has been raised for any event, including P1, which allowed the curtailment of non-consequential load or firm transmission service in the existing standard.
- In R2.9 is the team requiring that a criteria be set by each Transmission Owner to set a maximum level of non-consequential load loss allowed by that Transmission Owner, or, that the amount of non-consequential load curtailment needed to meet the requirement be documented?
- What is the rationale for being so prescriptive in requiring specific years to be studied in R2.1.1? Why not allow the TP and/or PC to decide on the three years to be studied in the Near Term?
- In the subrequirements of R2.1.3 and R2.4.3, the use of the word “timing” is unclear. Consider using “in service date” or “schedule for”.
- R2.1.4: The spare equipment strategy is too severe. The requirement should take into consideration the probability of occurrence of the events. Losing a transformer followed by the loss of a generator and a second transmission element is very unlikely. Non-consequential load loss should be allowed for this type of analysis.
- With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend adding the following to the end of R2.5.1: “unless justification can be provided to demonstrate that the results of an older study are still valid.”
- In R.2.4.1 it is mentioned that an aggregate System Load model that represents dynamic behavior of the load is acceptable. Does it mean that load at every bus in the study area has to be represented with an aggregate load model? This could be very cumbersome effort and we are not sure whether the software program can handle this magnitude of dynamic data. To help address this, revise “Load” to be “Load that could impact the study area is acceptable.”
- In Requirement R2.6.2, please clarify the definition of “project initiation date”.
- Please explain the reason why Requirement

<p>R2.8 is needed in the Assessment and how does reporting the largest Consequential Load Loss impact reliability? • Please explain the reason why Requirement R2.9 is needed in the Assessment and how does reporting the largest Non-Consequential Load Loss impact reliability? • Please clarify the use of the word "permissible" in the phrase "maximum permissible Non Consequential Load Loss".</p>
<p>• In R3.5 what would constitute "an evaluation of possible actions designed to reduce..." R3 should be broken into two pieces where the near term portion could be a Medium VRF but the long term section should be a Low VRF. Violations occurring in the longer term horizon are subjective and assumptions concerning future plans too broad to justify a Medium VRF. • In Requirement R3.1, it is suggested that the word "contingency" be added to describe the lists created in R3.4.</p>
<p>• In R4.5 what would constitute "an evaluation of possible actions designed to reduce..." • R4.3.2 requires that voltage ride through capability be analyzed. It is not clear what should be analyzed (e.g. auxiliary loads, generator protection, generator capability, etc.) This requirement needs more clarity. • R4.3.2 – By in large, the industry does not have the input data or the methods to do this. It would seem necessary to have PRC-024 approved before this can be met.</p>
<p>• M5 doesn't make any sense. Need to revise this Measure so that it fits the Requirement R5. Also need to revise the Data Retention discussion in Section 1.4 to align with R5. • In the VSL associated with R5, we believe that failure to define and document the proxies should be a moderate VSL.</p>
<p>No comments.</p>
<p>• This requirement is addressed through FERC Order No. 890 (9 principles of transmission planning).</p>
<p>No</p>
<p>• Include a definition of "planned facilities": Facilities that address the near-term deficiencies and have been approved with a financial commitment. • In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. Are these now no longer considered to be Non-Consequential Load Loss but instead now considered to be Load Reduction, Supplemental Load Loss, or something else?</p>
<p>No</p>
<p>• P2.1 should allow the shedding of load along the line that would be served radially to mitigate overloads or undervoltages on the radial line. Doing so would clearly not result in degradations to the BES but only the local area served by the radial line. • P4.5 is an extremely unlikely occurrence and should be equivalent to P4.6. • P5 should not be a planning event. PRC standards address Protection systems. The complexity associated with identifying and simulating such events is unknown and the defense of assumptions made and events simulated will lead to inconsistency in compliance and enforcement. Industry accepted proxies for such events could be developed that would allow for efficient identification of areas needing further detailed study. Attempting to intermingle protection system operation with BES performance will be nearly impossible to implement given current technologies. • In general, the entire table should be reconciled, one way or another, with MOD standards governing ATC/AFC. If multiple contingencies, protection system failures, breaker failures, and other less likely events must be planned for, then ATC/AFC processes should be equally limited, at least for long term service. Any service granted on a simple N-1 basis should be Conditional Firm. Anything less than interconnection-wide application of more stringent AFC/ATC evaluation processes commensurate with the long term planning standards will result in the shifting of costs and risks from wholesale users to retail rate payers.</p>
<p>Yes</p>
<p>• Units obligated to re-dispatch must include all Network Resources</p>
<p>No</p>
<p>• P1 events needs to be correctly classified as "raising the bar": P1 events should be included in the bulleted list of areas where the "bar was raised". The paragraph beginning at the bottom of page 2 of the Implementation Plan clearly states that the bar was raised "because loss of Non-Consequential Load or interruption of firm transfers is no longer allowed". Since P1 events in the existing standard allow this, the revised P1 events should be categorized as a raising of the bar. • Effective date needs to be extended: Additionally, in the areas where the bar has been raised, the effective date needs to be extended to at least 7 years. Siting (environment assessment and permitting, right-of-way acquisition, regulatory approvals) alone for many of the facilities likely needed can take 3 years or more in some areas. Likely delays due to litigation and affected stakeholder intervention must be considered. In addition, while the SDT has collected some cursory estimates of the costs which may be passed on to end-use customers, no discussion of the intended or expected increase in reliability has been published. Other considerations that will have an impact on the effective date are construction outages on the bulk transmission system and competition of resources (human and material). • Effect on reliability is not adequately quantified: Since one of the SDT's objectives is to ensure that "requirements set at an appropriate level to ensure reliability," what reliability metrics are expected to be impacted? By</p>

how much? What will the billions of dollars spent on transmission procure in terms of reliability to ratepayers? To what degree would the proposed standard decrease the probability of a blackout? If a blackout were to occur, would the proposed standard tend to decrease or increase the size and magnitude of the event? • More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective. • Since breaker duty is a new "raising the bar" issue - should there also be a 5 or more year implementation plan for this as well? • If a Transmission Planner has a Corrective Action Plan identified within the accepted time limitations but the facilities identified in the CAP cannot be implemented in time, would the TP be found non-compliant on the TPL-001-1? • If contingencies in one utility's system results in issues within another utility, who is responsible for studying the contingencies and who would be responsible for documenting the CAP?

Individual

Joe Knight

Great River Energy

R1.1 is just repeating what should already be in the MOD-010 and MOD-012 requirements. Why re-iterate this in the TPL standard? The planners are expecting that the model building process will already include these components listed in R1.1 otherwise there wouldn't be a functional model. R1.1.1 may be the only thing that needs to be identified in R1 as any known long-term outage or retirement of a facility may have happened after the model building process. If R1.1 is kept I would suggest removing "Models for" so that R1.1 reads "The Planning Assessment shall represent: R 1.1.1 says the assessment shall represent planned outages if specifically known. It does not however distinguish the length of the outage to be considered. Should a 1 week maintenance outage in Year five be included? Should a 2 year complete rebuild outage lasting through year two and three be included? It is GRE's opinion that the SDT needs to add a comment about the length of the planned outage and its relevance to the assessment. In the Violation Severity Levels, R1 seems to be weak since any solved model should meet this requirement. Again this would seem to be more related to the MOD010 and MOD012 process. R1 should focus on documenting changes that are being preformed against the data that was submitted in MOD-010 and MOD-012 process.

R 2.1, 2.3, and 2.4 need consistency. 2.1 says "The Near-Term Transmission Planning portion of the Steady State analysis..." 2.3 says "The short circuit portion of the Planning Assessment ... addressing the Near-Term Planning Horizon..." 2.4 says "The Near-Term Transmission Planning portion of the Stability analysis..." These three sentences confuse the order. As I understand the Planning Assessment has two parts, a Near-Term portion and a Long-Term portion. Each of those parts has three components, a Steady state component, a Short Circuit component, and a Stability component. I believe the standard's language should be structured as such. R2.1.3- The last bullet would seem to indicate that planners have the capability of predicting the future. The statement would seem to fit more in an operating standard. A suggested revision would be: Known long-term transmission outages with duration greater than one year R 2.1.4 addresses the spare equipment strategy. What is the scope of this sensitivity? Is the intent to do only a full steady state analysis with regard to long lead time spares? R2.6.2 would seem to be placing the planner again in the capability of predicting the future. Coming up with specific dates based on budgets, projected growth rates, potential permitting issues, and material delivery schedules would make it difficult to define an initiating date and an in-service date. An in-service season and year may be more applicable in a planning study for near-term projects. GRE is not sure why an initiating date is of relevance in an assessment.

R3.3.3 The relay loadability section needs better definition. Is this identifying that: if the relay load limit is the most Limiting Element of a transmission line how it would be handled if it is overloaded considering that there may be some margin before opening the line and/or if the line reaches a certain overload level based on a non-Relay Load Limit being the Most Limiting Element that the relay load limit should be analyzed to see if it will actually activate an opening of the transmission line or the planners need to review all of the relays associated with all transmission lines within the model and indicate if loadability is a concern for each contingency analyzed. There are a lot of lines, (probably the majority), that have not defined a relay capability within the rating fields of the model! This would seem to be a FAC-009 issue. As a discussion point on R3.3.3, it would seem that relay loadability should be addressed in FAC-009 and the Model Building process. Putting this burden in the planning assessment will be difficult to determine if the Most Limiting Element within the model is not a relay load limit as those parameters typically are not the Most Limiting Element. Every line in the model may need to be defined as to what its relay loadability is to meet this requirement. Our regional model build reports a Most Limiting Element, a short term emergency level, and a long-term emergency for the three ratings available within the model. It would seem that the long-term emergency field should be replaced with a Relay Load Limit value such that the R3.3.3 would not be as great of a burden on the planner.

No
Why is the P needed in defining the category? They all have a P. Top note f and i should reference the Planning criteria established by the Planning Coordinator (or the Transmission Owner if more restrictive). The Transmission Owner is typically the one that sets the limits on their facilities. The Planner just works for the Owner.
Individual

Comments: Consider just referring to the MOD series of standards, not specific individual MOD standards because the numbering of the MOD standards could change and additional relevant MOD standards could be added. Consider rewording the second sentence to read, "The data and models shall meet all requirements of the MOD series of standards." The MOD standards should include the requirements of regulatory authorities and other legal obligations and need not be repeated in the TBL standard(s). R1.1.2: Consider changing to, "New planned Facilities and planned changes to existing..." and changing the fifth bullet to read, "Normal actions of Protection System equipment" R1.1.3: Consider changing to, "End-use customer loads and generators" [how small loads are aggregated should be covered in the MOD standards. A key point is that large industrial customers with significant generation that reduces their net peak demand should not be represented simply as a net load since that would not properly model the dynamic impacts of the load and generation components]. R1.1.4: Consider changing to, "Worst-case transfers on Firm Transmission Service Reservations". R1.1.5: Consider removing this requirement. It should be covered by R1.1.4 R1.1.6: Consider changing to, "Generating units" [the MOD standards should specify the details like how exciters, governors and associated control equipment must be modeled] Comment on M1: Consider changing to, "...using data consistent with the MOD series of standards, simulating" Consider just referring to the entire series of a particular standard, not specific individual standards because the numbering of the standards being referenced could change and additional relevant individual standards could be added.
Comments: Consider changing the second sentence to read, "This Planning Assessment shall use current or past studies, document assumptions, document results and shall cover all analyses needed to clearly demonstrate that the proposed system expansion plan meets all planning criteria and standards." This standard should not limit the studies to only "steady state analyses, short circuit analyses and Stability analyses" none of which seem to be defined anywhere. In some cases it would be appropriate for planning studies to cover analyses of such phenomenon as electromagnetic transients, sub-synchronous resonance, ferroresonance and harmonics. The fact that "Stability" is capitalized suggests that it refers to the definition of "Stability" in the NERC glossary, but that definition reads just, "The ability of an electric system to maintain a state of equilibrium during normal and abnormal conditions or disturbances", but stability analyses (often more properly termed "dynamic simulation studies") usually encompass more than simply electromechanical or voltage stability. Usually voltage and frequency excursions are also analyzed and perhaps temporary overcurrent also (eg, assessing temporary overvoltage levels across series capacitor banks).
R3.3.3: Consider changing it to read, "Demonstrate that, for all Transmission lines, relay loadability standards are met in accordance with the PRC series of standards"
Comments: Consider changing R4.3.2 to, "Confirm proper generator performance under anticipated conditions including low voltage ride-through capability" In R4.3.3, change "VAR" to "var". The IEC has adopted the name var, var (volt ampere reactive power), for the coherent SI unit volt ampere for reactive power. (see: http://www.iec.ch/zone/si/si_elecsmag.htm#si_rpo). Is there an overlap between R4.3.3 and the MOD standards? If so, perhaps R4.3.3 should be deleted. If not, perhaps the MOD standard should be expanded to include this. Consider adding R4.3.4, "not simulate any operator intervention"
Comments: The meaning of the word "proxies" in this context seems uncommon making the requirement unclear. Perhaps "proxies" should be replaced with "criteria" or "criteria or proxies".
No
Comments: In almost all instances, the word "horizon" should be changed to "period" in both the definitions and throughout the standard. The word horizon refers to the end of the period; it literally means, "the limit of one's mental outlook" and the horizon is normally the furthest we can see. A long-term horizon-year study would be a study of conditions expected in the last year of the long-term planning period (often the 10th or 20th year). A long-term horizon-year study

would not be expected to refer to a series of studies of each year in the long-term planning period.

No

Comments: Note "d": The term "Normal Clearing" is not well defined. Consider adding a definition in this standard or changing the NERC Glossary definition of "Normal Clearing" to read, "A protection system operates as designed and the fault is cleared in the maximum time that a properly functioning protection system would be expected to take to clear the fault, considering tolerances in normal protection operating times and circuit breaker interrupting times" No generating unit or units totaling more than the Contingency Reserve of the Balancing Authority (or Reserve Sharing Group if applicable) shall be disconnected from the System by a Special Protection System Note "e": Consider changing to, "For all Planning Events, planned System adjustments such as Transmission configuration changes and redispatch of generation are allowed if such adjustments are automatic (ie, implemented by a NERC-certified Special Protection System, SPS) and executable within the time duration applicable to the Facility Ratings. For P1 and P2 events, (a) generation shedding shall be limited to the normal level of Contingency Reserve of the Balancing Authority (or Reserve Sharing Group if applicable) that would be carried in the control area under the system conditions being studied and (b) no manual operator actions should be necessary to ensure Facility Ratings are not exceeded. Note that, in the operating time frame, the operator would immediately take whatever actions and system adjustments are needed to prepare for the next set of possible contingencies". It should be recognized that this will result in a higher transmission planning standard than the previous wording and that should be seen as a desirable outcome of updating the NERC standards since transmission system reliability (or lack of it) is the impetus for the whole Mandatory Reliability Standards (MRS) process. It should also be emphasized that PLANNING standards are necessarily conservative, simple and easy to apply since in the planning time frame all possible circumstances that might be encountered in the operating timeframe cannot be assessed or nothing would ever get built. If operator action is permitted "if such adjustments are executable within the time duration applicable to the Facility Ratings", how will that be measured consistently to ensure the standard is met? One planner might count on five operators having nothing to distract them from adjusting the output levels of 10 plants to reduce the load on a line to below its 10-minute overload rating, whereas another might be more conservative and assume some of the operators may be busy with other things and be more conservative in estimating how much can be accomplished in 10 minutes. If no operator action is permitted, the standard is easily measured and a more secure system results, one of the main objectives of the MRS. The addition of the requirement that criteria are met without operator action is consistent with R3.3.1 that states "[Contingency analysis shall] simulate the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention [emphasis added]". Performance Category P7: Consider changing the first event to, "All circuits on common structures" and consider changing the fault type to 3-phase. Extreme Events (Steady State): Consider changing item 1 to read, "With an initial condition of a single generator, Transmission Circuit, DC Line (one pole), shunt device or transformer forced out of service and prior to System adjustments, a second generator, Transmission Circuit, DC Line (one pole), shunt device or transformer is forced out of service." Extreme Events (Stability): Change item 1 to read, "With an initial condition of a single generator, Transmission Circuit, DC Line (one pole), shunt device or transformer forced out of service and prior to System adjustments, apply a 3Ø fault on a second generator, Transmission Circuit, DC Line (one pole), shunt device or transformer." Change item 2.g to read, "3Ø fault on all Transmission lines on a common Right-of-Way. Simultaneous 3Ø faults on all lines on a common right of way seems more likely (plane crash, avalanche, earth quake, wildfire) than simultaneous SLG faults. Footnote 1: Consider changing Item 1.a.I to read, "For Planning Events P1 and P2: No generating unit or units...." And consider adding the following sentence, "No generating unit or units totaling more than the Contingency Reserve of the Balancing Authority (or Reserve Sharing Group if applicable) shall be disconnected from the System by a Special Protection System". Footnote 8: Consider changing to, "Opening of Breaker(s) w/o fault in category P2 includes the situation in which one end of a normally networked Transmission circuit becomes open-ended, possibly resulting in voltage deviations outside acceptable limits especially at the open end of the line". Using the phrase "Opening of Breaker(s) w/o fault" that is used in the "event" column of category P2 will help people make the connection to the footnote.

No

Comments: Consider changing Footnote 10 to read, "Curtailement of firm Transmission Service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column entitled ["title" is a noun, not a verb and "titled" is an adjective meaning having a title, esp. of nobility] 'Initial System Conditions') and a corrective action provided both are accomplished automatically by a NERC-certified SPS, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings

in those regions must be considered.

Individual

Marie Knox

Midwest ISO

Generally the Midwest ISO agrees with FirstEnergy's comments regarding this requirement. However, if the SDT insists on keeping this requirement as is then we propose the following corrections specific to each requirement. Specific Comments for Requirement 1: A) Under R1 there is language that references "other data sources"; can the SDT please offer some clarification on what "other data sources" are to be? Could other data sources be Tariff requirements? B) Again under R1, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R1 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". C) Under R1.1.1 it is required that models represent planned outages of generation and transmission facilities, if specifically known. This does not allow or require a Transmission Planner or Planning Coordinator to include outages due to maintenance and/or due to construction programs where certain facilities are out of service during various phases of construction, as part of the Assessment. For this reason, we believe the following language for R1.1.1 would improve this requirement: Planned outages of generation and Transmission Facilities if specifically scheduled or planned for. D) Under R1.1.1 we suggest adding sub-requirement R1.1.7 Generation dispatch patterns deemed appropriate by the Transmission Planner and Planning Coordinator. This clarifies that when building System models, generation dispatch is part of the model building process. E) Under R1.1.2 there is uncertainty around the language of "New planned Facilities". We offer the following definition for Planned Facilities to be added to the definition section of this standard and further added to the NERC Glossary of Terms: Planned Facilities – Generation and Transmission Facilities that are expected to be implemented with an in service date prior to the plan year being studied. F) Under R1.1.2 a bullet should be added for "Relay Loadability Limitations". The standard requirements for relay loadability are included in PRC-023-1.

Opening Remarks. Specific Comments for Requirement 2: A) Under R2, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R2 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". B) Under R2.1 there is a reference to qualified past studies in R2.6. We believe that this reference should be pointing to R2.5 not R2.6. C) Under R2.1.3 there is ambiguity in the third bullet language "...new or modified Facilities..." and we believe that this language should mimic that of R1.1.2 in order to improve this requirement. The third bullet should read: Timing of the installation of new Planned Facilities or changes to existing Facilities. D) Under R2.1.3 there is ambiguity in the fourth bullet language "...capability..." and we believe that this language should read: Reactive resource capability (Generator, STATCOM, SVC, other...etc). We believe that this language addition improves this requirement. E) Under R2.1.3 there is ambiguity in the seventh bullet language "...Transmission outages..." and we believe that this language should read: Planned duration or timing of specifically scheduled or planned for Transmission outages. This language mimics similar language suggested above in R1.1.1 (letter C on page 3 of 9) F) When a spare equipment strategy does not cover the long lead time unavailability as stated in 2.1.4, will the system be treated as "normal system condition" and Table 1 requirements or as having a contingency from which system adjustments are to be made prior to subsequent events. We believe that this task will be burdensome for large entities such as RTOs and we are not clear on the benefit that this requirement brings. For example: If in an RTO system where a party has spare equipment, how can the RTO ensure that a spare part from one asset owner can be made available to other asset owners? G) Under R2.2 a System peak load study is required annually for one of the years in the assessment period. R2.2.1 requires the assessing entity to extend their planning assessment to accommodate any known longer lead time projects that may take longer than ten years to complete. It does not make sense to study the ten year horizon, find a problem in year ten which has a solution that required twelve years to build. For compliance with this standard, you would need to find another solution that can be built within ten years as opposed to the suggested language in R2.2.1 of extending the planning assessment beyond ten years to accommodate the solution that falls outside of the Long-Term Planning Horizon. No project solution greater than 10 years should be acceptable because it falls outside the Long-Term Transmission Planning Horizon. Suggestion to strike sub-requirement R2.2.1 from this standard. H) Under R2.3 the second sentence requires that "The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study year". We suggest changing the language to read: "The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with Planned Facilities in service which could impact the study year". The definition of Planned Facilities was suggested to be added in the comment above in R1.1.2

under letter (E). I) Under R2.4 the second sentence requires states "The following studies are required". We suggest changing the language to read: "The following current studies are required". We believe that this language addition improves this requirement. J) Under R2.4.1 the first sentence leaves to much ambiguity as to who determines whether severity of system peak or off peak as well as whether the system load levels appropriately represents the dynamic behavior of loads. If the monitoring agency wishes to make this determination than it should be explicitly written here in this requirement. If the assessing entity is to make this determination than we offer the following language suggestion that we feel will improve this requirement. "For one of the five years, the more severe System peak or off peak System load level, as judged by the assessing entity, shall be used which in the judgment of the assessing entity appropriately represents the dynamic behavior of Loads including consideration of the behavior of induction motors". K) For R2.4.2, we suggest striking this requirement altogether and add System Off-Peak to R2.4.1 above in R2.4.1 under letter (I). L) Under R2.4.3 there is ambiguity in the third bullet language "...new or modified Facilities..." and we believe that this language should mimic that of R1.1.2 in order to improve this requirement. The third bullet should read: Timing of the installation of new Planned Facilities or changes to existing Facilities. M) Under R2.4.3 there is ambiguity in the fourth bullet language "...capability..." and we believe that this language should read: Reactive resource capability (Generator, STATCOM, SVC, other...etc). We believe that this language addition improves this requirement. N) The sub requirement R2.5.2 states that for steady state, short circuit, or stability analysis; the "present System model" shall not include any material changes, such as.....etc. The present language in this section is vague and requires discretion on the part of both the Transmission Planner and the Planning Coordinator performing the assessment. For example, new transmission enhancements may have been added since the previous System model was developed. In general, such topology enhancements will only improve reliability and would not necessitate re-assessment with a newly updated System model. In addition, any significant generator additions would have been evaluated with a full separate generator interconnection study at which the full reliability of the System would have been taken into consideration. For this reason, we believe the following language for R2.5.2 would improve this requirement: For steady state, short circuit, or Stability analysis: the current System model of the assessed plan year shall not include any changes material to the assessment, as judged by the entity performing the assessment, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study year. Material generation changes could include: O) Under R2.6.1 the fifth bullet regarding the use of Operating Procedures needs to be made clearer. We believe that the following language will improve this requirement: Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan. Operating Procedures may not include Non-Consequential Load Loss when not permitted in Table 1. P) Under R2.6.1 the sixth bullet regarding the use of rate applications, DSM, new technologies or other initiatives can be improved with the following language additions: Use of rate applications, DSM, new technologies or other demand side initiatives can be improved with the following language additions. Q) Under R2.6.2 the language regarding project initiation date is vague. We suggest the following definition to be added to this standard and further added to the NERC Glossary of Terms: Project Initiation Date – A date in which Planned Facilities are expected to break ground. R) Under R2.8 please add a coma between the words event and caused. A PC/TP would study multiple P1 and P2 events involving consequential load loss not just the largest. Unless the SDT has a measure in mind for consequential load loss, this requirement should be removed. S) Under R2.9 please strike the word permissible and replace with necessary. It is not clear what the SDT is requesting with this requirement.

Opening Remarks. Specific Comments for Requirement 3: A) Under R3, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R3 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". B) Under R3.1 the "Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the lists created in the Requirement 3.4". We believe that the following language will improve this requirement: Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the more severe contingency lists created in the Requirement 3.4. C) Under R3.3.2 the Midwest ISO generally agrees with FirstEnergy's comments on this. D) Under R3.3.3 the Midwest ISO feels that this sub-requirement is redundant with PRC-023-2 and therefore we feel that this sub-requirement needs to be removed and replaced with our suggested bullet language under R1.1.2 – Relay Loadability Limitation (see F on page 3 of 9 above) E) Under R3.4 to make this requirement clearer, please add the following language between the words "expected to" in the first sentence: ...expected by the assessing entity to... We believe that this language addition improves the clarity of this requirement. The first sentence would then read: Those Planning Event Contingencies in Table 1 that are expected by the assessing entity to produce more severe System impacts shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created. F) Under R3.5 to make this requirement clearer, please add the following language between the words "expected to" in the first sentence: ...expected by the assessing entity to... We believe that this

language addition improves the clarity of this requirement. The first sentence would then read: Those Extreme Events in Table 1 that are expected by the assessing entity to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R3.2 created.

Opening Remarks. Specific Comments for Requirement 4: A) Under R4, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R4 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

Under R5, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R5 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

A) Under R6, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R6 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

A) Under R7, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R7 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". B) The coordination of analysis of results through an open and transparent process is already a FERC requirement thus producing a double jeopardy for those entities that fall under the jurisdiction of FERC Order 890. We recommend striking the following language in the last sentence: ...coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890. C) Under R7 only the Planning Coordinator is required to coordinate the distribution of Planning Assessment results among adjacent PCs and any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890. Should the TP be added to this requirement? We propose the suggested language change: Each Transmission Planner and Planning Coordinator shall coordinate the distribution of Planning Assessment results among adjacent Transmission Planners and Planning Coordinators, respectfully, and to any functional entity who has indicated a reliability need, coordinating analysis of these results through an open and transparent peer review process such as described in FERC Order 890. D) Based on the comments above in (B) and (C), our suggested requirement language is as follows: Each Transmission Planner and Planning Coordinator shall coordinate analysis in support of assessments in accordance with applicable regulatory requirements. Each Planning Coordinator shall distribute its completed planning assessment results among adjacent Planning Coordinators and any functional entity who indicated in writing a reliability related need.

No

Year One: At a minimum the SDT needs to address the applicability of this definition to include both the Transmission Planner and Planning Coordinator. The Year One definition needs additional clarification with the current calendar year. According to the definition, Year One can start any time between 12 and 18 months from a current calendar year. Suggested definition for Year One: The first year that each Transmission Planner and Planning Coordinator is responsible for conducting a Planning Assessment. This is further defined as the planning window that begins at least 12-18 months from the end of the current calendar year.

Yes

The stability studies require significantly more computer time and a more detailed model. The standard should allow the PC/TP to use judgment to manage size and complexity of the study.

Yes

Yes

The 3rd draft states that this will be addressed later in the project. Removal of these standards would not affect NERC and the RE's obligations to perform assessments. Will the PC/TP be obligated under NERC Rules of Procedure to provide Assessments to NERC and the Regions upon request?

Group

NERC Standards Review Subcommittee

N/A

MRO NSRS proposes the following comments for R2: Modify R2.6.2 to remove the obligation to include the project initiation date. The inclusion of this date would add unnecessary work that is not needed to assure adequate BES reliability. In addition, it is not clear whether "initiation" refers to the commencement of engineering, design, construction, etc. Augment R2.6.5 to include annual verification of the continued validity of the Corrective Action Plan because the value of implementation status is dependent on the status of continued validity. MRO NSRS

suggests this text: "Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status . . ." Augment R2.7.2 to include annual verification of the continued validity of the Corrective Action Plan because the value of implementation status is dependent on the status of continued validity. MRO NSRS suggests this text that is similar to R2.6.5: "Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status." Remove R2.8., MRO NSRS does not know of any reason why the investigation and inclusion of the largest Consequential Load Loss caused by any P1 or any P2 events is needed to assure adequate BES reliability. In addition, all events involving Consequential Load Loss are studied, not just the largest load loss (see R3.3.1).

MRO NSRS proposes the following comments for R3. Revise the R3.3.2 text to clarify that subsequent analysis is performed on generators whose voltages are expected to fall below the minimum voltage limits. MRO NSRS suggests this text: "Consider the minimum steady state voltage limitations of all generators and identify how generators with bus voltages below its minimum voltage limits are analyzed in the subsequent steady state simulations." Revise the R3.3.3 text to more clearly relate to the specific requirements in PRC-023. MRO NSRS suggests this text: "Incorporate relay loadability per PRC-023 and identify how relay loadability is analyzed in the steady state simulation."

MRO NSRS proposes the following comments for R4: Add R4.3.3 text include relay loadability in the R4 (Stability) requirements to parallel R3.3.3 in the R3 (Steady State) requirement which would more clearly relate to the specific requirements in PRC-023. MRO NSRS suggests this text: "Incorporate relay loadability per PRC-023 and identify how relay loadability is analyzed in the dynamic simulation." In R4.3.4, MRO NSRS proposes limiting the scope to automatic devices and adding the notion of "including but not limited to". MRO NSRS suggests R4.3.4 text of: "Simulate the expected automatic operation of existing and planned control devices including but not limited to generation exciter control and power system stabilizers, static VAR compensators, power flow controllers, and DC Transmission controllers."

MRO NSRS proposes specifying that the proxy documentation be included in the Planning Assessment and add the rationale for the proxy. MRO NSRS suggests this text: "Each Transmission Planner and Planning Coordinator shall document within the Planning Assessment any proxies used in the analysis to identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding. The documentation will consist of the definition of each proxy used and the rationale for the proxies."

MRO NSRS is not clear if: 1) Each Transmission Planner is to meet all the requirements including doing all the studies and all Planning coordinators are to meet the requirements including doing all the studies. Or 2) If the Transmission Planner and Planning Coordinator are to work as a team to meet all the requirements including doing all the studies. Either one of them could do various parts of the required studies. For example, maybe the PC could do the stability part so all TP's would not necessarily have to buy that software if they did not need it for other planning purposes. In the first read of this standard, it appears that the intention was number 1, which sounds awfully duplicative. But then take a look at Requirement 6. R6. Each Transmission Planner and Planning Coordinator shall determine and identify individual and joint responsibilities for performing the required studies for the Planning Assessment. [Violation Risk Factor: Low] [Time Horizon: Long-term Planning] After reading R6, it appears that number 2 was intended. Perhaps R6 should be the very first requirement in the standard. The MRO NSRS requests that the NERC SDT clarify the responsibility of the requirements of this standard.

MRO NSRS proposes expanding the scope of entities to consider, limit it to those entities that indicate a reliability need for coordination, and eliminate the direct reference to Order 890. MRO NSRS suggests this text: "Each Planning Coordinator shall establish a list of adjacent Planning Coordinators and any functional entity who has indicated a reliability need, distribute its Planning Assessment results to the listed entities and consider comments on the assumptions and results through an open and transparent peer review process."

No

MRO NSRS suggests the following comments: Add a Consequential Generation Loss definition because both load and generation loss can be considered, but there is only Consequential Load Loss definition. MRO NSRS suggests text of: "Consequential Generation Loss: All Generation that is no longer delivered to any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions." Expand the Consequential Load Loss definition to include protection for abnormal operating conditions. MRO NSRS suggests text of: "Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions." Expand the Load Reduction definition to include consideration of TOP judgment and established protection schemes. MRO NSRS suggests text of: "Load Reduction: The reduction of Load that is still connected to the System, but in the judgment of the Transmission Operator or through the previous established Special Protection Systems, Under-Frequency Load Shedding programs, Over-Frequency Load Shedding program, should be reduced to overcome to lower voltage

conditions following a Planning or Extreme Event.” Modify the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. MRO NSRS suggests text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” Modify the Planning Events definition more explicitly apply to the TPL-001 requirements. MRO NSRS suggests text of: “Planning Events: Events that are identified in the steady state and stability performance requirements set forth in the TPL-001 standard.” Expand the Year One definition to include the PC, refer to the Planning Assessment, and refer to the current calendar year. MRO NSRS suggests text of: “Year One: The first year that each Transmission Planner and Planning Coordinator is responsible for conducting a Planning Assessment. This is further defined as the planning window that begins 12-18 months from the current calendar year.” MRO NSRS would like to delete the definition of “Year One”. This is already being done and adding a planning window opens entities to noncompliance for conditions i.e. Model building outside of entities control.

No

MRO NSRS suggests the following changes: MRO NSRS believes reference to the use of Load Reduction to meet steady state performance requirement was omitted in Planning Events, Steady State and Stability, Item b. MRO NSRS suggests modifying the last sentence in Item b: “However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance requirements.” MRO NSRS proposes limiting the scope to automatic devices in Planning Events, Steady State and Stability, Item c. MRO NSRS suggests text of: “c. Simulate the removal of all elements that Protection Systems and other Controls are expected to disconnect automatically for each Contingency”. Modify the P3 Category performance criteria to apply only to the loss of two generators because probability of the loss of two base load generators is an order of magnitude higher than the loss of a generator and any other transmission element. MRO NSRS suggests the listing of: the loss of transmission circuit, transformer, shunt device, and single pole of DC line be removed from the P3 Events column. The corresponding events be moved to the P6 Category by “1. Generator” to the listing in the Initial System Condition (Loss of . . .) column. Limit the scope of the simulations in Item 1 of the Extreme Events, Steady State and Stability section to automatic systems and controls. MRO NSRS suggests this text: “1. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect automatically for each Contingency.” Clarify the meaning of the loss of multiple circuits in Item 2.a of the Extreme Events, Steady State section by using wording similar to P7. MRO NSRS suggests this text: “a. Loss of three or more circuits that share a common structure.” Clarify the reference to actual, historical operating experience in Item 3.b of the Extreme Events, Steady State section. MRO NSRS suggests this text: “b. Other events based upon actual operating experience that may result in wide area disturbances.” Clarify the reference to actual, historical operating experience in Item 2.i of the Extreme Events, Stability State section. MRO NSRS suggests this text that is similar to Steady State, Item 3.b: “i. Other events based upon actual operating experience that may result in wide area disturbances.” Further clarify the applicable shunt devices in Footnote 7 with this suggested text: “7. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters.”

Yes

N/A

No

MRO NSRS offers the following comments. The last paragraph should be removed from the Effective Date section. This paragraph contains requirements and describes compliance procedures, rather than stating effective date details. If any requirements regarding Corrective Action Plans are included, then they should be placed in the R2 section. If descriptions of compliance procedures related to Corrective Action Plan implementation are deemed to be necessary, then they should be placed in NERC procedure documents. This standard should not contain any requirements regarding the implementation of Corrective Action Plans. The implementation of transmission system action plans depends on the actions (e.g. financing, regulatory approval, legal services, engineering, construction, commissioning) of many different entities, other than PCs or TPs. So, PCs and TPs should not be held responsible for the implementation of action plans since they have little or no control over the activities related to implementation. The standard could include requirements that obligate PCs and TPs to develop Corrective Action Plans that are executable (i.e. plans that are based on lead times that provide reasonable assurance that the planned facilities can be placed in service by the time that they are needed) or devise revised Corrective Action Plans when they learn that the actions plans are not expected to be implemented by the intended in-service date. The standard could also include requirements that obligate PCs and TPs to establish and apply project implementation lead time assumptions that are derived from historical experience and the implementation lead time projections from the applicable TOs, GOs, and DPs. Remove or modify the 60 month effective date statement because it’s impractical and unreasonable. The effective date for performing analyses and developing subsequent Corrective Action Plans is 24 months. This leaves only 36

months to expect that the more stringent Corrective Action Plans would be implemented. It is improbable that all action plans related to BES facilities, especially above 300 kV could be implemented. Some EHV projects can take 5 to 10 years to implement depending on the size, complexity, and controversial nature of the project. MRO NSRS suggests that the effective date be stated in a more "implementation dependent" rather than a "fixed timeframe" manner. Consider wording such as "tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2.6.4) is allowed until Corrective Action Plans based on TPL-001-1 analyses are implemented".

Individual

Jessica Rice

NV Energy

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). R2.1.3 should be modified to remove the last bullet point. Transmission outages should be a part of operational study work not planning study work. Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to

do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

No Comments

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clairification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS? We are also wondering how loads that have interruptible rates should be handled.

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

Yes

No

We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years? Why is this changing from an annual reset period in the current standards?

Individual

Mark Kuras

PJM

In R1, why require a Planning Coordinator AND a Transmission Planner to maintain models for the same area? Concern with the words -- for each year—in R1.1.2. Does this mean that a case for each year, at least, will need to be produced? Will five, one for each season and a light load, each year need to be produced? R1.1.5 is not clear. Is the Interchange exclusive of Firm Transmission Service as mentioned in R1.1.4? Maybe --non-firm transmission service-- is clearer.

In R2, why require a Planning Coordinator AND a Transmission Planner to perform this analysis? Isn't this a duplication of effort? In R2, I have always heard that dynamics studies are performed to determine Stability. In R2.1, need to update reference to R2.6 from R2.5. In 2.1.1 and R2.1.2, is this annual peak or seasonal peak? Summer peak for summer peaking entities and winter peak for winter peaking entities or both summer and winter peak for all entities. R2.1.1 year one or two studies should be only required as operating studies. By their nature, the upgrades or fixes that could be accomplished in this time frame are limited to short lead time fixes. These analyses are needed to determine how to accommodate construction schedule deviations and near term system issues that may cause issues. Traditional Planning studies will be of no benefit in this timeframe. Change the requirement to be a study for year 3,4 or 5 with updates for material changes that occur when a previous year study is still within this time frame. R2.1.2 and R2.1.1 should be combined and the TP should assess and justify its choice of the critical load scenarios to analyze. Concerned about the extent of variations required in R2.1.3. Like would I have to vary all proposed generator in-service dates? Just a couple? One? Requirements need to be clear or compliance will assume the largest scope possible. Also in R2.1.3, first bullet words should align with the words of R1.1.3. Also in R2.1.3, second bullet words should align with words of R1.1.4 and R1.1.5. Also in R2.1.3, third bullet, modified facilities are not installed, suggest changing --installation— to --availability--. Also in R2.1.3, fifth bullet, suggest moving --retirements-- up to third bullet and dropping -- Generation additions, retirements, or other...-- leaving just --dispatch scenarios— R2.1.4 should be deleted. There are no NERC requirements on spare equipment availability and this requirement seems like

a backhanded way to include such a requirement. R2.2.1 should be reworded because it now requires everyone to extend their studies. Suggest –If planned projects will take longer than ten years to complete, the Planning Assessment shall be extended accordingly- R2.4.1 – Not sure I understand. The second sentence and the third sentence seem to be in conflict R2.4.2. This requirement has lost significance with the deletion of unit stability. Off-Peak scenarios are critical for unit stability and analysis of pockets of known light load stability sensitivity. This requirement should not be worded to require a general system off-peak stability study since this will not provide useful information. The requirement should be reworded to clarify that the TP should identify its critical off-peak stability sensitivities and provide annual stability analyses that address the system's off peak stability issues. R.2.4.3 should only refer to R2.4.1 since R2.4.2 are sensitivities themselves. In R2.4.3, first bullet, how would load model assumptions be varied? Same comments on bullets here as R2.1.3 above. R2.5.2 is impossible to judge. Material changes needs to be defined. The word –could— in the sentence before the bullets makes them useless as a definition. By trying to define material changes the SDT has created a situation where, for large interconnection, it would be virtually impossible to use a past study. The addition of a 100 MW generator two states removed from the study area would not be considered material but by the guidelines in this requirement it can be interpreted as such. R2.5.2 Add that retools of past studies that address the local impacts of specific cumulative material changes that occur are sufficient to continue to support current planning assessment. R2.6 has a mixing singular and plural tenses. What if only one problem is found and therefore only one Corrective Action Plan is needed. Or can one Plan cover all the problems found? Responses to R2.8 and R2.9 would be considered Critical Energy Infrastructure Information (CEII) and that should be noted so it can be protected. R2.8 and 2.9 change to read that the Planning Coordinator will provide its criteria for load loss that is adhered to for all events.

In R3, why require a Planning Coordinator AND a Transmission Planner to perform this analysis? Isn't this a duplication of effort? R3.4 should come before R3.1. You should never reference down in a standard. Please present the items in the order in which they should be performed/considered. R3.5 should come before R3.2. You should never reference down in a standard. Please present the items in the order in which they should be performed/considered. R3.3.2 should be broken into two requirements since two separate tasks need to be performed. R3.3.3 should be broken into two requirements since two separate tasks need to be performed. Also in R3.3.3, analysis of relay loadability will require the inclusion of all relay models 200 kV and above. This information is not presently gathered by the ERAG MMWG for the Eastern Interconnection. To help with compliance, questions R3.3.4 needs more specificity. Maybe define a minimum percentage of total possible contingencies as a bright line whether you have performed enough more severe contingencies. Would expect a number between 10 and 25 percent. R3.4 should be broken into two requirements since two separate tasks need to be performed. To help with compliance questions, R3.3.5 needs more specificity. Maybe define a minimum percentage of total possible contingencies as a bright line whether you have performed enough more severe extreme contingencies. Would expect a number between 10 and 25 percent. R3.5 should be broken into three requirements since three separate tasks need to be performed.

In R4, why require a Planning Coordinator AND a Transmission Planner to perform this analysis? Isn't this a duplication of effort? R4.4 should come before R4.1. You should never reference down in a standard. Please present the items in the order in which they should be performed/considered. Also in R4.1, a space is needed between –Requirement— and -R4.4-. R4.5 should come before R4.2. You should never reference down in a standard. Please present the items in the order in which they should be performed/considered. In R4.2.3, I question whether the existing dynamics models can evaluate voltage ride through. If you are just talking about modeling voltage protection of generators then maybe, but this protection information is presently not collected by the ERAG MMWG for the Eastern Interconnection. R4.4 should be broken into two requirements since two separate tasks need to be performed. R4.5 should be broken into three requirements since three separate tasks need to be performed.

R7 needs to be broken into two parts. First establish the list of entities that need to get the assessment results. Second would be to coordinate the results as mentioned. Are the results mentioned in R7 different from the Planning Assessment?

No

Planning Events and Extreme Events should refer to the lists in the tables since there is no other way to understand which contingency falls into what definition. The designation is deterministic and somewhat arbitrary but commonly accepted.

No

Table 1, Lead in Note I. The industry has not yet reached a consensus on appropriate Transient Voltage Limits. It's not clear that reliability will be enhanced by requiring each entity to establish a Transient Voltage Limit. Table 1 footnote 1 - System stable means: a. Angular Stability: i. For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism. A

generator being disconnected from the System by fault clearing action or by a Special Protection System is not considered pulling out of synchronism. This is not consistent with Loss of load whereby load can be lost due to a first contingency within contractual arrangements made with the load. This definition should be modified to read -A generator being disconnected from the System by fault clearing action or by a Special Protection System or prior arrangement...- as long as no other cascading outages occur. In Table 1, Extreme Events, Item 3a, i, ii, iii, iv and vi seem like events that would occur over long periods of time not in contingency simulation time frames. They seem more like sensitivities. Table 1 Delete P5 is the preferred option. If not deleted need to clarify that so that related or additional -faults in the vicinity of- are considered. As currently worded it can require all simultaneous N-2 combinations within some number of substation radius for which overtrips could occur. You would have to do all combinations since they are unpredictable. If the SDT means for the relay failure to be located at or very near to the initiating event, then perhaps the combinations are more manageable but still extremely burdensome.

Yes

No

Removal of these standards will not affect NERC and the Regional Entity's obligations to perform assessments. Will the PC/TP be obligated under NERC Rules of Procedure to provide Assessments to NERC and the Regions upon request?

SERC Engineering Committee Dynamics Review Subcommittee (DRS)

There may be a potential conflict between MOD-010 and MOD-012 and legal documents such as Interconnection Agreements e.g. IA may specify a capacity level that exceeds the reported test levels. In the case of such conflicts, which one should rule? An order of precedence is needed as part of this requirement. Suggest adding terminal equipment to the list of planned facilities. The phrase, "for each year of the Near-Term and Long-Term Transmission Planning Horizon", should be revised to remove "each year" because there may not be studies in each year.

1. R2.1.4 –Loss of 2 transformers is itself a very severe contingency. However, when it is combined with R2.1.4 (spare equipment strategy) it can lead to a triple contingency which is unnecessarily severe and has an extremely low probability of occurrence. We recommend that the requirement be deleted from the standard. In the subrequirements of 2.1.3 and 2.4.3, the use of the word "timing" is unclear. Consider using "in service date" or "schedule for". With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: "unless justification can be provided to demonstrate that the results of an older study are still valid."

R3.3.3 applies to "all Transmission lines." Should this only apply to lines above 230 kV and lines identified as critical below 230 kV? At least this should be limited to BES lines. R3.3.4 says "Simulate the expected operation of existing and planned devices designed to provide Steady State control of electrical system quantities." This should say, "Simulate the expected operation of existing and planned BES devices designed to provide Steady State control of BES electrical system quantities."

None.

We recommend that the word "proxies" be changed to "criteria".

None.

None.

No

There is a need to add definitions to discriminate between planned and proposed projects. We propose the following definitions: Planned Facilities: Facilities that address the near-term deficiencies and have been approved with a financial commitment. Proposed Facilities: Facilities that address long-term deficiencies for which no commitment is required today since they may change based on future evaluation. We propose the following definitions for events: Planning Events: Events which are listed as Planning in Table 1 in Standard TPL-001-1. Extreme Events: Events which are listed as Extreme in Table 1 in Standard TPL-001-1. Bus-tie Breaker definition still seems somewhat generic and the use of 'configurations' causes uncertainty. We propose the following definition: Bus-tie Breaker: A circuit breaker whose intended purpose is to connect two individual substation buses. The definition of Supplemental Load Loss includes the phrase, "by end-user equipment", which could be understood to mean there are devices at the end-user location that remove this equipment (and conversely, load that is not disconnected "by" end-user equipment cannot be included). Also, the term "post-Contingency" can be confusing because in the case of faults, this phrase is not clear if it means conditions after the fault initiation itself or only after the clearing of the fault. We propose the following definition: Supplemental Load Loss: End-user Load that inherently disconnects from the System as a consequence of (or "in

response") to the conditions created by the System event. Load Reduction: A decrease in the amount of connected Load caused by lower voltage conditions following a Planning or Extreme Event.

No

P5 should not be a Planning Event. PRC Standards address protection system failures. The complexity associated with identifying and simulating such events is unknown and the defense of assumptions made and events simulated will lead to inconsistency in compliance and enforcement. Industry-accepted proxies for such events could be developed that would allow for efficient identification of areas needing further detailed study. Attempting to intermingle protection system operation with BES performance will be nearly impossible to implement given current technologies. Stability Extreme 2g needs a note like number 12 that excludes short distances. Stability Extreme 2h: Is this meant to be an event initiated by a 3LG fault or is it a catastrophic event that leaves all the elements at a station with a 3LG fault. If it is the former, then 2h needs a note to limit this to locations where actual events could lead to the loss of the entire station. There is no need to study this if there are no protection system events that lead to loss of the whole station (there would be no scenario to model). If 2h is meant to represent some catastrophe that causes all the elements at the site to experience a fault, then some clarification is needed to get consistent studies. Possibly rewrite 2h as, "Assume all the buses at a single voltage level (one voltage level plus transformers) experience an event that results in a 3LG fault and disables local protection (fault must clear from remote stations or other side of transformer)."

No

More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective. A 60 month effective date seems acceptable for planning activities, but may not adequate for all construction activities. Typical times to construct a transmission line in various areas of SERC can range between 7 to 10 years. Accordingly, we recommend the effective date for construction projects be changed to at least 84 months.

no comment

In R2.1, end of paragraph i believe you mean Requirement 2.5, not 2.6. In R2.6.2 we believe maintaining a 'project initiation date' serves no purpose and should be deleted. These dates are wildly variable given the nature of each project and the numerous issues that can affect these dates. 2.6.2 and 2.6.3 should be combined to simply require an in-service year/date and allow the owners to work as needed to meet these dates. We think R2.9 should be deleted as it is vague in nature, seems to serve no purpose and would be hard to verify the accuracy of the value in an audit. 2.8 is direct and can be easily detailed for an audit.

R3.4 and 3.5 give us a concern. Table 1 identifies a number of events that are to be assessed but requiring an explanation of why certain events would produce less severe results seems to be open ended thus making it hard to audit. If all the events in Table 1 are studied or have been studied in the past then what is one supposed to document? we understand this is to allow the planner a certain amount of flexibility in their analysis but it seems counter to the idea of requiring a review of all the events in Table 1. We don't have any suggested wording changes, just passing along a general idea.

Same general comment in 4.4 and 4.5 about the requirement to maintain documentation on why certain events would produce less severe results.

no comment

is there any other way to identify responsibilities between the parties than having an agreement? R6 seems to indicate an agreement of some sort must be in place. if that is the case then it could simply say an agreement must be in place.

no comment

Yes

No

For the most part Table 1 is acceptable but not entirely. The general 'feel' is that more studies are required. Requiring more studies is not going to provide additional reliability benefit but Brazos does not own many miles of transmission above 300 kV so the impact will be less for us than other larger TOs. We do not see the purpose of studying events where all forms of load loss is allowed. We understand upgrading the transmission system for these events is not required and is unneeded so why study certain events other than to insure that cascading outages don't occur? Without running a full set of studies it is a little hard to determine if Table 1 can be

readily assessed or the true value of the additional studies.

Under R1.1.2., Add "Transformers", otherwise, revise "Transmission Lines" to read "Transmission Facilities". Also under R1.1.2., add "Series Reactors and Capacitors" as a distinct category of facilities from "Reactive Power devices" that include shunt capacitors and reactors, and "Control devices" that include phase angle regulating and variable frequency transformers, FACTS devices, and other power electronics. These additions would further clarify the types of facilities that should be included, and these comments are made in full recognition that the introductory sentence to R1.1.2. contains the wording "such as".
AEP agrees with R2.3., but should note that the planning horizon short circuit models are not presently developed in any systematic fashion, since, unlike the development of steady-state (power flow) and stability models that are mandated under MOD-010 and MOD-012, respectively, there are no NERC Standards that mandate the development of short circuit models in a similar fashion. As to R2.4., requiring study of both peak and off-peak conditions in every stability assessment removes the possibility in this regard that stability study scopes may be defined most appropriately by engineering judgment. We believe system load level is often important, but not necessarily more important than any of the other sensitivity variables listed under R2.4.3. We suggest listing system load level along with these and removing R2.4.1. and R2.4.2. The text in R2.4.1., referring to dynamic load modeling, may still be retained somewhere, and since this falls in the category of modeling and data, we suggest including this under R1.1. With regard to R2.5., a 20 MW increase in generation may well be construed as a material generation change, but it is questionable whether a 20 MW decrease would be for transmission planning purposes. Also, the validity of many studies, particularly plant oriented stability studies, may well extend beyond five years if there have been no transmission modifications in the vicinity of the plant or to the plant itself. In these instances, it would seem counter-productive to disqualify a study after five years. The duration of the validity of certain types of past studies is better determined by the occurrence of significant transmission or generation changes. Please note, under R2.6.2., to define "project initiation date" [Changed sequence to keep in numerical order].
With regard to R3.3.3., please include transformers as relay loadability also applies to transformers.
The cross-referencing between R4.1 and R4.4, and between R4.2 and R4.5, seems to add unnecessary complexity and could be eliminated by merging each of these pairs of sub-requirements. Under the event column of Table 1 of the proposed TPL standard, considering entries P3 and P6, the option to apply either SLG or 3-phase fault types should be retained to be consistent with the existing TPL standards, which permit either SLG or 3-phase faults (see existing Table 1, Category B and Category C3). If the SDT decides not to make the requested change, then the SDT should give recognition to the unique characteristics of 765 kV lines where permanent 3-phase faults are virtually non-existent. AEP's 765 kV transmission facilities have been successfully planned and operated with only a SLG fault criterion. Therefore, Table 1 Planning Events P3 and P6 should permit application of SLG faults.

"Load Reduction" does not need to be retained as a defined term; in fact it only appears once in the draft standard at the top of Table 1. In addition, it is well understood that load is sensitive to voltage, so it seems unnecessary to call attention to it. Furthermore, the "Supplemental Load Loss" definition should also be removed. These definitions are not generally relevant to planning studies. Neither steady-state nor stability planning studies should acknowledge or rely on "Supplemental Load Loss" because it is simply unpredictable without detailed load device protection data. In fact, properly set minimum voltage limits should ensure that no appreciable load is tripped by customer equipment response as long as that equipment meets generally accepted equipment and design standards. For the same reason, steady-state planning studies should not rely on "Load Reduction" because the planning function is supposed to ensure that a designated forecasted load can be served under credible contingencies. However, it is okay that stability studies acknowledge and rely on load voltage sensitivity ("Load Reduction"), and in fact this is required due to the nature of the analysis and cannot be otherwise. Therefore, there is no need to call attention to it. Given the above comments, the remaining two load loss definitions should be further clarified, though not changed substantively, to read as noted below.

Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Facilities being removed from service by a planned Protection System operation to isolate fault conditions. It excludes Load that is disconnected from the network by load internal protection or end-user equipment responding to post-Contingency System conditions. Also, it excludes Load that remains connected to the System, but that may be reduced due to lower voltage conditions as a consequence of a Planning or Extreme Event. Non-Consequential Load Loss: Any Load loss intentionally caused due to automatic system protective functions such as UVLS, special protection systems, or as the result of operating procedures. Finally, the lettered bullets at the top of Table 1 need to be modified as appropriate to reflect the above comments that load loss due to internal load protection or end-user equipment, what was called "Supplemental Load Loss", should NOT be permitted in complying with either steady-state or stability performance criteria. Load that remains connected to the System, but that may be reduced due to lower voltage, should NOT be permitted in complying with steady-state performance criteria, but should be allowed, by necessity, in complying with stability performance criteria.

No

Consider adding a Planning Event defined to address common mode outages of two generating units. The language could parallel that of P7, substituting "common system" for "common structure". In the present draft, Planning Events P4 and P5 address single faults that may result in multiple contingencies. Most of these events can be expected to involve either multiple transmission facilities or a mix of generating units and transmission facilities. P7 covers common mode (structure) outages of transmission lines. There are no common mode generator contingencies specified. Define the term "common Right-of-Way" and/or modify the term to "common or adjacent Right(s)-of-Way". In the absence of a definition, if two lines are built on opposite sides of some geographic boundary (such as a two-lane road) they may legally be completely separate, potentially with no overlap in the agreements between the Transmission Owner and landowners. However, from the standpoint of BES exposure to weather related outages, the lines clearly will simultaneously be exposed to similar conditions. Lines that follow geographically parallel routes for more than a minimum distance and are within some minimum separation should be considered to be on a common Right-of-Way. Suggestion for the minimum parallel distance would be 1 mile (based on footnote 12).

Tampa Electric

R1 Ensure that statement reflects that TP and PC are only responsible for their planning area. R1.1.2 Add transformers to list and clarify modeling of circuit breakers and protection system equipment. Models should reflect the effect of this equipment, not the actual equipment. R1.1.4 Models should only reflect firm transmission service that is expected to be utilized in the study case. Consider changing effective dates of all requirements to be the same date so that you do not have to meet two standards during the same time period.

R2.1 should state R2.5 at the end of requirement instead of R2.6 R2.1.4 Consider revising to only include P0-P2 contingencies. R2.5.1 please clarify whether the 5 years is from the beginning of the assessment or end of the assessment. R2.6 Consider changing the terminology for "Corrective Action Plan" to "Transmission Plan" R2.8 Please clarify the reason for this requirement. This is not necessary for reliability and the effort to collect this information is substantial and does not benefit the BES. R2.9 Please clarify the reason for this requirement. This is not necessary for reliability and the effort to collect this information is substantial.

Consider revising standard for clarity. Subrequirements are not clear as written. Consider moving subrequirements R3.3.1 - R3.3.4 under other requirements for clarification. R3.5 Including an explanation of why remaining contingencies would produce less severe system results could be a limitless effort. Listing all "possible" extreme events seems unrealistic.

Clarification needed on modeling of protection system equipment.

Please define the term "proxies".

Comments: We question the value of R1.1.1, which requires the inclusion of transmission or generator outages "if..known", in a planning standard. If an "outage" puts you in a compliance deficiency for the duration of any outage, would you be "fined" for such an instance? Category P6 contingencies should cover these outages and not require a separate requirement such as R1.1.1. This requirement could also make an entity subject to fines for long term outages needed to upgrade or replace equipment as part of a CAP for other category violations. If this requirement is kept, it should be restricted to very long term outages and exclude those outages needed to complete CAPs for other violations. R1.1.6 requires the use of "Network Resources" to supply load. For many planning studies, particularly beyond the five year window, the capacity additions needed to supply load are frequently unknown. Since there are no requirements or guidelines for assuming what and where these resources will be, "assumptions" will have to be made regarding the needed resources. Additionally, existing "network resources" could be retired or re-designated to serve other load. It is unclear as written exactly what would be a violation of this requirement if known network resources are not sufficient to serve projected load. Finally, with the advent of market power, would a dispatch utilizing this type of dispatch be considered a violation of this standard.
Comments: In R2.1, there is a reference to "R2. 6". Based on the posted red-line version, we believe this reference should be changed to "R2.5". Should this same reference be included in R2.4"? In R2.3, it is stated that the short circuit analysis should be supported by either current or past studies. Should a reference be added to R2.5? In R2.6 it is stated: "Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3. " While we recognize that this conforms to FERC orders, it would still seem that this statement might be interpreted to mean that CAPs intended to cover a number of sensitivities go beyond standards and be used by interveners to block such CAPs. A revision to the standard to encourage CAP when needed for numerous sensitivities might be appropriate. R 2.6.4, as written, is very subjective. While we understand the need for R2.6.4, who is the ultimate judge of what "situations" are "beyond the control" of the TP or PC responsible for the mitigation plan and if they "are taking prudent actions to resolve the situation"? As written, it is the auditor. This will be difficult to prove compliance and might provide significant discrepancies in compliance with standards.
Comments: If the SDT feels that a requirement such as R3.3.4 is necessary, it may also be necessary to identify further limitations on the use of the control devices referred to. For example, a manually controlled phase shifter would require a time period, or loading limits, to readjust flows to limit a post-contingency flow if not pre-set in the pre-contingency state. Similarly, a tap-changing transformer also requires an adjust period for voltage control. We suggest adding a statement to this requirement (or somewhere in performance requirements) that "all post-contingency flows/voltages must remain within the applicable facility ratings before, during, and after the use of such control devices."
Comments: In R2.5.1, a limitation is identified for stability studies that are used to support the annual assessment be less than five calendar years old. Should this reference be included in R4"?
None
Comments: Should this requirement state that "The Transmission Planner in conjunction with their Planning Coordinator shall determine and identify individual and joint responsibilities for performing the required studies for the Planning Assessment."
None
Yes
None
Yes
None
Yes
Comments: We concur that footnote 10 should not apply to P0, P1 or P2 events.
Yes
Comments: We generally concur. However, it would appear that there is no incentive to submit a mitigation plan for less than 60 months for the new requirements that raise the bar (those listed as bullet points). If "circumstances are within your control" to mitigate in less than 60 months, why not require it?
Group
SERC Engineering Committee Reliability Review Subcommittee (RRS)
•In bullet three of R1.1.2, are bus-tie circuit breakers to be represented in the models? Typically

circuit breakers are included in the contingency definitions along with the protection system equipment used in the powerflow models. The number of zero impedance branches which can presently be modeled using PSS/E software is limited to 4000. Also, the number of buses included in the powerflow models would increase with additional breaker modeling. •In R1.1.2, don't we need to also represent the existing transmission system, and not just changes to the existing system? •In R1.1.2, does the phrase 'for each year' signify each year for which assessment work was performed, or each year of the Near-Term and Long-Term Transmission Planning Horizon? The phrase, "for each year of the Near-Term and Long-Term Transmission Planning Horizon", should be revised to remove "each year" because there may not be studies in each year. •In bullet five of R1.1.2, what protection system equipment is to be included in the stability models? •In bullet seven of Requirement R1.1.2, what "new technologies" are to be represented in the models? •Concerned about only having one year to implement all new modeling requirements - especially the additional relay requirements noted in R1.1.2. •The SDT stated during its June 30th Webinar that protection system equipment need not be explicitly represented in models, but had difficulty in determining adequate wording for the proposed sub-requirement. Because protection system action is described in R3.3.1, R3.3.4, R4.3.1, and R4.3.3 we suggest that protection system equipment be removed from the list in R1.1.2. •There may be a potential conflict between MOD-010 and MOD-012 and legal documents such as Interconnection Agreements e.g. IA may specify a capacity level that exceeds the reported test levels. In the case of such conflicts, which one should rule? There may be a need to add definitions to discern the difference between planned and proposed projects. Suggest replacing 'circuit breakers' in R1.1.2 with 'terminal equipment' since circuit breakers are covered by Protection System Equipment. •Does there need to be a reference in R1 to NERC Reliability Assessment Guidebook version 1.2 on pp 17-18 for everyone to use a 50/50 load forecast for inclusion in the planning models? •R1.1.4 Firm Transmission Service - a single source can have transmission service to multiple sinks, and can be associated with transmission service in excess of the capacity of the source. There is a lack of clarity regarding the means by which Firm Transmission Service, a marketing term, is to be included in planning models. For example, should the standard define how to model wind farms (100% - off-peak and 20% on-peak, based on firm capacity from the wind generators, or other dispatch levels)? Not sure if this is applicable to Requirement 1 or 2.

•The proposed standard not only raises the bar for system performance requirements, but also raises the bar for reporting and documentation. We need to employ almost as many librarians and technical writers as engineers to develop and keep track of the documentation. Engineers need to spend more time performing the studies and spend less time documenting studies keeping track of documentation for multiple years. •R2 – Instead of "document results" the requirement should be to "summarize results". While results will be documented, the Planning Assessment should just include a summary. •R2.1 – What's the value in being able to use "qualified past studies" if you have to use "annual current studies"? Strike the words "supplemented with" and insert the word "or". •In R2.1, change the reference to requirement R2.6 (at the end of the last line) to R2.5. •Do not understand the rationale for being so prescriptive in requiring specific years to be studied in R2.1.1. Why not allow the TP and/or PC to decide on the three years to be studied in the Near Term? •In the subrequirements of R2.1.3 and R2.4.3, the use of the word "timing" is unclear. Consider using "in service date" or "schedule for". •In R2.1.3, it is suggested that the studies be referred to as the "base studies" to avoid confusion with the sensitivity studies. Also suggest that another phrase be added at the end for clarity. The entire R2.1.3 would then be as follows: For each of the base studies described in Requirements R2.1.1 and R2.1.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment. Sensitivity studies would include changes to: oIn Requirement R2.1.4, it is suggested that language be added to reflect the possible unavailability of the equipment, such as: •When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment. •How would adequate lead times be determined? •In Requirement R2.1.4, recommend that the requirement be revised as follows: When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment. •Since R2.3 short circuit analysis is a new "raising the bar" requirement, should the implementation plan for this be for 5 years like the other new requirements? •R2.3 – Insert the phrase "one year of" after the word "addressing". •In Requirements R2.3 and R2.4, do we need a reference to Requirement R2.5 for the past studies? •Further clarification is needed in R2.4.1 concerning load models that appropriately represent the dynamic behavior of loads. •In Requirement R2.4.1, it is suggested that it be reworded to the following: System peak Load for one of the five years, including Load

models which appropriately represents the dynamic behavior of Loads, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable. •R2.4.1: It is not clear how much Load must have a dynamic model. Likely, it must still be proven that the analysis software can accommodate every load in the model having a load model that includes induction motor models. To help address this, revise "Load" to be "Load that could impact the study area is acceptable. Is a NERC drafting team addressing these issues to determine an industry standard? •Load models referenced in R2.4.1 should be confined to the consideration of transient stability study work. •In Requirement R2.4.3, it is suggested that this sub-requirement be reworded to the following: For each of the base studies described in Requirements R2.4.1 and R2.4.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the base studies shall be included in the Assessment. Sensitivity studies would include changes to: oRegarding Requirement R2.6, it is suggested that the word "modeled" be added as follows: For Planning Events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System modeled shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3. The Corrective Action Plan shall: •In bullet three of Requirement R2.6.1, would we allow automatic generation tripping for a single (P1) event if it is not consequential? It seems that tripping of generation should be restricted to P2 events 2 or 3 at a minimum. •In bullet five of Requirement R2.6.1, is there a maximum duration that operating procedures can be used before a capital project must be included (or completed) in the Corrective Action Plan? •With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Similar to the draft MOD-026-1 standard, this period should be 10 years. •With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: "unless justification can be provided to demonstrate that the results of an older study are still valid." •R2.5.2 – Suggest deleting the phrase "Material generation changes could include:" and the two accompanying bullets. A change of 20 MW on a large system may not always be material. •In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. In R2.6.1, installation or modification of Protection Systems or Special Protection Systems are now allowed as part of the Corrective Action Plan. Should undervoltage and underfrequency load shed also be allowed in the Corrective Action Plan? •In Requirement R2.6.2, what constitutes a "project initiation date," and how will it be used? Please clarify. •Please explain the reason why Requirement R2.8 is needed in the Assessment and how does reporting the largest Consequential Load Loss impact reliability? •Please explain the reason why Requirement R2.9 is needed in the Assessment and how does reporting the largest Non-Consequential Load Loss impact reliability? •If contingencies occur inside one utility that affect facilities in another utility, which utility is responsible for running these studies during the annual assessments? •R2.8 and R2.9 should be deleted. We don't see a reliability-related need for these requirements. •In R2.9, does the requirement require the maximum non-consequential load that can occur for contingencies in Table 1 or does it require just the maximum that a utility will allow on its system? Suggest clarifying "permissible" or perhaps using similar language as found in R2.8. •R2.9: One cannot determine the "maximum permissible Non-Consequential Load Loss" for every Planning Event. First of all, this should not be a requirement, as it is, for those events that do not even cause Non-Consequential Load Loss. Secondly, to obtain the "maximum permissible" value, one would have to stress the system in some way until one of the performance requirements are violated. That is an unreasonable stipulation and cumbersome to perform such an analysis.

•In R3, should the "and" in the first sentence actually be "or"? especially for same footprint? Perhaps the "and" should be replaced by "and/or". Can the PC satisfy this requirement by reviewing studies performed by differing TPs or is separate analysis really required especially when the TP and PC have the same footprint? •In Requirement R3.1, it is suggested that the word "contingency" be added to describe the lists created in R3.4. •R3.3.1. Recommend that it be clarified that simulation of the more conservative case of a single branch (bus-to-bus) outage is acceptable, as opposed to always simulating the full breaker-to-breaker outage. •R3.3.2 The requirement needs to be clarified. It is not clear if it is referring to the ability of plants to meet their voltage schedule, or to their ability to stay connected during post contingencies. •Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R3.4. •R3.3.2 "For all generators, studies shall consider the minimum steady state voltage limitations and identify how the generators are analyzed in the steady state simulation." The above wording needs to be

changed, as the intent of this sentence is unclear. Is the intent that Transmission Planners need to ensure that generating plants can meet their voltage schedule under Base Case (N-0) conditions? Is this the same as the generator underexcited operation limit? •In R3.3.2, need guidance on how to consider minimum steady state voltage limitations. Is there a NERC team addressing this? •R3.3.3 "For all Transmission lines, studies shall consider relay loadability and identify how loadability is analyzed in the steady state simulation." The above wording needs to be changed, as the intent of this sentence is unclear. Is the intent that Transmission Planners need to ensure that relay loading limits are included in the facility ratings? Is this the 130% of conductor rating limit? •Revise M3 to include a reference to R6, since the allocation of responsibilities will directly affect the evidence which is to be provided. •In the VSL for R3, a severe VSL is listed as failing to meet performance requirement for P0 or P1. We do not understand why a severe VSL would be applied to an all ties closed event which should have little if any problems. We believe that this should be a lower or moderate VSL instead of severe. •In R3.3.3 is the relay loadability required for all HV and EHV voltage levels? Previously NERC had required this for 230-kV and above only. This would be massive requirement for our Transmission Lines between 100 and 200-kV. •Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R3.4. •In Requirement R3.3.4, it is suggested adding the words "and switched" to capacitors and reactors: Simulate the expected operation of existing and planned devices designed to provide Steady State control of electrical system quantities. These devices include equipment such as phase-shifting transformers, load tap changing transformers, and switched capacitors and inductors.

•In R4, should the "and" in the first sentence actually be "or"? •Footnote #3 needs to be revised to include 2LG faults in addition to 3Phase faults indicating that the SLG criteria is met. •In Requirement R4.1, it is suggested that the word "contingency" be added to describe the lists created in R4.4 •Studies shall be performed to determine whether the BES meets the performance requirements in Table 1 based on the contingency lists created in Requirement R4.4. •Regarding Requirement R4.4, it is suggested that a rewording be considered such as the following: For each category of the Planning Events in Table 1, those Planning Event Contingencies that are expected to produce more severe System impacts shall be identified, and a list of those Contingencies to be evaluated for System performance in Requirement R4.1 shall be created. The rationale for the Contingencies selected for evaluation shall be available as supporting information with an explanation of why the remaining Contingencies would produce less severe System results. •R4.3.2 requires that voltage ride through capability be analyzed. It is not clear what should be analyzed (e.g. auxiliary loads, generator protection, generator capability, etc.) This requirement needs more clarity. •R4.3.2 – By in large, the industry does not have the input data or the methods to do this. It would seem necessary to have PRC-024 approved before this can be met. •In R4.3.2, need guidance on how to consider minimum steady state voltage limitations.

•There is no requirement that the Planning Coordinator (PC) must use the same proxies as the Transmission Planner (TP). Since differences in proxy assumptions may lead to different study results, R5 should be revised to require the PC and TP to coordinate the use of proxies. •M5 doesn't make any sense. Need to revise this Measure so that it fits the Requirement R5. Also need to revise the Data Retention discussion in Section 1.4 to align with R5. •In the VSL associated with R5, we believe that failure to define and document one of the proxies should be a moderate VSL, failure to define and document two proxies should be a high VSL, while failure to define and document three proxies should be a severe VSL. Otherwise failing to document only one proxy would result in a severe VSL.

•In absence of these agreements, it is assumed that both Transmission Planners and Planning Coordinators would be responsible for performing the studies. How do the Corrective Action Plans get resolved between these entities if there is no agreement on the study results? •Requirements R1, R2, R3, R4 and R5 should all be revised to include a reference to R6 regarding the determination of individual and joint responsibilities for performing the required studies. •In the VSL associated with R6, we believe that failure to determine and identify one responsibility should be a moderate VSL, failure to determine and identify two responsibilities should be a high VSL, while failure to determine and identify three responsibilities should be a severe VSL. Otherwise failing to document only one responsibility would result in a severe VSL.

•The reference to FERC Order 890 as it is currently written makes it seem like a suggestion to follow Order 890. If Order 890 explicitly describes this process then the sentence should read "as described in FERC Order 890." If not, this should not be mentioned at all. •Requirement R7 describes that the Planning Coordinator is to share Planning Assessments with adjacent Planning Coordinators. Does this need to be expanded for the Transmission Planners to share their Planning Assessments with the Planning Coordinators? •In the VSL associated with R7, we believe that the PC failing to coordinate analysis should be a moderate VSL, the PC failing to distribute should be a high VSL, and failing to do both of these tasks should be a severe VSL.

No

•Revised Definitions are generally better than those from the previous version, but additional clarity could be provided. •Load Reduction – Please clarify whether this includes both load

response and operator initiated action, such as in changes to transformer LTC. •Supplemental Load Loss - From a utility perspective, this would be considered as load response. Please clarify how Supplemental Load Loss would be included in the stability analysis. •Bus tie breaker – A statement in the previous version which listed examples was removed from this version of the definition. The statement was helpful and should be re-inserted. The statement was: “Substation configurations such as ring bus, breaker and a half, or double-bus double-breaker do not use bus tie breakers.” •Extreme Events definition references severity and probability. These terms should be included in the definition of Planning Events. Add a definition of Planned and Proposed facilities. Planned facilities address the near term deficiencies and have been approved with a financial commitment while proposed facilities address long term deficiencies for which no commitment is required today since they may change based on future evaluation. •Revised Definitions are generally better than those from the previous version, but additional clarity could be provided. •Consequential Load Loss - Is an SPS to trip load qualify as a planned protection system? •Load Reduction - Is this automatic as in a load response or is it operator initiated as in changes to transformer LTC? •Supplemental Load Loss - From a utility perspective, this would be considered as load response. How would Supplemental Load Loss be included in the stability analysis? Table 1 suggests that it cannot be included to meet steady-state performance. Suggest that the following be added to the definition: Supplemental Load Loss associated with an event shall not be used to meet steady state performance requirements. •Where would interruptible load be included in these definitions? •Bus-tie Breaker definitions still seems somewhat generic and the use of 'configurations' causes uncertainty. Revise Bus-tie Breaker to read, "A circuit breaker whose intended purpose is to connect two individual substation buses." "Bus-tie" is not capitalized in the Table. •Consequential Load Loss must include load that is lost due to the inherent response of the particular type of load. Some motors, lighting and processes will naturally trip during an event, although not as a result of the protection system. It may have been the intent of the SDT to include this phenomenon in the Supplemental Load Loss definition. However, this definition includes the phrase, "by end-user equipment", and that makes one think that there are devices at the end-user location that is removing this equipment (and conversely, load that is not disconnected "by" end-user equipment cannot be included). Also, the term "post-Contingency" can be confusing because in the case of faults, this phrase is not clear if it means conditions after the fault initiation itself or only after the clearing of the fault. Revise Supplemental Load Loss to read, "End-user Load that inherently disconnects from the System as a consequence of (or "in response") to the conditions created by the System event." •SERC RRS suggests adding back the following to the Bus-tie breaker definition that was contained in Posting #2: “Substations configurations such as ring bus, breaker and a half, or double bus double breaker protection schemes do not use bus tie breakers”. SERC Members believe that this additional wording helps explain this definition much more clearly. •In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. Are these now no longer considered to be Non-Consequential Load Loss but instead now considered to be Load Reduction, Supplemental Load Loss, or something else? •Should Supplemental Load Loss be further defined as load that is disconnected from the network by end-user equipment responding during duration of the fault as well as to post contingency system conditions? Also the definition of Supplemental Load Loss may benefit from some examples in the definition to further help clarify. •The second sentence in the Year One definition is rather confusing. We would suggest changing “calendar year” to “date”. Otherwise it may be interpreted that Year One would begin 12 to 18 months from the end of the current calendar year. Suggest from “beginning”.

No

•The word "Requirements" needs to be added to the Table 1 titles in the existing tables. oTable 1 – Steady State & Stability Performance Requirements oPlanning Events Table 1 — Steady State & Stability Performance Requirements oExtreme Events Table 1 — Steady State & Stability Performance Requirements •Footnotes (Planning Events and Extreme Events) •We recommend that Table 1 be split back as was done in the previous draft to handle the 1) steady-state and 2) stability performance requirements. This is needed to provide clarity on which contingencies apply to steady-state and which apply to stability analysis. •Table I, P7.1: It would not be likely to lose the two outside circuits on a vertically configured structure and not lose the middle circuit. Change the wording to: “Any two adjacent circuits on a common structure.” •The word "Requirements" needs to be added to the Table 1 titles in the existing tables. oTable 1 – Steady State & Stability Performance Requirements oPlanning Events Table 1 — Steady State & Stability Performance Requirements oExtreme Events Table 1 — Steady State & Stability Performance Requirements •Since it appears that the Table 1 cannot fit on a single page, it is suggested that multiple tables be developed to handle the 1) steady-state and 2) stability performance requirements. Footnotes may be included on a second page if needed. •Comments were provided in early versions regarding the issues associated with raising the bar, and it was suggested that the marginal reliability benefits associated with these changes were not worth the marginal costs. We have not seen any significant changes from the earlier performance requirements. The question still remains, are we directing the resources where they need to be allocated to address and improve system reliability? So far the answer is believed to be "No". •The existing TPL 002-0 allows for some local load to be dropped for a single contingency event

as long as the Bulk system reliability was not impacted. However there is no such allowance any longer for losing such load for a single contingency in the proposed draft. It would be very expensive for SERC Members to fix all such events in several remote areas that would have very little impact on the overall reliability of the SERC Members' bulk system. SERC Members believe that the capital spent for these fixes could be used to better strengthen the overall bulk system in much better ways. •P5 should not be a planning event. PRC standards address protection system failures. The complexity associated with identifying and simulating such events is unknown and the defense of assumptions made and events simulated will lead to inconsistency in compliance and enforcement. Industry accepted proxies for such events could be developed that would allow for efficient identification of areas needing further study. Attempting to intermingle protection system operation with BES performance will be nearly impossible to implement given current technologies.

No

•Suggest rewording of footnote 5 to: Curtailment of conditional Firm Transmission Service is allowed when the conditions and/or events being studied formed the basis for the conditional Firm Transmission Service. •Footnote 10 is definitely an improvement from previous versions. It is suggested that the word "also" be added to the last line: •Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch, is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources must be considered. Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must also be considered. •Stability Extreme 2g needs a note like number 12 that excludes short distances. •Stability Extreme 2h: Is this meant to be an event initiated by a 3LG fault or is it a catastrophic event that leaves all the elements at a station with a 3LG fault. If it is the former, then 2h needs a note to limit this to locations where actual events could lead to the loss of the entire station. There is no need to study this if there are no protection system events that lead to loss of the whole station (there would be no scenario to model). If 2h is meant to represent some catastrophe that causes all the elements at the site to experience a fault, then some clarification is needed to get consistent studies. Possibly rewrite 2h as, "Assume all the buses at a single voltage level (one voltage level plus transformers) experience an event that results in a 3LG fault and disables local protection (fault must clear from remote stations or other side of transformer)."

No

•60 months after effective date seems generally acceptable for planning activities, but may not adequate for all construction activities. Typical times to construct a transmission line in various areas of SERC can range between 7 to 10 years. Accordingly, we recommend the effective date for construction projects be changed to at least 84 months. •More time is needed for entities to determine the appropriate dynamic load model required by R2.4.1. We recommend at least 36 months before this requirement becomes effective. •Since breaker duty is a new "raising the bar" issue - should there also be a 5 or more year implementation plan for this as well? •Also trying to construct enough facilities within the 5 year implementation period will result in multiple outages at same time - possibly affecting SERC member's bulk reliability during this construction period. Also SERC members are concerned that EHV equipment manufacturers will not be able to meet all the equipment orders that will be required to meet the "raising the bar" requirements. •SERC members are also concerned that the costs to meet the new requirements contained in this TPL will amount to many billions of dollars with very little impact overall on the reliability of the Bulk transmission system. •When will the Implementation Plan be removed from the standard after it is officially approved? Will a revised TPL standard need to be prepared to omit this implementation language? •If contingencies in one utility's system results in issues within another utility, who is responsible for studying the contingencies and who would be responsible for documenting the CAP?

Individual

Mary Ann Groszek

Northern Indiana Public Service Company

Under R1.1, insert, "as applicable" after "represent". Since R1 covers steady state, short circuit and dynamic models, data requirements should be applicable to the specific model. Representation of circuits breakers, protection system equipment and control devices is not typical of steady state model inputs.

R2.3: Clarify the requirement. Does the short circuit study examine topology for a single year, the topology in years studied using the steady state models or each year of the near term planning horizon?

R3.3.3: Evaluation of loadability should be triggered only for those circuits with new protection settings issued since the last assessment; evaluation of circuits that have not been newly assigned or re-assign protection settings is a misuse of resources.

No
The definitions need clarification, especially if they will be extracted from the standard when approved and included in the NERC Glossary. The SDT should include a Technical Writer to clarify the proposed language.
No
In A5, text appearing under "Effective Date" is not clear regarding application of the phrase, "(above 300 kV)", for the first and fourth dot points.
Individual
Wang, Yu (David)
San Diego Gas and Electric Co
The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words "including requirements of regulatory authorities and other legal obligations" at the end of R1. Entities already are required to do this. It does not need to be included in the standard.
Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as "material change" for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.
As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.
As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3,

with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clarification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

Group

Florida Reliability Coordinating Council, Inc - Transmission Working Group

R1 and M1: Consider clarifying that it is not the TP or PC responsibility to independently verify the consistency of the System models for portions of the Bulk Electric System outside of the TP or PC planning area (related to not using data consistent with data submitted as part of MOD-010 and MOD-012, each TP and PC should not have to review the data submitted by those outside of its planning area, but only its own planning area). Please Clarify the phrase "Models shall use data consistent withMOD-010" – is the intent for the data to be "identical" to the data provided under MOD-10 and MOD-12, or "consistent" meaning that the data might be older or newer depending on when the assessment took place vs when the data was submitted. R1.1 Consider changing Assessment (which does not include models) or re-wording to "Models for performing the studies needed to complete the Planning Assessment shall represent:" R1.1.1 Brings clarity to the question regarding planned outages. R1.1.2: Consider adding "Transformers" to the list of facilities. R1.1.2, please clarify what the drafting team intentions are for Circuit Breakers. Planning models used for power flow, dynamics and short circuit do not include circuit breakers. Modeling circuit breakers would cause convergence problems in the models due to that large number of zero impedance line sections. We suggest eliminating circuit breaker from the bullet list. R1.1.2 "Protection System equipment" this should be clarified to only apply to system stability models. The modeling of protective relays should be caveated with "as deemed appropriate". We suggest eliminating "Protection System equipment" from the bullet list. R1.1.4 Consider adding "that is expected to be utilized in the study case scenario" not all Firm Transmission can be included in all studies and are only used upon the availability of other resources . Consider changing the effective dates of R1 and R7 to take effect at the same time as R2 through R6 so you do not have to meet two standards during the same time period. Otherwise, clarify how the effective date impacts which version of the standard is to be used in an assessment before a scheduled compliance audit.

Incorrect reference shown at the end of R2.1. The appropriate reference should be R2.5. The end of the first sentence of R2.3 should have a reference to R2.5. The end of the first sentence of R2.4 should have a reference to R2.5. R2.1.4 - Please consider revising this for the analysis to include only Contingencies P0-P2 in Table 1. Alternatively we suggest moving this requirement to

be under sections 2.1.3 and 2.4.3 and treated as a sensitivity. R2.5 – This requirement is very valuable in clarifying that past studies can be used and what criteria needs to be met for them to be used. However it is not clear if all new studies could be met using past studies (e.g. a small system with very few changes year to year) or if some sub-requirements require a new study every year, with past studies only used as supporting information. If the intent is that some sub-requirements can not be met with past studies, then consider making that clear through a foot note or a list under Section 2.5 listing which study requirements may depend only past studies that are still current. R2.5.1 – Please clarify if the 5 calendar years is from the date the assessment is “finished” or the date the study process for the assessment begins. R2.5.2 – the identified 20 MW threshold is extremely small and would be doubtful to change the response of the BES. This requirement could also be interpreted that a previous study where the base case is not identical to the current planning case could be used. Please consider the following proposed language: “For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period that would impact the study area.” (not show the list) R2.6 - Requiring sensitivities but not requiring that they meet specific performance requirements is a sound approach. R2.6 requires a corrective action plan when performance will not be met in the simulations. However, if an entity has already planned a needed facility and/or operation steps for a given conditions, the simulations will not show any deficiencies and therefore no corrective action plan is required. The term “Corrective Action Plan” implies that the situation is “wrong or incorrect”, consider changing the approach to be to require an entity to have a “planning and Operations plan”, “Improvement Action Plan”, or simply a “Transmission Plan” that includes all facilities planned for the BES and descriptions of conditions where an operational process is being used. R2.6.1 – (Bullet 2) This requirement should also account for the removal of a Special Protection Systems: “Installation, modification or removal of Protection Systems or Special Protection Systems”. R2.6.4 – This is an excellent addition R2.8 – Please explain the reason for this requirement. The effort required to collect this data is substantial and does not have any benefit to the BES. R2.9 – Please explain the reason for this requirement. It seems to cause Entities to develop performance criteria for themselves for Multiple and Extreme Contingencies that are not in Table 1. The effort required to collect this data to compare against any self-imposed criteria is substantial and does not have any benefit to the BES. The requirement will result in inconsistency across North America. There is also no discussion of what happens if a Multiple or Extreme contingency is shown to exceed the Entity’s self-imposed criteria, is the Entity then non-compliant? If so, what if the Entity simply changes the self-imposed criteria? We suggest eliminating this requirement.

R3.3.1 & 3.3.4 – Consider adding language that the entity should not be held responsible for simulating “the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention” on neighboring systems, only on the entity’s own system. Also, consider moving R3.3.1 and R3.3.4 under R3.1 as sub-requirements and require that the overall studies take into account the effect of protection systems and control devices in the performance of the BES and it’s ability to meet the table 1 requirements. R3.3.1 – This seems unnecessary for normal 2-terminal lines, consider adding language to the effect of: “Simulation of individual element outages is allowed if it produces an effect more severe than the entire circuit outage”. R3.4 – Consider changing the header for table 1 – “Steady State & Stability Performance Extreme Events” to Table 2 – “Steady State & Stability Performance Events”. As is, it could be interpreted that the expected performance requirements associated with Planning Events apply to Extreme Events also.

R4.3.1 – Please clarify, is the intent of this requirement to have every relay modeled? We suggest clarifying that the intent is that Protection System Equipment would be incorporated into the contingency list, and that modeling the Protection System equipment settings and logic would only be done for Protection Systems that could significantly impact stability response (e.g., out-of-step relaying) as deemed appropriate through engineering judgment, and that the intent would be to do this only for the Region under study and not the entire Interconnection (e.g., studies in Florida should not need to include relays in Canada). R4.4 & R4.5 – Does the intent of allowing this “More severe events” to establish actual study parameter extend between the planned events and extreme events (e.g. if a range of extreme events establishes that planning events performance requirements are met, would a redundant analysis of the planning events still be required)

None - no concerns identified by the TWG

Please clarify that the phrase “individual and joint responsibilities” applies to entities (e.g., the TPs and PCs) and not specific individuals. R6 – Please clarify if this requirement is intended for cases where a TP is not a PC and therefore is working “under” a PC? Or if this is intended to apply across neighboring PC’s?

The requirement as written requires that the results of the assessment are shared on a post assessment basis between entities in a manner similar to the Attachment K process. Please clarify whether: -Is this intended to be the end results? Or does this require the inviting of entities in at the very beginning and facilitating their participation throughout the process? -Is it intended that the process described in order 890 become essentially a NERC Standard that every

sentence must be met in the most literal of sense? Or is this referencing the order as a general guideline on what should be expected but not as a literal checkmark of the process? Consider adding a footnote or other clarifications that failure of others to participate in the process is not a non compliance by the entity inviting them to the process. Otherwise non-responsiveness of a neighboring PC who may not have reliability need to participate and whose participation is beyond the control of the PC that initiated the process could trigger non-compliance.

Yes

Excellent changes

The table is significantly improved from the prior versions and provides superior clarification over the existing standards. However, please explain why there is a performance difference between P2.3 (breaker failure), P4 (stuck breaker) and P7 (2 circuits on a common tower) for EHV. We recommend consistant criteria between P2.3, P4 and P7 that allow curtailment of firm service and loss of non-consequential load.

Yes

Excellent addition Footnote 10 is long and subjective. There is no purpose in adding the phrase "when coupled with the appropriate re-dispatch of resources obligated to re-dispatch" because if there is an obligation to re-dispatch, it is done, and if there is no obligation to do so, then curtailment is the only alternative – no coupling necessary. Suggested revision: 10. Curtailment of firm transmission service is allowed both as a System adjustment (as identified in the column titled 'Initial System Conditions') and as a corrective action, providing those adjustments do not result in the shedding of any firm Load.

Overall the plan is an improvement! Allowing for a 60 month phase in of the more restrictive performance requirements is useful, however consider applying the 60 month phase in (or some timeframe) to P1 events for extenuating circumstances, e.g. unable to obtain ROW, etc. Having R1 and R7 going into effect first do raise the concern of what TPL standards are in effect during the time frame. The implementation should also be more specific on what "going into effect" means. Assessments are not a one day event but are a year long effort that culminates in a final "report" that is the assessment. Most NERC standards effect ongoing activities, and the day they go into effect the utilities functions are expected to be compliant. In this case that rationale would require that in the prior year two assessments where performed, one compliant with the current standard and one compliant with then new standard, however we don't believe that was the intent. Perhaps a statement below the paragraph regarding the 60 month implementation plan for Corrective Action Plans to the effect of: "Once effective all future assessments shall upon completion be compliant with this standard. Assessments completed prior to the effective date shall be based on the TPL standards in effect at the time. The standard is not intended to require a retroactively compliant assessment be in effect when the standard becomes active, but instead that the next assessment be compliant with the revised standard"

Individual

Peter S. Schommer

Minnesota Power

A) Under R1 there is language that references "other data sources"; can the SDT please offer some clarification on what "other data sources" are to be? Could other data sources be Tariff requirements? B) Again under R1, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R1 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". C) Under R1.1.1 it is required that models represent planned outages of generation and transmission facilities, if specifically known. However, the requirement does not distinguish the length of the outage to be considered. Should a one week maintenance outage in Year Five be included? Should a two-year complete rebuild outage lasting through the entire years 2 and 3 be included? The SDT team needs to add a comment about the length of the planned outage and its relevance to the assessment. D) R1.1 is repeating what should already be in the MOD-010 and MOD-012 requirements. Is the inclusion of these elements in the TPL standard redundant? The planners expect the model building process will already included the components listed in R1.1, otherwise there would not be a functional model. If R1.1 is kept, we suggest removing the "Models for" so that R1.1 reads "The Planning Assessment shall represent:"

A) Under R2, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R2 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". B) Under R2.1 there is a reference to qualified past studies in R2.6. We believe that this reference should be pointing to R2.5 not R2.6. C) R2.1.4 addresses the spare equipment strategy. What is the scope of this sensitivity? Is the intent only to do a steady state analysis on equipment with long lead time spares? D) Under R2.2 a System peak load study is required annually for one of the years in the assessment period. R2.2.1 requires the assessing entity to extend their planning assessment to accommodate any known longer lead time projects that may take longer than ten

years to complete. It does not make sense to study the ten year horizon, then find a problem in year ten which has a solution that requires twelve years to build. For compliance with this standard, you would need to find another solution that can be built within ten years as opposed to the suggested language in R2.2.1 of extending the planning assessment beyond ten years to accommodate the solution that falls outside of the Long-Term Planning Horizon. No project solution greater than 10 years should be acceptable because it falls outside the Long-Term Transmission Planning Horizon. Suggestion to strike sub-requirement R2.2.1 from this standard. E) Requirements R2.1, R2.3, and R2.4 are written inconsistently. 2.1 says "The Near-Term Transmission Planning portion of the Steady State analysis..." 2.3 says "The short circuit portion of the Planning Assessment ... addressing the Near-Term Planning Horizon..." 2.4 says "The Near-Term Transmission Planning portion of the Stability Analysis..." These three sentences confuse the order. As we understand, the Planning assessment has two parts: a Near-Term portion and a Long-Term portion. Each of those parts has three components: a Steady State component, a Short Circuit component, and a Stability component. We suggest the language in the standard should be structured consistently and appropriately as such. F) Under R2.4.3 there is ambiguity in the third bullet language "...new or modified Facilities..." and we believe that this language should mimic that of R1.1.2 in order to improve this requirement. The third bullet should read: Timing of the installation of new Facilities or changes to existing Facilities. G) The sub requirement R2.5.2 states that for steady state, short circuit, or stability analysis; the "present System model" shall not include any material changes, such as....etc. The present language in this section is vague and requires discretion on the part of both the Transmission Planner and the Planning Coordinator performing the assessment. For example, new transmission enhancements may have been added since the previous System model was developed. In general, such topology enhancements will only improve reliability and would not necessitate re-assessment with a newly updated System model. In addition, any significant generator additions would have been evaluated with a full separate generator interconnection study at which the full reliability of the System would have been taken into consideration. For this reason, we believe the following language for R2.5.2 would improve this requirement: "For steady state, short circuit, or Stability analysis: the current System model of the assessed plan year shall not include any changes material to the assessment, as judged by the entity performing the assessment, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study year. Material generation changes could include:" H) Modify R2.6.2 to remove the obligation to include the project initiation date. The inclusion of this date would add unnecessary work that is not needed to assure adequate BES reliability In addition, it is not clear whether "initiation" refers to the commencement of engineering, design, construction, etc.

A) Under R3, the Time Horizon of the TPL standards is intended for years one through 10; however, the Time Horizon shown in R3 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning". B) R3.3.3 Is this sub-requirement redundant with PRC-023-2? Is it covered in FAC-009? We believe the SDT should review these standards and if it is a redundant requirement, then this sub-requirement needs to be removed. C) Under R3.4 to make this requirement clearer, please add the following language between the words "expected to" in the first sentence: "...expected by the assessing entity to..." We believe that this language addition improves the clarity of this requirement. The first sentence would then read: "Those Planning Event Contingencies in Table 1 that are expected by the assessing entity to produce more severe System impacts shall be identified and a list of those Contingencies to be evaluated for System performance in Requirement R3.1 created." D) Under R3.5 to make this requirement clearer, please add the following language between the words "expected to" in the first sentence so that the phrase reads: "...expected by the assessing entity to..." We believe that this language addition improves the clarity of this requirement. The first sentence would then read: "Those Extreme Events in Table 1 that are expected by the assessing entity to produce more severe System impacts shall be identified and a list of those events to be evaluated for System performance in Requirement R3.2 created."

Under R4, the Time Horizon of the TPL standards is intended for years one through 10; however, the Time Horizon shown in R4 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

Under R5, the Time Horizon of the TPL standards is intended for years one through 10; however, the Time Horizon shown in R5 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

Under R6, the Time Horizon of the TPL standards is intended for years one through 10; however, the Time Horizon shown in R6 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

Under R7, the Time Horizon of the TPL standards is intended for years one through 10; however,

the Time Horizon shown in R7 only says "Long-term Planning". By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: "Near-Term and Long-Term Transmission Planning".

Yes

Yes

The stability studies require significantly more computer time and a more detailed model. The standard should allow the PC/TP to use judgment to manage size and complexity of the study.

Yes

Yes

Group

FMPA, and it's All-Requirements Project Participants, as follows: Lakeland Electric; Fort Pierce Utilities Authority; Keys Energy Services; City of Vero Beach; Beaches Energy Services; Kissimmee Utility Authority; and Lake Worth Utilities

R1, consider clarifying that it is not the TP or PC responsibility to independently verify the consistency of the System models for portions of the Bulk Electric System outside of the TP or PC planning area (related to not using data consistent with data submitted as part of MOD-010 and MOD-012, each TP and PC should not have to review the data submitted by those outside of its planning area, but only its own planning area). R1.1.2: Consider adding "Transformers" to the list of facilities. R1.1.2, please clarify what the SDTs intentions are for Circuit Breakers. Planning models used for power flow, dynamics and short circuit do not include circuit breakers. Modeling circuit breakers would cause convergence problems in the models due to that large number of zero impedance line sections. We suggest clarifying that the intent is to develop "planned" Facility Ratings in the models to reflect new Circuit Breakers, and to reflect the location and timing of circuit breakers in contingency lists, and not to model the actual circuit breakers. R1.1.2 "Protection System equipment" should be clarified to only apply to system stability models. The modeling of protective relays should be caveated with "as deemed appropriate". We suggest clarifying that the intent is, for power flow and short circuit studies, Protection System Equipment would be incorporated into Facility Ratings and the contingency list. And we suggest further clarifying that the intent is the same for Stability Studies, with the addition of modeling Protection System equipment that could significantly impact stability response (e.g., out-of-step relaying) as deemed appropriate through engineering judgment. R1.1.4 Consider adding "that is expected to be utilized in the study case scenario" not all Firm Transmission can be included in all studies and are only used upon the availability of other resources (for instance, if there are two firm point-to-point contracts in opposite directions across the same Interchange, both probably ought not to be modeled at the same time). Consider changing the effective dates of R1 and R7 to take effect at the same time as R2 through R6 so you do not have to meet two standards during the same time period. Otherwise, clarify how the effective date impacts which version of the standard is to be used in an assessment before a scheduled compliance audit.

Incorrect reference shown at the end of R2.1. The appropriate reference should be R2.5. The end of the first sentence of R2.3 should have a reference to R2.5. The end of the first sentence of R2.4 should have a reference to R2.5. R2.1.4, what does "(t)he analysis shall reflect the Contingencies identified in Table 1" mean? Is the intention similar to sensitivities, where there is no direct requirement to meet the performance standards of Table 1? If so, why not include loss of a long lead time Facility followed by other contingencies one of the Sensitivities and not have a separate sub-requirement for it? Or, is the intention that the TP and PC must meet the performance requirements of Table 1 considering the outage of a long lead time Facility? We hope that the intent is not to require Entities to be able to meet the performance requirements of Table 1 assuming a long lead time Facility out of service. If that is the intent, then we believe that only Contingencies P0- P2 in Table 1 ought to apply to Requirement R2.1.4. Otherwise, Requirement R2.1.4 would require building transmission to triple contingency (N-3) criteria. Contingency P3 requires building transmission to a single contingency plus a generator outage (a double contingency that has the same performance criteria requirements as single contingencies). Since generators are long term lead Facilities that no one that we know of carries spares for, R2.1.4 as written would mean that Contingency P3 becomes two generators out of service with system adjustments followed by another contingency (N-3). This would have the (possibly unintended) consequences of significantly reducing long-term firm ATC since utilities will likely use TRM to account for the potential for long-term outages. If meeting the criteria of Table 1 is the intent of the SDT, then a potential way to address this is to restate R2.1.4 to state that only P0 through P2 (zero and single contingency) apply to R2.1.4. If meeting the performance criteria of Table 1 is the intent of the SDT for R2.1.4, then we also believe that R2.1.4 should also only apply to the EHV and not the HV system. Yes, when a major piece of equipment such as a transformer fails, it could be out for a long period of time; however, a transformer failure is far less probable than an over-head transmission line failure (e.g., a

transformer failure is in the range of a once in 50 year event, whereas a transmission line fails probably once a year or once every other year, almost two orders of magnitude difference). A major 500 kV/230 kV autotransformer failure will have a far larger radius of impact than a 230 kV/138 kV autotransformer meant to serve the local area, giving additional support to purchasing a spare transformer for the 500/230 kV auto (EHV system). A small utility with only one or two 230 / 138 kV autos does not have sufficient justification to purchase a spare autotransformer due to the very low failure rate and the much more localized purpose of the transformer. If the intent of the SDT is to meet the performance requirements of Table 1 for R2.1.4, then the standard would essentially cause many small utilities who cannot justify spare autos to plan to serve only load and significantly reduce ATC in the planning horizon. Based on the lesser impact of HV connected autos as compared to EHV connected autos, and if the intent of the SDT is to meet the performance requirements of Table 1 for R2.1.4, then we would recommend that, for auto-transformers, R2.1.4 should only be applicable to EHV connected auto-transformers. R2.8 – Please explain the reason for this requirement. The effort required to collect this data is substantial and does not have any benefit to the BES. R2.9 – Please explain the reason for this requirement. It seems to cause Entities to develop performance criteria for themselves for Multiple and Extreme Contingencies that are not in Table 1. The effort required to collect this data to compare against any self-imposed criteria is substantial and does not have any benefit to the BES. The requirement will result in inconsistency across North America. There is also no discussion of what happens if a Multiple or Extreme contingency is shown to exceed the Entity's self-imposed criteria, is the Entity then non-compliant? If so, what if the Entity simply changes the self-imposed criteria?

R3.1, The criteria in Table 1 do not allow load shedding following a single contingency (e.g., the old footnote "b" was removed). While we agree this ought to be the case for the EHV system, we believe that there are cases where for the HV system, which often acts more like a distribution system, the costs to meet this standard would be prohibitive and unfair to the consumers served by those utilities. For instance, the Florida Keys served by the Florida Keys Electric Coop (FKEC) and Keys Energy Services (KEYS) is connected to the mainland by two 138 kV lines down to Tavernier Key (about 1/3rd the distance from the mainland to Key West). Currently, the system is planned and operated under single contingency to allow non consequential load shedding automatically via Under-Voltage Load Shedding, and to meet thermal limits by manual load shedding, all load shed is in the Florida Keys following the single contingency with no impact to the Bulk Electric System. The standard, as written, would force one of two things: 1) the construction of a third line in this environmentally pristine area at a very high cost that might increase rates to customers in the Florida Keys by 20% for a level of reliability that much of the Keys would not even experience since 2/3rds of the Keys is fed by a radial line with consequential load loss; or 2) separate the two lines such that both are operated radially with resultant consequential load loss, compliant with the standards, but actually causing consumers to have a lower level of reliability. We propose to reinstate footnote "b" for the HV system, allowing non-consequential load loss for lower voltage system that have little to no impact on the Bulk Electric System and limit the elimination of non-consequential load loss to be applicable to only the EHV. Alternatively, but less appealing and more of an administrative challenge would be to establish a Regional Entity administered process for application for exception to this criteria. FERC's Order 693 at paragraph 1794 states that: "(t)he Commission also clarifies that an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances". We interpret this as meaning the Regional Entity can allow exceptions under certain criteria such as a significant increase in costs to consumers with little discernable benefit as is the case with the Florida Keys. For R3.2, we are at a loss of how a hurricane event can be modeled, and why such an evaluation is needed. Albeit, many contingencies can occur during a hurricane event, it is not likely that multiple contingencies will happen within the same < 1 minute window it takes to go from transient stability conditions to steady state conditions, and then it is unlikely that multiple significant contingency events will occur within the 30 minutes it takes operators to adjust the system to prepare for the next contingency. Therefore, we do not understand the significance of modeling a hurricane event. In addition, a hurricane can have an infinite number of different scenarios and time-lines of contingencies and picking one or two would be a meaningless exercise since an actual hurricane will be completely different than what is modeled. At least an earthquake has a fault line that makes it relatively easier to identify which facilities might be affected, but a hurricane has an infinite number of possibilities. We suggest eliminating hurricanes from extreme events and model potential results of a hurricane, such as loss of a ROW, loss of a substation or plant, and loss of a major load center. R3.3, the list ought to consider contingencies on neighboring systems that could impact the TP's / PC's system (this comment would not carry over to R4.3 since stability is more a protection system / clearing time issue). R3.3.1, the entity should not be held responsible for simulating "the removal of all elements that the Protection System and other automatic controls are expected to disconnect for each Contingency without operator intervention" on neighboring systems, only on the Entity's own system. R3.4 and the first part of R3.5 ought to be combined, e.g., both require justification for why a limited set of worst case contingencies are studied for N-1, N-2 and extreme contingencies. The latter part of R3.5 concerning cascading outages for an extreme contingency should become the only requirement of R3.5 (there are currently two requirements

embedded within R3.5).

R4.2, see comment on R3.3 concerning how to model a hurricane event or other weather event. R4.3, contingency analysis ought to specifically exclude studying contingencies on neighboring systems since stability is more related to protection system and clearing times. R4.3.1, please clarify, is the intent of this requirement to have every distance relay in each Interconnect modeled? We suggest clarifying that the intent is that Protection System Equipment would be incorporated into Facility Ratings and the contingency list, and that modeling the Protection System equipment settings and logic would only be done for Protection Systems that could significantly impact stability response (e.g., out-of-step relaying) as deemed appropriate through engineering judgment, and that the intent would be to do this only for the Region under study and not the entire Interconnection (e.g., studies in Florida should not need to include relay models in Canada). R4.3.2, we assume that the intent of this requirement would be to help establish the magnitude and duration of acceptable post-transient voltage dips, presumably to meet the curve published in the PRC-023 standard under draft. Is this a correct assumption? We assume the drafting team does not expect models to be written for every generator to actually model potential loss of station service due to voltage dips and automatically model potential generator trips. R4.4 and R4.5, see comments on R3.4 and R3.5 about re-arranging these requirements.

No comments

Please clarify that the phrase "individual and joint responsibilities" applies to entities (e.g., the TPs and PCs) and not specific individuals.

No comments

Yes

No

Table 1 seems to have lost the requirement to be within Facility Ratings for single and double contingencies (e.g., the change in note "f" of Table 1). Are we missing something? If not, is this change intentional? Footnote 10 does not seem to adequately highlight that Facilities should be within applicable ratings for single and credible double contingencies. The table is significantly improved from the prior versions and provides superior clarification over the existing standards. However, please explain why there is a performance difference between P2.3 (breaker failure), P4 (stuck breaker) and P7 (2 circuits on a common tower) for EHV. Considering the frequency of these events in actual experience, it would seem that 2 circuits on a common tower should have a more restrictive or equal performance to a stuck breaker performance, yet the performance requirements are just the opposite. We recommend allowing curtailment of firm service and loss of non-consequential load for a stuck breaker or failed breaker.

Yes

We disagree with how the performance criteria is applied to different contingencies, but agree that firm transmission can be curtailed post-contingency as a system adjustment, and especially as preparation for the next contingency.

No

We suggest that the 60 month calendar apply to the HV system as well for all Categories. It is just as difficult, if not more difficult, to build a new 138 kV line in the Florida Keys as it is to build a 300+ kV line. The same time frame should apply to both. Also, as highlighted in the comments above to R2.1.4, P3 essentially causes utilities to build upgrades to N-3 planning criteria which may necessitate significant transmission upgrades if left unchanged. Hence, if left unchanged, P3 ought to have at least 5 years as well. The implementation plan ought to include an "out" for extenuating circumstances, e.g., unable to obtain ROW, etc. For instance, it is doubtful that another line in the Keys could ever get built without significant intervention and utilities that are unable to obtain ROW should not receive sanctions for something outside of their control. Consider changing the effective dates of R1 and R7 to take effect at the same time as R2 through R6 so you do not have to meet two standards during the same time period. Otherwise, clarify how the effective date impacts which version of the standard is to be used in an assessment before a scheduled compliance audit. The implementation should also be more specific on what "going into effect" means. Assessments are not a one day event but are a year long effort that culminates in a final "report" that is the assessment. Most NERC standards effect ongoing activities, and the day they go into effect the utilities functions are expected to be compliant. In this case that rationale would require that in the prior year two assessments were performed, one compliant with the current standard and one compliant with then new standard, however we don't believe that was the intent. Perhaps a statement below the paragraph regarding the 60 month implementation plan for Corrective Action Plans to the effect of: "Once effective all future assessments shall upon completion be compliant with this standard. Assessments completed prior to the effective date shall be based on the TPL standards in effect at the time. The standard is not intended to require a retroactively compliant assessment be in effect when the standard becomes active, but instead that the next assessment be compliant with the revised standard"

Individual
Tim Wu
LADWP
For R1.1.4 the requirements should be based on "expected transfer" instead of "firm transmission service". When projecting into future, the term "firm transmission service" is meaningless because transmission service contracts can be changed overnight. Using "firm transmission service" as a base would also exclude any new contract that are not considered in the study. It is very short-sighted to plan new transmission facilities only based on "firmed transmission services". R1.1.2 is very confusing. What is a new technology? Is it something we don't know? If we know what it is, is it still a new technology? If we don't know, how do we model it? Also, we do not model individual circuit breaker but the effect of the circuit breakers; same apply with control devices or protective system equipment. Need more clarity. In general, a laundry list of items to be represented is a bad idea because it gives the impression that anything not on the list does not need to be modeled.
R2.3 There is no value to conduct short circuit analysis on an annual basis. Short circuit contribution is location constrained. Maximum short circuit interrupting duty cannot be determined by any planning cases; so putting this requirement in TPL will cause only confusion and will create misleading information. If there is a need to develop a standard on how to evaluate maximum short circuit interrupting duty, the more appropriate place would be FAC. R2.1.3 Controllable Loads and DWM: DSM should not be a stand alone item in planning studies because DSM already is imbedded in load forecasts. Not sure what controllable loads are. R2.1.4 Any requirement dealing with spare parts should be handled in TOP, not TPL. TOP is the forum to develop operating procedures, "work-arounds", and so on when the non-availability of spare forced a company to develop temporary mitigations and it would be a mistake to suggest that planners should be able to consider such temporary fixes as acceptable planning solutions. R 2.5.2 The 20 MW threshold, at best, is "noise" for us. We would not be concerned with generation changes that is 10 times this threshold. What is the rationale for requiring a new study just because there is a change in generation capability? R2.8 and 2.9 What measurements would this required information be measured against? I can't find any and if there is no measurement, it really does not belong. R2.6.2 Project initiation date is hard to define. Is it the date the project is budgeted? or the date the management approved the budget and at what level? or is it the date when engineering design is initiated? For both short term and long term planning horizons, the project in service date should be sufficient. there are too many variables to define "project initiation date" not to mention there is no measurable to benchmark such a requirement.
R3.4 This requirement is very strange. If there is a known planning event that is more severe than those listed in Table 1, it should be so identified in Table 1. It is not fair to ask every planner to search for more severe contingencies without any specifics. R3.4 should be deleted. R3.5 This is similar to R3.4; this requires proving of null set. The only way this requirement can be met is to perform an exhaustive and unlimited list of extreme event, real or imaginary, before a rationale can be rendered. This requirement should be deleted with the exception of the last sentence regarding "cascading outages."
R4.5 See comments on R3.4 and 3.5
What is a proxy as related to transmission planning? The drafting team should not introduce "non-standard" terms in a Standard document.
R6: Does this requirement requires authors of the planning assessment report should be identified? If so, can we use plain English like "The authors of the Planning Assessment report shall be identified". If not, please explain what this requirement is all about.
FERC 890 stands on its own, why should a planning standard refers to a FERC Order? Does this imply that if a FERC Order is not referenced in the planning standard, we can ignore the order?
No
UVLS should be an allowed mitigation for multiple contingencies, P3 and above. UVLS is an effective measure against voltage collapse, a system condition that if not mitigated in a timely fashion could lead to cascading events. Same with UFLS.
No
Table 1 continues with discriminatory performance criteria required of 300kV and above facilities. This new "higher" criteria could lead to endless argument and litigations as to who did what to whom if implemented. Currently, all transmission facilities have same performance criteria; the impacts of each new facility are carefully evaluated and mitigations are included as part of the Plan of Service. This new, discriminatory requirement would force everyone with EHV facilities to re-do its planning studies and mitigate the impacts. Unfortunately, the real world is quite messy. For example, Company A has put in a 500KV line twenty years ago and since then, Companies B, C, and D have put in several underlying 230 kV, 115 kV lines. Is company A on hook now to mitigate all the problems for lines that came in later? Or is it required to re-create the conditions 20 years ago and mitigate only what would have been required. This is a very simplistic example to illustrate potential disagreements that would arise by this discriminatory criteria. If there is

any engineering evidence to support this arbitrary requirements, it has yet to be presented. As I commented in the past, the last two major system wide cascading event, both in WECC AND THE Eastern Interconnect, were both caused by 230kV systems.

No

The use of the term "Firm Transmission Service" is problematic at best. See my comments on R1. The proper term is "Expected Transfer Level"

No

Cannot agree to something when this is not final.

John Collins

Platte River Power Authority

R1.1.2. "...for each year of the Near-Term and Long-Term..." Models for each year of the 10 years in the planning horizons are not developed in our Region. Please clarify your intention.
 R1.1.2. 3rd bullet - "Circuit breakers (or the effects of)" R1.1.2. 4th bullet - "Protection System equipment (or the effects of)" R1.1.2. 5th bullet - "Control devices (or the effects of)" R1.1.2. 6th bullet - "New technologies (or the effects of)" R1.1.4. "Firm Transmission Service (or expected transfers)

R2.6.2. Expand on the meaning of the "initiation date." R2.8. I don't understand the relevance of this requirement. May your intention be explained differently? R2.9. I don't understand the relevance of this requirement. May your intention be explained differently?

R3.3.3. Zone 3 type relay loadability studies (single and multiple contingency analyses) should be performed in the OPERATING HORIZON to provide results flagged for possible problems to the Relay Engineers who will evaluate a relay setting change on an Facility or a modification to a relay setting for a new Facility about to be put in-service. I do not see the value of Zone 3 relay loadability checks in the Planning Horizon.

R4.3.2. Delete this requirement as it is covered under MOD-013-1, R1.2 for RRO Dynamics Data requirements. When the generator is modeled accordingly the generator's performance will be simulated and analyzed in the stability studies. R4.3.3. Delete this requirement as it is covered under MOD-013-1, R1.2 and R1.3 for RRO Dynamics Data requirements. When the generator is modeled accordingly the generator's performance will be simulated and analyzed in the stability studies.

R5. For clarification, please list examples of "proxies" that might be used.

R7. Delete this requirement as it is the responsibility of the Transmission Provider under FERC Order 890.

No

Non-Consequential Loss of Load - It is not clear in all the Load Loss definitions where planned load shedding or "controlled interruption of electric supply" belong. However, the NERC Webinar on June 30 was very helpful, and I make the following comment in line with the answer I heard to my question. A "Yes" in the last column of Table 1 means that planned load shedding or "controlled interruption of electric supply" is allowed for that Category of Contingencies. (For a P2.2 Bus Section Fault, SLG, HV, "Yes", one could choose to implement a planned load shedding procedure or scheme to meet system performance requirements.) Planned load shedding may be manual load shedding or automatic actions such as direct load tripping or UVLS for example. Therefore, please add mention of the planned load shedding or the "controlled interruption of electric supply" and list specific examples in the definition for "Non-Consequential Loss of Load."

No

At the top of Table 1 Planning Events, under "Stability Only:" regarding Note "i": Suggest deleting everything from "established" on to the end. (WECC establishes acceptable limits for transient voltage response.)

Yes

Larry Brusseau

MAPPCOR

R1 - what it means to include "requirements of regulatory authorities and other legal obligations". Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1. R1.1.1 - should remove the word "specifically" since it means nothing. Only known long-term outages of generation and transmission should be required to be modeled. R1.1.2 in the first line should have the word "studied" to avoid confusion, to read "New planned Facilities and changes to existing Facilities for each year studied of the ..." R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not

necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.

R2.1.1 – Consider calling this “Near Term years” instead of specifically naming certain years.

R2.1.3 – eliminate the last bullet. Planned duration or timing of Transmission outages is part of R1.1.1 which already specifies that models will include planned outages of generation and transmission facilities. R2.1.4 – the second line is unclear. There is a reference to “...lead time of one year or more...” Is the intent for that to mean “... outage duration of one year or more...”? If so, it should be written that way. Also, in the 3rd line, eliminate the words “... an analysis of...” (otherwise it would direct one to assess an analysis.) This in essence is an N-3 study. This risk that a TO or GO takes will show up in the operations of the BES. Also some states assess a penalty for equipment that is sitting idle that cost the taxpayers, so you could be penalize for not have spare equipment or if you do have it. R2.2.1 – does this mean, for example, that entities may be doing 12 year or 15 year assessments? It should be written to say what it means. R2.4.1 – Change to read: “For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.” R2.5.1 – Suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 – Incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the latest Transmission Planning Horizon System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include:

- The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner.
- An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner.

R2.6 – The creation of hard and fast Corrective Action Plans for the LTRA is not a good use of resources. The reason for planning studies is to uncover possible weak spots in the system for some number of years into the future, and then pursue additional studies to examine the issues. Planning studies include many assumptions, and the issues may not even arise on the real system. If they do, there may be many possible remedies. Creating CAPs with milestones and other firm dates for potential problems uncovered in assessments of future years is simply not practical, and the PC (PA) may have little or no influence on what remedy is selected even if a problem appears to be real. R2.6.2 – The phrase “Project Initiation Date” needs to be defined. It is unclear if this is the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase “as well as an in-service date” should be modified to read “as well as a target in-service date”. R2.6.3 – Plans can provide a target in-service year but not an actual in-service year. R2.6.4 – recommend clarifying how “situations beyond the control of the TP or PC” are determined. It is unclear if this is to imply that if something is outside of the control of the department who conducts the planning studies or if it is outside the control of the registered function’s legal entity (i.e. corporation). There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year’s assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year’s assessment and develop corrective actions. R2.8 – appears to be nonessential information for reliability; for what purpose does this requirement exist? R2.9 - appears to be nonessential information for reliability; for what purpose does this requirement exist?

R3.3.2 – Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R3.3.3 – PRC-023 requires relay loadability to be reflected in facility ratings. Therefore this additional requirement is unnecessary and should be deleted. R3.4 – is there a measure for what is a “more severe system impact”? R3.5 – Recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events -It should be clear that an evaluation does not require solution development for all Extreme Events -Change “an evaluation of possible actions...” to “where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered.”

R4.3.2 - Traditionally transmission planners have assumed that generators would ride through low voltages associated with Planning Events which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R4.5 -Recommend that the

requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: -Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events -It should be clear that an evaluation does not require solution development for all Extreme Events -Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered."

an example of proxy may be helpful, not all entities use proxies.

Propose expanding the scope of entities to consider, limit it to those entities that indicate a reliability need for coordination, and eliminate the direct reference to Order 890. Suggest this text: "Each Planning Coordinator shall establish a list of adjacent Planning Coordinators and any functional entity who has indicated a reliability need, distribute its Planning Assessment results to the listed entities and consider comments on the assumptions and results through an open and transparent peer review process."

Individual

Aaron Staley

Orlando Utilities Commission

-This section is very clear. Section R1.1.1 brings clarity to the question regarding planned outages. -The phrase "Models shall use data consistent with ...MOD-010", is the intent for the data to be "identical" to the data provided under MOD-10 and -12, or just "consistent." For example does the data in the study have to be the same or can the studies be based on older or more up to date data depending on when the studies took place?

-I think R2.1 has a typo and should reference requirement R2.5, not R2.6. -R2 Does the phrase "System Peak Load" require true system peak be tested, or a peak condition. As an example, FRCC experience a two peak loads, a summer peak that occurs regularly on summer afternoons, and a slightly higher winter peak that occurs only every few years. While the load is lower, the summer condition is more critical since it is coincident with high ambient temperatures resulting in line and generator capabilities lower than those in the winter. -Overall I think Section R2.5 is very valuable in clarifying that past studies can be used and what criteria needs to be met for them to be used. However in reading through all the requirements I am unclear if all the studies could be met using past studies or if some require a new study every year. If the intent is that some sub requirements can not be met with a past study, that should be made clearer through a foot note or a list under Section 2.5 showing which study requirements may depend only on past studies that are still current. -R2.5.1: Is 5 calendar years from the date the assessment is "final" or the date the study process for the assessment begins? -R2.5.2: I believe this requirement is a sound approach to establishing the validity of past studies. From the structure it appears that the list of material changes is intended as an example not a prescribed list? -R2.6: This requirement as written is a sound approach to building a reliable system. -R2.6: Requires a corrective action plan when performance will not be met in simulations. Is this just plan that covers the gap between simulation performance and desired performance? To take this example further, in application it would seem a project need may be identified in the current set of studies and added to the corrective plan, but once that project was added to the simulation model (in subsequent years studies) then the project would not longer appear in the corrective plan. As a minor issue, if the actual intent is for this plan to cover all planned projects, not just the gap between current plan and current study, could the name be changed to something like "Transmission improvement and operational plan", the name "corrective action plan" always implies to me that you've actually violated something and are trying to correct it rather than the natural evolution of transmission plans. The section of this requirement addressing sensitivities and the corrective action plan is excellent. -R2.6.4: This is an excellent addition. There are certainly cases where a utility that is closely interconnected can be affected by a change of a neighbor's transmission plan. Requiring documentation of the steps being taken to resolve the issue is the appropriate requirement to place on utilities in that position. -R2.9: Is this the largest actual Non Consequential load loss that could occur for those events based on simulation (like R2.8), or is it an overall criteria that the utility sets and applies to itself during studies to determine when a Non Consequential load loss is large enough to require further action?

For Requirement 3.3.1 and 3.3.4 I suggest adding language similar to 3.3.2 and 3.3.3 establishing that "studies shall consider" rather than requiring every simulation precisely recreate this usually minor part of system performance. These devices generally do not respond except for a nearby event, and even then their response is rarely such that it would make the situation "worse". The effect of these devices must be considered, but mandating that every simulation

faithfully reproduce the response of every device is not only an efficient way to do this, it actually provides a counter incentive to going above and beyond the standard requirements. Any simulation used to meet this standard that failed to precisely reproduce the performance of this equipment would be a violation of this requirement (as currently written). As such there is no incentive for an entity to include anything but the absolute minimum number of simulations required to meet the standard, since each extra simulation represents an opportunity to miss this requirement. Good planning is based on running a broad range of events against a broad range of conditions and evaluating those responses against a set of performance criteria. This is encouraged by requiring that studies consider the response of equipment to these events rather than mandating their precise reproduction in simulation.

For Requirement 4.3.1 and 4.3.3 I suggest adding language similar to 3.3.2 and 3.3.3 establishing that "studies shall consider" rather than requiring every simulation precisely recreate this usually minor part of system performance. These devices generally do not respond except for a nearby event, and even then their response is rarely such that it would make the situation "worse". The effect of these devices must be considered, but mandating that every simulation faithfully reproduce the response of every device is not only an efficient way to do this, it actually provides a counter incentive to going above and beyond the standard requirements. Any simulation used to meet this standard that failed to precisely reproduce the performance of this equipment would be a violation of this requirement (as currently written). As such there is no incentive for an entity to include anything but the absolute minimum number of simulations required to meet the standard, since each extra simulation represents an opportunity to miss this requirement. Good planning is based on running a broad range of events against a broad range of conditions and evaluating those responses against a set of performance criteria. This is encouraged by requiring that studies consider the response of equipment to these events rather than mandating their precise reproduction in simulation. Requirement 4.4 and 4.5 establish that only those events that would cause the most severe system impacts should be studied. This is an excellent requirement since it focuses the large resource requirement in performing these studies on the events that will provide the best information. Does the intent of the "More severe events" to establish actual study parameter extend between the planned events (R4.4) and extreme events (R4.5)? Or phrased another way, if an entity selects a proper range of extreme events and establishes that planning event performance requirements are met, could that be used as evidence that R4.4 is met as well, or would R4.4 require the same conditions be reproduced in their less severe configuration.

R6: Is this requirement intended for cases where the TP is not also their PC, or is this between adjacent PC's?

The term "results of the assessment", is this is the final end result that is shared and analyzed? A requirement should not reference an order or another non NERC document. All the requirements and measures for performance should be covered in the standard or through reference to another NERC approved standard. The language used in other standards would be more appropriate and directly auditable. Require that the PC/TP to share assessment and support material with those requesting entities and respond to any of their specific comments. This will insure openness and transparency in a manner and can be directly audited.

Yes

Good Job.

Yes

Comments: The table is significantly improved from the prior versions and provides superior clarification over the existing standards. In areas where an entity is the TSP and the PC, it is obvious that the Firm Service provided by the TSP falls within the performance requirements of the standard regarding curtailment. However if the firm service is provided by another TSP (a different PC) and causes a problem, who is responsible for insuring it does not have to be curtailed. As an example if System A has a firm transmission service agreement that under contingency causes a problem on System C, is system C in violation if the service has to be cut to protect their system, or is System A that granted and is responsible for the service?

Yes

Overall the plan is excellent! Allowing for a 60 month phase in of the more restrictive performance requirements and an exception for those who need longer to meet them is an equitable and reliable practice. Having R1 and R7 go into effect first though raises the question of what TPL standard is in effect during that time frame? I recommend having the entire standard go into effect at the same time and avoid that issue. There is limited benefit to R1 and R7 going into effect early. The implementation should also be more specific on what "going into effect" means. Assessments are not a one day event but are a year long effort that culminates in a final "report" that is the assessment. Most NERC standards affect ongoing activities, and the day they go into effect the utilities functions are expected to be compliant, this is not however so clear when the "function" is the culmination of a year long effort. Perhaps a statement below the paragraph regarding the 60 month carve out to the effect of: "Once this standard becomes

effective all future assessments shall be compliant with this standard. Assessments completed prior to the effective date shall be judged by their compliance with TPL standards in effect at the time."

Group

Progress Energy Carolina (PEC)

PEC would like clarification on the following: "Models for the Planning Assessment shall represent: Circuit Breakers, Protection System Equipment, etc." The clarification should state that the models do not have to explicitly include these elements as long as their effect can be modeled.

PEC believes that "R2.1.1. System peak Load for either Year One or year two, and for year five" is unnecessarily prescriptive. PEC recommends eliminating the Year One or year two addition. PEC believes that R2.1.4. concerning an entity's spare equipment strategy is overly conservative. The standard should only require N-2 deep planning and not N-3. PEC believes that for R2.4.1 "a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads" should be clarified to include "as appropriate" clause. Induction motor load modeling should not be required for all dynamic studies. PEC believes that for R2.5.2. The language "For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area" needs to be made more clear. The important point is that material changes must be modeled if they have occurred. Also the 20MW threshold is far too small to be material. PEC believes that R2.8. and P2.9 are unnecessary and should be removed.

No

In this definition: "Year One: The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current calendar year" recommend that the '12-18 months' specification be removed. It is confusing.

PEC prefers having separate tables for steady-state and dynamic analyses. PEC believes the requirements were more clear in that format.

No

PEC believes that Footnote 10 should be clarified. The proposed wording "Where Facilities external to the Transmission Planner's planning region are relied upon, Facility Ratings in those regions must be considered" is unclear. It is not clear what "relied upon" means. Also, thermal overloads on neighboring systems are generally the neighboring system's responsibility to mitigate.

No

More time than 12 months is needed for modeling the complete effects of Relay Protection Systems and the effects of Relay Loadability. PEC suggests that this period of time be extended to 24 months or longer.

Individual

Jason Shaver

American Transmission Company

We propose the following comments for R2: In sections R2.1.3 and R2.4.3 please explain the reference to "expected transfers" and how that differs from R1.1.5 "interchange." If these are analogous, then change the references to "interchange." Modify R2.5.2 second bullet to clarify that this addresses "an aggregated addition/deletion/change to a group of generating units directly connected through a shared step-up transformer" Modify R2.6.2 to remove the obligation to include the project initiation date. The inclusion of this date would add unnecessary work that is not needed to assure adequate BES reliability. In addition, it is not clear whether "initiation" refers to the commencement of engineering, design, construction, etc. ATC agrees that the Transmission Planner should be responsible for a corrective action plan (R 2.6) and its associated sub-requirements, but we do not agree that the Planning Coordinator should also be listed. Unlike a Transmission Planner, a Planning Coordinator does not have the ability or responsibility to implement a corrective action plan. Requirement 2.6 and its associated sub-requirements should be limited to only the Transmission Planner. Remove the R2.8 requirement. The activity of identifying and including the largest Consequential Load Loss caused by any P1 or any P2 events in the Planning Assessment may not assure adequate BES reliability. A P1 or P2 event with the largest Consequential Load Loss could occur at a location on the system that is

strong enough to not result in any performance violation. The amount of Consequential Load Loss may not have a relevant correlation to system performance and reliability. Remove the R2.9 requirement. The activity of identifying and including the maximum permissible Non-Consequential Load Loss caused by selected Table 1 Planning Events may not assure adequate BES reliability. The maximum permissible Non-Consequential Load Loss could occur at a location on the system that is strong enough to not result in any performance violation. The maximum amount of Non-Consequential Load Loss may not have a relevant correlation to system performance and reliability. Add R2.10. The obligation to identify and observe applicable steady state voltage and post-Contingency voltage deviations should be a Requirement, rather than performance note "a" in the Planning Events, Steady State Only section of Table 1. And the obligation to identify and observe applicable transient voltage response limits should be a Requirement, rather than performance note "b" in the Planning Events, Stability Only section of Table 1. In addition, due to the system limit requirements of FAC-010 and FAC-014 the reference to the PC and TP is unnecessary. We suggest this text: "The Planning Assessment shall identify the applicable steady state voltage, post-Contingency voltage deviations, and transient voltage response limits."

We propose the following comments for R3. Revise the R3.3.2 text to clarify that subsequent analysis is performed on generators whose voltages are expected to fall below the minimum voltage limits. We suggest this text: "Consider the minimum steady state voltage limitations of all generators and identify how generators with bus voltages below its minimum voltage limits are analyzed in the subsequent steady state simulations." Revise the R3.3.3 text to more clearly relate to the specific requirements in PRC-023. We suggest this text: "Incorporate relay loadability per PRC-023 and identify how relay loadability is analyzed in the steady state simulation." Add R3.3.5. The obligation to consider only planned System adjustments that are executable should be a Requirement, rather than performance note "e" in the Planning Events, Steady State & Stability section of Table 1. We suggest this text: "Consider planned System adjustments, such as Transmission configuration changes and redispatch of generation, that are executable within the time duration of the applicable Facility Ratings."

We propose the following comments for R4: Add R4.3.3 text to include relay loadability in the R4 (Stability) requirements to parallel R3.3.3 in the R3 (Steady State) requirement which would more clearly relate to the specific requirements in PRC-023. We suggest this text: "Incorporate relay loadability per PRC-023 and identify how relay loadability is analyzed in the dynamic simulation." In R4.3.4, we propose limiting the scope to automatic devices and adding the notion of "including but not limited to". We suggest R4.3.4 text of: "Simulate the expected automatic operation of existing and planned control devices including but not limited to generation exciter control and power system stabilizers, static VAR compensators, power flow controllers, and DC Transmission controllers." Add R4.3.5. The obligation to consider only planned System adjustments that are executable should be a Requirement, rather than performance note "e" in the Planning Events, Steady State & Stability section of Table 1. We suggest this text that matches R3.3.5: "Consider planned System adjustments, such as Transmission configuration changes and redispatch of generation, that are executable within the time duration of the applicable Facility Ratings."

We propose specifying that the proxy documentation be included in the Planning Assessment and add the rationale for the proxy. We suggest this text: "Each Transmission Planner and Planning Coordinator shall document within the Planning Assessment any proxies used in the analysis to identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding. The documentation will consist of the definition of each proxy used and the rationale for the proxies."

We agree with the revisions to R6.

We propose expanding the scope of entities to consider, limit it to those entities that indicate a reliability need for coordination, and eliminate the direct reference to FERC Order 890 and peer review. We suggest this text: "Each Planning Coordinator shall establish a list of adjacent Planning Coordinators and any functional entity who has indicated a reliability need, and distribute its Planning Assessment results to the listed entities and consider comments on the assumptions and results."

No

We suggest the following comments: Add a Consequential Generation Loss definition because both load and generation loss can be considered, but there is only Consequential Load Loss definition. We suggest text of: "Consequential Generation Loss: All Generation that is no longer delivered to any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions." Expand the Consequential Load Loss definition to include protection for abnormal operating conditions. We suggest text of: "Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the Transmission Facilities removal from service by the operation of the installed Protection Systems designed to isolate fault conditions or otherwise protect the Transmission Facilities from abnormal operating conditions." Expand the Load Reduction definition to include consideration of TOP judgment and established protection schemes. We

suggest text of: "Load Reduction: The reduction of Load that is still connected to the System, but in the judgment of the Transmission Operator or through the previous established Special Protection Systems, Under-frequency Load Shedding programs, Over-frequency Load Shedding program, should be reduced to overcome to lower voltage conditions following a Planning or Extreme Event." Modify the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: "Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard." Modify the Planning Events definition to more explicitly apply to the TPL-001 requirements. We suggest text of: "Planning Events: Events that are identified in the steady state and stability performance requirements set forth in the TPL-001 standard." Expand the Year One definition to include the PC, refer to the Planning Assessment, and refer to the current calendar year. We suggest text of: "Year One: The first year that each Transmission Planner and Planning Coordinator is responsible for conducting a Planning Assessment. This is further defined as the planning window that begins 12-18 months from the current calendar year."

No

We suggest the following changes: We believe reference to the use of Load Reduction to meet steady state performance requirement was omitted in Planning Events, Steady State and Stability, Item b. We suggest modifying the last sentence in Item b: "However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance requirements." We propose limiting the scope to automatic devices in Planning Events, Steady State and Stability, Item c. We suggest text of: "c. Simulate the removal of all elements that Protection Systems and other Controls are expected to disconnect automatically for each Contingency". Remove performance note "e" in the Planning Events, Steady State & Stability section and replace it with R3.3.5 and R4.3.5, as suggested in the comments for R3 and R4. The qualification of allowable planned System adjustments should be a Requirement, rather than a performance note. Remove performance note "a" in the Planning Events, Steady State Only section, and replace it with R2.10, as suggested in the comments for R2. The obligation to identify and observe applicable steady state voltage and post-Contingency voltage deviations should be a Requirement, rather than a performance note. Remove performance note "b" in the Planning Events, Stability Only section and replace it with R2.10, as suggested in the comment for R2. The obligation to identify and observe applicable transient voltage response limits should be a Requirement, rather a performance note. Modify the P3 Category performance criteria to apply only to the loss of two generators because the probability of the loss of two base load generators is an order of magnitude greater than the loss of a generator and any other transmission element. We suggest the listing of: the loss of transmission circuit, transformer, shunt device, and single pole of DC line be removed from the P3 Events column. The corresponding events be moved to the P6 Category by "1. Generator" to the listing in the Initial System Condition (Loss of . . .) column. Limit the scope of the simulations in Item 1 of the Extreme Events, Steady State and Stability section to automatic systems and controls. We suggest this text: "1. Simulate the removal of all elements that Protection Systems and controls are expected to disconnect automatically for each Contingency." Clarify the meaning of the loss of multiple circuits in Item 2.a of the Extreme Events, Steady State section by using wording similar to P7. We suggest this text: "a. Loss of three or more circuits that share a common structure." Clarify the reference to actual, historical operating experience in Item 3.b of the Extreme Events, Steady State section. We suggest this text: "b. Other events based upon actual operating experience that may result in wide area disturbances." Clarify the reference to actual, historical operating experience in Item 2.i of the Extreme Events, Stability State section. We suggest this text that is similar to Steady State, Item 3.b: "i. Other events based upon actual operating experience that may result in wide area disturbances." Further clarify the applicable shunt devices in Footnote 7 with this suggested text: "7. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters." ATC suggest that following change to Table 1, footnote 4. Existing language: "Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 300kV and lower voltage Systems." Suggested Modification: "Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as greater than 300kV and high voltage (HV) Facilities defined as the 100kV through the 300kV Systems."

Yes

No

We offer the following comments. The proposed standard implies that the 24 and 60 month periods run in parallel rather than sequentially. As currently proposed, the effective date for performing analyses and developing subsequent Corrective Action Plans is 24 months. If the identification of new needs and action plans take 24 months, then only 36 months would be left to implement the new action plans. It may not be feasible to install some BES facilities, especially above 300 kV in less than 3 years. Some EHV projects can take 5 to 10 years to

implement depending on the size, complexity, and controversial nature of the project. We suggest that the effective date be stated in a more "implementation dependent" rather than a "fixed timeframe" manner. Consider wording such as "tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2.6.4) is allowed until Corrective Action Plans that are based on TPL-001-1 analyses can be implemented".

Header note 'f' under Planning Events: The redline version shows that the sentence "Facility Ratings shall not be exceeded" was removed from the beginning of header note 'f' (header note 'b' in the previous draft). This sentence needs to be reinserted at the beginning of header note 'f'. The requirement that Facility Ratings not be exceeded is a core principle of steady-state transmission-system assessment and needs to be explicitly stated somewhere in the standard. If this sentence is not reinserted, it could lead to a situation where different regions come up with different interpretations of the manner in which Facility Ratings need to be respected. Category P2: In the third column of the table, there is a dotted line that appears to be separating two parts of the description for event type P2.3. It appears that this dotted line should be removed. Category P3: In the fifth, sixth, and seventh columns of the table, there is one set of cells for event types P3.1 through P3.4 and another set of cells for event type P3.5. Since these two sets of cells are identical, they can be merged into one set that applies to event types P3.1 through P3.5. This would make the presentation of requirements for Category P3 consistent with that of Category P1. Category P7: Category P7 requires analyzing SLG faults on any two circuits on common structures. Add language to clarify whether SLG faults on both the same and different phases of the two circuits need to be considered or whether it is sufficient to assume that the SLG faults occur on the same phase of the two circuits.

David Angell

Idaho Power

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. R2.5 "20 MW threshold is too small. The limit should be based on a percentage of the study area's installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this

information on the "largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event" if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – The requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study is overly burdensome. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. Listing all possible extreme events could result in a limitless list.

R4.3.2 – Generation protection system contain up to a dozen tripping functions functions. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – Again I disagree with this requirement. It is the same as R3.5 and overly burdensome.

No

Clairification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

Yes

No

I would like to review this after completion of the standard.

Casey Hashimoto

Turlock Irrigation District

TPL 001-1 R1 could potentially result in a WECC auditor having to determine compliance with "requirements of regulatory authorities and other legal obligations," beyond the scope of its expertise. TID proposes that if that language is to be retained, it shall be assumed that the requirements of regulatory authorities and other legal obligations are being simulated unless those other entities have formally found the member to be in violation of their requirements or obligations.

TID expresses concern that the planning extension of R2.2.1 could lead to a scenario where a single member's long term project (beyond 10 years) could then require all neighboring members to extend their own planning horizons (similar to a "lowest common denominator" issue) and face unnecessary technical issues.

In light of the fact that FERC has determined not to apply the Order No. 890 transmission planning processes requirement to non-public utilities, TID expresses concern over the reference to Order No. 890 in R7. TID recommends that this reference be replaced with a more direct instruction that details what exactly is meant by the requirement of "an open and transparent peer review process." R7 makes reference to the peer review process laid out in FERC Order No. 890. This reference to Order No. 890 is duplicative and vague and must be clarified. The peer review process set forth in Attachment K of Order No. 890, lays out nine different principles (Coordination, Openness, Transparency, Information Exchange, Comparability, Dispute Resolution, Regional Participation, Economic Planning Studies, and Cost Allocation for New

Projects). Most of these principles are inapplicable when placed in the context of NERC Reliability Standards. Subjecting NERC members to all of these vague and broad principles without specific guidance as to their application would be a significant burden. TID proposes that the reference to Order No. 890 be removed from R7 and replaced with a provision that expressly details the principles of openness and transparency that are contemplated in R7. Such an express provision would bring clarity to the requirement so that entities subject to R7 would know exactly what they are expected to do to comply with the requirements of R7. As it is now written, the broad reference to Order No. 890 is vague and confusing. TID is also concerned with the fact that the Violation Severity Levels for R7 now appear to run from High to Severe, with the potential of significant penalties being assessed on noncompliant entities. The High and Severe Violation Severity Levels for TLP-001-1 R7 are inappropriate given the already vague and conflicting guidance of R7, especially as R7 merely duplicates the Order No. 890 requirements. Once the reference to Order No. 890 is replaced with a provision that expressly provides specific guidance as to what is meant by the "open and transparent peer review process," the appropriate Violation Severity Level for R7 would be Low to Moderate.

Gregory Campoli

New York Independent System Operator

R1.1.1 requires that models shall represent planned outages of generation and transmission facilities, if specifically known. The standard should be clarified to state whether it allows or requires a PC/TP to include as part of the Assessment outages due to maintenance and due to construction programs where certain facilities are out of service during phases of construction. Such maintenance and construction schedules are established but may not be finalized over the planning horizon. Further, the standard is not clear whether planned outages are to be treated as creating a "normal system condition" or as a contingency from which system adjustments are made prior to subsequent events? MOD 10 and 12 are based on requirements determined by the RRO in MOD 11 and 13 respectively. Is this appropriate? Further, the PC is not an applicable entity in MOD 10 and 12. Moreover, the standard should define "other data sources". R1.1.2. states that models for facilities such as circuit breakers and protection systems should be represented. Comment - The list of facilities should be deleted for the following reasons: - it is not needed; - the NYISO does not model circuit breakers, Control Devices, and Protection Systems; - it is not consistent with the definition of 'Facilities' in the NERC Glossary.

R2.1.2 - System off-peak is more likely a stability issue than a steady state issue. If system off-peak becomes a steady state issue, it can be mitigated through generation redispatch. Accordingly, it appears that this requirement is not necessary for steady state analysis. R2.1.4 - With respect to spare equipment strategy, this requirement potentially imposes a requirement to plan for three events, which is overly severe. As previously stated in R1, the system model should be a model of the projected system, which would include a long term actual forced outage. If this requirement is not referring to actual outages, then it is suggesting an N-1-1-1 analysis, which is a requirement that would require significant additional work with little value added for reliability because such contingencies have a very low probability. Under R2.5 - "Past Studies may be used to support the Planning Assessment if they meet the following requirements" and the sub-requirement R2.5.2 states that for SS, SC, or stability analysis "the PRESENT (emphasis added) System model shall not include any material changes, such as," The NYISO interprets this language to mean that past studies may be used to support planning assessments as long as there are no material changes to the LATEST PLANNING HORIZON system model. The Standards Drafting Team should clarify whether this interpretation is correct. The standard should further state whether, if there was a material change such as a 20 MW generator, the past study may be used if the impact of this small change is assessed. Finally, the regional entity should have a process to determine whether changes are material that is similar to the NPCC's process for determining what level of annual transmission review should be conducted each year.

R3.5. - The Extreme Events testing in Table 1 should be removed from this standard since there is no requirement to develop a Corrective Action Plan to address unacceptable consequences and the requirements are very general or vague. At a minimum, testing should only be required for EHV facilities or facilities specified by the Regional Entity – for example, NPCC designates facilities that can have consequences outside an area as bulk power system facilities.

The Standards Drafting Team should clarify the standard as to whether the PC will be expected to distribute the TP Planning Assessments as part of its coordination requirement?

No

The Year One definition is confusing. According to the definition, "Year One" can start any time between 12 and 18 months from a current calendar year. Is that January 1 of the current calendar year? Further, when does year 2, year 3, etc... start? Is this definition only applicable to the TP?

The stability studies require significantly more computer time and a more detailed model. The standard should allow the PC/TP to use judgment to manage size and complexity of the study.

The 3rd draft states the Plan will be addressed later in the project. Removal of these standards would not affect NERC and the RE's obligations to perform assessments. The Standards Drafting Team should clarify whether the PC/TP will be obligated under NERC Rules of Procedure to provide Assessments to NERC and the Regions upon request.

Group

FirstEnergy Corp

As stated in prior comment periods, we hold the opinion that the TPL-001-1 standard should start from the premise that a valid system model exist based on MOD-010, MOD-012 and other FERC approved MOD standards that are not referenced by this TPL-001-1 standard. The inclusion of R1 introduces an overlap and potential for double jeopardy violations that need not occur. The TPL-001-1 standard should not delve into model building and keep to its core purpose of assessing future performance of the BES. Specific comments, Requirements of R1 A. R1.1.2: The last bullet "New Technologies" is too vague and should be struck from the requirement. B. R1.1.4: It is not well understood how "Firm Transmission Service" would be evaluated by a compliance auditor when reviewing a simulation model. The models contain agreed upon Interchange Transactions between BA areas, but no details are provided to reflect individual Firm Transmission Service arrangements. In reality only the net-Interchange values between BA areas are reflected in the simulation models. C. R1.1.6: FE believes this requirement would be more accurately assigned to the Resource Planner or Load Serving Entity and not the Transmission Planner. We agree with the stated Measures, VRF, Time-Horizon, Data Retention and VSL of requirement R1

The standard provides prescriptive language in requirement R2.4.1 regarding dynamic stability load models but is silent on steady-state load modeling. Most transmission planners use a conservative approach of simulating constant power loads in the steady-state environment, but other steady-state load modeling assumptions such as constant impedance load and constant current load can be utilized. At a minimum, the standard should require the transmission planner to document its load modeling assumptions for steady-state simulations. To this end, we suggest a new sub-requirement R2.1.1 be placed ahead of the existing R2.1.1 that parallels R2.4.1 and indicates the TP should document its load modeling assumptions for steady-state simulations. Specific comments, Requirements of R2 A. R2.1: The requirement incorrectly references R2.6 which should be a reference to R2.5. B. R2.1.1: We propose that the SDT adjust requirement R2.1.1 to annually require one current year Near-Term and one Long-Term study, with the Long-Term study required to alternate between year six and year ten every other assessment year. This would reduce the workload on the industry and cover the mid-point transition period between the Near-term and Long-Term horizons that the standard team believes needs some attention. We find the requirement to perform two Near-Term studies and one Long-Term study each year overly burdensome, in light of the increased workload caused by sensitivity analysis for each steady-state and stability review that is required. FE believes that one current year study within each time period should suffice in being able to interpolate and extrapolate results to cover the entire assessment range; especially when supplemented with qualified past study results. C. We offer the following comments related to requirement R2.4.1: 1. In the last round of comments we made the following comment "This requirement should be separated into two requirements as it covers two distinct topics; a) peak load study for one of the near-term years and b) dynamic load modeling." The SDT responded "...This Requirement is to make you properly represent the dynamic behavior of Loads at high System Load levels." Apparently, the SDT did not agree with our recommendation to split the requirement as no change was made in this regard. Therefore, as written the standard in R2.4.2 (stability study of the Off-Peak Load level) seems to imply that the appropriate modeling of dynamic behavior of loads, including consideration of induction motor loads, is NOT required for the Off-Peak Load stability study. Please clarify or confirm this view of R2.4.2. 2. R2.4.1: We are still of the opinion that the word "appropriately" is vague and only serves to add confusion within this requirement. It's recommended that "appropriately" be struck from the requirement. 3. R2.4.1: In Draft 3, the SDT added text to this requirement that states "An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable" to clarify that a detailed dynamic Load model is not required at each bus. We understand this to mean that the model is not expected to try and replicate the dynamic behavior of individual end-user Load characteristics and that general approximations for a customer class(es) (residential, commercial or industrial) simulated at a given load bus is acceptable. 4. Based on our comments C.1 through C.3 we propose the following requirement language: R2.4.1. System peak Load for one of the

five years. R2.4.2. System Off-Peak Load for on of the five years. R2.4.3. Load models used for stability analysis shall represent the dynamic behavior of Loads, including the behavior of induction motor Loads. The study shall document assumptions made for representing the dynamic behavior of Loads, based on the following load classes - residential, commercial and industrial. D. R2.5.2: For clarity and readability we propose to insert the word "that" between the words "and would" so the requirement reads "...intervening period and that would impact ...". E. R2.6.1: This requirement indicates that an entity's Corrective Action Plans list situations where Table 1 Performance Criteria are not met and the associated actions needed to achieve required System performance. What if the actions and plans associated with newly identified deficiencies (current year studies) are not yet fully known and require further analysis and a more detailed study of various options. Would it be acceptable for a TP to indicate that the planned solution is To Be Determined? This could be a likely scenario for a long-term planning horizon study which may identify a number of deficiencies which require more detailed analysis to determine the appropriate solution. F. R2.6.2: We believe this requirement is overly prescriptive in requiring a project initiate date. The standard should not question an entity's project management but stay focused on whether or not the Correct Action Plan was put in place in a timely fashion. We propose that the team strike from this requirement the reference to project initiation date and focus on whether or not Corrective Action Plans were completed in a timely manner to ensure Table 1 Performance Criteria is met. Additionally, project initiation date is pertinent to a operating procedure solution that is allowed by the standard. R2.6.4: We support requirement R2.6.4 but suggest the word "prudent" be struck from the text of the requirement as it can be subjective and open for debate. G. R2.7: This requirement introduces additional Corrective Action Plan requirements beyond what is stated in R2.6. FE proposes that the SDT restructure the two requirements into a single requirement (and sub-requirements) focused on Corrective Action Plans. H. R2.8: Does this requirement apply to sensitivity simulations? If so, it has limited applications to only those sensitivity analyses that consider variations in load such as a higher forecast (90/10), or increased reactive load (sensitivity to poor power-factor loads), etc. The SDT should consider clarifying the intent of the requirement if each current year study as well as their corresponding sensitivity simulation model(s) is intended to have this information documented within the assessment report. I. R2.9: We ask the SDT to confirm or correct our understanding that the requirement is asking about a TP's criteria for maximum allowable non-consequential load drop and NOT the maximum non-consequential load shed required to meet performance criteria for a particular contingency evaluation. We agree with the stated Measures, VRF, Time-Horizon, Data Retention and VSL of requirement R2

Specific comments, Requirements of R3: A. R3: For readability revise "computer simulations using models utilizing data" to "computer simulation models utilizing data" B. R3.3.2: The intent of this requirement is not clear. What is the voltage limitation sought? Vmin at the generator terminals, high-side of the GSU, low-side GSU, etc.? Also the requirement text "identify how the generators are analyzed in the steady state simulation" does not drive a particular reliability goal. If the objective is to require tripping of units during a contingency simulation that are identified to be below their stated Vmin then the requirement should clearly state that the unit should be tripped and solution resolved. C. R3.3.3: This requirement should be removed as it is redundant with facility rating requirements stated in PRC-023, FAC-008 and FAC-009. D. R3.3.4: For readability we suggest inserting the word "may" in between "devices include". We agree with the stated Measures, VRF, Time-Horizon, Data Retention and VSL of requirement R3

Specific comments, Requirements of R4: A. R4.1: A space is needed between the text "Requirement and R4.4" which are run together in the requirement. B. R4.3.3: For readability we suggest inserting the word "may" in between "devices include". We agree with the stated Measures, VRF, Time-Horizon, Data Retention and VSL of requirement R4

We agree with the stated Requirement, Measure, VRF, Time-Horizon, Data Retention and VSL of requirement R5.

We agree with the stated Requirement, Measure, VRF, Time-Horizon, Data Retention and VSL of requirement R6.

We agree with the stated Requirement, Measure, VRF, Time-Horizon, Data Retention and VSL of requirement R7.

No

A. Supplemental Load Loss: We disagree with newly proposed definition for "Supplemental Load Loss" which is introduced to address some stakeholders concerns related to a Load's response to transient conditions. Table 1 note "b" causes confusion indicating that Supplemental Load Loss is an acceptable consequence of a Planning Event or an Extreme Event but then goes on to say that Supplemental Load Loss can not be relied upon to meet steady state performance requirements. This seems to imply that it is permissible to use Supplemental Load Loss for stability analysis. It is not logical to allow its use in one time frame but not the other. The inclusion of the Supplemental Load Loss definition enters into a power quality issue at the end-user delivery point which is not the focus of the TPL-001-1 standard. FE suggests that this definition be removed. B. Load Reduction: The new proposed definition of "Load Reduction" while technically written correctly may not align with its common use throughout industry. Load Reduction is often thought of as an operator initiated response, rather than a natural system

response to a contingency event. If the definition remains, the SDT should consider striking the text "following a Planning or Extreme Event" so that the definition can more generally apply to other areas of the standards if needed. However, as stated in question 9, we believe Load Reduction was inadvertently omitted in note "b" of the Table 1. If so, we would have similar concerns with the occasional use of Load Reduction in that it would be allowed in stability and excluded in steady-state FE suggests that this definition be removed. The "Load Reduction" definitional term brings into question what is an acceptable steady-state load model within the TPL-001-1 standard. The standard provides some prescriptive language in requirement R2.4.1 regarding dynamic stability load models but is silent on steady-state load modeling. Most transmission planners use a conservative approach of simulating constant power loads in the steady-state environment and therefore the "Load Reduction" definition would not apply. However, if a constant impedance load model were used, Load Reduction would be reflected and less conservative outcomes would result. At a minimum, the standard should require the transmission planner to document its load modeling assumptions for steady-state simulations. [See above comment on Question 2 regarding a proposed new R2.1.1 requirement] C. Year One: We continue to oppose the Year One definition developed by the SDT. In our Draft 2 comments, FirstEnergy proposed a Year One definition of "The planning year that begins with the upcoming annual period under study". During the last comment period we indicated: "We believe the attempt to try and delineate between the near-term planning horizon and operational planning horizon is not needed within the TPL standard and that the near-term period should account for the upcoming annual study periods. If not revised, the need for two near-term studies on an annual basis is overly burdensome as many transmission planning organizations perform upcoming annual seasonal assessments for seasonal peak (summer/winter) periods. Requiring an additional two studies near-term does not provide significant benefit. Further reasoning for making the change is the allowance of operating procedures as part of Corrective Action plans. Operating procedures can easily be developed and implemented to mitigate projected performance violations prior to an upcoming seasonal period." The SDT's response from the Draft 2 comment period indicated "The standard does not require that studies are duplicated. If an operating study can be used to demonstrate an assessment for planning purposes, then the operating study would be sufficient." Since "Year One" is defined as "...a planning window that begins 12-18 months from the current calendar year" we would appreciate the SDT reconciling their Draft 2 response to the Year One definition and confirm whether or not it intends that a study of the next occurring seasonal peak period would suffice for meeting one of the current year Near-Term studies as required in requirement R2.1.1. A secondary concern with the Year One definition is its reference to the Transmission Planner with no mention of the Planning Coordinator. D. Planning Assessment: We suggest that the team consider an enhancement to the definition of "Planning Assessment". When read independently within the NERC Glossary of Terms a lay person should have a better understanding of the transmission Planning Assessment and it should set the foundational understanding that a Planning Assessment is not equivalent to a single study but rather a collection of studies. Additionally, the definition should more explicitly apply to the TPL-001-1 intended purpose. We propose a new definition based largely on the verbiage in requirement R2. "Planning Assessment: An annual documented evaluation of future Transmission System performance predicted over a minimum 10-year period, based on new or previously completed simulation studies and the Corrective Action Plans needed to satisfy steady-state, stability and short circuit performance requirements." E. Planning Event: We propose that the definition of "Planning Event" more explicitly apply to the TPL-001-1 standard and read as follows: "Planning Event: A contingency condition evaluated for its steady-state and stability impacts on the BES transmission System, requiring Corrective Action plans to remedy identified deficiencies" F. Consequential Load Loss: We suggest that the definition be revised to more closely align with the text stated in requirement R3.3.1. The proposed definition would read "Consequential Load Loss: All Load that is no longer served by any Transmission Facilities as a result of the removal of all elements that the Protection System and other automatic controls are expected to disconnect for a transmission System Contingency without operator intervention." If our proposed new definition is not acceptable, we suggest that the word "automatically" be added between "being removed" and replace "a planned" with "as designed".

No

A. Note b: Please see comments in our response to Question #8 related to note b and the Supplemental Load definition. B. Note b: We believe the SDT inadvertently allowed the used of Load Reduction to meet Steady State performance requirements. We suggest text of: "However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance requirements." C. Note b: If our assumption is correct on item B above, we fail to see the need to define two terms Load Reduction and Supplemental Load Loss which are not permitted within the Table 1 performance requirements for steady-state nor mentioned and used within the requirement language. It appears that the Load Reduction and Supplemental Load Loss are permissible within the stability timeframe. It is not understood why it would be valid to account for these in the stability timeframe but not steady-state. D. Note i: What if the TP or PC has no criteria for transient voltage response? The standard should have a requirement that ensures that such a criteria is documented by the entity if it is intended to be used within the TPL-001-1 standard. E. P2-3: It seems that footnote 10 should apply to the EHV

criteria stated in the column titled "Interruption of Firm Transmission Service Allowed" since it applies for the P5-1 through P5-5 EHV criterion. F. P5: We agree with the change made in Draft 3 to remove the reference to "single component" of the Protection System. Additionally, the SDT clarified its intended purpose of the P5 event as stated in the Draft 2, Q7 Summary Considerations: "A number of commenters expressed concern related to Planning Event P5 Protection System Failure and the need to evaluate a single component failure of a BES Protection System; particularly a failure of a station battery. The SDT has revised the P5 Planning Event description to remove the reference to single component failure and the event description was changed to match what is stated in the currently approved TPL standards under Category C6 through C9. The intent of P5 is to evaluate a failure of a single Protection System design that introduces a delayed clearing mode that may also include additional electrical Facilities being removed when compared to normal fault clearing. A Protection System failure resulting in loss of the substation (one voltage level plus transformers) would not qualify as a P5 Planning Event since that event is considered an Extreme Event. A Standard Authorization Request (SAR) has been issued for industry comment (1/20/2009 through 2/18/2009) based on work completed by the System Protection and Controls Task Force (SPCTF). The proposed project will address the need for Protection System redundancy, based on an n-1 failure of individual components of the Protection System." It is suggested that a footnote be added the text Protection System as stated in the P5 Event Description. The footnote should read "Failure of a single Protection System design that introduces a delayed clearing mode that may also include additional electrical Facilities being removed when compared to normal fault clearing. This contingency is NOT based on failure of any particular single component of the Protection System design." This footnote will help clarify the intent without having to rely on the Comment record established during this standard development project. In the Extreme Event table we suggest event identifiers that are similar to those used in the Planning Events table. For Extreme Steady State we suggest ESS1, ESS2-1, ESS2-1... ESS2-5, ESS3-1 and ESS3-2. For the Extreme Stability we suggest ES1, ES2-1...ES2-9. This will provide a short-cut reference for industry when referring to a particular event.

Yes

We presently agree with the Footnote 5 and Footnote 10 text.

No

We disagree with the proposed Implementation Plan. The implementation period for the TPL-001-1 transmission planning standard should be limited to the time needed to transition to the new study requirements. The proposed 5-year implementation for the "raise the bar" aspects of this standard delves into project management and review of capital construction progress which should remain outside the scope of this standard. The standard should only consider if an entity has completed the required studies and has developed Corrective Action Plans to ensure performance criteria is being maintained. The last paragraph of the Implementation Plan is not appropriate for the Implementation Plan as it discusses compliance enforcement information. This paragraph should be stricken.

Individual

Greg Rowland

Duke Energy

Revise R1.1.2 to include the phrase "to be studied" as follows: "New planned Facilities and changes to existing Facilities for each year to be studied of the Near-Term and Long-Term Transmission Planning Horizon, such as :"

R2 – Instead of "document results" the requirement should be to "summarize results". While results will be documented, the Planning Assessment should just include a summary. R2.1 – What's the value in being able to use "qualified past studies" if you have to use "annual current studies"? Strike the words "supplemented with" and insert the word "or". R2.5.2 – Suggest deleting the phrase "Material generation changes could include:" and the two accompanying bullets. A change of 20 MW on a large system may not always be material. R2.8 and R2.9 should be deleted. We don't see a reliability-related need for these requirements. In the sub-requirements of 2.1.3 and 2.4.3, the use of the word "timing" is unclear. Consider using "in service date" or "schedule for". R2.4.1: It is not clear how much Load a dynamic model must have. Likely, it must still be proven that the analysis software can accommodate every load in the model having a load model that includes induction motor models. To help address this, revise "Load" to be "Load that could impact the study area is acceptable."

Revise M3 to include a reference to R6, since the allocation of responsibilities will directly affect the evidence which is to be provided.

Revise M4 to include a reference to R6, since the allocation of responsibilities will directly affect the evidence which is to be provided.

M5 doesn't make any sense. Need to revise this Measure so that it fits the Requirement R5. Also need to revise the Data Retention discussion in Section 1.4 to align with R5.

Requirements R1, R2, R3, R4 and R5 should all be revised to include a reference to R6 regarding the determination of individual and joint responsibilities for performing the required studies.

No

Bus-tie Breaker definitions still seems somewhat generic and the use of 'configurations' causes uncertainty. Revise Bus-tie Breaker to read, "A circuit breaker whose intended purpose is to connect two individual substation buses." "Bus-tie" is not capitalized in the Table. Consequential Load Loss must include load that is lost due to the inherent response of the particular type of load. Some motors, lighting and processes will naturally trip during an event, although not as a result of the protection system. It may have been the intent of the SDT to include this phenomenon in the Supplemental Load Loss definition. However, this definition includes the phrase, "by end-user equipment", and that makes one think that there are devices at the end-user location that are removing this equipment (and conversely, load that is not disconnected "by" end-user equipment cannot be included). Also, the term "post-Contingency" can be confusing because in the case of faults, this phrase is not clear if it means conditions after the fault initiation itself or only after the clearing of the fault. Revise Supplemental Load Loss to read, "End-user Load that, due to its characteristics, disconnects from the System in response to the conditions created by the System event."

Yes

No

Stability Extreme 2g needs a note like number 12 that excludes short distances. Stability Extreme 2h: Is this meant to be an event initiated by a 3LG fault or is it a catastrophic event that leaves all the elements at a station with a 3LG fault. If it is the former, then 2h needs a note to limit this to locations where actual events could lead to the loss of the entire station. There is no need to study this if there are no protection system events that lead to loss of the whole station (there would be no scenario to model). If 2h is meant to represent some catastrophe that causes all the elements at the site to experience a fault, then some clarification is needed to get consistent studies. Possibly rewrite 2h as, "Assume all the buses at a single voltage level (one voltage level plus transformers) experience an event that results in a 3LG fault and disables local protection (fault must clear from remote stations or other side of transformer)."

No

Requirements R2 through R6 are proposed to become effective the first day of the first calendar quarter 24 months after applicable regulatory approval, and we agree with that. However, the standard also provides that for 60 months following the first day of the first calendar quarter following applicable regulatory approval, Corrective Action Plans applying to performance elements P2-1, P2-2 (above 300 kV), P2-3 (above 300 kV), P3-1 through P3-5, P4-1 through P4-5 (above 300 kV), and P5 (above 300 kV) are allowed to include tripping of Non-Consequential Load or curtailment of Firm Transmission Service (in accordance with Requirement R2.6.4) that would not otherwise be permitted by the requirements of TPL-001-1. Since the first 24 months following regulatory approval will be spent developing and validating new studies and methodologies needed to meet TPL-001-1, that would only leave 36 months to implement corrective actions. We propose that the 60 month clock start with the effective dates of Requirements R2 through R6, to allow sufficient time to implement corrective actions that are determined within the 24 month period, which could include system modifications that require long lead times. Also, the implementation plan contains the following wording regarding retirement of the existing TPL standards: "TPL-001-0, TPL-002-0a, TPL-003-0a, and TPL-004-0 are being retired as they are replaced in their entirety by TPL-001-1. TPL-005-0 and TPL-006-0 are being retired because their requirements are adequately covered by the revised TPL-001-1 and NERC's Rules of Procedure, Section 800." TPL-001-1 should not be used as a vehicle for fulfilling any of the TPL-005-0 and 006-0 requirements because of the difference in focus and entities involved. In reality, the new TPL-001-1 does not appear to have incorporated any of the requirements of TPL-005-0 and 006-0. TPL-001-1 appropriately focuses on how PC's and TP's should perform studies and document assessments of their transmission facilities' impact on BES reliability. TPL-005-0 and 006-0 focus on assessments of regional and inter-regional BES reliability, including other non-transmission issues as well. The NERC Rules of Procedure and existing FERC Order 890 efforts appear to be sufficient to cover the requirements of TPL-005-0 and 006-0. Therefore, retirement of TPL-005-0 and 006-0 is still appropriate.

Central Maine Power Company

R1 Priority Comment- There needs to be some direction provided on the initial conditions used in the assessment. This guidance should include discussion as to whether or not representations of generator forced outages are to be represented in the base case or if they are addressed through the sensitivity testing (Could add R1.1.7 Reasonable representations of unplanned generator outages.) Additionally, the standard is also silent on the treatment of system transfers, both internal and external, as to how they should be modeled in the base case. For some areas, their

current practice is to include heavy system stresses in their base case, which leaves little for sensitivity testing. It is unclear if this practice works within this standard. R1.1.1 Priority comment – R1.1.1 should be removed. It seems like there is an overlap between the requirements of this standard and Operational Planning studies with respect to known outages. Planned outages are addressed by our Operational Planning processes and Transmission Operating Procedures removing the need for this to be incorporated into Planning Assessments. In addition, outages are not generally known years in advance R1 Comment – We do not understand what it means to include “requirements of regulatory authorities and other legal obligations”. Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1. R1.1.2 comment - Do we need to have the list of equipment to model? How do we model circuit breakers, etc? We recommend deleting the list. Make R1.1.2 simply read: R1.1.2 New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon. R1.1.5 comment – What specifically needs to be modeled under Interchange? R1.1.6 comment – This needs further definition or it should be deleted. It is not clear what a “network resource required to supply load” is. Does this refer to Network Resource per FERC LGIP?

R2 Comment – We recommend replacing the phrase “prepare” with “conduct and document” in the first sentence. R2.1.1 Comment – The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2. R2.1.2 Comment – The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments. R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment. R2.1.4 Priority Comment – With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Why doesn't the standard state “(such as a transformer, generator or power electronic device)” and not just “(such as a transformer)”. What constitutes “spare equipment strategy”? Would a strategy that involves out-of-merit dispatch or operational restrictions be considered a valid “spare equipment strategy”. If a transformer is lost, could a reconfiguration of transmission constitute a valid “spare equipment strategy”? R2.2 Comment – We suggest replacing the phrase “a current System peak Load study” with “a valid System peak Load study” in the first sentence. The word current is confusing as some read the word current to mean “today's” rather than “valid”. R2.3 Comment – Please provide guidance as to what year should be represented when performing short circuit studies. R2.4.1 Comment – Change to read: “For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.” R2.5.1 Comment– We suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 Comment – To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: • The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study] • An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner. R2.6 Priority Comment – As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read “Provide documentation that explains the reasoning for the sensitivities considered and selected.” R2.6 Comment – At the end of the second sentence, the phrase “in the tables” is used. We suggest using more definitive language such as “in Table 1”. R2.6.2 Comment – The phrase “Project Initiation Date” needs to be defined. It is unclear if this is the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase “as well as an in-service date” should be modified to read “as well as a target in-service date”. R2.6.3 Comment – Plans can provide a target in-service year but not an actual in-service year. R2.6.4 Priority Comment – There should be a cutoff point when changes occur beyond a certain date. When

that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions. R2.8 Comment –Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. R2.9 Comment – This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.

R3.3.2 Comment – Traditionally transmission planners have used their judgment about the minimum steady state voltage limitations of generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R3.3.3 Comment – PRC-023 requires relay loadability to be reflected in facility ratings. Therefore this additional requirement is unnecessary and should be deleted. R3.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered."

R4.3.2 Priority Comment - Traditionally transmission planners have assumed that generators would ride through low voltages associated with Planning Events which is generally adequate for non-wind generators. If this standard is going to require its incorporation into the assessments, there should be an MOD standard developed requiring the generators to provide the necessary information prior to its inclusion as a requirement in this standard. R4.5 Priority Comment – We recommend that the requirement for Extreme Event testing be removed from this standard as there is no requirement to develop a Corrective Action Plan to address unacceptable consequences. Otherwise we recommend the following: - Extreme Event performance should be a consideration when developing Corrective Action Plans to address Planning Events - It should be clear that an evaluation does not require solution development for all Extreme Events Change "an evaluation of possible actions..." to "where appropriate, reasonably practicable actions designed to reduce the likelihood or mitigate the consequences and adverse impacts of the event(s) shall be considered."

Comments: It is unclear as to what is meant by the term "proxy used in the analysis" used in this requirement. Does this mean Planning Coordinator established practices, thresholds or guidelines used to gauge when simulations suggest an event such as cascading outages occurs? If so the language should state: R5. Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, when established practices, thresholds or guidelines identify System instability for conditions such as cascading outages, voltage instability, or uncontrolled islanding.

We do not feel that this requirement belongs in this standard and it should be deleted. The standard defines requirements for the assessment not who does what.

This standard should not be reiterating FERC Order 890. We do not feel that this requirement belongs in this standard and it should be deleted.

No

Refine load loss definitions as follows. Load Reduction: Load that is still connected to the System, but is reduced due to lower voltage conditions resulting from a Planning or Extreme Event. Non-Consequential Load Loss: Intended post contingency loss of load (other than Interruptible Load, Supplemental Load or Load Reduction) caused by operator or SPS (RAS) action. (Priority Comment)

No

Steady State & Stability comments as follows: Steady State & Stability: a. Transmission voltage instability, cascading outages, and uncontrolled islanding shall not occur. b. Consequential Load Loss, Supplemental Load Loss, Load Reduction, and consequential generation loss are acceptable as a consequence of any Planning or Extreme Event excluding P0. However, Supplemental Load Loss and Load Reduction associated with an event shall not be used to meet steady state performance requirements P5 Priority Comment – As written, this requirement is overly severe. This would require the simulation of a "dead" station if only one battery is present (use of NERC Glossary Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. P7 Priority Comment – Event 1 - This requirement requires the evaluation of the loss of two circuits on a multiple circuit tower. We recommend that this be modified so that only the loss of two adjacent (vertically or horizontally) circuits need be evaluated. We also recommend that the Planning Coordinator be

allowed to evaluate and if appropriate exempt specific locations from this contingency based on acceptable risk. Comments on Extreme Events – Table 1- We recommend renumbering the Extreme Events table to be Table 2. Extreme Event Stability Condition 2 Note a - Priority Comment - As written, this requirement is overly severe. This would require the simulation of a “dead” station if only one battery is present (use of NERC Glossary Protective System definition is too broad). The failure of the single protection system should be limited to certain aspects of the protection system. Extreme Event Stability Condition 2 Note h – Eliminate this requirement or change to loss of station following three phase fault. This note is confusing. Without providing a better defined scenario, it is unclear as to what clearing times should be used in this simulation. Footnote 1.a.ii – Contingency Reserve is dependent on the generation on-line. We suggest changing the first sentence to say that you can’t lose more than that permissible by the Planning Coordinator. Also change “pull out of synchronism” to “lose synchronism” in this sentence and in the second sentence. (Is “Lose synchronism” a more commonly used term?). Footnote 1.a.i, states "For Planning Event P1: No generating unit or units shall be allowed to pull out of synchronism." There is the potential for this requirement to be taken too far. Does this mean that someone's 4 kW generator at home needs to remain synchronized? Therefore, there needs to be some sort of qualifier on this requirement. Suggested wording: "For Planning Event P1: No generating unit or units greater than 20 MW and directly interconnected at 100 kV or above shall be allowed to lose synchronism. Note that synchronism applies to conventional synchronous generators and may not apply to other generation technology." Footnote 3 – We recommend revising the wording of the last sentence to “A three phase fault study indicating criteria are being met is sufficient evidence that a SLG condition would also meet criteria.” Footnote 4 – We recommend that a lower bound be put on the HV electric systems (such as 100 kV), rather than just saying “and lower”. Footnote 12 – We recommend adding an alternative modifier to the end of the sentence, “or for 5 towers or less.” This is consistent with NPCC criteria.

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words “including requirements of regulatory authorities and other legal obligations” at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. The 20 MW threshold identified as “material change” for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area’s installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the “largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event” if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clarification is needed on the use of UVLS. Is it acceptable or not. Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS?

No

P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4.

We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the "not applicable" entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years?

The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. An alternative, instead of specifically listing elements, make a general statement that the models should include those elements required in MOD-010 through MOD-013. If an element is missing, double jeopardy could result due to a violation of the applicable MOD standard and this TPL standard. Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4

should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted. We disagree with the inclusion of the words “including requirements of regulatory authorities and other legal obligations” at the end of R1. Entities already are required to do this. It does not need to be included in the standard.

Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault). In R2.1, we believe the reference for past studies should be Requirement R2.5 not Requirement R2.6. Also, we suggest removing the phrase “supplemented with” and replacing it with the word “or”. This phrase indicates that previous studies cannot be a primary source for the assessment, which contradicts section 2.5. Remove the phrase “not already included in the studies” in R2.1.3. With this phrase included, you cannot use a previous sensitivity study to support the current assessment and Requirement R2.5 allows the use of previous studies if the conditions are met. Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3. We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement. Remove the phrase “not already included in the studies” in R2.4.3. With this phrase included, you cannot use a previous sensitivity study to support the current assessment and Requirement R2.5 allows the use of previous studies if the conditions are met. The 20 MW threshold identified as “material change” for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area’s installed generating capacity. R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the “largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event” if it is documented? R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.

As currently drafted, R3.3 is not a requirement. Without the statements in R3.3.1-R3.3.4, R3.3 is simply a phrase. Sub-Sub-Requirements R3.3.1 through R3.3.4 should be bullets under R3.3, with the language in R3.3 modified so that it becomes the requirement to conduct contingency analyses that address the four resulting bullets R3.3.2 is unclear as drafted. The minimum steady state voltage limitation for synchronous generators is not a very meaningful value. All generators with an automatic voltage regulator will maintain the set point voltage until the VAR capability of the generator is exceeded, and then the voltage will deteriorate. R3.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingencies than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

As currently drafted, R4.3 is not a requirement. Without the statements in R4.3.1-R4.3.3, R4.3 is simply a phrase. Sub-Sub-Requirements R4.3.1 through R4.3.3 should be bullets under R4.3, with the language in R4.3 modified so that it becomes the requirement to conduct contingency analyses that address the three resulting bullets. R4.3.2 – it is not clear what is required to be modeled. Typically a generator may have 10 or more protective relays. Is the intent to model all relay protection? The existing commercial programs do not have sufficient models or capacity to do that for all generators in the system. R4.5 – We disagree with the requirement to explain why remaining Extreme Contingencies would produce less severe System results than the ones selected for study. The first part of the requirement requires identification of events that produce more severe System impacts. The reason the others were not selected is because they were less severe or non-credible. In any case, theoretically, there can always be a more severe Extreme Contingency than the one selected for study. For example, if the Extreme Contingency studied were simultaneous loss of 3 transmission lines with failure of redundant RAS, then simultaneous loss of 4 lines with failure of 2 sets of redundant RAS would be more severe. Listing all possible extreme events could result in a limitless list.

The term proxy is unclear. Please provide an example or an explanation of proxy.

We believe that references to FERC Orders should not be included in requirements of standards. This comment also applies to M7.

No

Clarification is needed on the use of UVLS. Is it acceptable or not? Typically UVLS relays are modeled in the study. Not allowing any load shedding as a result of UVLS relays could result in very costly fixes for a very small amount of remote load. If the Non-Consequential Load Loss Allowed column is No, is load disconnected from the system by UVLS a violation? What about Supplemental Load Loss or UFLS? Year One – The use of calendar year is confusing. When does the 12-18 month window begin? We suggest “The year 18 months beyond the present month.”

No

Clarify use of the term “single contingency” in P2 as P2-2 and P2-3 are labeled as single contingencies but multiple elements are effected. In the past loss of a branch or shunt element has been considered a single contingency but loss of a bus element could involve the loss of multiple branch or shunt elements. P4: Under the event column it should clarify and state language similar to that of P5 (Loss of multiple elements caused by a stuck breaker). In addition, this is a multiple contingency condition and may result in loss of more than 2 elements. As such, this is a low probability condition and loss of Non-Consequential load should be allowed for EHV. We disagree with raising the bar for EHV for P4. We also disagree with raising the bar for P5. This is a multiple contingency condition and may result in loss of more than 2 elements. We strongly disagree with elimination of load shed (of non-consequential load) for loss of multiple branch or shunt elements >300 kV.

We agree that TPL-005 and TPL-006 appear to have been adequately covered in the draft TPL-001-1 as currently written. However, we will need to review this assessment after TPL-001-1 is finalized. In addition, there is no place to state our concerns for Section D. so we added it here. We question the “not applicable” entry under Section D 1.1.2. What does it mean when the reset period is not applicable? Does it mean there is no reset period, so all non-compliance in all prior years will be counted as prior violations when considering non-compliance in future years? We believe that 60 months is not sufficient to implement the Corrective Action Plan for the “raise the bar” requirements. Siting transmission lines can take longer than this window. We strongly recommend increasing the window to 120 months which is a more realistic estimate of the time required to bring an EHV transmission project from conception to construction.

1. R1: What modeling/simulation is envisaged by the phrase “requirements of regulatory authorities and other legal obligations”? Note that this condition is not included in the measure or the VSL, making its compliance (whatever it is) irrelevant. If it is indeed a needed condition, then it should be measured and included in the VSL language under the Severe condition. Further, we suggest replacing “simulate” with “incorporate” since R1 deals with building of the system model that will be used to perform simulations governed by Requirement R2. Moreover, we do not think this requirement (to simulate projected System conditions including requirements of regulatory authorities and other legal obligations) belongs to R1, which is a requirement to develop the system model. R2 is the requirement for conducting Planning Assessments which include simulation using the model. We suggest moving this requirement to R2 upon making appropriate changes, where necessary to address our comments on the wording. 2. We recommend introducing “applicable” before “regulatory authorities”. 3. R1.1.2: suggest to add Transformers. 4. R1.1.5: suggest to change “Interchange” to “Interchange Schedules” or “Interchange Transactions”. 5. We agree with the VRF, Time Horizon, Measures and VSLs, other than the “requirements of regulatory authorities and other legal obligations” noted above.

1. We think “conduct and document” is more appropriate than “prepare”. Suggest to make this change. 2. We understand the reason for introducing the spare equipment strategy in R2.1.4 is to address comments raised on planned and long-term outages. However, this is not the only cause of unavailability of major Transmission equipment for more than 12 months. Construction or line upgrade program may also require certain transmission facilities be taken out of service for a protracted period. We suggest that R2.1.4 be revised to “.....When an entity’s spare equipment strategy or transmission project construction plan could result in the unavailability of.....” 3. When would PCs and TPs be expected to perform the analysis referred to in R2.1.4 – in anticipation of the possibility of unavailability of major transmission equipment or after such unavailability has occurred or is planned? 4. R2.3: The first sentence is unclear and the wording “can be supported” is misleading. We suggest the first sentence be revised to: “The short circuit analysis portion of the Planning Assessment addressing the Near-Term Transmission Planning Horizon shall be conducted annually and be supported by current or past studies.” Alternatively, language similar to R2.4 may be considered: “The Near-Term Transmission Planning Horizon portion of the short circuit analysis shall be assessed annually and be supported by current or

past studies.” 5. R2.4 stipulates the details of the study for Near-Term Transmission Planning horizon for the stability analysis. Unlike its steady state analysis counterpart, there is no requirement stipulated for the Long-Term Transmission Planning horizon for the stability analysis. Is this intentional, or do the same conditions apply to the Long-Term stability analysis? 6. R2.6: Suggest to change “in the tables” to “Table 1” at the end of the second sentence. 7. We agree with the VRFs, Mitigation Horizons and Measures. We also agree with the VSLs except R2.5 is not included. However, If R2.5 is meant to be explanatory (to illustrate the conditions under which past studies may be used), then the conditions should be provided in those requirements (e.g. R2.3) that allow for the use of past studies. If, however, these conditions are meant to be requirements, then their VSLs should be developed.

1. In our opinion, R3 as drafted is rather convoluted as it attempts to cover several objectives. Firstly, we recommend replacing “utilizing data in Requirement R1” with “developed in accordance with Requirement R1” both in the requirement and the VSLs. Secondly, is the main objective of R3 to ensure studies are conducted based on computer simulation utilizing data provided in Requirement R1? Or is it to ensure that this is done, and that all the other objectives are also fulfilled, for example: assessment of system performance (R3.1 and R3.5), conducting the analysis as specified in R3.2 and R3.3, identification of critical Planning Event contingencies (R3.4), etc. If it is the former, then not conducting studies based on computer simulation utilizing data provided in Requirement R1 alone should have a VSL of Severe. If it is the latter, then the requirement should be either: (a) Revised to place all supporting conditions in the subrequirements. As an example, R3 could be revised as follows: R3. The steady state analyses of the Near-Term and Long-Term Planning Assessment as stipulated in R2.1 and R2.2 shall be performed as follows: R3.1. Studies are conducted based on computer simulation utilizing data provided in Requirement R1; R3.2. Studies shall be performed to determine.... (the rest of the existing R3.1) R3.2. The existing R3.3, and so on. This way, not conducting studies based on computer simulation utilizing data provided in Requirement R1 will be “rolled up” to the VSLs for the main requirement, as is currently stated in the VSL table. Or (b) Restructure, if there are multiple main objectives in R3, to clearly have the main objectives in the main requirement, or split it into more than one main requirement. 2. Based on the way R3 is written, we agree with the VRF, Time Horizon and Measure. However, we do have a difficulty with the VSL based on our comments above on the requirement, especially on the Moderate VSL for “The Transmission Planner or Planning Coordinator did not base its studies on computer simulations using models utilizing data provided in Requirement R1.”

. Same comments as in R3, above, except our proposed wording on R4 will read: R4. The Stability analyses of the Near-Term Planning Assessment as stipulated in R2.4.2 shall be performed as follows:.... since there are no detailed requirements stipulated for Stability analysis portion for the Long-Term Planning Assessment. However, the main requirement contains a condition for performing the Contingency analyses listed in Table 1. First of all, there are no VSLs for failing to meet this condition. Secondly, this duplicates with some of the subrequirements, e.g. R4.4, R4.5. Suggest to remove this condition from the main requirement. If the main requirement is to be revised in a similar fashion as suggested for R3, then this will become a non-issue. 2. Similar to R3, we agree with the VRF, Time Horizon and Measure for R4. However, we do have the same difficulty with the VSL based on our comments on the convoluted nature of the requirement as indicated above, especially on the Moderate VSL for “The Transmission Planner or Planning Coordinator did not base its studies on computer simulations using models utilizing data provided in Requirement R1.”

We agree with the requirement, the VRF, Time Horizon, Measure and VSLs.

We agree with the requirement, the VRF, Time Horizon, Measure and VSLs.

1. We question the need to mention FERC 890. If this meant to be an example for the US entities, we suggest this to be put into a footnote with indication that it is an example for the US entities only. 2. We agree with the requirement, the VRF, Time Horizon, Measure and VSLs.

No

Is Year One intended to coincide with a calendar year or can it start in any month of the year? We suggest the following change to the definition. Insert “calendar” before “first” and “within” before “12” and change “from” to “of”. NERC should seek to reinstate a definition of “cascading outages” and create one for “uncontrolled islanding”.

No

“Single-phase-to-ground” faults should replace all occurrences of “single-line-to-ground” faults. Events in P6 and P7 need more clarity for back to back installation where no DC line exists. In note footnote 11 we propose the following change. 11. A stuck breaker means that for a gang-operated breaker, all three phases of the breaker have remained closed. For an independent pole operated (IPO) breaker, only one pole is assumed to remain closed. A stuck breaker results in Delayed Fault Clearing. We do not agree with the removal of the provision to allow load rejection for 1 and 2 elements out of service under certain defined conditions as indicated in footnote “b” of Table I of the current TPL standards.

Yes

Group
IRC Standards Review Committee
(1) R1.1.1 requires that models shall represent planned outages of generation and transmission facilities, if specifically known. Does this allow or require a PC/TP to include outages due to maintenance and due to construction programs where certain facilities are out of service during phases of construction as part of the Assessment? Such maintenance and construction schedules are made but may not be finalized over the planning horizon. Further, are planned outages to be treated as creating a "normal system condition" or is the planned outage a contingency from which system adjustments are made prior to subsequent events? (2) MOD 10 and 12 are based on requirements determined by the RRO in MOD 11 and 13 respectively. Is this appropriate? Further, the PC is not an applicable entity in MOD 10 and 12. (3)What are "other data sources"?
(1) When a spare equipment strategy does not cover the long lead time unavailability as stated in 2.1.4, will the system be treated as "normal system condition" or as having a contingency from which system adjustments are to be made prior to subsequent events. (2) Under R2.5 "Past Studies may be used to support the Planning Assessment if they meet the following requirements" and the sub requirement R2.5.2 states that for SS, SC, or stability analysis; the PRESENT system model shall not include any material changes, such as Does this mean that past studies may be used to support planning assessments as long as there are no material changes to the present system model? If so, that would be an impossible scenario to recreate.
No comment.
No comment.
No comment
No comment.
Is the PC expected to distribute the TP Planning Assessments as part of its coordination requirement?
No
The Year One definition is confusing. According to the definition, Year One can start any time between 12 and 18 months from a current calendar year. Is that January 1 of the current calendar year? Further, when does year 2, year 3, etc... start? Is this definition only applicable to the TP?
Yes
The stability studies require significantly more computer time and a more detailed model. The standard should allow the PC/TP to use judgment to manage size and complexity of the study.
Yes
Yes
The 3rd draft states this will be addressed later in the project. Removal of these standards would not affect NERC and the RE's obligations to perform assessments. Will the PC/TP be obligated under NERC Rules of Procedure to provide Assessments to NERC and the Regions upon request?
Individual
Harold Wyble
Kansas City Power & Light
R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.
R2.1.3 – is this indicating that only one of the variations need to be studied? ("...in one or more of the following conditions..."). Recommend having the planner work with the load to determine what sensitivity studies to perform. R2.1.4 – it is unclear as to what should be done with the analysis that incorporates the company's spare equipment strategy. Is this requirement inferring that a company's spare equipment strategy need to ensure that it can still operate to within the requirements for contingencies of Table 1 without the component? R2.2.1 – is the intent to have the study for the 10 year horizon or to include any project that is started within the next 10 years and thus the study must be extended to the forecasted completion of the project (conceivably as long as 20 years or more?) R2.5.2 - Remove the word "intervening" and this requirement must be more specific about what this requirement is trying to communicate and accomplish. R2.6.4 – recommend clarifying how "situations beyond the control of the TP or PC" are determined. It is unclear if this is to imply that if something is outside of the control of the department who conducts the planning studies or if it is outside the control of the registered function's legal entity (i.e. corporation). R2.8 – appears to be nonessential information for reliability; for what purpose does this requirement exist? R2.9 - appears to be nonessential information for reliability; for what purpose does this requirement exist?

R3.3.3: Relay loadability has no bearing beyond the near term horizon. Loadability is not determined several years out. R3.5 – does this imply that mitigation plans must be implemented? If not, then this is highly subjective and the last sentence of this requirement should be deleted.

R4.3 – requires very labor intensive and detailed studies to be conducted; there are concerns about being able to accomplish the required studies within the 24 month implementation period; additionally, while there may be some reliability benefit to requiring these studies have the costs of this reliability increase been studied?; an alternative could be some sort of phased implementation (x% completed by 24months, etc.) R4.3.3 – to what degree is generator relaying factored into the model/study?

The term “proxies” is somewhat confusing; recommend the use of “assumptions” if that is an acceptable substitute.

Why is this needed if both entities must comply with the standard? At a minimum the requirement should include language to state that the one party must provide to the other with enough notice to comply with a required study if there is a shift or assignment of a responsibility.

Recommend deleting the portion of the requirement that states: “coordinating analysis of these results through an open and transparent review process such as described in FERC Order 890.”

Yes

Yes

Yes

No

Regional areas may be made up of multiple Planning Coordinators. It is important to maintain an assessment of an entire Regional Reliability Organizations area. TPL-005 and TPL-006 should not be replaced with this proposed TPL-001.

Consideration of Comments on Third Draft of Standard TPL-001-1 — Project 2006-02

The Assess Transmission Future Needs Standard Drafting Team thanks all commenters who submitted comments on the third draft of the TPL-001-1 standard. This standard was posted for a 45-day public comment period from May 26, 2009 through July 9, 2009. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 85 sets of comments, including comments from more than 170 different people from over 85 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

<http://www.nerc.com/filez/standards/Assess-Transmission-Future-Needs.html>

Due to industry comments and continuing review of Order 693 directives applicable to TPL, changes have been made to the following:

Definitions: Consequential Load Loss, Non-Consequential Load Loss, and Year One

Requirements: R1 and parts 1.1, 1.1.1, 1.1.2, 1.1.3, 1.1.4, 1.1.5, and 1.1.6; R2 and parts 2.1, 2.1.3, 2.1.4 (and bullets 1, 3, and 7), 2.1.5, 2.1.6, 2.2, 2.2.1, 2.3, 2.4, 2.4.1, 2.4.3 (and bullets 1 and 3), 2.5, 2.6.1, 2.6.2, 2.7, 2.7.1 bullet 2, 2.7.2, 2.7.5, 2.7.6, 2.8, 2.8.2, 2.9; R3 and parts 3.1, 3.2, 3.3, 3.3.2, 3.3.3, 3.3.4, 3.4, 3.4.1, 3.5, 3.6; R4 and parts 4.1, 4.1.1, 4.1.2, 4.1.3, 4.2, 4.3, 4.3.2, 4.3.3, 4.3.4, 4.4, 4.4.1, 4.5; R5, R6, R7; R8 and part 8.1.

Measures: M1, M5, M7, and M8.

VSLs: R1, R2, R3, R4, R5, R6, R7, and R8.

Table elements: Header notes 'a', 'c', 'f', and 'k'; P4, P7; extreme event 'a', steady state 1, Stability 1; footnotes: 2, 3, 4, 7, 9, 10, and 11

Implementation Plan

In addition, the SDT has reformatted the standard to meet the latest guidelines.

The SDT feels that the volume and scope of these changes warrants a fourth posting of this standard.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Reliability Standards Development Procedures:
<http://www.nerc.com/standards/newstandardsprocess.html>.

Index to Questions, Comments, and Responses

1. Requirement R1 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	12
2. Requirement R2 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	59
3. Requirement R3 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	176
4. Requirement R4 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	211
5. Requirement R5 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	238
6. Requirement R6 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	245
7. Requirement R7 – Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.	250
8. The SDT changed several definitions in response to industry comments to the second posting. Do you agree with these changes? If not, please clearly indicate which definition you disagree with and provide specific comments.	263
9. Do you agree with the changes in the performance elements and notes in Table 1? If not, please provide specific comments by note number, note alpha character, or performance category. Please note that footnotes 5 and 10 are handled separately in question 10.	289
10. The changes to the Table include the addition/revision of footnotes 5 and 10 that address curtailment of Firm Transmission Service and conditional Firm Transmission Service. Do you agree with the footnotes? If not, please provide specific comments.	332
11. The SDT has provided an Implementation Plan as part of this posting. The plan includes the retirement of TPL-005-0 and TPL-006-0. Do you agree with the elements of the Plan? If not, please provide specific comments.	343

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. Requirement R1 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Summary Consideration: The SDT has made several clarifying changes to Requirement R1 and its various parts based on industry comments. The major changes made were to delete the phrase “including requirements of regulatory authorities and other legal obligations” from Requirement R1, the addition of “existing facilities” to the parts of Requirement R1, changing ‘planned’ outages to ‘known’ outages, combining the part calling for Firm Transmission Service and Interchange, and clarifying the final part as to the use of resources. Measure M1 was revised to provide greater clarity. The VSLs for Requirement R1 have been revised to match the new wording in the requirement.

R1 Each Transmission Planner and Planning Coordinator shall maintain System models within *its* respective area for performing the studies needed to complete *its* Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.

1.1 System models shall represent:

1.1.1 Existing Facilities

1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.

1.1.3 New planned Facilities and changes to existing Facilities

1.1.4 Real and reactive Load forecasts

1.1.5 Known commitments for Firm Transmission Service and Interchange

1.1.6 Resources required to supply Load

M1 Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, *representing* projected System conditions, and that the models represent the required information in accordance with Requirement R1.

R1 VSL	The responsible entity's System model failed to represent one of the Requirement R1, parts 1.1.1 through 1.1.6	The responsible entity's System model failed to represent two of the Requirement R1, parts 1.1.1 through 1.1.6. OR The System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and	The responsible entity's System model failed to represent three of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, parts 1.1.1 through 1.1.6. OR The System model did not represent projected System conditions as described in Requirement

Organization	Question 1 Comment
Dominion - Electric Transmission	<p>R1 - Dominion questions the legal authority NERC has to include the recently inserted language “including requirements of regulatory authorities and other legal obligations.” This language is too broad and far exceeds the jurisdiction of NERC’s mission.</p> <p>R1.1.5 - Dominion has seen base case models built by other transmission entities which do not include area interchanges for all areas and must be solved with area interchange “turned off”. Would these base case models be in violation of R.1.1.5?</p>
<p>Response: The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT believes that the base cases should include any area interchange that is planned between utilities. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>	
Northeast Power Coordinating Council	<p>R1--There needs to be some direction provided on the initial conditions used in the assessment. This guidance should include discussion as to whether or not representations of generator forced outages are to be represented in the base case or if they are addressed through the sensitivity testing (Could add R1.1.7 Reasonable representations of unplanned generator outages.)</p> <p>Additionally, the standard is also silent on the treatment of system transfers, both internal and external, as to how they should be modeled in the base case. For some areas, their current practice is to include heavy system stresses in their base case, which leaves little for sensitivity testing. It is unclear if this practice works within the purview of this standard. Guidance is needed on how to treat base case generation dispatch and system transfers.</p> <p>The inclusion of “requirements of regulatory authorities and other legal obligations” is not understood. Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1.</p> <p>"Simulate" should be changed to "incorporate".</p> <p>R1.1.1 Priority comment. Only known long-term outages of generation and transmission should be required to be modeled.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>R1.1.2 comment - Do we need to have the list of equipment to model? How are circuit breakers, and other equipment modeled? Also, what should be the level of detail and the form that Protection System Equipment and Control Devices be modeled? We recommend deleting the list. Make R1.1.2 simply read as follows: R1.1.2--Projected system configuration, taking into account new planned Facilities and changes to existing Facilities, for each year of the Near-Term and Long-Term Transmission Planning Horizon.</p> <p>R1.1.5 comment What specifically needs to be modeled under Interchange</p> <p>"R1.1.6 comment " This needs further definition or it should be deleted. It is not clear what a network resource required to supply load is. Does this refer to Network Resource per FERC LGIP?</p>
<p>Response: The SDT believes that the outages should be modeled to insure the System reliability during the outage durations. If a Transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-Contingency. All performance criteria would then apply to that new base case. Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed "including requirements of regulatory authorities and other legal obligations" since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within their respective areas for performing the studies needed to complete their Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has changed the word "simulate" to "represent" in Requirement R1.</p> <p>Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices is typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list as they are already covered in the Corrective Action Plan under Requirement R2, part 2.7. Existing Facilities are now shown under Requirement R1, part 1.1.1.</p> <p>1.1.1 Existing Facilities</p> <p>Interchange is defined in the NERC glossary as "energy transfers that cross Balancing Authority boundaries" while Firm Transmission Service is "the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption." Requirement R1, part 1.1.5 has been revised to include</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>known commitments for Firm Transmission Service and Interchange.</p> <p>The intent of the SDT was that this includes network resource as per the FERC LGIP but that it is not limited to that. The SDT has clarified the wording for Requirement R1, part 1.1.6.</p> <p>1.1.6 Resources required to supply Load</p>
<p>Transmission Planning</p>	<p>R1.1. COMMENT: Should read: Models for performing the studies needed to complete the Planning Assessment shall represent: instead of Models for the Planning Assessment shall represent:</p> <p>R1.1.1. COMMENT: Should the requirement specify which known outages should be modeled? For example, would it be considered incomplete and therefore a violation if a known generator maintenance outage with a one week duration is not included (not modeled off-line) in a case that represents a full summer season at peak conditions? Please provide guidelines as to what duration outages should be modeled in representative planning horizon cases. (i.e. one day, several days, one week, one month, in a case that represents a significantly longer time period.)</p> <p>R1.1.2. COMMENT: Should add Transformers to this list;</p> <p>COMMENT: What is meant by “represent” - Planning models do not typically include explicit Circuit breaker modeling. The planning models used for power flow, dynamics and short circuit analysis represent the power system with busses and branches. The effect of circuit breakers is taken into account as part of contingency modeling. Including circuit breakers as a sub-requirement is likely to result in transmission planners being required to demonstrate that circuit breakers are modeled. Explicit representation of circuit breakers with existing software would result in major convergence problems due to large number of low impedance branches.</p> <p>COMMENT: Should clarify "Protection System equipment" to apply only to system stability models. Does this mean all relays on the system must be included in the dynamics modeling? While a certain limited number of protective relays can be modeled with the software used for dynamics, it is not practical to model more than a very small percentage of the protection systems used in the BES. Including protective relays as a sub-requirement is likely to result in transmission planners being required to demonstrate that all protective relays are modeled which is an impossible task. The modeling of protective relays should be caveated with as deemed appropriate.</p> <p>COMMENT: "Control devices" Should be specific. Is this for Phase Angle Regulators (PAR), Synchronous Condensers, Static Var Compensators (SVC), exciters, governors etc? Control devices should be specifically defined as the following: PAR, SVC, HVDC.</p> <p>COMMENT: "New technologies" seems too broad. Needs to be better defined. Planning models may not have the capability to adequately model new technologies.</p> <p>R1.1.4. Firm Transmission Service COMMENT: Should add that is expected to be utilized in the study case scenario because not all Firm Transmission Service can be included in every study case model. Some firm transmission reservations (Network Resources that could be Reserves) are used optionally depending upon the availability of other Network resources.</p> <p>The following apply to all VRF, Time Horizon, Measure, Data Retention, and VSL for all requirements in the standard.VRF: Agree. No comment.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>Time Horizon: COMMENT: Long-Term Planning This is confusing. Is it only the newly defined Long-Term Transmission Planning Horizon? Shouldn't it include the Near-Term Transmission Planning Horizon Suggest Long-Term and Near-Term Transmission Planning Horizon as used in definitions.</p> <p>Measure: Agree. No comment.</p> <p>Data Retention: Agree. No comment.</p> <p>VSL: Are bullets in requirements all required? (I.e. If circuit breakers are not explicitly modeled, as the bullet list in R1.1.2 seems to indicate, is it a violation?)</p> <p>What is meant by did not simulate projected System conditions as described in R1.</p> <p>How are projected System conditions criteria described in R1?</p>
<p>Response: The SDT has reworded the requirement.</p> <p>1.1 System models shall represent:</p> <p>Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list as they are already covered in the Corrective Action Plan under Requirement R2, part 2.7.</p> <p>The SDT has revised Requirement R1, part 1.1.2 to provide clarity.</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). New technologies were removed from the equipment list under Requirement R1, part 1.1.2 since these are already covered in the Corrective Action Plan under Requirement R2, part 2.7</p> <p>Models are only specific to the case study. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The <i>Time Horizon</i> term at the end of the requirement deals with mitigation time periods (as shown below) and is not connected to the assessment time frames. Time Horizons are a consideration when there is a violation of a requirement – the impact to the BES of violating a requirement with a long-term planning horizon is not expected to be as severe as the impact associated with violating a requirement with a real-time operations time horizon. No change made.</p> <p>Mitigation Time Horizon - The time horizons available for mitigating a violation to a requirement include the following::</p> <ul style="list-style-type: none"> • Long-term Planning — a planning horizon of one year or longer.

Organization	Question 1 Comment
--------------	--------------------

- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Thank you for your response on Measures and Data Retention.

The SDT has removed the equipment list. Transmission lines, generators, and reactive power devices were removed from the equipment list due to already being included in MOD standards. Circuit breakers, Protection System equipment, and control devices were removed from the equipment list since these items are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note c in Table 1. New technologies were removed from the list as they are already covered in the Corrective Action Plan under Requirement R2, part 2.7.

The SDT has deleted the equipment list.

The SDT has replaced "simulate" with "represent" under the Severe VSL category for R1.

R1 VSL	The responsible entity's System model failed to represent one of the Requirement R1, parts 1.1.1 through 1.1.6	The responsible entity's System model failed to represent two of the Requirement R1, parts 1.1.1 through 1.1.6. OR The System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.	The responsible entity's System model failed to represent three of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, parts 1.1.1 through 1.1.6. OR The System model did not represent projected System conditions as described in Requirement R1.
---------------	--	--	---	--

Requirement R1 contains the requirements needed for creating proper base cases.

SERC Engineering Committee Planning Standards	R1.1.2: In bullet three of R1.1.2, are bus-tie circuit breakers to be represented in the models? Typically circuit breakers are included in the contingency definitions along with the protection system equipment used in the power flow models. The number of zero impedance branches which can presently be modeled using PSS/E software is limited to 4000. Also, the number of buses

Organization	Question 1 Comment
Subcommittee	included in the power flow models would increase with additional breaker modeling. Protection System Equipment: The SDT stated during its June 30th Webinar that protection system equipment need not be explicitly represented in models, but had difficulty in determining adequate wording for the proposed sub-requirement. Because protection system action is described in R3.3.1, R3.3.4, R4.3.1, and R4.3.3 we suggest that protection system equipment be removed from the list in R1.1.2.
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p>	
Modesto Irrigation District	<p>Comment: Are all bullets under R1.1.2 required to be explicitly modeled or are the effect of the devices or the effect of the removal of the devices to be modeled? We don't explicitly model circuit breakers or explicitly model protection system equipment in the steady state model.</p> <p>R1.1.4 should refer to expected transfers to be consistent with the bullet under R2.1.3.</p> <p>Please explain the difference between R1.1.4 and R1.1.5</p>
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>Requirement R1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>Interchange is defined in the NERC glossary as "energy transfers that cross Balancing Authority boundaries" while Firm Transmission Service is "the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption."</p>	
OPUC	<p>1. Requirement R1 Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments: A: Language in R1.1.2 still needs further clarification. Base case models do not clarify modeling required for the effect or absence of circuit breakers, protection system equipment and control devices.</p> <p>B: Clarity would be increased were R1.1.4 to refer to expected transfers rather than Firm Transmission Service, permitting the elimination of then redundant R1.1.5</p> <p>C: Removing "including requirements of regulatory authorities and other legal obligations" at the end of R1 would also eliminate redundant text.</p>
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed "including requirements of regulatory authorities and other legal obligations" since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective areas for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>
<p>Bonneville Power Administration PacifiCorp Deseret Generation & Transmission SRP Southern California Edison Company Pacific Gas and Electric Co, NV Energy San Diego Gas and Electric Co California ISO</p>	<p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome.</p> <p>Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.</p> <p>We disagree with the inclusion of the words including requirements of regulatory authorities and other legal obligations at the end of R1. Entities already are required to do this. It does not need to be included in the standard.</p>
	<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Organization	Question 1 Comment
	<p>powerflow models would increase with additional breaker modeling.</p> <p>In R1.1.2, don't we need to also represent the existing transmission system, and not just changes to the existing system</p> <p>In R1.1.2, does the phrase for each year signify each year for which assessment work was performed, or each year of the Near-Term and Long-Term Transmission Planning Horizon? The phrase, for each year of the Near-Term and Long-Term Transmission Planning Horizon, should be revised to remove each year because there may not be studies in each year.</p> <p>In bullet five of R1.1.2, what protection system equipment is to be included in the stability models</p> <p>In bullet seven of Requirement R1.1.2, what "new technologies" are to be represented in the models Concerned about only having one year to implement all new modeling requirements - especially the additional relay requirements noted in R1.1.2. The SDT stated during its June 30th Webinar that protection system equipment need not be explicitly represented in models, but had difficulty in determining adequate wording for the proposed sub-requirement. Because protection system action is described in R3.3.1, R3.3.4, R4.3.1, and R4.3.3 we suggest that protection system equipment be removed from the list in R1.1.2.</p> <p>There may be a potential conflict between MOD-010 and MOD-012 and legal documents such as Interconnection Agreements e.g. IA may specify a capacity level that exceeds the reported test levels. In the case of such conflicts, which one should rule?</p> <p>There may be a need to add definitions to discern the difference between planned and proposed projects.</p> <p>Suggest replacing circuit breakers in R1.1.2 with terminal equipment since circuit breakers are covered by Protection System Equipment.</p> <p>Does there need to be a reference in R1 to NERC Reliability Assessment Guidebook version 1.2 on pp 17-18 for everyone to use a 50/50 load forecast for inclusion in the planning models??</p> <p>R1.1.4 Firm Transmission Service - a single source can have transmission service to multiple sinks, and can be associated with transmission service in excess of the capacity of the source. There is a lack of clarity regarding the means by which Firm Transmission Service, a marketing term, is to be included in planning models. For example, should the standard define how to model wind farms (100% - off-peak and 20% on-peak, based on firm capacity from the wind generators, or other dispatch levels)? Not sure if this is applicable to Requirement 1 or 2.</p>
	<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.</p> <p>The SDT has revised Requirement R1, part 1.1.1 to include "existing system".</p> <p>1.1.1 Existing Facilities</p> <p>The reference to "year" has been removed from Requirement R1, part 1.1.2 (now part 1.1.3)</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>Requirement R1, part 1.1.2 (now part 1.1.3) has been revised as described above.</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). New technologies were removed from the equipment list in Requirement R1, part 1.1.2 (now part 1.1.3) since these are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>In Draft 1, the SDT proposed using the terms “planned” and “committed” (similar to your proposal of proposed and planned) to distinguish the “firmness” of projects. Based on industry comments, the SDT eliminated the terms from Draft 2. No change made.</p> <p>Requirement R1, part 1.1.2 (now part 1.1.3) has been revised as described above.</p> <p>The SDT does not believe that a reference is needed to the NERC Reliability Assessment Guidebook since most utilities are using at least a 50/50 Load forecast as a minimum. No change made.</p> <p>The SDT believes that all firm Transmission contracts should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>
<p>FirstEnergy Corp</p>	<p>As stated in prior comment periods, we hold the opinion that the TPL-001-1 standard should start from the premise that a valid system model exist based on MOD-010, MOD-012 and other FERC approved MOD standards that are not referenced by this TPL-001-1 standard. The inclusion of R1 introduces an overlap and potential for double jeopardy violations that need not occur. The TPL-001-1 standard should not delve into model building and keep to its core purpose of assessing future performance of the BES. Specific comments, Requirements of R1A.</p> <p>R1.1.2: The last bullet "New Technologies" is too vague and should be struck from the requirement.</p> <p>B. R1.1.4: It is not well understood how "Firm Transmission Service" would be evaluated by a compliance auditor when reviewing a simulation model. The models contain agreed upon Interchange Transactions between BA areas, but no details are provided to reflect individual Firm Transmission Service arrangements. In reality only the net-Interchange values between BA areas are reflected in the simulation models.</p> <p>C. R1.1.6: FE believes this requirement would be more accurately assigned to the Resource Planner or Load Serving Entity and not the Transmission Planner.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	We agree with the stated Measures, VRF, Time-Horizon, Data Retention and VSL of requirement R1
	<p>Response: The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The SDT believes that the Transmission Planner/Planning Coordinator is responsible for incorporating this information into the System models. No change made.</p> <p>Thank you for your response on Measures et al.</p>
IRC Standards Review Committee	<p>(1) R1.1.1 requires that models shall represent planned outages of generation and transmission facilities, if specifically known. Does this allow or require a PC/TP to include outages due to maintenance and due to construction programs where certain facilities are out of service during phases of construction as part of the Assessment? Such maintenance and construction schedules are made but may not be finalized over the planning horizon. Further, are planned outages to be treated as creating a “normal system condition” or is the planned outage a contingency from which system adjustments are made prior to subsequent events”</p> <p>(2) MOD 10 and 12 are based on requirements determined by the RRO in MOD 11 and 13 respectively. Is this appropriate? Further, the PC is not an applicable entity in MOD 10 and 12.</p> <p>(3)What are “other data sources”?</p>
	<p>Response: The SDT believes that the outages (if known) should be modeled to insure the System reliability during the outage durations. If a Transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-contingency. All performance criteria would then apply to that new base case. Requirement R1, part 1.1.2 (now part 1.1.3) has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT understands that MOD-010 and -012 are impacted by MOD-011 and -013. The Planning Coordinator is not applicable - but has to utilize data provided by others such as in MOD-010 and -012.No change made.</p> <p>The SDT had removed the reference to “other data sources” under Requirement R1.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>
TVA System Planning	<p>The phrase, for each year of the Near-Term and Long-Term Transmission Planning Horizon, should be revised to remove each year because there may not be studies actually required in each year.</p> <p>The SDT stated during its June 30th Webinar that protection system equipment need not be explicitly represented in models, but had difficulty in determining adequate wording for the proposed sub-requirement. Because protection system action is described in R3.3.1, R3.3.4, R4.3.1, and R4.3.3 we suggest that protection system equipment be removed from the list in R1.1.2.</p> <p>If R1.1.2 is not removed, TVA is concerned about the level of resources that will be required to model these additional relay requirements in the one year allowed in the Implementation Plan.</p> <p>In bullet three of R1.1.2, are bus-tie circuit breakers to be represented in the models? Typically circuit breakers are included in the contingency definitions along with the protection system equipment used in the powerflow models.</p> <p>In bullet seven of Requirement R1.1.2, what "new technologies" are to be represented in the models?</p>
<p>Response: The reference to “year” has been removed from Requirement R1, part 1.1.2 (now part 1.1.3).</p> <p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>See Requirement R1, part 1.1.2 comment above</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). New technologies were removed from the Requirement R1, part 1.1.2 list (now part 1.1.3) and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p>	
Southern Company	<p>The VSLs for Requirement R1 incorporates several sub-requirements but neglects one of the three components of the main requirement. Consider that R1 requires the TP and RC to (a) maintain System models, (b) use data consistent with certain MOD standards, and (c) simulate projected System conditions. Because the first component is not a part of the proposed VSL and the</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>purpose of this standard mentions a broad spectrum of System conditions, the recommendation is to add maintaining the system model into the VSLs for R1.</p> <p>R1.1.3 uses the terminology real and reactive Demand of Load. We suggest striking the word "Demand" because it refers only to real power.</p> <p>We recommend the the SDT limit R1 to load flow and stability models.</p> <p>Does R1 apply to short circuit models? If so does this imply that the short circuit model must be the same as the load flow model?</p>
<p>Response: The SDT revised the VSLs for Requirement R1 to align with the changes made to the requirement – note that the revised R1 does not use the word, “simulate.”</p> <p>The SDT has modified Requirement R1, part 1.1.3 (now part 1.1.4).</p> <p style="padding-left: 40px;">1.1.4 Real and reactive Load forecasts</p> <p>The SDT believes that Requirement R1 also contains some requirements that are necessary for short circuit cases but R1 does not require the models to be the same, since different software applications may be used. No change made.</p>	
<p>United Illuminating Northeast Utilities ISO New England, Inc. Central Maine Power Company</p>	<p>R1 Priority Comment- There needs to be some direction provided on the initial conditions used in the assessment. This guidance should include discussion as to whether or not representations of generator forced outages are to be represented in the base case or if they are addressed through the sensitivity testing (Could add R1.1.7 Reasonable representations of unplanned generator outages.)</p> <p>Additionally, the standard is also silent on the treatment of system transfers, both internal and external, as to how they should be modeled in the base case. For some areas, their current practice is to include heavy system stresses in their base case, which leaves little for sensitivity testing. It is unclear if this practice works within this standard.</p> <p>R1.1.1 Priority comment R1.1.1 should be removed. It seems like there is an overlap between the requirements of this standard and Operational Planning studies with respect to known outages. Planned outages are addressed by our Operational Planning processes and Transmission Operating Procedures removing the need for this to be incorporated into Planning Assessments. In addition, outages are not generally known years in advance</p> <p>R1 Comment We do not understand what it means to include requirements of regulatory authorities and other legal obligations. Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1.</p> <p>R1.1.2 comment - Do we need to have the list of equipment to model? How do we model circuit breakers, etc? We recommend deleting the list. Make R1.1.2 simply read: R1.1.2 New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon.</p> <p>R1.1.5 comment What specifically needs to be modeled under Interchange</p> <p>R1.1.6 comment This needs further definition or it should be deleted. It is not clear what a network resource required to supply load is. Does this refer to Network Resource per FERC LGIP?</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>Response: The SDT believes that the outages should be modeled to insure the System reliability during the outage durations. If a Transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-contingency. All performance criteria would then apply to that new base case. Requirement R1, part 1.1.2 (now part 1.1.3) has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>Interchange is defined in the NERC glossary as “energy transfers that cross Balancing Authority boundaries” while Firm Transmission Service is “the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.”</p> <p>Requirement R1, part 1.1.6 has been broadened while still incorporating Network Resources.</p> <p>1.1.6 Resources required to supply Load</p>
<p>System Protection and Transmission Planning Department</p>	<p>R1 the requirement to maintain System models for performing the studies is redundant with MOD-010, and should be moved to MOD-010.</p> <p>The phrase that requires model data used in Studies used for Annual Assessments be consistent with data submitted under MOD-010 seems OK.</p> <p>R1.1.2, a sub-requirement of R1.1, states that models for Planning Assessments shall represent “new planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon”. Is this a requirement for maintaining a case representing every year of the near-term and long-term planning horizons (i.e. 10 cases)? We do not think that is what the SDT had in mind. If all that is required to remain cognizant of Facility In-Service dates so that topology is reliable, please so state. To make this read clearer, we suggest you take out the phrase for each year .</p> <p>Regarding bullet 5 of R1.1.2, does inclusion of Protection System equipment require modeling of all relays in dynamic studies? The NERC definition of Facility pertains to equipment energized at primary voltages, not Protective System equipment. We</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>suggest the Protective Systems be eliminated from this list. To make this read clearer, we suggest you delete text and bullet items following Transmission Planning Horizon.</p> <p>Regarding R1.1.2 bullet items: The bullets list examples of Facilities. This list is not needed, since the term Facility is already defined in the NERC Glossary. If you do not remove all bullets, then we warn you that the bullet "New Technologies" can be interpreted to cover a broad range of topics by an auditor and is not clearly defined by NERC, so we cannot visualize measurable documentation.</p>
<p>Response: The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. No change made.</p> <p>Thank you for your response.</p> <p>The reference to “year” has been removed from Requirement R1, part 1.1.2 (now part 1.1.3).</p> <p style="padding-left: 40px;">1.1.3 New planned Facilities and changes to existing Facilities</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The bulleted list has been deleted.</p>	
PPL Energy Plus	<p>PPL agrees with the requirement that regulatory and legal requirements need to be respected in planning studies.</p> <p>Also, Requirement R1.1.6 appears to conflict with FERC Pro-forma OATT Section 30.4 in that Network Resource output should not be limited as this Requirement states.</p>
<p>Response: The SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p style="padding-left: 40px;">R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>Requirement R1, part 1.1.6 has been broadened while still incorporating Network Resources.</p> <p style="padding-left: 40px;">1.1.6 Resources required to supply Load</p>	
Western Area Power Administration	<p>Since the modeling data used for the Planning Assessment is initially created and governed per Mod-10 & Mod-12 Standards, this requirement should be clarified to include maintain revisions of the modeling data required to perform the Planning Assessment</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	and not just "maintain system models for performing the studies needed to complete their Planning Assessment?."
Orlando Utilities Commission	-This section is very clear. Section R1.1.1 brings clarity to the question regarding planned outages.-The phrase Models shall use data consistent with MOD-010?, is the intent for the data to be "identical" to the data provided under MOD-10 and -12, or
Kansas City Power & Light	R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.
<p>Response: The SDT has modified Measure M1 to use the latest data available.</p> <p>M1 Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.</p>	
Tampa Electric	<p>R1 Ensure that statement reflects that TP and PC are only responsible for their planning area.</p> <p>R1.1.2 Add transformers to list and clarify modeling of circuit breakers and protection system equipment. Models should reflect the effect of this equipment, not the actual equipment.</p> <p>R1.1.4 Models should only reflect firm transmission service that is expected to be utilized in the study case.</p> <p>Consider changing effective dates of all requirements to be the same date so that you do not have to meet two standards during the same time period.</p>
<p>Response: The SDT had modified Requirement R1 to state that the Transmission Planner/Planning Coordinator are each responsible for maintaining System models for its respective area.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement r4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that all firm Transmission should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
<p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>	
<p>The SDT believes that certain steps need to be taken in succession to allow utilities to progress toward meeting the new requirements - while not placing an undue burden for utilities to meet all the new requirements at the same time. Also additional time is needed for many utilities to meet "raising the bar" requirements that may be required and which could take considerable lead time. No change made.</p>	
<p>Florida Reliability Coordinating Council, Inc - Transmission Working Group</p>	<p>R1 and M1: Consider clarifying that it is not the TP or PC responsibility to independently verify the consistency of the System models for portions of the Bulk Electric System outside of the TP or PC planning area (related to not using data consistent with data submitted as part of MOD-010 and MOD-012, each TP and PC should not have to review the data submitted by those outside of its planning area, but only its own planning area).</p> <p>Please Clarify the phrase Models shall use data consistent with .MOD-010 is the intent for the data to be identical to the data provided under MOD-10 and MOD-12, or consistent meaning that the data might be older or newer depending on when the assessment took place vs when the data was submitted.</p> <p>R1.1 Consider changing Assessment (which does not include models) or re-wording to Models for performing the studies needed to complete the Planning Assessment shall represent: R1.1.1 Brings clarity to the question regarding planned outages.</p> <p>R1.1.2: Consider adding "Transformers" to the list of facilities.</p> <p>R1.1.2, please clarify what the drafting team intentions are for Circuit Breakers. Planning models used for power flow, dynamics and short circuit do not include circuit breakers. Modeling circuit breakers would cause convergence problems in the models due to that large number of zero impedance line sections. We suggest eliminating circuit breaker from the bullet list.</p> <p>R1.1.2 Protection System equipment this should be clarified to only apply to system stability models. The modeling of protective relays should be caveated with as deemed appropriate. We suggest eliminating Protection System equipment from the bullet list.</p> <p>R1.1.4 Consider adding that is expected to be utilized in the study case scenario not all Firm Transmission can be included in all studies and are only used upon the availability of other resources .</p> <p>Consider changing the effective dates of R1 and R7 to take effect at the same time as R2 through R6 so you do not have to meet two standards during the same time period. Otherwise, clarify how the effective date impacts which version of the standard is to be used in an assessment before a scheduled compliance audit.</p>
<p>Response: The SDT has modified Requirement R1 to state that the Transmission Planner and Planning Coordinator are each responsible for maintaining System models for its respective area.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. The SDT has incorporated these additional requirements with the intent that they will be removed from the TPL standard when they are incorporated into the MOD standards at a</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>later date. The SDT has modified Measure M1 to use the latest data available.</p> <p>M1 Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.</p> <p>The SDT agrees and has reworded Requirement R1, part 1.1.</p> <p>1.1 System models shall represent:</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The SDT believes that certain steps need to be taken in succession to allow utilities to progress toward meeting the new requirements - while not placing an undue burden for utilities to meet all the new requirements at the same time. Also additional time is needed for many utilities to meet "raising the bar" requirements that may be required and which could take considerable lead time. No change made.</p>
<p>FMPA</p>	<p>R1, consider clarifying that it is not the TP or PC responsibility to independently verify the consistency of the System models for portions of the Bulk Electric System outside of the TP or PC planning area (related to not using data consistent with data submitted as part of MOD-010 and MOD-012, each TP and PC should not have to review the data submitted by those outside of its planning area, but only its own planning area).</p> <p>R1.1.2: Consider adding Transformers to the list of facilities. R1.1.2, please clarify what the SDTs intentions are for Circuit Breakers. Planning models used for power flow, dynamics and short circuit do not include circuit breakers. Modeling circuit breakers would cause convergence problems in the models due to that large number of zero impedance line sections. We suggest clarifying that the intent is to develop planned Facility Ratings in the models to reflect new Circuit Breakers, and to reflect the location and timing of circuit breakers in contingency lists, and not to model the actual circuit breakers.</p> <p>R1.1.2 "Protection System equipment should be clarified to only apply to system stability models. The modeling of protective relays should be caveated with as deemed appropriate. We suggest clarifying that the intent is, for power flow and short circuit studies, Protection System Equipment would be incorporated into Facility Ratings and the contingency list. And we suggest further clarifying that the intent is the same for Stability Studies, with the addition of modeling Protection System equipment that could significantly impact stability response (e.g., out-of-step relaying) as deemed appropriate through engineering judgment.</p> <p>R1.1.4 Consider adding "that is expected to be utilized in the study case scenario" not all Firm Transmission can be included in all studies and are only used upon the availability of other resources (for instance, if there are two firm point-to-point contracts in opposite directions across the same Interchange, both probably ought not to be modeled at the same time).</p> <p>Consider changing the effective dates of R1 and R7 to take effect at the same time as R2 through R6 so you do not have to meet</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	two standards during the same time period. Otherwise, clarify how the effective date impacts which version of the standard is to be used in an assessment before a scheduled compliance audit.
	<p>Response: The SDT had modified Requirement R1 to state that the Transmission Planner/Planning Coordinator are each responsible for maintaining System models for its respective area.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that all firm Transmission should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The SDT believes that certain steps need to be taken in succession to allow utilities to progress toward meeting the new requirements - while not placing an undue burden for utilities to meet all the new requirements at the same time. Also additional time is needed for many utilities to meet "raising the bar" requirements that may be required and which could take considerable lead time. No change made.</p>
Progress Energy Carolina (PEC)	PEC would like clarification on the following: "Models for the Planning Assessment shall represent: Circuit Breakers, Protection System Equipment, etc." The clarification should state that the models do not have to explicitly include these elements as long as their effect can be modeled.
	<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p>
Gainesville Regional Utilities	<p>Concerning the effective dates of R1 & R7, I suggest that you move them to be effective at the same time as R2 through R6 so you will not have to try to meet two standards during the same time period.</p> <p>Effective Date: Clarify how the effective date impacts which version of the standard (and its reference numbering) is to be used in an assessment just before (in cycle) a scheduled compliance audit.</p> <p>Suggest that the term "Corrective Action Plan" be retitled to "Improvement Action Plan" because the first implies that the situation is "wrong or incorrect" which may not be the case.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>Response: The SDT believes that certain steps need to be taken in succession to allow utilities to progress toward meeting the new requirements - while not placing an undue burden for utilities to meet all the new requirements at the same time. Also additional time is needed for many utilities to meet "raising the bar" requirements that may be required and which could take considerable lead time. No change made.</p> <p>The Effective Date of the requirements in force at the time the Planning Assessment is completed will dictate which requirements are the governing requirements.</p> <p>The SDT believes that the term "Corrective Action Plan" (a defined term) is sufficient due to lack of comments received from industry requesting this change. No change made.</p>
JEA	<p>Reword R1.1.2. New planned Facilities and changes to existing and old planned Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon where such Facilities affect the electric connectivity and topology of the system or affects the accurate simulation of system disturbance response where practical. [Delete bulleted list]Add R1.2. Where it is not practical to model all Facilities composing the electric system connectivity and topology, consideration of those Facilities and their affect on the model simulations shall be documented in detail in the annual Planning Assessment where appropriate.</p> <p>This addition may not be necessary with rewording of R3.</p>
	<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p>
NorthWestern Corporation NorthWestern Energy (NWE) (NWMT)	<p>The system models that are described in MOD-010 Requirement1, MOD-011 Requirement 1, MOD-012 Requirement 1, and MOD-013 Requirement 1 do not address all the bulleted items under R.1.2. Circuit breakers, protection system equipment and control devices are not modeled. Rather, the effect of these devices, such as circuit breaker misoperation, thermal overload, etc., on the transmission system are modeled. The wording of these bullets should be corrected to match what is actually modeled.</p> <p>Firm Transmission Service, listed in R.1.1.4, is not specifically addressed in MOD-010. Requirement 1 of MOD-010 states existing and future Interchange Schedules as data requirements for steady-state modeling and simulation. Models in the West do not model Firm Transmission Service as such. It is difficult to know what the Firm Transmission Service will be in the future. This is particularly true in regions where there is a predominance of merchant generation and proposals for the interconnection of new merchant generation. It is more reasonable to estimate the expected interchanges. The definition for Interchange Energy transfers that cross Balancing Authority boundaries describes the modeling requirement better that the definition of Firm Transmission Service The highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruptions. The wording Expected Transfers" is used in R2.1.3 and R2.4.3. To maintain consistency, this term could be used in R.1.1.4 and could also be substituted in Table 1 for Firm Transmission. From a Planning perspective, since Firm Transmission cannot be determined from a study model. R1.1.4 and R1.1.5 should be deleted and replaced with a requirement to model expected transfers on interconnections with neighboring Balancing Authorities.</p> <p>For study purposes R.1.1.6 is not needed either. In the models, the load represented is served by the generators modeled. Network Resources are more in tune with local area studies that ensure that the network load can be served by the network</p>

Organization	Question 1 Comment
	<p>resources over available transmission.</p> <p>The words “including requirements of regulatory authorities and other legal obligations at the end of R1. does not need to be in the standard.</p>
	<p>Response: The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>Interchange is defined in the NERC glossary as “energy transfers that cross Balancing Authority boundaries” while Firm Transmission Service is “the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.” Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p style="text-align: center;">1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The SDT believes that Requirement R1, part 1.1.6 is still required but it has been broadened.</p> <p style="text-align: center;">1.1.6 Resources required to supply Load</p> <p>The SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions</p>
SMUD	<p>R1: The requirement should end after the words "shall simulate projected System conditions.”.</p> <p>The following words should be deleted as it results in a clause that is overly broad and does not specify clear and concise reliability requirements: "including requirements of regulatory authorities and other legal obligations".</p>
	<p>Response: The SDT agrees and has changed Requirement R1 accordingly.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>
Progress Energy Florida, Inc.	<p>For R1.1.2, PEF has the following comments:T-T Transformers, as major components of the BES, should be on this list.PEF does not object to the inclusion of Circuit Breakers on this list, provided that representation is not required in steady state load flow</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>cases. Breaker failure scenarios can be extensively studied in the steady state and stability realms by removing from service the transmission facilities that such a breaker event would initiate. PEF assumes that the inclusion of Protection System Equipment applies only to Stability Analysis. As for breakers, relay failure scenarios can be extensively studied in the steady state realm by removing from service the transmission facilities that such a relay event would initiate. Additionally, PEF also assumes that a comprehensive modeling of all Protection System Equipment (e.g. Transformer Sudden Pressure Relays, Bus Diff Relays, etc.) in Stability Analysis is not required, since only a limited amount of relaying in dynamic modeling is needed to adequately model the system with respect to what transmission/generation components would trip for a given event. A lack of specificity on the term Control devices leaves it open to wide interpretation. The SDT should, in detail and/or with examples, state what is intended.</p> <p>The term New technologies is only acceptable for inclusion if provision is made for the fact that Planning analysis software often lags behind the design industry in getting new technologies modeled such that Planners can analyze them.</p> <p>For R1.1.4 on Firm Transmission Service: PEF assumes that the SDT understands that some firm transmission service is not always modeled in every case, depending upon the economics and availability of alternate resources.</p>
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that all firm Transmission should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p style="text-align: center;">1.1.5 Known commitments for Firm Transmission Service and Interchange</p>	
Xcel Energy	<p>R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.</p>
<p>Response: The SDT has modified Measure M1 to use the latest data available.</p> <p>M1 Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.</p>	
Arizona Public Service Co	<p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of</p>

Organization	Question 1 Comment
	Near term assessment.
	<p>Response: Requirement R7 (formerly Requirement R6) requires the Transmission Planner and Planning Coordinator to determine and identify joint responsibilities. The SDT believes that having this as a separate requirement is sufficient. No change made.</p> <p>The SDT believes that the VSLs for Requirement R1 are already sufficient based on lack of industry comments. Note that the VSLs were modified to conform to the changes made to the requirement. Violation Risk Factors assess the impact to the BES of violating a requirement – not VSLs.</p> <p>Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p style="text-align: center;">1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p>
Western Area Power Administration	<p>General, all-encompassing comment: The change in TPL Standards, while well intended, will be difficult to administer since it has taken a simple Performance Table and translated it into a legal-type document that is very complex to relate to the physical system for the planning and operations staff. The performance requirements must be related to the physical response characteristics of the interconnected system operation without depending on a legal advise for training my new transmission system planning staff.</p> <p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome.</p> <p>Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.</p> <p>I disagree with the inclusion of the words including requirements of regulatory authorities and other legal obligations at the end of R1. Entities already are required to do this. It does not need to be included in the standard.</p>
	<p>Response: The SDT believes that it is following the intent of FERC and NERC in creating a reliable Bulk Electric System by following the requirements in TPL 001-1.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is “the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.” Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p style="text-align: center;">1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>
<p>Ameren</p>	<p>There may be a potential conflict between MOD-010 and MOD-012 and legal documents such as Interconnection Agreements e.g. IA may specify a capacity level that exceeds the reported test levels. In the case of such conflicts, it is not clear which one should rule.</p> <p>Suggest replacing circuit breakers in R1.1.2 with terminal equipment since circuit breakers are covered by Protection System Equipment.</p> <p>Consider adding a reference in R1 to NERC Reliability Assessment Guidebook version 1.2, pp 17-18 for use of a particular load forecast level for inclusion in the planning models. I</p> <p>n R1.1.2, revise the language to show that we need to also represent the existing transmission system, and not just changes to the existing system.</p> <p>In R1.1.2, Clarification is needed for the phrase for each year should signify only those years for which assessment work was performed, rather than each year of the Near-Term and Long-Term Transmission Planning Horizon. There typically is not a model built for each year of the Near-Term and Long-Term Transmission Planning Horizon.</p> <p>In bullet three of R1.1.2, it is not clear whether bus-tie circuit breakers to be represented in the models. Typically circuit breakers are included in the contingency definitions along with the protection system equipment used in the powerflow models. The number of zero impedance branches which can presently be modeled using PSS/E software is limited to 4000. Also, the number of buses included in the powerflow models would increase with additional breaker modeling.</p> <p>In bullet seven of Requirement R1.1.2, what "new technologies" are to be represented in the models"</p> <p>R1.1.4 Firm Transmission Service - a single source can have transmission service to multiple sinks, and can be associated with transmission service in excess of the capacity of the source. There is a lack of clarity regarding the means by which Firm Transmission Service, a marketing term, is to be included in planning models. For example, should the standard define how to model wind farms (100% - off-peak and 20% on-peak, based on firm capacity from the wind generators, or other dispatch levels)?</p>
	<p>Response: The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT does not believe that a reference is needed to the NERC Reliability Assessment Guidebook since most utilities are using at least a 50/50 Load forecast as a minimum. No change made.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>The SDT has revised Requirement R1, part 1.1.1 to include "existing Facilities".</p> <p>1.1.1 Existing Facilities</p> <p>The SDT has deleted the reference to year.</p> <p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>See response to Requirement R1, part 1.1.2 above. .</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). New technologies were removed from the list in Requirement R1, part 1.1.2 (now part 1.1.3) and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that all firm Transmission contracts should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>
Puget Sound Energy, Inc.	<p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome.</p> <p>Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.</p>
	<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is "the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption." Tenaska, Inc.	<p>It is not clear that Requirement R1 requires ALL existing generators, substations, transmission line, transformers, etc. to be explicitly modeled for steady state and stability studies. In fact, Requirement 1.1.6 could be interpreted to exclude various generators from the models if they are not contracted to supply load. A suggestion is to re-word R1.1 to read as follows:R1.1 Models for the Planning Assessment shall represent all existing generators, substations (including specific busses within a substation), transmission lines, loads, capacitors, reactors, and other equipment connected to the transmission system and shall</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>further represent the following:(continue with R1.1.1 through R1.1.6)</p> <p>A further refinement to R1.1.6 should also be considered as follows:R1.1.6 Commitment and dispatch schedules of resources expected to serve Load for the specific model.</p>
<p>Response: The intent of the SDT is to model all bulk electric Transmission Facilities depending on the model used - whether for load flow, Stability, or short circuit. The SDT has modified Requirement R1, part 1.1 to provide better clarity on these models.</p> <p>1.1 System models shall represent:</p> <p>Requirement R1, part 1.1.6 has been broadened while still incorporating Network Resources.</p> <p>1.1.6 Resources required to supply Load</p>	
Manitoba Hydro	<p>Requirement Text: R1: What is meant by including requirements of regulatory authorities and other legal obligations? This phrase should be deleted. Can NERC make it an obligation in a standard to follow regulatory authority and other legal obligations? The planner has scope to determine the projected system conditions, and if a local regulator mandated a requirement, the planner would be able to include it without this statement.</p> <p>R1.1.1: Only long duration known planned or scheduled outages that are expected to last over a system peak should be included in the scope of this standard. Known planned or scheduled maintenance outages should not be a part of the planning scope as they are short duration and are planned to be taken when system conditions allow. Suggest wording change to Planned outages of generation and Transmission Facilities with an expected duration of 6 months or longer, if specifically known.</p> <p>R1.1.2: Suggest deleting new technologies as it is unknown as to what this is. If the SDT wants to make the list all inclusive, add words such as shall include but not be limited to in the requirement wording.</p> <p>Circuit breakers are not specifically represented in the planning models in order to keep the number of buses within the program capabilities. However, the effect of the circuit breaker configuration is normally considered in the creation of contingency files. Can the drafting team confirm that circuit breakers do not have to be specifically represented in the model? The same comment can be said about protection system equipment. Some generic zone 1 modeling may be included but in general the effect of protection equipment is included in contingency files.</p> <p>R1.1.4 & R1.1.5: Firm Transmission Service represents a contract that the planner is obligated to include. Based on the NERC definition, Interchange is defined as Energy transfers that cross Balancing Authority boundaries. Including it as a requirement mandates system expansion for non-firm system usage. Interchange is already covered in the sensitivities (Expected Transfers) and should not be a specific sub requirement of R1.1.2. Perhaps simply documenting the value of the Interchange used in the Model is sufficient. This value may change in the sensitivity analysis conducted in R2.1.3 and the TP/PA will decide the level that they will plan on protecting.Measure: The measure requires the planner to provide evidence such as the System model.</p> <p>What further evidence is required to ensure the planner is using data consistent with the MOD standards, is simulating projected system conditions, and that the models represent the required information in accordance with Requirement R1? It is suggested to remove and shall simulate projected System conditions from the main paragraph of R1 and reword R1.1 to System models and contingency files for the Planning Assessment shall represent projected System Conditions including:</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>Requirement R1 is very vague, and the Measure refers back to R1. The MOD standards deal with the building of the model. Most planners provide data in accordance with the MOD standards for a regional model building process. These models form the basis for the models the TPs and the PC use. The R1 could be more specific by requiring the PC/TP to provide rationale for the projected system conditions used, which might include the generation schedule assumed, the transfer conditions, why peak or off-peak is important, etc..</p> <p>VSLs: The requirement is very generic in nature and leans on the MOD requirements. Verification of compliance to this requirement will be problematic. What will be required to prove that the data “is consistent with the data provided in accordance with the MOD-010 and MOD-012 and other data sources”? What are these other data sources??</p> <p>R1 only stipulates that the planner shall “simulate expected system conditions”, so how does one decided that the “model did not simulate projected System Conditions as described in R1” (severe VSL)?</p>
<p>Response: The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. Organization	Question 1 Comment
	<p>conditions.</p> <p>The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed "including requirements of regulatory authorities and other legal obligations" since utilities already have to abide by such requirements.</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>
National Grid	<p>Comments: R1: A. Priority Comment- There needs to be some direction provided on the initial conditions used in the assessment. This guidance should encourage the use of initial conditions that reasonably stress transfers across interfaces between companies, areas, regions, into load pockets, and out of constrained areas. The expectation that transfers are reasonably stressed for a variety of interface conditions will require the consideration of different generation dispatches, which goes beyond the single generator out of service requirement of the standard. If initial conditions consider reasonably stressed conditions, then sensitivity analysis is embedded in the process. If sensitivity is embedded in the process, it is unclear if additional sensitivity is still required by the standard.</p> <p>B. In the reference to regulatory authorities and other legal obligations it is suggested that the phrase be changed from "simulate projected System conditions including requirements of regulatory authorities and other legal obligations" to "include projected System conditions and requirements of regulatory authorities and other legal obligation." In common usage of terms, models are used to simulate system response, but models alone do not simulate the system.</p> <p>Violation Severity Levels:R1 Suggest changing the phrase "simulate projected System conditions as described in Requirement R1" to "include projected System as described in Requirement R1," consistent with the recommended change to Requirement R1.</p> <p>Errata:Delete the period after "R1" in the first bullet in the Data Retention section.</p> <p>R1.1.1 Priority comment ? R1.1.1 should be removed. - Planned outages are addressed by Operational Planning processes and Transmission Operating Procedures for up to two years ahead removing the need for this to be incorporated into Planning Assessments. - If outages are planned, but Operations can not accommodate them in real time, then the outages are cancelled. - Outages are not generally known beyond one to two years in advance.</p> <p>R1.1.2 Comment - We recommend deleting the list of facilities:- Circuit breakers are not modeled as elements in a power flow nor are Control Devices and Protection Systems - The list of facilities is not consistent with the definition of "Facilities" in the NERC GlossaryR1.1.2 should simply read:R1.1.2New planned Facilities and changes to existing Facilities for each year of the Near-Term and Long-Term Transmission Planning Horizon.</p> <p>R1.1.3 Comment - The use of "real and reactive power" is prevalent within the industry, but R1.1.3 should be changed to "Active and reactive Demand of Load." When load is expressed as a complex quantity, active power is the real portion and reactive power is the imaginary portion. Thus for consistency, we should refer to active and reactive.</p> <p>R1.1.5 Comment What specifically needs to be modeled under Interchange"</p> <p>R1.1.6 Comment "This needs further definition or it should be deleted. It is not clear what a "network resource required to supply</p>

Organization	Question 1 Comment
	load” is. Does this refer to Network Resource per FERC LGIP?

Response: Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange. However the expected transfers under Requirement R2, part 2.1.3 are to further stress the system as a possible sensitivity analysis.

1.1.5 Known commitments for Firm Transmission Service and Interchange

The SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.

R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.

The SDT has replaced "simulate" with "represent" under the Severe VSL category for Requirement R1.

R1 VSL	The responsible entity's System model failed to represent one of the Requirement R1, parts 1.1.1 through 1.1.6	The responsible entity's System model failed to represent two of the Requirement R1, parts 1.1.1 through 1.1.6. OR The System model did not use the latest data consistent with the data provided in accordance with the MOD-010 and MOD-012 standards and other sources, including items represented in the Corrective Action Plan.	The responsible entity's System model failed to represent three of the Requirement R1, parts 1.1.1 through 1.1.6.	The responsible entity's System model failed to represent four or more of the Requirement R1, parts 1.1.1 through 1.1.6. OR The System model did not represent projected System conditions as described in Requirement R1.
---------------	--	--	---	--

The SDT agrees and had made this change under Data Retention.

Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.

1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.

The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT has modified Requirement R1, part 1.1.4 (former part 1.1.3).</p> <p style="padding-left: 40px;">1.1.4 Real and reactive Load forecasts</p> <p>Interchange is defined in the NERC glossary as "energy transfers that cross Balancing Authority boundaries" while Firm Transmission Service is "the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption."</p> <p>The intent is to include, but not be limited to these requirements. The SDT has revised Requirement R1, part 1.1.6.</p> <p style="padding-left: 40px;">1.1.6 Resources required to supply Load</p>
<p>Entergy Services, Inc</p>	<p>Planned facilities and planned changes to existing facilities should be further defined to ensure facilities or changes that are unlikely to be constructed are not included in the models. See the proposed definition of planned facilities in the comments provided to question #8. Facilities included in the models should be only those projects that are committed to by the Transmission Owner or other users of the transmission grid. Consistent with the standards requirement to include only firm transmission service (R1.1.4), uncommitted facilities should not be included because an oversubscription of the grid could occur.</p> <p>R1.1: Please clarify what the SDT means by models for the Planning Assessment shall present, especially for facilities such as circuit breakers, protection system equipment, and new technologies. Models also need to represent existing facilities</p> <p>R1.1.2: The phrase, for each year of the Near-Term and Long-Term Transmission Planning Horizon, should be revised to remove each year because there may not be studies in each year.</p> <p>R1.1.4: Firm Transmission Service - a single source can have transmission service to multiple sinks, and can be associated with transmission service in excess of the capacity of the source. There is a lack of clarity regarding the means by which Firm Transmission Service, a marketing term, is to be included in planning models. Not sure if this is applicable to Requirement 1 or 2.</p>
	<p>Response: The projects that get included under the Corrective Action Plans are presumed to be the utility's best alternatives at that time in order to achieve compliance. The SDT understands that these alternatives may change over time - but these changes must be addressed under Requirement R2, part 2.7.6 in the revised standard.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement r2, part 2.7.1 in the revised standard.</p> <p>The reference to year has been deleted.</p> <p>The SDT believes that all firm Transmission contracts should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
<p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>	
<p>Great River Energy</p>	<p>R1.1 is just repeating what should already be in the MOD-010 and MOD-012 requirements. Why re-iterate this in the TPL standard? The planners are expecting that the model building process will already include these components listed in R1.1 otherwise there wouldn't be a functional model.</p> <p>R1.1.1 may be the only thing that needs to be identified in R1 as any known long-term outage or retirement of a facility may have happened after the model building process. If R1.1 is kept I would suggest removing "Models for" so that R1.1 reads "The Planning Assessment shall represent: R 1.1.1 says the assessment shall represent planned outages if specifically known. It does not however distinguish the length of the outage to be considered. Should a 1 week maintenance outage in Year five be included? Should a 2 year complete rebuild outage lasting through year two and three be included? It is GRE's opinion that the SDT needs to add a comment about the length of the planned outage and its relevance to the assessment.</p> <p>In the Violation Severity Levels, R1 seems to be weak since any solved model should meet this requirement. Again this would seem to be more related to the MOD010 and MOD012 process. R1 should focus on documenting changes that are being preformed against the data that was submitted in MOD-010 and MOD-012 process.</p>
<p>Response: The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. The SDT has incorporated these additional requirements with the intent that they will be removed from the TPL standard when they are incorporated into the MOD standards at a later date. The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT has revised the language in Requirement R1, part 1.1 (now part 1.1.2) based on industry comments. .</p> <p style="text-align: center;">1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT believes that the Severe level should be applied as noted in the VSL table since these cases are the basis for having an accurate Planning Assessment. No change made.</p>	
<p>BC Hydro</p>	<p>Comments: Consider just referring to the MOD series of standards, not specific individual MOD standards because the numbering of the MOD standards could change and additional relevant MOD standards could be added. Consider rewording the second sentence to read, The data and models shall meet all requirements of the MOD series of standards. The MOD standards should include the requirements of regulatory authorities and other legal obligations and need not be repeated in the TBL standard(s).</p> <p>R1.1.2: Consider changing to, New planned Facilities and planned changes to existing and changing the fifth bullet to read, Normal actions of Protection System equipment</p> <p>R1.1.3: Consider changing to, "End-use customer loads and generators [how small loads are aggregated should be covered in the MOD standards. A key point is that large industrial customers with significant generation that reduces their net peak demand should not be represented simply as a net load since that would not properly model the dynamic impacts of the load and</p>

Organization	Question 1 Comment
	<p>generation components].</p> <p>R1.1.4: Consider changing to, Worst-case transfers on Firm Transmission Service Reservations.</p> <p>R1.1.5: Consider removing this requirement. It should be covered by R1.1.4</p> <p>R1.1.6: Consider changing to, Generating units [the MOD standards should specify the details like how exciters, governors and associated control equipment must be modeled]</p> <p>Comment on M1: Consider changing to, using data consistent with the MOD series of standards, simulating. Consider just referring to the entire series of a particular standard, not specific individual standards because the numbering of the standards being referenced could change and additional relevant individual standards could be added.</p>
<p>Response: The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. The SDT referenced the specific MOD standards to ensure that the requirements were limited to those needed to complete the Planning Assessment. When the MOD standards are revised, this standard will be reviewed for conforming changes. The SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has reworded Requirement R1, part 1.1.1 to include existing Facilities.</p> <p>1.1.1 Existing Facilities</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part R3.3, Requirement r4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT has modified Requirement R1, part 1.1.4 (now part 1.1.5) to state "Real and reactive Load Forecasts. Note that the generator modeling is addressed in the MOD standards.</p> <p>1.1.4 Real and reactive Load forecasts</p> <p>The SDT believes that all contracted firm Transmission should be modeled. Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>See response for Requirement R1, part 1.1.2 above.</p> <p>The SDT believes that the specific MOD standards should be addressed in this TPL 001-1 draft since they deal directly with the modeling requirements necessary for creating base cases. No change made.</p>	

Organization	Question 1 Comment
Midwest ISO	<p>Generally the Midwest ISO agrees with FirstEnergy’s comments regarding this requirement. However, if the SDT insists on keeping this requirement as is then we propose the following corrections specific to each requirement. Specific Comments for Requirement 1: A) Under R1 there is language that references “other data sources; can the SDT please offer some clarification on what “other data sources are to be Could other data sources be Tariff requirements”</p> <p>B) Again under R1, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R1 only says “Long-term Planning”. By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: Near-Term and Long-Term Transmission Planning.</p> <p>C) Under R1.1.1 it is required that models represent planned outages of generation and transmission facilities, if specifically known. This does not allow or require a Transmission Planner or Planning Coordinator to include outages due to maintenance and/or due to construction programs where certain facilities are out of service during various phases of construction, as part of the Assessment. For this reason, we believe the following language for R1.1.1 would improve this requirement: Planned outages of generation and Transmission Facilities if specifically scheduled or planned for.</p> <p>D) Under R1.1.1 we suggest adding sub-requirement R1.1.7 Generation dispatch patterns deemed appropriate by the Transmission Planner and Planning Coordinator. This clarifies that when building System models, generation dispatch is part of the model building process.</p> <p>E) Under R1.1.2 there is uncertainty around the language of New planned Facilities. We offer the following definition for Planned Facilities to be added to the definition section of this standard and further added to the NERC Glossary of Terms: Planned Facilities Generation and Transmission Facilities that are expected to be implemented with an in service date prior to the plan year being studied.</p> <p>F) Under R1.1.2 a bullet should be added for Relay Loadability Limitations. The standard requirements for relay loadability are included in PRC-023-1.</p>
<p>Response: The SDT has removed the language “and other data sources”.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The <i>Time Horizon</i> term at the end of the requirement deals with mitigation time periods (as shown below) and is not connected to the assessment time frames. No change made. Time Horizons are a consideration when there is a violation of a requirement – the impact to the BES of violating a requirement with a long-term planning horizon is not expected to be as severe as the impact associated with violating a requirement with a real-time operations time horizon.</p> <p>Mitigation Time Horizon</p> <p>The time horizons available for mitigating a violation to a requirement include the following:</p> <ul style="list-style-type: none"> • Long-term Planning — a planning horizon of one year or longer. 	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<ul style="list-style-type: none"> • Operations Planning — operating and resource plans from day-ahead up to and including seasonal. • Same-day Operations — routine actions required within the timeframe of a day, but not real-time. • Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system. • Operations Assessment — follow-up evaluations and reporting of real time operations. <p>If a transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-contingency. Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p style="padding-left: 40px;">1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>Requirement R1, part 1.1.6 now states Resources required to supply Load.</p> <p style="padding-left: 40px;">1.1.6 Resources required to supply Load</p> <p>Requirement R1, part 1.1.3 covers new planned Facilities and changes to existing Facilities.</p> <p style="padding-left: 40px;">1.1.3 New planned Facilities and changes to existing Facilities</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.</p> <p>Relay loadability is covered under Requirement R3, part 3.3.3. No change made.</p>
PJM	<p>In R1, why require a Planning Coordinator AND a Transmission Planner to maintain models for the same area</p> <p>Concern with the words - for each year in R1.1.2. Does this mean that a case for each year, at least, will need to be produced? Will five, one for each season and a light load, each year need to be produced</p> <p>R1.1.5 is not clear. Is the Interchange exclusive of Firm Transmission Service as mentioned in R1.1.4 Maybe -non-firm transmission service-- is clearer.</p>
	<p>Response: Requirement R7 requires the Transmission Planner and Planning Coordinator to determine and identify joint responsibilities. The SDT has modified Requirement R1 to state that the Transmission Planner and Planning Coordinator are responsible for maintaining System models for their respective areas.</p> <p style="padding-left: 40px;">R1 Each Transmission Planner and Planning Coordinator shall maintain System models within their respective areas for performing the studies needed to complete their Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has revised Requirement R1, part 1.1.2 (now part 1.1.3) to delete the reference to "year".</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
<p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is “the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.” Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>	
<p>American Electric Power</p>	<p>Under R1.1.2. Add Transformers, otherwise, revise Transmission Lines to read Transmission Facilities.</p> <p>Also under R1.1.2., add Series Reactors and Capacitors as a distinct category of facilities from Reactive Power devices that include shunt capacitors and reactors, and Control devices that include phase angle regulating and variable frequency transformers, FACTS devices, and other power electronics. These additions would further clarify the types of facilities that should be included, and these comments are made in full recognition that the introductory sentence to R1.1.2. contains the wording such as.</p>
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7. The SDT has also revised this requirement to remove ‘such as’.</p>	
<p>ITC Holdings</p>	<p>Comments: We question the value of R1.1.1, which requires the inclusion of transmission or generator outages if..known, in a planning standard. If an outage puts you in a compliance deficiency for the duration of any outage, would you be fined for such an instance? Category P6 contingencies should cover these outages and not require a separate requirement such as R1.1.1. This requirement could also make an entity subject to fines for long term outages needed to upgrade or replace equipment as part of a CAP for other category violations. If this requirement is kept, it should be restricted to very long term outages and exclude those outages needed to complete CAPs for other violations.</p> <p>R1.1.6 requires the use of Network Resources to supply load. For many planning studies, particularly beyond the five year window, the capacity additions needed to supply load are frequently unknown. Since there are no requirements or guidelines for assuming what and where these resources will be, assumptions will have to be made regarding the needed resources. Additionally, existing network resources could be retired or re-designated to serve other load. It is unclear as written exactly what would be a violation of this requirement if known network resources are not sufficient to serve projected load. Finally, with the advent of market power, would a dispatch utilizing this type of dispatch be considered a violation of this standard.</p>
<p>Response: The SDT believes that the outages should be modeled to insure the system reliability during the outage durations. Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months. If a transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-contingency. All performance criteria would then apply to that new base case.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>The SDT has revised Requirement R1, part 1.1.6. to include Resources required to supply Load.</p> <p>1.1.6 Resources required to supply Load</p>
Northern Indiana Public Service Company	Under R1.1, insert, "as applicable" after "represent". Since R1 covers steady state, short circuit and dynamic models, data requirements should be applicable to the specific model. Representation of circuits breakers, protection system equipment and control devices is not typical of steady state model inputs.
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.</p>	
Minnesota Power	<p>A) Under R1 there is language that references other data sources; can the SDT please offer some clarification on what other data sources are to be? Could other data sources be Tariff requirements?</p> <p>B) Again under R1, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R1 only says Long-term Planning. By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: Near-Term and Long-Term Transmission Planning.</p> <p>C) Under R1.1.1 it is required that models represent planned outages of generation and transmission facilities, if specifically known. However, the requirement does not distinguish the length of the outage to be considered. Should a one week maintenance outage in Year Five be included? Should a two-year complete rebuild outage lasting through the entire years 2 and 3 be included? The SDT team needs to add a comment about the length of the planned outage and its relevance to the assessment.</p> <p>D) R1.1 is repeating what should already be in the MOD-010 and MOD-012 requirements. Is the inclusion of these elements in the TPL standard redundant? The planners expect the model building process will already included the components listed in R1.1, otherwise there would not be a functional model. If R1.1 is kept, we suggest removing the "Models for" so that R1.1 reads "The Planning Assessment shall represent:"</p>
<p>Response: The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. The SDT has deleted the language "and other data sources".</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within their respective areas for performing the studies needed to complete their Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The <i>Time Horizon</i> term at the end of the requirement deals with mitigation time periods (as shown below) and is not connected to the assessment time frames. Time Horizons are a consideration when there is a violation of a requirement – the impact to the BES of violating a requirement with a long-term planning horizon is not expected to be as severe as the impact associated with violating a requirement with a real-time operations time horizon. No change made.</p>	

Organization	Question 1 Comment
<p>Mitigation Time Horizon</p>	<p>The time horizons available for mitigating a violation to a requirement include the following:</p> <ul style="list-style-type: none"> • Long-term Planning — a planning horizon of one year or longer. • Operations Planning — operating and resource plans from day-ahead up to and including seasonal. • Same-day Operations — routine actions required within the timeframe of a day, but not real-time. • Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system. • Operations Assessment — follow-up evaluations and reporting of real time operations. <p>The SDT believes that the outages should be modeled to insure the system reliability during the outage durations. If a transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-contingency. All performance criteria would then apply to that new base case. Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. The SDT has incorporated these additional requirements with the intent that they will be removed from the TPL standard when they are incorporated into the MOD standards at a later date. The SDT has reworded Requirement R1, part 1.1.</p> <p>1.1 System models shall represent:</p>
<p>LADWP</p>	<p>For R1.1.4 the requirements should be based on "expected transfer" instead of "firm transmission service". When projecting into future, the term "firm transmission service" is meaningless because transmission service contracts can be changed overnight. Using "firm transmission service" as a base would also exclude any new contract that are not considered in the study. It is very short-sighted to plan new transmssion facilities only based on "firmed transmission services".</p> <p>R1.1.2 is very confusing. What is a new technology? Is it something we don't know? If we know what it is, is it still a new tchnology? If we don't know, how do we model it?</p> <p>Also, we do not model individual circuit breaker but the effect of the circuit breakers; same apply with control devices or protective system equipment. Need more clarity. In general, a laundry list of items to be represented is a bad idea because it gives the impression that anything not on the list does not need to be modeled.</p>
	<p>Response: The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is “the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.” Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.). New technologies were removed from the list in Requirement R1, part 1.1.2 and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p>
<p>Platte River Power Authority</p>	<p>R1.1.2. "...for each year of the Near-Term and Long-Term..." Models for each year of the 10 years in the planning horizons are not developed in our Region. Please clarify your intention.</p> <p>R1.1.2. 3rd bullet - "Circuit breakers (or the effects of)"</p> <p>R1.1.2. 4th bullet - "Protection System equipment (or the effects of)"</p> <p>R1.1.2. 5th bullet - "Control devices (or the effects of)"</p> <p>R1.1.2. 6th bullet - "New techonologies (or the effects of)"</p> <p>R1.1.4. "Firm Transmission Service (or expected transfers)</p>
	<p>Response: The SDT has deleted "year".</p> <p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2 (now part 1.1.3). Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is "the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption." Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>
<p>MAPPCOR</p>	<p>R1 - what it means to include requirements of regulatory authorities and other legal obligations. Even if some version of this language is kept in the final standard, it seems to belong in R2 rather than R1.</p> <p>R1.1.1 - should remove the word specifically since it means nothing. Only known long-term outages of generation and transmission should be required to be modeled.</p> <p>R1.1.2 in the first line should have the word studied to avoid confusion, to read "New planned Facilities and changes to existing Facilities for each year studied of the "?</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.</p>
	<p>Response: : The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed "including requirements of regulatory authorities and other legal obligations" since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within their respective areas for performing the studies needed to complete their Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has deleted 'if specifically known'.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT has deleted "year".</p> <p>The SDT has modified Measure M1 to use the latest data available.</p> <p>M1 Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.</p>
<p>Idaho Power</p>	<p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome.</p> <p>Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.</p>
	<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement r3, part 3.3, Requirement r4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is "the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption." Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
<p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p>	
<p>Turlock Irrigation District</p>	<p>TPL 001-1 R1 could potentially result in a WECC auditor having to determine compliance with requirements of regulatory authorities and other legal obligations, beyond the scope of its expertise. TID proposes that if that language is to be retained, it shall be assumed that the requirements of regulatory authorities and other legal obligations are being simulated unless those other entities have formally found the member to be in violation of their requirements or obligations.</p>
<p>Response: The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed "including requirements of regulatory authorities and other legal obligations" since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>	
<p>New York Independent System Operator</p>	<p>R1.1.1 requires that models shall represent planned outages of generation and transmission facilities, if specifically known. The standard should be clarified to state whether it allows or requires a PC/TP to include as part of the Assessment outages due to maintenance and due to construction programs where certain facilities are out of service during phases of construction. Such maintenance and construction schedules are established but may not be finalized over the planning horizon. Further, the standard is not clear whether planned outages are to be treated as creating a normal system condition or as a contingency from which system adjustments are made prior to subsequent events. MOD 10 and 12 are based on requirements determined by the RRO in MOD 11 and 13 respectively. Is this appropriate?</p> <p>Further, the PC is not an applicable entity in MOD 10 and 12.</p> <p>Moreover, the standard should define other data sources.</p> <p>R1.1.2. states that models for facilities such as circuit breakers and protection systems should be represented. Comment - The list of facilities should be deleted for the following reasons:- it is not needed;- the NYISO does not model circuit breakers, Control Devices, and Protection Systems;- it is not consistent with the definition of Facilities in the NERC Glossary.</p>
<p>Response: The SDT believes that the outages should be modeled to insure the System reliability during the outage durations. If a Transmission element outage occurs during a specified time, then the new base case for that time period would result with that element out of service pre-contingency. Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The Planning Coordinator is to still use the information provided under MOD-010 and -012.</p> <p>The SDT has removed "and other data sources".</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p>
Duke Energy	<p>Revise R1.1.2 to include the phrase to be studied as follows: New planned Facilities and changes to existing Facilities for each year to be studied of the Near-Term and Long-Term Transmission Planning Horizon, such as :</p>
<p>Response: The SDT has deleted "year".</p> <p style="padding-left: 40px;">1.1.3 New planned Facilities and changes to existing Facilities</p> <p>Existing Facilities are now shown under Requirement R1, part 1.1.1.</p> <p style="padding-left: 40px;">1.1.1 Existing Facilities</p>	
Tucson Electric Power Company	<p>The language in R1.1.2 needs to be clarified. Many of these facilities are not explicitly included in the models in the base cases (circuit breakers, protection system equipment, control devices). The language should be clarified to require modeling the effect of the devices or the effect of the removal of the devices where it is expected to impact the study outcome. An alternative, instead of specifically listing elements, make a general statement that the models should include those elements required in MOD-010 through MOD-013. If an element is missing, double jeopardy could result due to a violation of the applicable MOD standard and this TPL standard.</p> <p>Clarity is needed to explain the difference between R1.1.4 and R1.1.5. Expected interchange can be reasonably projected, but information on Firm Transmission Service is not always known or reasonably projected for future cases. For consistency with the 2nd bullet under R2.1.3, R1.1.4 should refer to expected transfers rather than Firm Transmission Service. With this change, R1.1.4 and R1.1.5 would be redundant and one should be deleted.</p> <p>We disagree with the inclusion of the words including requirements of regulatory authorities and other legal obligations at the end of R1. Entities already are required to do this. It does not need to be included in the standard.</p>
<p>Response: The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>The SDT believes that additional modeling requirements not presently contained in the MOD standards are necessary for Transmission Planning purposes. The SDT has incorporated these additional requirements with the intent that they will be removed from the TPL standard when they are incorporated into the MOD standards at a later date.</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>The SDT believes that transfers and Firm Transmission Service are actually two separate items since Firm Transmission Service is “the highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.” Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p>1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>
<p>Independent Electricity System Operator</p>	<p>1. R1: What modeling/simulation is envisaged by the phrase requirements of regulatory authorities and other legal obligations? Note that this condition is not included in the measure or the VSL, making its compliance (whatever it is) irrelevant. If it is indeed a needed condition, then it should be measured and included in the VSL language under the Severe condition.</p> <p>Further, we suggest replacing simulate with incorporate since R1 deals with building of the system model that will be used to perform simulations governed by Requirement R2.</p> <p>Moreover, we do not think this requirement (to simulate projected System conditions including requirements of regulatory authorities and other legal obligations) belongs to R1, which is a requirement to develop the system model. R2 is the requirement for conducting Planning Assessments which include simulation using the model. We suggest moving this requirement to R2 upon making appropriate changes, where necessary to address our comments on the wording.</p> <p>2. We recommend introducing applicable before regulatory authorities.</p> <p>3. R1.1.2: suggest to add Transformers.</p> <p>4. R1.1.5: suggest to change Interchange to Interchange Schedules or Interchange Transactions.</p> <p>5. We agree with the VRF, Time Horizon, Measures and VSLs, other than the requirements of regulatory authorities and other legal obligations noted above.</p>
	<p>Response: The goal is for the responsible entity to build a realistic simulation, and the entity has to comply not only with the criteria in the TPL standard's tables, but also with other non-NERC regulations. However, the SDT has removed “including requirements of regulatory authorities and other legal obligations” since utilities already have to abide by such requirements.</p> <p>R1 Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use the latest data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	<p>The SDT has changed the word “simulate” to “represent” in Requirement R1.</p> <p>The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note ‘c’ in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>Requirement R1, part 1.1.5 has been revised to include known commitments for Firm Transmission Service and Interchange.</p> <p style="padding-left: 40px;">1.1.5 Known commitments for Firm Transmission Service and Interchange</p> <p>Thank you for your response on VRF et al.</p>
<p>Kansas City Power & Light</p>	<p>R1 states that the models used in these studies shall be consistent with data provided through MOD-010 and MOD-012. The data submitted for these are updated on a schedule provided by the RRO and not necessarily reflective of any emerging changes that may have occurred between the MOD data collection cycle. The requirement should allow for exceptions to allow the most recent information to be included in the TPL studies.</p>
<p>Response: The SDT has modified Measure M1 to use the latest data available.</p> <p style="padding-left: 40px;">M1 Each Transmission Planner and Planning Coordinator shall provide evidence, in electronic or hard copy format, that it is maintaining System models, using the latest data consistent with MOD-010 and MOD-012, including items represented in the Corrective Action Plan, representing projected System conditions, and that the models represent the required information in accordance with Requirement R1.</p>	
<p>ReliabilityFirst Corporation</p>	<p>R1.1.1 requires to include Planned outages of generation and Transmission Facilities, “if specifically known” Should the generation be capitalized? Suggest changing it to “All planned Generation and Transmission facilities should be modeled.</p> <p>R1.1.2 Use of the word “such as” is not very clear and may not be enforceable. There are some size limitations in the study tools and it may not be possible to model all circuit breakers.</p> <p>Last three bullets are very hard to model and these are not consistent with MOD-010 and MOD-012. I am not sure what “New Technologies” mean.</p> <p>Does this require a model for each year? This contradicts the requirements in Sections R2.1-R2.1.1, R2.1.2 and R2.2. Suggest changing this to read “New planned Facilities and changes to existing Facilities for Near-Term and Long-Term Transmission Planning Horizon as described in Sections R2.1-R2.1.1, R2.1.2 and R2.2.”</p> <p>Modeling of Protection Systems, Control Systems requires new data collection effort and falls under Section 1600 of NERC Rules of Procedure.</p> <p>The list does not include Transformers.Suggest removing Protection System equipment and Control devices from the list and adding another sub-section which states “Models should reflect the limitations imposed by Protective Devices and Control systems characteristics.</p> <p>Define “New Technologies”</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 1 Comment
	R1.1.3 Here it is better to include the Type of Forecast (50/50 or 90/10). A reference NERC Reliability Assessment Guidebook can be included here.
<p>Response: Generation is not a defined term itself in the NERC glossary - thus it does not need to be capitalized in Requirement R1.1.1. Requirement R1, part 1.1.2 has been revised to include known outages of generation or Transmission Facilities with a minimum duration of 6 months.</p> <p>1.1.2 Known outage(s) of generation or Transmission Facility(ies) with a duration of at least six months.</p> <p>The SDT has revised R1.1.2 to remove "such as". The SDT has removed the equipment list under Requirement R1, part 1.1.2. Transmission lines, generators, and reactive power devices are already included in MOD standards. Circuit breakers, Protection System equipment, and control devices are not typically modeled - the impact of these devices are typically simulated and thus these are already included in Requirement R3, part 3.3, Requirement R4, part 4.3, and in header note 'c' in Table 1. New technologies were removed from the list and are already covered in the Corrective Action Plan under Requirement R2, part 2.7.1 in the revised standard.</p> <p>New technologies include any technology that is not currently in use on the electric power System that helps improve efficiency (i.e., energy storage/production technologies, low sag conductors, solid state interrupters, etc.).</p> <p>The SDT has deleted "year".</p> <p>1.1.3 New planned Facilities and changes to existing Facilities</p> <p>The SDT does not believe that a reference is needed to the NERC Reliability Assessment Guidebook since most utilities are using at least a 50/50 Load forecast as a minimum. No change made.</p>	

2. Requirement R2 — Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement.

Summary Consideration: The industry had many comments on Requirement R2 but for the most part, the questions were requesting clarification. The SDT has changed a number of the parts of this requirement with the major changes being: part 2.1.4 and part 2.4.3 on sensitivities, additional clarification on part 2.2 for the Long-Term Transmission Planning Horizon and the addition of a new part 2.7.2 on multiple sensitivity deficiencies. The full list of changes is:

Year One: The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.

R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.

2.1.4 (previously 2.1.3) For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.

- Real and reactive forecasted Load.
- Expected transfers.
- Expected in service dates of new or modified Transmission Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.
- Controllable Loads and Demand Side Management.
- Duration or timing of planned Transmission outages.

2.1.5 (previously 2.1.4) When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.

2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:

2.2.1 A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.

2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.

2.4 The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as indicated in Requirement R2, part 2.6. The following studies are required.

2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.

2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.

- Load level, Load forecast, or dynamic model assumptions.
- Expected transfers.
- Expected in service dates of new or modified Facilities.
- Reactive resource capability.
- Generation additions, retirements, or other dispatch scenarios.

2.5 (new) The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed generation additions or changes in that timeframe and be supported by current or past studies.

2.6.1 (previously 2.5.1) For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.

2.6.2 (previously 2.5.2) For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.

2.7 (previously 2.6) For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:

2.7 (previously 2.6) bullet 2: Installation, modification, or removal of Protection Systems or Special Protection Systems

2.7.2 (new) Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.

2.7.5 (previously 2.6.4) If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.

2.7.6 (previously 2.6.5) Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.

2.8 (previously 2.7) For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:

2.8.2 (previously 2.7.2) Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.

2.9 (previously 2.8) The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.

R2 VSL	The responsible entity failed to comply with Requirement R2, part 2.9 or Requirement R2, part 2.6.	The responsible entity failed to comply with Requirement R2, part 2.3 or part 2.8.	The responsible entity failed to comply with one of the following parts of Requirement R2: part 2.1, part 2.2, part 2.4, part 2.5, or part 2.7	The responsible entity failed to comply with two or more of the following parts of Requirement R2: part 2.1, part 2.2, part 2.4, or part 2.7.
---------------	--	--	--	---

Organization	Question 2 Comment
Dominion - Electric Transmission	<p>R2.1.3 - Dominion suggests that SDT needs to be more specific on which of the variations to include.</p> <p>Also for the last bullet, the SDT needs to clarify the duration or timing of planned transmission outages (in relation to Planning horizon).</p> <p>R2.4.1 - While we appreciate the intent of introducing induction motor modeling in simulations, this is a difficult proposal in actual practice. The question of how much of the load is comprised of induction motors and what is a reasonable/practical model has been around now for over twenty years yet is still not resolved satisfactorily. For example, we have heard several experts declare the CLOAD model is inadequate for study. NERC needs to take the lead in developing appropriate models for the widely used simulation software and a methodology for determining load composition prior to requiring induction Load modeling in dynamic simulation studies. Additionally, this requirement states that Aggregate System Load model is acceptable to represent the dynamic behavior of induction motor Loads. Our interpretation is that such aggregate models shall be inserted by the Planners at the time of study, over a specific study area as determined by TP, and these models are not to be represented in the interconnection-wide (i.e. ERAG/MMWG) dynamics base cases. If ERAG/MMWG dynamics base cases are populated with such aggregate load models, the dynamic simulation cases could become very difficult to solve, if not impossible.</p> <p>R2.8 - Dominion does not see any purpose in reporting largest consequential load loss. This is not easily calculated, and</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>would vary from year by year, season by season.</p> <p>R2.9 - Dominion requests further clarification. Is the intent of this requirement to develop criteria for maximum allowable non-consequential load loss prior to requiring a corrective action plan or to just calculate such a load loss where it is permitted in Table 1?</p>
	<p>Response: Part 2.1.3 (now Part 2.1.4) has been revised to provide greater clarification. It is intended that the Planning Coordinator or the Transmission Planner will select the variation to include in the sensitivity studies.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>The last bullet in Part R2.1.3 (now Part 2.1.4) is intended to cover planned outages of Facilities in sensitivity studies if such planned outages are known at the time the planning studies are performed, for example, nuclear power plant refueling, generating unit maintenance, etc.</p> <p>Part 2.4.1 is intended to allow the Planning Coordinator and Transmission Planner the discretion in the use of aggregated System Load models in Stability Studies, if specific models are not available. However, it does not dictate the methodology or the process on how the studies are to be done.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
Northeast Power Coordinating Council	<p>It is recommended to replace the phrase prepare with conduct and document in the first sentence.R2.1.1</p> <p>Comment The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon</p>

Organization	Question 2 Comment
	<p>identified in R2.</p> <p>R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment.</p> <p>R2.1.4 With respect to spare equipment strategy; this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Remove the wording (such as a transformer). What constitutes "spare equipment strategy"? Would a strategy that involves out-of-merit dispatch or operational restrictions be considered a valid "spare equipment strategy". If a transformer is lost, could a reconfiguration of the transmission system constitute a valid "spare equipment strategy"</p> <p>R2.2 Comment We suggest replacing the phrase a current System peak Load study with a valid System peak Load study in the first sentence. The word current is confusing as some read the word current to mean today's rather than valid.</p> <p>R2.3 Comment Please provide guidance as to what year should be represented when performing short circuit studies.</p> <p>R2.4.1 Comment ? Change to read: "For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.</p> <p>R2.5.1 Comment We suggest deleting this requirement, and incorporating it into R2.5.2.</p> <p>R2.5.2 Comment To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the latest Transmission Planning Horizon System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study]" An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner.</p> <p>R2.6 Priority Comment As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read Provide documentation that explains the reasoning for the sensitivities considered and selected.</p> <p>R2.6 Comment At the end of the second sentence, the phrase in the tables is used. We suggest using more definitive</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>language such as in Table 1.</p> <p>R2.6.2 Comment The phrase Project Initiation Date needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase as well as an in-service date should be modified to read as well as a target in-service date.</p> <p>R2.6.3 Comment Plans can provide a target in-service year but not an actual in-service year.</p> <p>R2.6.4 Priority Comment There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions.</p> <p>R2.8 Comment Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted.</p> <p>R2.9 Comment This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.</p> <p>It is strongly recommended that the standard should consider not allow non-consequential load loss to resolve any violation arising from the planning events in Table 1. Therefore, this requirement would then be deleted.</p> <p>The use of System Off-Peak Load is too general. Is the intention to have the system minimum load used here? Because of the seasonal differences in equipment ratings, seasonal peak and off peak (minimum) loads should be analyzed.</p>
	<p>Response: The SDT was not able to locate the word "prepare" in the first sentence of Part 2.1.1. However, Requirement R2 states, "Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, document results, and shall cover steady state analyses, short circuit analyses, and Stability analyses". The SDT assumes that the comment was meant for this sentence. The SDT does not think that replacing "prepare" with "conduct and document" would add clarity, since Requirement R2 includes the requirement to document assumptions and results. No change made.</p> <p>The SDT disagrees that the requirement to evaluate Year One and year two is inconsistent with the Time Horizon in R2. The new definition defines Year One as the first year that the planner is responsible for assessing. No change made.</p> <p>Part 2.1.3 (now Part 2.1.4) has been rewritten to clarify the intent of the requirement. The Planning Coordinator or Transmission Planner can include a discussion of risk in response to the new Part 2.7.2 on the actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary. No change made.</p> <p>In Part 2.1.4 (now Part 2.1.5) when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the "normal" (P0) condition in Table 1 and the rest of Table 1 will be applied as stated. Part 2.1.4 is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Actions such as out of</p>

Organization	Question 2 Comment
	<p>merit dispatch, operational restrictions, System reconfiguration can be part of a Corrective Action Plan if the System cannot meet performance requirements without the Facility in service. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2 is intended to require a study performed in the current year, as opposed to studies performed in the past years. Part 2.2 has been revised to provide greater clarity.</p> <p>2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>For Part 2.3 the decision on the year to be represented in the study is left to the discretion of the Planning Coordinator or Transmission Planner. Part 2.3 only requires it to be either a study that was performed during the current year or in the past. For example, this year is 2009 and a study performed in 2009 is a current study, the study can investigate the System in a future year, which is at the discretion of the Planning Coordinator or Transmission Planner performing the study. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.4.1 was not changed as suggested because the intent of the last sentence is to allow the use of an aggregated System Load model as an appropriate Load representation. The suggested change could be read to mean that an aggregated System Load model would not appropriately represent the dynamic behavior of Loads. However, Part 2.4.1 has been revised to provide greater clarity.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Parts 2.5 .1 and 2.5.2 (new Parts 2.6.1 and 2.6.2) were not combined. While the SDT appreciates the concern that a 20 MW generation addition can be small compared to a large System, a NERC standard needs to be clear as to the applicability. A requirement, which contains “determined to be material by the Planning Coordinator or Transmission Planner”, is not clear. Therefore, changing from 20 MW to “material” will also have to require justification from the Planning Coordinator or Transmission Planner on what is “material”. Material has been deleted from the requirement.</p> <p>Part 2.6.2 and 2.6.3 have been removed.</p> <p>Part 2.6 has been modified and included as new Part 2.7. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur in more than one sensitivity). Although not required, the standard does not preclude the Planning Coordinator or Transmission Planner to develop Corrective Action Plans for high risk scenarios. However, if the scenario is high risk, then it should have been included in the base assumptions in the assessment and the Corrective Action Plan would have been required. The end of the second sentence has been changed to refer to</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Table 1 as suggested.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Part 2.6.4 (now 2.7.5) allows the Planning Coordinator or Transmission Planner to address situations that are beyond its control by utilizing Non-Consequential Load Loss and/or curtailment of Firm Transmission Service, which are normally not permitted. Depending on the urgency of the need, the Corrective Action Plan may be developed outside the normal Assessment cycle at the discretion of the Planning Coordinator or Transmission Planner involved. No change made.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p> <p>The recommendation that “the standard should consider not allow non-consequential load loss to resolve any violation arising from the planning events in Table 1” will include also the multiple Contingencies, for which loss of Non-Consequential Load is allowed in the existing TPL Standards. While the sentiment is laudable, it may not be practical. No change made.</p> <p>The use of System Off-Peak Load is intended to be general to allow the Planning Coordinator or the Transmission Planner to use their best judgment suited to the study area, since the System must be able to meet performance requirements over all demand levels. The Planning Coordinator or Transmission Planner is not precluded from investigating more System conditions than are required in this standard. No change made.</p>
Transmission Planning	<p>R2.1.4. COMMENT: For the analysis to reflect the contingencies in Table 1 (P0 through P7 plus Extreme Events) is excessive.</p> <p>R2.5.2. COMMENT: The 20 MW change listed in bullet items are extremely small to larger transmission systems and by themselves would be unlikely to change BES response. As drafted, requirement 2.5 may be interpreted to preclude the use of any previous study in which the base case is not identical to the current planning case. It is recommended 2.5.2 be rewritten as follows; For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period that would impact the study area.</p> <p>R2.6.2. COMMENT: What is considered a project initiation date is it implying a construction start date, or the first time that it was identified as a mitigation plan? Additionally, R2.6.2 and R2.6.3 are not necessary because a Corrective Action Plan, by definition, includes an "associated timetable for implementation". Recommend deleting this requirement.</p> <p>R2.8. COMMENT: Why is this data collection a requirement? The effort required to determine this data is substantial and the value of this data is questionable. Recommend deleting this requirement.</p> <p>R2.9. COMMENT: Why is this data collection a requirement? The effort required to determine this data is substantial and</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	the value of this data is questionable. Recommend deleting this requirement.
	<p>Response: Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>While the SDT appreciates the concern, the proposed revision could be interpreted as removing the threshold for minimum change in generation. Part 2.5.2 has been revised as Part 2.6.2 to include an alternative threshold to be based on the study area's installed generation capacity.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
SERC Engineering Committee Planning Standards Subcommittee	<p>R2.1: In R2.1, change the reference to requirement R2.6 (at the end of the last line) to R2.5.</p> <p>R2.1.4: In Requirement R2.1.4, recommend that the requirement be revised as follows: "When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment.</p> <p>R2.4.1: In Requirement R2.4.1, it is suggested that it be reworded to the following: "System peak Load for one of the five years, including Load models which appropriately represents the dynamic behavior of Loads, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>R2.5.1: With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: unless justification can be provided to demonstrate that the results of an older study are still valid.</p> <p>R2.6.2: In Requirement R2.6.2, what constitutes a "project initiation date," and how will it be used? Please clarify.</p> <p>R2.8: Please explain the reason why Requirement R2.8 is needed in the Assessment. Reporting the largest Consequential Load Loss does not impact reliability.</p> <p>R2.9: Please explain the reason why Requirement R2.9 is needed in the Assessment. Reporting the largest Non-Consequential Load Loss does not impact reliability.</p>
<p>Response: In the new version, Part.2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. 	<p>Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>Modesto Irrigation District</p>	<p>On pages 6 and 7 under sections R2.1.3 and R2.4.3, I think the magnitude of the variations in the conditions asked for in the sensitivity cases, should be defined and not left to the analyst to decide.</p> <p>On page 8 under Section R2.5.2, examples of material changes for generation are given, but no examples for transmission changes. Shouldn't we include examples of material transmission changes, too</p> <p>Comments: Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES</p> <p>R2.8 and R2.9 load loss comment. We don't agree with R2.8 & R2.9. What reliability purpose is served by these requirements?</p>
	<p>Response: The items in Parts R2.1.3 (now Part 2.1.4) and 2.4.3 are intended for use as guides. NERC Standards must allow room for discretion of the Planning Coordinator and/or Transmission Planner who are closer to the issues in their respective areas.</p> <p>In Part 2.5.2 the SDT removed the examples related to the generation changes and therefore have not added examples of transmission changes.</p> <p>Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>OPUC</p>	<p>2. Requirement R2 Please provide any specific comments on the requirement text, VRF, Time Horizon, measure associated with the requirement, data retention associated with the requirement, and/or the VSL associated with the requirement. Comments:</p> <p>A: Short circuit of over-stressed breakers is already addressed in Table 1.Ex1: P2-3,4 (Internal Breaker Fault),Ex2: P4 (Stuck Breaker while attempting to clear a fault).</p> <p>B: In R2.1.4 Table 1, it is unclear how transformer contingency analysis can be aggregated or batched. It is also still unclear</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	whether corrective action plans are required solely to meet performance requirements for sensitivities.
	<p>Response: Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess the whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. This is not the same as the examples cited. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.6 has been revised and included as Part 2.7 to state that Corrective Action Plans do not need to be developed solely to meet the performance requirements for a single sensitivity run. Part 2.7.2 has also been added to require that the Corrective Action Plan include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur is more than one sensitivity).</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>2.7.2 Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.</p>
Bonneville Power Administration	<p>Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault).</p> <p>R2.1.1: Peak load modeled for the near term planning horizon may not be Year one or year two. Therefore, R2.1.1 should be revised to say System peak load for one of the five years.</p> <p>Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3.</p> <p>We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement.</p> <p>The 20 MW threshold identified as material change for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity.</p> <p>R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event? if it is documented?</p> <p>R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.</p>
	<p>Response: Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess the whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.1.1 is intended to require studies for System Peak Load Conditions for 2 of the years in the near-term planning horizon: 1) A Year five case to identify potential problem that can be addressed if the planned projects proceed as scheduled. 2) A Year one or Year two case to identify any potential problems unanticipated in the five-year case, which if not addressed, could impact operations as time progresses. Therefore, the SDT declines to make the change as suggested.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.5 has been revised and references to the 20 MW change have been deleted.</p> <p>2.5 The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed generation additions or changes in that timeframe and be supported by current or past studies.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>MRO NERC Standards Review Subcommittee</p>	<p>MRO NSRS proposes the following comments for R2: Modify R2.6.2 to remove the obligation to include the project initiation date. The inclusion of this date would add unnecessary work that is not needed to assure adequate BES reliability In addition, it is not clear whether initiation refers to the commencement of engineering, design, construction, etc. Augment R2.6.5 to include annual verification of the continued validity of the Corrective Action Plan because the value of implementation status is dependent on the status of continued validity. MRO NSRS suggests this text: Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status . . . Augment R2.7.2 to include annual verification of the continued validity of the Corrective Action Plan because the value of implementation status is dependent on the status of continued validity. MRO NSRS suggests this text that is similar to R2.6.5: Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.</p> <p>Remove R2.8. MRO NSRS does not know of any reason why the investigation and inclusion of the largest Consequential Load Loss caused by any P1 or any P2 events is needed to assure adequate BES reliability. In addition, all events involving Consequential Load Loss are studied, not just the largest load loss (see R3.3.1).</p>
	<p>Response: In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Parts 2.6.5 and 2.7.2 have been revised and included as Parts 2.7.6 and 2.8.2 respectively to reflect your suggestion.</p> <p>2.7.6 Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status of identified System Facilities and Operating Procedures.</p> <p>2.8.2 Be reviewed in subsequent annual Planning Assessments for continued validity and implementation status.</p> <p>Part 2.8 is intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed the requirement and agrees that as written, it was unclear. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
<p>SERC Engineering Committee Dynamics Review Subcommittee (DRS)</p>	<p>1. R2.1.4 Loss of 2 transformers is itself a very severe contingency. However, when it is combined with R2.1.4 (spare equipment strategy) it can lead to a triple contingency which is unnecessarily severe and has an extremely low probability of occurrence. We recommend that the requirement be deleted from the standard.</p> <p>In the subrequirements of 2.1.3 and 2.4.3, the use of the word timing is unclear. Consider using in service date or schedule for.</p> <p>With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: unless justification can be provided to demonstrate that the results of an older study are still valid.</p>
<p>Response: Part 2.1.4 (now Part 2.1.5) is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Parts 2.1.3 (now Part 2.1.4) and 2.4.3 have been revised to reflect your suggestion.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. 	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>Part 2.5.1 has been revised and included as Part 2.6.1 to address your concerns.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p>
<p>SERC Engineering Committee Reliability Review Subcommittee (RRS)</p>	<p>The proposed standard not only raises the bar for system performance requirements, but also raises the bar for reporting and documentation. We need to employ almost as many librarians and technical writers as engineers to develop and keep track of the documentation. Engineers need to spend more time performing the studies and spend less time documenting studies keeping track of documentation for multiple years.</p> <p>R2 Instead of document results the requirement should be to summarize results. While results will be documented, the Planning Assessment should just include a summary.</p> <p>R2.1 What's the value in being able to use qualified past studies if you have to use annual current studies? Strike the words supplemented with and insert the word or.</p> <p>In R2.1, change the reference to requirement R2.6 (at the end of the last line) to R2.5.</p> <p>Do not understand the rationale for being so prescriptive in requiring specific years to be studied in R2.1.1. Why not allow the TP and/or PC to decide on the three years to be studied in the Near Term?</p> <p>In the subrequirements of R2.1.3 and R2.4.3, the use of the word "timing" is unclear. Consider using in service date or schedule for. "</p> <p>In R2.1.3, it is suggested that the studies be referred to as the "base studies" to avoid confusion with the sensitivity studies. Also suggest that another phrase be added at the end for clarity. The entire R2.1.3 would then be as follows: For each of the base studies described in Requirements R2.1.1 and R2.1.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment. Sensitivity studies would include changes to:oln</p> <p>Requirement R2.1.4, it is suggested that language be added to reflect the possible unavailability of the equipment, such as: When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment. How would adequate lead times be determined” In Requirement R2.1.4, recommend that the requirement be revised as follows: When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience the possible unavailability of the long lead time equipment.</p> <p>Since R2.3 short circuit analysis is a new raising the bar requirement, should the implementation plan for this be for 5 years like the other new requirements?</p> <p>R2.3 Insert the phrase “one year of after the word addressing.</p> <p>In Requirements R2.3 and R2.4, do we need a reference to Requirement R2.5 for the past studies”</p> <p>Further clarification is needed in R2.4.1 concerning load models that appropriately represent the dynamic behavior of loads. In Requirement R2.4.1, it is suggested that it be reworded to the following: System peak Load for one of the five years, including Load models which appropriately represents the dynamic behavior of Loads, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable. R2.4.1: It is not clear how much Load must have a dynamic model. Likely, it must still be proven that the analysis software can accommodate every load in the model having a load model that includes induction motor models. To help address this, revise Load to be Load that could impact the study area is acceptable. Is a NERC drafting team addressing these issues to determine an industry standard? Load models referenced in R2.4.1 should be confined to the consideration of transient stability study work.</p> <p>In Requirement R2.4.3, it is suggested that this sub-requirement be reworded to the following: For each of the base studies described in Requirements R2.4.1 and R2.4.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the base studies shall be included in the Assessment. Sensitivity studies would include changes to:</p> <p>Regarding Requirement R2.6, it is suggested that the word "modeled" be added as follows: For Planning Events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plans addressing how the performance requirements will be met. Revisions to the Corrective Action Plans are allowed in subsequent assessments but the System modeled shall continue to meet the performance requirements in the tables. Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3 and R2.4.3. The Corrective Action Plan shall:</p> <p>In bullet three of Requirement R2.6.1, would we allow automatic generation tripping for a single (P1) event if it is not consequential? It seems that tripping of generation should be restricted to P2 events 2 or 3 at a minimum.</p> <p>In bullet five of Requirement R2.6.1, is there a maximum duration that operating procedures can be used before a capital</p>

Organization	Question 2 Comment
	<p>project must be included (or completed) in the Corrective Action Plan?</p> <p>With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Similar to the draft MOD-026-1 standard, this period should be 10 years.</p> <p>With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: unless justification can be provided to demonstrate that the results of an older study are still valid.</p> <p>R2.5.2 Suggest deleting the phrase Material generation changes could include: and the two accompanying bullets. A change of 20 MW on a large system may not always be material.</p> <p>In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. In R2.6.1, installation or modification of Protection Systems or Special Protection Systems are now allowed as part of the Corrective Action Plan. Should undervoltage and underfrequency load shed also be allowed in the Corrective Action Plan?</p> <p>In Requirement R2.6.2, what constitutes a "project initiation date," and how will it be used? Please clarify.</p> <p>Please explain the reason why Requirement R2.8 is needed in the Assessment and how does reporting the largest Consequential Load Loss impact reliability?</p> <p>Please explain the reason why Requirement R2.9 is needed in the Assessment and how does reporting the largest Non-Consequential Load Loss impact reliability?</p> <p>If contingencies occur inside one utility that affect facilities in another utility, which utility is responsible for running these studies during the annual assessments??</p> <p>R2.8 and R2.9 should be deleted. We don't see a reliability-related need for these requirements.</p> <p>In R2.9, does the requirement require the maximum non-consequential load that can occur for contingencies in Table 1 or does it require just the maximum that a utility will allow on its system? Suggest clarifying permissible or perhaps using similar language as found in R2.8.</p> <p>R2.9: One cannot determine the maximum permissible Non-Consequential Load Loss for every Planning Event. First of all, this should not be a requirement, as it is, for those events that do not even cause Non-Consequential Load Loss. Secondly, to obtain the maximum permissible value, one would have to stress the system in some way until one of the performance requirements are violated. That is an unreasonable stipulation and cumbersome to perform such an analysis.</p>
<p>Response: Requirement R2 has been revised to reflect your suggestion.</p> <p>R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning</p>	

Organization	Question 2 Comment
	<p>Assessment shall use current or past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p> <p>In Part 2.1 it is envisioned that not all parts of the studies on which the Assessment is to be based can rely on past studies. For example, a study on year five performed during the past year may not be representative of year five in the current year. A past study can still be used if it can be demonstrated that the requirements for use of past studies are met. No change made.</p> <p>In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>Part 2.1.1 is intended to require studies for System Peak Load Conditions for 2 of the years in the near-term planning horizon: 1) A Year five case to identify potential problem that can be addressed if the planned projects proceed as scheduled. 2) A Year one or Year two case to identify any potential problems unanticipated in the five-year case, which if not addressed, could impact operations as time progresses. Therefore, the SDT declines to make the change as suggested.</p> <p>Parts 2.1.3 (now Part 2.1.4) and R2.4.3 have been revised to clarify the word “timing”.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>The SDT reviewed Part 2.1.3 and declined to use the term “base study” because “base study” may have different meanings in different parts of the continent, and</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>the term, “studies described in Parts 2.1.1 and R2.1.2” should be sufficient to avoid confusion. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>The SDT does not feel that Part 2.3 raises the bar as entities should have been performing these studies all along. No change made.</p> <p>The SDT declines to revise Part 2.3 to include short circuit analysis for one of the years in the Near-Term Transmission Planning Horizon because Part 2.3 only requires that a Planning Assessment be performed. Past studies can be used to support the Planning Assessment. No change made.</p> <p>Parts 2.3 and 2.4 have been revised to include the reference to the requirements for use of past studies.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>2.4 The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as indicated in Requirement R2, part 2.6. The following studies are required:</p> <p>Part 2.4.1 has been revised to reflect your suggestion. In addition, Requirement R2.4 concerns only “The Near-Term Transmission Planning Horizon portion of the Stability analysis”. Part 2.4.1 is a sub-part of Part 2.4, and so should also carry the same limitation.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>The SDT reviewed Part 2.4.3 and declined to use the term “base study” because “base study” may have different meanings in different parts of the continent, and the term, “studies described in Parts 2.4.1 and R2.4.2” should be sufficient to avoid confusion. No change made.</p> <p>Part 2.6 has been revised and included as Part 2.7 to reflect your suggestion. The third bullet in Part 2.6.1 is intended to meet the requirements in Table 1. Generation tripping is allowed at the discretion of the Planning Coordinator or Transmission Planner for P1 Events as long as there is no loss of firm Non-Consequential Load. In addition, in the fifth bullet, the duration for use of an operating procedure is also at the discretion of the Planning Coordinator or Transmission Planner because it may not be feasible environmentally to implement Transmission reinforcements in some locations.</p> <p>Part 2.5.1 has been revised and included as Part 2.6.1 to address your concerns, but the SDT disagrees that the timeframe should be changed to 10 years.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>to demonstrate that the results of an older study are still valid.</p> <p>Part 2.5 has been revised to reflect your suggestion.</p> <p>2.5 The Long-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed to address the impact of proposed generation additions or changes in that timeframe and be supported by current or past studies.</p> <p>Use of generation tripping not precluded within the Standard and the maximum duration for operating procedures in Corrective Action Plans is not addressed within the standard. UVLS and UFLS are not precluded in the Corrective Action Plan for those events where controlled load shedding is allowed. The Standard does not address the acceptability of the tools to be used for any Corrective Action Plan.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p> <p>If Contingencies occur inside one utility that affect facilities in another utility, the Planning Coordinator or Transmission Planner for the utility, whose system is impacted would be responsible for performing the annual Assessment for those contingencies known to cause the impact. A certain amount of coordination will need to occur between the utilities. The parties can then mutually agree upon a Corrective Action Plan.</p>
<p>FirstEnergy Corp</p>	<p>The standard provides prescriptive language in requirement R2.4.1 regarding dynamic stability load models but is silent on steady-state load modeling. Most transmission planners use a conservative approach of simulating constant power loads in the steady-state environment, but other steady-state load modeling assumptions such as constant impedance load and constant current load can be utilized. At a minimum, the standard should require the transmission planner to document its load modeling assumptions for steady-state simulations. To this end, we suggest a new sub-requirement R2.1.1 be placed ahead of the existing R2.1.1 that parallels R2.4.1 and indicates the TP should document its load modeling assumptions for steady-state simulations.</p> <p>Specific comments, Requirements of R2A. R2.1: The requirement incorrectly references R2.6 which should be a reference to R2.5.</p> <p>B. R2.1.1: We propose that the SDT adjust requirement R2.1.1 to annually require one current year Near-Term and one Long-Term study, with the Long-Term study required to alternate between year six and year ten every other assessment year. This would reduce the workload on the industry and cover the mid-point transition period between the Near-term and</p>

Organization	Question 2 Comment
	<p>Long-Term horizons that the standard team believes needs some attention. We find the requirement to perform two Near-Term studies and one Long-Term study each year overly burdensome, in light of the increased workload caused by sensitivity analysis for each steady-state and stability review that is required. FE believes that one current year study within each time period should suffice in being able to interpolate and extrapolate results to cover the entire assessment range; especially when supplemented with qualified past study results.</p> <p>C. We offer the following comments related to requirement R2.4.1:</p> <ol style="list-style-type: none"> 1. In the last round of comments we made the following comment "This requirement should be separated into two requirements as it covers two distinct topics; a) peak load study for one of the near-term years and b) dynamic load modeling." The SDT responded "...This Requirement is to make you properly represent the dynamic behavior of Loads at high System Load levels." Apparently, the SDT did not agree with our recommendation to split the requirement as no change was made in this regard. Therefore, as written the standard in R2.4.2 (stability study of the Off-Peak Load level) seems to imply that the appropriate modeling of dynamic behavior of loads, including consideration of induction motor loads, is NOT required for the Off-Peak Load stability study. Please clarify or confirm this view of R2.4.2. 2. R2.4.1: We are still of the opinion that the word "appropriately" is vague and only serves to add confusion within this requirement. It's recommended that "appropriately" be struck from the requirement. 3. R2.4.1: In Draft 3, the SDT added text to this requirement that states "An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable" to clarify that a detailed dynamic Load model is not required at each bus. We understand this to mean that the model is not expected to try and replicate the dynamic behavior of individual end-user Load characteristics and that general approximations for a customer class(es) (residential, commercial or industrial) simulated at a given load bus is acceptable. 4. Based on our comments C.1 through C.3 we propose the following requirement language: R2.4.1. System peak Load for one of the five years.R2.4.2. System Off-Peak Load for on of the five years.R2.4.3. Load models used for stability analysis shall represent the dynamic behavior of Loads, including the behavior of induction motor Loads. The study shall document assumptions made for representing the dynamic behavior of Loads, based on the following load classes - residential, commercial and industrial. <p>D. R2.5.2: For clarity and readability we propose to insert the word "that" between the words "and would" so the requirement reads "...intervening period and that would impact ...".</p> <p>E. R2.6.1: This requirement indicates that an entity's Corrective Action Plans list situations where Table 1 Performance Criteria are not met and the associated actions needed to achieve required System performance. What if the actions and plans associated with newly identified deficiencies (current year studies) are not yet fully known and require further analysis and a more detailed study of various options. Would it be acceptable for a TP to indicate that the planned solution is To Be Determined? This could be a likely scenario for a long-term planning horizon study which may identify a number of deficiencies which require more detailed analysis to determine the appropriate solution.</p> <p>F. R2.6.2: We believe this requirement is overly prescriptive in requiring a project initiate date. The standard should not question an entity's project management but stay focused on whether or not the Correct Action Plan was put in place in a timely fashion. We propose that the team strike from this requirement the reference to project initiation date and focus on</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>whether or not Corrective Action Plans were completed in a timely manner to ensure Table 1 Performance Criteria is met. Additionally, project initiation date is pertinent to a operating procedure solution that is allowed by the standard.</p> <p>R2.6.4: We support requirement R2.6.4 but suggest the word "prudent" be struck from the text of the requirement as it can be subjective and open for debate.</p> <p>G. R2.7: This requirement introduces additional Corrective Action Plan requirements beyond what is stated in R2.6. FE proposes that the SDT restructure the two requirements into a single requirement (and sub-requirements) focused on Corrective Action Plans.</p> <p>H. R2.8: Does this requirement apply to sensitivity simulations? If so, it has limited applications to only those sensitivity analyses that consider variations in load such as a higher forecast (90/10), or increased reactive load (sensitivity to poor power-factor loads), etc. The SDT should consider clarifying the intent of the requirement if each current year study as well as their corresponding sensitivity simulation model(s) is intended to have this information documented within the assessment report.</p> <p>I. R2.9: We ask the SDT to confirm or correct our understanding that the requirement is asking about a TPs criteria for maximum allowable non-consequential load drop and NOT the maximum non-consequential load shed required to meet performance criteria for a particular contingency evaluation.</p> <p>We agree with the stated Measures, VRF, Time-Horizon, Data Retention and VSL of requirement R2</p>
<p>Response: The language does not preclude the documentation of the steady state Load model used because steady state assumption of Load model is a degree of conservativeness. See header note b. No change made.</p> <p>In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>As written, Requirements R2 and Part 2.1.1 provides flexibility for the Planning Coordinator or Transmission Planner to use past studies to support the current year assessment and to assess other years in addition to those identified in Part 2.1.1. So the suggestion to alternate between year six and year ten every other assessment is already allowed as written. No change made.</p> <p>In Part 2.4.1 the SDT specifies the dynamic Load model representation for on peak because the System voltages are generally lower during on peak. The percentage of motor load, e.g., in air conditioners, could significantly increase reactive power requirements especially when they stall due to low System voltage and can therefore impact dynamic System performance on-peak. However, motor Load would likely not pose the same problem during off-peak as the System voltages are usually higher. So, in Part 2.4.2, it can be left to the discretion of the Planning Coordinator or Transmission Planner whether the dynamic motor Load would need to be represented per Part 2.4.1,</p> <p>Part 2.5.2 has been modified and included as Part 2.6.2 and the “intervening period” language has been deleted.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Part 2.6 has been modified and included as new Part 2.7. Part 2.6.1 requires a Corrective Action Plan be developed to enable the System performance requirements in Table 1 and Part 2.6 states that “revisions to the Corrective Action Plans are allowed in subsequent assessments but the System shall continue to meet the performance requirements in Table 1”. This allows the Planning Coordinator or Transmission Planner to develop a Corrective Action Plan that can consist, for example, of a number of potential alternative solutions, and, the Corrective Action Plan can be revised as the study continues.</p> <p>‘Prudent’ has been deleted in Part 2.6.4 (now Part 2.7.5).</p> <p>2.7.5 If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service.</p> <p>Part 2.7: Short circuit duty Assessment has been revised for clarity and included as Part 2.8.</p> <p>2.8 For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>IRC Standards Review Committee</p>	<p>(1) When a spare equipment strategy does not cover the long lead time unavailability as stated in 2.1.4, will the system be treated as normal system condition or as having a contingency from which system adjustments are to be made prior to subsequent events.</p> <p>(2) Under R2.5 ?Past Studies may be used to support the Planning Assessment if they meet the following requirements and the sub requirement R2.5.2 states that for SS, SC, or stability analysis; the PRESENT system model shall not include any material changes, such as “.Does this mean that past studies may be used to support planning assessments as long as there are no material changes to the present system model” If so, that would be an impossible scenario to recreate.</p>
<p>Response: In Part 2.1.4 (now Part 2.1.5) when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the “normal” (P0) condition in Table 1. Part 2.1.5 is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.5.2 is intended to allow the use of past study if the System that is being modeled for Assessment today has not materially changed from the one modeled in the past study for the study area. While changes are expected to occur between planning cycles, not all changes have significant impacts on System performance. For example, if the load growth in an area has not changed significantly, there is no change in the Transmission System and no addition of new generation, and then a case can be made that the past study can be used to support a new Assessment.</p>
TVA System Planning	<p>Do not understand the rationale for being so prescriptive in requiring specific years to be studied in R2.1.1. Why not allow the TP and/or PC to decide on the three years to be studied in the Near Term?</p> <p>Since R2.3 short circuit analysis is a new raising the bar requirement, should the implementation plan for this be for 5 years like the other new raising the bar requirements?</p> <p>Further clarification is needed in R2.4.1 concerning load models that appropriately represent the dynamic behavior of loads. Is a NERC drafting team addressing these issues to determine an industry standard?</p> <p>If contingencies occur inside one utility that affect facilities in another utility, which utility is responsible for running these studies during the annual assessments?</p> <p>In R2.6.1, is there any limit to the time duration that a SPS and/or operating procedures can be used in the CAP?</p> <p>In Posting #2, undervoltage load shed, underfrequency load shed, and Special Protection Schemes were considered to be Non-Consequential Load Loss. In R2.6.1, installation or modification of Protection Systems or Special Protection Systems are now allowed as part of the Corrective Action Plan. Should undervoltage and underfrequency load shed also be allowed in the Corrective Action Plan?</p> <p>In R2.9, does the requirement require the maximum non-consequential load that can occur for contingencies in Table 1 or does it require just the maximum that a utility will allow on its system? Suggest clarifying permissible or perhaps using similar language as found in R2.8.</p> <p>Please explain the reason why Requirement R2.9 is needed in the Assessment. Reporting the largest Non-Consequential Load Loss doe not impact reliability.</p> <p>In R2.1, change the reference to requirement R2.6 (at the end of the last line) to R2.5.</p> <p>With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend add the following to the end of R2.5.1: unless justification can be provided to demonstrate that the results of an older study are still valid.</p> <p>In Requirement R2.6.2, what constitutes a "project initiation date," and how will it be used? Please clarify.</p> <p>Please explain the reason why Requirement R2.8 is needed in the Assessment. Reporting the largest Consequential Load Loss does not impact reliability.</p> <p>R2.1 What's the value in being able to use qualified past studies if you have to use annual current studies Strike the words supplemented with and insert the word or R2.3 Insert the phrase one year of after the word addressing.</p> <p>In the subrequirements of 2.1.3 and 2.4.3, the use of the word timing is unclear. Consider using in service date or schedule for.</p> <p>In R2.6, does the Corrective Action Plan need to show all possible alternatives to fix a problem that has been identified - or does only one solution need to be shown for a problem?</p>
<p>Response: As written, Requirement R2 and Part 2.1.1 provides flexibility for the Planning Coordinator or Transmission Planner to use past studies to support the current year Planning Assessment, and to assess other years in addition to those identified in Part 2.1.1. So the suggestion is already allowed as written. No change made.</p> <p>The SDT does not feel that Part 2.3 raises the bar as entities should have been performing these studies all along. No change made.</p> <p>Part 2.4.1 requires only that the Load model appropriately represent the dynamic behavior of Loads. It is up to the Planning Coordinator and Transmission Planner, who are closer to the issues in the planning area to determine the application of the Load models. No change made.</p> <p>If Contingencies occur inside one utility that affect Facilities in another utility, the Planning Coordinator or Transmission Planner for the utility whose System is impacted would be responsible for performing the annual Assessment for those Contingencies known to cause the impact. A certain amount of coordination will need to occur between the utilities. The parties can then mutually agree upon a Corrective Action Plan.</p> <p>Part 2.6 has been revised and included as Part 2.7 in the new version. In the fifth bullet in Part 2.6.1, the duration for use of an operating procedure is at the discretion of the Planning Coordinator or Transmission Planner because it may not be feasible to implement Transmission reinforcements in some locations.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>UVLS and UFLS are not precluded in the Corrective Action Plan for those events where controlled Load shedding is allowed. The Standard does not address the acceptability of the tools to be used for any Corrective Action Plan. Part.2.6 does not specify how the Corrective Action Plan is written, it only requires that there is a plan to correct the potential problem identified in the Assessment. Therefore, it can be a number of alternatives or a single definitive alternative as long as the potential problem is addressed.</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Part 2.9 has been deleted.</p> <p>In the new version, Part.2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>Part 2.5.1 has been revised and included as Part 2.6.1 to address your concerns.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>The SDT believes that Requirement R2, part 2.8 (now part 2.9) supports the objective of ensuring BES reliability by ensuring that the largest expected amount of Consequential Load Loss is reported in an open, transparent process. Part 2.9 has been clarified.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p> <p>In Part 2.1 it is envisioned that not all parts of the studies on which the Assessment is to be based can rely on past studies. For example, a study on year five performed during the past year may not be representative of year five in the current year. A past study can still be used if it can be demonstrated that the requirements for use of past studies are met.</p> <p>Parts 2.1.3 (now Part 2.1.4) and 2.4.3 have been revised to reflect your suggestion.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none">• Real and reactive forecasted Load.• Expected transfers.• Expected in service dates of new or modified Transmission Facilities.• Reactive resource capability.• Generation additions, retirements, or other dispatch scenarios.• Controllable Loads and Demand Side Management.• Duration or timing of planned Transmission outages. <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>Part.2.6 does not specify how the Corrective Action Plan is written, it only requires that there is a plan to correct the potential problem identified in the Assessment. Therefore, it can be a number of alternatives or a single definitive alternative as long as the potential problem is addressed.</p>
<p>Exelon Transmission Planning</p>	<p>There are large amounts of resources required to perform the volume of studies required, including the dynamic and steady state sensitivities, extreme studies, and one-year lead time equipment spares. Many of these studies ultimately do not require additional consideration or reinforcement and have low threshold triggers, such as a 20 MW generation change. Performing these studies will be very burdensome to many TPs and result in few, if any, reliability benefits. We believe that the TP should be given more flexibility to allocate planning resources to areas of maximum benefit.</p> <p>The Spare Strategy in R2.1.4 is still not well defined. What types of equipment are included? How would a one-year lead time element be determined for consideration in this requirement?</p> <p>In R2.4.1, we recommend changing appropriately represents to a dynamic model appropriate for the type of stability study being performed? The TP should be allowed to perform only those specific stability studies needed and pertinent to its system.</p> <p>The same can be said about the dynamic load model. Differing interpretations are possible. We suggest changing the last sentence in R2.4.1 to .., a Load model shall be used which appropriately represents..An aggregate System Dynamic Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>In 2.1.3 and 2.4.3 strike Expected from the phrase Expected transfers. Expected transfers should already be in the base case.</p> <p>In R2.5.2, the determination of a Material change is an engineering judgment issue and it should not be categorically defined here. There may be more significant material changes than a 20 MW increase in generation that would be better to study. In the phrase, For steady statesuch as generation or transmission additions/removals, or topology changes and would impact the study area, it is suggested to change would to could and impact the study area to significantly change the previous study results. The term should not be Corrective Action Plan, which implies a violation of a requirement. Suggest changing this term to Future Reliability Plan.</p> <p>What is the intended use for reporting the largest consequential and maximum non-consequential load loss amount and event? This would be a potential security concern if made public.</p> <p>There is a similar concern with the extreme event analysis.</p> <p>In 2.6.2 please define Initiation Date. While we appreciate your previous consideration of this comment, it is still not clear what this means. Is this the date of mitigation identification, regulatory approval date, construction start date, equipment procurement date, etc? If this is a commonly understood term not requiring a formal definition, could you then please</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>provide that definition in your response?</p> <p>If there is going to be a requirement to report on each contingency that results in non-consequential load loss it should be specified.</p>
	<p>Response: If there are specific requirements in the standard that you feel would require the Transmission Planner to allocate their resources a certain way then you need to supply those specifics. As it stands, the SDT feels that the Transmission Planner can allocate resources any way they want. The standard does not dictate how they should meet requirements. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its system, or have an agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.4.1 has been revised to address your concerns.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>The SDT declines to strike "Expected Transfers" from Parts 2.1.3 (now Part 2.1.4) and 2.4.3. Parts 2.1.4 and 2.4.3 are sensitivity cases to be examined, which should cover conditions different from the base case. In any case, the Planning Coordinator or Transmission Planner are only required to examine one of the items from the list, and has the flexibility to choose other sensitivity cases if changes in expected transfer is not applicable.</p> <p>Part 2.5.2 has been modified and included as Part 2.6.2. The SDT declines to change the term "Corrective Action Plan" to "Future Reliability Plan" because the Standard only requires the System performance to meet requirements. If a System meets requirements, then a Corrective Action Plan would not be necessary. An entity can still choose to install Transmission reinforcements for other reasons, but they would not be required by this Standard.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only. The SDT does not believe that this requirement represents a security concern as rewritten.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment			
	<p>events in Table 1.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>The comment – “If there is going to be a requirement to report on each contingency that results in non-consequential load loss it should be specified” does not reference any specific Requirement and therefore, the SDT can’t respond. No change made.</p>			
Southern Company	<p>The Lower VSL describes a scenario where the TP or PC fails one or both of two particular sub-requirements. This language does not reconcile how failure of two sub-requirements is consistent with failure of only one of the same requirements. The recommendation is to restructure the VSL such that it is invoked when either sub-requirement is violated (not when both are violated).</p> <p>Generating unit stability has now been combined with system stability to be just one category - Stability. Previously, the shelf life of generating unit stability studies was indefinite -only needed to be restudied when system changes required it. Now the maximum shelf life of Stability studies is five years. Does this mean that generating unit stability studies must be repeated every five years whether system changes make it necessary or not?</p> <p>Requirement 2.3 stating that the short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon. It is not clear if the intent of the requirement is to study every year within Year One and year five. A statement similar to R2.1.1 Year One or two and year five for steady state analysis would be helpful.</p> <p>Some clarification is needed for R2.3 on the term Near-Term. Requirement 2.3 stating that “the analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study area. What interrupting devices are included? Would the circuit breakers be enough? Moreover, the term System short circuit model is used for the first time (and the only time) here for the entire document. It is very common to use a different short circuit model for short circuit analysis while the steady state and stability analysis use different System models (power flow models). Some clarification is needed.</p> <p>R2.8 and R2.9 use the term megawatt "Demand". This is redundant. We suggest striking the word demand.</p>			
Response: The Lower VSL for Requirement R2 has been revised.				
R2 VSL	The responsible entity failed to comply with Requirement R2, part 2.9	The responsible entity failed to comply with Requirement R2, part 2.3 or part 2.8. Organization	Question 2 Comment		
			part 2.2, part 2.4, part 2.5, or part 2.7
<p>Part 2.5.1 has been revised and included as Part 2.6.1 to address your concerns.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>The SDT declines to revise Part 2.3 to include short circuit analysis for one of the years in the Near-Term Transmission Planning Horizon because Part 2.3 only requires that a Planning Assessment be performed. Past studies can be used to support the Planning Assessment.</p> <p>Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess the whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>The “megawatt” Is the qualifier for “Demand”. The SDT believe it is clear as written. No change made.</p>			
United Illuminating	<p>R2 Comment We recommend replacing the phrase “prepare” with “conduct and document” in the first sentence.</p> <p>R2.1.1 Comment The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2.</p> <p>R2.1.2 Comment The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments.</p> <p>R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment.</p> <p>R2.1.4 Priority Comment With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Why doesn't the standard state (such as a transformer, generator or power electronic device) and not just</p>		

Organization	Question 2 Comment
	<p>(such as a transformer).</p> <p>R2.2 Comment We suggest replacing the phrase “a current System peak Load study” with a valid System peak Load study in the first sentence. The word current is confusing as some read the word current to mean today’s rather than valid.</p> <p>R2.3 Comment Please provide guidance as to what year should be represented when performing short circuit studies.</p> <p>R2.4.1 Comment Change to read: “For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.</p> <p>R2.5.1 Comment? We suggest deleting this requirement, and incorporating it into R2.5.2.</p> <p>R2.5.2 Comment To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study]? An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner.</p> <p>R2.6 Priority Comment As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read Provide documentation that explains the reasoning for the sensitivities considered and selected.</p> <p>R2.6 Comment At the end of the second sentence, the phrase “in the tables” is used. We suggest using more definitive language such as in Table 1.</p> <p>R2.6.2 Comment The phrase Project Initiation Date needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase “as well as an in-service date” should be modified to read “as well as a target in-service date”.</p> <p>R2.6.3 Comment Plans can provide a target in-service year but not an actual in-service year.</p> <p>R2.6.4 Priority Comment There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year’s assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year’s assessment and develop corrective actions.</p> <p>R2.8 Comment Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted.</p> <p>R2.9 Comment This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for</p>

Organization	Question 2 Comment
	<p>non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.</p>
<p>Response: The SDT does not think that replacing “prepare” with “conduct and document” would add clarity, since Requirement R2 includes a requirement to document assumptions and results. No change made.</p> <p>The <i>Time Horizon</i> term at the end of the requirement deals with mitigation time periods (as shown below) and is not connected to the assessment time frames. No change made. Time Horizons are a consideration when there is a violation of a requirement – the impact to the BES of violating a requirement with a long-term planning horizon is not expected to be as severe as the impact associated with violating a requirement with a real-time operations time horizon.</p> <p>Mitigation Time Horizon</p> <p>The time horizons available for mitigating a violation to a requirement include the following:</p> <ul style="list-style-type: none"> • Long-term Planning — a planning horizon of one year or longer. • Operations Planning — operating and resource plans from day-ahead up to and including seasonal. • Same-day Operations — routine actions required within the timeframe of a day, but not real-time. • Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system. • Operations Assessment — follow-up evaluations and reporting of real time operations. <p>Part 2.1.2 requires that the Planning Coordinator and/or Transmission Planner also consider off-peak conditions because the System must be able to meet performance requirements over all demand levels. System peak condition may not represent all stressed conditions. For example, during off-peak, the Load is low, and the generation would have to be turned off to achieve Load-resource balance. Turning down resources within a Load area could result in reliability problems. Lowering the Load in areas with many non-dispatchable resources could also pose potential problems. As the System incorporates more and more renewable resources, some of them are non-dispatchable; a standard must be forward looking so the Planning Coordinator and Transmission Planner can identify potential problems as part of the Assessment. No change made.</p> <p>Part 2.1.3 (now Part 2.1.4) has been rewritten to clarify the intent of the requirement. The requirement does not preclude a discussion of risk.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. 	

Organization	Question 2 Comment
	<ul style="list-style-type: none"> • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>In Part 2.1.4 (now Part 2.1.5) when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the “normal” (P0) condition in Table 1 and the rest of Table 1 will be applied as stated. Part 2.1.5 is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the performance of their System. If a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Actions such as out of merit dispatch, operational restrictions, System reconfiguration can be part of a Corrective Action Plan if the System cannot meet performance requirements without the Facility in service. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2 is intended to require a study performed in the current year, as opposed to studied performed in the past years. Part 2.2 has been revised to provide greater clarity.</p> <p>2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>For Part 2.3 the decision on the year to be represented in the study is left to the discretion of the Planning Coordinator or Transmission Planner. Part 2.3 only requires it to be either a study that was performed during the current year or in the past. For example, this year is 2009 and a study performed in 2009 is a current study, the study can investigate the System in a future year, which is at the discretion of the Planning Coordinator or Transmission Planner performing the study. Requirement R2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.4.1 was revised but not changed as proposed because the intent of the last sentence is to allow the use of an aggregated System Load model as an appropriate Load representation. The suggested change could be read to mean that an aggregated System Load model would not appropriately represent the dynamic behavior of Loads.</p> <p>Parts 2.5 .1 and 2.5.2 (new Parts 2.6.1 and 2.6.2) were not combined. While the SDT appreciates the concern that a 20 MW generation addition can be small compared to a large System, a NERC standard needs to be clear as to the applicability. A requirement which contains “determined to be material by the Planning Coordinator or Transmission Planner” is not clear. Therefore, changing from 20 MW to “material” will also have to require justification from the Planning</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Coordinator or Transmission Planner on what is “material”. Material has been deleted.</p> <p>Part 2.6 has been modified and included as new Part 2.7. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur is more than one sensitivity). Although not required, the standard does not preclude the Planning Coordinator or Transmission Planner to develop Corrective Action Plans for high risk scenarios. However, if the scenario is high risk, then it should have been included in the base assumptions in the assessment and the Corrective Action Plan would have been required. The end of the second sentence has been changed to refer to Table 1 as suggested.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>Part 2.6.4 allows the Planning Coordinator or Transmission Planner to address situations that are beyond its control by utilizing Non-Consequential Load Loss and/or curtailment of Firm Transmission Service, which are normally not permitted. Depending on the urgency of the need, the Corrective Action Plan may be developed outside the normal Assessment cycle at the discretion of the Planning Coordinator or Transmission Planner involved.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
Louisiana Energy and Power Authority	<p>R2.5. This basic requirement intends, as we understand it, to require that earlier studies not be used for a current assessment if they are no longer accurate. But the phrasing is potentially confusing, and would be clearer if revised. Since the requirement deals with the use of past studies, we suggest that R2.5.2 be revised to state that the study may be used only if there have been no material changes, so that R2.5 reads in full: R2.5. Past studies may be used to support the Planning Assessment if they meet the following requirements: R2.5.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less. R2.5.2. For steady state, short circuit, or Stability analysis: the study may be used only if there have been no material changes, such as generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: The addition/deletion/change of individual generating unit capability of 20 MW or greater. An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater.</p> <p>With respect to footnote 10 to Table 1, we fear that the flexibility suggested by those provisions may be excessive for a planning standard. The ambiguity occasioned by stating emergency actions that can properly be taken in a planning standard can be utilized by those who plan the system in a manner which plans to drop non-consequential loads just as footnote b has been used in the past. If this is intended to raise the bar as stated these provisions do not belong in a</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>planning standard, at least as now stated.</p> <p>It may be appropriate to remove the reference to footnote 10, at least in the Initial System Condition entry in P3, where it suggests that it can be invoked after loss of a single generator, and we request the SDT to review that footnote to assure that it is appropriate in the other entries to which it is applied.</p>
	<p>Response: Part 2.5 has been revised and included as Part 2.6 as shown.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Footnote 10 (now footnote 9) was added to address the disjoint between how some parties calculate ATC/AFC when assessing Long Term Firm Transmission Service and the currently proposed TPL-001-1 standard. TPL-001-1 requires Transmission Planners to plan their systems to meet multiple contingency events and some parties assess Long Term Firm Transmission Service on a first Contingency basis. Units obligated to re-dispatch, as contemplated in Footnote 9 are those units which are contractually bound to provide the service as well as those obligated to provide the service under Network Integrated Transmission Service, under FERC's pro forma OATT. Under the pro forma OATT, units designated as network resources receiving NITS are obligated to re-dispatch as requested by the Transmission Provider pursuant to Section 33.2 to maintain reliability. The footnote is worded such that curtailment/re-dispatch cannot result in the loss of firm Load preserves the guidance given by FERC in Order 693 that no single Contingency result in the loss of firm Load. No change made.</p> <p>The SDT has reviewed the application of footnote 10 (now footnote 9) and believes that it is correct. No change made.</p>
<p>System Protection and Transmission Planning Department</p>	<p>R2 - The term "Stability Analysis" is used frequently in the standard, but is not clearly defined. Based on an IEEE paper ("Definition and Classification of Power System Stability," Kundar, et al) there are 5 different categories of stability analysis: 1)small signal angle stability; 2) transient angle stability; 3) frequency stability; 4) large disturbance voltage stability; and 5) small disturbance voltage stability. Does the writing committee intend to make the analysis of all these types of stability issues mandatory? I recommend inserting a new definition into the standard for stability as follows: "Stability Analysis - The study of the bulk electric power system's ability, for a given initial operating condition, to regain a state of operating equilibrium after being subjected to a physical disturbance. There are 5 accepted categories of power system stability: 1) small signal angle stability; 2) transient angle stability; 3) frequency stability; 4) large disturbance voltage stability; and 5) small disturbance voltage stability. While there are situations that exist that require small signal angle and voltage stability analysis, only transient angle stability, frequency stability, and large disturbance voltage stability analysis are generally relevant to system planning performance assessments.</p> <p>R2.1.4 is a new requirement directing studies to consider impacts of spare equipment strategy. Does this require the TP to run scenario analysis without certain transformers? It is not clear what is required. How many spare transformers are required? What reliability level is acceptable?</p> <p>R2.1.4 The one year cut-off seems arbitrary. One MONTH may be unacceptably long in some cases. Instead of one year or more, we suggest the requirement state an extended time period.</p>

Organization	Question 2 Comment
	<p>R2.2. The wording on this requirement is not clear. Is it trying to say that a long-term (5-10 year) peak loading study is required to be performed annually</p> <p>R2.2: What is meant by the term current System peak Load study A powerflow study performed under expected peak-load conditions? Or a forecast of peak loads?</p> <p>R2.3 A short circuit analysis requirement is now added to Planning Assessment requirements. Short circuit analysis appears to be in the standard to document adequate ratings for interrupting equipment. That would be the purpose of short circuit studies we perform. If there are other intended meanings, then additional detail is needed.</p> <p>R2.3 We do not agree that a short circuit analysis needs to be conducted annually. The requirement for a new short circuit duty study should be driven by changes in the system, as is done for powerflow study work. In short, until system changes are made, we would not anticipate higher fault duties, and there would be no reason to rerun studies.</p> <p>R2.4.1 requires dynamic load models. Development of dynamic load models is ongoing, and therefore will need a much longer implementation period than the steady state portions of the standard. We are not sure two years will be enough. It depends partly on pending work that is not under our control.R1.1.2, R2.1.4, R2.5.2, R3.3.4, R4.3.3, R5 When text of a Standard Requirement includes the phrase such as or could include, then gives a list of possible choices, we take it to mean “just one of these items, or none of these, or something not listed here”. In other words, such as lists are really non-required, non-interpretable, non-measurable options. They should not be included in requirements. Lists such as these belong in transmittal notes and associated SDT commentary, not in Compliance Standard Requirements.</p> <p>R2.5.2 Limits such as “addition/deletion/change to a group of generating units . . . which total 20 MW or greater. are not always appropriate. Appropriateness of Generation netting with load should depend on system size and engineering judgment, not artificial limits. The suggestion list following generation changes could include: should be eliminated.</p> <p>R2.6.2. For the Near-Term Transmission Planning Horizon, include both a project initiation date as well as an in-service date? The assessment report should not require a full project development just a description of what is required to provide adequate service within specified operating criteria. The term project initiation is not clear. Requirement R2.6.2 should be eliminated.</p> <p>R2.8. The Planning Assessment shall provide the largest Consequential Load Loss (megawatt Demand) and the associated event caused by any P1 event and any P2 event in Table 1. is complicated, and may require new modeling software capability to comply. Software vendors would develop this capability. Why is this required? What is the expected benefit to system reliability?</p>
	<p>Response: The SDT disagrees that the Standard should include a definition of Stability analysis because it is covered in Requirement R2. “Stability analysis” is not a defined NERC term and is not intended to be defined as in IEEE; however, it does not conflict with the IEEE definition. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won’t last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, and may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its system, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>one year. The Planning Coordinator and/or Transmission Planner will need to decide which pieces of major Equipment in their respective Systems would be more vulnerable to long term outage. In Part 2.1.5 when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the “normal” (P0) condition in Table 1 and the rest of Table 1 will be applied as stated. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2 has been revised to provide greater clarity. The standard will require that a study for one year within the Long-Term Transmission Planning Horizon be conducted. The Planning Assessment can be supplemented by past studies.</p> <p>2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>Part 2.3 has been revised to provide greater clarity. In addition, Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. The Assessment is to be supported by a current or past study. Therefore, annual short circuit study is not required if no material change has occurred.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.4.1 allows the use of an aggregate System Load model which represents the overall dynamic behavior of the Load that could impact the study area. Part 2.4.1 has been revised to provide greater clarity. In addition, the SDT was not able to locate the phrase “such as” in Requirement R2.4.1. There were two places in Requirement R2 that this phrase appears (Parts 2.1.4 and 2.5.2). In both instances, what follows were examples and not requirements.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Part 2.5.2 has been revised and included as Part 2.6.2 to address your concerns.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with</p>

This requirement is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.</p>
	<p>Response: Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt. Even though the effects of short circuit capability are localized and may be related to new planned Facilities, it is important to BES reliability. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.5 has been revised and included as Part 2.6 as shown. The references to a 20 MW threshold have been deleted from the revised standard.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
Western Area Power Administration	Short-circuit studies as related to maintaining adequate protection devices and systems are normally performed either by a specific System Protection Group/Department or System Maintenance Department and should not be in this requirement, but Post-Transient Analysis to mitigate voltage collapse scenarios should be included (includes R2.5.1 & R2.5.2). Also, System Protection including mitigation of short-circuit duty above installed facilities capabilities or for new planned facilities are already covered by the PRC Standards and need not be included and duplicated in the TPL Planning Standard such as in R2.3 & R2.7.
	<p>Response: Parts 2.3 and 2.7 are intended for the Planning Coordinator and/or Transmission Planner to assess whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt, and develop Corrective Action Plan is needed. As such, they are not specifically related to new planned Facilities. Requirement for Post-transient voltage collapse is included in Table 1, Header note (a), which states "Voltage instability, cascading outages, and uncontrolled islanding shall not occur." No change made.</p>
Tampa Electric	<p>R2.1 should state R2.5 at the end of requirement instead of R2.6</p> <p>R2.1.4 Consider revising to only include P0-P2 contingencies.</p> <p>R2.5.1 please clarify whether the 5 years is from the beginning of the assessment or end of the assessment.</p> <p>R2.6 Consider changing the terminology for "Corrective Action Plan" to "Transmission Plan"</p> <p>R2.8 Please clarify the reason for this requirement. This is not necessary for reliability and the effort to collect this information is substantial and does not benefit the BES.</p> <p>R2.9 Please clarify the reason for this requirement. This is not necessary for reliability and the effort to collect this</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>information is substantial.</p> <p>Response: In the new version, Part.2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>For Part 2.5.1 the 5 years should be measured from the completion of the past study to be used to support the current Planning Assessment. However, Part 2.5.1 has been revised and included as Part 2.6.1, which will allow the use of studies older than 5 years if a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>In Part 2.6, the SDT declines to change the term “Corrective Action Plan” to “Transmission Plan” because the Standard only requires the System performance to meet requirements. If a System meets requirements, then a Corrective Action Plan would not be necessary. An entity can still choose to install Transmission reinforcements for other reasons, but they would not be required by this Standard.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Requirement R2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>Florida Reliability Coordinating Council, Inc - Transmission Working Group</p>	<p>Incorrect reference shown at the end of R2.1. The appropriate reference should be R2.5.</p> <p>The end of the first sentence of R2.3 should have a reference to R2.5.</p> <p>The end of the first sentence of R2.4 should have a reference to R2.5.</p> <p>R2.1.4 - Please consider revising this for the analysis to include only Contingencies P0-P2 in Table 1. Alternatively we suggest moving this requirement to be under sections 2.1.3 and 2.4.3 and treated as a sensitivity.</p> <p>R2.5 ? This requirement is very valuable in clarifying that past studies can be used and what criteria needs to be met for them to be used. However it is not clear if all new studies could be met using past studies (e.g. a small system with very few changes year to year) or if some sub-requirements require a new study every year, with past studies only used as supporting information. If the intent is that some sub-requirements can not be met with past studies, then consider making that clear through a foot note or a list under Section 2.5 listing which study requirements may depend only past studies that are still current.</p>

Organization	Question 2 Comment
	<p>R2.5.1 Please clarify if the 5 calendar years is from the date the assessment is “finished” or the date the study process for the assessment begins.</p> <p>R2.5.2 the identified 20 MW threshold is extremely small and would be doubtful to change the response of the BES. This requirement could also be interpreted that a previous study where the base case is not identical to the current planning case could be used. Please consider the following proposed language: For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period that would impact the study area. (not show the list)</p> <p>R2.6 - Requiring sensitivities but not requiring that they meet specific performance requirements is a sound approach.R2.6 requires a corrective action plan when performance will not be met in the simulations. However, if an entity has already planned a needed facility and/or operation steps for a given conditions, the simulations will not show any deficiencies and therefore no corrective action plan is required. The term Corrective Action Plan implies that the situation is wrong or incorrect, consider changing the approach to be to require an entity to have a planning and Operations plan, Improvement Action Plan?, or simply a Transmission Plan that includes all facilities planned for the BES and descriptions of conditions where an operational process is being used.</p> <p>R2.6.1 (Bullet 2) This requirement should also account for the removal of a Special Protection Systems: Installation, modification or removal of Protection Systems or Special Protection Systems?.</p> <p>R2.6.4 This is an excellent addition</p> <p>R2.8 Please explain the reason for this requirement. The effort required to collect this data is substantial and does not have any benefit to the BES.</p> <p>R2.9 Please explain the reason for this requirement. It seems to cause Entities to develop performance criteria for themselves for Multiple and Extreme Contingencies that are not in Table 1. The effort required to collect this data to compare against any self-imposed criteria is substantial and does not have any benefit to the BES. The requirement will result in inconsistency across North America. There is also no discussion of what happens if a Multiple or Extreme contingency is shown to exceed the Entity’s self-imposed criteria, is the Entity then non-compliant? If so, what if the Entity simply changes the self-imposed criteria? We suggest eliminating this requirement.</p>
<p>Response: In the new version, Part.2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference.</p> <p>Parts 2.3 & 2.4 have been revised to reflect your suggestion.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>2.4 The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as indicated in Requirement R2, part2.6. The following studies are required.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the</p>

If a System meets requirements, then a Corrective Action Plan would not be necessary. An entity can still choose to install Transmission reinforcements for other reasons, but they would not be required by this Standard. Although additions of Protection Systems and Special Protection Systems are usually associated with projects to enable the System to meet performance requirements, the second bullet in Part 2.7 has been modified to include removal of Protection Systems or Special Protection Systems to provide greater clarity.</p> <p>2.7 bullet 2: Installation, modification, or removal of Protection Systems or Special Protection Systems</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
FMPA	<p>Incorrect reference shown at the end of R2.1. The appropriate reference should be R2.5.</p> <p>The end of the first sentence of R2.3 should have a reference to R2.5.</p> <p>The end of the first sentence of R2.4 should have a reference to R2.5.</p> <p>R2.1.4, what does (t)he analysis shall reflect the Contingencies identified in Table 1 mean? Is the intention similar to sensitivities, where there is no direct requirement to meet the performance standards of Table 1? If so, why not include loss of a long lead time Facility followed by other contingencies one of the Sensitivities and not have a separate sub-requirement for it? Or, is the intention that the TP and PC must meet the performance requirements of Table 1 considering the outage of a long lead time Facility? We hope that the intent is not to require Entities to be able to meet the performance requirements</p>

Organization	Question 2 Comment
	<p>of Table 1 assuming a long lead time Facility out of service. If that is the intent, then we believe that only Contingencies P0-P2 in Table 1 ought to apply to Requirement R2.1.4. Otherwise, Requirement R2.1.4 would require building transmission to triple contingency (N-3) criteria. Contingency P3 requires building transmission to a single contingency plus a generator outage (a double contingency that has the same performance criteria requirements as single contingencies). Since generators are long term lead Facilities that no one that we know of carries spares for, R2.1.4 as written would mean that Contingency P3 becomes two generators out of service with system adjustments followed by another contingency (N-3). This would have the (possibly unintended) consequences of significantly reducing long-term firm ATC since utilities will likely use TRM to account for the potential for long-term outages. If meeting the criteria of Table 1 is the intent of the SDT, then a potential way to address this is to restate R2.1.4 to state that only P0 through P2 (zero and single contingency) apply to R2.1.4. If meeting the performance criteria of Table 1 is the intent of the SDT for R2.1.4, then we also believe that R2.1.4 should also only apply to the EHV and not the HV system. Yes, when a major piece of equipment such as a transformer fails, it could be out for a long period of time; however, a transformer failure is far less probable than an over-head transmission line failure (e.g., a transformer failure is in the range of a once in 50 year event, whereas a transmission line fails probably once a year or once every other year, almost two orders of magnitude difference). A major 500 kV/230 kV autotransformer failure will have a far larger radius of impact than a 230 kV/138 kV autotransformer meant to serve the local area, giving additional support to purchasing a spare transformer for the 500/230 kV auto (EHV system). A small utility with only one or two 230 / 138 kV autos does not have sufficient justification to purchase a spare autotransformer due to the very low failure rate and the much more localized purpose of the transformer. If the intent of the SDT is to meet the performance requirements of Table 1 for R2.1.4, then the standard would essentially cause many small utilities who cannot justify spare autos to plan to serve only load and significantly reduce ATC in the planning horizon. Based on the lesser impact of HV connected autos as compared to EHV connected autos, and if the intent of the SDT is to meet the performance requirements of Table 1 for R2.1.4, then we would recommend that, for auto-transformers, R2.1.4 should only be applicable to EHV connected auto-transformers.</p> <p>R2.8 Please explain the reason for this requirement. The effort required to collect this data is substantial and does not have any benefit to the BES.</p> <p>R2.9 Please explain the reason for this requirement. It seems to cause Entities to develop performance criteria for themselves for Multiple and Extreme Contingencies that are not in Table 1. The effort required to collect this data to compare against any self-imposed criteria is substantial and does not have any benefit to the BES. The requirement will result in inconsistency across North America. There is also no discussion of what happens if a Multiple or Extreme contingency is shown to exceed the Entity's self-imposed criteria, is the Entity then non-compliant? If so, what if the Entity simply changes the self-imposed criteria?</p>
<p>Response: In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. Parts 2.3 and 2.4 have been revised to reflect your suggestion.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned</p>

Organization	Question 2 Comment
	<p>generation and Transmission Facilities in service which could impact the study area.</p> <p>2.4 The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as indicated in Requirement R2, part 2.6. The following studies are required.</p> <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Transmission Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. The Planning Coordinator and/or Transmission Planner will need to decide which pieces of major Equipment in their respective systems would be more vulnerable to long term outage. In Part 2.1.5 when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the "normal" (P0) condition in Table 1 and the rest of Table 1 will be applied as stated. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>Progress Energy Carolina (PEC)</p>	<p>PEC believes that "R2.1.1. System peak Load for either Year One or year two, and for year five" is unnecessarily prescriptive. PEC recommends eliminating the Year One or year two addition.</p> <p>PEC believes that R2.1.4. concerning an entity's spare equipment strategy is overly conservative. The standard should only require N-2 deep planning and not N-3.</p> <p>PEC believes that for R2.4.1 "a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads" should be clarified to include "as appropriate" clause. Induction motor load modeling should not be required for all dynamic studies.</p> <p>PEC believes that for R2.5.2. The language "For steady state, short circuit, or Stability analysis: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area" needs to be made more clear. The important point is that material changes must be modeled if they have occurred. Also the 20MW threshold is far too small to be material.</p> <p>PEC believes that R2.8. and P2.9 are unnecessary and should be removed.</p>

Organization	Question 2 Comment
	<p>Response: Requirement R2, part 2.1.1 is intended to require studies for System Peak Load Conditions for 2 of the years in the Near-Term Transmission Planning Horizon: (1) A year five case to identify potential problem that can be addressed if the planned projects proceed as scheduled; (2) A Year One or year two case to identify any potential problems unanticipated in the five-year case, which if not addressed, could impact operations as time progresses. The standard provides flexibility for the Planning Coordinator or Transmission Planner to use past studies to support the current year assessment, and to assess other years in addition to those identified in Requirement R2, part 2.1.1. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. In Part 2.1.5 when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the "normal" (P0) condition in Table 1 and the rest of Table 1 will be applied as stated. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.4.1 allows the use of an aggregate System Load model which represents the overall dynamic behavior of the Load that could impact the study area. Part 2.4.1 has been revised to provide greater clarity.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Part 2.5.2 has been revised and included as Part 2.6.2 to address your concerns. The references to a 20 MW threshold have been deleted from the revised standard.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
CPS Energy	As written, is it the intent of Requirement R2.1.4. to escalate the contingencies in Table 1 from "N-1" to "N-2" and "N-2" to "N-3" for long lead-time replacement equipment, such as autotransformers and GSUs? If so, we feel that this requirement is

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>overly burdensome that will result in unnecessary expense to the customers.</p> <p>In Requirement R2.4.1., what is the intent of the second sentence if an aggregate system load model is acceptable? We feel that the second sentence should be removed.</p> <p>In Requirement R2.6.2., we feel that statement of the project initiation date has no benefit and should be removed as a requirement. The required in-service date should be adequate.</p> <p>We do not believe that there is any benefit to reliability by documenting the Consequential and Non-Consequential Load Loss data required by Requirements R2.8. and R2.9.</p>
	<p>Response: Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>In Part 2.4.1, the intent for the second sentence is that if more accurate Load Model is available it should be used. The standard should not inadvertently disallow improved Load modeling.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
MidAmerican Energy Company	MidAmerican commends the SDT for all its hard work on this standard. MidAmerican offers the following comments on R2: MidAmerican believes that the second sentence of R2.3 as written will result in unnecessary modeling for the required short

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>circuit analysis. MidAmerican recommends that the sentence The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study area. MidAmerican recommends that R2.3 be changed by deleting the words any and could and replace with the words materially. In this way, the sentence would read, They analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with generation and Transmission Facilities in service which materially impact the study area.</p> <p>Requirement 2.5 is too confining and is complicated and unnecessary. MidAmerican asks that the requirement be deleted in its entirety. Alternatively, if the SDT does not agree with deleting all of R2.5, then MidAmerican asks that the SDT consider deleting the R2.5.1.</p> <p>MidAmerican believes R2.4 will ensure that analysis is fresh by requiring a certain number of studies be conducted for certain years in the planning horizon. Why add the requirement for no older than 5 calander years? With the R2.4 and the material requirements in R2.5.2 shouldn't that be more than enough to ensure that the analysis is fresh enough to support the assessment?? If R2.5.2 is not deleted, the words and interconnected to the Bulk Electric System should be added behind 20 MW or greater.</p> <p>Requirement 2.6.2 requires the project initiation date. MidAmerican recommends that the SDT delete the requirement to provide this date as an initiation date is not related to system reliability. If the SDT believes it is critical to get this date, then the SDT should define it. Does it mean when engineering starts, when it is decided to proceed, or something else?</p> <p>At a minimum, MidAmerican believes that the SDT should add the word expected behind largest to avoid unnecessary compliance issues for an unexpected event, and clarify that R2.8 and R2.9 are not required for sensitivity cases.</p>
	<p>Response: Part 2.3 has been revised to provide greater clarity. However, the SDT declines to make the changes suggested because Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt, and develop a Corrective Action Plan as needed. As such, they are not specifically related to individual new planned Facilities.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Deleting Part 2.5 would leave no guidance on when past studies can be used to support current Assessment. This can increase work load. Part 2.5 has been revised and included as Part 2.6 as shown.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>In our last meeting the SDT agreed to revise Part 2.6 (and included it as Part 2.7) and project initiation date is no longer required.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>Deseret Generation & Transmission</p>	<p>R2.5.2 For Past studies to be used in the Planning Assessment, the suggestion that the addition of a 20 MW generator would disqualify those past studies is way too restrictive. It should be left up to the Transmission Planner to evaluate the applicability of past studies and the two sub bullets should be removed and replace with a general statement about past studies should adequately represent the present system to be used in the Planning Assessment.</p> <p>Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault).</p> <p>Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV. We also recommend changing this from a separate sub-Requirement to one of the sensitivities to be considered under 2.1.3.</p> <p>We also believe that the statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement.</p> <p>R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the “largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event” if it is documented?</p> <p>R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.</p>
	<p>Response: Part 2.5.2 has been revised and included as Part 2.6.2 to address your concerns. The references to a 20 MW threshold have been deleted from the revised standard.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>demonstrate that System changes do not impact the performance results in the study area.</p> <p>Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess the whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.6 has been modified and included as new Part 2.7. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur is more than one sensitivity). Part 2.7.2 has also been added to require that the Corrective Action Plan include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur is more than one sensitivity).</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>2.7.2 Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in he new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
Northeast Utilities	<p>R2 Comment We recommend replacing the phrase prepare with conduct and document in the first sentence.</p> <p>R2.1.1 Comment The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2.</p> <p>R2.1.2 Comment The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments.</p>

Organization	Question 2 Comment
	<p>R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity study just to meet the requirement of the standard does not add value to the assessment.</p> <p>R2.1.3 Comment - What should be the time duration for the bullet that reads Planned duration or timing of Transmission outages</p> <p>R2.1.4 Priority Comment With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard needs to allow Non-Consequential load loss for P3 & P6 events when spare equipment strategy is incorporated in the testing. An example of such an event, that non-consequential load loss should be acceptable, would be a long-term outage of one transformer at a station which would be modeled in the base, followed by event P6 testing on initial system condition of a transformer out of service then followed by a 2nd transformer outage. This would be three transformers out at the same station and this could approach Extreme Events Contingency.</p> <p>R2.2 Comment We suggest replacing the phrase a current System peak Load study with a valid System peak Load study in the first sentence. The word current is confusing, as some read the word current to mean today's rather than valid.</p> <p>R2.3 Comment Please provide guidance as to what year should be represented when performing short circuit studies.</p> <p>R2.4.1 Comment ? Change to read: "For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.</p> <p>R2.5.1 Comment" We suggest deleting this requirement, and incorporating it into R2.5.2. R2.5.2 Comment To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MW generator is fairly small in a 30,000 MW system and system concerns would already be addressed through the System Impact Study]?An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner.</p> <p>R2.6 Priority Comment As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read Provide documentation that explains the reasoning for the sensitivities considered and selected. R2.6 Comment At the end of the second sentence, the phrase in the tables is used. We suggest using more definitive language such as in Table 1.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>R2.6.2 Comment The phrase Project Initiation Date needs to be defined. It is unclear if this is the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase as well as an in-service date should be modified to read as well as a target in-service date.</p> <p>R2.6.3 Comment Plans can provide a target in-service year but not an actual in-service year.</p> <p>R2.6.4 Priority Comment There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions.</p> <p>R2.8 Comment Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted.</p> <p>R2.9 Priority Comment We highly recommend that the standard should not allow non-consequential load loss to resolve any violation arising from the planning events in Table 1. Therefore, this requirement should be deleted.</p>
ISO New England, Inc.	<p>R2 Comment We recommend replacing the phrase prepare with conduct and document in the first sentence.</p> <p>R2.1.1 Comment The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2.</p> <p>R2.1.2 Comment The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments.</p> <p>R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment.</p> <p>R2.1.4 Priority Comment With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Why doesn't the standard state (such as a transformer, generator or power electronic device) and not just (such as a transformer). R2.2 Comment We suggest replacing the phrase a current System peak Load study with a valid System peak Load study in the first sentence. The word current is confusing as some read the word current to mean today's rather than valid.</p> <p>R2.3 Comment Please provide guidance as to what year should be represented when performing short circuit studies.</p> <p>R2.4.1 Comment Change to read: For peak System Load levels, a Load model shall be used which appropriately</p>

We suggest making the standard read Provide documentation that explains the reasoning for the sensitivities considered and selected.</p> <p>R2.6 Comment At the end of the second sentence, the phrase in the tables is used. We suggest using more definitive language such as in Table 1.</p> <p>R2.6.2 Comment The phrase Project Initiation Date needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase as well as an in-service date should be modified to read as well as a target in-service date.</p> <p>R2.6.3 Comment Plans can provide a target in-service year but not an actual in-service year.</p> <p>R2.6.4 Priority Comment There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year's assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year's assessment and develop corrective actions.</p> <p>R2.8 Comment Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted.</p> <p>R2.9 Comment This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.</p>
Central Maine Power Company	<p>R2 Comment We recommend replacing the phrase prepare with conduct and document in the first sentence.</p> <p>R2.1.1 Comment The requirement to evaluate year one or year two should be removed. This is not consistent with the time horizon identified in R2.</p>

Organization	Question 2 Comment
	<p>R2.1.2 Comment The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments.</p> <p>R2.1.3 Comment - The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on reasonable risk. The assessment should have to include a discussion of reasonable risk. The sensitivity list can be used to select sensitivities to assess risk. Having a requirement to perform one sensitivity just to meet the requirement of the standard does not add value to the assessment.</p> <p>R2.1.4 Priority Comment With respect to spare equipment strategy, this requirement imposes severe testing requirements upon the system. However, there is no discussion on the generation dispatch or system transfers that are to be used for this portion of the assessment. The expectations for changes in system stresses need to be clear as part of the standard. Additionally, this section does not contemplate changing the acceptability of load loss. After experiencing a major contingency such as this, some change in the acceptability of load loss should be expected. The standard should consider allowing Non-Consequential load loss for P1 & P2 events. The standard needs to allow Non-Consequential load loss for P3 & P4 events. Why doesn't the standard state "(such as a transformer, generator or power electronic device)" and not just "(such as a transformer)". What constitutes "spare equipment strategy" Would a strategy that involves out-of-merit dispatch or operational restrictions be considered a valid "spare equipment strategy". If a transformer is lost, could a reconfiguration of transmission constitute a valid "spare equipment strategy"?</p> <p>R2.2 Comment We suggest replacing the phrase a current System peak Load study with a valid System peak Load study in the first sentence. The word current is confusing as some read the word current to mean today's rather than valid.</p> <p>R2.3 Comment Please provide guidance as to what year should be represented when performing short circuit studies.</p> <p>R2.4.1 Comment Change to read: For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.</p> <p>R2.5.1 Comment We suggest deleting this requirement, and incorporating it into R2.5.2.</p> <p>R2.5.2 Comment To incorporate R.2.5.1 into R2.5.2; please modify the section as follows:For steady state, short circuit, or Stability analysis the study shall be less than five calendar years old or less: the present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. [A 20 MVA generator is fairly small in a 30,000 MW system and system concerns would already be addressed though the System Impact Study]? An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES determined to be material by the Planning Coordinator or Transmission Planner.</p> <p>R2.6 Priority Comment As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read Provide documentation that explains the reasoning for the sensitivities considered and</p>

Organization	Question 2 Comment
	<p>selected.</p> <p>R2.6 Comment At the end of the second sentence, the phrase in the tables is used. We suggest using more definitive language such as in Table 1?.</p> <p>R2.6.2 Comment The phrase Project Initiation Date needs to be defined. It is unclear if this is this the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase as well as an in-service date should be modified to read as well as a target in-service date?.</p> <p>R2.6.3 Comment Plans can provide a target in-service year but not an actual in-service year.</p> <p>R2.6.4 Priority Comment There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year’s assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year’s assessment and develop corrective actions.</p> <p>R2.8 Comment Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted.</p> <p>R2.9 Comment This requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment.</p>
<p>Response: The SDT does not think that in Requirement R2 replacing “prepare” with “conduct and document” would add clarity, since Requirement R2 includes requirement to document assumptions and results. No change made.</p> <p>The <i>Time Horizon</i> term at the end of the requirement deals with mitigation time periods (as shown below) and is not connected to the assessment time frames. No change made. Time Horizons are a consideration when there is a violation of a requirement – the impact to the BES of violating a requirement with a long-term planning horizon is not expected to be as severe as the impact associated with violating a requirement with a real-time operations time horizon.</p> <p>Mitigation Time Horizon</p> <p>The time horizons available for mitigating a violation to a requirement include the following:</p> <ul style="list-style-type: none"> • Long-term Planning — a planning horizon of one year or longer. • Operations Planning — operating and resource plans from day-ahead up to and including seasonal. • Same-day Operations — routine actions required within the timeframe of a day, but not real-time. • Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system. • Operations Assessment — follow-up evaluations and reporting of real time operations. <p>Part 2.1.2 requires that the Planning Coordinator and/or Transmission Planner also consider off-peak conditions because the System must be able to meet</p>	

Organization	Question 2 Comment
	<p>performance requirements over all demand levels. System peak condition may not represent all stressed conditions. For example, during off-peak, that Load is low, and the generation would have to be turned off to achieve Load-resource balance. Turning down resources within a Load area could result in reliability problems. Lowering the Load in areas with many non-dispatchable resources could also pose potential problems. As the System incorporates more and more renewable resources, some of them are non-dispatchable; a standard must be forward looking so the Planning Coordinator and Transmission Planner can identify potential problems as part of the Assessment. No change made.</p> <p>Part 2.1.3 (now Part 2.1.4) has been rewritten to clarify the intent of the requirement. The requirement does not preclude a discussion of risk.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. The Planning Coordinator and/or Transmission Planner will need to decide which pieces of major Equipment in their respective Systems would be more vulnerable to long term outage. In Part 2.1.5 when a piece of long lead-time Equipment is unavailable, System adjustments will need to be made. The System, after it is adjusted to accommodate that piece of Equipment out of service will be treated as the "normal" (P0) condition in Table 1 and the rest of Table 1 will be applied as stated. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2 is intended to require a study performed in the current year, as opposed to studied performed in the past years. Part 2.2 has been revised to provide</p>

Organization	Question 2 Comment
	<p>greater clarity.</p> <p>2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>For Part 2.3 the decision on the year to be represented in the study is left to the discretion of the Planning Coordinator or Transmission Planner. Part 2.3 only requires it to be either study that was performed during the current year or in the past. For example, this year is 2009 and a study performed in 2009 is a current study, the study can investigate the System in a future year, which is at the discretion of the Planning Coordinator or Transmission Planner performing the study. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.4.1 was not changed as proposed because the intent of the last sentence is to allow the use of an aggregated System Load model as an appropriate Load representation. The suggested change could be read to mean that an aggregated System Load model would not appropriately represent the dynamic behavior of Loads. Note that changes were made to Part 2.4.1 based on other stakeholder comments.</p> <p>Parts 2.5 .1 and R2.5.2 (new Parts 2.6.1 and R2.6.2) were not combined. The references to the “20 MW” threshold have been deleted from the revised standard.</p> <p>Part 2.6 has been modified and included as new Part 2.7. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur is more than one sensitivity). Although not required, the standard does not preclude the Planning Coordinator or Transmission Planner to develop Corrective Action Plans for high risk scenarios. However, if the scenario is high risk, then it should have been included in the base assumptions in the assessment and the Corrective Action Plan would have been required. The end of the second sentence has been changed to refer to Table 1 as suggested.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Requirement R2, part 2.6.3 has been deleted.</p> <p>Part 2.6.4 allows the Planning Coordinator or Transmission Planner to address situations that are beyond its control by utilizing Non-Consequential Load Loss and/or curtailment of Firm Transmission Service, which are normally not permitted. Depending on the urgency of the need, the Corrective Action Plan may be developed outside the normal Assessment cycle at the discretion of the Planning Coordinator or Transmission Planner involved. No change made.</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
Gainesville Regional Utilities	<p>R2.1.1- References a "system peak Load" for each of the referenced years. Some utilities are summer peaking and some are winter peaking and others may have a history of having one or the other in any given year. So can you clarify which peak you are referring to or change to statement to perform studies involving both seasonal peaks?</p> <p>R.2.4.1- I suggest quantifying the reference to the behavior of induction motor loads to single motors greater than 1000 hp or multi motors at one bus totalling more that 2000 hp or so, since smaller induction motors probably will not have any significant impact of the BES. I feel this is best handled as a sensitivity issue determined by the PC who is familiar with this area.</p> <p>R2.5.1- If the system has not had any significant changes of the last ten years, then a study going back to that change should be acceptable for the assessment.</p> <p>R2.5.2- Should the "shall not include" really read as "shall include"?</p> <p>R2.6- The reference to "tables" in line 6 should be "table" since there is only a Table 1 in the standard.</p> <p>R2.6.1-R2.6.3- Question-- Why is the font size of the bullet text smaller that the other bullet segments?</p>
<p>Response: In Requirement R2, part 2.1.1, the selection of the system peak Load conditions is at the discretion of the Planning Coordinator or Transmission Planner. The standard allows for use of past studies to support a current Assessment. Therefore, for an area with both summer and winter peaks, the Planning Coordinator or Transmission Planner can choose to perform summer and winter peak cases on alternate years and the Assessment can rely on, e.g., a summer peak study performed in the current year and a winter peak study performed in the previous year, provided the requirement for use of past year studies is satisfied. No change made.</p> <p>Part 2.4.1 allows for the use of an aggregate System Load model which represents the overall dynamic behavior of the Load that could impact the study area. So as written, the suggested representation is allowed. Note that changes were made to Part 2.4.1 based on other stakeholder comments.</p> <p>Part 2.5.1 has been revised and included as Requirement R2, part 2.6.1 to address your concerns.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>In Part 2.5.2 "shall not include" is correct because the intent is that for the past study to be applicable, the present System should not have changed materially compared to that represented in the past study. However, Requirement R2, part 2.5.2 has been revised and included as Requirement R2, part 2.6.2 in the new version to provide greater clarity.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Part 2.6 (now 2.7) was modified to use the phrase, "in Table 1" rather than "in the tables."</p> <p>Part 2.5.1 (now 2.6.1) has been revised as shown.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>For Part 2.6.1 (now 2.7.1) the format has been corrected. Parts 2.6.2 and 2.6.3 were deleted from the revised standard.</p>
JEA	<p>R2.1.4 It is not clear if this spare equipment strategy excludes Generator Owner's obligations for their generation plant equipment and only includes Transmission Owner's equipment. It is also not clear what Measurable document is required to back up a position of no vulnerabilities. I recommend that we limit the spare equipment strategy to TO equipment and not include GO equipment which excludes step-up transformers, turbines, generators, rotors, etc. Also, it does seem unreasonable to assess the long-term loss of a transformer to the "Extreme Events" of Table 1 or any other event other than the P3 events unless substituted in the assessment by a more extreme and probable event. An event from P3 alone should be sufficient to expose a weakness of a spare equipment strategy based on historical industry statistics for such likelihood. Propose changing "The analysis shall reflect the Contingencies identified in Table 1..." to "An analysis shall be performed that as a minimum assesses the impact of the long term outage of Transmission Owner equipment under either a P3 event that could occur in the absence of the subject equipment" or a more stressful event as deemed appropriate by the Functional Entity performing the assessment.</p> <p>R2.6.4 First of all, some level of expected Non-consequential load loss is always prudent to balance customer expectations on cost and reliability subject to Local and State Authority's guidance. Second, load development and generation development are the major drivers for transmission development needs. Generation plans are more dependable and manageable as to timing and impact. Load development is not very dependable and manageable relative to transmission system improvement needs. It is not unusual for new load forecast to either expose a transmission weakness or on the other hand to eradicate a transmission weakness in the Near Term horizon. Without guidance, it could be assumed that affects from load forecast are beyond the control of the Transmission Planner and Transmission Coordinator. In addition, it is not unusual to have the load forecast lead the generation plan by a few years causing a need for Non-Consequential Load Loss until such time the additional generation is in-service providing generation balance to the load area and mitigating the transmission improvement needs. This occurs frequently as generation development lags load development in fast growing communities. Propose establishing a cap on Non-Consequential Load Loss for all Corrective Action Plans where the Table 1 events currently do not allow at all. An additional option for the SDT to consider could be to add an allowance of lag time (maybe 4-5 years) to cover the gap while the generation addition is being developed.</p>
	<p>Response: Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Transmission Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. However, the major Equipment is not limited to the major Equipment of the Transmission Owner; this standard covers major pieces of pieces of Transmission Equipment without regard to ownership. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. Requirement R2, part 2.1.5 has been revised to require that the analysis reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>For Part 2.6.4 (now 2.7.5), the SDT declines to set a cap on Non-Consequential Load Loss on situations that are outside the control of the Planning Coordinator or the Transmission Planner. The premise is that the Corrective Action Plan has already been developed, but was not able to be implemented in time. The situation can occur with both unexpected changes in generation, Load pattern or delay in permitting and construction of new Transmission Facilities. In addition, a cap on the allowable Non-Consequential Load Loss may be different for different areas and may not be practical in a Continent-wide standard. No change made.</p>
<p>NorthWestern Corporation NorthWestern Energy (NWE) (NWMT)</p>	<p>Short circuit analysis is a local issue. The reliability of the BES does not depend on the regular assessment of short circuit duty. Therefore, we believe short circuit analysis should be deleted from R2.</p> <p>R2.1.4 needs more clarification as to what constitutes major Transmission equipment. This would require a separate analysis (study) for each transformer (or any long lead-time equipment) for which a spare is not available, which could result in numerous additional cases. Major Transmission equipment could be limited to voltage levels greater than 200 kV. An exception should be made for phase-shifting transformers. As the system changes, with new generation and transmission lines being added, these analyses could become outdated very quickly. If a transformer were to fail, the Planning Department would immediately study the current system with this transformer removed.</p> <p>As stated in R2.4.1, the requirement to include induction motor loads is too prescriptive. At this time, with all of the unknown or estimated variables in the system model, accuracy of the model would not be improved. If a highly industrialized section were to develop within the NWE footprint, induction motor load could be added to the system model.</p> <p>The 20 MW threshold identified as “material change” for generation in R2.5 is too small. A better number for material generation changes would be 100 MW or a limit based on a percentage of the study area’s installed generating capacity. Also, an aggregate of 20 MW addition/deletion generation would depend on the location of the individual generators to determine whether the overall system would be affected or not.</p> <p>The statement at the end of R2.6 that indicates corrective action plans are not required solely to meet the performance requirements for sensitivities should also apply to the spare equipment requirement.</p> <p>R2.8 should be deleted. It is not necessary for reliability.</p> <p>R2.9 should be deleted. It is not necessary for reliability.</p>
	<p>Response: Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess the whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. Requirement R2, part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.4.1 is intended to allow the Planning Coordinator and Transmission Planner the discretion in the use of Aggregated System Load models in Stability Studies, if specific models are not available. However, it does not dictate the methodology or the process on how the studies are to be done. No change made.</p> <p>Part 2.5 has been revised and included as requirement R2, part 2.6 as shown. Note that the references to the "20 MW" threshold were deleted from the revised standard.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
SMUD	<p>R2.1.3 and R2.4.3The sentence, "sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment: ", should be modified by changing the second 'included' to 'considered'.</p> <p>R2.1.4Since there is no NERC reliability standard requirement for a 'spare equipment strategy', what is the standing of a requirement that is based on having one</p> <p>R2.5.2There is no example given for 'Transmission additions/removals' Recommend that the wording of this requirement be made more discretionary with a requirement that the Transmission Planner include language explaining the reasons for using past studies.</p>
	<p>Response: Parts 2.1.3 (now Part 2.1.4) and R2.4.3 have been revised. However, the SDT declines to change the work "included" to "considered" because the intent is that if the base case modeled already models the stressed condition, such as 1 in 10 adverse weather Load, even higher Load may not need to be included in the sensitivity study,</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of</p>

Organization	Question 2 Comment
	<p>changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>The SDT has included the spare equipment strategy in Part 2.1.4 to ensure that the BES is designed so that it remains reliable even with long lead time Equipment unavailable, consistent with the directive from FERC Order 693.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>The SDT revised Part 2.5.2 (now Part 2.6.2) to remove the “Transmission additions/removals” and “generation changes” language.</p>
Progress Energy Florida, Inc.	<p>Concerning R2.1.4, this sub-requirement is overly burdensome for two primary reasons: a) It amounts to a system-wide N-2 and N-3 analysis, which goes against FERC’s policy of separation and distinction between types of events as stated in Paragraph 1788 of Order 693: Under TPL-002-0 the system is not required to be able to withstand another N-1 contingency. That N-1 requirement is a Category C contingency which is addressed by TPL-003-0. b) The requirement to perform system-wide analysis for such a scenario is a significant workload issue, and will take time away from analysis of more probable events. Concerning the issue of material changes in past studies in sub-requirement</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>R2.5.2, PEF objects to the specification of changes in units of 20 MW or greater, due to the fact that a change (or even deletion) of a 20 MW unit in a case modeling a large BES does not truly constitute a material change. The SDT in its response to Question 15 in the comments for draft 2 stated that The SDT did not want to be overly prescriptive when describing the type of changes that could be considered material and has left the text general. PEF suggests that the SDT take its own advice, making the language in R2.5.2 more general in nature and leaving such modeling details to the discretion of the Transmission Owner.</p> <p>In R2.6.2, PEF assumes that the term “project initiation date” is intended to mean the Construction Move-In date. If the term means the first date at which Planners had identified it as a mitigation, PEF would object to this as it would appear to preclude the right to develop superior mitigations, or to cancel a project if it can be demonstrated as no longer needed.</p> <p>Concerning R2.8 and R2.9, PEF strenuously objects to such requirements. These requirements have no bearing on demonstrating the reliability (or lack thereof) of the BES, and therefore should be removed from the Standard.</p>
	<p>Response: Part 2.1.4 (now Part 2.1.5) is based on FERC Order 693, Paragraphs 1724 – 1727. Part 2.1.5 is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Part 2.1.5 has been revised to require that the Planning Assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.5.2 has been revised and included as Requirement R2, part 2.6.2 to address your concerns. The revised standard does not include the reference to a “20 MW” threshold.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Part 2.6 has been revised and included as Requirement R2, part 2.7 in the new version.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
<p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>	
<p>Xcel Energy</p>	<p>R2.1.3 is this indicating that only one of the variations need to be studied? (“in one or more of the following conditions”). Recommend having the planner work with the load to determine what sensitivity studies to perform.</p> <p>R2.1.4 it is unclear as to what should be done with the analysis that incorporates the company’s spare equipment strategy. Is this requirement inferring that a company’s spare equipment strategy need to ensure that it can still operate to within the requirements for contingencies of Table 1 without the component?</p> <p>R2.2.1 is the intent to have the study for the 10 year horizon or to include any project that is started within the next 10 years and thus the study must be extended to the forecasted completion of the project (conceivably as long as 20 years or more?)</p> <p>R2.6.4 recommend clarifying how situations beyond the control of the TP or PC are determined. It is unclear if this is to imply that if something is outside of the control of the department who conducts the planning studies or if it is outside the control of the registered function’s legal entity (i.e. corporation).</p> <p>R2.8 appears to be nonessential information for reliability; for what purpose does this requirement exist?</p> <p>R2.9 - appears to be nonessential information for reliability; for what purpose does this requirement exist?</p>
<p>Response: Part 2.1.3 (now Part 2.1.4) does not preclude the Planning Coordinator or Transmission Planner working with other Functional Entities to develop strategies on performing sensitivity studies. Part 2.1.4 requires that the Planning Coordinator or Transmission Planner perform sensitivity studies for at least one of the variation not already covered in the studies described in Parts 2.1.1 and 2.1.2</p> <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won’t last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreements with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2.1 has been revised because extending the Planning Horizon beyond 10 years for projects with lead times longer than 10 years is already covered in the definition of Long-Term Transmission Planning Horizon. This allowance is needed to provide planning flexibility, and is at the discretion of the Planning Coordinator or Transmission Planner. For example, if the System is found not to meet performance standards in year 10, but the project to correct the loading cannot be placed in service for 12 years, then the Corrective Action Plan needs to identify the interim solutions before the project can be brought on line.</p> <p>2.2.1 A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the</p>

Organization	Question 2 Comment
	<p>rationale for why that year was selected.</p> <p>Part 2.6.4 refers to the situations beyond the control of the Transmission Planner or Planning Coordinator as Functional Entities.</p> <p>Parts 2.8 and R2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>New Brunswick System Operator</p>	<p>R2.1.4 Major transmission element needs to be defined. For example, what about sync condenser, or generator step up transformer</p> <p>R2.2 Clarity required. Example: What is meant by "current System peak load"</p> <p>It is not clear what supplemental load loss is. Would load tripped due to undervoltage or SPS as a result of a contingency be considered supplemental load? As a follow up what then is Non-consequential load (provide examples). How would this load be lost? The requirements appear the same regardless of the amount of Non-consequential load loss.</p> <p>Is there any consideration of applying thresholds both on supplemental and non-consequential load loss where these loads are defined as (or applied as) "exceeding xxx amount of MW".</p> <p>Regarding Table 1 b, what does the following mean: "However, Supplemental Load Loss associated with an event shall not be used to meet steady state performance requirements."</p> <p>Please clarify the definition of Year One. This definition also does not include Planning coordinator. Was that intentional?</p>
	<p>Response: In Part 2.1.4 (now Part 2.1.5), major Transmission Equipment would be those pieces of Equipment, the loss of which can have significant impact on System performance. They are typically the ones listed in the Contingency Events in Table 1. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2 refers to a "current System peak Load study". This would be a System peak Load study that is performed in the current year.</p> <p>In the Definition Section, Supplemental Load Loss is defined as Load that is disconnected from the network by end-user Equipment responding to post-Contingency System conditions. Because the disconnection is at the discretion of the Load customer, not the Planning Coordinator or Transmission Planner, they cannot be counted on to leave the System. Therefore, the Transmission System cannot be planned as if such Load would disconnect. Part 2.2 has been revised to provide greater clarity.</p> <p>2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the</p>

Organization	Question 2 Comment
	<p>following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>A cap on the allowable Non-Consequential Load Loss may be different for different areas and may not be practical in a Continent-wide standard. No change made. See response for Part 2.2 above.</p> <p>The definition has been revised to include Planning Coordinator.</p> <p>Year One: The first year that a Planning Coordinator or a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the end of the current calendar year.</p>
Lafayette Utilities System	<p>R2.5. This basic requirement intends, as we understand it, to require that earlier studies not be used for a current assessment if they are no longer accurate. But the phrasing is potentially confusing, and would be clearer if revised. Since the requirement deals with the use of past studies, we suggest that R2.5.2 be revised to state that the study may be used only if there have been no material changes, so that R2.5 reads in full: R2.5. Past studies may be used to support the Planning Assessment if they meet the following requirements: R2.5.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less. R2.5.2. For steady state, short circuit, or Stability analysis: the study may be used only if there have been no material changes, such as generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. Material generation changes could include: The addition/deletion/change of individual generating unit capability of 20 MW or greater. An aggregated addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater.</p> <p>With respect to footnote 10 to Table 1, we fear that the flexibility suggested by those provisions may be excessive for a planning standard. The ambiguity occasioned by stating emergency actions that can properly be taken in a planning standard can be utilized by those who plan the system in a manner which plans to drop non-consequential loads just as footnote b has been used in the past. If this is intended to raise the bar as stated these provisions do not belong in a planning standard, at least as now stated.</p> <p>It may be appropriate to remove the reference to footnote 10, at least in the Initial System Condition entry in P3, where it suggests that it can be invoked after loss of a single generator, and we request the SDT to review that footnote to assure that it is appropriate in the other entries to which it is applied.</p> <p>In addition to the foregoing, we are concerned that the language of footnote 10 to Table 1 is unclear and subject to at least one interpretation that would seriously undermine reliability. Specifically, the first sentence of footnote 10 permits "[c]urtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources obligated to re-dispatch." The reference to an "obligat[ion] to re-dispatch" is ambiguous at best and should be clarified. For example, footnote 10 should not be read as permitting Balancing Authority A to rely on curtailment of firm transmission service coupled with re-dispatch of generation by adjacent Balancing Authority B during a Level 5 TLR event, based on the theory that, if a Level 5 TLR is declared and the Reliability Coordinator assigns to Balancing Authority B an NNL reduction responsibility that compels it to reload its resources, Balancing Authority B is therefore "obligated to re-dispatch" within the meaning of footnote 10. We suspect the intent of the first sentence of footnote 10 was to recognize and give effect to arrangements in which (following the example) Balancing Authority A has made a prior contractual arrangement with</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Balancing Authority B (or another generation owner) to provide redispatch services when requested by Balancing Authority A. In that circumstance, Balancing Authority A would be allowed to couple the curtailment of firm transmission with redispatch provided by Balancing Authority B (or another generation owner) pursuant to its contractual obligation. We suggest that this limitation be reflected by revising the first sentence of footnote 10 to read as follows: Curtailment of firm transmission service, when coupled with the appropriate re-dispatch of resources subject to a contractual obligation to provide re-dispatch service to the operator of the system for which the Transmission Planner is responsible, is allowed both as a System adjustment (as identified in the column titled "Initial System Conditions") and a corrective action, where it can be demonstrated that Facilities remain within applicable Facility Ratings and those adjustments do not result in the shedding of any firm Load. Without the limitation reflected in the foregoing revision, an entity could interpret footnote 10 as allowing it to rely on the redispatch of generation by other systems that may be (in effect) mandated by a Reliability Coordinator during a Level 5 TLR event. That sort of "leaning" on adjacent systems should not be permitted as a System adjustment or corrective action under TPL-001, especially where it imposes uncompensated burdens and costs on the system(s) forced to redispatch under these circumstances.</p>
	<p>Response: Part 2.5 has been revised and included as Requirement R2, part 2.6 as shown. Note that the revised standard does not include any reference to the "20 MW" threshold.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Footnote 10 (now footnote 9) was added to address the disjoint between how some parties calculate ATC/AFC when assessing Long Term Firm Transmission Service and the currently proposed TPL-001-1 standard. TPL-001-1 requires Transmission Planners to plan their systems to meet multiple contingency events and some parties assess Long Term Firm Transmission Service on a first Contingency basis. Units obligated to re-dispatch, as contemplated in Footnote 9 are those units which are contractually bound to provide the service as well as those obligated to provide the service under Network Integrated Transmission Service, under FERC's pro forma OATT. Under the pro forma OATT, units designated as network resources receiving NITS are obligated to re-dispatch as requested by the Transmission Provider pursuant to Section 33.2 to maintain reliability. The footnote is worded such that curtailment/re-dispatch cannot result in the loss of firm Load preserves the guidance given by FERC in Order 693 that no single Contingency result in the loss of firm Load. No change made.</p> <p>The SDT has reviewed the application of footnote 10 (now footnote 9) and believes that it is correct. No change made.</p>
Mississippi Delta Energy Agency	<p>R2.5. This basic requirement intends, as we understand it, to require that earlier studies not be used for a current assessment if they are no longer accurate. But the phrasing is potentially confusing, and would be clearer if revised. Since the requirement deals with the use of past studies, we suggest that R2.5.2 be revised to state that the study may be used only if there have been no material changes, so that R2.5 reads in full:"R2.5. Past studies may be used to support the Planning Assessment if they meet the following requirements: R2.5.1. For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less. R2.5.2. For steady state, short circuit, or Stability analysis: the study may be used only if there have been no material changes, such as generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. 	<p>addition/deletion/change to a group of generating units directly connected through their step-up transformer(s) to the BES which total 20 MW or greater.</p> <p>With respect to footnote 10 to Table 1, we fear that the flexibility suggested by those provisions may be excessive for a planning standard. The ambiguity occasioned by stating emergency actions that can properly be taken in a planning standard can be utilized by those who plan the system in a manner which plans to drop non-consequential loads just as footnote b has been used in the past. If this is intended to raise the bar as stated these provisions do not belong in a planning standard, at least as now stated. It may be appropriate to remove the reference to footnote 10, at least in the Initial System Condition entry in P3, where it suggests that it can be invoked after loss of a single generator, and we request the SDT to review that footnote to assure that it is appropriate in the other entries to which it is applied.</p>
	<p>Response: Part 2.5 has been revised and included as Requirement R2, part 2.6 as shown. Note that the revised standard does not include any reference to the “20 MW” threshold.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Footnote 10 (now footnote 9) was added to address the disjoint between how some parties calculate ATC/AFC when assessing Long Term Firm Transmission Service and the currently proposed TPL-001-1 standard. TPL-001-1 requires Transmission Planners to plan their systems to meet multiple contingency events and some parties assess Long Term Firm Transmission Service on a first Contingency basis.. Units obligated to re-dispatch, as contemplated in Footnote 9 are those units which are contractually bound to provide the service as well as those obligated to provide the service under Network Integrated Transmission Service, under FERC’s pro forma OATT. Under the pro forma OATT, units designated as network resources receiving NITS are obligated to re-dispatch as requested by the Transmission Provider pursuant to Section 33.2 to maintain reliability. The footnote is worded such that curtailment/re-dispatch cannot result in the loss of firm Load preserves the guidance given by FERC in Order 693 that no single Contingency result in the loss of firm Load. No change made.</p>
Ameren	<p>In R2, The phrase document results should be changed to summarize results. While results will be documented, the Planning Assessment should just include a summary.</p> <p>In R2.1, the reference to requirement R2.6 (at the end of the last line) should be changed to R2.5.</p> <p>In R2.1.3, it is suggested that the studies be referred to as the "base studies" to avoid confusion with the sensitivity studies. Also it is suggested that another phrase be added at the end for clarity. The entire R2.1.3 would then be as follows: For each of the base studies described in Requirements R2.1.1 and R2.1.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the studies shall be included in the Assessment. Sensitivity studies would include changes to:</p> <p>In Requirement R2.1.4, it is suggested that language be added to reflect the possible unavailability of the equipment, such as: When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The analysis shall reflect the Contingencies identified in Table 1 during the conditions that</p>

Organization	Question 2 Comment
	<p>the System is expected to experience the possible unavailability of the long lead time equipment. It is not clear how adequate lead times for equipment would be determined.</p> <p>In Requirements R2.3 and R2.4, consider adding a reference to Requirement R2.5 for the past studies.</p> <p>In Requirement R2.4.1, it is suggested that it be reworded to the following: System peak Load for one of the five years, including Load models which appropriately represents the dynamic behavior of Loads, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable. Load models referenced in R2.4.1 should be confined to the consideration of transient stability study work.</p> <p>With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. We suggest adding the following to the end of R2.5.1: unless justification can be provided to demonstrate that the results of an older study are still valid.</p> <p>In Requirement R2.4.3, it is suggested that this sub-requirement be reworded to the following: For each of the base studies described in Requirements R2.4.1 and R2.4.2, sensitivity case(s) that are intended to stress the System with variations in one or more of the following conditions not already included in the base studies shall be included in the Assessment. Sensitivity studies would include changes to:</p> <p>In bullet three of Requirement R2.6.1, would we allow automatic generation tripping for a single (P1) event if it is not consequential? It seems that tripping of generation should be restricted to P2 events 2 or 3 at a minimum.</p> <p>In bullet five of Requirement R2.6.1, is there a maximum duration that operating procedures can be used before a capital project must be included (or completed) in the Corrective Action Plan?</p> <p>In Requirement R2.6.2, it is not clear what constitutes a "project initiation date". Please clarify.</p> <p>Please explain the reason why Requirement R2.8 is needed in the Assessment. Reporting the largest Consequential Load Loss does not impact reliability.</p> <p>Please explain the reason why Requirement R2.9 is needed in the Assessment. Reporting the largest Non-Consequential Load Loss does not impact reliability.</p> <p>The proposed standard not only raises the bar for system performance requirements, but also raises the bar for reporting and documentation. We need to employ almost as many librarians and technical writers as engineers to develop and keep track of the documentation. Engineers need to spend more time performing the studies and spend less time documenting studies keeping track of documentation for multiple years.</p>
<p>Response: Part 2 has been revised to reflect your suggestion.</p> <p>R2. Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES. This Planning Assessment shall use current or past studies, document assumptions, summarize documented results, and cover steady state analyses, short circuit analyses, and Stability analyses.</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>The SDT reviewed Part 2.1.3 (now Part 2.1.4) and declined to use the term “base study” because “base study” may have different meanings in different parts of the continent, and the term, “studies described in Parts 2.1.1 and 2.1.2” should be sufficient to avoid confusion. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Parts 2.3 and 2.4 have been revised to include the reference to the requirements for use of past studies.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>2.4 The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as indicated in Requirement R2, part2.6. The following studies are required.</p> <p>Part 2.4.1 has been revised to reflect your suggestion. In addition, Part 2.4 concerns only “The Near-Term Transmission Planning Horizon portion of the Stability analysis”. Part 2.4.1 carries the same limitation as Part 2.4.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>The requirement has been revised as suggested.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>The SDT reviewed Part 2.4.3 and declined to use the term “base study” because “base study” may have different meanings in different parts of the continent, and the term, “studies described in Parts 2.4.1 and 2.4.2” should be sufficient to avoid confusion. No change made.</p> <p>Part 2.6 has been revised and included as Requirement, part 2.7 to reflect your suggestion.</p> <p>2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>The third bullet in Part 2.6.1 (now 2.7.1) is intended to meet the requirements in Table 1. Generation tripping is allowed at the discretion of the Planning</p>

Organization	Question 2 Comment
	<p>Coordinator or Transmission Planner for P1 Events as long as there is no loss of firm Non-Consequential Load. In addition, in the fifth bullet, the duration for use of an operating procedure is also at the discretion of the Planning Coordinator or Transmission Planner because it may not be feasible environmentally to implement Transmission reinforcements in some locations.</p> <p>Project initiation date has been deleted from the requirements.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>Puget Sound Energy, Inc.</p>	<p>Short circuit analyses is a local phenomenon and should not be required as part of a transmission planning assessment of the BES. In any case, the effects of failure of over-stressed breakers are already included in the Events to be assessed in Table 1. For example, P2-3 and P2-4 (Internal Breaker Fault), and P4 (Stuck Breaker while attempting to clear a fault).</p> <p>Clarity is needed in R2.1.4. The requirement to assess the Contingencies identified in Table 1 is too burdensome. This requirement does not specify any limits on the equipment for which an analysis must be conducted. As currently drafted, this could require a separate analysis for each transformer (or any long lead-time equipment) for which a spare is not available. A separate initial case would need to be developed to assess the Contingencies identified in Table 1 for each transformer. This could result in a countless number of additional cases. We recommend a threshold be established, such as all transformers with a low side voltage above 200 kV.</p> <p>The 20 MW threshold identified as material change for generation in R2.5 is too small. The limit should be raised or based on a percentage of the study area's installed generating capacity.</p> <p>R2.7 should be deleted, see comment on R2 above.</p> <p>R2.8 should be deleted. It is not necessary for reliability. What will be done with this information on the largest Consequential Load Loss and the associated event caused by any P1 event and any P2 event? if it is documented?</p> <p>R2.9 should be deleted. It is not necessary for reliability. It will be difficult to determine the maximum permissible Non-Consequential Load value. It will end up being based on cost (monetary, societal, environmental, etc.), which is dependent, among other things, on the types of load being served. It very well may be a case by case situation.</p>
	<p>Response: Part 2.3 is intended for the Planning Coordinator and/or Transmission Planner to assess the whether circuit breakers supporting the BES have interrupting capability for Faults that they will be expected to interrupt and is not specifically related to new planned Facilities. Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Part 2.1.4 (now Part 2.1.5) has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>The language in Part 2.5.2 that referenced a 20 MW threshold was deleted from the revised standard.</p> <p>The SDT assumes that you meant the comment on short circuit analysis above. The SDT declines to delete the requirement as the SDT believes that it is a necessary part of an overall Planning Assessment.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed the both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
Manitoba Hydro	<p>Requirement Text: R2.1: Reference of past studies should be to R2.5, not R2.6 (typo).</p> <p>R2.1.3: The sensitivity to Planned duration or timing of Transmission Outages should be modified to only include Planned long duration Transmission outages that span multiple seasons, if known. Short duration planned maintenance outages should not be included in a planning assessment.</p> <p>R2.1.4 - The second sentence doesn't read right - the sentence should be changed to read: "The analysis shall reflect the Contingencies identified in Table 1 under the conditions that the System is expected to experience during the unavailability of the long lead time equipment.</p> <p>R2.2.1 - This sub-requirement should be deleted. Why do extra assessments beyond the 10 year period" Any items beyond 10 years will be covered when they fall into the 10 year period. For example, if we assess the 10 year horizon, then the project due to be complete in 12 years will be part of the assessment in 2 years when it is 10 years out. We will have to show every year how our system meets compliance regardless of this extra analysis, so what's the point. Every year we have to show how we comply in the short and long term so what difference does it make when each project is completed as long as we are in compliance or identify Corrective Action Plans (CAPs) along the way.</p> <p>R2.4.1: The statement "a Load model shall be used which appropriately represents the dynamic behavior of Loads is not very crisp. What will appropriate be interpreted to mean by the NERC auditor? Does an MOD standard exist that covers gathering data and validating loads models? This should be a first step. The SDT should add a statement that the application of detailed induction motor modeling can be limited to areas where poor voltage recovery is expected due to a high concentration of such load. The requirement should be modified to require the PC/TP to provide a rationale for the load models used in its specific planning area.</p> <p>R2.5: A Past Study is a definition and should be moved to the definition section. The definition only identifies power changes</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>as possible material changes, but should also include machine control (exciters/governors) changes. We suggest the bulleted list of Material Generation changes be expanded.</p> <p>R2.6.1: Can the SDT clarify how a rate application qualifies as a CAP action?</p> <p>R2.9 - The sentence should refer to maximum Non-Consequential Load Loss not maximum permissible Non-Consequential Load Loss.</p>
	<p>Response: In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>In Part 2.1.3 (now Part 2.1.4), outages that span multiple seasons are included in the last bullet, "Planned duration or timing of Transmission outages". No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) has been revised to reflect your suggestion.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2.1 has been revised because extending the Planning Horizon beyond 10 years for projects with lead times longer than 10 years is already covered in the definition of Long-Term Transmission Planning Horizon. This allowance is needed to provide planning flexibility, and is at the discretion of the Planning Coordinator or Transmission Planner. For example, if the System is found not to meet performance standards in year 10, but the project to correct the loading cannot be placed in service for 12 years, then the Corrective Action Plan needs to identify the interim solutions before the project can be brought on line.</p> <p>2.2.1 A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected.</p> <p>Part 2.4.1 has been revised to provide greater clarity.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>The SDT declines to move past study to the Definition Section because the Definition, once approved, will apply to all NERC Standards, however, past study is only used in this TPL Standard.</p> <p>In Part 2.6.1, "rate application" refers to rate incentives to change behavior of end-use customers and can be part of the "actions to achieve required System performance". This is included to allow for non-traditional solutions to achieving required System performance.</p> <p>Part 2.9 has been deleted.</p>
E.ON U.S.	<p>R2.1.3Change For each of the studies to For at least one of the studies R2.1.1 and R2.1.2 require that 3 studies be performed each year. As written, the requirement indicates that the transmission planner has to perform at least one sensitivity study for the 3 studies required by R2.1.1 and R2.1.2. This means that the transmission planner would also have to perform 3 or more sensitivity studies each year. One sensitivity study for one of the 3 studies required by R2.1.1 and</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>R2.1.2 should suffice.</p> <p>R2.1.4.Delete “The analysis shall reflect the Contingencies identified in Table 1 during the conditions that the System is expected to experience due to the unavailability of the long lead time equipment. This statement is redundant since R3 requires this analysis for all of R2.1. Including this statement in R2.1.4 and not in R2.1.1 and R2.1.2 makes it appear that this requirement has different performance requirements.</p> <p>R2.4.3R2.4 does not require studies annually. However, if the transmission planner chooses to study a System Peak Load or a System Off-Peak Load condition R2.4.3 requires that the planner also study sensitivity to that same condition in the current year. E.ON U.S. believes it sufficient that the assessment include a sensitivity study for some System Peak Load and some System Off-Peak Load condition.R2.6The third sentence should be modified to include R2.1.4., so that it reads “Corrective Action Plans do not need to be developed solely to meet the performance requirements for sensitivities run in accordance with Requirements R2.1.3, R2.1.4 and R2.4.3. The annual studies performed for Category P6 alert the Transmission Planner to the risks of transformer failure. The Transmission Planner is required to design the system to limit those risks. If the delivery time for a piece of equipment is 11 months, then P6 allows Interruption of Firm Transmission Service and Non-Consequential Load Loss. If the delivery time for a piece of equipment is 12 months, then P1 requires that the system be designed for no Interruption of Firm Transmission Service and Non-Consequential Load Loss. This is a significant increase in performance requirements for an event that will most likely not extend beyond to a second System Peak Load period. If R2.1.4 is not included in the requirement the transmission planners would essentially be designing for an Extreme Event, i.e., events which are more severe and have a lower probability of occurrence than Planning Events.</p> <p>R2.6.1Operating Procedures, by NERC definition, require significantly more detail than is appropriate for a Corrective Action Plan. It is not appropriate that Transmission Planners write Operating Procedures to be used by NERC Certified System Operators. E.ON U.S. suggests that Operating Procedures be changed to mitigation plans.</p> <p>R2.6.5 Planning Assessments and System Facilities are not NERC defined terms. Operating Procedures, by NERC definition, require significantly more detail than is appropriate for a Corrective Action Plan. It is not appropriate that Transmission Planners write Operating Procedures to be used by NERC Certified System Operators. E.ON U.S. suggests that Operating Procedures be changed to mitigation plans.</p> <p>R2.8There are no requirements to limit Consequential Load Loss. Impacted customers are typically aware of the customary level of service and have chosen not to pay for extraordinary levels of service. E ON US questions the purpose and benefit of this requirement. While continuity of service to end use customers is an important measure of service reliability for which utilities answer to state authorities, BES reliability requires that the system remain balanced and that local failures not result in cascading BES events NERC standards should, pursuant to FPA Section 215, focus solely on BES reliability</p>
<p>Response: Parts 2.1.3 (now Part 2.1.4) and 2.4.3: The SDT disagrees with changing Parts 2.1.4 and 2.4.3 to requiring sensitivity study for only one System condition because this change potentially could reduce the Assessment to be based on one sensitivity study on one System condition. Since the same sensitivity can have different impacts on System performance under different System conditions, and different System conditions may require different sensitivities to be investigated, such limitation may not be adequate to maintain reliability going forward. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Transmission Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreements with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.6 is not intended for the Planning Coordinator or Transmission Planner to write Operating Procedures, only to reflect the effects or results of the Operating Procedures in its Corrective Action Plan. Mitigation Plan carries a special meaning for Compliance and so may not be appropriate for use in this standard. No change made. The term, "Planning Assessment" is one of several terms proposed for addition to the NERC Glossary of Terms Used in Reliability Standards. "System" and "Facilities" are already approved terms.</p> <p>Part 2.8 is intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed the requirement and agrees that as written it was unclear. Part 2.8 has been revised and included as Requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
LCRA Transmission Services Corporation	<p>In R2.6.2, it is stated that a project initiation date is required as well as an in-service date. What is considered the project initiation date, the point at which the project plan is approved or the time at which construction is to begin? If it is the time at which construction is to begin, then LCRA TSC believes this requirement does not belong in the TPL-001-1 standard as the construction timeframe for a project is developed by groups outside of Planning based on resources and outage availability.</p>
<p>Response: Project initiation date has been deleted from the requirements.</p>	
National Grid	<p>R2 Comment In the first sentence, replace the phrase prepare with conduct and document and in the second sentence replace "This Planning Assessment shall use current or past studies, document assumptions, document results, and shall cover steady state analyses, short circuit analyses, and Stability analyses" with "The Planning Assessment shall review assumptions of current or past studies and assess the continuing validity of the steady state, short circuit, and stability results. The review of assumptions, supplemental analysis, and updated results shall be documented.</p> <p>R2.1 Comment A. The terms assess and annual study are referenced in the same requirement. It is unclear what constitutes either. Is an annual study required for every area or is an annual assessment required for every area, which may include some supporting study to address changes to the conditions?</p> <p>B. Requirement R2.1 should refer to R2.5 rather than R2.6</p> <p>R2.1.1 Comment A. Year One and year two do not provide enough time to implement Corrective Action Plans and are better</p>

Organization	Question 2 Comment
	<p>suited for Operations studies. The requirement to evaluate Year One or year two should be removed.</p> <p>B. Is a year 5 study required annually for every area of a system?</p> <p>R2.1.2 Comment ? The requirement should be removed. With no description of the system stresses and generator outages to be applied when assessing the off-peak load, it is difficult to imagine any issues which would arise which are not revealed in the peak load evaluation that could not be addressed through generation dispatch adjustments. Need to define conditions for assessment.</p> <p>R2.1.3 Comment A. The emphasis on sensitivity testing in the existing section appears misdirected and should be focused on the expected accuracy of the assumptions. The assessment should have to include a discussion of accuracy of the assumptions. Having a requirement to perform one more sensitivity not already included is vague and does not add value to the assessment or the standard.</p> <p>B. Planned Transmission Outages are not known in the Planning horizon. Also the release of the outage on any given day is controlled by operations based on the conditions. The conditions are not known for the Planning assessment. The last bullet referring to Planned Transmission Outages should be deleted.</p> <p>C. Delete the phrase "are intended to." It is difficult to measure intent and what is important is whether the system has been stressed, not whether the responsible entity intended to stress the system.</p> <p>D. What is expected from a sensitivity analysis? Is it to change the base case and see how the case responded, is it to create a new base case and rerun all of the events, or is it to change the base case and rerun a select number of events. It is anticipated that the answer will vary based on what is changed.</p> <p>R2.1.4 Priority Comment With respect to spare equipment strategy; this requirement potentially imposes a requirement to plan for three events, which is overly severe. After experiencing a major contingency of a long lead time facility, there should be some change in the acceptability of risk. This change in risk could include an allowance for the loss of non-consequential load or some of the multiple events from Table 1 should be evaluated as Extreme Contingency events.</p> <p>R2.2 Comment We suggest replacing the phrase a current System peak Load study? with a valid System peak Load study in the first sentence. The word current is confusing as some read the word current to mean today's rather than valid.</p> <p>R2.3 Comment A. The requirement to conduct annually isn't consistent with support. We suggest Conducted annually should be replaced with the phrase assessed annually?.B. "Interruption duty" should be changed to "interrupting duty." All terms in the IEEE dictionary related to breaker opening use the word "interrupting," while terms related to loss of supply to customers use the word "interruption."</p> <p>R2.4.1 Comment A. The two sentences are describing an or condition and they should be merged to read: For peak System Load levels, a Load model shall be used which appropriately represents the dynamic behavior of Loads, including consideration of the behavior of induction motor Loads or an aggregate System Load model which represents the overall dynamic behavior of the Load.</p> <p>R2.4.3 Comment - Delete the phrase "are intended to." It is difficult to measure intent and what is important is whether the system has been stressed, not whether the responsible entity intended to stress the system.</p>

Organization	Question 2 Comment
	<p>R2.5 Comment If past studies only support, then a new study is still required. We suggest changing “Past studies may be used to support the Planning Assessment if they meet the following requirements:” to “Past studies may be used to fulfill all or a portion of the Planning Assessment provided they meet the following requirements:”</p> <p>Violation Severity Levels:R2 - There is no VSL associated with R2.5. A VSL should be added, perhaps under Moderate, that "past studies were utilized to fulfill all or a portion of the requirement, but the studies did not meet the requirements in R2.5."</p> <p>R2.5.1 Comment? We suggest deleting this requirement, and incorporating it into R2.5.2.R2.5.2 Comment To incorporate R.2.5.1 into R2.5.2; please modify the section as follows: For steady state, short circuit, or stability analysis the study shall be less than five calendar years old from the date of completion. The present System model shall not include any material changes, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study area. A material change does not require the whole study to be redone. It only requires that the affected portion of the study be reassessed. Material generation changes include: The addition/deletion/change of individual generating unit capability determined to be material by the Planning Coordinator or Transmission Planner. “ An aggregated addition/deletion/change to a group of generating units directly connected to the BES at one point of interconnection through one or more transformers and determined to be material by the Planning Coordinator or Transmission Planner. The reference to the step-up transformer may not capture a wind farm that could have transformers to step-up to a collection voltage and transformer that wouldn’t be labeled a GSU to connect to the system.</p> <p>R2.6 Priority Comment A. As written, this section undermines the value of the sensitivity testing. This section should require a corrective action plan to fix problems determined in sensitivity analysis if there is a reasonable risk of occurrence. We suggest making the standard read Provide documentation that explains the reasoning for the sensitivities considered and selected.</p> <p>B. At the end of the second sentence, the phrase in the tables” is used. We suggest using more definitive language such as in Table 1.</p> <p>R2.6.1 Comment -In the last bullet, the reference to "rate application" is unclear.</p> <p>R2.6.2 Comment The phrase Project Initiation Date needs to be defined. It is unclear if this is the date of ground breaking, purchase orders being issued, solution study initiation, etc. Additionally, in the second sentence the phrase as well as an in-service date should be modified to read as well as a target in-service date.</p> <p>R2.6.3 Comment Plans can provide a target in-service year, but not an actual in-service year.</p> <p>R2.6.4 Priority Comment There should be a cutoff point when changes occur beyond a certain date. When that date occurs, further changes will be evaluated in the next year’s assessment. Otherwise, if a state makes a decision not to site a project a few weeks prior to the end of the assessment period, there will not be sufficient time to incorporate this into that year’s assessment and develop corrective actions.</p> <p>R2.7 Comment A. "Interruption duty" should be changed to "interrupting duty." All terms in the IEEE dictionary related to breaker opening use the word "interrupting," while terms related to loss of supply to customers use the word "interruption."B. The requirement would be clearer if it we restructured as follows: "For short circuit analysis, if the short circuit interrupting duty determined in Requirement R2.3 exceeds the Equipment Rating of fault interrupting devices, the Planning Authority . .</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>."</p> <p>R2.8 Comment A. Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted. B. If it is not deleted, do we have to prepare one number for P1 and a separate number for P2? The phrase any P1 event and any P2 event in Table 1 could also be read as the worst loading for each event within P1 and P2, which could be hundreds of values depending on how many events are analyzed. We recommend that the requirement be modified to require documentation of the maximum amount of consequential load loss that was relied upon during the assessment of the P1 and P2 events.C. If it is not deleted, "shall provide" should be changed to "shall identify" for consistency with R2.9</p> <p>R2.9 Comment A. Largest consequential load loss is not factored into the Planning Assessment and should therefore be deleted.</p> <p>B. If it is not deleted, this requirement is unclear. Is this requirement asking for each transmission planner to list their criteria for non-consequential load loss, or is it asking how much non-consequential load loss was being relied upon in the assessment? Including the word "permissible" implies the responsible entity must decide how much Non-Consequential Load Loss is allowed. We recommend that the requirement be modified to require documentation of the maximum amount of non-consequential load loss that was relied upon during the assessment of the P1 and P2 events.</p>
<p>Response: The SDT does not think that in Requirement R2 replacing "prepare" with "conduct and document" would add clarity, since Requirement R2 includes requirement to document assumptions and results. No change made.</p> <p>In the Definition Section, Planning Assessment is defined as "Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies". Therefore, in Part 2.1, an Assessment is an evaluation of System performance based on studies performed. While an Assessment is required annually, it can be based on past studies as long as the requirement for a valid past study is met. As such, all studies used to support the Assessment do not have to be preformed annually. No change made.</p> <p>In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>For Part 2.1.1 Year One and year two are within the Planning Horizon. In the Definition Section, Year One is defined as "The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current calendar year". Operating Studies are performed for system conditions within 12 months of the current calendar year. No change made.</p> <p>Part 2.1.1 is intended to require studies for System Peak Load Conditions for 2 of the years in the Near-Term Transmission Planning Horizon: (1) A Year five case to identify potential problems that can be addressed if the planned projects proceed as scheduled; (2) A Year one or Year two case to identify any potential problems unanticipated in the five-year case, which if not addressed, could impact operations as time progresses. The standard provides flexibility for the Planning Coordinator or Transmission Planner to use past studies to support the current year assessment and to assess other years in addition to those identified in Part 2.1.1. No change made.</p> <p>Part 2.1.2 requires that the Planning Coordinator and/or Transmission Planner also consider off-peak conditions because the System must be able to meet performance requirements over all demand levels. System peak condition may not represent all stressed conditions. For example, during off-peak, the Load is low and the generation would have to be turned off to achieve Load-resource balance. Turning off resources within a Load area could result in reliability problems. Lowering the Load in areas with many non-dispatchable resources could also pose potential problems. As the System incorporates more and more renewable resources, some of them are non-dispatchable; a standard must be forward looking so the Planning Coordinator and Transmission Planner can identify potential problems. If studies for one of the Load periods are not needed annually, the Planning Coordinator or Transmission Planner can rely on past studies for the</p>	

Organization	Question 2 Comment
	<p>Planning Assessment. No change made.</p> <p>Part 2.1.3 (now Part 2.1.4) has been rewritten to clarify the intent of the requirement. The Planning Coordinator or Transmission Planner can include a discussion of accuracy of the assumptions in response to the new Part 2.7.2 on the actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>2.7.2 Include actions to resolve performance deficiencies identified in multiple sensitivity studies or provide a rationale for why actions were not necessary.</p> <p>The last Bullet in Part 2.1.3 (now Part 2.1.4) is intended to cover planned outages of Facilities in sensitivity studies if such planned outages are known at the time the planning studies are performed, for example, planned outage of a major Transmission line during construction if the Corrective Action Plan calls for rebuilding of the line to a higher operating voltage. The sensitivity study can cover the “what if” situation where the project start can be delayed or the project may take longer to construct. No change made.</p> <p>Part 2.1.3 - ‘Are intended to’ has been deleted.</p> <p>The SDT declines to make the change as suggested. A Planning Assessment is not the same as a study. As stated in the Definition, a Planning Assessment is a “documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies”. As such, a Planning Assessment is based on a number of studies from which to draw conclusions about System performance and to develop Corrective Action Plans where needed. The suggested change would necessarily imply that a study is the same as a Planning Assessment, which is not the intent of Part 2.3.</p> <p>Part 2.1.4 (now Part 2.1.5) is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. Part 2.1.5 has been revised to address some of your concerns. Part 2.1.4 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2 is intended to require a study performed in the current year, as opposed to studies performed in the past years. Part 2.2 has been revised to provide greater clarity.</p> <p>2.2 The Long-Term Transmission Planning Horizon portion of the steady state analysis shall be assessed annually and be supported by the following annual current study, supplemented with qualified past studies as indicated in Requirement R2, part 2.6:</p> <p>Part 2.3 has been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>Part 2.4.1 was not changed as suggested because the intent of the last sentence is to allow the use of an aggregated System Load model as an appropriate Load representation. The suggested change could be read to mean that an aggregated System Load model would not appropriately represent the dynamic behavior of loads. However, Part 2.4.1 has been revised to provide greater clarity.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Part 2.4.3 has been revised to provide greater clarity, and the phrase, “are intended to” is no longer used.</p> <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>As revised Part 2.1.3 (now Part 2.1.4) requires the use of sensitivity studies to “demonstrate the impact of changes to the basic assumptions used in the model”. To this end the sensitivity studies need only to be able to demonstrate the impact of changes. Typically, a sensitivity study would be a subset of the study already performed. It usually involves comparing the base cases with and without the change under consideration, and rerunning a list of the worst Contingencies. However, each situation is different and the specifics are left to the Planning Coordinator or Transmission Planner who are more familiar with the situation(s) to be</p>

Organization	Question 2 Comment
	<p>investigated.</p> <p>Part 2.5 (now Part 2.6) was not changed because studies, including past studies, are used to support the annual Assessment, and are not used to support current studies.</p> <p>The VSL for Part 2.5 (now Part 2.6) was added as a Lower VSL.</p> <p style="padding-left: 40px;">R2, Lower VSL: The responsible entity failed to comply with Requirement R2, part 2.9 or Requirement R2, part 2.6.</p> <p>Parts 2.5.1 and 2.5.2 (new Parts 2.6.1 and 2.6.2) were not combined; however, they have been revised to address your concerns.</p> <p style="padding-left: 40px;">2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p style="padding-left: 40px;">2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Part 2.6 has been modified and included as new Part 2.7. The intent is to allow discretion for the Planning Coordinator or Transmission Planner to correct those deficiencies if they are prevalent (i.e., occur in more than one sensitivity). Although not required, the standard does not preclude the Planning Coordinator or Transmission Planner to develop Corrective Action Plans for high risk scenarios. However, if the scenario is high risk, then it should have been included in the base assumptions in the assessment and the Corrective Action Plan would have been required.</p> <p style="padding-left: 40px;">2.7 For planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity run in accordance with Requirements R2, parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall:</p> <p>Part 2.6 has been modified and included as new Part 2.7</p> <p>In Part 2.6.1, “rate application” refers to rate incentives to change behavior of end-use customers and can be part of the “actions to achieve required System performance”. This is included to allow for non-traditional solutions to achieving required System performance.</p> <p>Part 2.6.3 - Project initiation date and in service date are no longer used in the requirements.</p> <p>Part 2.6.4 allows the Planning Coordinator or Transmission Planner to utilize Non-Consequential Load Loss and/or curtailment of Firm Transmission Service, which are normally not permitted to address situations that are beyond its control. Depending on the urgency of the need, the Corrective Action Plan may be developed outside the normal Assessment cycle at the discretion of the Planning Coordinator or Transmission Planner involved.</p> <p>Part 2.7 has been revised and included as Requirement R2, part 2.8 to reflect your suggestion.</p> <p style="padding-left: 40px;">2.8 For short circuit analysis, if the short circuit current interrupting duty on circuit breakers determined in Requirement R2, part 2.3 exceeds their Equipment Rating, the Planning Assessment shall include a Corrective Action Plan to address the Equipment Rating violations. The Corrective Action Plan shall:</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed the both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Requirement R2, part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
<p>Entergy Services, Inc</p>	<p>The "study area" referred to in R2.3 should be defined. Does it mean external contingency events should be evaluated, or, the effects of internal contingency events on external parties. It should be clarified that generating facilities are not included in R2.1.4. The strategy may include agreements to share spare equipment among facilities, generation owners, and transmission owners.</p> <p>In R2.6.4 what is "prudent"? Who decides what is prudent? Recommend that the word be stricken.</p> <p>R2.6.4 is in conflict with the Implementation Plan. The Implementation plan omits P1 as an event where the bar has been raised but R2.6.4 allows the use of non-consequential load and firm transmission service curtailment. Clearly, the bar has been raised for any event, including P1, which allowed the curtailment of non-consequential load or firm transmission service in the existing standard.</p> <p>In R2.9 is the team requiring that a criteria be set by each Transmission Owner to set a maximum level of non-consequential load loss allowed by that Transmission Owner, or, that the amount of non-consequential load curtailment needed to meet the requirement be documented? What is the rationale for being so prescriptive in requiring specific years to be studied in R2.1.1 Why not allow the TP and/or PC to decide on the three years to be studied in the Near Term??</p> <p>In the subrequirements of R2.1.3 and R2.4.3, the use of the word timing is unclear. Consider using in service date or "schedule for".</p> <p>R2.1.4: The spare equipment strategy is too severe. The requirement should take into consideration the probability of occurrence of the events. Losing a transformer followed by the loss of a generator and a second transmission element is very unlikely. Non-consequential load loss should be allowed for this type of analysis.</p> <p>With the elimination of the distinction between system and generating plant stability studies, the blanket requirement in R2.5.1 that all stability analyses be five calendar years old or less, regardless of any material changes to the system, would cause needless work to be performed on those plants or areas of the system where no changes are occurring. Recommend adding the following to the end of R2.5.1: unless justification can be provided to demonstrate that the results of an older study are still valid.</p> <p>In R.2.4.1 it is mentioned that an aggregate System Load model that represents dynamic behavior of the load is acceptable. Does it mean that load at every bus in the study area has to be represented with an aggregate load model? This could be very cumbersome effort and we are not sure whether the software program can handle this magnitude of dynamic data. To help address this, revise Load to be Load that could impact the study area is acceptable.</p> <p>In Requirement R2.6.2, please clarify the definition of "project initiation date".</p> <p>Please explain the reason why Requirement R2.8 is needed in the Assessment and how does reporting the largest</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>Consequential Load Loss impact reliability??</p> <p>Please explain the reason why Requirement R2.9 is needed in the Assessment and how does reporting the largest Non-Consequential Load Loss impact reliability?? Please clarify the use of the word permissible in the phrase “maximum permissible Non Consequential Load Loss”.</p>
	<p>Response: In Part 2.3 because the area that can be impacted is not confined to Facilities ownership, the study area should therefore include all Facilities that can reasonably be impacted. Where the study area involves several owners, coordination is required. However, since short circuit analysis is usually a localized issue, the area impacted would not be extensive.</p> <p>Part 2.1.4 (now Part 2.1.5) refers to “unavailability of major Transmission equipment” without regard to ownership. Also, Part 2.1.5 only requires a spare equipment strategy but does not dictate the details of that strategy. So sharing of spare equipment is allowed. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>2.1.5 When an entity’s spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.6.4 has been revised to address your concerns and the word, “prudent” was removed.</p> <p>The Implementation Plan has been revised to include certain P1 events where the bar is being raised.</p> <p>Part 2.1.1 is intended to require studies for System Peak Load Conditions for 2 of the years in the near-term planning horizon: A Year five case to identify potential problem that can be addressed if the planned projects proceed as scheduled. A Year one or Year two case to identify any potential problems unanticipated in the five-year case, which if not addressed, could impact operations as time progresses. The standard provides flexibility for the Planning Coordinator or Transmission Planner to use past studies to support the current year assessment and to assess other years in addition to those identified in Part 2.1.1.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p> <p>Part 2.1.3 (now Part 2.1.4) and R2.4.3 have been revised to reflect your suggestion.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p>

Organization	Question 2 Comment
	<ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>Part 2.4.1 has been revised to address your concerns.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Part 2.5 has been revised and included as Part 2.6.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Part 2.6.2 was removed.</p>
Great River Energy	<p>R 2.1, 2.3, and 2.4 need consistency. 2.1 says "The Near-Term Transmission Planning portion of the Steady State analysis..." 2.3 says "The short circuit portion of the Planning Assessment ... addressing the Near-Term Planning Horizon..." 2.4 says "The Near-Term Transmission Planning portion of the Stability analysis..." These three sentences confuse the order. As I understand the Planning Assessment has two parts, a Near-Term portion and a Long-Term portion. Each of those parts has three components, a Steady state component, a Short Circuit component, and a Stability component. I</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>believe the standard's language should be structured as such.</p> <p>R2.1.3- The last bullet would seem to indicate that planners have the capability of predicting the future. The statement would seem to fit more in an operating standard. A suggested revision would be: Known long-term transmission outages with duration greater than one year</p> <p>R 2.1.4 addresses the spare equipment strategy. What is the scope of this sensitivity? Is the intent to do only a full steady state analysis with regard to long lead time spares?</p> <p>R2.6.2 would seem to be placing the planner again in the capability of predicting the future. Coming up with specific dates based on budgets, projected growth rates, potential permitting issues, and material delivery schedules would make it difficult to define an initiating date and an in-service date. An in-service season and year may be more applicable in a planning study for near-term projects. GRE is not sure why an initiating date is of relevance in an assessment.</p>
<p>Response: In the third posting, the Standard, as proposed, requires steady state, Stability and short circuit analyses for the Near-Term Transmission Planning Horizon; steady state for the Long-Term Transmission Planning Horizon. In the fourth posting, the SDT proposes to add Stability analysis to the Long-Term Transmission Planning Horizon. So the requirements are not the same as you described. However, the Requirements have been revised to provide greater clarity.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>2.4 The Near-Term Transmission Planning Horizon portion of the Stability analysis shall be assessed annually and be supported by current or past studies as indicated in Requirement R2, part2.6. The following studies are required.</p> <p>The last Bullet in Part 2.1.3 (now Part 2.1.4) is intended to cover planned outages of Facilities in sensitivity studies if such planned outages are known at the time the planning studies are performed, for example, planned outage of a major Transmission line during construction if the Corrective Action Plan calls for rebuilding of the line to a higher operating voltage. The corresponding sensitivity could simulate unplanned delay starts or unplanned extension of construction period. No change made.</p> <p>Part 2.1.4 (now Part 2.1.5) is intended for the Planning Coordinator and/or Transmission Planner to take into account their spare Equipment strategy for long lead time Equipment when assessing the performance of their System. If the loss of a piece of major Equipment can be replaced within a reasonable period of time, planning studies for the following year can assume that that piece of Equipment will be replaced. If not, its impact of unavailability would need to be assessed. As such the analysis is not limited to steady state studies. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Parts 2.6.2 and 2.6.3 have been removed since the definition of Corrective Action Plan already includes "timetable for implementation".</p>	

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
BC Hydro	<p>Comments: Consider changing the second sentence to read, This Planning Assessment shall use current or past studies, document assumptions, document results and shall cover all analyses needed to clearly demonstrate that the proposed system expansion plan meets all planning criteria and standards. This standard should not limit the studies to only steady state analyses, short circuit analyses and Stability analyses none of which seem to be defined anywhere. In some cases it would be appropriate for planning studies to cover analyses of such phenomenon as electromagnetic transients, sub-synchronous resonance, ferroresonance and harmonics. The fact that Stability is capitalized suggests that it refers to the definition of Stability in the NERC glossary, but that definition reads just, The ability of an electric system to maintain a state of equilibrium during normal and abnormal conditions or disturbances?, but stability analyses (often more properly termed dynamic simulation studies) usually encompass more than simply electromechanical or voltage stability. Usually voltage and frequency excursions are also analyzed and perhaps temporary overcurrent also (eg, assessing temporary overvoltage levels across series capacitor banks).</p>
<p>Response: Even though the other types of studies as identified are important for specific cases, a NERC Standard needs to be applicable continent-wide. The modification could require the inclusion of studies such as EMTP, long-term stability, etc., in the annual Planning Assessment, which is not necessary in all cases. No change made.</p>	
Midwest ISO	<p>Opening Remarks. Specific Comments for Requirement 2:A) Under R2, the Time Horizon of the TPL standards is intended for years one through 10; However the Time Horizon shown in R2 only says Long-term Planning. By definition of Long-Term Transmission Planning Horizon this covers years 6 through 10 and beyond. Suggestion to change the Time Horizon to read: Near-Term and Long-Term Transmission Planning.</p> <p>B) Under R2.1 there is a reference to qualified past studies in R2.6. We believe that this reference should be pointing to R2.5 not R2.6.</p> <p>C) Under R2.1.3 there is ambiguity in the third bullet language new or modified Facilities and we believe that this language should mimic that of R1.1.2 in order to improve this requirement. The third bullet should read: Timing of the installation of new Planned Facilities or changes to existing Facilities.</p> <p>D) Under R2.1.3 there is ambiguity in the fourth bullet language capability and we believe that this language should read: Reactive resource capability (Generator, STATCOM, SVC, other?etc). We believe that this language addition improves this requirement.</p> <p>E) Under R2.1.3 there is ambiguity in the seventh bullet language Transmission outages and we believe that this language should read: Planned duration or timing of specifically scheduled or planned for Transmission outages. This language mimics similar language suggested above in R1.1.1 (letter C on page 3 of 9)</p> <p>F) When a spare equipment strategy does not cover the long lead time unavailability as stated in 2.1.4, will the system be treated as “normal system condition and Table 1 requirements or as having a contingency from which system adjustments are to be made prior to subsequent events. We believe that this task will be burdensome for large entities such as RTOs and we are not clear on the benefit that this requirement brings. For example: If in an RTO system where a party has spare equipment, how can the RTO ensure that a spare part from one asset owner can be made available to other asset owners”</p>

Organization	Question 2 Comment
	<p>G) Under R2.2 a System peak load study is required annually for one of the years in the assessment period. R2.2.1 requires the assessing entity to extend their planning assessment to accommodate any known longer lead time projects that may take longer than ten years to complete. It does not make sense to study the ten year horizon, find a problem in year ten which has a solution that required twelve years to build. For compliance with this standard, you would need to find another solution that can be built within ten years as opposed to the suggested language in R2.2.1 of extending the planning assessment beyond ten years to accommodate the solution that falls outside of the Long-Term Planning Horizon. No project solution greater than 10 years should be acceptable because it falls outside the Long-Term Transmission Planning Horizon. Suggestion to strike sub-requirement R2.2.1 from this standard.</p> <p>H) Under R2.3 the second sentence requires that “The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with any generation and Transmission Facilities in service which could impact the study year”. We suggest changing the language to read: The analysis shall determine the maximum short circuit interruption duty on fault interrupting devices using the System short circuit model with Planned Facilities in service which could impact the study year”. The definition of Planned Facilities was suggested to be added in the comment above in R1.1.2 under letter (E).</p> <p>I) Under R2.4 the second sentence requires states The following studies are required. We suggest changing the language to read: The following current studies are required. We believe that this language addition improves this requirement.</p> <p>J) Under R2.4.1 the first sentence leaves to much ambiguity as to who determines whether severity of system peak or off peak as well as whether the system load levels appropriately represents the dynamic behavior of loads. If the monitoring agency wishes to make this determination than it should be explicitly written here in this requirement. If the assessing entity is to make this determination than we offer the following language suggestion that we feel will improve this requirement. “For one of the five years, the more severe System peak or off peak System load level, as judged by the assessing entity, shall be used which in the judgment of the assessing entity appropriately represents the dynamic behavior of Loads including consideration of the behavior of induction motors”.</p> <p>K) For R2.4.2, we suggest striking this requirement altogether and add System Off-Peak to R2.4.1 above in R2.4.1 under letter (I).</p> <p>L) Under R2.4.3 there is ambiguity in the third bullet language new or modified Facilities and we believe that this language should mimic that of R1.1.2 in order to improve this requirement. The third bullet should read: Timing of the installation of new Planned Facilities or changes to existing Facilities.</p> <p>M) Under R2.4.3 there is ambiguity in the fourth bullet language capability and we believe that this language should read: Reactive resource capability (Generator, STATCOM, SVC, other etc). We believe that this language addition improves this requirement.</p> <p>N) The sub requirement R2.5.2 states that for steady state, short circuit, or stability analysis; the present System model shall not include any material changes, such as..etc. The present language in this section is vague and requires discretion on the part of both the Transmission Planner and the Planning Coordinator performing the assessment. For example, new transmission enhancements may have been added since the previous System model was developed. In general, such topology enhancements will only improve reliability and would not necessitate re-assessment with a newly updated System</p>

Organization	Question 2 Comment
	<p>model. In addition, any significant generator additions would have been evaluated with a full separate generator interconnection study at which the full reliability of the System would have been taken into consideration. For this reason, we believe the following language for R2.5.2 would improve this requirement: For steady state, short circuit, or Stability analysis: the current System model of the assessed plan year shall not include any changes material to the assessment, as judged by the entity performing the assessment, such as, generation or Transmission additions/removals, or topology changes that have occurred in the intervening period and would impact the study year. Material generation changes could include:</p> <p>O) Under R2.6.1 the fifth bullet regarding the use of Operating Procedures needs to be made clearer. We believe that the following language will improve this requirement: Use of Operating Procedures specifying how long they will be needed as part of the Corrective Action Plan. Operating Procedures may not include Non-Consequential Load Loss when not permitted in Table 1.</p> <p>P) Under R2.6.1 the sixth bullet regarding the use of rate applications, DSM, new technologies or other initiatives can be improved with the following language additions: Use of rate applications, DSM, new technologies or other demand side initiatives can be improved with the following language additions.</p> <p>Q) Under R2.6.2 the language regarding project initiation date is vague. We suggest the following definition to be added to this standard and further added to the NERC Glossary of Terms: Project Initiation Date A date in which Planned Facilities are expected to break ground.</p> <p>R) Under R2.8 please add a coma between the words event and caused. A PC/TP would study multiple P1 and P2 events involving consequential load loss not just the largest. Unless the SDT has a measure in mind for consequential load loss, this requirement should be removed.</p> <p>S) Under R2.9 please strike the word permissible and replace with necessary. It is not clear what the SDT is requesting with this requirement.</p>
<p>Response: The <i>Time Horizon</i> term at the end of the requirement deals with mitigation time periods (as shown below) and is not connected to the assessment time frames. Time Horizons are a consideration when there is a violation of a requirement – the impact to the BES of violating a requirement with a long-term planning horizon is not expected to be as severe as the impact associated with violating a requirement with a real-time operations time horizon. No change made.</p> <p>Mitigation Time Horizon</p> <p>The time horizons available for mitigating a violation to a requirement include the following:</p> <ul style="list-style-type: none"> • Long-term Planning — a planning horizon of one year or longer. • Operations Planning — operating and resource plans from day-ahead up to and including seasonal. • Same-day Operations — routine actions required within the timeframe of a day, but not real-time. • Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system. 	

Organization	Question 2 Comment
	<ul style="list-style-type: none"> • Operations Assessment — follow-up evaluations and reporting of real time operations <p>In the new version, Part 2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made</p> <p>Part 2.1.3 (including the third and seventh bullets) (and now Part 2.1.4) has been revised to provide greater clarity. The SDT declines to change the fourth bullet because adding a partial list of devices that could provide reactive resources may not improve clarity beyond the present description.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>Part 2.1.4 (now Part 2.1.5) requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or can be purchased and be placed in service such that the outage won't last into the next planning cycle. Loss of a transformer is given as an example as a piece of major Equipment, which if forced out of service and had to be replaced with a new transformer, may have a lead time of more than one year. However, if a company has a strategy, for example, to have spare transformers in its System, or have agreement with another entity to share spare transformers, it would significantly reduce the probability of an outage of a transformer for longer than one year. Perhaps it would help if sharing major Equipment can be part of an operating agreement within entities belonging to the RTO; however, that would be outside the scope of this Standard. Part 2.1.5 has been revised to require that the assessment reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time Equipment.</p> <p>2.1.5 When an entity's spare equipment strategy could result in the unavailability of major Transmission equipment that has a lead time of one year or more (such as a transformer), an analysis of the impact of this possible unavailability on System performance shall be assessed. The Planning Assessment shall reflect the P0, P1, and P2 categories identified in Table 1 during the conditions that the System is expected to experience due to the possible unavailability of the long lead time equipment.</p> <p>Part 2.2.1 has been revised because extending the Planning Horizon beyond 10 years for projects with lead time longer than 10 years is already covered in the definition of Long-Term Transmission Planning Horizon. This allowance is needed to provide planning flexibility, and is at the discretion of the Planning Coordinator or Transmission Planner. For example, if the System is found not to meet performance standard in year 10, but the project to correct the loading cannot be placed in service for 12 years, then the Corrective Action Plan needs to identify the interim solutions before the project can be brought on line.</p> <p>2.2.1 A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the</p>

Organization	Question 2 Comment
	<p>rationale for why that year was selected.</p> <p>Part 2.3 has been revised to reflect your suggestion.</p> <p>2.3 The short circuit analysis portion of the Planning Assessment shall be conducted annually addressing the Near-Term Transmission Planning Horizon and can be supported by current or past studies as indicated in Requirement R2, part 2.6. The analysis shall be used to determine whether circuit breakers have interrupting capability for Faults that they will be expected to interrupt using the System short circuit model with any planned generation and Transmission Facilities in service which could impact the study area.</p> <p>In Part 2.4.1, the SDT was not able to locate the reference to the comment on the “ambiguity as to who determines whether severity of system peak or off peak”. No change made.</p> <p>Part 2.4.1 has been revised to provide greater clarity. However, the SDT declines to modify Part 2.4.1 to require study for “the more severe System peak or off peak System load level” for one of the five years in the Near-Term Transmission Planning Horizon because the System needs to meet performance requirements under all System conditions including peak and off-peak. In addition, the Planning Coordinator or Transmission Planner can rely on past studies as provided in Part 2.5 (Part 2.6 in the new version). For this reason Part 2.4.2 has been retained.</p> <p>2.4.1 System peak Load for one of the five years. System peak Load levels shall include a Load model which represents the dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aggregate System Load model which represents the overall dynamic behavior of the Load is acceptable.</p> <p>Part 2.4.3 (including the third bullet) has been revised to provide greater clarity. The SDT declines to change the fourth bullet because adding a partial list of devices that could provide reactive resources may not improve clarity beyond the present description.</p> <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>Part 2.5 has been revised and included as Part 2.6.</p> <p>2.6.1 For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate that the results of an older study are still valid.</p> <p>2.6.2 For steady state, short circuit, or Stability analysis: the study shall not include any material changes unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area.</p> <p>Part 2.6.1 has been revised and included as Part 2.7.1 to provide greater clarity. However, the SDT declines to include “Operating Procedures may not include Non-Consequential Load Loss when not permitted in Table 1” because it is redundant. Part 2.6.1 (now Part 2.7.1) is a sub-part of Part 2.6 (now Part 2.7), which</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>explicitly requires meeting the performance requirements in Table 1.</p> <p>Parts 2.6.2 and 2.6.3 have been removed since the definition of Corrective Action Plan already includes “timetable for implementation” so a new NERC definition is not required.</p> <p>Parts 2.8 and 2.9 were intended to contribute to open and transparent Transmission planning for peer review. The SDT reviewed both requirements and agrees that as written, they were unclear. Part 2.9 has been deleted. Part 2.8 has been revised and included as Part 2.9 in the new version to require that the Planning Assessment provides the expected largest Consequential Load Loss identified by the analysis of P1 and P2 events in Table 1 only.</p> <p>2.9 The Planning Assessment shall provide the expected largest Consequential Load Loss (megawatt Demand) identified by the analysis of P1 and P2 events in Table 1.</p>
PJM	<p>In R2, why require a Planning Coordinator AND a Transmission Planner to perform this analysis? Isn't this a duplication of effort?</p> <p>In R2, I have always heard that dynamics studies are performed to determine Stability.</p> <p>In R2.1, need to update reference to R2.6 from R2.5. In 2.1.1 and R2.1.2, is this annual peak or seasonal peak? Summer peak for summer peaking entities and winter peak for winter peaking entities or both summer and winter peak for all entities.</p> <p>R2.1.1 year one or two studies should be only required as operating studies. By their nature, the upgrades or fixes that could be accomplished in this time frame are limited to short lead time fixes. These analyses are needed to determine how to accommodate construction schedule deviations and near term system issues that may cause issues. Traditional Planning studies will be of no benefit in this timeframe. Change the requirement to be a study for year 3,4 or 5 with updates for material changes that occur when a previous year study is still within this time frame.R2.1.2 and R2.1.1 should be combined and the TP should assess and justify its choice of the critical load scenarios to analyze.</p> <p>Concerned about the extent of variations required in R2.1.3. Like would I have to vary all proposed generator in-service dates? Just a couple? One? Requirements need to be clear or compliance will assume the largest scope possible.</p> <p>Also in R2.1.3, first bullet words should align with the words of R1.1.3.</p> <p>Also in R2.1.3, second bullet words should align with words of R1.1.4 and R1.1.5.</p> <p>Also in R2.1.3, third bullet, modified facilities are not installed, suggest changing -installation to -availability--.</p> <p>Also in R2.1.3, fifth bullet, suggest moving retirements-- up to third bullet and dropping -- Generation additions, retirements, or other-- leaving just dispatch scenarios</p> <p>R2.1.4 should be deleted. There are no NERC requirements on spare equipment availability and this requirement seems like a backhanded way to include such a requirement.</p> <p>R2.2.1 should be reworded because it now requires everyone to extend their studies. Suggest If planned projects will take longer than ten years to complete, the Planning Assessment shall be extended accordingly-</p> <p>R2.4.1 Not sure I understand. The second sentence and the third sentence seem to be in conflict</p>

Consideration of Comments on 3rd Draft of Standard TPL-001-1 (Project 2006-02)

Organization	Question 2 Comment
	<p>R2.4.2. This requirement has lost significance with the deletion of unit stability. Off-Peak scenarios are critical for unit stability and analysis of pockets of known light load stability sensitivity. This requirement should not be worded to require a general system off-peak stability study since this will not provide useful information. The requirement should be reworded to clarify that the TP should identify its critical off-peak stability sensitivities and provide annual stability analyses that address the system's off peak stability issues.R.2.4.3 should only refer to R2.4.1 since R2.4.2 are sensitivities themselves.</p> <p>In R2.4.3, first bullet, how would load model assumptions be varied? Same comments on bullets here as R2.1.3 above.</p> <p>R2.5.2 is impossible to judge. Material changes needs to be defined. The word could in the sentence before the bullets makes them useless as a definition. By trying to define material changes the SDT has created a situation where, for large interconnection, it would be virtually impossible to use a past study. The addition of a 100 MW generator two states removed from the study area would not be considered material but by the guidelines in this requirement it can be interpreted as such.</p> <p>R2.5.2 Add that retools of past studies that address the local impacts of specific cumulative material changes that occur are sufficient to continue to support current planning assessment.</p> <p>R2.6 has a mixing sigular and plural tenses. What if only one problem is found and therefore only one Corrective Action Plan is needed. Or can one Plan cover all the problems found?</p> <p>Responses to R2.8 and R2.9 would be considered Critical Energy Infrastructure Information (CEII) and that should be noted so it can be protected.</p> <p>R2.8 and 2.9 change to read that the Planning Coordinator will provide its criteria for load loss that is adheared to for all events.</p>
	<p>Response: Requirement R2 applies to both the Planning Coordinator and Transmission Planner because the Planning Coordinator may have a larger area than the Transmission Planner. Functional Model Version 3 states that, "Like the Resource Planners and Transmission Planners at the 'local' level, the Planning Coordinator maintains system models and performs the necessary studies to evaluate whether the composite resource and transmission plans of its Resource Planners and Transmission Planners are in compliance with reliability standards". No change made.</p> <p>Please suggest modifications to more accurately describe "stability" Analyses. No change made.</p> <p>In the new version, Part.2.6 now contains the requirement for the use of past studies, so Part 2.1 now has the correct reference. No change made.</p> <p>For Part 2.1.1, Year One and year two are within the Planning Horizon. In the Definition Section, Year One is defined as "The first year that a Transmission Planner is responsible for assessing. This is further defined as the planning window that begins 12-18 months from the current calendar year". Operating Studies are performed for system conditions within 12 months of the current calendar year. Part 2.1.1 is intended to require studies for System Peak Load Conditions for 2 of the years in the Near-Term Transmission Planning Horizon: (1) A Year five case to identify potential problem that can be addressed if the planned projects proceed as scheduled; (2) A Year one or year two case to identify any potential problems unanticipated in the five-year case, which if not addressed, could impact operations as time progresses. The standard provides flexibility for the Planning Coordinator or Transmission Planner to use past studies to support the current year assessment and to assess other years in addition to those identified in Part 2.1.1. Part 2.1.2 requires that the Planning Coordinator and/or Transmission Planner also consider off-peak conditions in addition to peak conditions because the System must be able to meet performance requirements over all demand levels. System peak condition may not represent all stressed conditions. For example, during off-peak, the Load is low, and the generation would have to be</p>

Organization	Question 2 Comment
	<p>turned off to achieve Load-resource balance. Turning down resources within a Load area could result in reliability problems. Lowering the Load in areas with many non-dispatchable resources could also pose potential problems. As the System incorporates more and more renewable resources, some of them are non-dispatchable; a standard must be forward looking so the Planning Coordinator and Transmission Planner can identify potential problems. If studies for one of the Load periods are not needed annually, the Planning Coordinator or Transmission Planner can rely on past studies for the Planning Assessment.</p> <p>The bullets under Requirement R1, Part 1.1.3 have been removed from the revised standard, so no effort was made to line up the bullets in Requirement R1, Part 1.1.3 with the first two bullets under Requirement R2, Part 2.1.3. Parts 2.1.3 (now Part 2.1.4) and 2.4.3 and associated bullet lists have been revised to provide greater clarity for the expected changes. "Installation" has been removed from the third bullet. The SDT believes it is appropriate to treat generation change and transmission changes separately and did not move retirements up to the third bullet. The extent of the variations for each item listed is left to the discretion of the Planning Coordinator or Transmission Planner who are more familiar with the system being studied. Load modeling assumptions can be varied by varying, for example, the percentage of motor Load or the customer mix. It is up to the Planning Coordinator or the Transmission Planner to decide how the assumptions would be varied.</p> <p>2.1.4 For each of the studies described in Requirement R2, parts 2.1.1 and 2.1.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Real and reactive forecasted Load. • Expected transfers. • Expected in service dates of new or modified Transmission Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. • Controllable Loads and Demand Side Management. • Duration or timing of planned Transmission outages. <p>2.4.3 For each of the studies described in Requirement R2, parts 2.4.1 and 2.4.2, sensitivity case(s) shall be utilized to demonstrate the impact of changes to the basic assumptions used in the model for the list of items shown below. To accomplish this, the sensitivity analysis in the Planning Assessment must vary one or more of the following conditions not already included in the studies by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance.</p> <ul style="list-style-type: none"> • Load level, Load forecast, or dynamic model assumptions. • Expected transfers. • Expected in service dates of new or modified Facilities. • Reactive resource capability. • Generation additions, retirements, or other dispatch scenarios. <p>Part 2.1.4 (now Part 2.1.5) is based on FERC Order 693, Paragraphs 1724 – 1727. Part 2.1.4 requires that the Planning Coordinator and/or Transmission Planner consider the possibility that a piece of major Equipment can be out of service for an extended period of time because no spare piece of Equipment is on hand or</p>
