We agree but, consider the following comments. The R1 method is designed to assure a minimum level of SOER and FR is available to analyze events. It does so by requiring a certain process must be periodically performed by the entity. This seems to be a good process to ensure that an entity has a minimally acceptable level of monitoring on their system. However, the drafting team should consider a less burdensome alternative for entities that are working to install modern equipment with FR and SOER capabilities on all their circuits. Once a system includes a high percentage of modern equipment with SOER and FR capability (also see comments to item 7), R1 through R5 are not needed and become purely burdensome compliance items. At our company gathering data to ensure 100% compliance is a high burden activity. An alternative method for entities with high percentages of modern equipment installed might be to provide a list of BES transmission line terminals showing that at least 50% (or another appropriate percentage) of all employ modern equipment with SOER and FR capability (also see comments to item 7). This data is typically available (we keep it on an ongoing basis) with a very minimal effort. Only a very minimal effort should be required for a system that is already highly monitored and doesn't need a standard to force the issue. This method would be an alternative to R1 through R4 (R5 becomes moot when a high percentage of transformers are monitored) which are designed for entities not monitoring their system. The entity would choose which method to use and the effort required on a highly monitored system would be minimized.
Yes
No
We believe the drafting team has done a good job of trying to focus on the important BES elements that should require Dynamic Disturbance Recording. Requiring DDR for the most important BES elements rather than all BES elements at a certain station is technically sound and a major improvement over some attempts at past criteria to determine which elements should require DDR. We concerend however that about the specificty for determination as to the number and location of where DDR will be required per this requirement. The requirment may result in an unnecessary number of installations. We urge the drafting team to provide for the PC to determine the number and location of the devices. Addtionally, use of the NERC book of flowgates may not support again the necessary data required because every line in a Flowgate or IROL, IROLs is not always dynamic limited.
No
We don't agree that R3 is necessary at all, see item 7 comments. In a large company hundreds of pieces of equipment require monitoring. If one item out of hundreds are missing, the effect on monitoring is minimal. The drafting team should consider changing the lower violation severity level to more than X% but less than 95% (instead of 100%). Zero tolerance approaches, especially on standards that "look back" and support analysis are unnecessary and wasteful of engineering resources.
Yes
Comments on R3: R3 states that circuit breaker position must be monitored for identified breakers. In our companies standard design, we connect circuit breaker auxiliary contacts to relays that include monitoring. However, this requirement will present a significant burden since a database must be created to cross-reference prints to prove that hundreds of breaker auxiliary contacts are connected to satisfy compliance requirements. Since three phase currents are to be monitored under the proposed Requirement3, this information can be used to determine circuit breaker status in lieu of monitoring a 52 contact. With three phase current values available, it is not difficult to figure out when breakers were opened based on loss of current and is actually more accurate than breaker auxiliary contacts. It is very straight forward to figure out when breakers are opened based on loss of current for a straight bus configuration. If a single circuit breaker in a ring bus or similar configuration opens for some reason and flow is not interrupted the sequence of breaker openings can still be determined using currents. It is also not necessary to know exactly when a breaker in a ring bus opens if flows in the ring are merely rerouted. Thus, a detailed sequence of events timeline of a power system disturbance can be determined without the use of a circuit breaker contact. In rare cases connection of a circuit breaker contact may have been mistakenly excluded from the

protection design. In this case, complying with the standard as written could require installing 1000 feet or more of control cable in an EHV switchyard, incurring a high cost for very little gain. Thus, we believe the drafting team should eliminate this requirement as it just creates a significant burden, potentially adds cost, provides no commensurate increase in reliability, and is not necessary for events analysis when three phase currents are already required. Comments on R4: It is a natural progression for a TO to upgrade BES lines before upgrading BES transformers since BES lines are subject to many more faults and operations. Thus, modernizing BES lines first has the greatest impact on reliability. For example, a large % of our comapies T-lines employ modern relays with FR and SOER capability and the remaining lines will have this capability shortly. These upgrades are being done on previously determined schedules and include all 138 kV and above lines. The percentage of BES Transformers with modern equipment is much less (15-20%) and upgrades are typically only done when transformers infrequently fail or when protective equipment is obsolete and problematic. Although R4 does state that the TO/GO shall have fault recording necessary to determine required quantities (transformer information can be determined from monitored line data as needed), the drafting team should consider revising the guidance section of R4 to state that it is adequate to monitor lines and use their fault recordings to determine transformer quantities. The drafting team should also consider just eliminating R4.2.1. Monitoring lines is much more important and provides information to determine flows in transformers. This would also recognize that the natural progression of system upgrades is to concentrate on the most exposed and problematic areas (T-lines). The number of transformers with increased monitoring is increasing sufficiently already and monitoring of transformers inherently benefits from the rapidly increasing level of monitoring on transmission lines. Comments on R5: R5.3 states that trigger settings need to include Neutral (residual) overcurrent and phase undervoltage. RFC had a disturbance monitoring standard for a few years that we worked diligently to comply with. It required triggering on one or more of various quantities including negative sequence current, negative sequence voltage, residual current, undervoltage, overvoltage, or overcurrent. ComEd met this requirement in hundreds of devices by triggering on residual current (for grd faults), phase overcurrent (for multi-phase faults), and pickup of any forward or backward (if used) phase distance zone (for multi-phase faults). Undervoltage elements weren’t always available. The drafting team should consider modifying this requirement to allow phase undervoltage or phase overcurrent as a trigger for multi-phase faults. Having to tweak hundreds of relay settings (an arduous and expensive process) to meet a NERC standard that is slightly different than the RFC standard just doesn’t seem right. There is a good argument that once a system is highly monitored, triggering an event record when the relay trips provides sufficient information for events analysis. We do not believe that a standard specifying what to trigger on is necessary at all for a highly monitored system. Having to go back and change event trigger equations on a highly monitored system is purely burden to the registered entity with no commensurate increase in reliability or increased capability to analyze disturbances.

Please see the comments of the NAGF SRT. I support their response to this question.
No
Generator should not be a functional entity for this standard. In cases where generators own a breaker on a transmission system, the only requirement should be a breaker status signal, which properly should be supplied under the interconnection agreement.
No
The standard is too prescriptive for DDR. The TO should select the sites, install and maintain the DDR they properly need to analyze a disturbance on their system. The standard should simply require "DDR shall be installed as necessary to analyze a fault on the TO's system". Violations of the standard would only occur if a fault is unable to be analyzed due to equipment not being installed (not due to failure or outage of installed equipment).

No
No
See the NAGF SRT comments. Smaller entities who may have one SOE system to install will be forced to comply 100% within two years.

The document “Mapping of Standard’s Introduction of BOT Approved PRC-002-1 to Proposed PRC-002-2” from January 2013 described line terminals above 200 kV and large generators/transmission stations which warrant this level of data gathering, as they represent the backbone of the transmission system. It would be better to start with this system level first and test out data collection. For the sake of comparison, the approximate median value of the 11 highest (short circuit) MVA PSE buses where digital fault recorders are already in place, is 6800 MVA. Lowering to a short circuit MVA level of 1500-2500 MVA quadruples the quantity of collection sites.

Referring to comments for Question 2 on this Comment Form, it would be prudent to at first require a subset of the Fault Recording, SOER and DDR to be up and running and monitored for a time. Then NERC, WECC and entities can refine the standard based upon what we learn. In a nutshell, we should start small.

FMPA does not believe that a standard is justified for Disturbance Monitoring, as such, we believe that disturbance monitoring is better addressed through guidelines than through a standard, as further discussed below. In the scheme of things, disturbance monitoring provides very little value to operating the bulk-power system reliably as compared to other standards. Establishing SOLs and operating to them; coordinating and maintaining effective protection systems; maintaining supply/demand balance and frequency; cyber security; and effective and trained human resources are greater than one quantum step more important to reliable operations than equipment installed simply to ease the ability to perform post-mortem analyses on events and to validate stability modeling that cannot be that accurate in the first place simply due to Chaos Theory (e.g., the Butterfly Effect) and the inability to predict the future accurately. While installing DMEs may be good / prudent action, FMPA believes it is imperative to avoid a mode of thought that seems to prevail among many within our industry, and that is a mode of thought that if something is good for reliability, then we need to write a standard for it. Such mode of thought is counterproductive and stunts creative improvement because it creates a perverse incentive to only do the minimum to meet the existing standards due to the danger of better performance causing an increased level of governmental regulation. Governmental regulation should be to minimum requirements while not stunting the creativity of the industry to perform better than required, and FPA Section 215 is crafted with that thought in mind: "The term `bulk-power system' means-- `(A) facilities and control systems NECESSARY FOR OPERATING an interconnected electric energy transmission network ..." (emphasis added) "The term `reliability standard' means a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system." While DMEs may be good/prudent, they are not necessary to provide reliable operation of the bulk-power system. In addition to a lack of technical justification, a standard that requires DMEs is also not justified from a cost/benefit perspective. The benefit of DMEs as stated in the purpose of the draft standard are to assist in post-mortem analyses of events. We have been doing event analyses for decades without the standard. Yes, they may take longer to perform do to the difficulty in establishing a sequence of events post-mortem and other challenges, but, we were able to do it. So, the benefit of a DME is to shorten the time and effort it takes to do a post-mortem (what is that, maybe three or four person-years, maybe a million?) compared to a cost of installing these devices and maintaining them on hundreds of buses (maybe $10's of millions) for events that may happen once in 10-20 years close enough to a DME to matter. In addition, the system has changed a lot over the last 10 years since the Northeast Blackout of 2003 and we can gain much more information now from microprocessor based relays prevalent throughout the system and phaser measurement units (PMUs) also installed throughout the system. Additionally, the effort does not justify the compliance administration costs at both the entities and at NERC and the Regions for administering compliance to this proposed standard. The standard as written is complicated, long, has many requirements, and in general is far too complicated and onerous in relation to its minimal reliability benefit. Also, how would such a proposed standard impact compliance with PRC-006, EOP-004 and other standards that require post-mortem event analyses? In conclusion, FMPA believes that a standard is not justified, either from technical or cost benefit perspectives, and we believe that measurement devices for purposes of post-mortem analysis of events ought to be addressed through guidelines rather than a standard.

1) Add “balanced three phase” between “dynamic” and “power” in order to clarify the context of Dynamic Disturbance Recording. The revised definition would be “The recording of time sequenced data for dynamic, balanced three phase power system characteristics such as power swings, frequency variations, and abnormal voltage problems.” 2) The definition of SOER presently uses the phrase “… status of Elements, which may include protection and control devices.” Recommend changing the word “Elements” to “circuit breakers” which is what is stated in R3. Also, the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status. 3) Recommend not using the acronyms SOER, FR, and DDR as defined NERC Glossary acronyms. These acronyms have historically been

used by industry to label the recording equipment; therefore the same acronym should not be used when referring to the equipment's data.
Yes
Yes
No
We believe the proposed DDR installation criteria will require an excessive number of installations, has not been technically justified by the SDT for the increase in DDR installations which will be required, and will be unnecessarily burdensome to the industry. Industry experience shows that disturbance events for which DDR information and analysis is needed are very rare, and we believe the R61.1 criteria puts us closer to what should be a target number of installations rather than a minimum number.
Yes
No
Clearly state the timeframe required for implementation of newly identified locations resulting from the R1 five year assessment.
1) All SER and FR data requirements should be included as part of a single table and referenced in a single requirement. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation multiple requirements. 2) Similar to 1) above, all DDR data requirements should be included as part of a single table and referenced in a single requirement. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation of multiple requirements. 3) Add "by voltage level" in Requirement R1 so that it reads "Each Transmission Owner shall identify BES bus locations by voltage level for Sequence of Events Recording (SOER) and Fault Recording (FR)." This is consistent with Attachment 1, Step 1 and clarifies that the FR and SOER are only required at that voltage level. 4) In Requirement R5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the Requirement. Suggest Requirement R5.1 be reworded to say "A single record or multiple records that include at least one of the following:" 5) Reword Requirement R14 to 'Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 upon the discovery of a failure shall: (a) Restore the recording ability within 120 calendar days; or (b) "If recording ability is not restored within 120 calendar days, demonstrate efforts to correct the unresolved failure." Recommend increasing the allowed repair time by 30 days to allow for non-inventoried repair parts and limited access of repair personnel to such equipment which may be restricted during certain periods of the year.

No

Please provide the technical justification for Requirement R6.1.1.
No
It is unclear what the implementation timeframe is for newly identified facilities after the original implementation of the standard. Should a facility be identified in the future as requiring a SOER, FR or DDR it is unclear how long the responsibility entity has to install equipment to capture the necessary data to be compliant.
Group
Duke Energy
Michael Lowman
Duke Energy recommends the following suggestion to the new definitions (1) Dynamic Disturbance Recording (DDR) –The recording of time sequenced data for dynamic power system analysis comprising characteristics such as power flow, and frequency and voltage excursions. (2) Fault Recording (FR) –The recording of time sequenced waveform data, such as current(s) and voltage(s), for short circuits or failure of BES Elements. (3) Sequence of Events Recording (SOER) –The recording of time sequenced data for change in status of BES Elements, which may include components of protection and control systems.

Yes
Yes
Yes
Yes
(1) Duke Energy believes that ambiguity exists between Requirement 14 and the Rationale. The standard suggests that an entity must “Report the inability to record data to the Registered Entity along with a Corrective Action Plan (CAP) to restore the recording ability” within 90 calendar days. However, in the Rationale for Requirement 14, the language suggests that a Registered Entity must issue a report on the inability to record data to the Registered Entity after a timeframe of 90 days. (2) Triggering of frequency events in Requirement 10 should be adjusted. Significant events will be missed if recorders on generators are set to trigger below 59.75. Also, the rate of change wording is confusing and should trigger if the rate of change is greater than a value not less than a value. Lastly, the Rate of change frequency set point of 125 mHz is too large and should be triggered on generation around 20 mHz per second. (3) Electrical quantities identified in Requirement 9 should better align with MOD-26 (MW, MVARS, Terminal Volts, Field Volts, Field Amps). (4) According to the rationale for R6, the intent of the requirement is to “ensure that there are sufficient BES Elements identified for DDR because of the crucial role DDR plays in wide-area disturbance analysis. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system model’s performance.” Duke Energy believes to require that DDRs be located in areas necessary to monitor all elements of permanent Flowgates is excessive. Permanent Flowgates fall into one of three categories: Voltage, Stability, or Thermal. The majority of the Flowgates identified are classified as being Thermal. Thermal Flowgates are chosen due to concerns with steady-state loading and not for transient/post-transient activity. With some PCs or RCs having as many as 1000 permanent Flowgates, the cost versus reliability gain would be astronomical. For Flowgates that have been identified to be voltage or stability related, the case can certainly be made to have DDRs monitor them in the transient/post-transient timeframe. We suggest that all permanent Flowgates should be removed from the requirement and only keep those permanent Flowgates that have been identified as voltage or stability limited. This would reduce the

amount of Flowgates requiring DDRs, reduce the cost for industry stakeholders, and still achieve the intent of this requirement.

a) In the Background section, the SDT explains the basis for the 500MW threshold; however, there is no explanation/ basis for the 300MW at locations over 1000MW. b) It is not clear in R9 whether the specification for signal measurements is on a generating unit basis or if the signals of interest are a per line basis aggregate at generating stations. Please more clearly specify if the signals of interest are individual unit measurements or plant total measurement (grouped by output circuit, plant total, etc.). This determination weighs heavily on the cost and method of implementation where new equipment must be installed. Example: (i.e. combined cycle plant (1075MW total) with units of 325, 325, 425 but only one transmission line)? c) In reference to the R6.1.4: The monitoring of all elements of a permanent flowgate should be changed to only the major elements or perhaps those that contribute more than 20%. In some cases multiple lines of 500, 230, and 115kV may be involved but the lower voltage lines may only contribute 5-10% of the total capacity. Having to install DDR capability at these multiple locations is overly burdensome and does not enhance the overall goal of this Standard.
Yes
No
Referencing Note 9 of the Background section, ‘Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant’; we feel the requirement to be ‘25% compliant within two (2) years following notification of the list’ is problematic and overly burdensome for both TOs and GOs. We feel that a more appropriate timeframe for implementation would be as follows: o At least 25% compliant within three (3) years following notification of the list o At least 50% compliant within four (4) years following notification of the list o 100% compliant within five (5) years following notification of the list
a) The requirements of R3, R4, R5 and R12 for SER and FR data should be included as part of a single attachment/ table and R3 should simply reference the table. As structured presently, if an owner fails to include provide data for a single required element, they would be in violation multiple Requirements. b) Similar to a) above, R8, R9, R10, R11, and R12 for DDR data should be included as part of a single attachment/ table or possibly separate attachments/tables for TOs and GOs and referenced in a single Requirement. As structured presently, if an owner fails to include provide data for a single required element, they would be in violation of multiple Requirements. c) The inclusion of the word ‘either’ in R4.1 seems redundant. d) R10 allows the use of triggered records from equipment installed prior to the effective date of PRC-002-2, but does not specify how many records an entity must be able to produce in the retrievable period specified in R13 as 10 days prior to a request. This specification is crucial to the amount of memory requirements of existing equipment. At the maximum trigger frequency (triggering every 3 minutes), the existing equipment becomes effectively a continuous recorder. For existing equipment with triggered recording capability, how many records are required to be available in the 10 day retrievable record?

PJM Interconnection
Yes
Yes
PJM does support the methodology and also is providing the following comments. The R1 method is designed to assure a minimum level of SOER and FR is available to analyze events. It does so by requiring a certain process must be periodically performed by the entity. This seems to be a good process to ensure that an entity has a minimally acceptable level of monitoring on their system. However, the drafting team should consider a less burdensome alternative for entities that are working to install modern equipment with FR and SOER capabilities on all their circuits. Once a system includes a high percentage of modern equipment with SOER and FR capability (also see comments to item 7), R1 through R5 are not needed and become purely burdensome compliance items. At our company gathering data to ensure 100% compliance is a high burden activity. An alternative method for entities with high percentages of modern equipment installed might be to provide a list of BES transmission line terminals showing that at least 50% (or another appropriate percentage) of all employ modern equipment with SOER and FR capability (also see comments to item 7). This data is typically available (we keep it on an ongoing basis) with a very minimal effort. Only a very minimal effort should be required for a system that is already highly monitored and doesn’t need a standard to force the issue. This method would be an alternative to R1 through R4 (R5 becomes moot when a high percentage of transformers are monitored) which are designed for entities not monitoring their system. The entity would choose which method to use and the effort required on a highly monitored system would be minimized.
Yes
No
PJM is concerned about the specificty for determination as to the number and location of where DDR will be required per this requirement. Our concerns include the number of DDRs may be sufficient for monitoring but not for data validation. Monitoring lines may not provide the data to adequately perform disturbance analysis. Additionally, the requirment may result in an unnecessary number of installations. We urge the drafting team to provide for the PC to determine the number and location of the devices. Addtionally, use of the NERC book of flowgates may not support again the necessary data required because every line in a Flowgate or IROL, IROLs is not always dynamic limited.

It is understood that the intent of this version 2 of the PRC-002 Standard is to ensure that sufficient recording capability exists without being prescriptive as to the type of equipment that must be installed to meet the recording capability requirements. It is also understood that the SDT did not wish to be unnecessarily prescriptive with respect to periodic maintenance activities, and as such, this version 2 of PRC-002 contains no such requirement. It does not appear however that the Standard would necessarily ensure that Entities continue to have the required recording capability over time following initial installation and commissioning and after completion of the Implementation Plan. Although an Entity should be compliant at all times, is it plausible that an Entity could be unaware if some of the required recording capability is deficient or no longer exists? Disturbances do not occur very frequently, and an Entity may not become aware of deficiencies for many months or years until a disturbance occurs, when the disturbance data is requested; at which point they realize that the disturbance recording functions or capability is deficient in some manner. It could be argued that verifying compliance, and ensuring that the required recording capability exists, is the task of the auditor; however, this is dependent upon the Standard being included in an audit, and an audit itself may only occur once every 3-6 years. We suggest that the SDT consider adding a requirement for Entities to simply perform a periodic verification of the required recording capability, without specifying how to verify such recording capability, on an interval to be determined by the SDT. There are many mechanisms available for verification such as downloading recorded data, performing equipment self-tests, etc. Allowing Entities to perform periodic verification of the required recording capability in a manner they choose is consistent with the spirit of the Standard of not being unnecessarily prescriptive, and is consistent with ensuring that the required recording capability is in place.

No
Believe that applicability to TO and GO entities should be limited to those with the current equipment capable of the required monitoring and should not de facto create a situation where an entity has to purchase equipment to comply with the requirements of the standard, including the storage and auditing of post-fact information sufficent to meet the requirements.

Group
SERC Protection and Controls Subcommittee
David Greene
No
The SERC PCS requests that the SDT to make the following changes: 1. Add ‘balanced, three phase’ between ‘dynamic’ and ‘power’ in order to clarify the context of Dynamic Disturbance Recording. Thus it would read ‘The recording of time sequenced data for dynamic balanced, three phase power system characteristics such as power swings, frequency variations, and abnormal voltage problems.’ 2. Also the definition of SOER presently uses the phrase “… status of Elements, which may include protection and control devices.” We recommend changing the word “Elements” to “circuit breakers” which is what is stated in R3. Also the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status. 3. We do not support using the abbreviations SOER (or SER or SOE), FR (or DFR) and DDR as defined NERC Glossary abbreviations. These acronyms have been used by the industry for many years to label recording equipment. When industry experts and engineers refer to a FR (or a DFR) they mean the equipment, a digital fault recorder, not a particular type of recorded measurement data. Same is true for SOER (or SOE or SER) and DDR. Since this is a data standard, strong consideration should be given to using the word “data” in place of the word “recording”, such as Dynamic Disturbance Data, Fault Data and Sequence of Events Data with acronyms of DD, FD and SD.
Yes
Yes
No
1. Our industry experience is that disturbance events for which DDR information and analysis is needed are extremely rare (perhaps one per decade; in fact we’ve not yet experienced such an event). We believe that the proposed R6.1.4 alone would increase our number of NERC required DDR for one of our members at least thirty-fold. The SDT has not provided technical justification for this proposed significant increase. For this member, the other parts of 6.1 may well triple their NERC required DDRs. We ask the SDT to consider a reasonable approach and omit Requirement 6.1.4 and reconsider it in the five-year review of this standard if NERC-wide experience in the meantime warrants it. Perhaps this is a regional issue and some regions have a stronger need; if so, we suggest they draft a regional standard. 2. A quick analysis of another of our members identified 12 generating plant locations (R6.1.3), 18 flowgates (R6.1.4) at 12 locations and one IROL (R6.1.6) location where we own Elements. Presently we are required by SERC to have DDR at 6 locations. This results in the entity possibly needing DDR at 19 additional locations, with a total of 25! Was there any effort, as was suggested in the Atlanta drafting team open forum meeting, for a data request of the REs to assess how many DDRs (Elements) would be need to be monitored? If so where is this information? If this was not done, it must be a part of the cost impact effort. 3. Clarity is needed under Requirement 6.1.3 to understand how to add up the MW ratings of combined cycle unit generators and cross compound generators. Some examples will be most helpful. 4. Clarity is needed in Requirement 6.1.4 (if it is retained) when you refer to “monitor all Elements of: all permanent flowgates”. If a flowgate is made up of a combination of several transmission lines and transformers, does every line need to be monitored? Do both ends of the lines need to be monitored? Does every transformer need to be monitored (lowside or highside side)? Please show some typical examples. 5. Under Requirement 6.1, it may be better to move the minimum quantities Requirements 6.1.1 (minimum 1 DDR per 3000MW) and 6.1.2 (minimum 1 DDR per RE footprint) to the end of the list. In that way the Requirements for 6.1.3 (Generation resources), 6.1.4 (Flowgates, etc…), 6.1.5 (HVDC), 6.1.6 (IROLs) and 6.1.7 (UVLS) will be stated up front as non-negotiable Requirements, and state that additional DDR locations are only needed if fulfilling the first 5 Requirements does not meet the two extra minimum quantities Requirements.
Yes

No
1. Extend the GO 100% requirement to 6 years because it better matches the typical major unit overhaul schedule for the large units and plants that this standard targets. 2. Clearly state that the TO / GO has 3 years to attain 100% for any newly identified locations in the five year review.
We request the SDT to make the following changes: 1. The Requirements of R3, R4, R5 and R12 for SER and FR data should be included as part of a single attachment/ table and R3 should simply reference the table. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation multiple Requirements. 2. Similar to 1) above, Requirements R8, R9, R10, R11, and R12 for DDR data should be included as part of a single attachment/ table or possibly separate attachments/tables for TOs and GOs and referenced in a single Requirement. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation of multiple Requirements. 3. Provide at least one example in the Guidance Section, or develop a reference document similar to the BES Definition effort. A system one line similar to BES Definition Reference Figure S1-1 augmented with circuit breakers in various configurations (e.g. straight bus, ring bus, breaker-and-a-half). The drafting team could go through the various Requirements to demonstrate the SDT intentions. Although the present guidance and rationale are helpful, we believe there are still many unclear aspects to these Requirements. 4. Add ‘by voltage level’ in Requirement R1 so that it reads ‘Each Transmission Owner shall identify BES bus locations by voltage level for Sequence of Events Recording (SOER) and Fault Recording (FR).’ This is consistent with Attachment 1, Step 1 and clarifies that the FR and SOER are only required at that voltage level. 5. In Requirements R1.2 and R 6.2, what prevents a TO or RE from assessing the locations and elements on too frequent of a time basis? As written, it provides no clause to prevent excessively short re-assessment periods. There should be some minimum time (say several years) between assessments to provide stability in where monitoring is really needed. Frequent assessments could jockey locations above and below the minimum criteria line and create confusion. 6. In Requirement R2, it infers that the TO as part of Requirement R1 develop a list of Elements;, however, Requirement R1 requires the TO only to determine BES bus locations. If it was the intent that the TO determine the specific Elements, we suggest Requirement R2 be reworded to say “Each transmission owner shall identify BES Elements at the bus locations established in Requirement R1 and shall notify…”. If it was the intent that the GOs (and other affected TOs) to determine which BES Elements they own at the bus locations, then do not require that the TO identify the BES Elements, instead let the owners of those Elements identify their Elements. Time has to be allotted to allow identifying the Elements at the BES bus locations. Element ownership sometimes changes between the two terminals of an Element, so this needs to be addressed. GO and TO are each concerned with the unwarranted cost burden this standard proposes, and there will be disputes as to cost responsibility. 7. Use a consistent footer (pages 18 through 40 say Draft 1), and number the pages throughout (they stop at page 25 of 40). 8. Clarify the intent of Requirement R3 which we believe is unclear. The drafting team may intend that a breaker auxiliary contact be connected to the SOER to provide circuit breaker position. Page 32 Guideline for Requirement R3 last sentence implies that breaker status can be determined from the FR. However page 33 last sentence under Recording of Electrical Quantities suggest that these only augment the SOER. 9. Add ‘including generator interconnection facilities’ after Transmission lines in Requirement R4 to be consistent with page 32 Guideline and Project 2010-07. 10. In Requirement R5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the Requirement. We suggest Requirement R5.1 be reworded to say “A single record or multiple records that include at least one of the following:” 11. Reword Requirement R13 to ‘Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 shall provide data for those BES Elements to the Regional Entity upon request.’ The regions already have a process for collecting these types of data and can act as a clearinghouse if indeed the Reliability Coordinator and/or NERC need the exact same data. The reality is that all these entities will collaborate in the disturbance analysis if an event of this magnitude ever does occur. It is unreasonable to require the TO and GO to respond to duplicative data requests in such a short time. 12. Reword Requirement R14 to ‘Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 upon the discovery

of a failure shall: (a) Restore the recording ability within 120 calendar days; or (b) If recording ability is not restored within 120 calendar days, demonstrate efforts to correct the unresolved failure.' Please increase the allowed repair time by 30 days because the access of repair personnel to such equipment is often restricted during certain periods of the year. In addition; revise the second part to be consistent with the handling of Unresolved Maintenance Issues in PRC-005-2 R5. This change triggers an M14 part (3) change to "(3) if not repaired within 120 calendar days of discovery, evidence that it has undertaken efforts to correct the unresolved failure Issues in accordance with Requirement R14. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.' We believe that the proposed reporting requirement is much too burdensome for this equipment.
Individual
Angela P Gaines
Portland General Electric Company
No
Portland General Electric Company (PGE) appreciates the standard drafting team's efforts in crafting this proposed standard and understands the importance of the data that will eventually be available once the standard is implemented. However, a four (4) year implementation window may not be enough time if an entity is required by its Responsible Entity (in our case, the RC) to install several disturbance monitoring units. It is interesting to note that an entity that has only one element to implement has the entire 4 year window to do so. However, if an entity has 2 elements, for example, that entity does not get 8 years to implement but, in effect, has half the time. The more elements required to be implemented, the less overall time an entity has to do so. PGE suggests letting the RC develop an implementation timeframe based on the elements it determines an entity needs to install. Depending on the number of elements required, an entity would be considered compliant as long as it was meeting specified and agreed upon milestones. The triggering of the negotiated timeframes could be based on a pre-determined number of elements, i.e. >4, or on a business-justified request from the entity for an extended implementation window. To suggest that an entity is non-compliant because all necessary projects are not fully completed after a 4 year implementation window fails to distinguish between entities that have taken no action whatsoever and entities that have projects and activities in progress well ahead of the effective date of this proposed standard.

ReliabilityFirst
Yes
No
Requirement R1, Attachment 1 - ReliabilityFirst questions the rational to not require any Fault Recording and Sequence of Events Recording if there are no buses that fall on the list (i.e. an entity has no buses with maximum available calculated three phase short circuit MVA of 1500 MVA or greater). ReliabilityFirst believes to effectively recreate events using Fault Recording and Sequence of Events Recording data, Transmission Owners that have no buses on the list should still be required, at a minimum, to have at least one BES bus location with Fault Recording and Sequence of Events Recording. It could be required at least one BES bus location with the highest maximum available calculated three phase short circuit MVA. In order to achieve this, ReliabilityFirst

recommends the first sentence in Step 7 ("If there are no bus locations on the list: the procedure is complete and no Fault Recording and Sequence of Events Recording will be required. Proceed to Step 9."), be removed from the methodology. Also, even though ReliabilityFirst believes the template for determining Fault recorder and SOE bus locations is helpful, ReliabilityFirst recommends developing a step by step example detailing the locational selection methodology.
No
Applicability - ReliabilityFirst understands the rationale behind differentiating the Responsible Entity per Interconnection, but does not agree with ERCOT still stating "Planning Coordinator or Reliability Coordinator". ERCOT is both the Planning Coordinator and Reliability Coordinator so the SDT needs to decide which function in ERCOT will be responsible for determining DDRs to avoid any future confusion for monitoring compliance.
No
Requirement R6, Part 6.1.3.2 - For Requirement R6, Part 6.1.3.2 ("Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA), does this mean only individual units which are greater than 300 MVA and part of plant need to have DDRs? If this is the case, it appears that a plant that has five 200 MVA units does not require DDRs. Is this the SDTs intent? ReliabilityFirst believes any plant/facility that has an aggregate nameplate greater than 1000 MVA, should have equipment capable of DDR.
No
VSL for Requirement R3 (the same rationale in this comment also apply to the VSLs for Requirement R4,R5, R8, R9, R10 and R11) - ReliabilityFirst believes the gradation of VSLs should be in 10% increments (or similar to the VSL designations for Requirement R1). For example, if an entity only implemented 59% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers, this does not meet the intent of the requirement and therefore should be a "Severe" VSL.
Requirement R4, Part 4.2.1 - With the forthcoming approval of the NERC BES Definition including "Transformers with the primary terminal and at least one secondary terminal operated at 100 kV…", ReliabilityFirst does not believe the informative language in Requirement R4, Part 4.2.1 is needed and recommends removing the following language from Requirement R4, Part 4.2.1: "that have a low-side operating voltage of 100kV or above" since it serves no purpose. Requirement R14 - ReliabilityFirst does not believe there is any value for an Entity to report their inability to record data (due to a failure of a FR, SOER or DDR) to the Regional Entity. ReliabilityFirst believes the record keeping will be burdensome with little or no benefit. ReliabilityFirst would rather like to see the Entities get the corrective actions plans in place and the equipment fixed, thus the Regions really have no need for this type of report. Compliance can be monitored through a data submittal on an annual basis rather than an ongoing reporting requirement. Also, even though a bulleted list in a Reliability Standard indicates an "or" statement, it is still unclear that these are considered two options. ReliabilityFirst recommends adding the word "either" after the word "shall" in the parent Requirement R14 and including the word "or" after the word "ability" in the first bullet. ReliabilityFirst also recommends the following to remove the Regional Entity from the second bullet and adding a timeframe for when the CAP needs to be completed (it should not be open ended): "Develop and implement a Corrective Action Plan (CAP) to restore the recording ability within xx days." Also, the CAP should not have an open-ended timeframe for completion, such as years into the future. There needs to be some time limit for correction.

To maintain parallel structure in the definition of Dynamic Disturbance Recording (DDR) we suggest changing 'abnormal voltage problems' to 'abnormal voltage deviations'. The acronym for Fault Recording (FR) may be confused with that of Frequency Response as has been previously defined in BAL-003. Would it be prudent to change one or the other? Insert 'which' in the next to last line of

the Rationale Box such that it reads '...proliferation of multiple function devices, and the intent of the Standard which is to address the result, not the how...'
Yes
Insert an 'a' in the 6th line of the 2nd paragraph of the Rationale Box such that it reads '...have a significant effect on system reliability and performance. Conversely, locations with a very low short...' We suggest the drafting team watch for consistency in the use of the adjective 'three-phase' throughout all the posted documents. Make sure it is properly hyphenated.
Yes
We thank the drafting team for deleting the Reliability Coordinator as an Applicable Entity in the Eastern Interconnection.
No
Requirement R6.1.3.2 requires DDR for all generating units greater than 300 MVA at a plant/facility with an aggregate nameplate rating equal to or greater than 1000 MVA. Does this apply in situations where the generating units may be connected at different voltage levels within the plant/facility? Especially those which may not even be tied together within the plant/facility? Requirement R6.1.4 requires DDR for all permanent Flowgates within the Eastern Interconnection. We believe this requirement is troublesome for several reasons. First, Flowgates can be added on the fly in Real-time. Although these Flowgates are at that time temporary, they can become permanent at the end of the month in which they were created in the Book of Flowgates. Thus a Transmission Owner would then be responsible for having DDR equipment on that Flowgate within less than 30 days. This is an unreasonable request. Additionally, most Flowgates are thermally limited and not all of them represent facilities which have a significant impact on the BES. They may have been created to address localized loading issues. As such, requiring these facilities to be monitored by DDR equipment is excessive and does not contribute significantly to the reliability of the BES. On the other hand, there may be other Flowgates which do consist of or represent facilities which can have a tremendous impact on the BES. Some of these Flowgates are there specifically to address voltage stability and dynamic system stability issues. These facilities need to be monitored by DDR equipment. The difficulty becomes determining which Flowgates fit the latter category. The drafting team needs to put some effort into determining the criteria to use in deciding which Flowgates are worthy of DDR monitoring.
Yes
We note in several of the Severe VSLs that quantifiers of greater than 0% but less than 10% are used. However, in Requirement R11, the quantifiers are greater than 1% but less than 10%. Was the 1% intended or should it have also been 0%?
Requirement R2 calls for Transmission Owners to notify other owners (who would also be Transmission Owners) of other facilities within the locations identified in Requirement R1. There could conceivably be situations where multiple owners would be involved and possibly none of the owners was able to identify 11 locations as specified in R1. In this situation, those particular facilities would not be required to have SOER or FR equipment even though the impact of those facilities could be significant on the BES. While this situation may be very unlikely to occur, it is still a possibility. In Requirement R2 and its associated Rationale Box as well as throughout the posted documents, check for hyphenation of terms such as 90-calendar days, 60-calendar days, 30-calendars days, etc. In the Rationale Box for R8 modify the single-line, paragraph to read 'Because all of the buses within a location are typically at the same frequency, one frequency measurement is adequate.' In the 1st paragraph under the Guideline for Requirement R1 section in the Guidelines and Technical Basis, modify the next to last line to read '...voltage and current for individual circuits allow precise reconstruction of events of both...'. Check the usage of wide-area and make sure it is properly hyphenated throughout the standard and the posted documents. Something appears to be missing in the 2nd sentence in the last paragraph under the Guideline for Requirement R1 section in the Guidelines and Technical Basis. 'Five years is long enough to avoid unnecessary, but long enough to adapt...'. To avoid unnecessary what? In the 1st line of the 2nd paragraph under the Guideline for Requirement R5 section in the Guidelines and Technical Basis, change 'Pre and post...' to 'Pre- and post-...'. In the 2nd line of the same paragraph, change 'SOE' to 'SOER'. In the 6th and 8th lines of the same paragraph, hyphenate '50-cycle post trigger'. In the 2nd line of the 4th paragraph under the Guideline for Requirement R5 section in the Guidelines and Technical Basis,

replace ‘Oscilloscope’ with ‘oscilloscope’. In the 7th line of the 4th paragraph under Guideline for Requirement R6 section in the Guidelines and Technical Basis, modify the line to read ‘…interfaces are defined by the Regional Entity. In the ERCOT and Quebec Interconnections, the…’. In the Guidelines for Requirement 7 and Requirement 12 in the Guidelines and Technical Basis, the reader is referred to the Rationale Boxes in the standard for the information on those requirements. Once the standard is approved, the Rationale Boxes will disappear. We suggest going ahead and inserting the material from those boxes here even if it is redundant. In the 1st line of the 1st paragraph under Guidelines for Requirement R8, revise the line to read ‘Dynamic Disturbance Recording measures transient response to system disturbances after a fault is…’. In the 3rd line of the 1st paragraph under Guidelines for Requirement R10, revise the line to read ‘…analysis. Pre- and post-contingency data help identify the causes and effects of each event…’. Modify the 1st line of the 1st paragraph under Guidelines for Requirement R11 to read ‘Dynamic Disturbance Recording contains the dynamic response of a power system to a…’ or ‘Dynamic Disturbance Recording contains the dynamic response of power systems to a…’. In the 3rd line of the same paragraph hyphenate ‘short-term’ and ‘long-term’. In the 4th line of the same paragraph delete the ‘the’ such that the line reads ‘…interest is changing over time, Dynamic Disturbance Recording is normally stored in the…’. We suggest the following to replace the 1st sentence in the 1st paragraph in the Guideline for Requirement R13: ‘This requirement directs the applicable entities, that upon requests from the Reliability Coordinator, Regional Entity or NERC, to provide SOER and FR data for locations determined in Requirement R1 and DDR data for Elements determined in Requirement R6. Replace ‘was’ with ‘were’ in the 4th line of the 6th paragraph in the Guideline for Requirement R13 section of the Guidelines and Technical Basis. We suggest the drafting team number the pages in Attachment 1 and the Guidelines and Technical Basis document.

Agree
AECI Supports comments posted by SERC PCS In addition, AECI particularly questions the value and technical rationale for citing all permanent flowgates. There are several types of permanent flowgates, and not all would correlate to the BES Reliability purpose to warrant DDR measurements at either end. Is it this SDT's intent to move the Eastern Interconnection away from flowgate methodogy for assessing impact and capacity for commerce across its bulk transmission system? If the other specified technical assessments have merit, then busses terminating any flowgates significant for DDR will show up.

City of Austin dba Austin Energy
No
City of Austin dba Austin Energy (AE) believes that the proposed PRC-002-2 standard is overly prescriptive and provides unnecessary requirements that are already addressed by Regional rules, guidelines, requirements, etc. For example, ERCOT has requirements for installing Disturbance Monitoring Equipment (DME) that may address more specific regional needs, considering ERCOT system characteristics. Additionally, AE believes the standard, as proposed, would be costly to implement.

No
CenterPoint Energy understands the potential usefulness of dynamic data for event analysis and supports the collection of dynamic data for event analysis as a Best Practice. However, the Company's experience has been that sufficient data for event analysis is available from existing fault recording devices and therefore is strongly opposed to inclusion of a requirement to provide dynamic data. The only way to provide dynamic data is through a dynamic recording device. If an entity does not currently have any dynamic recording devices installed on its system then the entity has little choice but to spend capital in order to acquire and install these devices to comply with the Requirement. CenterPoint Energy does not believe the enabling legislation allows for Reliability Standards to require the expenditure of capital funds. While the SDT contends the requirement is only for dynamic data, not the installation of dynamic recording devices, and an entity is free to determine how it will comply, CenterPoint Energy finds this argument disingenuous. CenterPoint

Energy strongly recommends the deletion of this requirement. The Company cannot support any draft Standard that contains such a requirement.
No
CenterPoint Energy is concerned the proposed Implementation Plan does not allow sufficient time for entities to make arrangements with other entities or, if needed, to install required devices or communication devices. Based on Requirement R6 the ERCOT Region would require approximately 18 – 20 DDR's and several times that amount of SOER's. The installation of DDR's and SOER's would require scheduling outages on possibly hundreds of pieces of equipment. The scheduling and coordination of this amount of planned outages is simply not possible within the allotted timeframe. CenterPoint Energy recommends expanding the Implementation Plan to three to five years.
1. CenterPoint Energy believes the intent of some of the requirements is unclear without the corresponding Rationale box. It is our understanding that auditors may consult the rationale and other information to be placed in the Application Guidelines section; however, auditors must always refer to the requirement language. Therefore, the language of the requirements should clearly explain the intent of the requirement with less reliance on the Rationale boxes. For example; Requirement R13.2 should identify the data retrieved as only the data measured within 10 days preceding a request. Recommend modifying Requirement 13.2 to read "Only recorded data measured and recorded within 10 days prior to a request will be retrievable." The Rationale box for R13 clarifies the intent of the requirement; however the language should be more specific. The language for requirement R14 should explicitly identify the sub-bullets as an "or". Furthermore, CenterPoint Energy recommends modifying the second bullet of Requirement R14 to read "If the recording ability cannot be restored within 90 days, report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability."

The R6.1 sub-requirement describes minimum locations. There are no limitations on the DDR requirements written into the standard language. This could potentially lead to the Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) overburdening the TO/GO with the volume of included locations. The language in R1 provides a “20%” audit curtailment for the FR/SOER but there is no similar language for the DDRs in R6.
Yes
Yes
General: Oncor identified several instances where the Rationale Boxes provided much needed clarity to the Requirement itself. It is understood the Rationale Boxes will be retained but relocated to the Application Guidelines Section of the Standard. However, incorporating the Rationale/intent language into the Requirement itself would further clarify the Requirements resulting in a clear and mutual understanding for both the Registered Entity and the auditor(s). Therefore Oncor recommends the Standard Drafting Team review the Requirement language and the corresponding relocated Rationale language to ensure there are no gaps once moved to final state. Additional details provided below. R1: To clarify the line/bus distinction, Attachment "BES Sketches - Facility Example & Boundary Definitions" should be added to the Standard. R2 and R6.2: The Implementation Plan includes specific references to timeframes for becoming fully compliant with the locations lists, but the Requirement language itself does not include post-implementation compliance timelines for the required reassessments. The Implementation Plan states "Entities shall be 100% compliant with a reassessed list from Requirement R1, Part 1.2 or R6, Part 6.2 within three (3) years following notification of the list." This language should also be included in the language of the affected Requirements to prevent any disparity following the initial implementation and departure from the Implementation Plan. R3: Legacy FR equipment installed before the standard effective date may not be capable of embedded SOER. R3 does not afford the same caveat for older equipment where SOER is required that R10 provides for older equipment where DDR is required. Language should be added to R3 providing the option to utilize FR digitals to monitor circuit breaker position for each circuit breaker. R4 and R8: Add Rationale box stipulation that the required “electrical quantities, whether directly measured or derived,” to R4 and R8 as described below: The R4 Rationale Box explains the method of deriving electrical quantities; however, the requirement language of R4.1 does not reflect the intent described in the Rationale Box. Specifically, whether or not locations where busses are effectively tied together, such as on ring or breaker-and-half bus configurations, can derive the required phase-to-neutral voltages by monitoring a minimum of two of each phase-to-neutral voltages, from either line terminal or bus potentials. In a typical large switching station, this could eliminate costly retrofits to literally provide all three phase-neutral voltages for “each line or bus.” The language of R8.3 does not specify the method used to provide “Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required.” If the intent follows the electrical quantity collection of R4, the language of R8 should also specify the ability to derive electrical quantities. Allowing calculated power flow would prevent costly retrofits to literally provide 6 dedicated analog traces for each Element required to have a DDR. R10: The language of R10 could be interpreted to mean the triggering requirements are only applicable to DDR equipment installed prior to the effective date of the standard. The triggering requirements are applicable to all DDR equipment. Additionally, the collection of 3-minute FR records for every transient event as a substitute for a DDR is a costly modem transfer and storage retention practice. R11: If relays meet the requirement of a DDR, the language of R11.1 or M11 should specify that synchrophasor data is acceptable for DDR analysis. R12: The language of R12 should provide a caveat to allow for manipulating event records to UTC

for equipment that is synchronized but cannot time-stamp with UTC as the reference. This would be similar to the “or derived” language suggestions to Requirements R4 and R8 which would allow for legacy equipment to meet the standard as well as allow for the time-alignment for multiple FR/SOERs as M12 evidence. Additionally, Rationale box language, further explaining the UTC local offset, should be included in M12 to clarify that offset records are acceptable as evidence. In other words, requested records must be supplied in UTC format, but the stored format does not need to adhere to UTC format. R13: Some entities do not automatically name files in the COMNAME format for ease of data storage. With the phrase “formatted records,” M13 implies that manipulation of file before submittal is allowed. If data file names can be changed to the prescribed COMNAME formatting, R13.5 should specify that the data files need only be provided in this format rather than originally named this way.

No
BPA feels the definitions are not succinct enough to explain to someone exactly what it is they’re being required to do.
Yes
No
BPA feels that responsible functional entities — as well as roles and responsibilities — must be clearly identified in the Standards and requirements. As the Standard is currently written, BPA feels that too much credence is given to assumptions outlined in the Standard and, unless clearly defined, these assumptions will not pan out as described.
No

a) BPA feels there should not be a requirement to monitor all elements of a path/interface/IROL when three of five lines can supply enough understanding (used in conjunction with other DME); and b) The IROL should be determined by Planning Criteria, not by a dynamic/ever-changing IROL.
No
BPA feels that R6 should remove “x percent” of the identified Elements (or Busses) and keep the time-based VSL.
Yes
A. Introduction 4. Applicability 4.1 The Responsible Entity is: BPA feels that under this section planning coordinators and reliability coordinators are named as the responsible entities which are later tasked with determining the necessary locations for dynamic disturbance recording equipment. This was one of the primary issues with the previous version of the standard, PRC-018. These entities failed to write such standards and therefore the standard lacked the necessary content for transmission and generation owners to apply. This basis will face similar challenges. Additionally this delineation of the responsible Entity takes authority away from the TOs and GOs to operate their monitoring systems in a way that makes good financial and operational sense for their individual companies. This definition should also be expanded to include Transmission Operators and Generation Operators. B. Requirements and Measures R1. BPA feels the substance of this section is based on the Attachment 1, which is later labeled as Attachment A, so it is on that section that comments shall be provided. The methodology presented in Attachment 1 is overly complex and does not present a sound technical basis for the location of DFRs and SERs. Monitoring locations above 1500MVA are subject to selection based on mathematical manipulation for which no system impact basis is provided. A final step of “engineering judgment” is then applied in order to round out the list. This methodology may not result in consistent or repeatable bus selection for the placement of DFRs and SERs and will be difficult to defend in an audit scenario. This use of an MVA based location criteria is not consistent with other system impact based criteria currently being used within the NERC standards, such as CIP-002-4 & 5, nor with draft versions of the WECC disturbance monitoring standard. R2. BPA feels this requirement places a compliance burden on the Transmission and Generation owners for equipment over which they have no control. TOs and GOs might be responsible for bus identification and notification of other entities with interconnections to those busses but the identification of individual BES elements and the associated compliance burdens should be left to those with operational responsibility for those elements. R3. BPA feels this requirement refers to R2 in the text I believe this reference should be to R1 as R2 does not define bus locations. R4. BPA feels that this requirement needs to be clarified. Specifically, BPA feels that not all line voltages are required if there is no bus (with two lines minimum). R5. BPA feels that in sections 5.1 and 5.2 specific record lengths and sample rates are delineated. The standard goes too far in mandating equipment specification for the Transmissions and Generation owners. The development of equipment specification must be left to the individual owners and operators in order for them to effectively balance cost and operational requirements. R6. BPA feels the responsibility for the sighting of DDRs should be assigned to the Transmission/Generator Operator/Owner not the reliability coordinator. The Operator/Owner must be left to identify BES elements which require dynamic disturbance recording equipment. This may be easily and consistently accomplished through the application of bright line criteria. The criteria provided in 6.1 are insufficient. The criteria do not account for operating voltage or equipment such as series capacitor installations which could contribute to sub synchronous resonant situations. A comprehensive set of bright line criteria for DFRs, SERs, and DDRs must be developed. These criteria should be consistent with similar criteria used in other NERC and industry standards. Any list of locations which is delineated by a Responsible entity must be subject to some adjustment by the affected TO or GO. R7. BPA feels the Transmission/Generation Owner/Operator must be responsible for the identification of locations which require DDRs not the Reliability Coordinator. Only in this manner may the individual TOs and GOs achieve visibility of their own systems. R14. BPA feels the requirement needs to clearly indicate that it is an “OR” distinction between the two bullets. So that one-hour or one-day equipment reporting and corrective action plan is not required at the time of discovery, but rather (as is intended) only after 90 days of failure.

No
No
No
Yes
As shown in the VRF levels (all "lower"), we do not believe that there is sufficient reliability justification to make this a standard.
No
Thank you standard drafting team for all of your efforts. We believe that all of the disturbance monitoring equipment referenced in this standard can be very helpful to an organization. We do not believe that it has a reliability impact that merits the cost in time and money to install, maintain, and report on all these devices as specified in the standard. As shown by the VRFs this does not highly impact reliability and although disturbance monitoring is something that could be useful, at times, should not be part of a mandatory standard. If a standard is to be implemented, we view the approach as written, to be too broad and cumbersome. We would recommend that a technical criteria based on system configuration be established to identify critical points for disturbance monitoring (DM) and that DM be implemented at those locations. We believe a more focused and technically based approach to placement of DM equipment would yield higher benefits while eliminating unnecessary and undesirable impacts.
Individual

Xcel Energy
Yes
Yes
We believe the "Responsible Entity" should be consistent across the Interconnections. We recommend changing this to be the Reliability Coordinator for all Interconnections.
Yes
We agree, however some clarity should be added: 1) In R6, mention is made of both Elements and locations for locating DDR. Is the intent to have the location be an entire substation, an entire bus, or a single Element? Or is that entirely at the discretion of the Responsible Entity? 2) R6 refers to generating resources with individual nameplate capacities. For a combined cycle plant, does the individual nameplate capacity of the resource refer to the combined unit or the individual turbines? Recommend making this more clear. 3) Is the list in R6 intended to be an all-inclusive list or is it a minimum list? If it is a minimum list, there is a concern that the standard may allow one entity to put increased costs on another entity, for example a Reliability Coordinator that wants a DDR on every generator, regardless of size. We ask the drafting team work to address this issue. We recommend that the drafting team determine the list of places that need a DDR and redraft the requirement to eliminate the responsible entities of the RC and PC and instead just require the owner of elements that meet the specifications install DDRs.
No

1) Our concern with the implementation plan is that its milestone requirements are significantly different from requirements for similar equipment in PRC standards that are now awaiting final FERC approval. Specifically, PRC-019, PRC-024, & PRC-025 involve the same facilities and all have 5 year implementation plans (with some caveats). Yet the implementation plan for PRC-002 is 4 years. When entities are considering work planning and execution, it would be more efficient to provide an implementation schedule that allows 'campaigns' at generation facilities to address all of the protective system equipment changes due to the suite of PRC standards under one maintenance project. (This is especially critical when considering this work will likely require an outage.) Therefore, Xcel Energy recommends PRC-002 utilize the same phased in schedule as PRC-019, PRC 024 and PRC-025. At a high level, the modification would be to change the implementation plan to: [Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13: -Where determined by the Generator Owner, Transmission Owner, or Distribution Provider that additional equipment is not necessary, the first day 60 months from notice of applicability of R1 or R6. -Where determined by the Generator Owner, Transmission Owner, or Distribution Provider that additional equipment is necessary, the first day 84 months.] 2) Finally, the standard is written such that the requirements are phased in over time. However, there is no period identified for the TO or GO to become compliant after any change in the points identified. As an example, in 2020, if the TO determines in R1 that a new point needs a device, R2 allows them 90 days to notify the owner of that equipment. Yet, for R3, R6 and R7 there is no established period of time for the TO or GO to make such an installation. We recommend the drafting team add in an implementation period for newly identified points beyond the immediate phased-in implementation of the standard.
1) It appears that a lot of individual requirements are written for something that isn't overly complex. Please consider consolidating R8-R11, or consolidating the technical specs that comprise R5, R11, and R12. 2) In R14, its not clear why the Regional Entity is introduced here. Also, the Regional Entity would take on the burden of tracking corrective action plans, if the recorder isn't restored in the 90 day period. Recommend changing Regional Entity to Reliability Coordinator.

Western Area Power Administration
Lloyd A. Linke
Yes
Yes
Would like more information as to how the 1500 MVA value was decided upon.
Yes
No
DDR installations have been resource intensive and problematic to install and to place on-line. Section 6 opens the door for quite a number of DDR deployments. Section 6.1.4 requires the monitoring of all Elements of major transfer paths on the Western Interconnection. Utilities in the Western Interconnection have already participated in WECC's WISP program and have installed and commissioned DDR's as required. DDR deployment per WISP should be considered sufficient in the WECC footprint.
Yes
Yes
Overall, the implementation program appears reasonable. However, the work involved is linked to the requirements of the standard which could possibly change. The requirements of R6 may be difficult to meet as written. See comments under Question 4.
Section 5.3 – Disagree with the trigger requirements as written. There are many factors that contribute to effective triggering such as: • Triggering for local vs. remote faults • Avoiding over-triggering that could result in "information overload" and the filling up of data storage • Capturing relevant and complete fault representation The requirements stated are inadequate. It is felt that trigger settings are best left to the professional judgement of the relay engineer. While triggering on

Neutral (residual) overcurrent is often standard, care must be taken regarding the sensitivity level. Similarly, triggering issues related to sensitivity and pickup time are associated with phase undervoltage triggering. Other triggering methods (such as based on protection element pickup) may be preferred instead of undervoltage methods. Section R13 – the requirements of R13.4 and R13.5, while achievable, are somewhat archaic. More flexibility should be allowed for frequently used, industry standardized fault recording formats such as SEL event records. Also, the naming convention put forth in C37.232 is not the easiest to follow.

Consideration of Comments
Project 2007-11 Disturbance Monitoring

The Disturbance Monitoring Drafting Team thanks all commenters who submitted comments on the SAR. These standards were posted for a 45-day public comment period from November 1, 2013 through December 16, 2013. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 76 sets of comments, including comments from approximately 205 different people from approximately 157 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration

In response to numerous comments, the SDT has agreed to remove the proposed definitions from the draft standard. The SDT received a comment to revise and use the existing term Disturbance Monitoring Equipment (DME) instead. The SDT has developed the standard to focus on data rather than equipment. The SDT considered revising or retiring the defined term, DME. The SDT reviewed the body of NERC Standards and found the only reference to DME is in PRC-002-1 and PRC-018-1 which will both be replaced by PRC-002-2 upon its approval, and decided to leave the definition as is. The draft standard includes requirements for sequence of events recorder (SER) data, fault recorder (FR) data and dynamic disturbance recorder (DDR) data.

The comments received regarding the methodology in Attachment 1 were directed at Requirements R1 and R2, and Attachment 1. Comments were specifically addressed at explaining "location", station configurations, and equipment ownership. The Drafting Team intended that the bus location be the bus location identified in a system study, and further identifies it in Attachment 1 as "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." There are cases where buses contain Elements that the Transmission

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Owner does not own. In these instances, the Transmission Owner identifies the bus and then notifies the owners of any Elements that it does not own.

Comments were received on the selection of the Entities identified in the Applicability Section. The PC and RC are included because they have an overall view of the BES to be what BES Elements need to be included for DDR. Responsible Entity was used by the SDT to reflect the fact that the Planning Coordinator and Reliability Coordinator have different functions across the continent. Comments were received that pointed to the hardware for capturing data. This standard is not about "how" the data is captured, but "what" data is captured. The need for generator data was questioned. During wide-area or slowly evolving disturbances, generator reaction is crucial to the reconstruction and understanding of an event.

The comments received regarding Requirement R6 (now R5) indicated that stakeholders believed the requirement demanded DDR data capture on an excessive number of BES Elements. The SDT revised the requirement to address these comments by:

- Instead of monitoring all Elements of IROLs, monitor one or more
- Instead of monitoring all Elements of permanent Flowgates and transmission interfaces, monitor "Any one BES Element associated with major transmission interfaces…"

The Parts/sub-Parts of what is now Requirement R5 were rearranged for clarity.

The concerns of most of the comments received regarding the Implementation Plan were directed at the length of time required for implementation of Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10), and R13 (now R11). The schedule for implementation is now to be at least 50% compliant within three (3) years following notification of the list, and 100% compliant within five (5) years following notification of the list. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within five (5) years following notification of the list.

Based on stakeholder comments, the DMSDT made significant revisions to PRC-002-2 including:

- Combined Requirements R1 and R2.
- Combined Requirements R6 and R7.
- Removed references to "equipment" and specified data requirements for FR, SER and DDR.

- Removed references to “locations” and replaced “bus” with “BES bus”
- Updated rationales with clarifications and more general information for each requirement.
- Revised Requirement R6 (now R5) for more clarity regarding DDR data requirements.
- Revised the VSLs to conform to the revised requirement language.
- Added language to the Guidelines and Technical Basis section of the standard.

Index to Questions, Comments, and Responses

The Industry Segments are:

1 — Transmission Owners

*** Comments submitted after comment period closed.**

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

Summary Consideration: The Standard Drafting Team (SDT) thanks the entities below for indicating their participation in other entities' comment submissions. The posted Requirement R6 (revised to what is now number R5) was revised to reflect comments received addressing dynamic disturbance recording data which included Flowgates.

Organization	Agree	Supporting Comments of "Entity Name"
Associated Electric Cooperative, Inc. - JRO00088	Agree	AECI Supports comments posted by SERC PCSIn addition, AECI particularly questions the value and technical rationale for citing all permanent flowgates. There are several types of permanent flowgates, and not all would correlate to the BES Reliability purpose to warrant DDR measurements at either end. Is it this SDT's intent to move the Eastern Interconnection away from flowgate methodology for assessing impact and capacity for commerce across its bulk transmission system? If the other specified technical assessments have merit, then busses terminating any flowgates significant for DDR will show up.
Consolidated Edison Co. of NY, Inc.	Agree	NPCC

Organization	Agree	Supporting Comments of “Entity Name”
Cowlitz PUD	Agree	FMPA's comment submitted by Frank Gaffney
Luminant Energy Company LLC	Agree	Luminant Generation Company LLC
Occidental Chemical Corporation	Agree	Ingleside Cogeneration, LP
South Carolina Electric and Gas	Agree	SERC PCS

1. **Do you support the new definitions for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording? If not, please explain why and provide suggested changes.**

Summary Consideration In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard. The DMSDT also received a comment to revise and use the existing term Disturbance Monitoring Equipment (DME) instead. The DMSDT has developed the standard to focus on data rather than equipment, and considered revising or retiring the defined term, DME. The DMSDT reviewed the body of NERC Standards and found the only reference to DME is in PRC-002-1 and PRC-018-1 which will both be replaced by PRC-002-2 upon its approval, and decided to leave the DME definition as is. The draft standard includes sequence of events recording (SER) data, fault recording (FR) data and dynamic disturbance recording (DDR) data.

Organization	Yes or No	Question 1 Comment
ACES Standards Collaborators	No	We do not support the proposed definitions because these seem to be straightforward and understandable without proposing additional glossary terms. The Standards DMSDT Guidelines, dated April 2009, states: “The DMSDT should avoid developing new definitions unless absolutely necessary. There is a glossary of terms that has been approved for use in reliability standards. Before a DMSDT adds a new term, the team should check the latest version of the Glossary of Terms for Reliability Standards to determine if the same term, or a term with the same meaning, has already been defined. If a term is used in a standard and the term is defined in a collegiate dictionary, then there is no need to also include the term in the NERC Glossary of Reliability Terms. The addition of an adjective or a prefix to an already defined term should not result in a new defined term. It is very difficult to reach consensus on new terms. If a simple phrase can be used in a standard to replace a new term, then the DMSDT should consider using the phrase rather than trying to obtain stakeholder consensus on the new term.”

Organization	Yes or No	Question 1 Comment
		We do not see how these proposed terms are “absolutely necessary.” Please provide a rationale why other approaches could not be taken.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard. DME (Disturbance Monitoring Equipment) is in the NERC Glossary. The DMSDT reviewed the body of NERC Standards and found the only reference to DME is in PRC-002-1 and PRC-018-1 which will be replaced by PRC-002-2 upon approval. The DMSDT decided to leave the DME definition as is in the NERC Glossary.		
Bonneville Power Administration	No	BPA feels the definitions are not succinct enough to explain to someone exactly what it is they’re being required to do.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		
Florida Municipal Power Agency	No	Please see response to question 7.
Response: Please see the DMSDT response to question 7.		
Hydro One Networks Inc.	No	The definition for SOER optionally includes protection devices and only mandates the monitoring of the status of Elements. This is reinforced by R3 which only dictates the recording of circuit breaker position. The purpose of the standard is to “have adequate data available to facilitate analysis of BES disturbances”. We don’t see how any comprehensive analysis of disturbances can be done in the absence of protection device information. At least some basic protection information is integral in disturbance analysis.
Response: The DMSDT believes that having SER and FR data as specified in the current draft of the standard is sufficient for understanding the nature of a large scale power system disturbance and for effective post-event analysis. NERC’s Event Analysis		

Organization	Yes or No	Question 1 Comment
group reviewed and agreed with this approach proposed by the DMSDT. Having precise information on sequence of operation of protection equipment may be of interest for detailed analysis of protection system performance. Having such capability is a technical and business decision that is left up to the individual Entities to make.		
New York Power Authority	No	The definition for SOER optionally includes protection devices and only mandates the monitoring of the status of Elements. This is reinforced by R3 which only dictates the recording of circuit breaker position. The purpose of the standard is to "have adequate data available to facilitate analysis of BES disturbances". We don't see how any comprehensive analysis of disturbances can be done in the absence of protection device information. At least some basic protection information is integral in disturbance analysis.
Response: The DMSDT believes that having SER and FR data as specified in the current draft of the Standard is sufficient for understanding the nature of a large scale power system disturbance and for effective post-event analysis. NERC's Event Analysis group reviewed and agreed with this approach proposed by the DMSDT. Having precise information on sequence of operation of protection equipment may be of interest for detailed analysis of protection system performance. Having such capability is a technical and business decision that is left up to the individual Entities to make.		
Northeast Power Coordinating Council	No	The definition for SOER optionally includes protection devices and only mandates the monitoring of the status of Elements. This is reinforced by R3 which only dictates the recording of circuit breaker position. The purpose of the standard is to "have adequate data available to facilitate analysis of BES disturbances".

Organization	Yes or No	Question 1 Comment
		We don't see how any comprehensive analysis of disturbances can be done in the absence of protection device information. At least some basic protection information is integral in disturbance analysis. We could support the definitions as used within this standard but do not support using the abbreviations SOER (or SER or SOE), FR (or DFR) and DDR as defined NERC Glossary abbreviations. These acronyms have been used by the industry for many years to label recording equipment. When industry experts and engineers refer to a FR (or a DFR) they mean the equipment, a digital fault recorder, not a particular type of recorded measurement data. Same is true for SOER (or SOE or SER) and DDR. Since this is a data standard, strong consideration should be given to using the word "data" in place of the word "recording", such as Dynamic Disturbance Data, Fault Data and Sequence of Events Data with acronyms of DD, FD and SD. Also the definition of SOER presently uses the phrase "... status of Elements, which may include protection and control devices." We recommend changing the word "Elements" to "circuit breakers" which is what is stated in R3. Also the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status.
Response: The DMSDT believes that having SER and FR data as specified in the current draft of the Standard is sufficient for understanding the nature of a large scale power system disturbance and for effective post-event analysis. NERC's Event Analysis group reviewed and agreed with this approach proposed by the DMSDT. Having precise information on sequence of operation of protection equipment may be of interest for detailed analysis of protection system performance. Having such capability is a technical and business decision that is left up to the individual Entities to make. **In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.**		

Organization	Yes or No	Question 1 Comment
The DMSDT decided to use the acronyms SER for sequence of events recording, FR for fault recording, and DDR for dynamic disturbance recording. **The wording in Requirement R3 (now R2) has been revised for clarification.**		
Santee Cooper	No	We agree with the SERC PCS comments.
Response: Please see the response to the SERC PCS below.		
SERC Protection and Controls Subcommittee	No	The SERC PCS requests that the DMSDT to make the following changes: 1. Add 'balanced, three phase' between 'dynamic' and 'power' in order to clarify the context of Dynamic Disturbance Recording. Thus it would read 'The recording of time sequenced data for dynamic balanced, three phase power system characteristics such as power swings, frequency variations, and abnormal voltage problems.' 2. Also the definition of SOER presently uses the phrase "... status of Elements, which may include protection and control devices." We recommend changing the word "Elements" to "circuit breakers" which is what is stated in R3. Also the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status. 3. We do not support using the abbreviations SOER (or SER or SOE), FR (or DFR) and DDR as defined NERC Glossary abbreviations. These acronyms have been used by the industry for many years to label recording equipment.

Organization	Yes or No	Question 1 Comment
		When industry experts and engineers refer to a FR (or a DFR) they mean the equipment, a digital fault recorder, not a particular type of recorded measurement data. Same is true for SOER (or SOE or SER) and DDR. Since this is a data standard, strong consideration should be given to using the word "data" in place of the word "recording", such as Dynamic Disturbance Data, Fault Data and Sequence of Events Data with acronyms of DD, FD and SD.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard. The DMSDT decided to use the acronyms SER for sequence of events recording, FR for fault recording, and DDR for dynamic disturbance recording.		
SPP Standards Review Group	No	To maintain parallel structure in the definition of Dynamic Disturbance Recording (DDR) we suggest changing 'abnormal voltage problems' to 'abnormal voltage deviations'. The acronym for Fault Recording (FR) may be confused with that of Frequency Response as has been previously defined in BAL-003. Would it be prudent to change one or the other?Insert 'which' in the next to last line of the Rationale Box such that it reads '...proliferation of multiple function devices, and the intent of the Standard which is to address the result, not the how...'
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		
Tacoma Power	No	What is the purpose of the following clause in the definition of SOER: "...which may include protection and control devices"? Since the focus of

Organization	Yes or No	Question 1 Comment
		this definition is on recording, and not equipment, consider removing this clause.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		
Ameren	No	(1) Ameren also supports the SERC Protection & Control Subcommittee (PCS) comments and hereby includes them by reference rather than repeating them all.
Response: Please see the response to SERC PCS.		
American Electric Power	No	Sequence of Events Recording (SOER) - This definition should only specify functionality and *not* attempt to define scope. Instead, we suggest "The recording of time sequenced data for change in status of a monitored, binary value". Fault Recording (FR) - Again, this definition should only specify functionality and *not* attempt to define scope. Instead, we suggest "The recording of time-sequenced waveform data for a monitored analog value."
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		
Dairyland Power Cooperative (DPC)	No	R4. If information is required to be gathered for every transmission line connected to the bus, equipment may need to be installed to capture this information. The capital cost may be significant to some smaller TO's to install the FR equipment capable to capture this information. The DMSDT is encouraged to consider this fact in regards to this requirement and in the implementation plan.

Organization	Yes or No	Question 1 Comment
Response: The DMSDT notes that this is a data standard and that many entities may already have adequate data recording capability to meet the intent of the requirements. The standard calls for entities to analyze their systems and be able to provide data based on that analysis. The CEAP for this project was posted to collect industry cost data.		
Entergy Services, Inc.	No	1) Add "balanced three phase" between "dynamic" and "power" in order to clarify the context of Dynamic Disturbance Recording. The revised definition would be "The recording of time sequenced data for dynamic, balanced three phase power system characteristics such as power swings, frequency variations, and abnormal voltage problems." 2) The definition of SOER presently uses the phrase "... status of Elements, which may include protection and control devices." Recommend changing the word "Elements" to "circuit breakers" which is what is stated in R3. Also, the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status. 3) Recommend not using the acronyms SOER, FR, and DDR as defined NERC Glossary acronyms. These acronyms have historically been used by industry to label the recording equipment; therefore the same acronym should not be used when referring to the equipment's data.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard. **The DMSDT decided to use the acronyms SER for sequence of events recording, FR for fault recording, and DDR for dynamic disturbance recording. They will not be defined in the NERC Glossary.**		
N/A	No	The proposed definition of SOER indicates that it may include protection and control devices. However, R3 only specifies the recording of circuit

Organization	Yes or No	Question 1 Comment
		breaker position (open/close). The purpose of the standard is to "have adequate data available to facilitate analysis of BES disturbances." In order to permit for a comprehensive analysis of disturbances some basic protection device information is necessary and should not be optional in the definition. I suggest replacing "may include" with "includes."
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		
Wisconsin Electric Power Company	No	1. DDR definition: The phrase "abnormal voltage problems" is redundant. Suggest definition be changed to: The recording of time sequenced data for dynamic power system characteristics such as power swings, frequency variations, or abnormal voltage conditions. 2. SOER definition: Need to specifically identify circuit breakers, which are the primary Elements needed for SOER as indicated in Requirement 3. Suggest it be changed to: The recording of time sequenced data for change in status of Elements, particularly circuit breakers, and including other protection and control devices as needed.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		
City of Austin dba Austin Energy	No	

Organization	Yes or No	Question 1 Comment
Colorado Springs Utilities	No	
Dominion	Yes	We could support the definitions as used within this standard but do not support using the abbreviations SOER (or SER or SOE), FR (or DFR) and DDR as defined NERC Glossary abbreviations. These acronyms have been used by the industry for many years to label recording equipment. When industry experts and engineers refer to a FR (or a DFR) they mean the equipment, a digital fault recorder, not a particular type of recorded measurement data. Same is true for SOER (or SOE or SER) and DDR. Since this is a data standard, strong consideration should be given to using the word "data" in place of the word "recording", such as Dynamic Disturbance Data, Fault Data and Sequence of Events Data with acronyms of DD, FD and SD.Also the definition of SOER presently uses the phrase "... status of Elements, which may include protection and control devices." We recommend changing the word "Elements" to "circuit breakers" which is what is stated in R3. Duke Energy		Duke Energy recommends the following suggestion to the new definitions (1) Dynamic Disturbance Recording (DDR) -The recording of time sequenced data for dynamic power system analysis comprising characteristics such as power flow, and frequency and voltage excursions. (2) Fault Recording (FR) -The recording of time sequenced waveform data, such as current(s) and voltage(s), for short circuits or failure of BES Elements. 3) Sequence of Events Recording (SOER) -The recording of time sequenced data for change in status of BES Elements, which may include components of protection and control systems.
Response: In response to numerous comments, the DMSDT has agreed to remove the definitions from the draft standard.		

2. **Do you agree with the methodology in Requirement R1 that selects the BES bus location for Sequence of Events Recording and Fault Recording? If not, please provide technical justification.**

Summary Consideration: The comments received were directed at Requirements R1 and R2, and Attachment 1. Comments were specifically addressed at explaining "location", station configurations, and equipment ownership. The DMSDT intended that the bus location be the bus location identified in a system study, and further identifies it in Attachment 1 as "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." There are cases where buses contain Elements that the Transmission Owner does not own. In these instances, the Transmission Owner identifies the bus and then notifies the owners of any BES Elements that it does not own.

Organization	Yes or No	Question 2 Comment
ACES Standards Collaborators	No	We concur with the DMSDT's observation and rationale that there is no need to monitor disturbances for small systems in the same manner as large systems. However, we believe this standard should require an entity to generate its own methodology that identifies how it will determine locations to install Fault Recording and Sequence of Events Recording devices and supporting equipment and how often it will conduct these assessments. We feel the method proposed for selecting bus locations is too restrictive and could be subject to interpretation from auditors when not properly followed.
Response: The Purpose of PRC-002-2 is "To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances." From post 2003 Blackout event analysis, it was clear that the industry needed direction on what data needed to be		

Organization	Yes or No	Question 2 Comment
captured. This standard addresses that need. The methodology developed is consistent with good engineering principles and operational practice. The DMSDT constructed Requirement R1 to not have any fill-in-the-blank concerns. The Methodology uses readily available data that it is not overly restrictive.		
Corporate Compliance/Engineering	No	The document “Mapping of Standard’s Introduction of BOT Approved PRC-002-1 to Proposed PRC-002-2” from January 2013 described line terminals above 200 kV and large generators/transmission stations which warrant this level of data gathering, as they represent the backbone of the transmission system. It would be better to start with this system level first and test out data collection. For the sake of comparison, the approximate median value of the 11 highest (short circuit) MVA PSE buses where digital fault recorders are already in place, is 6800 MVA. Lowering to a short circuit MVA level of 1500-2500 MVA quadruples the quantity of collection sites.
Response: For the purpose of PRC-002-2, a minimum number of locations for SER and FR are required to facilitate sufficient coverage and data for analyzing large system events. Based on these concepts, the DMSDT developed a procedure included in Attachment 1 – SOER and FR Locations Selection Methodology (Attachment 1 has been renamed to Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data (Requirement R1)) that utilizes the maximum available calculated three phase short circuit MVA. Using this methodology helps ensure sufficient coverage while accounting for variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides flexibility in the selection process. The comparison provided indicates that the lower threshold would be 6800 MVA and not 1500 MVA.		
Florida Municipal Power Agency	No	Please see response to question 7.

Organization	Yes or No	Question 2 Comment
Response: Please see the DMSDT response to Question 7.		
Hydro One Networks Inc.	No	This requirement (and associated Attachment 1) requires some clarity before we can determine if we agree with the methodology. This may be a bit problematic with the BES definition not confined to busses. What is a BES bus location? Does this mean the entity gathers information on all fault levels for busses which contain at least one BES Element?
Response: The DMSDT intended that the bus location be the bus location identified in a system study, and further identifies it in Attachment 1 as "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." "Location(s)" was removed from Requirement R1, and its use in Attachment 1 revised for clarification.		
IRC Standards Review Committee	No	We agree with R1, but we do not see the need for R2 since through R1 and Attachment 1, each TO has already identified the bus locations that it owns for having Sequence of Events Recording (SOER) and Fault Recording (FR). There is not another owner(s) that a TO needs to communicate the list to, unless the "list of BES bus locations that it owns" depicted in Step 1 of Attachment 1 means only the location ownership but not the Element ownership. But if that is the case, then Step 1 in Attachment 1 needs to be clarified to distinguish the need for R1 and R2.
Independent Electricity System Operator	Yes	We agree with R1, but we do not see the need for R2 since through R1 and Attachment 1, each TO has already identified the bus locations that it owns for having Sequence of Events Recording (SOER) and Fault Recording (FR).

Organization	Yes or No	Question 2 Comment
		There is not another owner(s) that a TO needs to communication the list to, unless the "list of BES bus locations that it owns" depicted in Step 1 of Attachment 1 means only the location ownership but not the Element ownership. But if that's the case, Step 1 in Attachment 1 needs to be clarified.
Response: In Requirement R1 the TO may identify elements that it does not own and therefore Requirement R2 is required for those entities to be notified. Requirements R1 and R2 were combined into what is now R1 as well as their Rationale Boxes. The Rationale Box for R1 provides an explanation.		
JEA	No	The 1500 MVA selection criteria is too low. It needs to be substantially increased.
Response: For the purpose of PRC-002-2, a minimum number of locations for FR and SOER (now SER) are required to facilitate sufficient coverage and data for analyzing large system events. Based on these concepts, the DMSDT developed a procedure included in Attachment 1 – SOER and FR Locations Selection Methodology (Attachment 1 has been renamed to Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data (Requirement R1)) that utilizes the maximum available calculated three phase short circuit MVA. Using this methodology helps ensure sufficient coverage while accounting for variations in size and system strength of Transmission Owners across all the Interconnections. This methodology also provides flexibility in the selection process.		
MRO NSRF	No	For R1 - Add wording that would only obligate each Transmission Owner to identify BES bus locations where it owns Elements with wording like, ". . . Each Transmission Owner shall identify BES bus locations where it owns Elements . . ."
Response: There are cases where buses contain Elements that the Transmission Owner does not own. In these instances, the Transmission Owner identifies the bus and then notifies the owners of any Elements that it does not own.		

Organization	Yes or No	Question 2 Comment
Nebraska Public Power District (NPPD)	No	For step 1 in Attachment 1 please confirm the following: For a 115kV and a 345kV bus in the same substation on the same ground grid is this considered two bus locations such that these would be used in step 3 as two of the 11 buses to calculate the median? For step 7 in Attachment 1 if I have a 230kV bus and a 345kV bus in the same substation in my top 10% is this acceptable to count them as two buses that require FR/SOER since it is a single location? Is this indicating that both buses need to meet the FR/SOER requirements? Please clarify for Attachment 1: Should a 115kV tap substation with no breakers but only a load serving transformer with a high side breaker be included in the fault bus list? It appears they should but would a tap sub with no breakers be required to have FR or SOER? Should generator GSU 13.8kV buses and tie transformer tertiary 13.8kV buses be in the bus fault list? Example list 1 appeared to have some 13.2kV buses but the instructions do say to use 100kV and above. Please confirm only 100kV or above buses should be used.
Response: Correct. In the example presented the 115kV and 345 kV are treated as two bus locations. **Correct. In the example presented the 230 kV and 345 kV are treated as two bus locations and since they are in the top 10%.** **The exact situation described is not clear. Please review the BES Definition Guidelines Document. If your example does not include BES buses, then it would not be included.**		
New York Power Authority	No	The methodology in Attachment 1 is overly complicated (9 steps); and following eight of these required steps, it is then left up to the T.O. to add

Organization	Yes or No	Question 2 Comment
		"discretionary" stations, if desired. Just using the highest 11 station fault MVA values may not be the most accurate. Contributions from a foreign, nearby utility can raise a station's fault values, even though the station itself is not that critical to the listing entity. Using "Station" instead of "Bus" or "Location" would be more definitive. e.g. a 230 kV "Station", a 345 kV "Station",...). The term "bus" can be defined in different ways, so can "location."
Response: For the purpose of PRC-002-2, a minimum number of locations for FR and SER are required to facilitate sufficient coverage and data for analyzing large system events. Based on these concepts, the DMSDT developed a procedure included in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. Using this methodology helps ensure sufficient coverage while accounting for variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides flexibility in the selection process. **In the previous version of the draft standard "station" was used and the DMSDT received numerous comments to change it. The DMSDT developed the current methodology used in the current draft standard. We have revised Step 1 of the attachment to explicitly define what a bus is "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus."**		
PPL NERC Registered Affiliates	No	These comments are submitted on behalf of the following PPL NERC Registered Affiliates (PPL): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; and PPL Generation, LLC, PPL; Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP.

Organization	Yes or No	Question 2 Comment
		The TOs have the system specific knowledge as to where on their networks, SOERs, FRs and DDRs should be installed to effectively capture disturbance data. Many TOs have existing DME equipment in place (previously specified per the Regional Entities) which provides the relevant system disturbance data required for disturbance analysis. The R1, R6 requirements may lead to installation of redundant equipment. Perhaps the R1, R6 requirements should specify that the TOs evaluate where SOERs and FRs are to be installed to effectively capture disturbance data? Re-specifying DME installation per PRC-002-2 may result in redundant evaluation and equipment installation of DMEs. Previous electric sector DME efforts driven by PRC-002-1 and Regional Criteria should be recognized in the specifications for DME installations.
Response: TOs do have the knowledge for SER and FR placement. The Responsible Entity - the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection - has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which DDR is required. **The standard addresses "what" data must be captured, not "how" it is captured. The intent of the standard is not to require redundancy, and if the data is already captured it does not have to be done again.**		
Reason International, Inc.	No	Several problems in the correct operation of protective measures are related as reflexes of unmitigated harmonics influencing the actuation of protective relays. Industrial plants with high nonlinearities and intense electric power consumption have large influence in the interconnection to the transmission system. The harmonic distortions introduced by these industrial plants range from low to very high orders, up to the 20th harmonic. These distortions may lead to measurement errors and the

Organization	Yes or No	Question 2 Comment
		incorrect operation of protective relays. To avoid aliasing the sampling rate needed to analyze such events, capturing up to the 24th harmonic, should be 48 samples per cycle. Fault recording should therefore be carried out at a minimum of 48 points per cycle, above the typically used 16 points per cycle of protection algorithms.
Response: The DMSDT is not aware of widespread BES disturbances being caused by harmonics generated by industrial facilities. The DMSDT does recognize that anything can happen. The DMSDT feels that the 16 sample per cycle recording rate as specified in Requirement R5 (requirement number revised to R4) is adequate. If an entity determines that a higher recording rate is needed, that data capture characteristic can be used.		
Tacoma Power	No	The 1500 MVA fault level includes many busses that are relatively unimportant to the BES. For example, in the 115 kV portion of our system, 83% of buses have fault levels above 1500 MVA. On our system, fault levels of 4000 MVA are a much better indication of buss important to the overall BES. However, rather than create a new MVA criteria in this standard, we suggest using criteria developed for other standards that determine important subsets of the BES. The requirements in CIP-002-5 R2.5 define substations that have a “medium” impact on the BES. Requiring a FR at a substations classified as “low” is overly burdensome. Alternatively, substations that do not have circuits subject to PRC-023-2 applicability section 4.2.1 should be except from FR requirements. Although we already have fault recorders on all 115 kV transmission substations with more than 3 lines, the purposed methodology would require additional Fault Recorders. These additional fault recorders would

Organization	Yes or No	Question 2 Comment
		provide very little additional data, because the existing fault records include the remote ends of almost all transmission lines. The proposed standard does not take into adequate account the industry progress towards GPS synchronized microprocessor based relays. Much of the data required by FR is already recorded by relays. However, relay records only count as FR if they meet all the FR requirements for the entire substation. Rather than focus on obtaining 100% coverage of quantities at substations, this standard should facilitate taking advantage as much as possible of already installed hardware.
Response: Attachment 1 provides a mechanism for adjusting the three phase short circuit MVA threshold. Steps 3-6 provide an adjustment which can raise the lower threshold to > 1500 MVA. **The comments regarding CIP-002-5 part 2.5 are outside of the scope of this project.** **The standard addresses "what" data must be captured, not "how" it is captured** **To be compliant with this standard an entity needs to have 100% coverage of selected buses.**		
American Electric Power	No	Fault analysis programs such as ASPEN include tap busses to provide connection points for distribution transformers, series capacitors, three-terminal lines, etc. Since these connection points do not have circuit breakers associated with them they are not appropriate locations for disturbance monitoring. However, when applying the Attachment 1 process, these tap busses could show up and possibly distort the Attachment 1 data. The fault summary feature in ASPEN has a check box to ignore tap busses. AEP requests that this feature be utilized in the

Organization	Yes or No	Question 2 Comment
		Attachment 1 process.AEP is concerned that the “top 10%” requirement could force the installation of fault recording devices to be installed at a station with only 2 BES sources. An example is a protected load bus with only 2 BES elements that is connected to stations which meet the requirement and have fault recording devices installed. In this case, both of the stations remote to the protected load bus are BES buses in the top 10% of a TO’s bus listing. The standard should not require DFR/SER at those locations. AEP’s position is that the standard should focus on fault information availability after an event that allows for accurate analysis and not on over-saturation of fault recording equipment that will require monitoring and maintenance to ensure that the equipment is in service when needed. R2 states that TOs must notify owners of Elements that those elements require SOER/FR. However, the process identified in R1 does not establish a requirement to identify BES Elements. This does not account for the fact that not all elements on the identified busses should require SOER/FR. AEP suggests that the DMSDT add a new R1.3 to state “For each bus identified per 1.1, the Transmission Owner shall identify the BES elements that require FR and the BES interrupting devices that require SOER”. The draft can be interpreted to require TOs to dictate to GOs and IPPs where they must install FR/SOER. AEP believes it would be inappropriate for TOs to specify FR/SOER locations for GOs and IPPs.

Organization	Yes or No	Question 2 Comment
		While Attachment 1 provides a reasonable method for TOs to produce a list of buses that it owns, R2 will make TOs responsible to keep track of elements within those buses that it does not own. This responsibility should be revised so that TOs can focus on ensuring that they have adequate equipment in place to monitor its system, rather than managing the complex logistics needed to notify GOs and IPPs.
Response: For the purpose of PRC-002-2, a minimum number of locations for FR and SOER are required to facilitate sufficient coverage and data for analyzing large system events. Based on these concepts, the DMSDT developed a procedure included in Attachment 1 – SOER and FR Locations Selection Methodology (Attachment 1 has been renamed to Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data (Requirement R1)) that utilizes the maximum available calculated three phase short circuit MVA. Using this methodology helps ensure sufficient coverage while accounting for variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides flexibility in the selection process. **The DMSDT intended that the bus location be the bus location identified in a system study. Data would have to be obtainable for each of those buses. If the tapped substation was not modeled in a system study as a bus, then it would not be considered a bus. If it was, derived data for it would be acceptable. If there were no breakers, then SOER (revised to SER) would not be required. The standard addresses "what" data must be captured, not "how" it is captured. Requirements R1 and R2 were combined (into what is now R1), and the wording now reads "…identify BES buses for which sequence of events recording (SER) and fault recording (FR) data…", Attachment 1 indicates "To identify monitored BES buses…". Because a "larger" TO might be responsible for a bus where there are Elements owned by another TO, the "larger" TO is the appropriate entity to make notifications. The standard stipulates just notifications. Requirement R2 (R1 and R2 combined into what is now R1) does not specify that the TO is responsible for tracking the Elements it doesn't own.**		
American Transmission Company, LLC	No	The methodology is acceptable, but a requirement should be added before R1 and the present R1 should be modified as noted below.

Organization	Yes or No	Question 2 Comment
		a. Generator Owners should also be obligated to identify applicable bus locations where they own Elements using the Attachment 1 Steps, rather than delegating this obligation to the Transmission Owners. b. Generator Owners will be able to determine maximum available calculated three phase short circuit MVA after PRC-027-1 becomes a mandatory standard because this standard will require Transmission Owners to provide short circuit study information which makes this possible. In the implementation plan for this standard, Generator Owners could be exempt from compliance with R1 until after the applicable regulatory approvals of PRC-027-1. c. In addition, the scope of the bus locations that need to be considered for identification should be explicitly limited to locations where an entity owns Elements. d. Consider wording for the present R1, but new Requirement R2 like, “Each Generator Owner and Transmission Owner shall identify BES bus locations where it owns Elements for Sequence of Events . . .”
Response: a, b, c: The Requirement R1 bus identifications are best selected by the Transmission Owners because they have the overview of the BES, the required tools, information, and working knowledge of their systems to determine these locations. PRC-002-2 is intended to be independent of other standards. **d) Requirements R1 and R2 were combined into a single requirement (into what is now R1). The Transmission Owner identifies buses and the associated Elements which it may not own. For example, a Generator Owner may own a breaker associated with a bus. The Generator Owner is notified of this and then must comply with PRC-002-2 requirements.**		
Dairyland Power Cooperative (DPC)	No	If information is required to be gathered for every transmission line connected to the bus, equipment may need to be installed to capture this

Organization	Yes or No	Question 2 Comment
		information. The capital cost may be significant to some smaller TO's to install the FR equipment capable to capture this information. The DMSDT is encouraged to consider this fact in regards to this requirement and in the implementation plan.
Response: The DMSDT notes that this is a data standard and that many entities may already have adequate data recording to meet the intent of the requirements. The standard calls for entities to analyze their systems and be able to provide data based on that analysis. The CEAP for this project was posted to collect industry cost data.		
Kansas City Power & Light	No	Attachment 1 and the median method results in an excessive number of buses requiring disturbance monitoring for a system (a large amount of tightly interconnected buses within a metropolitan area).
Response: For the purpose of PRC-002-2, a minimum number of locations for FR and SOER (revised to SER) are required to facilitate sufficient coverage and data for analyzing large system events. More information needs to be provided to the DMSDT for it to provide a response.		
Liberty Electric Power LLC	No	Please see the comments of the NAGF SRT. I support their response to this question.
Response: There was no NAGF SRT response to this question.		
Manitoba Hydro	No	The intent of the methodology is good and will help TOs in determining the number of DMEs required. However, the application of the methodology using the provided "Median_Method_Template" is quite cumbersome and could be simplified.
Response: Without any specific comments regarding the methodology, the DMSDT cannot respond to your concern.		

Organization	Yes or No	Question 2 Comment
Northern California Power Agency	No	Seems excessively tedious for all TOs. Transmission Owners need to produce Transmission Studies per TPL standards. Steps 1 & 2 can be obtained from those studies. Steps 3&4 and second paragraph of step 7 seem arbitrary. Why 11? Please justify the second paragraph of step 7.
Response: Eleven was selected because there is a definite median value. How an entity gets the data to make its determination is not the concern of this requirement. From the experience of the DMSDT, the breakdown of data acquisition requirements in Step 7 will get adequate data to analyze a wide-area system disturbance.		
ReliabilityFirst	No	Requirement R1, Attachment 1 - ReliabilityFirst questions the rational to not require any Fault Recording and Sequence of Events Recording if there are no buses that fall on the list (i.e. an entity has no buses with maximum available calculated three phase short circuit MVA of 1500 MVA or greater). ReliabilityFirst believes to effectively recreate events using Fault Recording and Sequence of Events Recording data, Transmission Owners that have no buses on the list should still be required, at a minimum, to have at least one BES bus location with Fault Recording and Sequence of Events Recording. It could be required at least one BES bus location with the highest maximum available calculated three phase short circuit MVA. In order to achieve this, ReliabilityFirst recommends the first sentence in Step 7 (“If there are no bus locations on the list: the procedure is complete and no Fault Recording and Sequence of Events Recording will be required. Proceed to Step 9.”), be removed from the methodology.

Organization	Yes or No	Question 2 Comment
		Also, even though ReliabilityFirst believes the template for determining Fault recorder and SOE bus locations is helpful, ReliabilityFirst recommends developing a step by step example detailing the locational selection methodology.
Response: With no buses on the list, the DMSDT decided that data from that "weak" system would not be critical to an analysis of a wide-area disturbance. The DMSDT felt that adequate data would be captured from interconnected entities that had higher levels of fault MVA.		
Colorado Springs Utilities	No	
Northeast Power Coordinating Council	Yes	We agree with the idea behind the methodology, however the term BES bus locations is not defined. The NERC BES definition applies to Elements, not buses. Continuing to Requirement R2, a TO might not have visibility to BES classification of elements it does not own. Planning/Reliability Coordinator would be a more applicable functional entity for this role. They should also be responsible for reaching out to the GO's with notification for SOER and FR. A TO has no authority to perform this function; a GO might also question the bus selection and ask that another TO bus be included instead. The methodology in Attachment 1 is overly complicated (9 steps); and following eight of these required steps, it is then left up to the T.O. to add "discretionary" stations, if desired. Just using the highest 11 station fault MVA values may not be the most accurate. Contributions from a foreign, nearby utility can raise a station's

Organization	Yes or No	Question 2 Comment
		fault values, even though the station itself is not that critical to the listing entity. Using “Station” instead of “Bus” or “Location” would be more definitive. e.g. a 230 kV “Station”, a 345 kV “Station”,...). The term “bus” can be defined in different ways, so can “location.”
Response: The DMSDT intended that the bus location be the bus location identified in a system study, and has revised Attachment 1 to read “For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.” **A "parent" TO will be able to make the notifications necessary to get the appropriate data captured, and authority is not an issue.** **Requirement R2 was included because a TO's contribution to fault levels at another TO's location might not warrant the data collection at the source TO’s location. Requirements R1 and R2 have been combined (into what is now R1).** **The DMSDT made the bus location divisions in Attachment 1 Step 7 based on an analysis of submitted fault level data.** **The DMSDT intended that the bus location be the bus location identified in a system study. ”Location(s)” was removed from Requirement R1, and its use in Attachment 1 revised.** **In the previous version of the draft standard “station” was used and the DMSDT received numerous comments to change it. The DMSDT developed the current methodology used in the current draft standard. We have revised Step 1 of the attachment to explicitly define what a bus is “For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.”**		
SPP Standards Review Group	Yes	Insert an ‘a’ in the 6th line of the 2nd paragraph of the Rationale Box such that it reads ‘...have a significant effect on system reliability and performance. Conversely, locations with a very low short...’We suggest the

Organization	Yes or No	Question 2 Comment
		DMSDT watch for consistency in the use of the adjective ‘three-phase’ throughout all the posted documents. Make sure it is properly hyphenated.
Response: The DMSDT reviewed the standard for consistency and grammar and made appropriate revisions.		
Western Area Power Administration	Yes	Would like more information as to how the 1500 MVA value was decided upon.
Response: 1500 MVA was arrived at based on three phase fault MVA data collected from industry. The DMSDT reviewed the wording to reflect this to the Guidelines.		
Exelon Companies	Yes	We agree but, consider the following comments. The R1 method is designed to assure a minimum level of SOER and FR is available to analyze events. It does so by requiring a certain process must be periodically performed by the entity. This seems to be a good process to ensure that an entity has a minimally acceptable level of monitoring on their system. However, the DMSDT should consider a less burdensome alternative for entities that are working to install modern equipment with FR and SOER capabilities on all their circuits. Once a system includes a high percentage of modern equipment with SOER and FR capability (also see comments to item 7), R1 through R5 are not needed and become purely burdensome compliance items. At our company gathering data to ensure 100% compliance is a high burden activity. An alternative method for entities with high percentages of modern equipment installed might be to provide a list of BES transmission line terminals showing that at least 50% (or another appropriate

Organization	Yes or No	Question 2 Comment
		percentage) of all employ modern equipment with SOER and FR capability (also see comments to item 7). This data is typically available (we keep it on an ongoing basis) with a very minimal effort. Only a very minimal effort should be required for a system that is already highly monitored and doesn't need a standard to force the issue. This method would be an alternative to R1 through R4 (R5 becomes moot when a high percentage of transformers are monitored) which are designed for entities not monitoring their system. The entity would choose which method to use and the effort required on a highly monitored system would be minimized.
PJM Interconnection	Yes	PJM does support the methodology and also is providing the following comments. The R1 method is designed to assure a minimum level of SOER and FR is available to analyze events. It does so by requiring a certain process must be periodically performed by the entity. This seems to be a good process to ensure that an entity has a minimally acceptable level of monitoring on their system. However, the DMSDT should consider a less burdensome alternative for entities that are working to install modern equipment with FR and SOER capabilities on all their circuits. Once a system includes a high percentage of modern equipment with SOER and FR capability (also see comments to item 7), R1 through R5 are not needed and become purely burdensome compliance items. At our company gathering data to ensure 100% compliance is a high burden activity. An alternative method for entities with high percentages of modern equipment installed might be to provide a list of BES transmission line terminals showing that at least 50% (or another appropriate

Organization	Yes or No	Question 2 Comment
		percentage) of all employ modern equipment with SOER and FR capability (also see comments to item 7). This data is typically available (we keep it on an ongoing basis) with a very minimal effort. Only a very minimal effort should be required for a system that is already highly monitored and doesn't need a standard to force the issue. This method would be an alternative to R1 through R4 (R5 becomes moot when a high percentage of transformers are monitored) which are designed for entities not monitoring their system. The entity would choose which method to use and the effort required on a highly monitored system would be minimized.
Response: The standard is designed to provide the requirements to ensure the capture of adequate data to be able to analyze disturbances. The DMSDT has evaluated other alternatives and found that what is presented accomplishes the objective in a reasonable and practical way. (Refer to the response to Question 7 comments).		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration notes that the MVA thresholds applied are generally consistent with those established in EOP-004-2 "Event Reporting" and the criticality criteria used in CIP Version 5. This makes inherent sense, and would encourage the use of similar rules across all NERC standards in order to properly balance regulatory costs against benefits.
Response: Thank you for the comment.		
Texas Reliability Entity	Yes	(1) The DMSDT may want to consider different short-circuit MVA levels based on the voltage or voltage class, i.e. 1500 MVA for 100-200kV, 2500 MVA for >300kV, etc. (2) To insure broader system coverage, the DMSDT may also want to consider including some flexibility in the location criteria in Step 8 of

Organization	Yes or No	Question 2 Comment
		Attachment 1, such as substations > 200kV with 3 or more non-radial line terminals, substations < 200kV with 5 or more non-radial line terminals.
Response: 1500 MVA was decided upon after a statistical analysis of all BES voltage levels. By using the three phase fault MVA criterion the need for breakdown by voltage was alleviated. Step 8 allows discretion on placement of 10% of the required locations to capture data.

Lincoln Electric System		LES recommends the DMSDT further clarify the bus selection process included in Attachment 1. As drafted, the current Attachment 1 methodology does not appear to account for substation configurations such as a 115kV tap bus with a radial transformer fed from that bus. Although the radial transformer would not be considered a BES Element, the bus would be considered BES since it carries through-flow on the line. At this substation, there is no relaying and therefore no capability for SEOR or FR. In consideration of this, does the DMSDT intend for this type of bus to be included on the list? By including these busses, the total number of busses, and therefore the total number of substations requiring SEOR and FR, would increase considerably for some entities.
Response: Attachment 1, Step 1 clarifies "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." The examples given would be considered as two buses. Data would have to be obtainable for each of those buses. If the tapped substation was not modeled in a system study as a bus, then it would not be considered a bus. If it was, derived data for it would be acceptable. If there were no breakers, then SOER (acronym revised to SER) would not be required.		

3. **Are the appropriate functional entities identified in the Applicability section for PRC-002-2?**

Summary Consideration: Comments were received on the selection of the Entities identified in the Applicability Section. The PC and RC are included because they have an overall view of the BES to be able to determine what BES Elements need to be included for DDR. Responsible Entity was used by the DMSDT to reflect the fact that the Planning Coordinator and Reliability Coordinator have different functions across the continent. Comments were received that pointed to the hardware for capturing data. This standard is not about "how" the data is captured, but "what" data is captured. The need for generator data was questioned. During wide-area or slowly evolving disturbances generator reaction is crucial to the reconstruction and understanding of an event.

Organization	Yes or No	Question 3 Comment
ACES Standards Collaborators	No	(1) There is confusion over the Planning Coordinator and Reliability Coordinator functions and their respective relationships. As the standard is currently written, both the PC and the RC are subject to the standard in ERCOT? (2) We do not believe any function would benefit from the standard. Industry has already benefitted from the DOE grants to install PMUs and would continue to benefit from these types financial incentives to continue installing PMUs for situational awareness. The existing financial incentives have obviated the need for the standard as evidenced by report on the September 8, 2011 Arizona-California outages. There was sufficient data to analyze the event. NERC should develop a technical guideline on this topic instead of a standard.
Response: Within ERCOT it is the Planning Coordinator or the Reliability Coordinator. **PMUs only provide DDR data, and not fault or sequence of events data.**		

Organization	Yes or No	Question 3 Comment
The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report: "Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed. A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices." Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data. PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data. The Disturbance Monitoring recordings are used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.		
Bonneville Power Administration	No	BPA feels that responsible functional entities - as well as roles and responsibilities - must be clearly identified in the Standards and requirements. As the Standard is currently written, BPA feels that too much credence is given to assumptions outlined in the Standard and, unless clearly defined, these assumptions will not pan out as described.
Response: The DMSDT has identified the correct functional entities through the NERC Functional Model.		

Organization	Yes or No	Question 3 Comment
Florida Municipal Power Agency	No	Please see response to question 7.
Response: Please see the DMSDT response to Question 7.		
IRC Standards Reveiw Committee	No	This is a “fill in the blank” as identified in the FERC Order 693 and was written to be complied with by the RROs for years. We question why there is need for the RC and PC to comply with these. In fact, the Paragraph 81 activities have identified many requirements that are by the FERC’s perspective not consequential or primary for reliability. We do not believe that a mere reassignment from the old RRO entities to the RC or PC that these requirements suddenly become critical to reliability. NERC should consider other avenues to provide entities with methods to acquire fault data for event analysis. The solution to everything we do shouldn’t be a standard. In fact nearly all new relays and digital meters have disturbance recording capabilities, it is possible to acquire data for event analysis without DDR. Since the intent of this standard is primarily to have post-event data available, it can be argued this is not a critical reliability standard. We point out that the NERC Rules of Procedure have a detailed section on disturbance response procedures.
Response: The PC and RC are included because they have an overall view of the BES and to determine what BES Elements need to be included for DDR. The DMSDT has reviewed the requirements in PRC-002 and PRC-018 against the P81 criteria and has retired two requirements. The standard addresses “what” data must be captured, not “how” it is captured. It must be noted that Disturbance Monitoring data can be used to make real-time restoration decisions.		

Organization	Yes or No	Question 3 Comment
The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report: "Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed. A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices." Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data. PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data. The Disturbance Monitoring recordings are used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events. The Rules of Procedure do not provide specific requirements for Disturbance Monitoring data. The DMSDT was formed to provide those requirements.		
North American Generator Forum - Standards Review Team (NAGF-SRT)	No	Modify the applicability section 4.3 by adding the following parenthetical after Generator Owner: ("Applies to GO only if GO owns a generator output breaker in the TO's system")

Organization	Yes or No	Question 3 Comment
		We made the comment in the 11/19/13 webinar that DME in general should be a topic for TOs and not GOs. TOs interpret and use DME data, GOs do not. TOs generally have wide-ranging arrays of DME, continuous recording and storage infrastructure, and experts in monitoring and maintaining such equipment; GOs do not. The webinar presenters stated that this would make TOs responsible for monitoring GO equipment, and there is no technical reason for making them do so. We disagree in that disturbances do not originate exclusively in generation plants, and the majority of such events may in fact stem from transmission system problems (as was the case for the Northeast blackout of '03). That is, one can just as easily say that R9 makes GOs responsible for monitoring reactions to the TO's system, and there is no technical reason for making GOs do so. Given this inability to establish a universal cause-vs-effect rule for disturbances the least-total-cost approach should be followed, and centralizing DME makes more sense than splitting it between involved entities (TOs) and those who merely hand-over recordings (GOs). This point was made again in the 12/5/13 NAGF outreach WebEx meeting, and there did not appear to be a strong rationale for having GOs be designated Responsible Entities when they in fact would be mere appendages, i.e. installing what are to them black boxes and handing-over recordings that they don't understand.
PPL NERC Registered Affiliates	No	PPL made the comment in the 11/19/13 webinar that DME in general should be a topic for TOs and not GOs. TOs interpret and use DME data, GOs do not. TOs generally have wide-ranging arrays of DME, continuous recording and storage infrastructure, and experts in monitoring and maintaining such equipment; stand alone GOs do not.

Organization	Yes or No	Question 3 Comment
		The webinar presenters stated that making R9 pertain to TOs rather than GOs would make TOs responsible for monitoring GO equipment, and there is no technical reason for making them do so. PPL disagrees in that disturbances do not originate exclusively in generation plants, and the majority of such events may in fact stem from transmission system problems (as was the case for the Northeast blackout of '03). That is, one can just as easily say that R9 makes GOs responsible for monitoring reactions to the TO's system, and there is no technical reason for making GOs do so. Given this inability to establish a universal cause-vs.-effect rule for disturbances the least-total-cost approach should be followed, and centralizing DME makes more sense than splitting it between involved entities (TOs) and those who merely hand-over recordings (GOs). This point was made again in the 12/5/13 NAGF outreach webex meeting, and there did not appear to be a strong rationale for having GOs be designated Responsible Entities when they in fact would be mere appendages, i.e. installing what are to them black boxes and handing-over recordings that they don't understand.

Response: GO's applicability in this standard is not confined to just the ownership of breakers. Generating resources along with transmission system components and topology are significant drivers to system stability and dynamic behavior. Dynamic behavior is captured best through dynamic disturbance data rather than fault recording or sequence of events data.

By connecting to the system a generator contributes to System dynamic behavior.

The providers of the data are not necessarily the sole beneficiaries of the data. The requirements in the standard that apply to GO's are limited to the applications where GO's have to provide data for wide-area disturbance analysis. System dynamic behavior is affected by individual generating unit responses.

Organization	Yes or No	Question 3 Comment
Ameren	No	(1) We ask the DMSDT to replace 'Planning Coordinator' with 'Regional Entity' in 4.1.1 because the Regional Entity has a wider view, and it promotes consistency.
Response: Referring to 4.1.1 in the Applicability Section, the use of Planning Coordinator is consistent throughout the Eastern Interconnection. The Planning Coordinator responsibilities delineated in PRC-002-2 are not necessarily within the scope of a Regional Entity. This would re-introduce the "fill-in-the-blank" elements that FERC ordered to be removed from standards.		
Flathead Electric Cooperative, Inc.	No	Believe that applicability to TO and GO entities should be limited to those with the current equipment capable of the required monitoring and should not de facto create a situation where an entity has to purchase equipment to comply with the requirements of the standard, including the storage and auditing of post-fact information sufficent to meet the requirements.
Response: The standard addresses "what" data must be captured, not "how" it is captured. The standard is not calling for the capturing of inconsequential data.		
Liberty Electric Power LLC	No	Generator should not be a functional entity for this standard. In cases where generators own a breaker on a transmission system, the only requirement should be a breaker status signal, which properly should be supplied under the interconnection agreement.
Response: GO's applicability in this standard is not confined to just the ownership of breakers. Generating resources along with transmission system components and topology are significant drivers to system stability and dynamic behavior. Dynamic behavior is captured best through dynamic disturbance data rather than fault or sequence of events data. **By connecting to the system a generator contributes to System dynamic behavior.**		

Organization	Yes or No	Question 3 Comment
The providers of the data are not necessarily the sole beneficiaries of the data. The requirements in the standard that apply to GO's are limited to the applications where GO's have to provide data for wide-area disturbance analysis. System dynamic behavior is affected by individual generating unit responses.		
Northern California Power Agency	No	WECC has a Synchrophasor program. Why would not the RE or the appropriate RC identify the areas where this equipment is located and continue with the existing program?
Response: The standard addresses "what" data must be captured, not "how" it is captured. The RC has the responsibility in the Western Interconnection for Element selection for DDR data. It is expected that the WECC WISP installations will meet many of the sub-Part requirements.		
ReliabilityFirst	No	Applicability - ReliabilityFirst understands the rationale behind differentiating the Responsible Entity per Interconnection, but does not agree with ERCOT still stating "Planning Coordinator or Reliability Coordinator". ERCOT is both the Planning Coordinator and Reliability Coordinator so the DMSDT needs to decide which function in ERCOT will be responsible for determining DDRs to avoid any future confusion for monitoring compliance.
Response: The DMSDT was given information that in ERCOT the use of "Planning Coordinator or Reliability Coordinator" was appropriate because depending on where in ERCOT you were, either entity could be applicable.		
Colorado Springs Utilities	No	
MRO NSRF	Yes	Please see question 7.
Response: Refer to the Question 7 response.		

Organization	Yes or No	Question 3 Comment
SPP Standards Review Group	Yes	We thank the DMSDT for deleting the Reliability Coordinator as an Applicable Entity in the Eastern Interconnection.
Response: Thank you for your comment.

Response: The DMSDT used the appropriate entity for each Interconnection based on how they perform the required functions.		

4. **Do you agree with the Elements requiring Dynamic Disturbance Recording listed in Requirement R6? If not, please provide technical justification.**

Summary Consideration: The thrust of the comments received was that Requirement R6 (Requirement R6 is Requirement R5 in the latest draft of the Standard) demanded DDR data capture on an excessive number of BES Elements. The DMSDT revised Requirement R6 (now Requirement R5) to address these comments by:

- **Instead of monitoring all Elements of IROLs, monitor one or more**
- **Instead of monitoring all Elements of permanent Flowgates and transmission interfaces, monitor "Any one BES Element associated with major transmission interfaces…"**

The Parts/sub-Parts of what is now Requirement R5 have been re-arranged for clarity.

Organization	Yes or No	Question 4 Comment
ACES Standards Collaborators	No	We believe that Requirement R6 could be consolidated with other requirements and the detailed sub-requirements could be moved to an appendix. This would be more appropriate to model this standard like PRC-023-2, where the appendix provides important details but does not subject registered entities to violations for every sub-requirement.
Response: Requirement R6 has been combined with R7 into what is now R5. In response to numerous comments received, the DMSDT revised R6 (now R5) to clarify which Elements are required (identified in the numbered Parts of the requirement) and which ones are to be considered (bulleted items).		
Bonneville Power Administration	No	a) BPA feels there should not be a requirement to monitor all elements of a path/interface/IROL when three of five lines can supply enough understanding (used in conjunction with other DME); and

Organization	Yes or No	Question 4 Comment
		b) The IROL should be determined by Planning Criteria, not by a dynamic/ever-changing IROL.
Response: Based on numerous comments, the DMSDT has changed the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts were updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one or more (as specified by the RC or PC) Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		
El Paso Electric	No	No. Requirement 6 contains too many potential DDR locations. DMSDT should provide clarity between requiring one DDR per system, requirement 6.1.2, versus requirements 6.1.5, 6.1.6 and 6.1.7. The criteria for placement need to be clarified.
Response: Based on numerous comments, the DMSDT has changed the format of the requirement (Requirement R6 is now R5) to clarify the data requirements which will reduce the potential number of locations that are to be identified.		
Florida Municipal Power Agency	No	Please see response to question 7.
Response: Please see the DMSDT response to Question 7.		
Hydro One Networks Inc.	No	1. R6.1.4, first bullet - Requiring monitoring of all "Flowgates" on the Eastern Interconnection seems arbitrary and diminishes the role of those with the best understanding of the nature of their system to determine the appropriate locations for DDRs. The guideline for R6 included in the draft fails to explain why all flowgates should be monitored. The Book of Flowgates includes circuits that can become thermally overloaded under outage conditions at low flows, e.g. circuits with the

Organization	Yes or No	Question 4 Comment
		maximum precontingency flow of 150 MW at unity power factor. This requirement seems to be very conservative and somehow conflicting with the requirement R6.1.3.2 since there are many generation plants that do not exceed the specified thresholds by a small number and those generating plants are not monitored. 2. Requirement R6.1.5 - This requirement should be rephrased to deal with the cases when the ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter are owned by different entities 3. Requirement R6.1.6 - The guideline for R6 included in the draft has no explanation about why all Elements associated with Interconnection Reliability Operating Limits (IROLs) should be monitored. The NERC lists including all elements associated with IROLs are very extensive. This requirement will increase the number of the DDRs need to be installed exponentially.

Response: Based on numerous comments, the DMSDT has revised Requirement R6 (now R5) in the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts have been revised according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).

The list of Elements for HVDC includes both ends of HDVC terminals; the data monitoring requirement for each end is based on the ownership of their respective Elements. The case described is included in the draft standard already; responsibility is based on ownership of Elements for DDR.

The Guideline has been revised for the R6 (Requirement is now R5) sub-Parts, and explanations for including each type of Element for DDR data monitoring.

Organization	Yes or No	Question 4 Comment
IRC Standards Review Committee	No	R6 is confusing. It asks for the identification of BES Elements for which Dynamic Disturbance Recording (DDR) is required but Part 6.1.1 and 6.1.2 are not criteria for “Elements”, but rather, they are criteria based on demand size and footprint. It would clarify for compliance if the requirement is split into two: one for the threshold for having DDR (demand size and footprint, i.e., Pats 6.1.1 and 6.1.2), and one for the location/element (Parts 6.1.3 to 6.1.6). Also, M6 for R6 states that the responsible entity must “accurately” identify elements requiring DDR per numerous sub-requirements under R.6.1. and measures degrees of compliance against an identified set of points as specified per 6.1.4. R.6.2. requires that entities, at a minimum, perform a new assessment for DDR locations every 5 years. When there are elements added to the Interconnections or long-term system reconfigurations that take a DDR(s) out of service or renders them incapable of recording the required data, should that be a trigger for a reassessment?
Response: In response to the comments received, the DMSDT has Revised Requirement R6 (now R5) for clarity. **The 5 year maximum reassessment period for the list of Elements requiring DDR data is used to capture any major changes to the system during that period. This is similar to what is required for SER, and FR (R1--R1 and R2 have been combined into what is now R1). Requirement R14 (Requirement number is now R12) should be followed If DDR equipment is removed from service such that it is out of service or incapable of recording the required data.**		
MRO NSRF	No	Note that R6 clearly states where DDRs are required where the intent of this Standard was for “data” and not devices. The DMSDT has presented mixed signals to the industry, please clarify.

Organization	Yes or No	Question 4 Comment
		In R6.1.2., it states that at least one DDR location in each Responsible Entity's footprint. It is not clear if this means the Responsible Entities listed in R6 or the Responsible Entities listed in the Applicability Section 4. Does the Planning Coordinator or Reliability Coordinator, (as applicable) identify BES Elements for which DDR is required in the footprint of each Transmission Owner and Generator Owner or in their own respective footprints? R6.1.2. should be clarified to read "Each Planning Coordinator or Reliability Coordinator, (as applicable) is required to have at least one DDR in their footprint."
Response: The focus of this standard is on the data, not equipment. The requirements were revised to reflect the necessity to monitor data, not prescribe how that data is collected. **"Responsible Entity" is a defined term for this standard PRC-002-2, and refers to the Planning Coordinator or Reliability Coordinator (as applicable for each Interconnection as per the Applicability Section of the standard). The minimum DDR criteria have been updated as (R5 is now R6):** **5.2 The elements shall include a minimum of :** **5.2.1. One BES Element.** **5.2.2. One additional BES Element for each additional 3,000 MW of its historical peak system Demand.**		
Nebraska Public Power District (NPPD)	No	For clarification, "A minimum of one DDR location per 3,000 MW of the Responsible Entity's historical peak system Demand, inclusive of Requirement R6, Part 6.1, Sub-parts 6.1.2 - 6.1.7" means that for a peak demand of 3030MW a Responsible Entity must have at least two DDRs on its system and this requirement is satisfied if two DDRs are already on the system due to the other sub parts in R6?

Organization	Yes or No	Question 4 Comment
		Has or should it be confirmed the RC or PCs have a clear understanding and listing of “permanent Flowgates” and locations necessary to monitor all Elements associated with IROLs? They may need to confirm they are using similar or same terminology.
Response: In response to numerous comments, the DMSDT has Revised Requirement R6 (now R5) for clarity. **The Standard DMSDT (DMSDT) has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of “major transmission interfaces” has on Transmission Owners. Sub-Parts have been revised according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. “Major transmission interfaces” are also included but at a reduced level. Only one Element of these interfaces is required and “major” is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring). Wording has been added to the Rationale Box for what is now R5 for further clarification.**		
New York Power Authority	No	R6.1.6 - This requirement could lead to unnecessary installation of DDRs in non-integral substations.
Response: Interconnection Reliability Operating Limits (IROLs) are a subset of System Operating Limits (SOLs) that if violated could lead to instability, uncontrolled separation, or initiate cascading outages (as defined in FAC-010-1). Due to the severity of these violations and the possibility for large-scale outages or cascading, these IROLs should be monitored for disturbance monitoring, and capturing and recreating system disturbances from a wide-area. However, the draft standard has been updated such that only one or more Element(s) of each IROL (as specified by the RC or PC) is required, rather than all Elements of each IROL.		
Northeast Power Coordinating Council	No	Requirement R6 is confusing. It asks for the identification of BES Elements for which Dynamic Disturbance Recording (DDR) is required but sub-Parts 6.1.1 and 6.1.2 are not criteria for “Elements”, but rather, they are criteria based on demand size and footprint.

Organization	Yes or No	Question 4 Comment
		It would be helpful if the requirement is split into two: one for the threshold for having DDR (demand size and footprint, i.e., sub-Parts 6.1.1 and 6.1.2), and one for the location/element (sub-Parts 6.1.3 to 6.1.6). Suggest moving the minimum quantities in sub-Parts 6.1.1 (minimum 1 DDR per 3000 MW) and 6.1.2 (minimum 1 DDR per RE footprint) to the end of the list. In that way the requirements for sub-Parts 6.1.3 (Generation resources), 6.1.4 (Flowgates, etc...), 6.1.5 (HVDC), 6.1.6 (IROLs) and 6.1.7 (UVLS) will be stated up front as non-negotiable requirements, and state that additional DDR locations are only needed if fulfilling the first 5 do not meet the two extra minimum quantities requirements. Sub-Part 6.1.3--Needs to be clarified to make it understood how to add up the MW ratings of combined cycle unit generators and cross compound generators. Some examples would be helpful. Sub-Part 6.1.4, first bullet - Requiring monitoring of all "Flowgates" on the Eastern Interconnection seems arbitrary and diminishes the role of those with the best understanding of the nature of their system to determine the appropriate locations for DDRs. If "Flowgate" monitoring is required, this item should include a link to the official list of NERC Flowgates so that the "Responsible Entity" knows where they need to install DDRs. For example, the NY-NE interface is one of the official NERC Flowgates, which means that entities will need a DDR at each of eight stations that interconnect with New York; while entities on the other end of the interconnection in NE will need to do the same. Regarding "monitor all Elements of: all permanent Flowgates". If a Flowgate is made up of a combination of several transmission lines and transformers, does every line need to be monitored? Do both ends of the lines need to be monitored? Does every

Organization	Yes or No	Question 4 Comment
		transformer need to be monitored (low side or high side side)? Please show some typical examples. The guideline for R6 included in the draft fails to explain why all Flowgates should be monitored. The Book of Flowgates includes circuits that can become thermally overloaded under outage conditions at low flows, e.g. circuits with the maximum pre-contingency flow of 150 MW at unity power factor. This requirement seems to be very conservative and somehow conflicting with sub-Part 6.1.3.2 because there are many generation plants that do not exceed the specified thresholds by a small number and those generating plants are not monitored. Clarify that DDR is for “all permanent Flowgates” ONLY if the Flowgates are BES Elements. Sub-Part 6.1.5 - this will require the installation of DDRs at HVDC facilities that are smaller than the generator requirement listed in sub-Part 6.1.3 (500 MW). This requirement should be rephrased to deal with the cases when the ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter are owned by different entities. Sub-Part 6.1.6 - This requirement could lead to installation of DDRs at many substations to just capture one flow that is part of an IROL. Also, DDR data is of little value for IROLs that are thermal in nature. Sub-Part 6.1.6/Guideline - The Guideline for R6 included in the draft has no explanation about why all Elements associated with Interconnection Reliability Operating Limits (IROLs) should be monitored.

Organization	Yes or No	Question 4 Comment
		The NERC lists including all elements associated with IROLs are very extensive. This requirement will dramatically increase the number of the DDRs need to be installed. This could cause too excessive burden on some TOs. Also, there is nothing to limit the burden which can be placed on the TO by a Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable). Depending on the impact, a 3-year implementation plan might not be achievable.
Independent Electricity System Operator	No	R6 is confusing. It asks for the identification of BES Elements for which Dynamic Disturbance Recording (DDR) is required but Part 6.1.1 and 6.1.2 are not criteria for "Elements", but rather, they are criteria based on demand size and footprint. It would be helpful if the requirement is split into two: one for the threshold for having DDR (demand size and footprint, i.e., Pats 6.1.1 and 6.1.2), and one for the location/element (Parts 6.1.3 to 6.1.6). Requirement R6.1.4 - The guideline for R6 included in the draft fails to explain why all flowgates should be monitored. The Book of Flowgates includes circuits that can become thermally overloaded under outage conditions at low flows, e.g. circuits with the maximum precontingency flow of 150 MW at unity power factor. This requirement seems to be very conservative and somehow conflicting with the requirement R6.1.3.2 since there are many generation plants that do not exceed the specified thresholds by a small number and those generating plants are not monitored. Requirement R6.1.5 - This requirement should be rephrased to deal with the cases when the ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter are owned by different entities.

Organization	Yes or No	Question 4 Comment
		Requirement R6.1.6 - The guideline for R6 included in the draft has no explanation about why all Elements associated with Interconnection Reliability Operating Limits (IROLs) should be monitored. The NERC lists including all elements associated with IROLs are very extensive. This requirement will increase the number of the DDRs need to be installed exponentially.

Response: In response to numerous comments, the Standard DMSDT (DMSDT) has revised R6 (now R5) for clarity.

The sub-Part for generating resources was also clarified as well as the Guideline document. Wording was added to the Rationale Box.

Based on numerous comments, the Standard DMSDT (DMSDT) has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).

The list of Elements for HVDC includes both ends of HDVC terminals; the data monitoring requirement for each end is based on the ownership of their respective Elements. The case described is included in the draft standard already; responsibility is based on ownership of Elements for DDR. Interconnection Reliability Operating Limits (IROLs) are a subset of System Operating Limits (SOLs) that if violated could lead to instability, uncontrolled separation, or initiate cascading outages (as defined in FAC-010-1). Due to the severity of these violations and the possibility for large-scale outages or cascading, these IROLs should be monitored for disturbance monitoring, and capturing and recreating system disturbances from a wide-area. However, the draft standard has been updated such that only one Element of each IROL is required, rather than all Elements of each IROL.

The DMSDT has revised Requirement R6 (now R5) to provide more clarity. Major transmission interface criteria have been developed in what is now sub-Part 5.1.2.

Organization	Yes or No	Question 4 Comment
Reason International, Inc.	No	Power swings are one of the most common and dangerous long-term disturbance events. They occur due to inadequate power flow conditions in a variety of states of the BES. These dangerous states may be reached through unforeseeable manual maneuvers or inadvertent automatic maneuvers during operation, as those occurring during an fault. Power swings may evolve to a system-wide failure, due to voltage dips, under- over-frequency, etc. To correct evaluate this situation it is necessary to compute the system power. Therefore, it's also necessary to monitor currents as well as voltages.
Response: The DMSDT agrees that currents should be monitored along with voltages; this is already accounted for in Requirements R8 (Requirement is now R6) and R9 (Requirement is now R7).		
SERC Protection and Controls Subcommittee	No	1. Our industry experience is that disturbance events for which DDR information and analysis is needed are extremely rare (perhaps one per decade; in fact we've not yet experienced such an event). We believe that the proposed R6.1.4 alone would increase our number of NERC required DDR for one of our members at least thirty-fold. The DMSDT has not provided technical justification for this proposed significant increase. For this member, the other parts of 6.1 may well triple their NERC required DDRs. We ask the DMSDT to consider a reasonable approach and omit Requirement 6.1.4 and reconsider it in the five-year review of this standard if NERC-wide experience in the meantime warrants it. Perhaps this is a regional issue and some regions have a stronger need; if so, we suggest they draft a regional standard. 2. A quick analysis of another of our members identified 12 generating plant locations (R6.1.3), 18 flowgates (R6.1.4) at 12 locations and one IROL (R6.1.6) location where we own Elements. Presently we are required by SERC to have DDR at 6 locations.

Organization	Yes or No	Question 4 Comment
		This results in the entity possibly needing DDR at 19 additional locations, with a total of 25! Was there any effort, as was suggested in the Atlanta DMSDT open forum meeting, for a data request of the REs to assess how many DDRs (Elements) would be need to be monitored? If so where is this information? If this was not done, it must be a part of the cost impact effort. 3. Clarity is needed under Requirement 6.1.3 to understand how to add up the MW ratings of combined cycle unit generators and cross compound generators. Some examples will be most helpful. 4. Clarity is needed in Requirement 6.1.4 (if it is retained) when you refer to "monitor all Elements of: all permanent flowgates". If a flowgate is made up of a combination of several transmission lines and transformers, does every line need to be monitored? Do both ends of the lines need to be monitored? Does every transformer need to be monitored (lowside or highside side)? Please show some typical examples. 5. Under Requirement 6.1, it may be better to move the minimum quantities Requirements 6.1.1 (minimum 1 DDR per 3000MW) and 6.1.2 (minimum 1 DDR per RE footprint) to the end of the list. In that way the Requirements for 6.1.3 (Generation resources), 6.1.4 (Flowgates, etc...), 6.1.5 (HVDC), 6.1.6 (IROLs) and 6.1.7 (UVLS) will be stated up front as non-negotiable Requirements, and state that additional DDR locations are only needed if fulfilling the first 5 Requirements does not meet the two extra minimum quantities Requirements.

Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according

Organization	Yes or No	Question 4 Comment
to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring). The sub-Part for generating resources has been clarified as well as the Guideline document to help provide clarity. Based on numerous comments, the DMSDT has revised R6 (now R5) for clarity.		
Southern Company	No	a) In the Background section, the DMSDT explains the basis for the 500MW threshold; however, there is no explanation/ basis for the 300MW at locations over 1000MW. b) It is not clear in R9 whether the specification for signal measurements is on a generating unit basis or if the signals of interest are a per line basis aggregate at generating stations. Please more clearly specify if the signals of interest are individual unit measurements or plant total measurement (grouped by output circuit, plant total, etc.). This determination weighs heavily on the cost and method of implementation where new equipment must be installed. Example: (i.e. combined cycle plant (1075MW total) with units of 325, 325, 425 but only one transmission line)? c) In reference to the R6.1.4: The monitoring of all elements of a permanent flowgate should be changed to only the major elements or perhaps those that contribute more than 20%. In some cases multiple lines of 500, 230, and 115kV may be involved but the lower voltage lines may only contribute 5-10% of the total capacity. Having to install DDR capability at these multiple locations is overly burdensome and does not enhance the overall goal of this Standard.

Organization	Yes or No	Question 4 Comment
Response: The DMSDT has included the 300 MVA threshold for generating resources at locations with a gross/aggregate nameplate rating of 1000 MVA to capture large multi-unit disturbances that could occur due to non-electrical related contingencies such as plant failures. NERC Event Analysis subject matter experts have identified plant or multi-unit generation trips that could pose a risk to grid stability. DDR is required only for "large" (300 MVA) units at plants greater than 1000 MVA to capture their response and potential tripping and risk to under-frequency events. A revision to the guidelines was made to clarify the 300 MVA threshold. **The TO or GO is required to provide the necessary DDR data to meet the requirements set forth in Requirement R6 (Requirement R6 is now R5). 500 MVA individual units or 300 MVA units at plants 1000 MVA or greater need to be monitored.** **Based on numerous comments, DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).**		
SPP Standards Review Group	No	Requirement R6.1.3.2 requires DDR for all generating units greater than 300 MVA at a plant/facility with an aggregate nameplate rating equal to or greater than 1000 MVA. Does this apply in situations where the generating units may be connected at different voltage levels within the plant/facility? Especially those which may not even be tied together within the plant/facility? YES Requirement R6.1.4 requires DDR for all permanent Flowgates within the Eastern Interconnection. We believe this requirement is troublesome for several reasons. First, Flowgates can be added on the fly in Real-time. Although these Flowgates are at that time

Organization	Yes or No	Question 4 Comment
		temporary, they can become permanent at the end of the month in which they were created in the Book of Flowgates. Thus a Transmission Owner would then be responsible for having DDR equipment on that Flowgate within less than 30 days. This is an unreasonable request. Additionally, most Flowgates are thermally limited and not all of them represent facilities which have a significant impact on the BES. They may have been created to address localized loading issues. As such, requiring these facilities to be monitored by DDR equipment is excessive and does not contribute significantly to the reliability of the BES. On the other hand, there may be other Flowgates which do consist of or represent facilities which can have a tremendous impact on the BES. Some of these Flowgates are there specifically to address voltage stability and dynamic system stability issues. These facilities need to be monitored by DDR equipment. The difficulty becomes determining which Flowgates fit the latter category. The DMSDT needs to put some effort into determining the criteria to use in deciding which Flowgates are worthy of DDR monitoring.

Response: The DMSDT has included the 300 MVA threshold for generating resources at locations with a gross/aggregate nameplate rating of 1000 MVA to capture large multi-unit disturbances that could occur due to non-electrical related contingencies such as plant failures. NERC Event Analysis subject matter experts have identified plant or multi-unit generation trips that could pose a risk to grid stability. DDR is required only for "large" (300 MVA) units at plants greater than 1000 MVA to capture their response to system disturbances.

The sub-Part for generating resources is also being clarified as well as the Guideline document to help provide clarity and examples. (This is used for generator aggregation.)

A revision to the guidelines was made to clarify the 300 MVA threshold.

Organization	Yes or No	Question 4 Comment
Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		
Tennessee Valley Authority	No	We respectfully request that a methodology similar to the one that was used in R1 is deployed in this requirement in order to determine an adequate percentage of flowgates needed for visibility of faults.
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		
Western Area Power Administration	No	DDR installations have been resource intensive and problematic to install and to place on-line. Section 6 opens the door for quite a number of DDR deployments. Section 6.1.4 requires the monitoring of all Elements of major transfer paths on the Western Interconnection. Utilities in the Western Interconnection have already participated in WECC's WISP program and have installed and commissioned DDR's as required. DDR deployment per WISP should be considered sufficient in the WECC footprint.

Organization	Yes or No	Question 4 Comment
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring). **Phasor Measurement Units (PMUs) and synchrophasor data are a subset of DDR, streaming high resolution data in real-time. The PMUs installed under the WECC WISP likely will meet many of the sub-Parts set forth in this standard; however, additional installations are required to capture wide-area system response to large outages such as cascading or instability.**		
Ameren	No	(1) In conjunction with our Planning Coordinator we have voluntarily installed over 30 PMUs which was a significant effort and resource commitment over the last 3 years. Even though they have not yet been needed for disturbance analysis, some operating visualization tools are being used and we have reviewed some minor perturbations. However, if we would still need to have a PMU covering every generator with 500 MW or greater as in 6.1.3.1, as well as all permanent flowgates, as covered in 6.1.4, that would require us to add many more PMUs to the system. We believe this would be burdensome, given the effort already undertaken over the last 3 years to get to where we presently are. We respectfully disagree with the DMSDT's brief justification in the Rationale for R6.
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is		

Organization	Yes or No	Question 4 Comment
defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring). **DDR data requirements for generating resources of the size threshold established requires a relatively low number of generating units monitored while capturing a large amount of the total MVA capacity on the system. This is based on the analysis performed by the DMSDT using the NERC GADS data.**		
American Electric Power	No	This listing appears far too prescriptive by going beyond the "what's" and specifying the "how's". In the application of R6, the Responsible Entity should consider existing DDR installations when determining where to require DDR. There may be existing installations that can satisfy the R6 criteria. At a minimum, it might be beneficial to add such considerations to the "Guideline for Requirement R6" section. It is unclear whether DDR is required on all generating resources or only some generating resources that meet the requirements of R6.1.3.1 and R6.1.3.2. We suggest changing the title of Section 6.1.3 to "All generating resources with:" to be consistent with the other sections.
Response: The DMSDT agrees that the Responsible Entity should consider existing DDR installations when determining the Elements requiring DDR data. (Requirement R6 in the posted PRC-002-2 draft has been renumbered to R5, and the sub-Parts rearranged). For example, generating resources, major transmission interfaces, IROLs, and voltage sensitive areas can be measured from multiple points. Note that data can either be directly measured or derived. The DMSDT does not believe that 'all' is needed in sub-Part 6.1.3 because sub-Parts 6.1.3.1 and 6.1.3.2 are clear.		
CenterPoint Energy Houston Electric	No	CenterPoint Energy understands the potential usefulness of dynamic data for event analysis and supports the collection of dynamic data for event analysis as a Best Practice.

Organization	Yes or No	Question 4 Comment
		However, the Company's experience has been that sufficient data for event analysis is available from existing fault recording devices and therefore is strongly opposed to inclusion of a requirement to provide dynamic data. The only way to provide dynamic data is through a dynamic recording device. If an entity does not currently have any dynamic recording devices installed on its system then the entity has little choice but to spend capital in order to acquire and install these devices to comply with the Requirement. CenterPoint Energy does not believe the enabling legislation allows for Reliability Standards to require the expenditure of capital funds. While the DMSDT contends the requirement is only for dynamic data, not the installation of dynamic recording devices, and an entity is free to determine how it will comply, CenterPoint Energy finds this argument disingenuous.CenterPoint Energy strongly recommends the deletion of this requirement. The Company cannot support any draft Standard that contains such a requirement.
Response: The DMSDT understands that in the case of DDR specific devices are needed to provide the data. In certain cases a fault recorder that is equipped to do provide DDR can be used. The standard is not concerned with the "how", but with "what" data is captured. The DMSDT's objective was to provide the industry as much flexibility as possible where the equipment was concerned to capture data. For a widespread slowly evolving event dynamic disturbance data is necessary to understand its development. **In response to comments, the DMSDT has revised Requirement R6 (R6 is now R5) to provide more specificity regarding data requirements.**		
Dairyland Power Cooperative (DPC)	No	Please provide the technical justification for Requirement R6.1.1.

Organization	Yes or No	Question 4 Comment
Response: Part 6.1.1 (Part is now 5.2.2) is included because there may be some areas of the system where a PC or RC does not have sufficient DDR coverage based on its peak system Demand size. If the other sub-Parts do not provide sufficient coverage, then additional unique locations should be selected such that wide-area coverage is attained.		
Dynegy	No	1.) Regional Standard PRC-002-NPCC-01 which recently became effective conflicts with PRC-002-2. There is no bright line 500 MVA criteria for GOs to install DDR in the NPCC Regional Standard which instead allows the Reliability Coordinator to make the call. Also, it is not clear from R6 if the GO is supposed to wait for notification from the RC to install DDR or if the GO should go ahead and install DDR at units >500 MVA on their own. 2.) It's recognized that the DMSDT researched the 500 MVA cutoff point to cover what was felt to be an appropriate percentage of US generating assets. Based on comparisons with other Regional Criteria and Standards, this number seems low - some use a number of 1000 MVA. A compromise cutoff of 750 MVA is suggested. 3.) PRC-002-NPCC-01 requires installation of SOER and FR at generating units while PRC-002-2 specifically states SOER and FR are not required at generating units. Some GOs have spent considerable capital dollars to comply with a new NPCC Regional Standard, only to have a new conflicting continent wide Standard proposed.
Response: In response to comments, the DMSDT has revised Requirement R6 (now R5) to provide more specificity regarding data requirements. A Generator Owner with an individual unit greater than or equal to 500 MVA is free to ensure that the data is available prior to notification. **(1) PRC-002-2 is a continent-wide standard; regional standards such as PRC-002-NPCC-01 may be more prescriptive than this draft standard. However, the DMSDT has included the 300 MVA threshold for generating resources at locations with a gross/aggregate**		

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 4 Comment</th></tr>
<tr><td colspan="3"> nameplate rating of 1000 MVA to capture large multi-unit disturbances that could occur due to non-electrical related contingencies such as plant failures. NERC Event Analysis subject matter experts have identified plant or multi-unit generation trips that could pose a risk to grid stability. (2) The DMSDT believes the 750 MVA cut off threshold is too high to provide sufficient data from generating units. The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in the NERC footprint while only requiring DDR coverage on about 12.5% of the generating units. (3) The regional standards may dictate stricter requirements pertaining to particular recording requirements. This continent-wide standard identifies the effectiveness of DDR data to capture generating resources and their longer-term response to system disturbances that are captured by DDR. This standard focuses on capturing DDR data while minimizing the impact of sequence of events and fault recording data requirements for Generator Owners. </td></tr>
<tr><td>Entergy Services, Inc.</td><td>No</td><td> We believe the proposed DDR installation criteria will require an excessive number of installations, has not been technically justified by the DMSDT for the increase in DDR installations which will be required, and will be unnecessarily burdensome to the industry. Industry experience shows that disturbance events for which DDR information and analysis is needed are very rare, and we believe the R61.1 criteria puts us closer to what should be a target number of installations rather than a minimum number. </td></tr>
<tr><td colspan="3">Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of “major transmission interfaces” has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. “Major transmission interfaces” are also included but at a reduced level. </table>

Organization	Yes or No	Question 4 Comment
Widespread outages are rare, but historical events have illustrated the need for time synchronized dynamic data from a wide-area perspective. Capturing wide-area system behavior prior to and immediately following a fault or contingency condition enables recreation of sequence of events during the cascading or outage. The sub-Parts put forth in this standard identify Elements for which time synchronized dynamic recording data provide valuable information for understanding and recreating the system's response.		
Exelon Companies	No	We believe the DMSDT has done a good job of trying to focus on the important BES elements that should require Dynamic Disturbance Recording. Requiring DDR for the most important BES elements rather than all BES elements at a certain station is technically sound and a major improvement over some attempts at past criteria to determine which elements should require DDR. We concerend however that about the specificty for determination as to the number and location of where DDR will be required per this requirement. The requirment may result in an unnecessary number of installations. We urge the DMSDT to provide for the PC to determine the number and location of the devices. Addtionally, use of the NERC book of flowgates may not support again the necessary data required because every line in a Flowgate or IROL, IROLs is not always dynamic limited.
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		

Organization	Yes or No	Question 4 Comment
Ingleside Cogeneration LP	No	Unlike the MVA thresholds applied in R1, ICLP does not believe that the 1000 MVA threshold for generation facilities (R6.1.3.2) is consistent with other NERC criticality criteria. In addition, from the perspective of a Cogeneration facility, full nameplate capacity is normally not fully available to the Bulk Electric System. Therefore, either the threshold should be raised to 1500 MVA or should be revised to specify that the 1000 MVA threshold refers to “aggregate nameplate capacity available to the BES”.
Response: The DMSDT has included the 300 MVA threshold for generating resources at locations with a gross/aggregate nameplate rating of 1000 MVA to capture large multi-unit disturbances that could occur due to non-electrical related contingencies such as plant failures. NERC Event Analysis subject matter experts have identified plant or multi-unit generation trips that could pose a risk to grid stability. DDR is required only for “large” (300 MVA) units at plants greater than 1000 MVA to capture their response and potential tripping and risk to underfrequency events. The 1000 MVA plant/aggregate nameplate rating captures the generating facilities of interest for DDR while 1500 MVA would exclude large power generating facilities. Examples of typical or likely configurations have been included in the Guidelines document to help clarify.		
ISO New England Inc.	No	Comment on R6 - The standard should not use the term “Responsible Entity” but should only refer to specific NERC entities like TO, GO, RC, etc. Comment on R6.1.4 -Requiring monitoring of all Elements of “Flowgates” on the Eastern Interconnection seems arbitrary and may miss important locations for DDRs, especially for areas that do not use flowgates. If “Flowgate” monitoring is required, this item should include a link to the official list of NERC Flowgates so that the “Responsible Entity” knows where they need to install DDRs. This requirement will also lead to installation of equipment that provides practically no value to the Purpose of this standard. For example, the NY-NE interface is one of the official NERC Flowgates, which means that ISO-NE will need a DDR at each of eight stations that interconnect with New York; NYISO will need to do the same and lead to the

Organization	Yes or No	Question 4 Comment
		installation of unnecessary, redundant equipment. DDR location requirements for ERCOT, Hydro-Quebec, and the Western Interconnection do not define major transmission interfaces or major transfer paths, allowing for arbitrary interpretation. Also, for the Western Interconnection, responsibility is placed on the "Regional Entity" and not a "Responsible Entity" like the Reliability Coordinator or Planning Coordinator. Comment on R6.1.5 - this will require Reliability or Planning Coordinators to call for the installation of DDRs at HVDC facilities that are smaller than the generator requirement listed in R6.1.3 (500 MW). If this requirement is retained, it should be specify "... HVDC facilities greater than 500 MW..." Comment on R6.1.6 - This requirement could lead to installation of DDRs at many, many substations in New England just to capture one flow or voltage that is part of an IROL. Also, DDR data is of little value for IROLs that are thermal in nature. General comment on 6.1.3 through 6.1.7: The level of detail specified in these items eliminates the role of the RC/PC who are best able to determine appropriate locations for DDRs. This requirement should recommend locations and not attempt to precisely specify where DDRs should be installed. These requirements could be rephrases as follows: "The RC/PC shall specify DDR locations that serve the Purpose of this standard (To have adequate data available to facilitate event analysis of BES disturbances). The RC/PC should consider specifying locations that include generators and HVDC facilities greater than 500 MW, major transmission interfaces, transfer paths, flowgates, voltage sensitive areas..."

Response: The Responsible Entity is used in this standard to refer to either the Planning Coordinator or Reliability Coordinator (NERC registered entities) based on Interconnection. This is detailed in the Applicability Section 4 of the Standard. This helps simplify the requirement verbiage and application to each Interconnection.

Organization	Yes or No	Question 4 Comment
Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring). The Regional Entity is used in the Western Interconnection for determining the "major transmission interfaces" because they have a well-defined list of interfaces (such as the WECC Path Rating Catalog) that have been studied and considered "major". Others such as ERCOT and Hydro-Quebec will have the Planning Coordinator or Reliability Coordinator develop a similar list of interfaces as described above, with recommendation from a guideline document provided. The DMSDT believes that all HVDC should be included and Part 6.1.5 (revised to be Part 5.1.3) has been revised to reflect this. The DMSDT notes that each TO is only responsible for DDR data for the elements that they own.		
ITC	No	6.1.4 for Eastern Interconnection "permanent Flowgates" rather than using a blanket approach to require DDR on all defined Flowgates, they should be selectively placed on those Flowgates that have a chronic congestion history. The DDRs should be placed on the defined monitored element(s) of permanent flowgates that exhibit a history of chronic congestion.
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		

Organization	Yes or No	Question 4 Comment
Kansas City Power & Light	No	The inclusion of all permanent flowgates is our objection. This requirement will result in the inclusion of monitoring points that are not necessarily critical to the BES. The approach of the Western Interconnection to include all major transfer paths as defined by the Regional Entity seems to be a more logical approach.
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		
LCRA Transmission Services Corporation	No	Not cost-effective based on cost of improvements vs. benefit. TO installations adequately address requirement. VRFs are all in the "Lower" range which supports the fact that the requirements are unnecessary. Reference recent actions related to Paragraph 81.
Lower Colorado River Authority	No	Not cost-effective based on cost of improvements vs. benefit. TO installations adequately address requirement. VRFs are all in the "Lower" range which supports the fact that the requirements are unnecessary. Reference recent actions related to Paragraph 81.
Response: The DMSDT has considered cost effectiveness compared with reliability benefit, and the CEAP is further considering this issue. The DMSDT acknowledges the use of "Lower" VRFs and notes the criteria for a "Lower VRF": 1) "if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system", 2) if violated, would not hinder the "ability to effectively monitor and control the bulk electric system", and 3) is a "requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to		

Organization	Yes or No	Question 4 Comment
adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system." This requirement meets the guidelines for a Lower VRF.		
Liberty Electric Power LLC	No	The standard is too prescriptive for DDR. The TO should select the sites, install and maintain the DDR they properly need to analyze a disturbance on their system. The standard should simply require "DDR shall be installed as necessary to analyze a fault on the TO's system". Violations of the standard would only occur if a fault is unable to be analyzed due to equipment not being installed (not due to failure or outage of installed equipment).
Response: The DMSDT has considered cost effectiveness compared with reliability benefit, and the CEAP is further considering this issue. **DDR is not used to analyze a fault on a TO's system, and is intentionally not used during unbalanced fault system conditions due to the RMS representation of waveform data. Fault Recording is used during fault conditions when the system is in an unbalanced operating condition rather than DDR data. The use of language such as "as necessary" is ambiguous and unenforceable. From a wide-area perspective, the Responsible Entity (RC or PC) has the tools and knowledge to specify DDR data locations.**		
N/A	No	1. Requirement R6.1.5 - Consideration should be given to address the case when the ends of HVDC terminals (back-to-back or each terminal of a DC circuit) on the AC portion of the converter are owned by different entities 2. Requirement R6.1.6 - Justification should be provided on the technical justification for all Elements associated with IROLs to be monitored. The NERC lists including all elements associated with IROLs are very extensive, thus significantly increasing the number of the DDRs that need to be installed.
Response: (1) The DMSDT believes that all HVDC should be included and has revised Part 6.1.5 (now Part 5.1.3) to reflect this. The DMSDT notes that each TO is only responsible for DDR data for the elements that they own.		

Organization	Yes or No	Question 4 Comment
(2) Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		
Oncor Electric Delivery	No	The R6.1 sub-requirement describes minimum locations. There are no limitations on the DDR requirements written into the standard language. This could potentially lead to the Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) overburdening the TO/GO with the volume of included locations. The language in R1 provides a "20%" audit curtailment for the FR/SOER but there is no similar language for the DDRs in R6.
Response: In terms of checks and balances for the Responsible Entity, the intent of the standard is not to implement unnecessary or excessive DDR for collecting wide-area data; rather, the intent is to capture sufficient data for the standard's purpose. The Responsible Entity should not impose excessive DDR data requirements on its respective TOs and GOs. To accommodate this concern, a list of "major transmission interface" criteria has been developed and put in Part 5.1.2 for selecting these "major" interfaces, attempting to minimize ambiguity and excessive requirements.		
PJM Interconnection	No	PJM is concerned about the specificity for determination as to the number and location of where DDR will be required per this requirement. Our concerns include the number of DDRs may be sufficient for monitoring but not for data validation. Monitoring lines may not provide the data to adequately perform disturbance analysis. Additionally, the requirement may result in an unnecessary number of installations.

Organization	Yes or No	Question 4 Comment
		We urge the DMSDT to provide for the PC to determine the number and location of the devices. Additionally, use of the NERC book of flowgates may not support again the necessary data required because every line in a Flowgate or IROL, IROLs is not always dynamic limited.
Response: The DMSDT has considered locations and Elements for DDR and chosen selected Elements for DDR since DDR may not be needed for all Elements at a particular location. The DMSDT agrees that the number of DDR for this standard is sufficient for monitoring and disturbance analysis; however, the number may be insufficient for model validation purposes. Disturbance monitoring for event analysis is the purpose of this standard with system and model validation an ancillary benefit. **For the Eastern Interconnection, the PC determines the Elements for which DDR data is required.** **Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).**		
ReliabilityFirst	No	Requirement R6, Part 6.1.3.2 - For Requirement R6, Part 6.1.3.2 ("Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA), does this mean only individual units which are greater than 300 MVA and part of plant need to have DDRs? If this is the case, it appears that a plant that has five 200 MVA units does not require DDRs. Is this the DMSDTs intent? ReliabilityFirst believes any plant/facility that has an aggregate nameplate greater than 1000 MVA, should have equipment capable of DDR.

Organization	Yes or No	Question 4 Comment
Response: **The 300 MVA capacity limit for individual units at large generating facilities with aggregate nameplate rating of 1000 MVA is used to capture only those "large" units at that plant and to mitigate the need for installing DDR equipment for relatively small generating units at a facility. The DMSDT and industry subject matter experts analyzed the NERC GADS data, and feel the 300 MVA lower MVA capacity limit is sufficient for capturing response of generating resources of interest.**		
Colorado Springs Utilities	No	
American Transmission Company, LLC	Yes	The criteria for selecting Elements requiring DDR in Requirement R6 are mostly acceptable. However, ATC recommends the consideration of the following wording changes: a. For R6 - Simplify the beginning with wording like, "Each Planning Coordinator or Reliability Coordinator (as applicable) shall . . ." b. For R6.1 - Specify more clearly that R6.1 is limited to BES Elements with wording like, "The BES Elements shall include the following:" c. For R6.1.1 - Make each sub requirement consistent with the parent R6.1 subject of "Elements" with wording like, "Elements at a minimum of one DDR location per . . ." d. For R6.1.2 - Make each sub requirement consistent with the parent R6.1 subject of "Elements" with wording like, "Elements at a minimum of one DDR location in . . ." e. For R6.1.3 - Add more clarity regarding the applicable Elements with wording like, "Elements at DDR locations, which interconnect the following generation resources to BES transmission buses:" f. For R6.1.4 - Make each sub item consistent with the parent R6.1 subject of "Elements" with wording like, "Elements necessary to monitor the following items:" g. For R6.1.4, bullet item 1 - Limit the scope of this item to only major permanent flowgates (similar to the other three bullets), rather than all permanent flowgates

Organization	Yes or No	Question 4 Comment
		(which generally includes all BES circuits), and allow the Planning Coordinators to define what "major" means with wording like, "Eastern Interconnection - all major permanent Flowgates as defined by the applicable Planning Coordinator."
Response: The wording and Part/sub-Part numbering in Requirement R6 (R6 and R7 have been combined into R5) in the latest revision of PRC-002-2 have been revised in response to comments received.		
Northern California Power Agency	Yes	Generally yes; however this should be consistent with WECC's continued synchrophasor program
Response: The WECC WISP installations can and should be considered when meeting the Requirement R6 (now R5) Element selection requirements.		
Texas Reliability Entity	Yes	(1) The DMSDT should clarify the meaning of "major transmission interfaces" in 6.1.4, as this is an undefined term that will lead to considerable debate about what a "major" interface is. (2) The DMSDT may also want to consider applying DDRs to Elements with a known angular stability issue or subsynchronous resonance issue that does not rise to the level of an IROL.
Response: Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring).		

Organization	Yes or No	Question 4 Comment
While subsynchronous resonance (SSR) and angular stability are not primary Parts/sub-Parts , it is expected that other DDR location requirements nearby could suffice for SSR purposes.		
Xcel Energy	Yes	We agree, however some clarity should be added: 1) In R6, mention is made of both Elements and locations for locating DDR. Is the intent to have the location be an entire substation, an entire bus, or a single Element? Or is that entirely at the discretion of the Responsible Entity? 2) R6 refers to generating resources with individual nameplate capacities. For a combined cycle plant, does the individual nameplate capacity of the resource refer to the combined unit or the individual turbines? Recommend making this more clear. 3) Is the list in R6 intended to be an all-inclusive list or is it a minimum list? If it is a minimum list, there is a concern that the standard may allow one entity to put increased costs on another entity, for example a Reliability Coordinator that wants a DDR on every generator, regardless of size. We ask the DMSDT work to address this issue. We recommend that the DMSDT determine the list of places that need a DDR and redraft the requirement to eliminate the responsible entities of the RC and PC and instead just require the owner of elements that meet the specifications install DDRs.
Response: (1) The DMSDT has revised the requirement to remove the use of "locations". **(2) Wording has been added to the Guidelines for R6 (now R5) to clarify generating resource issues.** **(3) The DMSDT notes that this is an all inclusive list and that Part 6.1.3 (now Part 5.1.1) specifies which generators are included. An RC or PC may not ask for DDR data on any other generation. In terms of checks and balances for the Responsible Entity, the intent of the standard is not to implement unnecessary or excessive DDR for collecting wide-area data; rather, the intent is to capture sufficient data "to facilitate event analysis of Bulk Electric System (BES) disturbances." Therefore, the Responsible Entity should not require excessive DDR data requirements on its respective TOs and GOs. To accommodate this concern, a list of "major**		

Organization	Yes or No	Question 4 Comment
transmission interface" criteria has been developed and put in Part 5.1.2 for selecting these "major" interfaces, attempting to minimize ambiguity and excessive requirements.		
Dominion	Yes	However, clarity is needed under 6.1.3 to understand how to add up the MW ratings of combined cycle unit generators and cross compound generators. Some examples will be most helpful. Also clarity is needed in requirement 6.1.4 when you refer to "monitor all Elements of: all permanent flowgates". If a flowgate is made up of a combination of several transmission lines and transformers, does every line need to be monitored? Do both ends of the lines need to be monitored? Does every transformer need to be monitored (lowside or highside side)? Please show some typical examples. Also, under requirement 6.1, it may be better to move the minimum quantities requirements 6.1.1 (minimum 1 DDR per 3000m MW) and 6.1.2 (minimum 1 DDR per RE footprint) to the end of the list. In that way the requirements for 6.1.3 (Generation resources), 6.1.4 (Flowgates, etc...), 6.1.5 (HVDC), 6.1.6 (IROLs) and 6.1.7 (UVLS) will be stated up front as non-negotiable requirements, and state that additional DDR locations are only needed if fulfilling the first 5 does not meet the two extra minimum quantities requirements.
Response: The Guidelines for R6 (now R5) clarify the generating resources specified. **Based on numerous comments, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts are being updated according to industry input as follows. Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer term disturbances on these key interfaces; however, only one Element is required. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by**		

Organization	Yes or No	Question 4 Comment
the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission system coverage of disturbance monitoring). Transformers must be monitored only if they are identified as Elements by the Responsible Entity per the sub-Parts in Requirement R6 (Requirement R6 now R5). The DMSDT has revised R6 (now R5) for clarity.

Wisconsin Electric Power Company	Yes	

5. Do you agree with the VRFs/VSLs and the Drafting Team's justification? If not, please explain why.

Summary Consideration: Of the comments received for this question, the most common concern was for the use of percentages in determining the severity levels for VSLs. The DMSDT used this approach because of the various BES Elements that recording data will be required for, and it would provide a fair foundation for VSL judgment. The DMSDT also felt that the time frames used in the VSLs were reasonable, and met the desired goal of having recording data expeditiously available. All VSLs and VRFs meet the NERC and FERC Guidelines.

Organization	Yes or No	Question 5 Comment
ACES Standards Collaborators	No	We do not support the standard as written, as it should be consolidated into fewer requirements and should take a more streamlined approach. Since we do not support the standard, we cannot support the corresponding VRFs and VSLs.
Response: The DMSDT combined R1 and R2 (into what is now R1), and R6 and R7 into what is now R5 but did not see any other combinations that would help clarify the standard.		
Arizona Public Service Company	No	R2 and R7 have 10 day time limits before elevating to the next Violation Security Level. This is too short and should be increased to 30 days.
Response: The DMSDT believes the 10 day step before elevating to the next VSL is adequate. In R2 (R1 and R2 have been combined into R1) the Transmission Owner has 90 calendar days to notify Element owners, and in R7 (R6 and R7 have been combined into R5) the Responsible Entity has 90 calendar days to notify the necessary Transmission Owners and Generator Owners. The 10 day steps on top of the initial 90 days are not unreasonable and reflect the importance of those requirements in the standard.		

Organization	Yes or No	Question 5 Comment
Bonneville Power Administration	No	BPA feels that R6 should remove “x percent” of the identified Elements (or Busses) and keep the time-based VSL.
Response: Because of the various Elements identified to have DDR data, it was decided that a fair evaluation of compliance would include the percentage of Elements identified, or a time frame to have that responsibility completed by.		
Corporate Compliance/Engineering	No	Referring to comments for Question 2 on this Comment Form, it would be prudent to at first require a subset of the Fault Recording, SOER and DDR to be up and running and monitored for a time. Then NERC, WECC and entities can refine the standard based upon what we learn. In a nutshell, we should start small.
Response: The DMSDT understands that the industry has experience with installing DME and collecting disturbance monitoring data and there is no need for the implementation of the standard as suggested.		
Florida Municipal Power Agency	No	Please see response to question 7.
Response: Please see the DMSDT response to Question 7.		
Nebraska Public Power District (NPPD)	No	“directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation...” I recommend these be moved to Moderate levels if not lower to match the criteria.
Response: The quote above comes from NERC’s Violation Risk Factors document High Risk Requirement Section. VRF Lower was selected because its definition meets what is required by Disturbance Monitoring. The DMSDT agrees the VRF should be lower. The VSLs are written to address how severely an entity violated a requirement. It is appropriate to have multiple levels because this only addresses the extent to which the violation of the requirement occurred, not the impact to the Bulk Electric System.		

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	The VSLs don’t take into account the size of responsible entity. Larger entities should be given more time.
Response: The sizes of the responsible entities were considered during the drafting of the standard, and the times presented were considered to be fair for all size entities.		
Tacoma Power	No	Considering the VSLs for Requirement R4, using “the product of the total number of monitored BES Elements and the number of specified electrical quanitities per each Element” would work well for current on the Element, but what about bus voltage shared by DDR on multiple Elements? Considering the VSLs for Requirements R4, R5, R8, R9, and R11, would it be more appropriate to base the percentages on how many required BES bus locations or BES Elements have the minimum recording properties, electrical quantities, or other specifications/parameters? (Consider the language in the VSLs for Requirement R10.) It seems like determining a percentage of the total recording properties, electrical quantities, or other specifications/parameters may be difficult in some cases. An example (scenario) of how these VSLs, as written, would be applied may be helpful.Should the Severe VSL for Requirement R11 be written something like the following? “The Transmission Owner or Generator Owner implemented Dynamic Disturbance Recording that meets less than or equal to 10% of the total recording properties as specified in Requirement R11.” In other words, is ‘1%’ intentional?Considering the VSLs for Requirement R13, are the percentages based upon (1) BES bus locations, or BES Elements; (2) recording properties, or electrical quantities; (3) length of data recorded; or (4) a combination? An example (scenario) of how these VSLs, as written, would be

Organization	Yes or No	Question 5 Comment
		applied may be helpful.In the VRF/VSL Justification, the FERC VSL G3 comment for Requirement R11 is missing (page 34).
Response: (1) Requirement R4 (now Requirement R3) does not apply to DDR. **(2) This methodology, from a compliance standpoint, makes it easier for the entity to receive credit for incomplete monitoring of bus locations or Elements.** **(3) The percentages in R13 (Requirement number now R11) refer to the total amounts of data that should have been available.** **(4) The DMSDT has made a revision to the VSL for Requirement R11 (now R9). The FERC VSL G3 comment for R11 (now R9) was added.**		
Tennessee Valley Authority	No	We believe that the time frames in the violation severity levels are too stringent when compared to the other items in the same violation level. A relatively short term delay in communication (30 to 60 days) is much less severe than not performing a function. Suggest lengthening out time frames.
Response: Communication is the foundation for defining what data has to be retrieved to do an analysis, and cannot be discounted. The DMSDT believes the time frames are fair.		
Exelon Companies	No	We don't agree that R3 is necessary at all, see item 7 comments. In a large company hundreds of pieces of equipment require monitoring. If one item out of hundreds are missing, the effect on monitoring is minimal. The DMSDT should consider changing the lower violation severity level to more than X% but less than 95% (instead of 100%). Zero tolerance approaches, especially on standards that "look back" and support analysis are unnecessary and wasteful of engineering resources.

Organization	Yes or No	Question 5 Comment
Response: Regarding Requirement R3 (Requirement R3 now R2) comment, see response in Question 7. **The VSL are written in accordance with FERC guidelines and only come into play when the standard has been violated.**		
Northern California Power Agency	No	No because I do not support the registraton process
Response: Thank you for your comment.		
ReliabilityFirst	No	VSL for Requirement R3 (the same rationale in this comment also apply to the VSLs for Requirement R4,R5, R8, R9, R10 and R11) - ReliabilityFirst believes the gradation of VSLs should be in 10% increments (or similar to the VSL designations for Requirement R1). For example, if an entity only implemented 59% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers, this does not meet the intent of the requirement and therefore should be a "Severe" VSL.
Response: The DMSDT believes the percentages selected are appropriate for the referenced requirements.		
ISO New England Inc.	No	The VSL for R6 calls for the Reliability Coordinator or Planning Coordinator to have "accurately identified the Elements for DDR as directed by Requirement R6". The term "accurately" should be deleted.
Response: The DMSDT has removed "accurately" from the R6 VSL.		
IRC Standards Reveiw Committee	No	

Organization	Yes or No	Question 5 Comment
Liberty Electric Power LLC	No	
SPP Standards Review Group	Yes	We note in several of the Severe VSLs that quantifiers of greater than 0% but less than 10% are used. However, in Requirement R11, the quantifiers are greater than 1% but less than 10%. Was the 1% intended or should it have also been 0%?
Response: The DMSDT has made a revision to the VSL for Requirement R11 (now R9).

6. Do you agree with the Implementation Plan? If not, please explain why.

Summary Consideration: The concerns of most of the comments received were directed at the length of time required for implementation of Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10), and R13 (now R11). The schedule for implementation is now to be at least 50% compliant within four (4) years of the effective date of the standard, and 100% compliant within six (6) years of the Effective Date of the standard. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within six (6) years of the Effective Date of the standard.

Organization	Yes or No	Question 6 Comment
ACES Standards Collaborators	No	The implementation plan is confusing. We do not see the need for a phased in plan, where some requirements are enforceable before others. Assuming standard continues to be developed which we do not support, we recommend consolidating the entire standard to two or three requirements and propose a straight forward implementation plan.
Response: The Implementation Plan was developed based on the technical content of the requirements. The Background Section of the Implementation Plan contains further details. Requirements R1 (R1 and R2 have been combined into what is now R1) and R7 (R6 and R7 have been combined into R5) set the basis for data that is required under other requirements. These must be implemented prior to the data requirements.		
Corporate Compliance/Engineering	No	Referring to comments to Question 2, it would be prudent to at first require a subset of the Fault Recording, SOER and DDR to be up and running and monitored for 2-3 years. Then NERC, WECC and entities can refine the standard based upon what we learn. In a nutshell, we should start small.
Response: In consultation with the NERC event analysis team, the standard requirements are developed to establish the minimum continent wide requirements for DME. It is not necessary to “test out” a subset.		

Organization	Yes or No	Question 6 Comment
Dominion	No	Recommend updating the “entity” for the following requirements on the Implementation Plan Summary:R8 - TOR9 - GOR10 - TO/GO
Response: The Implementation Plan has been corrected. In the latest draft of the standard Requirement R8 is R6, R9 is R7, and R10 is R8.		
Florida Municipal Power Agency	No	Please see response to question 7.
Response: Please see the DMSDT response to Question 7.		
MRO NSRF	No	According to the Implementation Plan, the STD makes it clear that this Standard reflects the need for data, not the equipment used to collect the data. In addition, the DMSDT has already identified that there is already a significant amount of SOER, FR, and DDR equipment currently employed on the BES. The NSRF wants to point out that Section 215 of the Federal Power Act states that the ERO cannot order the construction of additional generation or transmission assets. The NSRF views the purchasing of equipment to provide "data" as construction. The Implementation Plan states that Generator Owners and Transmission Owners may be required to schedule outages to install or implement SOER, FR, and DDR equipment. Installing or implementing of SOER, FR, and DDR equipment is construction because it changes the current equipment configuration to a different configuration. To build on this point, Requirement 12 has the requirement to synchronize the time element. We believe this can only happen with some sort of satellite clock/ gps device, requiring the purchase of said additional device.

Organization	Yes or No	Question 6 Comment
Response: The DMSDT does not interpret the installation of DME equipment as the construction of generation and transmission assets and therefore meets the intent of Section 215. The standard requires the provision of data.		
Nebraska Public Power District (NPPD)	No	It is recommended to have 5 years to become compliant instead of 4 years to match this with the reassessment activities. Since there is no method to track the various percent compliant for the 2nd and 3rd years it is recommended to require 100% compliance by the final year.
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to: • **At least 50% compliant within four (4) years of the Effective Date of PRC-002-2100% compliant within six (6) years of the Effective Date.** **Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.**		
North American Generator Forum - Standards Review Team (NAGF-SRT)	No	Disagree. Smaller generators who may be drawn into the standard are likely to have only one location to install equipment. This would require 100% compliance within 2 years of notification. If notification occurs soon after a major outage, the generator may be forced to take an unneeded outage just to comply with the standard. Suggest adding the following: For entities with fewer than four locations identified by the TO, entity shall be 100% compliant within four years with no compliance required prior to that date.

Organization	Yes or No	Question 6 Comment
Response: There is a note in the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) that states: **Note: Entities that own only one (1) identified BES bus , BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.**		
Northeast Power Coordinating Council	No	Recommend updating the "entity" for the following requirements on the Implementation Plan Summary: R8 - TOR9 - GOR10 - TO/GOThe Implementation Plan doesn't take into account the size of responsible entity. Larger entities should be given more time (see response to Question 5).
Response: After receiving input from industry, the time frames are reasonable for all size entities.		
Pepco Holdings Inc & Affiliates	No	1) Implementation for Requirement R14, as presently written, applies 9 months after the standard is approved. This requirement needs to be clarified. It should only apply to those SOE, FR, and DDR devices that have been installed in accordance with, and meet the requirements of, this standard. Legacy DME equipment that may exist at one of the busses identified in R1, which does not meet the requirements of this standard, should not be subject to Requirement R14, until the equipment is upgraded, or replaced, to meet the full requirements of this standard. This clarification needs to be made, or, the implementation for R14 should be moved to coincide with the timetable for Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13.

Organization	Yes or No	Question 6 Comment
		2) The timetable for implementation of Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13 allows an entity that owns only one bus location four years to achieve compliance. However, Entities must be compliant with a reassessed list from Requirement R1, Part 1.2 or R6, Part 6.2 within three years following notification of the list. Why this discrepancy? Four years seems appropriate in both cases, in order to schedule the numerous outages necessary to install the equipment, particularly if generation units are connected to the bus.
Response: Requirement R14 (now R12) is intended to only apply to data recording that meets the requirements of PRC-002-2. The DMSDT does not intend for legacy equipment that might not meet the intent of the requirement to be applicable under R14 (now R12). The standard is not concerned with "how" the data is recorded, but "what" data is recorded. We have changed the Implementation Plan to reflect this by having R14 (now R12) become effective three years after approval of the standard. This coincides with the newly revised Implementation Plan whereby entities have to be 50% compliant with the data requirements within four years. R14 (now R12) has been revised to indicate that it applies to data recording applicable under what is now R1, and what is now R5. **The DMSDT believes that a reassessment involves an incremental change and will involve fewer requirements for data. Therefore, a three year implementation is appropriate.**		
PPL NERC Registered Affiliates	No	Since there has been previous DME installation guidance provided by Regional efforts (via a Regional Standards or Criteria), it should be assumed that TOs have previously installed DME (SOER, FR, DDRs) equipment in locations specified per the Regional or local requirements. Therefore, requiring TOs to have any new DMEs installed per R1, R6 within 6-9 months of when PRC-002-2 becomes enforceable is not justifiable. There should be a

Organization	Yes or No	Question 6 Comment
		(12-24 month) grace period to install any newly required DMEs (SOERs, FRS, DDRs) per PRC-002-2 R1 and R6. Concur with implementation time frames of R2, R7 and R14 requirements.
Response: Requirements R1 (R1 and R2 have been combined into what is now R1) and R7 (R6 and R7 have been combined into R5) require determining the list and then providing notification to others. It does not require data recording capability to be implemented during this time frame.		
SERC Protection and Controls Subcommittee	No	1. Extend the GO 100% requirement to 6 years because it better matches the typical major unit overhaul schedule for the large units and plants that this standard targets. 2. Clearly state that the TO / GO has 3 years to attain 100% for any newly identified locations in the five year review.
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to: **At least 50% compliant within four (4) years of the Effective Date of PRC-002-2** **100% compliant within six (6) years of the Effective Date** **Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.** **The DMSDT has included a note in the Implementation plan which states: "Entities shall be 100% compliant with a reassessed list from Requirement R1 (R1 and R2 have been combined into what is now R1), or R5 (was R6 and R7) within three (3) years following notification of the list."**		

Organization	Yes or No	Question 6 Comment
Southern Company	No	Referencing Note 9 of the Background section, 'Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant'; we feel the requirement to be '25% compliant within two (2) years following notification of the list' is problematic and overly burdensome for both TOs and GOs. We feel that a more appropriate time frame for implementation would be as follows: o At least 25% compliant within three (3) years following notification of the list o At least 50% compliant within four (4) years following notification of the list o 100% compliant within five (5) years following notification of the list
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to: At least 50% compliant within four (4) years of the Effective Date of PRC-002-2 100% compliant within six (6) years of the Effective Date. Note: Entities that own only one (1) identified BES bus , BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.		
Tacoma Power	No	The disagreement is not so much with the implementation plan itself but whether part of the implementation plan should reside within the standard itself. More specifically, should part of the implementation plan be included under Requirements R3, R4, R5, R8, R9, R10, R11, R12, and R13? Of primary concern are BES bus locations or BES Elements that are added as part of the review at least once every five calendar years. An implementation plan normally

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 6 Comment</th></tr>
<tr><td></td><td></td><td>addresses phasing in of the standard, or new version of the standard, not ongoing implementation.</td></tr>
<tr><td colspan="3">Response: The Implementation Plan is approved in the same manner as the standard. It is balloted along with the standard, approved by the BOT and filed with regulatory authorities simultaneously with the standard. The Implementation Plan and its provisions will remain separate from the standard.

The following has been added to the end of the Implementation Sections:

Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.</td></tr>
<tr><td>Ameren</td><td>No</td><td>We request the DMSDT to make the following changes:

(1) Add 1 month to item 3 for the TO to identify BES Elements in R1.

(2) Delete ‘bus locations and’ in item 6 so that the total percentage (%) is based on BES Elements throughout the Implementation Plan. There are bus locations at which there are several different owners of the BES Elements.

(3) Replace ‘24 months or more’ with ‘up to 60 months’ in item 9.

(4) The Implementation Plan Summary is very helpful but the Entity is incorrect for R8, R9, and R10.</td></tr>
<tr><td colspan="3">Response:

1) The DMSDT believes that there is sufficient time to implement the standard.</td></tr>
</table>

Organization	Yes or No	Question 6 Comment
2) Item 6 is just an informational statement. Requirement R1 (Requirements R1 and R2 have been combined into what is now R1) addresses BES buses while Requirement R6 (now R5) addresses BES Elements. The statement in item 6 provides appropriate information regarding these two requirements. **3) Item 9 is an informational statement only. There are instances where outage cycles are as short as 24 months, but they can also be much longer.** **4) The table has been revised to reflect the latest updates to the standard and Implementation Plan.**		
American Electric Power	No	We believe the implementation plan will be sufficient, however we cannot state that with absolute certainty until the completion of the identification processes in R1 and R6. At this time, the actual scope is still unknown.
Response: Thank you for your comment.		
CenterPoint Energy Houston Electric	No	CenterPoint Energy is concerned the proposed Implementation Plan does not allow sufficient time for entities to make arrangements with other entities or, if needed, to install required devices or communication devices. Based on Requirement R6 the ERCOT Region would require approximately 18 - 20 DDR's and several times that amount of SOER's. The installation of DDR's and SOER's would require scheduling outages on possibly hundreds of pieces of equipment. The scheduling and coordination of this amount of planned outages is simply not possible within the allotted time frame. CenterPoint Energy recommends expanding the Implementation Plan to three to five years.
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to:		

Organization	Yes or No	Question 6 Comment
At least 50% compliant within four (4) years of the Effective Date of PRC-002-2 100% compliant within six (6) years of the Effective Date. Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.		
Dairyland Power Cooperative (DPC)	No	It is unclear what the implementation time frame is for newly identified facilities after the original implementation of the standard. Should a facility be identified in the future as requiring a SOER, FR or DDR it is unclear how long the responsibility entity has to install equipment to capture the necessary data to be compliant.
Response: **There is a section of the Implementation Plan which states: "Entities shall be 100% compliant with a reassessed list from Requirement R1 (now R1), or R5 (wasR6) within three (3) years following notification of the list."**		
Dynegy	No	The two/three/four year requirement for a GO to be 25%/50%/100% compliant should be increased to three/four/five years to give more time to budget these large capital expenditures.
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to: At least 50% compliant within four (4) years of the Effective Date of PRC-002-2 100% compliant within six (6) years of the Effective Date.		

Organization	Yes or No	Question 6 Comment
Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.		
Entergy Services, Inc.	No	Clearly state the time frame required for implementation of newly identified locations resulting from the R1 five year assessment.
Response: There is a line at the end of the Implementation Plan Sections of the Implementation Plan which states: **"Entities shall be 100% compliant with a reassessed list from Requirement R1 (now R1), or R5 (was R6) within three (3) years following notification of the list."**		
Idaho Power Company	No	Protection Engineering: The 4 year implementation plan could be challenging to fit into our project process. We employ a 3 year cycle with definition in year 1, scope/design in year 2, and construction in year 3. Any delays in any given year could cause us to exceed the requirement.
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to: **At least 50% compliant within four (4) years of the Effective Date of PRC-002-2** **100% compliant within six (6) years of the Effective Date.** **Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.**		
ISO New England Inc.	No	Installation of potentially 200 additional DDRs will take far longer than the time specified in the Implementation Plan.

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 6 Comment</th></tr>
<tr><td colspan="3">Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to:
At least 50% compliant within four (4) years of the Effective Date of PRC-002-2
100% compliant within six (6) years of the Effective Date.

Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.</td></tr>
<tr><td>Kansas City Power & Light</td><td>No</td><td>We do not agree based on our earlier comments in regards to Attachment 1.</td></tr>
<tr><td colspan="3">Response: Please see the DMSDT response to those comments in Question 2.</td></tr>
<tr><td>Liberty Electric Power LLC</td><td>No</td><td>See the NAGF SRT comments. Smaller entities who may have one SOE system to install will be forced to comply 100% within two years.</td></tr>
<tr><td colspan="3">Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to:
At least 50% compliant within four (4) years of the Effective Date of PRC-002-2
100% compliant within six (6) years of the Effective Date.

Note: Entities that own only one (1) identified BES bus , BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.</td></tr>
<tr><td>Manitoba Hydro</td><td>No</td><td>The times for meeting requirements R1 and R6 are adequate.
However, the time of 9 months required for complying with requirements R2, R7 and R14 is too short, especially considering that R14 may require troubleshooting, testing,</td></tr>
</table>

Organization	Yes or No	Question 6 Comment
		shipping, repairs, possible replacement of the failed FR, SOER or DDR, possible discussions with suppliers, design and drawing considerations if the replacement is not identical, etc. Given the existing demands on maintenance and design staff, and the need to also develop a corrective action plan for the Regional Entity, the DMSDT should consider extending this time.
Response: Requirements R2 (now R1) and R7 (R6 and R7 have been combined into R5) only require notification of identified buses or Elements. Requirement R14 (now R12) requires an entity to restore the recording capability OR develop a corrective action plan (CAP) within 90 days. The CAP should identify a timeline within which the repairs will be completed. Repairs do not necessarily have to be within 90 days but must take into account design and maintenance considerations. The intent of the requirement is to restore recording capability as soon as practical while taking into consideration workload and other factors which may hinder timely repairs.		
Northern California Power Agency	No	I do not agree with the registration
Response: Thank you for your comment.		
Portland General Electric Company	No	Portland General Electric Company (PGE) appreciates the standard DMSDT's efforts in crafting this proposed standard and understands the importance of the data that will eventually be available once the standard is implemented. However, a four (4) year implementation window may not be enough time if an entity is required by its Responsible Entity (in our case, the RC) to install several disturbance monitoring units.

Organization	Yes or No	Question 6 Comment
		It is interesting to note that an entity that has only one element to implement has the entire 4 year window to do so. However, if an entity has 2 elements, for example, that entity does not get 8 years to implement but, in effect, has half the time. The more elements required to be implemented, the less overall time an entity has to do so. PGE suggests letting the RC develop an implementation time frame based on the elements it determines an entity needs to install. Depending on the number of elements required, an entity would be considered compliant as long as it was meeting specified and agreed upon milestones. The triggering of the negotiated time frames could be based on a pre-determined number of elements, i.e. >4, or on a business-justified request from the entity for an extended implementation window. To suggest that an entity is non-compliant because all necessary projects are not fully completed after a 4 year implementation window fails to distinguish between entities that have taken no action whatsoever and entities that have projects and activities in progress well ahead of the effective date of this proposed standard.

Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to:

At least 50% compliant within four (4) years of the Effective Date of PRC-002-2
100% compliant within six (6) years of the Effective Date

Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.

Organization	Yes or No	Question 6 Comment
Wisconsin Electric Power Company	No	Item 5 This item references a nine month time frame associated with R14. There does not appear to be any such time frame listed under R14. Since the required in-service dates for DME are from two to four years, that time frame should determine the compliance date for R14.
Response: Requirement R14 (now R12) is intended to only apply to data recording that meets the requirements of PRC-002-2. We have changed the Implementation Plan to reflect this by having R14 (now R12) become effective nine (9) months after approval of the standard. This coincides with the newly revised Implementation Plan whereby entities have to be 50% compliant with the data requirements within four years.		
Xcel Energy	No	1) Our concern with the implementation plan is that its milestone requirements are significantly different from requirements for similar equipment in PRC standards that are now awaiting final FERC approval. Specifically, PRC-019, PRC-024, & PRC-025 involve the same facilities and all have 5 year implementation plans (with some caveats). Yet the implementation plan for PRC-002 is 4 years. When entities are considering work planning and execution, it would be more efficient to provide an implementation schedule that allows 'campaigns' at generation facilities to address all of the protective system equipment changes due to the suite of PRC standards under one maintenance project. (This is especially critical when considering this work will likely require an outage.) Therefore, Xcel Energy recommends PRC-002 utilize the same phased in schedule as PRC-019, PRC 024 and PRC-025. At a high level, the modification would be to change the implementation plan to:[Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13:-Where determined by the Generator Owner, Transmission Owner, or Distribution Provider that additional

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 6 Comment</th></tr>
<tr><td></td><td></td><td>equipment is not necessary, the first day 60 months from notice of applicability of R1 or R6.-Where determined by the Generator Owner, Transmission Owner, or Distribution Provider that additional equipment is necessary, the first day 84 months.]

2) Finally, the standard is written such that the requirements are phased in over time. However, there is no period identified for the TO or GO to become compliant after any change in the points identified.

As an example, in 2020, if the TO determines in R1 that a new point needs a device, R2 allows them 90 days to notify the owner of that equipment. Yet, for R3, R6 and R7 there is no established period of time for the TO or GO to make such an installation.

We recommend the DMSDT add in an implementation period for newly identified points beyond the immediate phased-in implementation of the standard.</td></tr>
<tr><td colspan="3">Response:

1) The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11) to:

At least 50% compliant within four (4) years of the Effective Date of PRC-002-2
100% compliant within six (6) years of the Effective Date.

Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.

2) The Implementation Plan provides three years for TO or GO to be 100% compliant with a reassessed list.</td></tr>
<tr><td>Colorado Springs Utilities</td><td>No</td><td></td></tr>
</table>

Organization	Yes or No	Question 6 Comment
Western Area Power Administration	Yes	Overall, the implementation program appears reasonable. However, the work involved is linked to the requirements of the standard which could possibly change. The requirements of R6 may be difficult to meet as written. See comments under Question 4.
Response: See the DMSDT response to Question 4.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration L.P. believes that the two to four year deployment schedule for recording capability is sufficient.
Response: The DMSDT has revised the Implementation Plan for Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10) and R13 (now R11)to: **At least 50% compliant within four (4) years of the Effective Date of PRC-002-2** **100% compliant within six (6) years of the Effective Date.** **Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be 100% compliant within six (6) years following notification of the list.**

7. **If you have any other comments that you haven't already mentioned above, please provide them here:**

Summary Consideration: Based on stakeholder comments, the DMSDT made significant revisions to PRC-002-2 including:

- **Combined Requirements R1 and R2.**
- **Combined Requirements R6 and R7.**
- **Removed references to "equipment" and specified data requirements for FR, SER and DDR.**
- **Removed references to "locations" and replaced "bus" with "BES bus"**
- **Updated rationales with clarifications and more general information for each requirement.**
- **Revised Requirement R6 (now R5) for more clarity regarding DDR data requirements.**
- **Revised the VSLs to conform to the revised requirement language.**
- **Added language to the Guidelines and Technical Basis section of the standard.**

Organization	Question 7 Comment
Texas Reliability Entity	(1) For Requirements R2-R5 at substations where there are multiple Transmission Owners, are entities allowed to use a shared FR/SOER, or is each entity individually responsible for the Elements that they own? (2) For Requirement R14, there appears to be an "or" missing following the 1st bullet, "Restore the recording ability, or". The DMSDT may want to consider having the entity reporting DDR failures report to the Responsible Entity as well as the Regional Entity, so that the Responsible Entity can look at possible alternative methods to monitor the Elements required per R7.

Response: (1) The Transmission Owners are allowed to use shared FR/SOER (now SER). The Transmission Owner of the Element for which data is to be captured is responsible for the capture of that data. The standard addresses "what" data must be captured, not "how" it is captured.

(2) A list with bulleted items is an "Or" list for the bulleted items.

Organization	Question 7 Comment
Tennessee Valley Authority	(1) We feel that the first bullet of 5.1 is not needed due to the content of the second bullet. If the team determines that it does need to be kept, a post-trigger record length of 30 cycles for the same trigger point would be adequate. (2) For R14, please provide additional clarity around the fact that if the equipment is returned to service within the 90 day time limit then it does not have to be reported. Respectfully suggest the second bullet to change to, "If not returned to service within 90 days, report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability."
Response: (1) A list with bulleted items is an "Or" list for the bulleted items. "Or" will be added between the bullets of Part 5.1 (now Part 4.1) for clarification. Both bullets of 4.1 are needed to address the Fault Recording that is available to industry. The DMSDT has made the revision to 30 cycles. **(2) The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be submitted to the Regional Entity. R14 (now R12) was revised for clarification.**	
Manitoba Hydro	(1) An acronym is given for each of Sequence of Events Recording (SOER) and Fault Recording (FR) and Dynamic Disturbance Recording (DDR) but the acronyms are never used, and sometimes the full phrase is used without the acronym noted. This occurs throughout the standard and should be made consistent and cleaned up. If the acronyms are not going to be used, there is no need to state them. (2) R1, 1.2 - would be clearer to state 'identified bus locations should be reassessed at least once every five calendar years'. (3) M1 (same applies for all measures) - should be written to say that the entity 'shall have' not 'has'.

Organization	Question 7 Comment
	(4) M1 - the last few words of the measure that deal with 1.2 are not complete - 'assessed within the required interval' should be 'and evidence that the identified bus locations have been reassessed within the required interval'. (5) R2 - would be more consistent with the rest of the standard to refer to 'BES bus locations' rather than 'locations' and 'identified' instead of 'established' and 'identification' instead of 'determination'. (6) M2 - would be more consistent to say 'BES Elements' rather than just 'Elements' and 'at the BES bus locations identified' as opposed to 'established' and 'notice' instead of 'information'. The measure is also missing the time frame. (7) R3/M3/R4 - the reference to Requirement R2 does not seem correct in this context - should be those BES bus locations identified in R1? (8) M3 - the description of the circuit breaker position in M3 is lacking specificity that appears in requirement - '(open/close) for each.....' (9) R4 - for consistency, 'bus locations' should be 'BES bus location' and 'as per' should be 'identified in'. (10) R6, 6.2 - would be clearer to state 'the identified BES Elements shall be reassessed at least once every five calendar years'. (11) M6 - would be more complete to state 'The Responsible Entity shall have a dated (electronic or hard copy) list of BES Elements for which Dynamic Disturbance Recording (DDR) is required as identified in accordance with Requirement R6 and evidence that such identified BES Elements have been reassessed within the required interval.' (12) R7 - reference to 'the locations' needs to be more specific - is this the 'BES bus locations'? To be consistent, 'Elements' should be 'BES Elements' and 'established in' should be 'identified in'. (13) M7 - would be clearer if reference to 'owners' was to 'each Transmission Owner and Generator Owner'. 'established' should be 'identified' to be consistent. (14) R8 - 'Element' should be 'BES Element'. The words 'for which they received notification' could be added after 'own'.

Organization	Question 7 Comment
	(15) R9 - same comments as R8 (16) R10 - the reference to R7 does not seem correct - is this meant to be R8 or R9 as it is these parts that put obligation on the TO and GO, whereas R7 puts an obligation on a responsible entity? Reference to 'equipment' seems vague - is this DDR equipment? (17) M10 - reference to 'data recording' should be to DDR? (18) R11 - as above, the reference to R7 does not seem correct - should be R8 or R9? 'Element' should be 'BES Element'. (19) R12 - as above, reference to R7 should be to R8 or 9? 'Element' should be 'BES Element', 'bus locations' should be 'BES bus locations' and the word 'identified pursuant to' should replace 'as per' to be consistent. (20) R13 - same comments as R12. (21) M13 - the words 'data was submitted' should be replaced with 'that SOER, FR and DDR data was provided to the Reliability Coordinator, Regional Entity or NERC upon request'. (22) R14 - same comments as R12.

Response: (1) The use of acronyms in the standard (including the Rationale Boxes) was reviewed by the DMSDT.FR is for fault recording, SER is for sequence of events recording, and DDR is for dynamic disturbance recording.

(2) Requirements R1 and R2 were combined into what is now R1. Part 1.2 was revised to read that bus identification would be performed upon changes to its portion of the BES OR at least once every five calendar years.

(3) The use of the word "has" is stipulated in NERC Measure writing guidance.

(4) The wording of M1 was revised for clarification. Measures M1 and M2 were combined (into what is now M1).

(5) Requirements R1 and R2 were combined (into what is now R1). Wording was made consistent throughout the standard.

(6) Requirements R1 and R2 and their associated Measures were combined (into what is now R1). Wording was made consistent throughout the standard.

Organization	Question 7 Comment
(7) Requirements R1 and R2 were combined (into what is now R1), and the references revised accordingly. The list is used by the TO and GO to provide the appropriate data recording. (8) Measure M3 (now M2) has been revised to be more specific. (9) The R4 (now R3) wording was reviewed for consistency, and revised accordingly. (10) Part 6.2 (now Part 5.3) was revised and clarified. (11) Measure M6 (now M5) was revised based on revisions that were made to Requirement R6 (now R5). (12) The R7 (R6 and R7 have been combined into R5) wording was revised. (13) M7 (now M5) was revised as suggested. (14) The R8 (now R6) wording was revised. (15) The R9 (now R7) wording was revised. (16) The reference to R7 (R6 and R7 have been combined into R5) in R10 (now R8) includes both the Transmission Owner and the Generator Owner, and it is not necessary to be more specific. Because R10 (now R8) deals with DDR, it is understood that the equipment is only that equipment used to capture the DDR. (17) Measure M10 (now M8) wording is only applicable to Requirement R10 (now R8). (18) In R11 (now R9), the reference to R7 (R6 and R7 have been combined into R5) is appropriate because R7 (R6 and R7 have been combined into R5) specifies the locations and BES Elements to be captured by DDR. Requirements R8 (now R6) and R9 (now R7) address the specifics of the data that is to be recorded. The use of "Element" versus "BES Element" was revised. (19) In R12 (now R10) the reference to R7 (R6 and R7 have been combined into R5) is appropriate because R7 (R6 and R7 have been combined into R5) specifies the notifications of Elements to be captured by DDR. Requirements R8 (now R6) and R9 (now R7) address the specifics of the data that is to be recorded. The use of "Element" versus "BES Element" was revised. "As identified" and "according to" replaced "as per".	

Organization	Question 7 Comment
(20) In R13 (now R11) the reference to R7 (R6 and R7 have been combined into R5) is appropriate because R7 (R6 and R7 have been combined into R5) specifies the locations and Elements to be captured by DDR. Requirements R8 (now R6) and R9 (now R7)address the specifics of the data that is to be recorded. The use of "Element" versus "BES Element" was revised. "As identified" and "according to" replaced "as per". **(21) The wording in M13 (now M11) was revised to match the revised requirement.** **(22) In R14 (now R12) has been revised to reference what is now R5 (R6 and R7 have been combined into R5). Requirements R8 (now R6) and R9 (now R7) address the specifics of the data that is to be recorded. "As identified" and "according to" replaced "as per".**	
Duke Energy	(1) Duke Energy believes that ambiguity exists between Requirement 14 and the Rationale. The standard suggests that an entity must "Report the inability to record data to the Registered Entity along with a Corrective Action Plan (CAP) to restore the recording ability" within 90 calendar days. However, in the Rationale for Requirement 14, the language suggests that a Registered Entity must issue a report on the inability to record data to the Registered Entity after a time frame of 90 days. (2) Triggering of frequency events in Requirement 10 should be adjusted. Significant events will be missed if recorders on generators are set to trigger below 59.75. Also, the rate of change wording is confusing and should trigger if the rate of change is greater than a value not less than a value. Lastly, the Rate of change frequency set point of 125 mHz is too large and should be triggered on generation around 20 mHz per second. (3) Electrical quantities identified in Requirement 9 should better align with MOD-26 (MW, MVARS, Terminal Volts, Field Volts, Field Amps). (4) According to the rationale for R6, the intent of the requirement is to "ensure that there are sufficient BES Elements identified for DDR because of the crucial role DDR plays in wide-area disturbance analysis. Additionally, DDR is used for capturing the Bulk Electric System transient

Organization	Question 7 Comment
	and post-transient response and for validating the system model's performance." Duke Energy believes to require that DDRs be located in areas necessary to monitor all elements of permanent Flowgates is excessive. Permanent Flowgates fall into one of three categories: Voltage, Stability, or Thermal. The majority of the Flowgates identified are classified as being Thermal. Thermal Flowgates are chosen due to concerns with steady-state loading and not for transient/post-transient activity. With some PCs or RCs having as many as 1000 permanent Flowgates, the cost versus reliability gain would be astronomical. For Flowgates that have been identified to be voltage or stability related, the case can certainly be made to have DDRs monitor them in the transient/post-transient time frame. We suggest that all permanent Flowgates should be removed from the requirement and only keep those permanent Flowgates that have been identified as voltage or stability limited. This would reduce the amount of Flowgates requiring DDRs, reduce the cost for industry stakeholders, and still achieve the intent of this requirement.

Response: (1) Requirement R14 (now R12) and its Rationale Box have been revised for clarity.

(2) Triggering values were chosen based on research and analysis of frequency response for each respective Interconnection. The values are intended to capture significant events. Requirement R10 (now R8) also only applies "If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording". Rate of change of frequency triggers were chosen to match the off-nominal frequency triggers and should be "less than" because the thresholds are negative quantities.

(3) The purpose of the standard is for disturbance monitoring, not to verify models. Therefore these quantities are outside the scope of the standard.

(4) Requirement R6 (now R5) has been revised regarding the use of Flowgates. Please refer to the comments /responses for Question 4.

Organization	Question 7 Comment
Seminole Electric Cooperative, Inc.	(1) In Requirement R5.1, are the two bulleted items both required, or is only one item required, i.e., are the bulleted items listed with a coordinating conjunction of “and” or “or”? From past balloting on other Standards, e.g., CIP Standards, a numbered list in the Measure/Requirement mean the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence.” Seminole requests clarification on this concern. (2) In Requirement R14, Seminole reasons that the requirement is intended to require the filing of a CAP if the inability to record data exists for longer than 90 consecutive calendar days. This reasoning is in line with the Rationale box for Requirement R14, however, the actual Requirement appears to require the filing of a CAP notwithstanding if the failure is remedied within 90 calendar days of discovery of the failure. Seminole requests that the requirement be revised to state that the filing of a CAP is only required if the inability to record exists for more than 90 calendar days from the date of discovery. (3) In Requirement R14, are the two bulleted items both required, or is only one item required, i.e., are the bulleted items listed with a coordinating conjunction of “and” or “or”? From past balloting on other Standards, e.g., CIP Standards, a numbered list in the Measure/Requirement mean the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence.” Seminole requests clarification on this concern. (4) In Requirement R14, it appears that the intent of the DMSDT was to require the submission of a CAP if the failure was not remedied within 90 calendar days. If the failure is not remedied within 90 calendar days, it appears from the Requirements and the VRF/VSL penalty matrix that a CAP is required to be submitted to the RE within the same 90-day window. Seminole requests that the time to submit a CAP be extended an additional 30 calendar days to read that an entity has 120 calendar days from the date of discovery of a failure in which to submit a CAP to its RE. This would allow a true 90-day window for fixing the CAP. For example, under the current language if

Organization	Question 7 Comment
	an entity believes it will have remedied a piece of equipment on day 83, it would probably be best practice for that entity to prepare a CAP for submission in order to meet the 90-day CAP 29submission window in case delays arose. Seminole believes that this is not in line with the intent of the DMSDT and Seminole request the additional 30-day window for submission of a CAP, i.e., 120 days from date of discovery of the failure, and for Requirement R14 and the penalty matrix to reflect this change.
Response: (1) A list with bulleted items is an "Or" list for the bulleted items. "Or" will be added between the bullets of Part 5.1 (now 4.1) for clarification. (2) The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be filed with the Regional Entity. R14 (now R12) was revised for clarification. (3) A list with bulleted items is an "Or" list for the bulleted items. Requirement R14 (now R12) was reworded for clarification. (4) The intent of Requirement R14 (now R12) is to have an entity restore recording ability within 90 days, but if that 90 day window couldn't be met then the Regional Entity would have to be notified along with a Corrective Action Plan and timeline for the recording ability restoration. The 90 day window is realistic and practical, and compliance should not be burdensome to an entity. Requirement R14 (now R12) was revised for clarification.	
ACES Standards Collaborators	(1) This standard is unnecessary because there are already significant amounts of PMU data to construct sequence of events and other post-event analysis of disturbances. As referenced in the Southwest Blackout Report of 2011, there is a multitude of disturbance monitoring devices installed on the electric grid. The Southwest Blackout Report states, "PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP)." We do not see the cost benefit of requiring additional resources for an issue that is not a high priority for reliability.

Organization	Question 7 Comment
	(2) As stated above, there are financial incentive programs through other federal agencies that provide funding for disturbance monitoring equipment. We recommend that NERC work with those programs to develop a technical guideline to ensure these devices are installed and monitoring critical areas of the electric system. (3) Why has the DMSDT decided to include 14 requirements to this project? In light of recent standards projects like Paragraph 81, the industry is supporting reducing and consolidating the amount of requirements. We do not see the need to have 14 requirements for disturbance monitoring. While we do not believe the standard is needed, we strongly recommend that the DMSDT revise this standard to two or three requirements if it persists. The amount of detail is unnecessary and poses a serious compliance burden on registered entities. (4) R2 requires implementation within ninety days of Fault Recording and Sequence of Events Recording devices following a notification provided by the Transmission Owner. We question if this will provide entities sufficient time to acquire such devices from their suppliers. Moreover, entities can be, from time-to-time, directed to suspend maintenance activities on their BES elements due to extreme weather conditions or more immediate system level emergencies. These entities plan their maintenance activities months in advance, only to have such activities delayed by days or weeks as necessary to maintain system reliability. We recommend extending the period required within R2 to at least twelve months, as this should be sufficient time to acquire and install these recording devices during non-peak calendar dates. (5) We feel that R8 and R9 do not adequately accommodate joint substation facilities and shared resources. As stated, the burden to install Dynamic Disturbance Recording devices falls on each individual Transmission Owner and Generator Owner. Sharing such installations limits the number of connected measuring devices to facility structures, including current and potential transformers, further limiting the possibility that one of these measuring devices catastrophically fails and leads to a more significant impact on the facility’s availability because they are jointly owned.

Organization	Question 7 Comment
	(6) We previously commented that an appendix, modeled similarly like in Standard PRC-023-2, would be a better alternative to Requirement R6. Likewise, including details like those listed in R12 would further strengthen a case to incorporate this appendix in the Standard and not subject registered entities to possible violations for every requirement. W`e feel that technology has significantly improved since 2003, as manufacturers have supported the need to align such devices on a common frame of time. Still R12 places the burden on registered entity, when it seems more appropriate to be included in a manufacturer technical specification. (7) We feel Requirement R13 is arbitrary, could be subject to interpretation from auditors and meets paragraph 81 criteria. Transmission Owners and Generator Owners could be required to prove the negative, and demonstrate that they have not received a request to provide device data to their Reliability Coordinators, Regional Entities, and NERC. Furthermore, this standard meets several Paragraph 81 criteria including B1 Administrative, B2 Data Collection/Data Retention, and B4 Reporting. The requirement is administrative because it compels data formats that are immaterial to reliability with the sole purpose to simplify data collection and communication. It meets the data collection/data retention criterion because the requirement is about collecting data. It also meets the reporting criterion because it compels data reporting. Please strike the requirement in its entirety. It would be more appropriate to include in a guideline. (8) We believe numerous requirements of this Standards fall under Paragraph 81 Criteria B, and are thus unnecessary. For instance, we feel requirements R1.2 and R6.2 are "Periodic Updates" due to the need to reassess each list every five calendar years. Likewise, we feel requirements R2, R7, and R13 are "Administrative" due to the need to collect, organize, format, and then circulate data and communications sent to identified entities within a specific time frame. We feel that several other requirements could be "Data Collection" in nature. Requirements R5.1, R5.2 require the collection of data according to specifications outlined for the minimum recording rate and data duration. Requirements R10.1 and R10.2 require the collection of data according to specifications outlined for the trigger record lengths and trigger settings. Likewise, Requirements R11.1 and R11.2 require the

Organization	Question 7 Comment
	collection of data according to specifications outlined for input sampling rate and output recording rate. Requirement R12 require the collection of data according to specifications outlined for time synchronization. Finally, Requirement R14 is “Administrative” and “Documentation” in nature based on the need to circulate the discovery of device failure within a specific time frame and provide a Corrective Action Plan to the Regional Entity if repair is outside this time frame. (9) The costs of installing new equipment for disturbance monitoring could be significant for our members. We find this standard is unnecessary and NERC should work with the Department of Energy (DOE) to further expand the use of grant money to supply registered entities with funding for these types of monitoring equipment. The prior grants from the DOE have been very successful and we see no reason to require these monitoring devices to be subject to enforceable reliability standards. There is no convincing evidence that these standards are being developed to address a reliability need. We see no justification for industry to allocate resources to disturbance monitoring equipment when there are other priorities that should be addressed first, such as cyber security. Furthermore, the joint NERC and FERC report on the September 8, 2011 outage in Arizona and southern California further demonstrates that there is not a need for the standard. It stated that there was ample event data that was recorded and used to analyze the event. (10) We appreciate the opportunity to comment on the cost of developing this standard (CEAP process). However, the timeline of submitting comments should align with the ballot and comment deadlines. It is unreasonable to set the comment deadline for the CEAP two weeks before the project comment deadline, considering the due date is Monday following Thanksgiving. We are concerned that industry was not aware of this deadline and did not have adequate time to prepare comments. (11) Thank you for the opportunity to comment.

Response: (1) (2) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:

“Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed.

Organization	Question 7 Comment

A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices."

Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data.

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data.

The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.

(3) As the DMSDT put together the standard, the number and necessity of requirements was reviewed, and the Paragraph 81 project referenced. The requirements in the standard are the minimum number that meets the Purpose of the standard. Consolidating requirements results in multiple reliability objectives in a single requirement.

(4) The ninety day period in Requirement R2 is a reasonable and practical time frame for implementing notification. The Implementation Plan stipulates the schedules for having to have the capabilities in service. Requirements R1 and R2 have been combined (into what is now R1).

(5) Requirements R8 (now R6) and R9 (now R7) apply to BES Elements and not substations facilities and shared resources. The owner of a particular Element is responsible for providing data.

Organization	Question 7 Comment
(6) Requirement R6 (now R5) has been revised, and the DMSDT has retained it in the body of the standard. The specifications enumerated in the Requirements of the standard are to ensure the adequacy of the data captured. **(7) The 2003 Northeast Blackout exposed the need for capturing complete data to analyze a disturbance. Disturbance analysis leads to improved system operations and equipment installations. To facilitate expeditious and reliable data capture, it is necessary to stipulate the data formats necessary for efficient data analysis. The more efficient and effective data capture, the more aggressively system reliability improvements can be applied.** **(8) Disturbance Monitoring recording is necessary to ensure the reliability of the BES by providing the data for a post event analysis that can determine if system improvements are necessary to ensure reliability. Disturbance Monitoring data can also be used to guide real-time operating decisions. The supporting Requirements are necessary, but may be deemed administrative. The approved standard will be subject to a Paragraph 81 review.** **(9) PRC-002-2 does not deal with equipment, but with data. Costs associated with meeting PRC-002-2 are considered in the CEAP posting. Refer to the responses to comments (1) and (2) above.** **(10) The Standards Committee is aware of this concern, and the CEAP was reposted to accommodate this concern. As the CEAP is used in the future the timeliness of its posting will be considered.**	
Pepco Holdings Inc & Affiliates	(1) Requirement R2 should be re-written as follows: Each transmission Owner that identifies BES Elements, which are owned by other entities, at the locations established in Requirement R1 shall notify the owners of those Elements ..... By adding the phrase - which are owned by other entities - eliminates the need to unnecessarily provide documentation that it notified itself of the requirement. (2) Requirement R4 Part 4.1 should be re-written as follows: Phase-to-neutral voltages for each phase of either each BES line or bus. The term BES must be added to provide clarity and to be consistent with Part 4.2 and the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide voltage monitoring on non BES radial lines, or distribution transformers connected to the bus. (3) Requirement R8 should be re-written as follows: Each Transmission Owner shall have Dynamic Disturbance Recording (DDR), for each BES Element they own as per Requirement R7, to determine

Organization	Question 7 Comment
	the following electrical quantities. The term BES must be added to provide clarity and be consistent with the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide monitoring on non BES radial lines, or distribution transformers connected to the bus. (4) Requirement R9 should be re-written as follows: Each Generator Owner shall have Dynamic Disturbance Recording (DDR), for each BES Element they own as per Requirement R7, to determine the following electrical quantities. The term BES must be added to provide clarity and be consistent with the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide monitoring on non BES station service transformers connected to the bus. (5) Requirement R13 Part 13.2 poses an indeterminate requirement on the size of the hard drive required to archive data. The present requirement states that the data will be retrievable for the period of 10 calendar days preceding a request. However, there is no requirement on how long after an event the request might be made. If the request was not made until six months after the event, would the data have to be retrievable for six months after the event? In order to place certainty on this data storage requirement Part 13.2 should be re-written as follows: The recorded data will be retrievable for a period of 10 calendar days following an event. This places a limit on data storage capacity and also makes it clear that a request for data must be made within 10 calendar days of the event. (6) Requirement R14 needs to be re-written to be consistent with the intent of the requirement as expressed in the shaded box describing the Rationale for R14. As presently written, R14 requires that the Owner must both restore recording ability AND report the inability to record data to the Regional Entity. To be consistent with the Rationale, Requirement R14 should be re-written as follows: Each Transmission Owner and Generation Owner, upon discovery of a failure of the Sequence of Events Recording (SOER), Fault Recording (FR), or Dynamic Disturbance Recording (DDR) at the bus locations as per Requirement R2 and elements as per Requirement R7, shall restore the recording ability within 90 calendar days, OR , if the recording capability cannot be restored within 90 days, report the

Organization	Question 7 Comment
	inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability. (7) In the Guidelines and Technical Basis in the next to last paragraph of the section on Guideline for Requirement R1 it states that there is no requirement for SOER and FR for generating units. Later in the section on Guideline for Requirement R4 it states that generator step-up transformers are excluded from fault recording. If so, why is Generator Owner listed as an applicable entity in Requirement R4? It makes sense to list them in R3, since they may own breakers connected to Transmission Owners bus, but the GSU Transformer, station service transformer, and generator itself would not qualify for Fault Recording. (8) There is no specific requirement for the sampling rate for SOER within the standard itself. In the Guidelines and Technical Basis section on Guideline for Requirement R5 it states that a minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SOER. There are a vast number of microprocessor relays currently installed on the system that have a sampling rate of 16 samples per cycle for analog inputs, however, the digital inputs, which would be used for SOE recording, are only sampled every quarter cycle. Existing regional DME standards and criteria recognize this and permit these types of microprocessor relays to be acceptable for both FR and SOER applications. As such, in order to allow these devices to continue to be an acceptable application, we would suggest two requirements be added for SOER devices, similar to that included in the RFC DME criteria, that states: SOER recording equipment should be capable of determining and recording the time that an input is received to within one quarter of an electrical cycle (or less) of input change of state. SOER recording equipment should have time stamp capability to record seconds to at least three decimal places (i.e. ss.000). (9) The bus selection methodology in Attachment 1 defines a single bus location as including any bus Elements at the same voltage level within the same physical location sharing a common ground grid. However, there are some substations that have multiple busses at the same voltage level within the same physical location that share a common ground grid, but are not physically connected together.

Organization	Question 7 Comment
	They are either physically isolated from one another, or connected via a normally open tie switch or breaker. In these cases, the above definition does fit this scenario and each bus should be evaluated independently. To address this scenario perhaps the definition should be re-written as follows: A single bus location includes any bus Elements at the same voltage level that are connected together within the same physical location sharing a common ground grid.

Response: (1) Requirements R1 and R2 have been combined (into what is now R1) to address the concerns.

(2) The DMSDT has added BES to Part 4.1 (now Part 3.1), and throughout the standard for consistency. Part 4.1 (now Part 3.1) has been revised.

(3) The DMSDT has added BES to Requirement R8 (now R6), and throughout the standard for consistency.

(4) The DMSDT has added BES to Requirement R9 (now R7), and throughout the standard for consistency.

(5) We have revised the language of Part 13.2 (now Part 12.2) to "Recorded data shall be retrievable for a minimum of 10 calendar days." It is not necessary for an entity to save the data for more than the 10 days specified. Because of the importance and need for expediency in analyzing BES system-wide disturbances, the DMSDT decided that 10 days was a reasonable time frame to have data stored for. Requesters of data will have to be aware of the 10 calendar day requirement.

(6) The wording in Requirement R14 (now R12) was rewritten for clarification. A list with bulleted items is an "Or" list for the bulleted items.

(7) The Generator Owner is listed as an applicable entity in R4 (now R3) to account for the situation where a Generator Owner is responsible for BES Elements beyond a GSU high side breaker; a bus section for example.

(8) The DMSDT believes that the quarter cycle devices mentioned are acceptable for SOE but not for FR data. The additional specifications suggested are too specific for the standard.

(9) It would depend on how the buses are modeled. If the buses are modeled separately, then they should be considered as separate bus locations. The wording in the Step 1 paragraph has been revised.

Organization	Question 7 Comment
Xcel Energy	(1) It appears that a lot of individual requirements are written for something that isn't overly complex. Please consider consolidating R8-R11, or consolidating the technical specs that comprise R5, R11, and R12. (2) In R14, its not clear why the Regional Entity is introduced here. Also, the Regional Entity would take on the burden of tracking corrective action plans, if the recorder isn't restored in the 90 day period. Recommend changing Regional Entity to Reliability Coordinator.
Response: (1) Each of the Requirements mentioned has its own specific reliability objective. Combining these requirements would have requirements with multiple reliability objectives which is contrary to the purpose of a requirement, and could present compliance difficulties. **(2) The requirement has been revised. If recording can't be restored within 90 calendar days, then a Corrective Action Plan has to be submitted to the Regional Entity along with a timeline for the restoration. Regional Entity is used because the Regional Entity has an overall view of the BES.**	
Entergy Services, Inc.	(1) All SER and FR data requirements should be included as part of a single table and referenced in a single requirement. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation multiple requirements. (2) Similar to 1) above, all DDR data requirements should be included as part of a single table and referenced in a single requirement. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation of multiple requirements. (3) Add "by voltage level" in Requirement R1 so that it reads "Each Transmission Owner shall identify BES bus locations by voltage level for Sequence of Events Recording (SOER) and Fault Recording (FR)." This is consistent with Attachment 1, Step 1 and clarifies that the FR and SOER are only required at that voltage level.

Organization	Question 7 Comment
	(4) In Requirement R5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the Requirement. Suggest Requirement R5.1 be reworded to say “A single record or multiple records that include at least one of the following:” (5) Reword Requirement R14 to ‘Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 upon the discovery of a failure shall: (a) Restore the recording ability within 120 calendar days; or (b) “If recording ability is not restored within 120 calendar days, demonstrate efforts to correct the unresolved failure.” Recommend increasing the allowed repair time by 30 days to allow for non-inventoried repair parts and limited access of repair personnel to such equipment which may be restricted during certain periods of the year.

Response: (1) Each of the Requirements mentioned has its own specific reliability objective. Combining these requirements would have requirements with multiple reliability objectives which is contrary to the purpose of a requirement, and could present compliance difficulties. The Requirements for sequence of events recording and fault recording are sufficiently unique where there can be no violation of multiple Requirements. Note that the proposed definitions for SOER, FR, and DDR have been removed from the standard.

(2) Each of the Requirements mentioned has its own specific reliability objective. Combining these requirements would have requirements with multiple reliability objectives which is contrary to the purpose of a requirement, and could present compliance difficulties. The Requirements for DDR are sufficiently unique where there can be no violation of multiple Requirements.

(3) The DMSDT discussed and decided that the additional language does not add any clarification to the requirement. The DMSDT also combined Requirements R1 and R2 (into what is now R1).

(4) A list with bulleted items is an “Or” list for the bulleted items. “Or” was added between the bullets of Part 5.1 (now Part 4.1) for clarification.

Organization	Question 7 Comment
(5) The intent of Requirement R14 (now R12) was to have an entity restore recording ability within 90 days, but if that 90 day window couldn't be met then a Corrective Action Plan has to be submitted to the Regional Entity along with a timeline for the restoration. The 90 day window is realistic and practical, and compliance should not be burdensome to an entity. The wording was revised for clarification.	
El Paso Electric	(1) In respect to requirement 6.1.4, will entities be required to monitor multiple lines of a major transfer path or only one? (2) In respect to requirement 6.1.5, will one entity owning an HVDC connecting two interconnections be required to monitor both sides of the HVDC element?
Response: **(1) Referring to the response to Question 4 which was based on numerous comments received, the DMSDT has revised the draft PRC-002-2 standard, acknowledging the impact that monitoring all Elements of "major transmission interfaces" has on Transmission Owners. Sub-Parts were updated according to industry input as follows:** • **One or more BES Elements of IROLs are still included due to their significant impact on system reliability and the necessity to recreate longer-term disturbances on these key interfaces. "Major transmission interfaces" are also included but at a reduced level. Only one Element of these interfaces is required and "major" is defined by the PC or RC (according to Interconnection) based on the guidelines set forth in this standard (key major transmission interfaces to provide wide-area transmission coverage of disturbance monitoring).** **(2) Both ends of HVDC terminals have to be monitored. However, the entity is only required to monitor the end that it owns. Requirement R6 (now R5) has been revised for clarity.**	
CenterPoint Energy Houston Electric	(1) CenterPoint Energy believes the intent of some of the requirements is unclear without the corresponding Rationale box. It is our understanding that auditors may consult the rationale and other information to be placed in the Application Guidelines section; however, auditors must always refer to the requirement language. Therefore, the language of the requirements should clearly explain the intent of the requirement with less reliance on the Rationale boxes. For example;

Organization	Question 7 Comment
	Requirement R13.2 should identify the data retrieved as only the data measured within 10 days preceding a request. Recommend modifying Requirement 13.2 to read "Only recorded data measured and recorded within 10 days prior to a request will be retrievable." The Rationale box for R13 clarifies the intent of the requirement; however the language should be more specific. (2) The language for requirement R14 should explicitly identify the sub-bullets as an "or". Furthermore, CenterPoint Energy recommends modifying the second bullet of Requirement R14 to read "If the recording ability cannot be restored within 90 days, report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability."
Response: (1) Only the language of the requirement is auditable. Rationales and guidelines are included in the standard to provide guidance to entities and auditors alike. The DMSDT has revised the wording of Part 13.2 (now Part 12.2) and provided an example in the guidelines section of the standard. (2) A list with bulleted items is an "Or" list for the bulleted items. "Or" was added between the bullets of Requirement R14 (now R12) for clarification. The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be developed. R14 (now R12) was revised to clarify.	
Public Service Enterprise Group	(1) In R2, to avoid confusion as to what the phrase "BES Elements at the locations established in Requirement R1" means, we recommend that the Attachment 1, Step 1 have this sentence modified with a new parenthetical phrase an the end: "A single bus location includes any bus Elements at the same voltage level within the same physical location sharing a common ground grid (i.e., Elements directly connected to the bus)." In addition, since the only owners of those Elements may be other TOs or GOs, the reference to "shall notify the owners of those Elements" should be clarified. This requirement should be written as follows: "Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the TRANSNISSION OWNERS AND GENERATION OWNERS of those Elements, within 90 calendar days of determination, that the Elements require Sequence of Events Recording (SOER) and Fault Recording (FR)."

Organization	Question 7 Comment
	(2) In R10, the last two bullets should be combined into one: o Under voltage trigger set at no lower than 85% of normal operating voltage for a duration of 5 seconds. (3) The language in R14 should have “either” added to clarify the required actions. In addition, the language in the second bullet “Report the inability to record data” was changed to “Report the inability to restore the recording ability.” See below. “Each Transmission Owner and Generation Owner, within 90 calendar days of the discovery of a failure of the Sequence of Events Recording (SOER), Fault Recording (FR), or Dynamic Disturbance Recoding (DDR) at the bus locations per Requirement R2 and Elements as per Requirement R7, shall EITHER: o Restore the recording ability o Report the inability to restore the recording ability to the Regional Entity along with a Corrective Action plan (CAP) to restore the recording ability.
Response: **(1) The DMSDT has combined R1 and R2(into what is now R1) to help clarify the responsibilities. Based on other commenters’ suggestions to revise Attachment 1 Step 1, the language was revised to “For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.”** **(2) The item was corrected as suggested in R10 (now R8).** **(3) The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can’t be achieved then a CAP would have to be developed. R14 (now R12) was revised to clarify. The bulleted items were moved to the body of the requirement.**	
PPL NERC Registered Affiliates	(1) It appeared from the 11/19/13 webinar that the R9 obligation for GOs to “have” DDR does not mean that they must own such equipment, and this position was confirmed in the 12/5/13 NAGF outreach meeting. That is, it would do just as well to have an agreement with the TO to fulfill the PRC-002 requirements if and where the TO already has DDR on their side of the generation plant fence. This point does not come across clearly in the present text of PRC-002. R9 should have a

Organization	Question 7 Comment
	footnote saying that "This standard defines the 'what' of DDR, not the 'how.' GOs may install this equipment or, where the TO already has suitable DDR, contract with the TO." It would be still better to just eliminate GOs from the requirement, however, per our comment to question #3 above. (2) R6 sets DDR applicability criteria based on the "nameplate rating," but doesn't say of what. This could be the generator, or the most-limiting component. We believe that applicability should be based on the most-limiting component, since this sets the actual output achievable. The term, "Facility Rating," as defined in FAC-008 should then be used to avoid confusion. (3) The frequency and Hz/s settings of R10 should have a latch-time criterion, to prevent inadvertent triggering of the DME. We suggest three cycles. (4) R10 calls for DME to be triggered at no lower than 85% of normal voltage with a latch-time of 5 seconds, but the 5-second ride-through requirement of PRC-024 is only +/- 10%, which is also often where V/Hz relays are set. A trigger of 85% voltage x 5 sec may therefore cause DME to miss the action. (5) Triggered (as opposed to continuously-recording) DME needs to have sufficient storage capability to capture a major disturbance and a potentially large number of aftershocks, but we have no way of knowing how many such recordable events may occur, creating a compliance risk. The DMSDT should establish the expected maximum number of recordable events and state it in the standard.
North American Generator Forum - Standards Review Team (NAGF-SRT)	(1) It appeared from the 11/19/13 webinar that the R9 obligation for GO's to "have" DDR does not mean that they must own such equipment, and this position was confirmed in the 12/5/13 NAGF outreach meeting. That is, it would do just as well to have an agreement with the TO to fulfill the PRC-002 requirements if and where the TO already has DDR on their side of the generation plant fence. This point does not come across clearly in the present text of PRC-002. R9 should have a footnote saying that "This standard defines the 'what' of DDR, not the 'how.' GOs may install this equipment or, where the TO already has suitable DDR, contract with the TO." It would be still better to just drop GOs from the picture, however, per our

Organization	Question 7 Comment
	comment to question #3 above. Additionally, it is not clear in R9 whether the specification for signal measurements is on a per generating unit basis or if the signals of interest are a per line basis aggregate at generating stations. This determination weighs heavily on Please more clearly specify if the signals of interest are individual unit measurements or plant total measurement (grouped by output circuit, plant total, etc.). the cost and method of implementation where new equipment must be installed. (2) R6 sets DDR applicability criteria based on the "nameplate rating," but doesn't say of what. This could be the generator, or the most-limiting component. We believe that applicability should be based on the most-limiting component, since this sets the actual output achievable. The term, "Facility Rating," as defined in FAC-008 should then be used to avoid confusion. (3) The frequency and Hz/s settings of R10 should have a latch-time criterion, to prevent spurious triggering of the DME. We suggest three cycles. (4) R10 calls for DME to be triggered at no lower than 85% of normal voltage with a latch-time of 5 seconds, but the 5-second ride-through requirement of PRC-024 is only +/- 10%, which is also often where V/Hz relays are set. A trigger of 85% voltage x 5 sec may therefore cause DME to miss the action. (5) Additionally, R10 allows the use of triggered records from equipment installed prior to the effective date of PRC-002-2, but does not specify how many records an entity must be able to produce in the retrievable period specified in R13 as 10 days prior to a request. This specification is crucial to the amount of memory requirements of existing equipment. At the maximum trigger frequency (triggering every 3 minutes), the existing equipment becomes effectively a continuous recorder. For existing equipment with triggered recording capability, how many records are required to be available in the 10 day retrievable record.

Response: (1) The DMSDT agrees that PRC-002-2 does not address "how" the data is captured, but "what" data is recorded. We have added your suggested language to the Rationale Box for Requirement R9 (now R7) with the caveat that the GO is still responsible for providing the data. The data should be provided for individual units greater than or equal to 500

Organization	Question 7 Comment
MVA nameplate (now Part 5.1.1). For plant/facility (now Part 5.1.1) individual generators with gross nameplate ratings greater than or equal to 300 MVA nameplate when the gross plant/facility rating is greater than or equal to 1000 MVA. **(2) Part 6.1.3 (now sub-Part 5.1.1) refers to "Generating resource(s) where:" and the sub-Parts describe the "Gross individual nameplate rating…" of those resources. Because the characteristics of the most limiting component might not affect a generator's response to system conditions, the applicability will remain based on a unit's nameplate MVA rating.** **(3) The frequency sub-Part 10.2 (now sub-part 9.2) does not preclude the use of latching or timing the trigger. The focus of this requirement is on magnitude threshold.** **(4) (5) The undervoltage trigger threshold and timer are intended to capture sustained undervoltage conditions such as fault induced delayed voltage recovery (FIDVR). The DMSDT believes these settings suffice for this purpose. Because the number of recordable events cannot be predicted, the quantity of records cannot be specified. The records of the data required by Requirement R6 (now R5) need to be retrievable for 10 days. An example has been added to the guideline section for R13 (now R11) describing the length of time data is to be retained.**	
Hydro One Networks Inc.	(1) R5.1 Bullet 2- The wording should be changed as follows: "At least two cycles of the pre-trigger data, the first three cycles of the fault as seen by the Fault Recorder, and the final cycle of the fault as seen by the Fault Recorder." Because the deployment of Fault Recorders are not required on every BES bus location, unless the fault is being cleared on an Element directly connected to the bus, the fault recorder may not always accurately capture the fault information if it is occurring more than one bus away from the Fault Recorder location. Without this additional wording the Fault Recorder would have to capture the actual final cycle of the fault which may be impossible if it is not directly monitoring it. (2) R4.1- More specificity is needed in the requirement. Are phase to neutral voltages needed for each line? If common bus side voltages are available is it sufficient to have one set of phase-neutral voltages for the bus location? If so the wording should more accurately reflect this. Presently it reads - ".... Voltages for each phase of either each line or bus." which could be confusing.

Organization	Question 7 Comment
	(3) R4.2 - Residual current and neutral current are two different things. Residual current is current present in the neutral of the Element CT circuit while neutral current implies current directly measured by a CT in the neutral of an Element. This wording should probably be more specific by stating if the monitored transformer has a neutral CT it should be monitored (if this was the intention of the DT). (4) R4.2.1 - Is monitoring required on both HV and LV sides of these transformers? The wording for this requirement should be more specific. (5) There is an error in the mapping document. R6 of PRC-018-1 speaks to the need for maintenance of DME. The DT has mapped this requirement to R14 of PRC-002-2. These two activities are not the same at all since R14 is a break-fix requirement for DME, while R6 of PRC-018 speaks to maintenance activities of DME. Maintenance of DME ensures devices that need calibration are calibrated as well as correcting any non-annunciated failures. In fact preventative maintenance should reduce the failures. R14 of PRC-002-2 requires entities to repair equipment that they know are in a failed state. (6) R13 - this requirement places the RC, RE and/or NERC in the middle of data sharing. There is no requirement in the standard to facilitate entities to partake in data sharing. Is this really the intent? What if adjacent entities need to exchange post-disturbance information? Does that really need to occur via the RC, RE or NERC if an entity cannot directly request necessary data? (7) R8.3 wording is too restrictive. Real and reactive power may not be able to be determined operationally if say a bus is split at the time of an event (or the split is caused by an event). Suggest the DT correct this requirement by perhaps referencing “nominal” real and reactive power which refers to the original design of the DDR channel assignments which under normal operating conditions, Real and Reactive Power could be determined. (8) R3, R4, R12, R13, R14 all reference “the bus locations as per Requirement R2” however this requirement is a notification requirement only for Elements not owned by the TO that need DME. These requirements need to reference both R1 and R2 pending changes to R1/R2.

Organization	Question 7 Comment
	(9) The way R2 is worded presently, it sounds like a TO is required to notify itself if it owns BES Elements at the bus locations. The only action in R1 is to identify busses for DME. It should probably be expanded to indicate that after the busses are identified the TO needs to have DME on the Elements that are owned by the same TO. (10) R3, R4, R12, R13, R14: List of locations that need Sequence of Events Recorders and Fault Recorders is identified in R1 and communicated in R2. Suggest replacing reference to R2 with R1 (11) R8,9,10,11 and R13, R14: Suggest changing reference to R7 with R6 (see the comment for R3 and R4 above) (12) Section 1.2 - Evidence Retention: Second sentence states:" For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit." . To avoid confusion we recommend that the DMSDT removes "may ask" and provide further clarification on what evidence needs to be retained and for how long. One approach would be to make a retention period to be "greater or longer of" the period since the last audit or the list below. (13) Section 1.2 - Evidence Retention: To avoid confusion we suggest that the retention period for R1/R2 and R6/R7 is specified as "current version of the list" or "current and previous version of the list". This will avoid confusion associated with the five years retention when the list is produced at a 5 year cycle.

Response: (1) The DMSDT has revised the language as follows: "At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder."

(2) The intention is not to make the standard overly specific. The intent of the Requirements is to lay the foundation for capturing adequate data for event analysis. Bus voltages could be used for all the Elements connected to that bus. Refer to the Rationale Box for additional explanation.

Organization	Question 7 Comment

(3) The DMSDT notes that the requirement is designed to have the entity provide data and the entity has flexibility as to how this is obtained or derived. Use of Residual current and neutral current will provide similar end results.

(4) Monitoring is not required on both sides of the transformers. Derived data is acceptable. The Requirement stipulates the determination of electrical quantities. We have added a clarification to the Rationale Box: "For transformers (Part 3.2.1), the data may be from either the high side or the low side of the transformer."

(5) PRC-018-1, R6 addresses maintenance and that is not specifically required in PRC-002. The DMSDT is not prescribing a maintenance program in PRC-002 and we are only requiring that a failure of data recording is reported per Requirement R14 (now R12). Because PRC-002-2 addresses "what" data is recorded, it is intended to have PRC-018-1 retired.

(6) Because the intent of the standard is to capture BES disturbances, the R13 (now R11) applicable entities will be involved with the necessary data exchange. The standard does not prohibit individual entities from sharing data amongst themselves.

(7) Requirement R8 (now R6) and Part 8.3 (now Part 7.3) stipulate that there has to be data to determine Real and Reactive Power. The requirement is not designed to address every possible system configuration and it is recognized that there may be cases where data is not available. The measured voltage and currents will be the basis for explaining any anomalies in MW and MVAR readings.

(8) The DMSDT has combined Requirements R1 and R2 (into what is now R1), and revised the wording appropriately. The requirements have been revised to reference BES Elements consistently throughout the standard.

(9) The DMSDT has combined Requirements R1 and R2 (into what is now R1), and revised the wording appropriately.

(10) The DMSDT has combined Requirements R1 and R2 (into what is now R1), and revised the wording appropriately.

(11) Requirement R7 (R6 and R7 have been combined into R5) addresses the Responsible Entity's selection of the "final" list for DDR.

(12)The language used is the standard language required by NERC.

Organization	Question 7 Comment
(13) The DMSDT agrees and has revised the Evidence Retention section. The revision reflects the combination of Requirements R1 and R2 (into what is now R1).	
Southern Company	(1) The requirements of R3, R4, R5 and R12 for SER and FR data should be included as part of a single attachment/ table and R3 should simply reference the table. As structured presently, if an owner fails to include provide data for a single required element, they would be in violation multiple Requirements. (2) Similar to a) above, R8, R9, R10, R11, and R12 for DDR data should be included as part of a single attachment/ table or possibly separate attachments/tables for TOs and GOs and referenced in a single Requirement. As structured presently, if an owner fails to include provide data for a single required element, they would be in violation of multiple Requirements. (3) The inclusion of the word 'either' in R4.1 seems redundant. (4) R10 allows the use of triggered records from equipment installed prior to the effective date of PRC-002-2, but does not specify how many records an entity must be able to produce in the retrievable period specified in R13 as 10 days prior to a request. This specification is crucial to the amount of memory requirements of existing equipment. At the maximum trigger frequency (triggering every 3 minutes), the existing equipment becomes effectively a continuous recorder. For existing equipment with triggered recording capability, how many records are required to be available in the 10 day retrievable record?
Response: **(1) Each of the Requirements mentioned has its own specific reliability objective. Combining these requirements would have requirements with multiple reliability objectives which is contrary to the purpose of a requirement, and could present compliance difficulties. The Requirements for sequence of events recording and fault recording are sufficiently unique where there can be no violation of multiple Requirements. Note that the proposed definitions for SOER, FR, and DDR have been removed from the standard.**	

Organization	Question 7 Comment
(2) Each of the Requirements mentioned has its own specific reliability objective. Combining these requirements would have requirements with multiple reliability objectives which is contrary to the purpose of a requirement, and could present compliance difficulties. The Requirements for dynamic disturbance recording sufficiently unique where there can be no violation of multiple Requirements. **(3) The wording of Part 4.1 (now 3.1) has been revised.** **(4) Because the number of recordable events cannot be predicted, the quantity of records cannot be specified. The records of the data required by Requirement R6 (now R5) need to be retrievable for 10 calendar days. The DMSDT updated Requirement R13 (now R11) to: "Recorded data shall be retrievable for a minimum of 10 calendar days."**	
Bonneville Power Administration	(1) Introduction4. Applicability 4.1 The Responsible Entity is: BPA feels that under this section planning coordinators and reliability coordinators are named as the responsible entities which are later tasked with determining the necessary locations for dynamic disturbance recording equipment. This was one of the primary issues with the previous version of the standard, PRC-018. These entities failed to write such standards and therefore the standard lacked the necessary content for transmission and generation owners to apply. This basis will face similar challenges. Additionally this delineation of the responsible Entity takes authority away from the TOs and GOs to operate their monitoring systems in a way that makes good financial and operational sense for their individual companies. This definition should also be expanded to include Transmission Operators and Generation Operators. (2) Requirements and MeasuresR1. BPA feels the substance of this section is based on the Attachment 1, which is later labeled as Attachment A, so it is on that section that comments shall be provided. The methodology presented in Attachment 1 is overly complex and does not present a sound technical basis for the location of DFRs and SERs. Monitoring locations above 1500MVA are subject to selection based on mathematical manipulation for which no system impact basis is provided. A final step of "engineering judgment" is then applied in order to round out the list. This methodology may not result in consistent or repeatable bus selection for the placement of DFRs and SERs and will be difficult to defend in an audit scenario. This use of an MVA based location criteria is

Organization	Question 7 Comment
	not consistent with other system impact based criteria currently being used within the NERC standards, such as CIP-002-4 & 5, nor with draft versions of the WECC disturbance monitoring standard. (3) R2. BPA feels this requirement places a compliance burden on the Transmission and Generation owners for equipment over which they have no control. TOs and GOs might be responsible for bus identification and notification of other entities with interconnections to those busses but the identification of individual BES elements and the associated compliance burdens should be left to those with operational responsibility for those elements. (4) R3. BPA feels this requirement refers to R2 in the text I believe this reference should be to R1 as R2 does not define bus locations. (5) R4. BPA feels that this requirement needs to be clarified. Specifically, BPA feels that not all line voltages are required if there is no bus (with two lines minimum). (6) R5. BPA feels that in sections 5.1 and 5.2 specific record lengths and sample rates are delineated. The standard goes too far in mandating equipment specification for the Transmissions and Generation owners. The development of equipment specification must be left to the individual owners and operators in order for them to effectively balance cost and operational requirements. (7) R6. BPA feels the responsibility for the sighting of DDRs should be assigned to the Transmission/Generator Operator/Owner not the reliability coordinator. The Operator/Owner must be left to identify BES elements which require dynamic disturbance recording equipment. This may be easily and consistently accomplished through the application of bright line criteria. The criteria provided in 6.1 are insufficient. The criteria do not account for operating voltage or equipment such as series capacitor installations which could contribute to sub synchronous resonant situations. A comprehensive set of bright line criteria for DFRs, SERs, and DDRs must be developed. These criteria should be consistent with similar criteria used in other NERC and industry standards. Any list of

Organization	Question 7 Comment
	locations which is delineated by a Responsible entity must be subject to some adjustment by the affected TO or GO. (8) R7. BPA feels the Transmission/Generation Owner/Operator must be responsible for the identification of locations which require DDRs not the Reliability Coordinator. Only in this manner may the individual TOs and GOs achieve visibility of their own systems. (9) R14. BPA feels the requirement needs to clearly indicate that it is an "OR" distinction between the two bullets. So that one-hour or one-day equipment reporting and corrective action plan is not required at the time of discovery, but rather (as is intended) only after 90 days of failure.

Response: (1) The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording (DDR) is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.

(2)R1: Refer to the Guideline for the process behind the development of Attachment 1. Three phase short circuit MVA can be directly correlated to the impact of facilities on the BES. The application of sound engineering principles and operational judgment for locations that need to be captured by sequence of events and fault recording ensure compliance. Adequate system coverage can be proven for an audit.

(3) R2: The DMSDT has combined R1 and R2 (into what is now R1) to help clarify the responsibilities.

(4) R3: The DMSDT has combined R1 and R2 (into what is now R1) to help clarify this and the references in other requirements have been corrected.

(5) R4: Requirement R4 (now R3) states that there has to be data to determine the electrical quantities. Refer to the Rationale Box, and Guideline.

(6) R5 (now R4): The DMSDT decided that Parts 5.1 (now Part 4.1) and 5.2 (now 4.2) are required to ensure an adequate quality of data. Based on other comments received, the 50 cycle requirement has been reduced to 30 cycles. Time-stamped pre- and post-trigger fault data aid in the analysis of protection system operations and determination of operation as

Organization	Question 7 Comment
designed. System faults generally occur for a short time period, approximately 1 to 30 cycles; thus, a 30 cycle post-trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles post-trigger. A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point-on-wave data for recreating accurate fault conditions. **(7) (8) R6/R7 (R6 and R7 have been combined into R5): The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected. DDR captures a wide-area view, and where dynamic disturbance data recording should be located is more appropriately assigned to the Planning Coordinator or Reliability Coordinator. A Transmission Owner or Generator Owner can always include more Elements to have data recorded.** **(9) R14 (now R12): A list with bulleted items is an "Or" list for the bulleted items. The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be developed. R14 (now R12) was revised to clarify.**	
Idaho Power Company	(1) As related to R5.1, we wonder if there is a need for both bulleted items. We are assuming that these two bulleted items represent an "OR" otherwise they would be listed as two separate Req. Further, if "At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault" is sufficient, why is there an option to capture 50 cycles of data? (2) We also request clarification of R8 to either explicitly allow or not allow the power measurements to be calculated from the voltage and current used in 8.1 & 8.2. (3) In the WECC footprint, we believe Sequence of Events is typically abbreviated SER.

Organization	Question 7 Comment
Response: (1) Part 5.1 (now Part 4.1) was revised to include "Or". The bullets reflect the capabilities of the means of recording that are available. A list with bulleted items is an "Or" list for the bulleted items. The data specifications reflect the capabilities that exist to industry. Based on comments received 50 cycles has been reduced to 30 cycles. 2) Requirement R8 (now R6) states that the electrical quantities in the Parts can be determined which would allow the power measurements to be derived (refer to the Guideline for Requirement R8 (now R6)). 3) The DMSDT agrees and has revised the acronym throughout the standard. In the standard SER is the acronym for sequence of events recording.	
American Transmission Company, LLC	ATC recommends the following: (1) Regarding Requirement R2 - Similar to the recommendation for R1, Generator Owners, not just Transmission Owners, should be obligated to identify Elements at BES bus locations established in R1 that require SOER and FR. If any identified Elements are owned by other Generator Owners or Transmission Owners, then the Generator Owner or Transmission Owner should notify the respective owners. ATC recommends revising the R2 wording to, "Each Generator Owner and Transmission Owner shall identify which BES Elements require SOER and FR at the BES bus locations established in Requirement R1." Revise the R2.1 wording to, "Each Generator Owner and Transmission Owner shall determine whether any required Elements are owned by other Generator Owners or Transmission Owners." And finally, revise the R2.2 wording to, "If any required Elements are owned by other Generator Owners or Transmission Owners, then the Generator Owner or Transmission Owner should notify the respective owners of those Elements." (2) Regarding Requirement R3 - This requirement should follow through with the obligations that were prepared for in R2 by requiring SOER and FR for all of the Elements identified in R2, not just selected circuit breakers. ATC recommends revising the R3 wording to, "Each Generator Owner and Transmission Owner shall have SOER and FR for each Element that they own and was identified per Requirement R2."

Organization	Question 7 Comment
Response: (1) The Requirement R1 bus locations are best selected by the Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these locations. Generator Owners do not typically have the necessary case studies of the transmission system. The DMSDT has combined R1 and R2 (into what is now R1) into a single requirement and revised the wording to clarify the intent. (2) The DMSDT has designed requirements R3 (now R2) and R4 (now R3) to implement what is specified in what is now R1--only want sequence of events recording for circuit breakers and not on each Element. Fault recording data is appropriate for Elements identified in R4 (now R3). The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent.	
Reason International, Inc.	(1) Attachment 2 provides a template for standardization of Sequence of Event records. Following the successful implementation of COMTRADE and recognizing the leading role the US BES plays internationally, it would be more beneficial to all parties involved if the template was based on C37.239-2010 COMFEDE, avoiding multiple templates for SOE records in several countries.
Response: (1) The DMSDT discussed and decided on the .CSV format as being universally acceptable to industry. The .CSV format was selected to ensure uniformity in data collected.	
City of Austin dba Austin Energy	(1) City of Austin dba Austin Energy (AE) believes that the proposed PRC-002-2 standard is overly prescriptive and provides unnecessary requirements that are already addressed by Regional rules, guidelines, requirements, etc. For example, ERCOT has requirements for installing Disturbance Monitoring Equipment (DME) that may address more specific regional needs, considering ERCOT system characteristics. Additionally, AE believes the standard, as proposed, would be costly to implement.
Response: (1) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:	

Organization	Question 7 Comment
"Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed. A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices." Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data. PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data. The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events. The CEAP postings gave the opportunity to provide cost input.	
Exelon Companies	(1) Comments on R3: R3 states that circuit breaker position must be monitored for identified breakers. In our companies standard design, we connect circuit breaker auxiliary contacts to relays that include monitoring. However, this requirement will present a significant burden since a database must be created to cross-reference prints to prove that hundreds of breaker auxiliary contacts are connected to satisfy compliance requirements. Since three phase currents are to be monitored under the proposed Requirement3, this information can be used to determine circuit breaker status in lieu

Organization	Question 7 Comment
	of monitoring a 52 contact. With three phase current values available, it is not difficult to figure out when breakers were opened based on loss of current and is actually more accurate than breaker auxiliary contacts. It is very straight forward to figure out when breakers are opened based on loss of current for a straight bus configuration. If a single circuit breaker in a ring bus or similar configuration opens for some reason and flow is not interrupted the sequence of breaker openings can still be determined using currents. It is also not necessary to know exactly when a breaker in a ring bus opens if flows in the ring are merely rerouted. Thus, a detailed sequence of events timeline of a power system disturbance can be determined without the use of a circuit breaker contact. In rare cases connection of a circuit breaker contact may have been mistakenly excluded from the protection design. In this case, complying with the standard as written could require installing 1000 feet or more of control cable in an EHV switchyard, incurring a high cost for very little gain. Thus, we believe the DMSDT should eliminate this requirement as it just creates a significant burden, potentially adds cost, provides no commensurate increase in reliability, and is not necessary for events analysis when three phase currents are already required. (2) Comments on R4: It is a natural progression for a TO to upgrade BES lines before upgrading BES transformers since BES lines are subject to many more faults and operations. Thus, modernizing BES lines first has the greatest impact on reliability. For example, a large % of our comapies T-lines employ modern relays with FR and SOER capability and the remaining lines will have this capability shortly. These upgrades are being done on previously determined schedules and include all 138 kV and above lines. The percentage of BES Transformers with modern equipment is much less (15-20%) and upgrades are typically only done when transformers infrequently fail or when protective equipment is obsolete and problematic. Although R4 does state that the TO/GO shall have fault recording necessary to determine required quantities (transformer information can be determined from monitored line data as needed), the DMSDT should consider revising the guidance section of R4 to state that it is adequate to monitor lines and use their fault recordings to determine transformer quantities. The DMSDT should also consider just eliminating R4.2.1. Monitoring lines is much more important and provides information to determine flows in transformers. This would also recognize that the natural progression of system upgrades is to concentrate on the most exposed and

Organization	Question 7 Comment
	problematic areas (T-lines). The number of transformers with increased monitoring is increasing sufficiently already and monitoring of transformers inherently benefits from the rapidly increasing level of monitoring on transmission lines. (3) Comments on R5: R5.3 states that trigger settings need to include Neutral (residual) overcurrent and phase undervoltage. RFC had a disturbance monitoring standard for a few years that we worked diligently to comply with. It required triggering on one or more of various quantities including negative sequence current, negative sequence voltage, residual current, undervoltage, overvoltage, or overcurrent. ComEd met this requirement in hundreds of devices by triggering on residual current (for grd faults), phase overcurrent (for multi-phase faults), and pickup of any forward or backward (if used) phase distance zone (for multi-phase faults). Undervoltage elements weren't always available. The DMSDT should consider modifying this requirement to allow phase undervoltage or phase overcurrent as a trigger for multi-phase faults. Having to tweak hundreds of relay settings (an arduous and expensive process) to meet a NERC standard that is slightly different than the RFC standard just doesn't seem right. There is a good argument that once a system is highly monitored, triggering an event record when the relay trips provides sufficient information for events analysis. We do not believe that a standard specifying what to trigger on is necessary at all for a highly monitored system. Having to go back and change event trigger equations on a highly monitored system is purely burden to the registered entity with no commensurate increase in reliability or increased capability to analyze disturbances.

Response: (1) Regarding currents, currents may reach zero without a breaker opening. The DMSDT contends that breaker position status data is necessary for disturbance analysis.

(2) R4 (now R3): The Purpose of the standard is "To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances." . Capturing transmission line and transformer data is necessary to achieve this goal. The requirement allows the entity to "determine…electrical quantities." As long as you have sufficient FR data available to determine the electrical quantities specified under the requirement, you do not have to monitor every element.

Organization	Question 7 Comment
(3) R5 (now R4): The DMSDT has revised sub-Part 5.3.2 (now sub-Part 4.3.2) to allow for overcurrent: sub-Part 5.3.2 (now sub-Part 4.3.2) reads: "Phase undervoltage or overcurrent."	
Florida Municipal Power Agency	(1) FMPA does not believe that a standard is justified for Disturbance Monitoring, as such, we believe that disturbance monitoring is better addressed through guidelines than through a standard, as further discussed below. In the scheme of things, disturbance monitoring provides very little value to operating the bulk-power system reliably as compared to other standards. Establishing SOLs and operating to them; coordinating and maintaining effective protection systems; maintaining supply/demand balance and frequency; cyber security; and effective and trained human resources are greater than one quantum step more important to reliable operations than equipment installed simply to ease the ability to perform post-mortem analyses on events and to validate stability modeling that cannot be that accurate in the first place simply due to Chaos Theory (e.g., the Butterfly Effect) and the inability to predict the future accurately. While installing DMEs may be good / prudent action, FMPA believes it is imperative to avoid a mode of thought that seems to prevail among many within our industry, and that is a mode of thought that if something is good for reliability, then we need to write a standard for it. Such mode of thought is counterproductive and stunts creative improvement because it creates a perverse incentive to only do the minimum to meet the existing standards due to the danger of better performance causing an increased level of governmental regulation. Governmental regulation should be to minimum requirements while not stunting the creativity of the industry to perform better than required, and FPA Section 215 is crafted with that thought in mind:"The term `bulk-power system' means--`(A) facilities and control systems NECESSARY FOR OPERATING an interconnected electric energy transmission network ..." (emphasis added)"The term `reliability standard' means a requirement, approved by the Commission under this section, to provide for reliable operation of the bulk-power system."While DMEs may be good/prudent, they are not necessary to provide reliable operation of the bulk-power system. In addition to a lack of technical justification, a standard that requires DMEs is also not justified from a cost/benefit perspective. The benefit of DMEs as stated in the purpose of the draft standard are to assist in post-mortem analyses of events. We have been doing event analyses for decades without the standard. Yes, they may take

Organization	Question 7 Comment
	longer to perform do to the difficulty in establishing a sequence of events post-mortem and other challenges, but, we were able to do it. So, the benefit of a DME is to shorten the time and effort it takes to do a post-mortem (what is that, maybe three or four person-years, maybe a million?) compared to a cost of installing these devices and maintaining them on hundreds of buses (maybe $10's of millions) for events that may happen once in 10-20 years close enough to a DME to matter.In addition, the system has changed a lot over the last 10 years since the Northeast Blackout of 2003 and we can gain much more information now from microprocessor based relays prevalent throughout the system and phaser measurement units (PMUs) also installed throughout the system. Additionally, the effort does not justify the compliance administration costs at both the entities and at NERC and the Regions for administering compliance to this proposed standard. The standard as written is complicated, long, has many requirements, and in general is far too complicated and onerous in relation to its minimal reliability benefit. Also, how would such a proposed standard impact compliance with PRC-006, EOP-004 and other standards that require post-mortem event analyses?In conclusion, FMPA believes that a standard is not justified, either from technical or cost benefit perspectives, and we believe that measurement devices for purposes of post-mortem analysis of events ought to be addressed through guidelines rather than a standard.

Response: (1) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:

"Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed.
A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices."

Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that

Organization	Question 7 Comment
applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data. **PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data.** **The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.**	
Nebraska Public Power District (NPPD)	(1) For clarification on R2 after receiving notification from a TO that FR or SOER may be required how long does the receiving entity have to install the appropriate recording device? Please clarify if it is still 4 years to be 100% compliant? (2) R3 can we clarify the circuit breakers that are not connected to lines and transformers designated in R4 are not required to be part of the SOER? For example, do not require SOER for a 115kV circuit breaker on a 115/34.5kV load serving transformer. (3) R4 M4 states that "Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations." For individual relays used as recorders this may encompass a significant amount of data. Consider allowing evidence to be a single design standard or common general design example to be allowed as evidence rather

Organization	Question 7 Comment
	than requiring all the detail data from every location which could be hundreds of relays with settings/drawings/records for example. There is a similar concern for R3 M3 evidence. (4) R5 5.1 states: A single record or multiple records that include: o A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. Consider using 30 cycles instead of 50 cycles for post records since faults typically should be clearing faster (less than 10 cycles on most critical high voltage lines). This may reduce the risk of memory record overwrite in relays that are of older vintage. DDR capabilities will also most likely be installed in the most critical areas for longer recording needs. (5) R5 5.3.2 lists a required trigger setting for phase under voltage. Many relays used for FR will use the phase impedance zone reaches to trigger records. This can clearly define the reach for data to be triggered where defining an under voltage may be more difficult to control the reach. There is some concern with overwriting data in the relays with settings that are less intuitive for controlling how often a device may trigger. I strongly recommend allowing phase under voltage or phase distance reaches for 5.3.2 as trigger points. Generally the trigger requirements appear logical. There is some concern that these recording devices are not perfect and devices that appear to be functioning correctly will occasionally not trigger as set. These are not perfect devices. Is there a risk for non-compliance for devices that are set to meet compliance yet do not trigger correctly? This seems like an unnecessary risk. (6) R8 8.1 seems to be a bit confusing. R8 8.1 allows a single phase to neutral voltage yet 8.3 appears to require all voltages. R8 8.2 is also similar in nature. Can this be changed to require one voltage and one current on the same phase? (7) R11 states “11.2. Output recording rate of electrical quantities of at least 30 times per second.”Please clarify to make sure this can be clearly understood by an audit or enforcement team as well as owners. Is this processing speed or DSP of a device? For example some relays state “AC

Organization	Question 7 Comment
	voltage and current inputs 8000 samples per second, 3 dB low-pass analog filter cut-off frequency of 3000 Hz" or "protection and control processing 8 times per power system cycle". Are these examples what is asked for with 11.2? Most devices are likely to meet this rate. Does it really need to be in the standard? This seems excessive. Any options to reduce the requirements in this standard would help to limit the complexity and data to manage. (8) R13 states: "13.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request."This is a good goal to shoot far however data can be overwritten in relaying devices with the best intentions when numerous operations and voltage levels are used to trigger events. I don't feel that the ability to guarantee data is available for this time period is fully under the control of the person setting the pickup and triggering in the device 100% of the time. This should not be a finable enforceable requirement and should be removed. On occasion failing equipment can provide such great amounts of data as to overwrite memories in relaying equipment. (9) R13.4 states "Fault Recording and Dynamic Disturbance Recording data will be provided in electronic C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files." Can the statement be added that if the device is not capable of providing COMTRADE files directly then it is acceptable to provide the data in its native format? I am concerned with the need to reformat data could risk loss of data before it may ever get to an analysis team. Some formats may not be easily convertible in older devices. Consider adding: Data content requirements and guidelines shall be in accordance with R13.3, R13.4 and R13.5 or other formats deemed acceptable by the requesting regional entity. (10) R14 requires the tracking of recording failures and restoration. I recommend this only be required for recording devices not under another maintenance plan. For protective relays performing recording functions they should not be under this requirement if they are covered under PRC-005

Organization	Question 7 Comment
	which is a stringent maintenance plan that will be in place. This will reduce additional tracking requirements and burden.

Response: (1) The standard does not specify installing a recording device, but have recording capability. The DMSDT also has combined Requirements R1 and R2 (into what is now R1). The Implementation Plan was revised and lists 100% completion for Requirements R3 (now R2), R4 (now R3), and R5 (now R4) in 6 years after the notification of the list. After the 5 year reassessment required under R1, entities have 3 years following notification to comply.

(2) Requirement R3 (now R2) dictates that SER is required for all circuit breakers connected to the BES buses identified in the original Requirement R2 (note that Requirements R1 and R2 have been combined into what is now R1). In the example given, if the 115kV side of the transformer is connected to a BES bus through a circuit breaker, then that breaker must be captured by SER. R3 (now R2) has been revised to read:

> **R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses identified in Requirement R1. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]**

(3) The DMSDT agrees and has added "including a single design standard as a representation for common installations" to the measures for M3 (now M2) and M4 (now M3).

(4) System faults generally occur for a short time period, approximately 1 to 30 cycles; thus, a 30 cycle post-trigger minimum record length is adequate. Responding to comments received, the 50 cycle requirement has been reduced to 30 cycles.

(5) The DMSDT has revised Part 5.3.2 (now 4.3.2) to include "overcurrent". If data is not captured that should have been captured, then Requirement R14 (now R12) regarding data recording failure would have to be followed.

(6) Requirement R8 (now R6) Part 8.1 (now Part 7.1) stipulates "One phase-to-neutral or positive sequence voltage." Requirement R8 (now R6) says "to determine". Three phase Real Power and Reactive Power flows can be determined from the single phase voltage and current values. Sufficient measurements must be made to accurately provide real and reactive power on a three phase basis. Requirement R8 (now R6) does read single phase quantities. Dynamic

Organization	Question 7 Comment
Disturbance Recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. **(7) Regarding Part 11.2 (now Part 10.2), refer to the Rationale Box. The DMSDT believes that this information needs to be specified in the standard in order to meet the needs for disturbance monitoring. While most devices meet the requirements, the DMSDT had to ensure that for consistency all recording capabilities would be addressed.** **(8) For clarity, the language of Part 13.2 (now Part 12.2) was revised to: 12.2 "Recorded data shall be retrievable for a minimum of 10 calendar days."** **(9) Part 13.4 (now Part 12.4) is necessary to specify the format because for past significant wide-area system events the data was not available in a consistent format, and that presented problems to the analysis of the event.** **(10) Requirement R14 (now R12) deals with sequence of events recording, fault recording, and dynamic disturbance recording failure, and the response to its failure. Any documentation, even if under another plan, would be acceptable.**	
Oncor Electric Delivery	(1) General: Oncor identified several instances where the Rationale Boxes provided much needed clarity to the Requirement itself. It is understood the Rationale Boxes will be retained but relocated to the Application Guidelines Section of the Standard. However, incorporating the Rationale/intent language into the Requirement itself would further clarify the Requirements resulting in a clear and mutual understanding for both the Registered Entity and the auditor(s). Therefore Oncor recommends the Standard DMSDT review the Requirement language and the corresponding relocated Rationale language to ensure there are no gaps once moved to final state. Additional details provided below. (2) R1: To clarify the line/bus distinction, Attachment "BES Sketches - Facility Example & Boundary Definitions" should be added to the Standard.

Organization	Question 7 Comment
	(3) R2 and R6.2: The Implementation Plan includes specific references to time frames for becoming fully compliant with the locations lists, but the Requirement language itself does not include post-implementation compliance timelines for the required reassessments. The Implementation Plan states "Entities shall be 100% compliant with a reassessed list from Requirement R1, Part 1.2 or R6, Part 6.2 within three (3) years following notification of the list." This language should also be included in the language of the affected Requirements to prevent any disparity following the initial implementation and departure from the Implementation Plan. (4) R3: Legacy FR equipment installed before the standard effective date may not be capable of embedded SOER. R3 does not afford the same caveat for older equipment where SOER is required that R10 provides for older equipment where DDR is required. Language should be added to R3 providing the option to utilize FR digitals to monitor circuit breaker position for each circuit breaker. (5) R4 and R8: Add Rationale box stipulation that the required “electrical quantities, whether directly measured or derived,” to R4 and R8 as described below: The R4 Rationale Box explains the method of deriving electrical quantities; however, the requirement language of R4.1 does not reflect the intent described in the Rationale Box. Specifically, whether or not locations where busses are effectively tied together, such as on ring or breaker-and-half bus configurations, can derive the required phase-to-neutral voltages by monitoring a minimum of two of each phase-to-neutral voltages, from either line terminal or bus potentials. In a typical large switching station, this could eliminate costly retrofits to literally provide all three phase-neutral voltages for “each line or bus.”The language of R8.3 does not specify the method used to provide “Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required.” If the intent follows the electrical quantity collection of R4, the language of R8 should also specify the ability to derive electrical quantities. Allowing calculated power flow would prevent costly retrofits to literally provide 6 dedicated analog traces for each Element required to have a DDR.

Organization	Question 7 Comment
	(6) R10: The language of R10 could be interpreted to mean the triggering requirements are only applicable to DDR equipment installed prior to the effective date of the standard. The triggering requirements are applicable to all DDR equipment. Additionally, the collection of 3-minute FR records for every transient event as a substitute for a DDR is a costly modem transfer and storage retention practice. (7) R11: If relays meet the requirement of a DDR, the language of R11.1 or M11 should specify that synchrophasor data is acceptable for DDR analysis. (8) R12: The language of R12 should provide a caveat to allow for manipulating event records to UTC for equipment that is synchronized but cannot time-stamp with UTC as the reference. This would be similar to the "or derived" language suggestions to Requirements R4 and R8 which would allow for legacy equipment to meet the standard as well as allow for the time-alignment for multiple FR/SOERs as M12 evidence. Additionally, Rationale box language, further explaining the UTC local offset, should be included in M12 to clarify that offset records are acceptable as evidence. In other words, requested records must be supplied in UTC format, but the stored format does not need to adhere to UTC format. (9) R13: Some entities do not automatically name files in the COMNAME fo`rmat for ease of data storage. With the phrase "formatted records," M13 implies that manipulation of file before submittal is allowed. If data file names can be changed to the prescribed COMNAME formatting, R13.5 should specify that the data files need only be provided in this format rather than originally named this way.

Response: (1) The DMSDT has reviewed the Requirements versus the Rationale Boxes. The content of the Rationale Boxes answer the question "why?". The DMSDT has reviewed the requirements and Rationale Boxes and revised accordingly taking into account stakeholder comments.

Organization	Question 7 Comment
(2) Requirements R1 and R2 have been combined (into what is now R1) for clarification in response to comments received. The wording in what is now R1 was clarified. **(3) The DMSDT has made the Implementation Plan and standard time frame consistent.** **(4) Regarding legacy equipment for sequence of events recording, the standard is not about equipment, just the data that is recorded. It is not the "how", but "what". The requirement was revised to clarify that it is the data that is required.** **(5) Requirements R4 (now R3) and R8 (now R6) do allow an entity "to determine", determine includes calculate. This is specific language used in a requirement. The R4 (now R3) and R8 (now R6) Rationale Boxes have been revised.** **(6) The dynamic disturbance recording triggering specified in Requirement R10 (now R8) deals with non-continuous recorders installed prior to the effective date of the standard. Otherwise, dynamic disturbance recording must be continuous. The three minute record applies to dynamic disturbance recording and not fault recording.** **(7) Regarding Requirement R11 (now R9), the standard is not about the "how" of capturing data, but "what" data is captured. If the data provided meets the requirements for recording, then that data can be used. For example, synchrophasor data would most likely meet the requirement of dynamic disturbance recording data.** **(8) Data provided must be time synchronized to UTC, with or without local time offset. The DMSDT added the following to the Rationale Box for R12 (now R10): Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.** **(9) Part 13.5 (now Part 12.5) stipulates that file names provided to the requesting entities are to be provided in COMNAME format. The standard is intentionally silent on what the file name should be prior to that.**	
Northern California Power Agency	I support the comments of FMPA from Frank Gaffney
Response: Please see the DMSDT response to FMPA.	

Organization	Question 7 Comment
American Electric Power	(1) In general, we believe the standard is written to prescriptively when the standard emphasizes post-event analysis. More clarity is needed regarding time frame, etc. as to what is expected of a TO after they informed that data recording is required for an element owed by the TO. (2) R13.1: Suggest “The recorded data will be provided within 30 calendar days, or other agreed-upon time frame, of a request.” (3) It appears that R2 applies to shared stations only. If this is accurate, we suggest rewording to clarify the intended applicability. In addition, it is unclear which entity would be responsible for the installations. (4) The wording in R13.2 is unclear. Possible interpretations include that the data must be retrievable for at least 10 days at any given time, or that the data must be retrievable on a continuous basis. Please revise to provide clarification. (5) The sub-bullets listed in R13, especially R13.2, would be more appropriately included in the technical requirements of each DME type in R3, R5 and R11. (6) The sub-bullets in R14 read do not clearly read as an OR statement and may be misinterpreted as an AND statement. We recommend removing the bullets and making the item read as a single sentence: “... shall restore the recording ability or report the inability to record data...” (7) R3 requires GOs and TOs to install SOER for each circuit breaker they own that is connected to the bus locations identified in R1. This does not account for the fact that not all of the circuit breakers on the identified busses should require SOER because some breakers may be associated with non BES equipment.

Organization	Question 7 Comment
	(8) R4.1 should be modified to state “Phase-to-neutral voltages for each phase of either each specified line or bus.” (9) In R5.1, an “or” should be added to the end of the first bullet to improve clarity. (10) Also, in R5.3 the word “settings” should be removed to improve technical accuracy. (11) In R7, the word “determination” should be replaced with “identification” to be consistent with the rest of the standard. (12) R8 should be revised as follows to improve clarity:R8.1: “At least one phase...”R8.2: “The current on the same phase as the voltage in...”R8.4: “Frequency of at least one of the.... (13) R9 should be revised as follows to improve clarity:R9.1: “At least one phase...” (14) R9.2: “The phase current on the same phase as the voltage in...”The DMSDT may want consider combining requirements that are related to the same monitoring equipment types. (15) R4 and R5 could be combined because they both relate to specifications of FR equipment. Similarly, R8, R10, and R11 could be combined, as they all relate to DDR equipment.

Response: (1) The time frames for each requirement are specified in the Implementation Plan.

(2) To ensure the expeditious and uniform submission of data, a time frame has to be specified. The 30 days specified in Part 13.1 (now Part 12.1) is a reasonable amount of time to respond to a request.

Organization	Question 7 Comment
(3) Requirement R2 (now R1) is not intended to apply to shared stations only. The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent. The standard does not address installations, only data. (4) Part 13.2 (now 12.2) has been revised to clarify the time frame for providing data. "Recorded data shall be retrievable for a minimum of 10 calendar days". (5) Because of applicability of the Parts of Requirement R13 (now R11), they will be kept under one central requirement. (6) Requirement R14 (now R12) has been revised to reflect the comments received. (7) Requirement R3 (now R2) dictates that SER data is required for all circuit breakers connected to the buses identified in Requirement R2 (the DMSDT has combined Requirements R1 and R2 into what is now R1). Requirement R3 (now R2) has been revised to read: R2: Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses identified in Requirement R1. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] (8) The DMSDT made a revision in the wording for Part 4.1 (now Part 3.1), and it includes "specified". (9) A list with bulleted items is an "Or" list for the bulleted items. "Or" will be added between the bullets of Part 5.1 (now part 4.1) for clarification. (10) The DMSDT does not feel that removing "settings" from Part 5.3 (now Part 4.3) would improve its technical accuracy. (11) "Determination" was changed to "identify" in Requirement R7 (now R5). (12) R8 is now R6. The DMSDT retained the original language in Part 8.1 (now Part 6.1) and 8.4 (now Part 6.4). Part 8.2 (now 6.2) was revised. (13) R9 is now R7. The DMSDT retained the original concept.	

Organization	Question 7 Comment
(14) Requirement R8 (now R6) applies to the Transmission Owner; Requirement R9 (now R7) applies to the Generator Owner. Because of the differences in the requirements for each entity, those requirements will remain separate. **(15) The DMSDT does not agree with this comment. Each requirement applies to different entities and/or data requirements.**	
Wisconsin Electric Power Company	(1) In Requirement 14, there is a discrepancy between the text of R14 and the Rationale statement which follows. The bullet "Restore the recording capability" should be changed to "Restore the recording capability if possible". This will allow the entity more time if necessary to correct the problem, which is allowable as described in the Rationale. As it stands, an entity will be in violation if the recording capability is not restored within 90 days of discovery of a failure.
Response: (1) The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be developed. R14 (now R12) and its Rationale Box have been revised.	
JEA	(1) It is unclear if both of the two statements in R5.5.1 are required, or if meeting only one of the two is sufficient.
Response: (1) The bullets reflect the capabilities of the means of recording that are available to industry. A list with bulleted items is an "Or" list for the bulleted items. "Or" will be added between the bullets of Part 5.1 (now 4.1) for clarification. Both bullets of 5.1 (now 4.1) are needed to address the Fault Recording that is available to industry.	

Organization	Question 7 Comment
AESI Acumen Engineered Solutions International Inc.	(1) It is understood that the intent of this version 2 of the PRC-002 Standard is to ensure that sufficient recording capability exists without being prescriptive as to the type of equipment that must be installed to meet the recording capability requirements. It is also understood that the DMSDT did not wish to be unnecessarily prescriptive with respect to periodic maintenance activities, and as such, this version 2 of PRC-002 contains no such requirement. It does not appear however that the Standard would necessarily ensure that Entities continue to have the required recording capability over time following initial installation and commissioning and after completion of the Implementation Plan. Although an Entity should be compliant at all times, is it plausible that an Entity could be unaware if some of the required recording capability is deficient or no longer exists? Disturbances do not occur very frequently, and an Entity may not become aware of deficiencies for many months or years until a disturbance occurs, when the disturbance data is requested; at which point they realize that the disturbance recording functions or capability is deficient in some manner. It could be argued that verifying compliance, and ensuring that the required recording capability exists, is the task of the auditor; however, this is dependent upon the Standard being included in an audit, and an audit itself may only occur once every 3-6 years. We suggest that the DMSDT consider adding a requirement for Entities to simply perform a periodic verification of the required recording capability, without specifying how to verify such recording capability, on an interval to be determined by the DMSDT. There are many mechanisms available for verification such as downloading recorded data, performing equipment self-tests, etc. Allowing Entities to perform periodic verification of the required recording capability in a manner they choose is consistent with the spirit of the Standard of not being unnecessarily prescriptive, and is consistent with ensuring that the required recording capability is in place.

Response: (1) The DMSDT considered the comment and determined that the addition of such a requirement would not improve the reliability of the BES without placing an undue burden on the responsible entities. With regard to maintenance, because the standard just deals with data, the DMSDT decided not to go further than Requirement R14 (now

Organization	Question 7 Comment
R12). It is understood that a data capture failure may only be exposed during a system disturbance, but with the extent of data capture mandated by this standard "normal" data failures can be tolerated.	
Modeling Working Group	(1) MWG finds that requirements for data retention are essential to this standard but are missing in the current draft. MWG recommends including a requirement that all triggered data recordings be retained for a minimum of 2 years and that all continuous data recordings be retained for a minimum of 30 days. MWG also recommends including a requirement that all continuous data recordings be scanned against the set of triggers defined in R10 and those portions of the continuous recordings that fall within the time periods defined by those triggers be retained for a minimum of 2 years.
Response: (1) The retention periods are specified in Requirement R13 (now R11). They were decided upon because the DMSDT felt that the data to analyze a significant system event would be called for quickly. Requesters of data also have to be aware of the retention requirements in the standard. Retention specifications beyond this "initial" data gathering are outside the scope of this standard. The DMSDT notes that this is a disturbance monitoring standard and that model verification is outside the scope of this standard.	
Dominion	(1) PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2013, NPCC applicable entities are two years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant with this Regional Reliability Standard. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Dominion cannot support this continent-wide standard without inclusion of a variance for the NPCC Region (PRC-002-NPCC-01).

Organization	Question 7 Comment
	(2) Dominion believes the intent of Requirement R2 is for Transmission Owners to notify "other" owners of BES Elements, as explained in the Rationale statement. The requirement as written would also require the Transmission Owner to notify itself. Therefore, Dominion suggests revising R2 and M2 as follows: R2. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the "other" owners of those Elements...M2. The Transmission Owner has dated evidence (electronic or hard copy) of notification to "other" owners of Elements... (3) In R1.2 and R 6.2, what prevents a TO or RE from assessing the locations and elements on too frequent of a time basis. As written, it provides no clause to prevent excessively short re-assessment periods. There should be some minimum time (say several years) between assessments to provide stability in where monitoring is really needed. Frequent assessments could jockey locations above and below the minimum criteria line and create confusion. (4) In R2, it infers that the TO as part of R1 developed a list of Elements, however R1 requires the TO only to determine BES bus locations. If it was the intent that the TO determine the specific Elements, we suggest R2 be reworded to say "Each transmission owner shall identify BES Elements at the bus locations established in Requirement R1 and shall notify...". If it was the intent that the GOs (and other affected TOs) to determine which BES Elements they own at the bus locations, then do not require that the TO identify the BES Elements, instead let the owners of those Elements identify their Elements. (5) In R5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the requirement. We suggest R5.1 be reworded to say "A single record or multiple records that include at least one of the following:". (6) In R14, reword to indicate that the second bullet is only applicable if the first bullet is not completed within 90 days. We suggest this wording for the second bullet - "If recording ability is not restored within 90 days, report the inability..."

Response: (1) The DMSDT is aware that the NPCC DMSDT has been reconvened to review the Regional Standard with respect to PRC-002-2 after it is approved.

Organization	Question 7 Comment
(2) The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent. **(3) There is nothing that prevents a TO or RE from a too frequent assessment. The DMSDT does not believe that reassessment will result in a significantly different set of buses or elements for which data is required unless significant construction activity or reclassification of BES elements has occurred. If an entity is notified that they have a data obligation, the implementation plan for PRC-002 allows them three years to become compliant.** **(4) The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent.** **(5) The bullets reflect the capabilities of the means of recording that are available. A list with bulleted items is an "Or" list for the bulleted items. "Or" was added between the bullets of Requirement R5 (now R4) for clarification.** **(6) The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be developed. R14 (now R12) and its Rationale Box have been revised to clarify. Requirement R14 (now R12) was revised to include "Or". The bulleted items were moved into the requirement wording.**	
New York Power Authority	(1) R10It is stated that triggered records from existing equipment can be accepted in lieu of continuous recording if the triggered records meet the criteria in 10.1 and 10.2. If continuous recording is available and meet all criteria, are triggered DDR records required? (2) R13.3There is no need to require this data to be written in CSV format. Tab delimited text would work as well and would not limit the use of commas in descriptors or other entries. The format described in Attachment 2 is limiting and incomplete (see comments on Attachment 2). (3) R13.4This requires that Fault Recording and Disturbance Recording data will be provided in COMTRADE (C37.111) formatted files, but does not specify a revision level or year for the COMTRADE standard. The requirement should specify "C37.111-2013 or later" in order to require a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

Organization	Question 7 Comment
	(4) Attachment 2The format in Attachment 2 is limited and incomplete. While the information required is obviously necessary, the format limits or omits information available from some SOERs. R13.3 states that the files must be comma-delimited, but Attachment 2 makes no statement about the length of any string or value. There is no provision for SOERs which may have detailed descriptors of the contacts being monitored but may be a single string. “Local Time Offset from UTC” should be expressed in hours before or after UTC rather than letter designations. There is no provision for acceptable terms for “State” except for “OPEN “and “CLOSE”. Other terms may be more appropriate for some devices monitored by an SOER, such as “ENABLED” or “DISABLED”, “ON” or “OFF”, etc. In short, Attachment 2 appears to be an attempt at defining a standard but does not adequately define a format. Development of such a standard may be better left to an IEEE Working Group or other entity.
Response: (1) Triggered DDR records would not be required if continuous recording is available. **(2) The DMSDT discussed and decided on the .CSV format as being universally acceptable to industry. The .CSV format was selected to ensure uniformity in data collected.** **(3) The DMSDT agrees and has made the revision to R13 (now R11) as suggested.** **(4) The intent of Attachment 2 was to show only what would be minimally required. There is nothing to prevent the inclusion of additional data. It is not intended to have any string or value length on Attachment 2. The “Local Time Offset from UTC” column heading has been revised to reflect hours before or after UTC. The footnote for the “State” column has been revised to indicate that “OPEN” or “CLOSE” must be used for circuit breakers to be consistent with Requirement R3 (now R2), and a note added that other status monitoring indication can be used for devices other than circuit breakers.**	
Lincoln Electric System	(1) R13.2 specifies that “The recorded data will be retrievable for the period of 10 calendar days preceding a request”. As drafted, this requirement seems to indicate that if an event happened on June 1st and the data was requested on June 30th, then the data would have to be retrievable from June 20th to the 30th. However, if a request is made on June 6th following a June 1st disturbance, it would not be possible to comply with the 10 calendar day requirement.Unless LES

<table>
<tr><th>Organization</th><th>Question 7 Comment</th></tr>
<tr><td></td><td>misunderstands the DMSDT’s intent, it seems as though the requirement is meant to ensure that data is available and retrievable for a period of 10 calendar days following a disturbance in the event further analysis needs to be conducted. To ensure this intent is conveyed, LES recommends rewording R13.2 to indicate that the 10 day period starts at the time of the event. Additionally, R13.2 should also account for circumstances beyond the control of the TO or GO in which multiple events caused the relays recording the data to overwrite it with more recent events due to limited memory space. As an example, a TO could have information available for the 10 days required by the standard, but multiple disturbances due to severe weather on day 12 resulted in initial data being unavailable for a request initiated on day 12 or later. If this occurs, R13.2 would then place the Transmission Owner or Generator Owner in violation of the standard due to a limitation inherent to the relay.13.2. The recorded data will be retrievable for the period of 10 calendar days following a disturbance.(1) Footnote (1): The 10 calendar day period may be waived for circumstances beyond the control of an applicable Transmission Owner or an applicable Generator Owner, such as, but not limited to, equipment manufacturer limitations resulting in the loss of data.</td></tr>
<tr><td colspan="2">Response: (1) Requirement R13 (now R11) stipulates the expectations of a Transmission Owner after being notified data is required. Specific time frames need to be specified in the Requirement to ensure the expeditious treatment of data. Part 13.2 (now Part 12.2) has been revised to clarify the time frame for providing data. The language of Part 13.2 (now Part 12.2) has been revised to “Recorded data shall be retrievable for a minimum of 10 calendar days.” Because of the importance and need for expediency in analyzing BES system-wide disturbances, the DMSDT decided that 10 days was a reasonable time frame to have data stored for. Requesters of data will also have to be aware of the 10 calendar day requirement.</td></tr>
<tr><td>Lower Colorado River Authority</td><td>(1) R3 - clarify if EMS/RTU or Plant DCS circuit breaker timestamps will meet this requirement.
(2) R3, R4, R5, R11, R12, R13, R14 - Clarify “AND” in requirement and “OR” in measure - language is confusing. It is inconsistent.</td></tr>
</table>

Organization	Question 7 Comment
	(3) R5 - Change 5.1 minimum length from 50 to 30 cycles. An excessive number of events can cause data to be overwritten and can delay the downloading of data. (4) Change 5.3 to "Trigger settings for at least one of the following:" -OR- remove Phase undervoltage as a trigger requirement. (5) R13 - revise 13.2 from a minimum of 10 calendar days down to 5 calendar days. Longer-term storage of data may be difficult with a large number of SOER/FR/DDRs on your system. (6) R14 - change minimum response time from 90 calendar days to 180 calendar days to allow for design, procurement, and installation of long lead-time equipment/components used for SOER/FR/DDR.
LCRA Transmission Services Corporation	(1) R3 - clarify if EMS/RTU or Plant DCS circuit breaker timestamps will meet this requirement. (2) R3, R4, R5, R11, R12, R13, R14 - Clarify "AND" in requirement and "OR" in measure - language is confusing. It is inconsistent. (3) R5 - Change 5.1 minimum length from 50 to 30 cycles. An excessive number of events can cause data to be overwritten and can delay the downloading of data. (4) Change 5.3 to "Trigger settings for at least one of the following:" -OR- remove Phase undervoltage as a trigger requirement. (5) R13 - revise 13.2 from a minimum of 10 calendar days down to 5 calendar days. Longer-term storage of data may be difficult with a large number of SOER/FR/DDRs on your system. (6) R14 - change minimum response time from 90 calendar days to 180 calendar days to allow for design, procurement, and installation of long lead-time equipment/components used for SOER/FR/DDR.

Response: (1) The standard is not concerned with "how" the data is captured, only "what" data is captured. It is the responsibility of the entity to make this determination.

Organization	Question 7 Comment
(2) "And" is used in the Requirements because the Requirements need to be all encompassing. The Measures are written with "Or" because they are written to address either entity's compliance with a Requirement and the types of evidence required are written as an either/or option. You do not have to have all forms of evidence. (3) In Part 5.1 (now Part 4.1) the 50 cycle requirement has been reduced to 30 cycles. (4) Both Fault Recorder Trigger settings were selected to cover those events involving and not involving ground, and those events that might not have an accompanying significant collapse in voltage. The DMSDT has revised sub-Part 5.3.2 (now 4.3.2) to revise the wording and allow for overcurrent: "4.3.2. Phase undervoltage or overcurrent." (5) The DMSDT considered the data storage necessary, and felt that the 10 days preceding a request was achievable with equipment available. (6) Based on industry comments, 90 days is realistic and practical for determining the availability of data recording capability. The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be developed. R14 (now R12) and its Rationale Box have been revised to clarify. R14 (now R12) is no longer bulleted.	
ITC	(1) R4, R11, R12, R13 and R14 need to be clear that they apply to the Element and/or equipment owner. They will be acceptable if they are reworded as:R4 after "following electrical quantities" insert "for each of the Elements they own"R11 after "for the Elements" insert "they own"R12 and R13 after "Dynamic Disturbance Recording (DDR) data for" insert "for Disturbance Monitoring Equipment they own"R14 after "or Dynamic Disturbance Recording (DDR)" insert "that they own"
Response: (1) The DMSDT has addressed ownership through revisions made to R4 (now R3), R11 (now R9), R12 (now R10), R13 (now R11) and R14 (now R12).	

Organization	Question 7 Comment
Northeast Power Coordinating Council	(1) Regarding Attachment 1:a) The term "BES bus location" is not clear. There could be two or more BES bus locations at the same physical location (substation). The definition of "BES bus" could not be found.b) Step 7 of Attachment 1 does not specify how to round the 10% of the BES bus locations, determined in Step 6, with the highest maximum available calculated three phase short circuit MVA.c) Step 8 of Attachment 1 does not specify how to round the additional 10% of the BES bus locations determined in Step 6.d) Attachment 1 does not specify how to distribute an odd number for 20% of the BES bus locations between b) and c) from above. (2) In Part 1.2 and Part 6.2, what prevents a TO or RE from assessing the locations and elements too frequently? As written, it provides no clause to prevent excessively short re-assessment periods. There should be some minimum time (say several years) between assessments to provide stability where monitoring is really needed. Frequent assessments could move locations above and below the minimum criteria line and create confusion. (3) We agree with R1, but do not see the need for R2 because through R1 and Attachment 1 each TO has already identified the bus locations that it owns for having Sequence of Events Recording (SOER) and Fault Recording (FR). There is not another owner(s) that a TO needs to communicate the list to, unless the “list of BES bus locations that it owns” stated in Step 1 of Attachment 1 means only the location ownership but not the Element ownership. But if that’s the case, Step 1 in Attachment 1 needs to be clarified. (4) In R2, it infers that the TO as part of R1 developed a list of Elements, however R1 requires the TO only to determine BES bus locations. If it was the intent that the TO determine the specific Elements, we suggest R2 be reworded to say “Each transmission owner shall identify BES Elements at the bus locations established in Requirement R1 and shall notify...”. If it was the intent that the GOs (and other affected TOs) to determine which BES Elements they own at the bus locations, then do not require that the TO identify the BES Elements, instead let the owners of those Elements identify their Elements. The intent of Requirement R2 is for Transmission Owners to notify “other” owners of BES Elements, as explained in the Rationale statement. The requirement as written would also require the Transmission Owner to notify itself. Therefore,

Organization	Question 7 Comment
	suggest revising R2 and M2 as follows:R2. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the “other” owners of those Elements...M2. The Transmission Owner has dated evidence (electronic or hard copy) of notification to “other” owners of Elements... (5) Requirement R3 specifically asks to have SOER, however the guideline for R3 allows for the breaker status to be determined by analysis of suitably time synchronized FRs with the data provided in the manner detailed in R4. This should be identified in the Requirement itself. The guideline is a non-binding portion of a standard. (6) The guideline for R3 has a typo (it should reference R4 instead of R14). (7) Requirement R4 is not clear if determine means that the required BES Elements of TO and GO shall have waveforms for each phase current and the residual or neutral current. Regarding Requirement R4, Part 4.2, it is not clear if only high-side voltage winding voltages and currents need to be recorded. Clarification is needed if low-side voltage windings and transformer neutral need to be monitored also. (8) Part 4.1- More specificity is needed in the requirement. Are phase to neutral voltages needed for each line? If common bus side voltages are available is it sufficient to have one set of phase-neutral voltages for the bus location? If so the wording should more accurately reflect this. Presently it reads - “.... Voltages for each phase of either each line or bus.” which could be confusing. (9) Part 4.2 - Residual current and neutral current are two different quantities. Residual current is current present in the neutral of the Element CT circuit while neutral current implies current directly measured by a CT in the neutral of an Element. This wording should probably be more specific by stating if the monitored transformer has a neutral CT it should be monitored (if this was the intention of the DMSDT). (10) Sub-Part 4.2.1 - Is monitoring required on both HV and LV sides of these transformers? The wording for this requirement should be more specific. (11) M4 (1): add “plus evidence the device was commissioned at the specific bus in question”.

Organization	Question 7 Comment
	(12) In Part 5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the requirement. We suggest R5.1 be reworded to say “A single record or multiple records that include at least one of the following:”. (13) Part 5.1 - the two bullet items in this requirement are confusing and should be reworded to clarify what is intended. (14) Part 5.1 Bullet 2- The wording should be changed as follows: “At least two cycles of the pre-trigger data, the first three cycles of the fault as seen by the Fault Recorder, and the final cycle of the fault as seen by the Fault Recorder.” Because the deployment of Fault Recorders are not required on every BES bus, unless the fault is being cleared on an Element directly connected to the bus, the fault recorder may not always accurately capture the fault information if it is occurring more than one bus away from the Fault Recorder location. Without this additional wording the Fault Recorder would have to capture the actual final cycle of the fault which may be impossible if it is not directly monitoring it. (15) Part 5.2 assumes that SOE recording is driven by DFR analog sampling since it infers the achievement of a 1ms digital event resolution for a 960Hz (16x60Hz) analog sample rate. Stating analog and event resolution requirements (i.e. 16 samples per cycle and 1ms event resolution respectively) separately and explicitly is clearer and accommodates instances where SOER is separate from analog sampling. (16) Part 5.3.1. asks to have trigger settings for neutral (residual) overcurrent, which implies for R4 that it is necessary not only to determine but to monitor either each phase current or neutral current. (17) Regarding requirement R6, the standard should not create a new term like “Responsible Entity” but should only refer to specific NERC entities like TO, GO, RC, etc. (18) If the DMSDT decides to retain sub-Part 6.1.6, then it is recommended the phrase "all Elements associated with Interconnection Reliability Operating Limits" be replaced with "elements critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" similar to the language used in CIP-002-4. CIP-002-4 - Attachment 1 Critical Asset

Organization	Question 7 Comment
	Criteria reads:1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies. (19) There is an error in the mapping document. R6 of PRC-018-1 speaks to the need for maintenance of DME. The DMSDT has mapped this requirement to R14 of PRC-002-2. These two activities are not the same since R14 is a break-fix requirement for DME, while R6 of PRC-018 speaks to maintenance activities of DME. Maintenance of DME ensures devices that need calibration are calibrated as well as correcting any non-annunciated failures. R14 of PRC-002-2 requires entities to repair equipment that they know is in a failed state. (20) The Part 8.3 wording is too restrictive. Real and reactive power may not be able to be determined operationally if say a bus is split at the time of an event (or the split is caused by an event). Suggest the DMSDT correct this requirement by referencing “nominal” real and reactive power which refers to the original design of the DDR channel assignments which under normal operating conditions Real and Reactive Power could be determined. The design should be assuming all normally-closed circuit breakers on a bus are closed. This avoids being out of compliance during a specific event, if open bus breakers preclude recording the MVA flows on all elements. (21) Requirement R10 should allow the legacy equipment to have multiple triggered records which make up the required length. It is stated that triggered records from existing equipment can be accepted in lieu of continuous recording if the triggered records meet the criteria in 10.1 and 10.2. If continuous recording is available and meet all criteria, are triggered DDR records required? (22) R13 - this requirement places the RC, RE and/or NERC in the middle of data sharing. There is no requirement in the standard to facilitate entities to partake in data sharing. Is this really the intent? What if adjacent entities need to exchange post-disturbance information? Does that really need to occur via the RC, RE or NERC if an entity cannot directly request necessary data? (23) Requirement R13, Part 13.3. asks for SOER data in Comma Separated Value (.CSV) format whereas the majority of Disturbance Monitoring Equipment (DME) do not save data in this

Organization	Question 7 Comment
	format. In addition, if breaker open/close position determination from FR data is acceptable, no .CSV file can be created by the recording tool itself. There is no need to require this data to be written in CSV format. Tab delimited text would work as well and would not limit the use of commas in descriptors or other entries. (24) The format described in Attachment 2 is limiting and incomplete (see comments on Attachment 2 below). (25) Similarly, R13 Part 13.4. asks for FR and DDR data in C37.111 , IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files whereas the majority of DME equipment does not save data in this format. Are manually converted records acceptable? This requires that Fault Recording and Disturbance Recording data will be provided in COMTRADE (C37.111) formatted files, but does not specify a revision level or year for the COMTRADE standard. The requirement should specify “C37.111-2013 or later” in order to require a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data. (26) In R14, reword to indicate that the second bullet is only applicable if the first bullet is not completed within 90 days. We suggest this wording for the second bullet - “If recording ability is not restored within 90 days, report the inability...” The Rationale for requirement R14 recognizes that the DME equipment cannot be always returned to service within 90 calendar days of the discovery of a failure. Requirement R14 itself, however, is not clear and should be rewritten to reflect that. (27) PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2013, NPCC applicable entities are two years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant with this Regional Reliability Standard. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements.

Organization	Question 7 Comment
	(28) Regarding Attachment 2, the format in Attachment 2 is limited and incomplete. While the information required is obviously necessary, the format limits or omits information available from some SOERs. R13.3 states that the files must be comma-delimited, but Attachment 2 makes no statement about the length of any string or value. There is no provision for SOERs which may have detailed descriptors of the contacts being monitored but may be a single string. "Local Time Offset from UTC" should be expressed in hours before or after UTC rather than letter designations. There is no provision for acceptable terms for "State" except for "OPEN "and "CLOSE". Other terms may be more appropriate for some devices monitored by an SOER, such as "ENABLED" or "DISABLED", "ON" or "OFF", etc. In short, Attachment 2 appears to be an attempt at defining a standard but does not adequately define a format. Development of such a standard may be better left to an IEEE Working Group or other entity.

Response: (1) The DMSDT intended that the bus location be the bus location identified in a system study, and further identifies it in Attachment 1 as "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." Steps 7 and 8 explicitly state "at least" 10% or 20% respectively.

(2) There is nothing that prevents a TO or RE from a too frequent assessment. The DMSDT does not believe that reassessment will result in a significantly different set of buses or elements for which data is required unless significant construction activity or reclassification of BES elements has occurred. If an entity is notified that they have a data obligation, the implementation plan for PRC-002 allows them three years to become compliant.

(3) (4) The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent.

(5) (6) The DMSDT has reviewed this language and removed it from the guidelines for R3 (now R2).

(7) The use of "determine" means that the stipulated data can be obtained by direct measurements or derived mathematically. Monitoring is not required on both sides of the transformers. Derived data is acceptable. The

Organization	Question 7 Comment
Requirement stipulates the determination of electrical quantities. We have added a clarification to the Rationale Box: "For transformers ((now)Part 3.2.1), the data may be from either the high side or the low side of the transformer." (8) The standard offers two option; either bus or line voltages. For each phase, you can use a bus or a line. The intent of the Requirement is to lay the foundation for capturing adequate data for event analysis. Bus voltages could be used in lieu of each of the Elements connected to that bus. (9) For the purposes of FR data, residual and neutral currents are the same. The DMSDT noted that the requirement is designed to have the entity provide data and the entity has flexibility as to how this is obtained or derived. Use of residual current or neutral current will provide the same results. They represent the zero sequence component of the fault current and are measured/determined by different techniques. (10) Monitoring is not required on both sides of the transformers. Derived data is acceptable. The Requirement stipulates the determination of electrical quantities. A clarification has been added to the Rationale Box: "For transformers (now Part 3.2.1), the data may be from either the high side or the low side of the transformer." (11) The DMSDT reviewed M4 (now M3) and found that the words "plus evidence the device was commissioned to capture data at the specific bus in question" did not need to be added because commissioning is not necessary for the acquisition of appropriate data.(12) A list with bulleted items is an "Or" list for the bulleted items. "Or" was added between the bullets of now Part 4.1 for clarification. (13) The DMSDT has revised the bullets for clarity: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point, or • At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder. (14) The standard refers to data and not equipment. See the preceding response. (15) Part 5.2 (now Part 4.2) only applies to FR and there is no linkage to SER. The specifics of sequence of event and fault recording data are separate and succinct.	

Organization	Question 7 Comment
(16) The DMSDT agrees that the triggering specified in Part 5.3.1 (now Part 4.3.1) requires monitoring either all phase currents or neutral current. (17) Because of the different responsibilities of entities throughout the continent, the DMSDT decided that the use of Responsible Entity was most appropriate. Responsible Entity is not a new term and is used in other NERC standards. (18) The wording of Part 6.1.6 (now sub-Part 5.1.4) has been revised to "One or more BES Elements associated with each Interconnection Reliability Operating Limit (IROL)." (19) PRC-002 addresses the provision of data. It does not address equipment nor does it address maintenance of equipment. PRC-018-1, R6 addresses maintenance and that is not specifically required in PRC-002-2. The DMSDT is not prescribing a maintenance program in PRC-002-2 and is only requiring that a failure of data recording is corrected according to R14 (now R12). The Notes Section on p. 13 of the Mapping Document explains the rationale behind mapping PRC-018-1 Requirement R6 to PRC-002-2 Requirement R14 (now R12). From the Mapping Document: "PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R14 (now R12) deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability." The Mapping Document was revised to reflect the R14 (now R12) wording. (20) The DMSDT has added verbiage to the Guidelines section of the standard to indicate this: "The data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed." (21) As stated in Requirement R10 (now R8), if there isn't continuous data recording on already installed equipment, Parts 10.1 (now Part 9.1) and 10.2 (now Part 9.2) must be met. If continuous recording is available for Elements, then the triggered recording is not required for those Elements. (22) Entities can share data with whomever they deem necessary as it is not precluded in the standard. This Requirement ensures that the RC, or NERC get the data because the intent of PRC-002-2 is to ensure that there is data available to analyze	

Organization	Question 7 Comment
wide-area disturbances. This Requirement does not state that data has to go through the RC, RE, or NERC. The dictates for sharing data are outside the scope of this standard. **(23) The DMSDT discussed and decided on the .CSV format as being universally acceptable to industry. The .CSV format was selected to ensure uniformity in data collected.** **(24)(25) The DMSDT has added language to clarify Part 13.4 (now 12.4) to indicate the version of C37.111 should be C37.111-2013 or later.** **(26) The intent of Requirement R14 (now R12) is to have recording failures restored within 90 days of discovery, and if that can't be achieved then a CAP would have to be developed. R14 (now R12) and its Rationale Box were revised to clarify.** **(27) The DMSDT is aware of NPCC's PRC-002-NPCC-01, and that its DMSDT has been reconvened to review the Regional Standard with respect to PRC-002-2 after it is approved. There won't be a variance for the NPCC Standard, because after review if requirements in PRC-002-NPCC-01 were more stringent than PRC-002-2 they would be kept.** **(28) The intent of Attachment 2 was to only show what would be minimally required. There is nothing to prevent the inclusion of additional data. It is not intended to have any string or value length on Attachment 2. The "Local Time Offset from UTC" column heading has been revised to reflect hours before or after UTC. The footnote for the "State" column has been revised to indicate that "OPEN" or "CLOSE" must be used for circuit breakers to be consistent with Requirement R3 (now R2), and a note added that other status monitoring indication wording can be used for devices other than circuit breakers.**	
Dynegy	(1) Regional Standard PRC-002-NPCC-01 technical specifications for DDR conflict with PRC-002-2 technical specifications. The NPCC Regional Standard R9 specifies a DDR recording rate of 6 times per second while PRC-002-2 specifies 30 times per second. Conflicts with the Regional Standard should be removed so entities are not penalized for Regional Standard compliance.
Response: (1) As explained in the Guidelines for Requirement R11 (now R9), the 30 times per second output recording rate is necessary to capture certain dynamic events. If the NERC standard is met, NPCC requirements will be exceeded.	

Organization	Question 7 Comment
SPP Standards Review Group	(1) Requirement R2 calls for Transmission Owners to notify other owners (who would also be Transmission Owners) of other facilities within the locations identified in Requirement R1. There could conceivably be situations where multiple owners would be involved and possibly none of the owners was able to identify 11 locations as specified in R1. In this situation, those particular facilities would not be required to have SOER or FR equipment even though the impact of those facilities could be significant on the BES. While this situation may be very unlikely to occur, it is still a possibility. (2) In Requirement R2 and its associated Rationale Box as well as throughout the posted documents, check for hyphenation of terms such as 90-calendar days, 60-calendar days, 30-calendars days, etc. (3) In the Rationale Box for R8 modify the single-line, paragraph to read 'Because all of the buses within a location are typically at the same frequency, one frequency measurement is adequate.' (4) In the 1st paragraph under the Guideline for Requirement R1 section in the Guidelines and Technical Basis, modify the next to last line to read '...voltage and current for individual circuits allow precise reconstruction of events of both...'. (5) Check the usage of wide-area and make sure it is properly hyphenated throughout the standard and the posted documents. Something appears to be missing in the 2nd sentence in the last paragraph under the Guideline for Requirement R1 section in the Guidelines and Technical Basis. 'Five years is long enough to avoid unnecessary, but long enough to adapt...'. To avoid unnecessary what? In the 1st line of the 2nd paragraph under the Guideline for Requirement R5 section in the Guidelines and Technical Basis, change 'Pre and post...' to 'Pre- and post-...'. In the 2nd line of the same paragraph, change 'SOE' to 'SOER'. In the 6th and 8th lines of the same paragraph, hyphenate '50-cycle post trigger'. In the 2nd line of the 4th paragraph under the Guideline for Requirement R5 section in the Guidelines and Technical Basis, replace 'Oscilloscope' with 'oscilloscope'. In the 7th line of the 4th paragraph under Guideline for Requirement R6 section in the Guidelines and Technical Basis,

Organization	Question 7 Comment
	modify the line to read '...interfaces are defined by the Regional Entity. In the ERCOT and Quebec Interconnections, the...'.In the Guidelines for Requirement 7 and Requirement 12 in the Guidelines and Technical Basis, the reader is referred to the Rationale Boxes in the standard for the information on those requirements. Once the standard is approved, the Rationale Boxes will disappear. We suggest going ahead and inserting the material from those boxes here even if it is redundant. In the 1st line of the 1st paragraph under Guidelines for Requirement R8, revise the line to read 'Dynamic Disturbance Recording measures transient response to system disturbances after a fault is...'.In the 3rd line of the 1st paragraph under Guidelines for Requirement R10, revise the line to read '...analysis. Pre- and post-contingency data help identify the causes and effects of each event...'.Modify the 1st line of the 1st paragraph under Guidelines for Requirement R11 to read 'Dynamic Disturbance Recording contains the dynamic response of a power system to a...' or 'Dynamic Disturbance Recording contains the dynamic response of power systems to a...'. In the 3rd line of the same paragraph hyphenate 'short-term' and 'long-term'. In the 4th line of the same paragraph delete the 'the' such that the line reads '...interest is changing over time, Dynamic Disturbance Recording is normally stored in the...'.We suggest the following to replace the 1st sentence in the 1st paragraph in the Guideline for Requirement R13: 'This requirement directs the applicable entities, that upon requests from the Reliability Coordinator, Regional Entity or NERC, to provide SOER and FR data for locations determined in Requirement R1 and DDR data for Elements determined in Requirement R6.Replace 'was' with 'were' in the 4th line of the 6th paragraph in the Guideline for Requirement R13 section of the Guidelines and Technical Basis. We suggest the DMSDT number the pages in Attachment 1 and the Guidelines and Technical Basis document.

Response: (1) Attachment 1 has provisions for when an entity cannot identify 11 locations. Step 3 states: "If the list has 11 or fewer buses, proceed to Step 7."

(2) The DMSDT made the necessary wording and grammatical revisions to the standard.

(3) The DMSDT has made the suggested revision.

Organization	Question 7 Comment
(4) The DMSDT has made the revision. **(5) The DMSDT made the necessary wording and grammatical revisions to the standard. Wide-area has been hyphenated in the standard. The Rationale Boxes stay with the standard after it is approved. They get moved to the end of the standard.**	
Luminant Generation Company LLC	(1) Requirement R4 as written could require both the Transmission Owner and the Generator Owner to monitor the requested electrical quantities for all lines and elements at the bus or switchyard where the generator is interconnected. R4 needs to be re-written to clarify that the GO is only responsible for monitoring for faults on the equipment it owns and the same for the TO. (2) For Requirement R13, subsections 13.3, 13.4 and 13.5 should be deleted from the standard entirely. These items are completely administrative in nature and are not results based. An entity could make a typo mistake in formatting or when naming a file and be non-compliant with the requirement. Also, the sub-requirements reference IEEE standards and software formats which are not subject to the NERC procedures for standards development and are not under the purview of the legally authorized regulatory authority. Thus these sub-requirements have no valid standing in a NERC Reliability Standard. These items are more appropriate for a reference document. (3) Finally, the standard is written in a confusing format where twelve of the 14 requirements in the standard reference other requirements, which in many cases reference another requirement (or two). As a GO, I need to know, in a clear concise manner, what electrical quantities or status I need to monitor where, and what attributes are needed for the disturbance monitoring equipment
Response: (1) The wording of Requirement R4 (now R3) has been revised. "Each Transmission Owner and Generator Owner shall have the following FR data to determine the following electrical quantities for each of the BES Elements they own connected to the BES buses identified in Requirement R1:"	

Organization	Question 7 Comment
(2) The need for the items in Parts 13.3 (now Part 12.3), 13.4 (now Part 12.4), and 13.5 (now Part 12.5) were made necessary due to problems with formatting of the submitted data after the 2003 Blackout. Data submitted was in different formats, making a difficult task that much harder. Because of the necessity to have data in the right formats, Parts 13.4 (now 12.4) and 13.5 (now 12.5) are needed. **(3) Making references between requirements in the standard was necessary to avoid repetition and wording. Requirements referencing other requirements simplify the measures. Requirements R1 and R2 have been combined (into what is now R1) which reduced the number of requirements referencing other requirements.**	
ReliabilityFirst	(1) Requirement R4, Part 4.2.1 - With the forthcoming approval of the NERC BES Definition including "Transformers with the primary terminal and at least one secondary terminal operated at 100 kV...", ReliabilityFirst does not believe the informative language in Requirement R4, Part 4.2.1 is needed and recommends removing the following language from Requirement R4, Part 4.2.1: "that have a low-side operating voltage of 100kV or above" since it serves no purpose. (2) Requirement R14 - ReliabilityFirst does not believe there is any value for an Entity to report their inability to record data (due to a failure of a FR, SOER or DDR) to the Regional Entity. ReliabilityFirst believes the record keeping will be burdensome with little or no benefit. ReliabilityFirst would rather like to see the Entities get the corrective actions plans in place and the equipment fixed, thus the Regions really have no need for this type of report. Compliance can be monitored through a data submittal on an annual basis rather than an ongoing reporting requirement. Also, even though a bulleted list in a Reliability Standard indicates an "or" statement, it is still unclear that these are considered two options. ReliabilityFirst recommends adding the word "either" after the word "shall" in the parent Requirement R14 and including the word "or" after the word "ability" in the first bullet. ReliabilityFirst also recommends the following to remove the Regional Entity from the second bullet and adding a time frame for when the CAP needs to be completed (it should not be open ended): "Develop and implement a Corrective Action Plan (CAP) to restore the recording ability within xx days."

<table>
<tr><th>Organization</th><th>Question 7 Comment</th></tr>
<tr><td></td><td>Also, the CAP should not have an open-ended time frame for completion, such as years into the future. There needs to be some time limit for correction.</td></tr>
<tr><td colspan="2">Response: (1) The DMSDT has retained the language to emphasize different transmission levels. This requirement excludes GSU transformers.

(2) Oversight is needed for the availability of Disturbance monitoring recording capability, and in the revised R14 (now R12) wording the DMSDT stipulates the submission of a Corrective Action Plan to the Regional Entity. The DMSDT has also added language to R14 (now R12) that requires the entity to include a timeline for restoration of data recording ability within the CAP.</td></tr>
<tr><td>ISO New England Inc.</td><td>(1) Requirement R5.1 currently reads:5.1. A single record or multiple records that include: o A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. o At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault.Comment R5.1 - the two bullet items in this requirement are confusing/conflicting and should be reworded to clarify what is intended. I.E. is it 50 cycles per bullet 1 or three cycles per bullet 2? This is probably for single and multiple records but the language should identify the difference as shown below. o A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. (Single Record Only) o At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault. (Multiple Records Only)
(2) Comment on R13, this requirement could place the Reliability Coordinator/Planning Coordinator in the middle of data sharing. This requirement should encourage direct sharing of data.
(3) Also, R13.3 and Attachment 2 attempts to define yet another format for SOE data; There are well established formats for this type of data, such as COMTRADE, that include many other aspects of data such as file and signal naming conventions.</td></tr>
</table>

Organization	Question 7 Comment
Response: (1) "Or" was added between the bullets of Part 5.1 (now 4.1) for clarification. Both bullets of 5.1 (now 4.1) are needed to address the Fault Recording capability that is available to industry. The DMSDT has changed 50 cycles to 30 cycles in the first bullet. The bullets, as stated in the standard, apply to single or multiple records. (2) Entities can share data with whomever they deem necessary as it is not precluded in the standard. This requirement ensures that the RC, Regional Entity, and NERC get the data because the intent of PRC-002-2 is to ensure that there is data available to analyze wide-area disturbances. This requirement does not state that data has to go through the RC, RE, or NERC. The dictates for sharing data are outside the scope of this standard. (3) The DMSDT discussed and decided on the .CSV format as being universally acceptable to industry. The .CSV format was selected to ensure uniformity in data collected. COMTRADE is for transient data reporting and binary data associated with it.	
Seattle City Light	(1) Seattle City Light appreciates the effort of the DMSDT in developing this proposed Standand, and understand the concept to focus requirement on data requirements rather than equipment requirements. That said, Seattle does not support this draft or approach. The draft is far too complex and technical to be an effective Federal regulation, in part because it requires a slow and cubmersome process to update each time a technical specification goes out of date. Seattle recommends that the Standard be revised to provide general requirements that are consistent over time, with details referenced in a separate document similar to the data collection and data preparation manuals associated with data-collection regulations in other areas (such as for regional model development). Additionally, Seattle cannot support such a detailed and complex Standard until additional guidance is available about the compliance implications, such as an RSAW or guidance document.
Response: (1) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report: "Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed.	

Organization	Question 7 Comment

A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices."
Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data.

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data.

The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.

Technical specifications will be superseded over time, but those contained in the standard will not require immediate attention that at present is not afforded by the revision process. Specificity in the requirements has been made intentionally general where possible to provide consistency. The Rationale Boxes (which stay with the standard) and Guidelines provide specifics, and background information. The standard was written minimizing the technical details. The RSAW for PRC-002-2 is to be posted at a later date.

Organization	Question 7 Comment
Western Area Power Administration	(1) Section 5.3 - Disagree with the trigger requirements as written. There are many factors that contribute to effective triggering such as: o Triggering for local vs. remote faults o Avoiding over-triggering that could result in "information overload" and the filling up of data storage o Capturing relevant and complete fault representationThe requirements stated are inadequate. It is felt that trigger settings are best left to the professional judgement of the relay engineer. While triggering on Neutral (residual) overcurrent is often standard, care must be taken regarding the sensitivity level. Similarly, triggering issues related to sensitivity and pickup time are associated with phase undervoltage triggering. Other triggering methods (such as based on protection element pickup) may be preferred instead of undervoltage methods. (2) Section R13 - the requirements of R13.4 and R13.5, while achievable, are somewhat archaic. More flexibility should be allowed for frequently used, industry standardized fault recording formats such as SEL event records. Also, the naming convention put forth in C37.232 is not the easiest to follow.
Response: (1) Triggering setting values are not specified in Part 5.3 (now Part 4.3), just the quantities to be used as triggers. Additional triggers may be set based on professional judgment. **(2) The formats listed were established from knowing what is available to and being used by industry**.	
Liberty Electric Power LLC	See NAGF SRT comments.
Response: Please see the DMSDT response to the NAGF SRT comments.	
Colorado Springs Utilities	(1) Thank you standard DMSDT for all of your efforts. We believe that all of the disturbance monitoring equipment referenced in this standard can be very helpful to an organization. We do not believe that it has a reliability impact that merits the cost in time and money to install, maintain, and report on all these devices as specified in the standard. As shown by the VRFs this does not highly impact reliability and although disturbance monitoring is something that

Organization	Question 7 Comment
	could be useful, at times, should not be part of a mandatory standard. If a standard is to be implemented, we view the approach as written, to be too broad and cumbersome. We would recommend that a technical criteria based on system configuration be established to identify critical points for disturbance monitoring (DM) and that DM be implemented at those locations. We believe a more focused and technically based approach to placement of DM equipment would yield higher benefits while eliminating unnecessary and undesirable impacts.

Response: (1) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:

"Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed.
A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices."
Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the "fill in the blank" aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). The consolidation of these two Standards will result in a Standard that fully addresses what is necessary to capture power system disturbance data.

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data.

Organization	Question 7 Comment
The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.	
N/A	The DMSDT and NERC staff are to be commended for the work done, this being such a complex standard. They have taken the right approach by addressesing "what" (data) is to be captured, not "how" and by not considering Disturbance Monitoring equipment. However,additional work is needed to make this standard acceptable. (1) The way R2 is worded presently, it sounds like a TO is required to notify itself if it owns BES Elements at the bus locations. The only action in R1 should be to identify busses for DME, expanded to indicate that after the busses are identified the TO needs to have DME on the Elements that are owned by the same TO and notify such identification for the Elements owned by others, if any. (2) R4.1- As written, this requirement could be confusing. Are phase to neutral voltages needed for each line? If common bus side voltages are available is it sufficient to have one set of phase-neutral voltages for the bus location? If so the wording should more accurately reflect this. Presently it reads - ".... Voltages for each phase of either each line or bus." which could be confusing. (3) R4.2 - Residual current and neutral current are two different things. Residual current is current present in the neutral of the Element CT circuit while neutral current implies current directly measured by a CT in the neutral of an Element. This requirement should specify that if the monitored transformer has a neutral CT it should be monitored (if this was the intention of the DT). (4) R4.2.1 - Is monitoring required on both HV and LV sides of these transformers? The wording for this requirement should be more specific. (5) R5.1 Bullet 2- The wording should be changed as follows: "At least two cycles of the pre-trigger data, the first three cycles of the fault as seen by the Fault Recorder, and the final cycle of the fault as seen by the Fault Recorder." Since the deployment of Fault Recorders is not required on every BES bus location, unless the fault is being cleared on an Element directly connected to the bus, the fault

Organization	Question 7 Comment
	recorder may not always accurately capture the fault information if it occurs more than one bus away from the Fault Recorder location. Without this additional wording the Fault Recorder would have to capture the actual final cycle of the fault which may be impossible if it is not directly monitoring it. (6) There seems to be an error in the mapping document. R6 of PRC-018-1 speaks to the need for maintenance of DME. The DT has mapped this requirement to R14 of PRC-002-2. These two activities are not the same at all since R14 is a break-fix requirement for DME, while R6 of PRC-018 speaks to maintenance activities of DME. Maintenance of DME ensures devices that need calibration are calibrated as well as correcting any non-annunciated failures. In fact preventative maintenance should reduce the failures. R14 of PRC-002-2 requires entities to repair equipment that they know are in a failed state. (7) Real and reactive power may not be able to be determined operationally if for example, a bus is split at the time of an event (or the split is caused by an event). Suggest the DT correct this requirement by perhaps referencing “nominal” real and reactive power which refers to the original design of the DDR channel assignments which under normal operating conditions, Real and Reactive Power could be determined. (8) R3, R4, R12, R13, R14 all reference “the bus locations as per Requirement R2” however this requirement is a notification requirement only for Elements not owned by the TO that need DME. These requirements need to refer to both R1 and R2. (9) R3, R4, R12, R13, R14: List of locations that need Sequence of Events Recorders and Fault Recorders is identified in R1 and communicated in R2. Suggest replacing reference to R2 with R1 (10) R8,9,10,11 and R13, R14: Suggest changing reference to R7 with R6 (see the comment for R3 and R4 above).

Organization	Question 7 Comment

Response: (1) The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent.

(2) The requirement has been revised to specify the determination of each phase of each specified BES bus. The intent of the Requirement is to lay the foundation for capturing adequate data for event analysis

(3) For the purposes of FR data, residual and neutral currents are the same. The DMSDT noted that the requirement is designed to have the entity provide data and the entity has flexibility as to how this is obtained or derived. Use of residual current or neutral current will provide the same results. They represent the zero sequence component of the fault current and are measured/determined by different techniques.

(4) Monitoring is not required on both sides of the transformers. Derived data is acceptable. The Requirement stipulates the determination of electrical quantities. A clarification has been added to the Rationale Box: "For transformers (now Part 3.2.1), the data may be from either the high side or the low side of the transformer."

(5) The standard refers to data and not equipment. The DMSDT has revised the bullets for clarity:

- **A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point, or**
- **At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.**

(6) PRC-002 addresses the provision of data. It does not address equipment nor does it address maintenance of equipment. PRC-018-1, R6 addresses maintenance and that is not specifically required in PRC-002-2. The DMSDT is not prescribing a maintenance program in PRC-002-2 and is only requiring that a failure of data recording is corrected according to R14 (now R12). The Notes Section on p. 13 of the Mapping Document explains the rationale behind mapping PRC-018-1 Requirement R6 to PRC-002-2 Requirement R14 (now R12). From the Mapping Document: "PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R14 (now R12) deals with the long term

Organization	Question 7 Comment
availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability." **(7) Regarding Requirements R8 (now R6), and R9 (now R7), the DMSDT has added verbiage to the Guidelines section of the standard to indicate this: "The data requirements for PRC-002-2 are based on a system configuration assuming all normally-closed circuit breakers on a bus are closed."** **(8, 9) The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent.** **(10) Requirement R7 (now R5) has been revised for clarification and appropriateness to use as the reference**.	
MRO NSRF	(1) The NSRF believes that this Standard should apply only to those devices already installed by the Generator Owners and Transmission Owners on BES Elements. The DMSDT has already made it clear that there is an abundance of these devices on the BES. Therefore, a footnote should be added that the Registered Entities are not required to spend the ratepayers' money to buy new equipment to satisfy the requirements of this Standard. The NSRF proposes it should read "Each Transmission Owner and Generator Owner is not required to have Dynamic Disturbance Recording, Fault Recording, or Sequence of Events Recording devices which capture the essential data of PRC-002-2, installed or activated on its BES Elements." This would be incredibly comparable to footnote 1 of the industry-approved NERC Standard PRC-024-1. That footnote states "Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit."

Organization	Question 7 Comment
Response: (1) It is intended that this standard ensure the capture of adequate data to analyze major system disturbances, and the wording reflects that intention. The standard addresses not "how" the data is captured, but "what" data is captured.	
Arizona Public Service Company	The proposed standard still needs work before it is acceptable. The following items need to be addressed: (1) The standard requires all owners of identified BES elements to implement the various types of recording. However, for jointly owned facilities, this puts co-owners in a position whereby they can be held in violation of the standard if the operating/maintenance entity of a co-owned facility does not implement and maintain compliance with the standard. For jointly owned facilities, the standard should specifically address which of the co-owners (preferably the co-owner that operates or maintains the facility) is responsible for compliance with the standard. (2) Requirement 14 needs to be re-written. As it is now written, R14 requires that a TO or GO formally report to the Regional Entity an outage of any of the recording capabilities covered by the standard along with a Corrective Action Plan. However, in the "Rationale for R14" discussion that is included it is clear that the intent or this requirement is to require the TO/GO to report the problem only if they cannot restore the lost recording capability within 90 days. The requirement needs to be re-written to state the actual intent because as it is now written, one must contact the Regional entity every time the recording capability goes out, no matter how long it went out for. (3) Requirements R10 through R13 all seem to be required specifications and shouldn't have their own requirements but could rather be combined into an Appendix to the standard. (4) The standard should allow for monitoring/recording up to the capability of the equipment presently installed (this is not referring to the capability of the presently installed recording capability but rather the presently installed BES equipment capability). A utility shouldn't have to install major

Organization	Question 7 Comment
	equipment (CCVTs, breakers, etc) just to meet the standard if their presently installed equipment doesn't allow adequate monitoring. (5) In Requirement R3 it is not clear if a GO will be required to monitor a low side generator breaker. The standard refers to breaker connected to the identified bus location. If this refers to each breaker that is directly connected to the bus location, the requirement should use the term "directly". Without qualifying as such, the question remains as to whether the low side breaker qualified as being connected to the bus since it is connected to the bus through the GSU transformer.
Response: (1) The registered owner that is responsible for compliance with NERC standards would be the one responsible for this standard as well. **(2) The wording of Requirement R14 (now R12) and its Rationale Box has been revised for clarification. See the Rationale Box for an explanation of the intent of this requirement**. **(3) The DMSDT considered combining Requirements R10 through R13, but decided that it was simpler and created a less cumbersome standard to leave them as separate requirements.** **(4) The requirements allow for flexibility in how the data is captured. Requirement R4 (now R3) requires entities to be able to determine electrical quantities, not actually have to measure them.** **(5) Requirement R3 (now R2) only relates to BES Elements determined by the Transmission Owner in Requirement R1. These Elements are connected to the TO's BES buses and do not include generator transformer low side breakers.**	
Tacoma Power	(1) There is general concern about the cost of implementation, especially cost sharing for installation of Dynamic Disturbance Recording (DDR). For example, the Responsible Entity seems to have latitude on selecting BES Elements, beyond the DDR locations identified in Requirement R6, Parts 6.1.3 through 6.1.7, and therefore which Transmission Owners and Generator Owners must install DDR to meet Requirement R6, Part 6.1.1. (2) If two Transmission Owners share equipment at a BES bus location, which Transmission Owner is responsible under R1 and R2 for identification and notification?

Organization	Question 7 Comment
	(3) Under Requirement R5, Part 5.1, do the bulleted items constitute an 'and' or 'or' condition? For example, if a post-trigger record length of 50 cycles is available, but a fault lasts 51 cycles such that the final cycle of the fault is not captured, would this be compliant with the intent of Requirement R5, Part 5.1? If not, then it seems that either (1) both bulleted items would be required or (2) just the second bulleted item would be required. Consider changing "a single record or multiple records that include:" to "a single record or multiple records that include at least one of the following:" (4) Under Requirement R5, Part 5.3, what latitude are Transmission Owners and Generator Owners afforded in establishing thresholds for neutral (residual) overcurrent and phase undervoltage trigger settings? (5) Under Requirement R6, Part 6.1.7 attempts to define every area that uses UVLS as a "Major Voltage Sensitive Area." UVLS programs are also used to address localized voltage issues. As currently written, a DDR would be required for every entity that uses any undervoltage relays, no matter how localized. We suggest removing section 6.1.7 as the other criteria in requirement 6 will provide widespread installation of DDRs. (6) Under Requirement R8, Part 8.2, consider changing "...same voltage corresponding to..." to "...same voltage level corresponding to..." (7) Under Requirement R9, Part 9.4, consider changing "...of at least one of..." to "...of any of..." (8) Under Measurement M12, consider explicitly adding "station drawings," or similar verbiage, as evidence. Device specifications and configuration or actual data recordings may be insufficient to demonstrate time synchronization; it may be necessary to demonstrate that cabling is connected. (9) If failure of DDR is discovered, recorded data may not be retrievable for the period of 10 calendar days preceding a request. If a disturbance occurs before recording ability is restored, but an entity is compliant with Requirement R14, is it the intent of the standard that an entity could be found non-compliant with Requirement R13 for the failed DDR? (10) Under Measurement M13, change "...evidence (electronic or hard copy) data..." to "...evidence (electronic or hard copy) that data..."

Organization	Question 7 Comment
	(11) Under Requirement R14, does loss of time synchronization qualify as a "failure"? Generally, it seems that this type of issue would be corrected quickly (within 90 calendar days of discovery) and therefore not require reporting. (12) Under Requirement R14, if a Transmission Owner or Generator Owner restores the recording ability within 90 calendar days of the discovery of a failure, does the failure need to be reported to the Regional Entity to be compliant with Requirement R14? In other words, do the bulleted items under Requirement R14 constitute an 'and' or 'or' condition? (13) In Attachment 1, Step 1, would bus Elements on the high-side of transformation at the same physical location be considered a single bus location and be distinct from the bus Elements on the low-side of the transformation, even if both sets of bus Elements share a common ground grid? In other words, is it possible to have two bus locations at the same physical location, even if they share a common ground grid, provided that there is transformation connecting the two bus locations? Consider a 230kV to 115kV substation. (14) In Attachment 1, Step 1, what is meant by the verbiage "...or from other DME devices"? Additionally, the acronym 'DME' does not appear to be defined in the standard itself (only in the Rationale for R14).

Response: (1) DDR data requirements are to be established by the RC in the WECC. The standard provides criteria for the location for DDR data that the RC is required to follow which minimizes the risk of arbitrary selection of DDR data locations. The standard is about "what" data is captured, not "how" it is captured.

(2) The registered owner that is responsible for compliance with NERC standards would be the one responsible for this standard as well.

(3) A list with bulleted items is an "Or" list for the bulleted items. "Or" was added between the bullets of Part 5.1 (now Part 4.1) for clarification. Both bullets of 5.1 (now 4.1) are needed to address the Fault Recording that is available to industry. The DMSDT revised 50 cycles to 30 cycles.

Organization	Question 7 Comment
(4) The DMSDT notes that the Requirement R5 Part 5.3 (now R4 Part 4.3) does not specify settings. Dictating the actual trigger settings is outside the scope of this standard. **(5) Part 6.1.7 (now Part 5.1.5) stipulates "Any one Element within a major voltage sensitive area…" The Guideline for Requirement R6 (now R5) says "Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are areas of significant Load." The Standard DMSDT has revised Requirement R6 (now R5) to clarify the dynamic disturbance recording data for UVLS.** **(6) Based on other comments received, the DMSDT revised Part 8.2 (now 6.2) to "at the same voltage in Requirement R6, Part 6.1…"** **(7) The DMSDT retained the original language** **(8) The wording of Measure M12 (now M10) has been revised to include station drawings.** **(9) An entity would not be non-compliant for not being able to capture data for the situation presented.** **(10) The Standard DMSDT has revised the wording in Measure M13 (now M11).** **(11) Loss of time synchronization is considered a failure andR14 (now R12) would apply.** **(12) The wording of Requirement R14 (now R12) and its Rationale Box have been revised for clarification. Refer to the Rationale Box for an explanation of the intent of this requirement**. **(13) The DMSDT intended that the bus location be the bus location identified in a system study, and has revised Attachment 1 Step 1 to read "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid." The example presented in the comment would be counted as two bus locations.** **(14) "…or from other DME devices" appears in Step 8, and the intent is that the disturbance monitoring recording devices should be electrically distant to maximize the recording coverage of the BES.**	
Ameren	We request the DMSDT to make the following changes:

Organization	Question 7 Comment
	(1) In R1, add 'After identifying BES bus locations, each TO shall identify the BES Elements directly connected to that bus location at its voltage level.' We request allocating another month to do so. We believe that this will provide a consistent reference for R2 which refers to BES Elements as if they've been established in R1. (2) In R3, insert 'Transmission Owner' before 'bus locations' to make it consistent with the page 32 Guideline for R3 explanation that the GO does not need SOER at its GO bus locations. Also insert 'BES' between 'each' and 'circuit breaker' because not all breakers are BES Elements. It then states 'Each Transmission Owner and Generator Owner shall have Sequence of Events Recording (SOER) for circuit breaker position (open/close) for each BES circuit breaker they own connected to the Transmission Owner bus locations as per Requirement R2.' (3) Include the BES bus location along with the BES Element in R6 so that it is clear that DDR is only required at one terminal of a two-terminal Element. (4) Reword R8 and R9 to 'Each Transmission (Generation) Owner shall have Dynamic Disturbance Recording (DDR), for each location and Element as dictated by the Responsible Entity per Requirement R7, to determine...' (5) Reword R11 to be similar using 'that is responsible for' to R10 to 'Each Transmission Owner and Generator Owner that is responsible for Dynamic Disturbance Recording (DDR) as per Requirement R7 shall conform ...' (6) Reword R12 to 'Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 shall time synchronize data to within ...' (7) If at all possible we would like another opportunity to provide comments on CEAP for PRC-002-2 in the next draft. Several aspects of this draft made in unclear as to what is required, and therefore difficult to assess cost impact.

Organization	Question 7 Comment
Response: (1) The DMSDT has combined R1 and R2 (into what is now R1) to help clarify the responsibilities. The DMSDT has discussed and decided that the 90 calendar days are sufficient for notifications. (2) The DMSDT has revised the wording in Requirement R3 (now R2) to read "…for each circuit breaker they own connected directly to the BES buses identified in Requirement R1, ..."), and combined Requirements R1 and R2 (into what is now R1) to clarify the responsibilities. (3) DDR refers to data capture for BES Elements, and not "how" or from where the data is captured. Only Requirement R6 (now R5) only specifies "Each terminal of a high-voltage direct current (HVDC) circuit…". Wording was added to the Rationale Box to make this clarification. (4) The wording of Requirements R8 (now R6) and R9 (now R7) have been revised in response to comments received to clarify that the intent is to capture the data for the BES Elements owned. (5) The wording of Requirement R11 (now R9) has been revised to clarify responsibility. (6) The wording of Requirement R12 (now R10) has been revised to clarify responsibility. (7) The second posting CEAP comments closed Feb. 7, 2014. Unless substantive changes are made to the standard there will not be another CEAP posting. A report was going to be generated by the CEAP review team.	
SERC Protection and Controls Subcommittee	We request the DMSDT to make the following changes: (1) The Requirements of R3, R4, R5 and R12 for SER and FR data should be included as part of a single attachment/ table and R3 should simply reference the table. As structured presently, if an owner fails to include or provide data for a single required element, they would be in violation multiple Requirements. (2) Similar to 1) above, Requirements R8, R9, R10, R11, and R12 for DDR data should be included as part of a single attachment/ table or possibly separate attachments/tables for TOs and GOs and referenced in a single Requirement. As structured presently, if an owner fails to include or

Organization	Question 7 Comment
	provide data for a single required element, they would be in violation of multiple Requirements. (3) Provide at least one example in the Guidance Section, or develop a reference document similar to the BES Definition effort. A system one line similar to BES Definition Reference Figure S1-1 augmented with circuit breakers in various configurations (e.g. straight bus, ring bus, breaker-and-a-half). The DMSDT could go through the various Requirements to demonstrate the DMSDT intentions. Although the present guidance and rationale are helpful, we believe there are still many unclear aspects to these Requirements. (4) Add 'by voltage level' in Requirement R1 so that it reads 'Each Transmission Owner shall identify BES bus locations by voltage level for Sequence of Events Recording (SOER) and Fault Recording (FR).' This is consistent with Attachment 1, Step 1 and clarifies that the FR and SOER are only required at that voltage level. (5) In Requirements R1.2 and R 6.2, what prevents a TO or RE from assessing the locations and elements on too frequent of a time basis? As written, it provides no clause to prevent excessively short re-assessment periods. There should be some minimum time (say several years) between assessments to provide stability in where monitoring is really needed. Frequent assessments could jockey locations above and below the minimum criteria line and create confusion. (6) In Requirement R2, it infers that the TO as part of Requirement R1 develop a list of Elements;, however, Requirement R1 requires the TO only to determine BES bus locations. If it was the intent that the TO determine the specific Elements, we suggest Requirement R2 be reworded to say "Each transmission owner shall identify BES Elements at the bus locations established in Requirement R1 and shall notify...". If it was the intent that the GOs (and other affected TOs)

Organization	Question 7 Comment
	to determine which BES Elements they own at the bus locations, then do not require that the TO identify the BES Elements, instead let the owners of those Elements identify their Elements. Time has to be allotted to allow identifying the Elements at the BES bus locations.Element ownership sometimes changes between the two terminals of an Element, so this needs to be addressed. GO and TO are each concerned with the unwarranted cost burden this standard proposes, and there will be disputes as to cost responsibility. (7) Use a consistent footer (pages 18 through 40 say Draft 1), and number the pages throughout (they stop at page 25 of 40). (8) Clarify the intent of Requirement R3 which we believe is unclear. The DMSDT may intend that a breaker auxiliary contact be connected to the SOER to provide circuit breaker position. Page 32 Guideline for Requirement R3 last sentence implies that breaker status can be determined from the FR. However page 33 last sentence under Recording of Electrical Quantities suggest that these only augment the SOER. (9) Add 'including generator interconnection facilities' after Transmission lines in Requirement R4 to be consistent with page 32 Guideline and Project 2010-07. (10)In Requirement R5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the Requirement. We suggest Requirement R5.1 be reworded to say "A single record or multiple records that include at least one of the following:" (11)Reword Requirement R13 to 'Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 shall provide data for those BES Elements to the Regional Entity upon request.' The regions already have a process for collecting these types

Organization	Question 7 Comment
	of data and can act as a clearinghouse if indeed the Reliability Coordinator and/or NERC need the exact same data. The reality is that all these entities will collaborate in the disturbance analysis if an event of this magnitude ever does occur. It is unreasonable to require the TO and GO to respond to duplicative data requests in such a short time. (12) Reword Requirement R14 to 'Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 upon the discovery of a failure shall: (a) Restore the recording ability within 120 calendar days; or (b) If recording ability is not restored within 120 calendar days, demonstrate efforts to correct the unresolved failure.' Please increase the allowed repair time by 30 days because the access of repair personnel to such equipment is often restricted during certain periods of the year. In addition; revise the second part to be consistent with the handling of Unresolved Maintenance Issues in PRC-005-2 R5. This change triggers an M14 part (3) change to "(3) if not repaired within 120 calendar days of discovery, evidence that it has undertaken efforts to correct the unresolved failure Issues in accordance with Requirement R14. The evidence may include but is not limited to work orders, replacement Component orders, invoices, project schedules with completed milestones, return material authorizations (RMAs) or purchase orders.' We believe that the proposed reporting requirement is much too burdensome for this equipment.

Response: (1)(2) Each of the Requirements mentioned has its own specific reliability objective. Combining these requirements would have requirements with multiple reliability objectives which is contrary to the purpose of a requirement, and could present compliance difficulties. The Requirements for SER and FR are sufficiently unique where there can be no violation of multiple requirements. The proposed definitions for SOER, FR, and DDR have been removed from the standard.

(3) The DMSDT has revised the Rationale Boxes and Guidelines (included diagrams where it was felt to be necessary) to clarify what the intended system configurations are.

Organization	Question 7 Comment
	(4) The DMSDT feels that adding the additional language to Requirement R1 (R1 is now the combined R1 and R2) does not add any clarification to the requirement because it is stipulated in Attachment 1. (5) There is nothing that prevents a TO or RE from a too frequent assessment. The DMSDT does not believe that reassessment will result in a significantly different set of buses or elements for which data is required unless significant construction activity or reclassification of BES Elements has occurred. If an entity is notified that they have a data obligation, the Implementation Plan for PRC-002 allows them three years to become compliant. (6) The DMSDT has combined R1 and R2 into a single requirement (into what is now R1) and revised the wording to clarify the intent. The Element owner is responsible for the data capture. The CEAP postings gave the opportunity to provide cost input. (7) The page numbering and footer has been made consistent throughout the standard. (8) The Requirement R3 (now R2) Rationale Box was revised to clarify that the intent is to have the SER data breaker status, not how. (9) The wording in Requirement R4 (now R3) and the associated Guideline have been made consistent. (10) The bullets reflect the capabilities of the means of recording that are available. A list with bulleted items is an "Or" list for the bulleted items. "Or" was added between the bullets of Requirement R5 (now R4) for clarification. (11) Because the intent of the standard is to capture BES disturbances, the R13 (now R11) entities will be involved with the necessary data exchange. The standard does not prohibit individual entities from sharing data amongst themselves. The intent of Requirement R13 (now R11) is not to encourage duplicative requests for data. If that should occur it should not place a burden on an entity. An entity would already have the data available.

Organization	Question 7 Comment
(12) The intent of Requirement R14 (now R12) is to have an entity restore recording capability within 90 days, but if that 90 day window couldn't be met then the Regional Entity would have to develop a Corrective Action Plan. The 90 day window is realistic and practical, and compliance should not be burdensome to an entity. The wording of Requirement R14 (now R12) has been revised for clarification.	
Edison Mission Marketing & Trading Inc.	(1) While we believe that our Wind sites have a low risk of being one of the selected entities required to install & maintain disturbance monitoring equipment, the standard provides no compensation for the purchase, installation, and maintenance of this equipment. It may a significant burden on our projects.
Response: (1) Recommend participation in the CEAP for this project.	
PSE	(1) While Entities, especially some of the larger Entities, may have a lot of FR, SOER and DDR equipment already in place, the level of capability of some of the equipment may need to be upgraded. This will take time and money.
Response: (1) Recommend participation in the CEAP for this project.	

Additional Comments:

PEPCO

David Thorne

1. Do you support the new definitions for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording? If not, please explain why and provide suggested changes.
Yes

2. Do you agree with the methodology in Requirement R1 that selects the BES bus location for Sequence of Events Recording and Fault Recording? If not, please provide technical justification.
Yes

3. Are the appropriate functional entities identified in the Applicability section for PRC-002-2?
Yes

4. Do you agree with the Elements requiring Dynamic Disturbance Recording listed in Requirement R6? If not, please provide technical justification.
Yes

5. Do you agree with the VRFs/VSLs and the Drafting Teamâ€™s justification? If not, please explain why.
Yes

6. Do you agree with the Implementation Plan? If not, please explain why.
No
Question 6 Comments:
1) Implementation for Requirement R14, as presently written, applies 9 months after the standard is approved. This requirement needs to be clarified. It should only apply to those SOE, FR, and DDR devices that have been installed in accordance with, and meet the requirements of, this standard. Legacy DME equipment that may exist at one of the busses identified in R1, which does not meet the requirements of this standard, should not be subject to Requirement R14, until the equipment is upgraded, or replaced, to meet the full requirements of this standard. This clarification needs to be made, or, the implementation for R14 should be moved to coincide with the timetable for Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13.

2) The timetable for implementation of Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13 allows an entity that owns only one bus location four years to achieve compliance. However, Entities must be compliant with a reassessed list from Requirement R1, Part 1.2 or R6, Part 6.2 within three years following notification of the list. Why this discrepancy? Four years seems appropriate in both cases, in order to schedule the numerous outages necessary to install the equipment, particularly if generation units are connected to the bus.

Response: (1) Requirement R14 (now R12) is intended to only apply to data recording that meets the requirements of PRC-002. The SDT does not intend for legacy equipment that might not meet the intent of the requirement to be applicable under R14 (now R12). We have changed the Implementation Plan to reflect this by having R14 (now R12) become effective three years after approval of the standard. This coincides with the newly revised Implementation Plan whereby entities have to be 50% compliant with the data requirements within three years. We have also revised R14 (now R12) to indicate that it applies to data recording applicable under R1 (R1 and R2 combined into what is now R1) and R5 (R6 and R7 have been combined into what is now R5).

(2) The SDT believes that a reassessment involves an incremental change and will involve fewer requirements for data recording capabilities. Therefore a three year implementation is practical.

7. If you have any other comments that you haven't already mentioned above, please provide them here:
Question 7 Comments:
1) Requirement R2 should be re-written as follows: Each transmission Owner that identifies BES Elements, which are owned by other entities, at the locations established in Requirement R1 shall notify the owners of those Elements â€¦.. By adding the phrase - which are owned by other entities - eliminates the need to unnecessarily provide documentation that it notified itself of the requirement.

Response: Requirements R1 and R2 have been combined (into what is now R1). The wording "other owners" was included because the SDT considered the situation where the section of an entity doing the BES bus identification might not be the section doing the implementation of the capability.

2) Requirement R4 Part 4.1 should be re-written as follows: Phase-to-neutral voltages for each phase of either each BES line or bus. The term BES must be added to provide clarity and to be consistent with Part 4.2 and the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide voltage monitoring on non BES radial lines, or distribution transformers connected to the bus.

Response: **The Drafting Team has revised Part 3.1, and added BES to Requirement R4 (now R3) and its Parts.**

3) Requirement R8 should be re-written as follows: Each Transmission Owner shall have Dynamic Disturbance Recording (DDR), for each BES Element they own as per Requirement R7, to determine the following electrical quantities. The term BES must be added to provide clarity and be consistent with the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide monitoring on non BES radial lines, or distribution transformers connected to the bus.

Response: **The Drafting Team has added BES to Requirement R8 (now R6).**

4) Requirement R9 should be re-written as follows: Each Generator Owner shall have Dynamic Disturbance Recording (DDR), for each BES Element they own as per Requirement R7, to determine the following electrical quantities. The term BES must be added to provide clarity and be consistent with the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide monitoring on non BES station service transformers connected to the bus.

Response: **The Drafting Team has added BES to Requirement R9 (now R7).**

5) Requirement R13 Part 13.2 poses an indeterminate requirement on the size of the hard drive required to archive data. The present requirement states that the data will be retrievable for the period of 10 calendar days preceding a request. However, there is no requirement on how long after an event the request might be made. If the request was not made until six months after the event, would the data have to be retrievable for six months after the event? In order to place certainty on this data storage requirement Part 13.2 should be re-written as follows: The recorded data will be retrievable for a period of 10 calendar days following an event. This places a limit on data storage capacity and also makes it clear that a request for data must be made within 10 calendar days of the event.

Response: **(5) We have revised the language of Part 13.2 (now Part 12.2) to "Recorded data shall be retrievable for a minimum of 10 calendar days." It is not necessary for an entity to save the data for more than the 10 days specified. Because of the importance**

and need for expediency in analyzing BES system-wide disturbances, the Drafting Team decided that 10 days was a reasonable time frame to have data stored for. Requesters of data will have to be aware of the 10 calendar day requirement.

6) Requirement R14 needs to be re-written to be consistent with the intent of the requirement as expressed in the shaded box describing the Rationale for R14. As presently written, R14 requires that the Owner must both restore recording ability AND report the inability to record data to the Regional Entity. To be consistent with the Rationale, Requirement R14 should be re-written as follows: Each Transmission Owner and Generation Owner, upon discovery of a failure of the Sequence of Events Recording (SOER), Fault Recording (FR), or Dynamic Disturbance Recording (DDR) at the bus locations as per Requirement R2 and elements as per Requirement R7, shall restore the recording ability within 90 calendar days, OR , if the recording capability cannot be restored within 90 days, report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability.

Response: The wording in Requirement R14 (now R12) was rewritten for clarification. The bulleted items were incorporated in the R14 (now R12) wording, and "Or" was added.

7) In the Guidelines and Technical Basis in the next to last paragraph of the section on Guideline for Requirement R1 it states that there is no requirement for SOER and FR for generating units. Later in the section on Guideline for Requirement R4 it states that generator step-up transformers are excluded from fault recording. If so, why is Generator Owner listed as an applicable entity in Requirement R4? It makes sense to list them in R3, since they may own breakers connected to Transmission Owners bus, but the GSU Transformer, station service transformer, and generator itself would not qualify for Fault Recording.

Response: The Generator Owner is listed as an applicable entity in Requirement R4 (now R3) to account for the situation where a Generator Owner is responsible for BES Elements beyond a GSU high side breaker; a bus section for example.

8) There is no specific requirement for the sampling rate for SOER within the standard itself. In the Guidelines and Technical Basis section on Guideline for Requirement R5 it states that a minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SOER. There are a vast number of microprocessor relays currently installed on the system that have a sampling rate of 16 samples per cycle for analog inputs, however, the digital inputs, which would be used for SOE recording, are only sampled every quarter cycle. Existing regional DME standards and criteria recognize this and permit these types of microprocessor relays to be acceptable for both FR and SOER applications. As such, in order to allow these devices to continue to be an acceptable application, we would suggest two requirements be added for SOER devices, similar to that included in the RFC DME criteria, that states: SOER recording equipment should be capable of determining and

recording the time that an input is received to within one quarter of an electrical cycle (or less) of input change of state. SOER recording equipment should have time stamp capability to record seconds to at least three decimal places (i.e. ss.000).

Response: The SDT believes that the quarter cycle devices mentioned are acceptable for SER but not for FR data. The additional specifications suggested are too specific for incorporation in this standard.

9) The bus selection methodology in Attachment 1 defines a single bus location as including any bus Elements at the same voltage level within the same physical location sharing a common ground grid. However, there are some substations that have multiple busses at the same voltage level within the same physical location that share a common ground grid, but are not physically connected together. They are either physically isolated from one another, or connected via a normally open tie switch or breaker. In these cases, the above definition does fit this scenario and each bus should be evaluated independently. To address this scenario perhaps the definition should be re-written as follows: A single bus location includes any bus Elements at the same voltage level that are connected together within the same physical location sharing a common ground grid.

Response: It would depend on how the buses are modeled. If the buses are modeled separately, then they should be considered as separate bus locations. The wording in the Attachment Step 1 paragraph has been revised.

PSE

Karen Silverman

1. Do you support the new definitions for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording? If not, please explain why and provide suggested changes.

Yes

2. Do you agree with the methodology in Requirement R1 that selects the BES bus location for Sequence of Events Recording and Fault Recording? If not, please provide technical justification.

No

Question 2 Comments:
The document "Mapping of Standard's Introduction of BOT Approved PRC-002-1 to Proposed PRC-002-2" from January 2013 described line terminals above 200 kV and large generators/transmission stations which warrant this level of data gathering as they represent the backbone of the transmission system. It would be better to start with this system level and identify difficulties with collecting that data first.
For the sake of comparison, the median value of the 11 highest (short circuit) MVA PSE buses where digital fault recorders are already in place, is 6800 MVA. Lowering to the level of 1500-2500 MVA quadruples the quantity of collection sites.

Response: For the purpose of PRC-002-2, a minimum number of locations for FR and SER are required to facilitate sufficient coverage and data for analyzing large system events. Based on these concepts, the SDT developed a procedure included in Attachment 1, now entitled Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data (Requirement R1) that utilizes the maximum available calculated three phase short circuit MVA. Using this methodology helps ensure sufficient coverage while accounting for variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides flexibility in the selection process.

The comparison provided indicates that the lower threshold would be 6800 MVA and not 1500MVA.

3. Are the appropriate functional entities identified in the Applicability section for PRC-002-2?
Yes

4. Do you agree with the Elements requiring Dynamic Disturbance Recording listed in Requirement R6? If not, please provide technical justification.
Yes

5. Do you agree with the VRFs/VSLs and the Drafting Team's justification? If not, please explain why.
No
Question 5 Comments:
See Comments for Question 2.

6. Do you agree with the Implementation Plan? If not, please explain why.

No

Question 6 Comments:

Referring to comments to Question 2, it would be prudent to at first require a subset of the Fault Recording, SOER and DDR to be up and running and monitored for 2-3 years. Then NERC, WECC and entities can refine the standard based upon what we learn. In a nutshell, we should start small.

<u>Response</u>: In consultation with the NERC event analysis team, the standard requirements are developed to establish the minimum continent wide requirements for DME for adequate data capture.

7. If you have any other comments that you haven't already mentioned above, please provide them here:

Question 7 Comments:

While Entities, especially some of the larger Entities, may have a lot of FR, SOER and DDR equipment already in place, the level of capability of some of the equipment may need to be upgraded. This will take time and money.

<u>Response</u>: Recommend participation in the CEAP for this project.

DTE

Kathleen Black

1. Do you support the new definitions for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording? If not, please explain why and provide suggested changes.

Yes

3. Are the appropriate functional entities identified in the Applicability section for PRC-002-2?
Yes

4. Do you agree with the Elements requiring Dynamic Disturbance Recording listed in Requirement R6? If not, please provide technical justification.
No
Question 4 Comments:
The Technical Basis stated that "The 500MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5% of the generating units." Also, the aggregate threshold was expected to have low impact to the number of units requiring monitoring. However, for an entity with a fleet of large generators, this MVA threshold could cover 50-75% of the fleet. Perhaps for these situations, a selection process could be developed based on strategic location within the entity's footprint, so monitoring is installed on a reasonable basis.

Response: Larger units have a significant impact on the power system that cannot be ignored in the analysis of system distrubances. The capture of each unit's data is necessary for a thorough system disturbance event analysis.

5. Do you agree with the VRFs/VSLs and the Drafting Team's justification? If not, please explain why.
Yes

6. Do you agree with the Implementation Plan? If not, please explain why.
No
Question 6 Comments:
Suggest that the stepped requirement for equipment installation be eliminated and the 100% completion in four years is the only requirement. This will allow entities to design and install equipment based on their own schedules within the four year time frame.

Response: In response to comments received, the Implementation Plan has been revised to be only two steps--three years for 50%, 5 years for 100%.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Disturbance Monitoring Standard Drafting Team (DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The project was placed into informal development the fall of 2010.
5. The project was placed into formal development January 2013.
6. Nominations for two additional DMSDT members were solicited April 12 – 25, 2013.
7. Three additional DMSDT members were added May 22, 2013.
8. Industry webinar was held May 22, 2013.
9. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.
10. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.

Description of Current Draft

This is the second draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	May 2014
Final Ballot	July 2014
BOT Adoption	August 2014

Effective Dates

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

- Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.

- Entities that own only one (1) identified BES bus location, Element, or generating unit shall be fully compliant within four (4) years of the Effective Date.

- Note: Entities that own only one (1) identified BES bus, BES Element, or generating unit and are notified by an entity shall be 100% compliant within six (6) years following notification.

Entities shall be 100% compliant with a reassessed list from Requirement R1or R5 within three (3) years following notification of the list.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the Rationale Boxes will be moved to the Guidelines and Technical Basis Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.
4. **Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities:

The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.

BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

B. Requirements and Measures

R1. Each Transmission Owner shall identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days that those BES Elements may require SER data and/or FR data, and reevaluate the identified BES buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data are required, identified in accordance with Attachment 1, and evidence that the bus identification has been reevaluated within the required interval. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Requirement R1 directs a uniform methodology to identify these BES buses. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of transmission lines and other Elements connected to the bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on system reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause large cascading system events, so SER and FR data from these BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection.

For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data are required, based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and system topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data are required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. SER and FR data will include generating resource contributions to an event. DDR data better shows generator response to disturbances.

Each Transmission Owner must reevaluate the list of BES buses every five calendar years to address system changes.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90 calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses identified in Requirement R1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which can include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R2:

The intent is to capture SER data (opening/closing) for the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance. Other status monitoring indications can be used for devices other than circuit breakers.

R3. Each Transmission Owner and Generator Owner shall have the following FR data to determine the following electrical quantities for each of the BES Elements they own connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltages for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations including a single design standard as a representation for common installations; or (2) actual data recordings or derivations.

Rationale for R3:

The required electrical quantities may either be directly measured or derivable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for system disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. Evidence may include, but is not limited to: (1) device specification (R4, Part 4.2) and configuration (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power system operations and determination if operations were as designed. System faults generally persist for a short time period, thus, a 30 cycle post-trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles post-trigger.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity shall identify BES Elements for which dynamic disturbance recording (DDR) data is required, notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1 The BES Elements shall include the following:

5.1.1 Generating resource(s) with:

- Gross individual nameplate rating greater than or equal to 500 MVA, or
- Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

5.1.2 Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines:

- Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection, or
- Transfer Paths in the Western Interconnection Path Rating Catalog, or
- Voltage stability limited transfer paths or load serving area, or
- Interfaces between Balancing Authority Areas, or
- Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements associated with Interconnection Reliability Operating Limits (IROLs).

5.1.5 Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program.

5.2 The BES Elements shall include a minimum of:

5.2.1 One BES Element.

5.2.2 One additional BES Element for each additional 3,000 MW of its historical peak system Demand.

M5. The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for DDR data, identified in accordance with Requirement R5, assessed within the required interval, dated evidence (electronic or hard copy) of notification to each Transmission Owner or Generator Owner of Elements identified in Requirement R5. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

DDR plays a crucial role in wide-area disturbance analysis, and the Responsible Entity needs to ensure that there are sufficient BES Elements identified for DDR data capture. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system performance. The requirement for DDR data for identified BES Elements, for the purpose of this standard, is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-assessment of the list is a reasonable interval for this review.

The DDR data is to be captured for a BES Element, and with the exception of HVDC, is obtainable from one terminal of an Element. This pertains to “major transmission interfaces”.

For HVDC (Part 5.1.3), each Transmission Owner is only responsible for DDR data for the Elements that it owns.

Part 5.1.5 is intended to have DDR data for at least one BES Element in a portion of the BES with a voltage response for system events that has required the installation of a UVLS.

It is intended that a Responsible Entity will have DDR data for one BES Element and one additional BES Element for each 3,000 MW of its historical peak system Demand.

Communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard. The Responsible Entity is only required to share the list of required Elements that each Transmission Owner and Generator Owner owns.

R6. Each Transmission Owner shall have DDR data for each BES Element it owns for which it received notification as identified in Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R6:

Dynamic disturbance recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the buses within a location are at the same frequency one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed.

R7. Each Generator Owner shall have DDR data for each BES Element it owns and is notified according to Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step up (GSU) transformer high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R7:

A crucial part of wide-area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high or low-side of the generator step up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how.' Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

R8. Each Transmission Owner and Generator Owner responsible for DDR data in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

8.2 At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recording and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings.

Rationale for R8:

Large scale system outages generally are an evolving sequence of events that occur over an extended period of time, making DDR essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

R9. Each Transmission Owner and Generator Owner in Requirement R5 shall have DDR data that conforms to the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings (R9, Part 9.2).

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle, on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power system disturbances.

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER, FR and DDR data for the BES buses identified in Requirement R1 and BES Elements identified in Requirement R5 to within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings, or (3) station drawings.

Rationale for R10:

Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.

R11. Each Transmission Owner and Generator Owner shall provide all SER, FR, and DDR data for the BES buses identified in Requirement R1 and BES Elements identified in Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 The recorded data will be provided within 30 calendar days of a request.

11.2 The recorded data will be retrievable for the period of 10 calendar days preceding a request.

11.3 SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2.

11.4 FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files.

11.5 Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records, (2) device specification and configuration, or (3) actual data recordings.

Rationale for R11:

Multiple entities and data recordings may be involved in wide-area disturbance analysis. Standardized file format and naming conventions improves timely analysis.

The DMSDT determined that providing the data within 30 calendar days is reasonable based on normal business operations workload.

For Part 11.2, the DMSDT intends for data to be available for 10 days preceding a request for that data. Requests are usually initiated the same or next day following an event for which data is requested. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requester of data has to be aware of the Part 11.2 10 day retrievability. Realistic overwrite concerns may have to consider the recording capability implemented.

Part 11.4 specifies the IEEE C37.111-2013 COMTRADE format for the FR and DDR data. IEEE C37.111 is the Standard for Common Format for Transient Data Exchange, and it is well established in industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

R12. Each Transmission Owner and Generator Owner shall, within 90 calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, restore the recording capability or develop a timeline for restoration and a Corrective Action Plan (CAP) for submission to the Regional Entity:*[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, or (3) dated CAP transmittals to the Regional Entity.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90 calendar days to ensure that adequate data is available for event analysis. Therefore, it is required to return the data recording capability to service within 90 calendar days of a discovery of failure. If the Disturbance Monitoring Equipment (DME) cannot be returned to service within 90 calendar days (e.g. budget cycle, service crews, vendors, etc.), the Entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. For example, DDR data from a generator may not be restored until the next outage cycle.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Long-term Planning	Lower	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 80% but less than 100% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by 30 calendar days or less. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by 10 calendar days or less.	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 70% but less than or equal to 80% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 30 calendar days and less than or equal to 60 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 10 calendar days but less than or equal to 20	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 60% but less than or equal to 70% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 60 calendar days and less than or equal to 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 20 calendar days but less than or equal to 30	The Transmission Owner identified the BES buses as directed by Requirement R1for less than or equal to 60% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1but was late by greater than 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying one or more other owners by greater than 30 calendar days.

				calendar days.	calendar days.	
R2	Long-term Planning	Lower	Each Transmission or Generator Owner as directed by Requirement R2 had more than 75% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the BES buses identified in Requirement R1.	Each Transmission or Generator Owner as directed by Requirement R2 had more than 50% but less than or equal to 75% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the BES buses identified in Requirement R1.	Each Transmission or Generator Owner as directed by Requirement R2 had more than 10% but less than or equal to 50% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the BES buses identified in Requirement R1.	Each Transmission or Generator Owner as directed by Requirement R2 had from 0% but less than or equal to 10% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the BES buses identified in Requirement R1.
R3	Long-term Planning	Lower	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 75% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities for each BES Element.	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 50% but less than or equal to 75% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities for each BES Element. Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for Sequence of Events Recording (SER) and Fault Recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20%.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1500 MVA or
- 20% of median MVA level determined in Step 5.

Step 7. <u>If there are no BES buses on the list:</u> the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

<u>If the list has 11 or fewer BES buses:</u> FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9.

<u>If the list has more than 11 BES buses: SER and FR </u>data is required on at least the 10% of the BES buses, determined in Step 6, with the highest maximum available

calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20% of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for SER and FR data, therefore the following types of BES buses are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance Monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance Monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R1:

Sequence of events and fault records for the analysis, reconstruction, and reporting of system disturbances is important. However, SER and FR data are not required at every BES bus on the BES to conduct adequate or thorough analysis of a disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuit sallow precise reconstruction of events of both localized and wide-area disturbances.

In addition, more quality information is always better than less when performing event analysis. However, 100% coverage of all elements is not practical or required for effective analysis of wide-area disturbance. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses where crucial information is available when required.
2. Excessive overlap of coverage is avoided.
3. Avoid gaps in critical coverage.
4. Provide coverage of system elements that could propagate a disturbance.
5. Avoid mandates to cover system elements that are more likely to be a casualty of a disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of transmission lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish bright line criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of transmission systems throughout the continent to analyze transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright-line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause electric system cascading outages.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater system impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for systems with more than 11 BES buses with three phase short circuit levels above 1500 MVA.

1. Total number of BES buses in the transmission system under evaluation.
    a. Only tangible substation or switchyard buses are included.
    b. Pseudo buses created for analysis purposes in system models are excluded.
2. Determine the three phase short circuit MVA for each bus.
3. Exclude buses from the list with short circuit levels below 1500 MVA.
4. Determine the median short circuit for the top 11 buses on the list (position number 6).
5. Multiply median short circuit level by 20%.
6. Reduce the list of BES buses with short circuit levels higher than 20% of the median.
7. Apply SER and FR at buses with short circuit levels in the top 10% of the list (from 6).
8. Apply SER and FR at buses at an additional 10% of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
    - Electrically distant BES buses or electrically distant from other DME devices
    - Voltage sensitive areas
    - Cohesive load and generation zones
    - BES buses with a relatively high number of incident transmission circuits
    - BES buses with reactive power devices
    - Major facilities interconnecting outside the Transmission Owners' area.

For event analysis purposes, more valuable information is attained about generators and their response to system events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The reevaluation interval of five years was chosen based upon the experience of the DMSDT to address changing system configurations while creating balance in the frequency of reevaluations.

Guideline for Requirement R2:

Analyses of wide-area disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. SER data for generator breaker operations provides little useful data of generator loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers connected to the Transmission Owner's bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission lines

Only those Elements that are identified as BES as identified in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100 kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the transmission system will be captured by FR data on the transmission system.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities
For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings
The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a transmission system is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_{r,}$ is calculated as a sum of vectors of three phase currents:
$\mathbf{I}_r = 3\bullet\mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings
Voltages are to be recorded at applicable BES buses. Note that the Requirement calls for the voltages to be determinable. There are two options for recording phase-to-neutral voltages at applicable BES buses:

1. At terminals of each line. This option would apply to lines that have a full set of VTs/CVTs required for distance protections, which is quite common in practice.
2. At a particular BES bus, in which case all the BES Elements connected to that common BES bus are covered.

Guideline for Requirement R4:

This requirement directs the applicable entities having FR determined as identified in Requirement R1 that meets the following:

Requirement R4, Part 4.1 specifies the minimum amount of FR data. Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection system operations after a fault to determine if a protection system operated as designed. Generally speaking, BES faults and the system response to them occur within a very short time period, approximately 1 to 30 cycles, thus a 30 cycle post-trigger record length captured adequate data. Multiple records allow for legacy microprocessor relays which when time synchronized to a common clock are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 cycle post trigger data.

Requirement R4, Part 4.2 specifies the minimum recording rate of FR data. A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SER.

Requirement R4, Part 4.3 specifies the minimum triggers to ensure FR data is available. A trigger is a set point on an oscilloscope or FR device. The trigger can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area disturbance monitoring to determine the system's electromechanical transient and post-transient response and validate system model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the system's dynamic response and ensuring sufficient coverage to determine system performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historic peak Demand. This DDR data is included to provide adequate system wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a disturbance helps the analysis of large Disturbances. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.

- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.
- The information in the spreadsheet does not provide information by which the plant location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings “greater than or equal to 500 MVA”. The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5% of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, Part 5.1.2 is included to capture larger units located at large generating plants which could pose a stability risk to the system if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1000 MVA. The 300 MVA threshold was chosen based on the DMSDT’s judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. The incremental impact to the number of units requiring monitoring is expected to be relatively low.

Major transmission interfaces are explicitly defined based on the Interconnection since a common naming convention for these interfaces does not exist. However, this data may be calculated, rather than directly measured if the accurate quantity can be derived (e.g. either end of the Flowgate line could be monitored since the other end could be derived). In the Western Interconnection, these major transmission interfaces are defined by the Regional Entity. In the ERCOT and Quebec Interconnections, the Responsible Entity will be required to identify those interfaces that are deemed significant enough to require monitoring (i.e. are utilized for real-time limits such as System Operating Limits or “contingencies”). Only one BES Element associated with a major transmission interface needs DDR data capability.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability could be captured on the BES. For example, a major 500kV or 230kV substation on the EHV system close to the load pocket where the UVLS is deployed would likely be a valuable BES Element for DDR coverage and would aid in post-disturbance analysis of the load area’s response to large system deviations (voltage, frequency, etc.). It is intended to have DDR data for “Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program.”

Guideline for Requirement R6:

DDR data shows transient response to system disturbances after fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. For example, a breaker-and-a-half or double bus configuration has a North (or East) Bus and South (or West) Bus, would require that both buses should have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current record is also acceptable.

For all circuits where current recording is required, real and reactive power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6, apply to Requirement R7. Since either of the high or low-side windings of the generator step up (GSU) transformer may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Large scale system outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high or low frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in system frequency which could be caused by large changes in generation or load, or possibly changes in system impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85% is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power system to a disturbance and is used for analyzing complex power system events. This recording is typically used to capture short term and long term disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency in sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

“Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…”

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

“Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…”

From NPCC’s SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.

Guideline for Requirement R11:

This requirement directs the applicable entities that upon requests from the Reliability Coordinator, Regional Entity or NERC to provide SER, FR data for BES buses determined in requirement R1 and DDR data for BES Elements determined per requirement R5. To facilitate the analysis of BES disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30 calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor.

Requirement R11, Part 11.2 specifies that the minimum time period of 10 calendar days for which the data will be retrievable preceding a request. With the equipment in use that has the capability of recording data, having the data retrievable for the 10 calendar days preceding a request is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10 calendar day time frame, an incident occurs on a Day 1. If a request for data is made on Day 6, then that data has to be provided to the requester within 30 calendar days. However, if a request for the data is made on Day 11, that is outside the 10 calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (.CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power system disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange it is well established in the industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for the naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files first version was approved in 2007. From the August 14, 2003 blackout there was thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and because of that it became difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements which had been established in Requirements R1 and R5 and are found to be out of service. The owners are to return the capability to service within 90 calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a "reasonable" amount of capability out of service does not result in lack of sufficient data for coverage of the system. Furthermore, 90 calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to return the capability to service within 90 calendar days, the requirement further provides that, for such cases, the entity must develop a timeline and a Corrective Action Plan (CAP) for submission to the Regional Entity. These actions are considered to be appropriate to provide for robust and adequate data availability.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Disturbance Monitoring Standard Drafting Team (~~SDT~~DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The project was placed into informal development the fall of 2010.
5. The project was placed into formal development January 2013.
6. Nominations for two additional ~~SDT~~DMSDT members were solicited April 12 – 25, 2013.
7. Three additional ~~SDT~~DMSDT members were added May 22, 2013.
8. Industry webinar was held May 22, 2013.
9. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.
10. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.

Description of Current Draft

This is the second draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	May 2014
Final Ballot	July 2014
BOT Adoption	August 2014

Effective Dates

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

~~See PRC-002-2~~

Implementation Plan.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.

Entities that own only one (1) identified BES bus location, Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.

- **Note**: Entities that own only one (1) identified BES bus, BES Element, or generating unit and are notified by an entity shall be 100% compliant within four (4) years following notification.

Entities shall be 100% compliant with a reassessed list from Requirement R1or R5 within three (3) years following notification of the list.

Version History

Version	Date	Action	Change Tracking
2.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the ~~text boxes~~Rationale Boxes will be moved to the ~~Application~~ Guidelines and technical Basis Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

~~3.~~**4. Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

~~3.1.1~~4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 –ERCOT – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities:

The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.

BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

~~Rationale for Functional Entities:~~

~~The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which Dynamic Disturbance Recorder (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.~~

~~BES Buses where Fault Recorder (FR) and Sequence of Events Recorder (SOER) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available.~~

B. Requirements and Measures

R1. Each Transmission Owner shall identify BES buses for which sequence of events ~~recorder~~recording (SER) and fault ~~recorder~~recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify ~~within 90 calendar days~~ other owners~~, if any,~~ of BES Elements connected to those BES buses~~.~~, if any, within 90 calendar days that those BES Elements may require SER data and/or FR data, and reevaluate the identified BES buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M1. The Transmission Owner has a dated (electronic or ~~hardcopy~~hard copy) list of BES buses for which SER and FR data are required, identified in accordance with Attachment 1, ~~assessed~~and evidence that the bus identification has been reevaluated within the required interval. The Transmission Owner will also have dated (electronic or ~~hardcopy~~hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Requirement R1 directs a uniform methodology to identify these BES buses. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of transmission lines and other Elements connected to the bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on system reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause large cascading system events, so SER and FR data from these BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection.

For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data are required, based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and system topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data are required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. SER and FR data will include generating resource contributions to an event. DDR data better shows generator response to disturbances.

Each Transmission Owner must reevaluate the list of BES buses every five calendar years to address system changes.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90 calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

~~Rationale for R1:~~

~~SER and FR data are not required from every location on the BES to conduct adequate analysis of a BES event; SER and FR from key locations on the BES will suffice. Requirement R1 directs a uniform methodology to select these locations.~~

~~Review of actual BES short circuit data received from the industry in response to the DMSDT's June 5, 2013 through July 5, 2013 data request illuminated a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of transmission lines and other Elements connected to the bus, and (iii) the number and size of generating units connected to the bus. Buses with a large short circuit MVA level Elements that have a significant effect on system reliability and performance. Conversely, buses with very low short circuit MVA level seldom cause large cascading system events, so FR and SER typically are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected locations. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection.~~

~~For the purpose of PRC-002-2, there are a minimum number of buses for which FR and SER are required based on the short circuit level, With these concepts and the objective being sufficient recording coverage for event analysis, the SDT developed a procedure included in Attachment 1, that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for FR and SER data regardless of variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process.~~

~~BES buses where FR and SER data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these buses. SER and FR data will reflect generating resource contributions to an event. DDR data better shows generator response to disturbances.~~

~~Each Transmission Owner must reevaluate the list of buses every five calendar years to address system changes such. Since there may be multiple owners of equipment that comprise a bus, the notification required in R1 is necessary to ensure all owners are notified.~~

~~To ensure effective and timely post-event analysis, it is important to have continuity of SER and FR, with sufficient data from bus locations across the BES. Of the BES bus locations determined in Requirement R1, there may be locations where the Transmission Owner of the bus location does not own all the Elements. This requirement ensures that all necessary BES Elements at a selected bus location have SOER and FR data available by requiring the Transmission Owner of that bus location to notify the other owners of their respective BES Elements that they require SER and FR per this standard. A 90 calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.~~

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified ~~per~~in Requirement R1 and associated with the BES Elements at those BES buses identified ~~per~~in Requirement R1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which can include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R2:

The intent is to capture SER data (opening/closing) for the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance. Other status monitoring indications can be used for devices other than circuit breakers.

~~Rationale for R3:~~

~~The intent is to capture SER data (opening/closing) for the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, timestamped, as per Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance.~~

R3. Each Transmission Owner and Generator Owner shall have the following FR data to determine the following electrical quantities ~~at~~for each of the BES Elements they own connected to the BES buses identified ~~per~~in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltages for each phase of each specified ~~line or~~ BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1. Transformers that have a low-side operating voltage of 100kV or above.

3.~~2.~~2.2 Transmission lines.

M3. ~~**M3.**~~ The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) of FR data is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations including a single design standard as a representation for common installations; or (2) actual data recordings or derivations.

~~Rationale for R4:~~

~~The required electrical quantities may either be directly measured or derived if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required to be determinable for each BES Bus identified in Requirement R1. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high side or the low side of the transformer.~~

Rationale for R3:

The required electrical quantities may either be directly measured or derivable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for system disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point~~.~~, or
- At least two cycles of the pre-trigger data, the first three cycles of the ~~fault~~post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2~~.~~ A minimum recording rate of 16 samples per cycle.

4.3~~.~~ Trigger settings for at least the following:

4.3.1. Neutral (residual) overcurrent.

4.3.2. Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) that FR data meets Requirement ~~R5~~R4. Evidence may include, but is not limited to: (1) device specification (R4, Part 4.2) and configuration (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

~~Rationale for R4:~~

~~Time-stamped pre- and post-trigger fault data aid in the analysis of power system operations and determination if operation were as designed. System faults generally persist for a short time period, approximately 1 to 50 cycles; thus, a 50 cycle post-trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 50 contiguous cycles post-trigger.~~

~~A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point-on-wave data for recreating accurate fault conditions.~~

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power system operations and determination if operations were as designed. System faults generally persist for a short time period, thus, a 30 cycle post-trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles post-trigger.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity ~~(Planning Coordinator or Reliability Coordinator, as applicable)~~ shall identify BES Elements for which dynamic disturbance ~~recorder~~recording (DDR) data is required, notify ~~within 90 calendar days~~ other owners~~, if any,~~ of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1. The BES Elements shall include the following:

5.1.1. Generating resource(s) with:

- ~~5.1.1.1.~~ Gross individual nameplate rating greater than or equal to 500 MVA~~.~~, or
- ~~5.1.1.2~~ Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to ~~1000MVA.~~ 1000 MVA.

5.1.2. Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines:

- Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection, or
- Transfer Paths in the Western Interconnection Path Rating Catalog, or
- Voltage stability limited transfer paths or load serving area, or
- Interfaces between Balancing Authority Areas, or
- Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC~~)~~).

5.1.3. Each terminal of a high~~-~~ voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4. One or more BES Elements associated with Interconnection Reliability Operating Limits~~.~~ (IROLs).

5.1.5. Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program.

5.2. The BES Elements shall include a minimum of:

5.2.1 One BES Element.

5.2.2 One additional BES Element ~~per~~for each additional 3,000 MW of its historical peak system Demand.

M5. The Responsible Entity has a dated (electronic or ~~hardcopy~~hard copy) list of BES Elements for DDR data, identified in accordance with Requirement R5, assessed within the required interval, dated evidence (electronic or ~~hardcopy~~hard copy) of notification to each Transmission Owner or Generator Owner of Elements identified in Requirement R5. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

DDR plays a crucial role in wide-area disturbance analysis, and the Responsible Entity needs to ensure that there are sufficient BES Elements identified for DDR data capture. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system performance. The requirement for DDR data for identified BES Elements, for the purpose of this standard, is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-assessment of the list is a reasonable interval for this review.

The DDR data is to be captured for a BES Element, and with the exception of HVDC, is obtainable from one terminal of an Element. This pertains to "major transmission interfaces".

For HVDC (Part 5.1.3), each Transmission Owner is only responsible for DDR data for the Elements that it owns.

Part 5.1.5 is intended to have DDR data for at least one BES Element in a portion of the BES with a voltage response for system events that has required the installation of a UVLS.

It is intended that a Responsible Entity will have DDR data for one BES Element and one additional BES Element for each 3,000 MW of its historical peak system Demand.

Communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard. The Responsible Entity is only required to share the list of required Elements that each Transmission Owner and Generator Owner owns.

~~Rationale for R5:~~

~~DDR plays a crucial role in wide area disturbance analysis, and the Responsible Entity needs to ensure that there are sufficient BES Elements identified for DDR data capture. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system performance. The requirement for DDR for identified BES Elements, for the purpose of this standard, is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis.~~

~~From its experience with changes to the Bulk Electric System that would affect DDR, the SDT decided that the five calendar year re-assessment of the list is a reasonable interval for this review.~~
~~The DDR data is to be captured for a BES Element, and with the exception of HVDC, is obtainable from one terminal of an Element.~~

~~For HVDC (Part 5.1.3), each Transmission Owner is only responsible for DDR data for the Elements that it owns.~~

~~Sub-Part 5.1.5 is intended to have DDR data for at least one BES Element in a portion of the BES with a voltage response for system events that has required the installation of a UVLS.~~

~~It is intended that a Responsible Entity will have DDR data for one BES Element, and one more BES Element for each 3,000 MW of its historical peak system Demand.~~

~~Communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard. The Responsible Entity is only required to share the list of required Elements that each Transmission Owner and Generator Owner owns.~~

R6. Each Transmission Owner shall have DDR data for each BES Element ~~they own~~it owns for which it received notification as ~~per~~identified in Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three-~~-~~phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or ~~hardcopy~~hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R6:

Dynamic disturbance recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the buses within a location are at the same frequency one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a system configuration assuming all normally closed circuit breakers on a bus are closed.

~~Rationale for R6:~~

~~Dynamic Disturbance Recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined--calculated, derived, etc.~~

~~Because all of the buses within a location are at the same frequencies one frequency measurement is adequate. The data requirements for PRC-002-2 are based on a system configuration assuming all normally-closed circuit breakers on a bus are closed.~~

R7. Each Generator Owner shall have DDR data for each BES Element ~~they own as per~~it owns and is notified according to Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step~~-~~ up (GSU) transformer high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three~~-~~ phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. ~~–~~The Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) of DDR data to determine electrical quantities as specified in Requirement ~~R9~~R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

~~Rationale for R7:~~

~~A crucial part of wide area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how.' GOs may install this capability or, where the TO already has suitable DDR data, contract with the TO. However, the Generator Owner is still responsible for the provision of this data.~~

Rationale for R7:

A crucial part of wide-area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high or low-side of the generator step up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how.' Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

R8. Each Transmission Owner and Generator Owner ~~that is~~ responsible for DDR data ~~as per~~in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~-~~**8.1** Triggered record lengths of at least three minutes.

8.2.~~ –~~ At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds.

~~no lower than 85% of normal operating voltage for a duration of 5 seconds~~

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or ~~hardcopy~~hard copy) of data recording and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings.

Rationale for R8:

Large scale system outages generally are an evolving sequence of events that occur over an extended period of time, making DDR essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

~~Rationale for R8:~~

~~Large scale system outages generally are an evolving sequence of events that occur over an extended period of time, making DDR essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data are available for the entire Disturbance.~~

~~Existing DDR recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).~~

R9. Each Transmission Owner and Generator Owner in Requirement R5 shall have DDR data~~, for the Elements as per Requirement R5, which conform~~ that conforms to the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings (R9, Part 9.2).

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle, on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power system disturbances.

~~Rationale for R9:~~

~~An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle, on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.~~

~~An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor low frequency oscillations typically of interest during power system disturbances.~~

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER, FR and DDR data for the BES ~~bus~~ buses identified ~~per~~in Requirement R1 and BES Elements identified ~~per~~in Requirement R5 to within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M10. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy)~~hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings, or (3) station drawings.

~~Rationale for R10:~~

~~Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.~~

~~Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:~~

~~“Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…”~~

~~Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:~~

~~“Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…”~~

~~From NPCC’s SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.~~

~~The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.~~

~~Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.~~

Rationale for R10:

Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.

R11. Each Transmission Owner and Generator Owner shall provide all SER, FR, and DDR data for the BES ~~bus locations~~buses identified ~~per~~in Requirement R1 and BES Elements identified ~~per~~in Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1. The recorded data will be provided within 30 calendar days of a request.

11.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request.

11.3. SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2.

11.4. ~~.~~ FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files.

11.5. ~~.~~ Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

M11. The Transmission Owner or Generator Owner has evidence (electronic or ~~hardcopy~~hard copy) data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records, (2) device specification and configuration, or (3) actual data recordings.

Rationale for R11:

Multiple entities and data recordings may be involved in wide-area disturbance analysis. Standardized file format and naming conventions improves timely analysis.

The DMSDT determined that providing the data within 30 calendar days is reasonable based on normal business operations workload.

For Part 11.2, the DMSDT intends for data to be available for 10 days preceding a request for that data. Requests are usually initiated the same or next day following an event for which data is requested. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requester of data has to be aware of the Part 11.2 10 day retrievability. Realistic overwrite concerns may have to consider the recording capability implemented.

Part 11.4 specifies the IEEE C37.111-2013 COMTRADE format for the FR and DDR data. IEEE C37.111 is the Standard for Common Format for Transient Data Exchange, and it is well established in industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

R12. Each Transmission Owner and Generator Owner shall, within 90 calendar days of the discovery of a failure of the recording capability for the SER ~~and~~, FR ~~data at the BES buses identified per Requirement R1~~ or DDR data ~~for the BES Elements identified per Requirement R5, shall~~, restore the recording capability or develop a timeline for restoration and a Corrective Action Plan (CAP ~~), to be submitted~~) for submission to the Regional Entity ~~, to restore the recording ability which includes a timeline for the restoration.:~~ ~~[~~:*[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or ~~hardcopy~~hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, or (3) dated CAP transmittals to the Regional Entity.

~~Rationale for R12:~~

~~Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90 calendar days to ensure that adequate data is available for event analysis. Therefore, it is required to return the data recording ability to service within 90 calendar days of a discovery of failure. If the Disturbance Monitoring Equipment (DME) cannot be returned to service within 90 calendar days (e.g. budget cycle, service crews, vendors, etc.), the Entity must report it to the Regional Entity along with a Corrective Action Plan for returning the equipment to service. The timeline required for the CAP depends on the entity and they type of data required. For example, DDR data from a generator may not be restored until the next outage cycle. A CAP is not necessary if the recording capability is restored within 90 day of the discovery of the failure.~~

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90 calendar days to ensure that adequate data is available for event analysis. Therefore, it is required to return the data recording capability to service within 90 calendar days of a discovery of failure. If the Disturbance Monitoring Equipment (DME) cannot be returned to service within 90 calendar days (e.g. budget cycle, service crews, vendors, etc.), the Entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. For example, DDR data from a generator may not be restored until the next outage cycle.

~~Rationale for R11:~~

~~Multiple entities and data recordings may be involved in wide area disturbance analysis. Standardized file format and naming conventions improves timely analysis.~~

~~The SDT determined that providing the data within 30 calendar days is reasonable based on normal business operations workload. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities how long the data will be available.~~

~~For Part 11.2, the SDT intends for data to be available for 10 days preceding a request for that data. Requests are usually initiated the same or next day following an event for which data is requested. A 10 calendar day time frame provides a practical limit on the amount of data required to be stored and lets the requesting entities how long the data will be available. The requester of data has to be aware of the Part 11.2 10 day retrievability.~~

~~Realistic overwrite concerns may have to consider the recording capability implemented.~~

~~Part 11.4 specifies the IEEE C37.111-2013 COMTRADE format for the FR and DDR data. IEEE C37.111 is the Standard for Common Format for Transient Data Exchange, and it is well established in the industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.~~

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity ~~(Planning Coordinator or Reliability Coordinator)~~ is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels

Methodology for Selecting Buses for Capturing Sequence of Events ~~Recorder~~Recording (SER) and Fault ~~Recorder~~Recording (FR) Data

~~Locations Selection Methodology~~

(Requirement R1)

To identify monitored BES ~~bus locations~~buses for Sequence of Events ~~Recorder~~Recording (SER) and Fault ~~Recorder~~Recording (FR) data required by Requirement 1~~ of PRC-002-2~~, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus~~ location~~ includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus~~ locations~~.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer ~~bus locations~~buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20%.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1500 MVA or
- 20% of median MVA level determined in Step 5.

Step 7. If there are no BES buses on the list: the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

If the list has 11 or fewer BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9.

If the list has more than 11 BES buses: ~~FR~~SER and ~~SER~~FR data is required on at least the 10% of the BES buses, determined in Step 6, with the highest maximum

available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. ~~FR~~SER and ~~SER~~FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20% of the BES ~~bus~~buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for ~~FR~~SER and ~~SER~~FR data, therefore the following types of BES buses are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored ~~locations~~BES buses for ~~FR~~SER and ~~SER~~FR data for ~~PRC-002-2~~ Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance Monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance Monitoring capability to ensure the completeness of BES data capture.

~~From a compliance perspective, questions have been raised by industry regarding how conformance to this standard would be judged during a natural disaster which most likely would cause abnormal system conditions for the capturing of data that PRC-002-02 addresses, and also cause the loss of Disturbance Monitoring capability. This is addressed by NERC in its Appendix 4B Sanction Guidelines of the North American Electric Reliability Corporation, Section 2 Basic Principles, Section 2.8 Extenuating Circumstances effective Dec. 20, 2012:~~

~~"In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate penalties."~~

The data requirements for PRC-002-2 are based on a system configuration assuming all normally~~-~~ closed circuit breakers on a bus are closed.

Guideline for Requirement R1:

Sequence of events and fault records for the analysis, reconstruction, and reporting of system disturbances is important. However, SER and FR data are not required at every ~~location~~BES bus on the BES to conduct adequate or thorough analysis of a disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuit sallow precise reconstruction of events of both localized and wide-area disturbances.

In addition, more quality information is always better than less when performing event analysis. However, 100% coverage of all elements is not practical or required for effective analysis of wide-area disturbance. Therefore, selectivity of required ~~locations~~BES buses to monitor is important for the following reasons:

1. Identify key ~~locations~~BES buses where crucial information is available when required.
2. Excessive overlap of coverage is avoided.
3. Avoid gaps in critical coverage.
4. Provide coverage of system elements that could propagate a disturbance.
5. Avoid mandates to cover system elements that are more likely to be a casualty of a disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

~~Listed as follows, the~~The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of transmission lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish ~~a~~ bright line criteria for the application of identified ~~locations~~BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives~~, rather than using opinions, feelings, or anecdotal judgment based upon experience in one area~~.

To answer these questions and establish criteria for ~~location~~BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The ~~team~~MVA Team collected information from a wide variety of transmission systems throughout the continent to analyze transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright-line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective ~~Location Selection Procedure~~Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

~~The Location Selection Procedure~~The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause electric system cascading outages.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater system impact.

To perform the ~~simple~~ calculations of Attachment 1~~ of the standard~~, the following information below is required and the following steps (provided in summary form) are required for systems with more than 11 BES ~~bus locations~~buses with three-phase short circuit levels above 1500 MVA.

1. Total number of BES buses in the transmission system under evaluation.
   a. Only tangible substation or switchyard buses are included.
   b. Pseudo buses created for analysis purposes in system models are excluded.
2. Determine the three-phase short-circuit MVA for each bus.
3. Exclude buses from the list with short circuit levels below 1500 MVA.
4. Determine the median short circuit for the top 11 buses on the list (position number 6).

5. Multiply median short circuit level by 20%.
6. Reduce the list of BES buses with short circuit levels higher than 20% of the median.
7. Apply SER and FR at buses with short circuit levels in the top 10% of the list (from 6).
8. Apply SER and FR at buses at an additional 10% of the list using engineering judgment, and allowing flexibility to factor in the following considerations~~.~~:
   - ~~a.~~ Electrically distant ~~bus locations~~BES buses or electrically distant from other DME devices
   - ~~b.~~ Voltage sensitive areas
   - ~~c.~~ Cohesive load and generation zones
   - ~~d.~~ ~~Bus locations~~BES buses with a relatively high number of incident transmission circuits
   - ~~e.~~ ~~Bus locations~~BES buses with reactive power devices
   - ~~f.~~ Major facilities interconnecting outside the Transmission Owners' area.

~~There is no requirement for SER and FR for generating units in this standard.~~For event analysis purposes, more valuable information is attained about generators and their response to system events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). ~~For event analysis purposes, more valuable information is attained about generators and their response to system events pre- and post-contingency through DDR data versus SER or FR records~~As a result, this standard only requires DDR data.

The reevaluation interval of five years was chosen based upon the experience~~. Five years is long enough to avoid unnecessary reevaluations, but long enough~~ of the DMSDT to address changing system configurations~~.~~ while creating balance in the frequency of reevaluations.

Guideline for Requirement ~~R3~~R2:

Analyses of wide-area disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. SER ~~of~~data for generator breaker operations provides little useful data of generator loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers ~~at~~connected to the Transmission Owner's bus~~ location. ~~.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The Elements connected to those ~~bus locations~~BES buses for which FR data is required include:

- ~~Transmission lines, including interconnection facilities with generating resources~~
- Transformers with a low-side operating voltage of 100kV or above
- Transmission lines

Only those Elements that are identified as BES as ~~per~~identified in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100 kV are not included.

FR data must be determinable from each terminal of ~~an~~a BES Element connected to applicable BES buses.

Generator step- up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault ~~in~~on the transmission system will be captured by FR data on the transmission system.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The ~~SDT~~DMSDT, after ~~consultating~~consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities

For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such ~~FRs~~FR data it is possible to determine all fault types. FR data also ~~augment~~augments SERs in evaluating circuit breaker operation.

Current Recordings

The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a transmission system is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:

$\mathbf{I}_r = 3\bullet\mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$ ~~Equation 1~~

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's ~~law~~Law. Fault currents for one of the BES Elements connected to a particular BES bus ~~location~~

can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus~~ location~~.

Voltage Recordings

Voltages are to be recorded at applicable BES buses. Note that the Requirement calls for the voltages to be determinable. There are two options for recording phase-to-neutral voltages at applicable ~~bus locations~~BES buses:

1. At terminals of each line. This option would apply to lines that have a full set of VTs/CVTs required for distance protections, which is quite common in practice.
2. At a particular BES bus, in which case all the BES Elements connected to that common BES bus are covered.

Guideline for Requirement R4:

This requirement directs the applicable entities having FR determined ~~per~~as identified in Requirement R1 that meets the following:

Requirement R4, Part 4.1 specifies the minimum amount of FR data. Pre- and post~~-~~-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection system operations after a fault to determine if ~~the~~a protection system operated as designed. Generally speaking, BES faults and the system response to them occur within a very short time period, approximately 1 to 30 cycles, thus a 30 cycle post-trigger record length captured adequate data. Multiple records allow for legacy microprocessor relays which when time synchronized to a common clock are capable of providing adequate fault data but not capable of providing fault data in a single record with ~~53~~30 cycle post trigger data.

Requirement R4, Part 4.2 specifies the minimum recording rate of FR data. A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SER.

Requirement R4, Part 4.3 specifies the minimum triggers to ensure FR data is available. A trigger is a set point on an ~~Oscilloscope~~oscilloscope or ~~Fault Recording~~FR device. The trigger can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area disturbance monitoring to determine the system's electromechanical transient and post-transient response and validate system model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the system's dynamic response and ensuring sufficient coverage to determine system performance, DDR is required ~~at~~for key ~~locations~~BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historic peak Demand. This DDR data is included to provide adequate system~~-~~ wide coverage across an

Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage ~~should~~had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a disturbance helps the analysis of large Disturbances. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The ~~team~~DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The ~~team~~DMSDT determined the following basic information about the generating units of interest (current ~~NA~~North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.
- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.
- The information in the spreadsheet does not provide information by which the plant location of each unit can be determined, i.e. the ~~team~~DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the ~~team~~DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings "greater than or equal to 500 MVA~~.~~". The ~~500MVA~~500 MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5% of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, Part 5.1.2 is included to capture larger units located at large generating plants which could pose a stability risk to the system if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1000 MVA. The ~~300MVA~~300 MVA threshold was chosen based on the ~~Team's~~DMSDT's judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. The incremental impact to the number of units requiring monitoring is expected to be relatively low. ~~Wording was added to cover combined cycle plants, in which the loss of one unit will lead to the loss of a companion unit within a very short period of time. Because of the loss of the entire combined cycle plant, 500MVA was chosen as the threshold.~~

Major transmission interfaces are explicitly defined based on the Interconnection since a common naming convention for these interfaces does not exist. However, this data may be calculated, rather than directly measured~~,~~ if the accurate quantity can be derived (e.g. either end of the Flowgate line could be monitored since the other end could be derived). In the Western Interconnection, these major transmission interfaces are defined by the Regional Entity. In the ERCOT and Quebec Interconnections, the Responsible Entity will be required to identify those interfaces that are deemed significant enough to require monitoring (i.e. are utilized for real-time limits such as System Operating Limits or "contingencies"). Only one BES Element associated with a major transmission interface needs DDR data capability.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective ~~location~~BES Element to monitor for DDR such that action of the UVLS or voltage instability could be captured on the BES. For example, a major 500kV or 230kV substation on the EHV system close to the load pocket where the UVLS is deployed would likely be a valuable ~~location~~BES Element for DDR coverage and would aid in post-disturbance analysis of the load area's response to large system deviations (voltage, frequency, etc.). It is ~~not~~ intended to have DDR data for ~~all areas affected by~~ "Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program."

Guideline for Requirement R6:

DDR data shows transient response to system disturbances after fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. For example, a breaker-and-a-half or double bus configuration has a North (or East) Bus and South (or West) Bus, ~~which~~ would require that both buses should have voltage recording~~,~~ because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a system configuration assuming all normally-closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current record is also acceptable.

For all circuits where current recording is required, real and reactive power will be recorded on a three-phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6, apply to Requirement R7~~, too~~. Since either of the high or low-side windings of the generator step-up (GSU) transformer may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As ~~it~~ was explained in the Guideline for R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a system configuration assuming all normally-closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Large scale system outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist ~~at~~for some ~~locations~~BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high or low frequency excursions of significant size based on the Interconnection size and inertia.
- Rate~~-~~ of~~-~~ change of frequency triggers are used to capture major changes in system frequency which could be caused by large changes in generation or load, or possibly changes in system impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85% is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power system to a disturbance and is used for analyzing complex power system events. This recording is typically used to capture short term and long~~-~~ term disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in ~~Fault Recorder~~FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency in sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine~~-~~ generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement ~~R110:~~ ~~See rationale.~~**R10:** Time synchronization of disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.

Guideline for Requirement R11:

This requirement directs the applicable entities that upon requests from the Reliability Coordinator, Regional Entity or NERC to provide SER, FR data for BES buses determined in requirement R1 and DDR data for BES Elements determined per requirement R5. To facilitate the analysis of BES disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum ~~timeframe~~time frame of 30 calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor.

Requirement R11, Part 11.2 specifies that the minimum time period of 10 calendar days ~~that~~for which the data will be retrievable preceding a request. With the equipment in use that has the capability of ~~making a~~ recording data, having the data retrievable for the 10 calendar days preceding a request is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10 calendar day time frame, an incident occurs on a Day 1. If a request for data is made on Day 6, then that data has to be provided to the requester within 30 calendar days. However, if a request for the data is made on Day 11, that is outside the 10 calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part ~~1~~11.3 specifies a Comma Separated Value (.CSV) format ~~per~~according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power system disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange it is well established in the industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance. C37.111-2013 is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.

Requirement R11, Part ~~1~~11.5 specifies the IEEE C37.232 COMNAME format for the naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files first version was approved in 2007. From the August 14, 2003 blackout there was thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and because of that it became difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in ~~their~~its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of ~~their~~its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and ~~Generator~~generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements which had been established in Requirements R1 and R5 and are found to be out of service. The owners are to return the capability to service within 90 calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a "reasonable" amount of capability out of service does not result in lack of sufficient data for coverage of the system. Furthermore, 90 calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to return the capability to service within 90 calendar days, the requirement further provides that, for such cases, the entity must ~~provide~~develop a timeline and a Corrective Action Plan (CAP) for submission to the Regional

Entity. These actions are considered to be appropriate to provide for robust and adequate data availability.

The DMSDT developed this Excel Workbook is designed to assist Transmission Owners in using the Median Method for determining monitoring bus locations for Fault Recording and Sequence of Events Recording on their individual systems.

Instructions for use:

For Transmission Owners Only:

1	Organize your short circuit data in the format shown on the Data Input worksheet
2	Your short circuit data should use three phase short circuit with your selected pre-fault voltage
3	Your short circuit data should be ordered from highest three phase short circuit MVA value to lowest three phase short circuit MVA value for all buses greater than 100 kV
4	Your short circuit data should either eliminate or commonly identify non-real buses, zero buses, pseudo buses, or buses which are used for modeling purposes only, by using a common designation for all these type buses that can be eliminated from the Median calculation. It is most common to identify these non-real buses with the number "0" in the bus coded number field.
5	The Data Input Worksheet is designed to have you copy your properly formatted and sorted three phase MVA short circuit data into rows starting at column A row 6 of the worksheet.
6	Data Input, Col. F, is the most important column, it must have the three phase MVA short circuit data values, sorted from highest MVA to lowest MVA. The MVA values in column F, as sorted from highest to lowest MVA, should include all voltage levels greater than or equal to 100 kV.
7	Once you input all of your short circuit data into the Data Input worksheet starting at Column A Row 6, the values in cells B2, B3 and B4 should all be equal. These values should equal the number of rows of short circuit data that you have input. Copy Cell B2 using Cntrl C, then Paste Value, Special value only, back into Cell B2. This should be the total number of rows contained in the data set.
8	If you have zero numbered buses, or pseudo buses, commonly identified by say a number 0 in the bus coded number column, then you need to determine the number of zero numbered buses that are included in this data set.
9	For you to be able to determine this zero bus coded number, you need to select your entire data set, including the header row, from column / row A5 to G___(last row of data). As an example, if your data contains 100 rows, then your highlighted area for sorting and filtering should be A5 to G105. Then using the sort filter command, turn on Filter
10	Once the Filter is on, go to the bus coded number column, pull down the Filter and select only the zero bus coded number rows. The values in cells B3, and B4 should now be equal and indicate the number of zero numbered buses in your data set.
11	We want to store the zero numbered bus rows (number) into cell B4 as a value. To do this, select Cell B4, hit Cntrl C, then hit paste special, value only. This now repalces the formula in Cell B4 with the value of zero buses in the data set.
12	Now we wish to eliminate the zero bus rows from the rest of our data processing, so in the bus coded number column, we want to filter out the zero bus rows, so we reverse the pull down selection by selecting all rows, except the zero bus coded numbered rows. Leave this Filter in place for the rest of the Median method process.
13	If Cell B4 contains the number zero, then Cell F2 should now contain the 6th value down from the highest short circuit MVA value, and Cell G2 should contain 20% of the Cell F2 value. If Cell F2's value is greater than 1500 MVA this is the new lowest MVA value to be used to determine the number of Median selected buses. If the value in F2 is less than 1500 MVA, then we will use 1500 MVA as the lowest value to select the number of Median buses.
14	If Cell B4 contains a value greater than zero, then Cell F2 needs to be replaced with the MVA value contained in the 11th row, column F of the filtered data set. If the value in F2 is less than 1500 MVA then we will use 1500 MVA as the lowest value to select the number of Median buses.
15	With the Filter still applied to our data set, and zero buses deselected, we will need to use the F2 value to apply as the value used for the MVA column pull down.
16	Using Column F, MVA value pull down, use the Number Filter function, greater than or equal to the F2 value. With this Filter F2 number value applied, now Cntrl C Cell C2, and replace C2 with paste special, value only. This now is the number of buses selected by the Median method.
17	You are Finished!!! The number in Cell C2 indicates the number of Median method selected buses, D2 contains the number of total FR and SOER locations, E2 shows the number of FR / SOER for the Top 10% buses and F2 shows the number of FR / SOER for the Distributed 10% buses.
Notes:	Example 1 (Ex 1 without zero buses) is an additional worksheet shown for a system that does not contains any zero buses. All zero bus entries have been eliminated from the data set.
Notes:	Example 2 (Ex 2 with zero buses) is an additional worksheet shown for a system that contains zero buses. Note for a system that contains zero buses, you must observe the row 11, column F MVA value, and place it into Cell F2. In example 2, this MVA value is equal to 5685 MVA, based on the data set provided.

Project 2007-11 Disturbance Monitoring

Requested Approvals

- PRC-002-2 Disturbance Monitoring and Reporting Requirements

Requested Retirements

- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals

- None

Applicable Entities

- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary

- None

Background

The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES.
2. A significant amount of sequence of events recording (SER), fault recording (FR), and dynamic disturbance recording (DDR) capability already exists on the BES. The monitoring requirements in this standard align with industry practices. Therefore, many existing recordings can satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses they own. Therefore, six (6) months is adequate time for generating the list of BES bus locations following the methodology described in Attachment 1 (Requirement R1).

4. Responsible Entities have the relevant data and information pertaining to the BES Elements requiring DDR and six (6) months is adequate time for working with any affected entities and generating the list of BES Elements.
5. The nine (9) month time period for R12 includes the six (6) month implementation for R1 and R5, and a three (3) month additional time period to make notifications. The nine (9) months for R12 implementation is reasonable for the contents of that requirement.
6. A total percentage (%) of BES buses and BES Elements established in Requirements R1 and R5 respectively, are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many monitoring requirements will become compliant with incremental changes to recording capability.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the Entities.
8. Implementation of disturbance monitoring recording following changes to the system are addressed by following reassessment of the lists as per Requirement R1 and Requirement R5.
9. Implementing SER, FR, and DDR capability may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners probably will have more BES Elements requiring SER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes scheduling outages into account.
10. An Entity owning only one (1) identified BES bus, BES Element, or generating unit is allowed six (6) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or capability that could impact implementation timelines for the respective Entities.

General Considerations

Each Transmission Owner and Generator Owner subject to PRC-018-1 shall maintain the ability to provide Disturbance monitoring data using current methods required by PRC_018-1 until the entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities with regard to their current Disturbance data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance Monitoring and Reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.

Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.

Entities shall be 100% compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the regional standards development process.

- The following conflicts PRC-002-2 Requirement R3 stipulates data must be captured by fault recording to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of dynamic disturbance recording data for HVDC. PRC-002-NPCC-01 does specify HVDC.
- PRC-002-2 Requirement R8 recognizes dynamic disturbance recording that is not continuous. PRC-002-NPCC-01 addresses dynamic disturbance recorders installed after the standard was approved have to be continuous.

Requested Retirements
- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals
- None

Applicable Entities
- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary

~~The standard drafting team proposes the following new definitions:~~	
~~Dynamic Disturbance Recording (DDR)~~	~~The recording of time sequenced data for dynamic power system characteristics such as power swings, frequency variations, and abnormal voltage problems.~~
~~Fault Recording (FR)~~	~~The recording of time sequenced waveform data for short circuits or failure of Elements resulting in abnormal voltage(s) and /or current(s).~~
~~Sequence of Events Recording (SOER)~~	~~The recording of time sequenced data for change in status of Elements, which may include protection and control devices.~~

Background

The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES~~system~~.
2. A significant amount of s~~S~~equence of ~~E~~events ~~R~~recording (SER), f~~F~~ault r~~R~~ecording (FR), and d~~D~~ynamic d~~D~~isturbance r~~R~~ecording (DDR) equipment already exists on the BES. The monitoring~~location~~ requirements in this standard align with industry practices~~ for locating this equipment~~. Therefore, many existing recordings can~~-~~ satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses ~~locations~~ they own. Therefore, six (6) months is adequate time for generating the list of BES bus locations following the methodology described in Attachment 1 (Requirement R1).
4. Responsible Entities have the relevant data and information pertaining to the BES Elements requiring DDR~~ynamic Disturbance Recording~~ and six (6) months is adequate time for working with any affected Entities and generating the list of BES Elements.
5. The nine (9) month time period for ~~R2, R7, and ~~R12~~4~~ includes the six (6) month implementation for R1, and R5~~6~~ ~~(refer to 3, and 4 preceding), and a three (3) month additional time period to make notifications.~~ The nine (9) months for R12~~4~~ implementation is reasonable for the contents of that requirement. ~~All requirements pertaining to possible implementation of equipment are referenced to notification of the list of bus locations or Elements to account for any delays in the process of location and Element selection.~~
6. A total percentage (%) of BES buses~~ locations~~ and BES Elements established in Requirements R1 and R5~~6~~ respectively, are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many locations will become compliant with incremental changes to recording.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the Entities. ~~The timelines put forth allow for inertial delays in implementing new equipment or technologies (e.g. developing new standards and processes, testing and energization, and project management).~~
8. Implementation of disturbance monitoring following changes to the system are addressed ~~by referencing the Implementation Plan to the time of notification following reassessment. Changes to disturbance monitoring are only required for identified bus locations or Elements ~~following reassessment of the lists as per Requirement R1~~, Part 1.2~~ and Requirement R5~~6, Part 6.2~~.

9. Implementing SOER, FR, and DDR may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners will have more Elements requiring SOER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes this into account for scheduling outages.
10. An Entity owning only one (1) identified bus location, Element, or generating unit is allowed four (4) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or equipment that could impact implementation timelines for the respective Entities.

General Considerations

Each Transmission Owner and Generator Owner shall maintain the ability to provide Disturbance Monitoring data using current methods until the entity meets the requirements of PRC-002-2 in accordance with this Implementation plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installed and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities in regards to their current Disturbance Data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance Monitoring and Reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

~~**Implementation Plan for Definitions**~~
~~Entities shall use these definitions when implementing any requirement in this standard that references one of the definitions.~~

Implementation Plan for PRC-002-2 Requirements R1 and R5~~6~~:
Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement~~s R2, R7, and~~ R12~~4~~:
Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) -months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R5, R6~~8~~, R7~~9~~, R8~~10~~, R9~~11~~, R10~~12~~ and R11~~3~~:
Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.

Entities that own only one (1) identified BES bus , BES Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.

~~Entities shall be compliant with the initial list of BES bus locations in Requirement R1 and list of Elements in Requirement R6 within the following:~~

- ~~Following governmental authority or as otherwise provided for in jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect,~~
    - ~~At least 25% compliant within two (2) years following notification of the list~~
    - ~~At least 50% compliant within three (3) years following notification of the list~~

- ~~100% compliant within four (4) years following notification of the list~~
- ~~**Note**: Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within four (4) years following notification of the list.~~

- ~~Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is forty-eight (48) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction,~~

Entities shall be 100% compliant with a reassessed list from Requirement R1~~, Part 1.2~~ or R5~~6, Part~~ 5~~6.2~~ within three (3) years following notification of the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the regional standards development process.

- The following conflicts PRC-002-2 Requirement R3 stipulates data must be captured by fault recording to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of dynamic disturbance recording data for HVDC. PRC-002-NPCC-01 does specify HVDC.

PRC-002-2 Requirement R8 recognizes dynamic disturbance recording that is not continuous. PRC-002-NPCC-01 addresses dynamic disturbance recorders installed after the standard was approved have to be continuous.

Implementation Plan Summary											
Requirement	Entity	Identify bus locations/ Elements	Notification	SOE	FR	DDR	Time Sync	5 Year Assessment	Other	Percent Compliant	Following compliance instructions noted for each requirement above:
R1	TO	X	X	X	X			X		100	Six (6) months
R2	TO		X							100	Nine (9) months
R23	TO/GO			X						25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R34	TO/GO				X					25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R45	TO/GO				X					25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R56	RE (PC or RC)	X	X			X		X		100	Six (6) months
R7	RE (PC or RC)		X							100	Nine (9) months
R68	RE (PC or RC)TO					X				25	Two (2) years
										50	Three (3) years

Background Information

Project 2007-11 Disturbance Monitoring was initiated to replace the existing fill-in-the-blank Standard PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements with a more comprehensive standard. (Fill-in-the-blank standards are those standards that depend on regional criteria or procedures not currently contained within certain Reliability Standards, but which are needed to provide additional requirements for implementing the standards within the Regions.) The Disturbance Monitoring Standard Drafting Team (DMSDT) posted a draft standard for a 45-day comment/ballot period November 1- December 16, 2013. Based on the comments received from stakeholders, the DMSDT has revised the standard. The revisions to the standard are summarized in the paragraphs below.

In response to numerous comments, the SDT has agreed to remove the proposed definitions from the draft standard. The SDT received a comment to revise and use the existing term Disturbance Monitoring Equipment (DME) instead. The SDT has developed the standard to focus on data rather than equipment. The SDT considered revising or retiring the defined term, DME. The SDT reviewed the body of NERC Standards and found the only reference to DME is in PRC-002-1 and PRC-018-1 which will both be replaced by PRC-002-2 upon its approval, and decided to leave the definition as is. The draft standard includes requirements for sequence of events recording (SER) data, fault recording (FR) data and dynamic disturbance recording (DDR) data.

The comments received regarding the methodology in Attachment 1 were directed at Requirements R1 and R2, and Attachment 1. Comments were specifically addressed at explaining "location", station configurations, and equipment ownership. The SDT intended that the bus location be the bus location identified in a system study, and further identifies it in Attachment 1 as "For the purposes of this standard, a single BES bus includes physical buses connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." There are cases where buses contain Elements that the Transmission Owner does not own.

In these instances, the Transmission Owner identifies the bus and then notifies the owners of any Elements that it does not own.

Comments were received on the selection of the Entities identified in the Applicability Section. The Planning Coordinator (PC) and Reliability Coordinator (RC) are included because they have an overall view of the BES to be what BES Elements need to be included for DDR. Responsible Entity was used by the SDT to reflect the fact that the PC and RC have different functions across the continent. Comments were received that pointed to the hardware for capturing data. This standard is not about "how" the data is captured, but "what" data is captured. The need for generator data was questioned. During wide-area or slowly evolving disturbances, generator reaction is crucial to the reconstruction and understanding of an event.

The comments received regarding Requirement R6 (now R5) indicated that stakeholders believed the requirement demanded DDR data capture on an excessive number of BES Elements. The SDT revised the requirement to address these comments by:

- Instead of monitoring all Elements of IROLs, monitor one or more
- Instead of monitoring all Elements of permanent Flowgates and transmission interfaces, monitor "Any one BES Element associated with major transmission interfaces…"

The Parts/sub-Parts of what is now Requirement R5 were rearranged for clarity.

The concerns of most of the comments received regarding the Implementation Plan were directed at the length of time required for implementation of Requirements R3 (now R2), R4 (now R3), R5 (now R4), R8 (now R6), R9 (now R7), R10 (now R8), R11 (now R9), R12 (now R10), and R13 (now R11). The schedule for implementation is now to be at least 50% compliant within three (3) years following notification of the list, and 100% compliant within five (5) years following notification of the list. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within five (5) years following notification of the list.

Based on stakeholder comments, the DMSDT made significant revisions to PRC-002-2 including:

- Combined Requirements R1 and R2.
- Combined Requirements R6 and R7.
- Removed references to "equipment" and specified data requirements for FR, SER and DDR.
- Removed references to "locations" and replaced "bus" with "BES bus"
- Updated rationales with clarifications and more general information for each requirement.
- Revised Requirement R6 (now R5) for more clarity regarding DDR data requirements.
- Revised the VSLs to conform to the revised requirement language.

- Added language to the Guidelines and Technical Basis section of the standard.

***Please use the electronic comment form to submit your final comments to NERC.**

Questions

You do not have to answer all questions. Enter all comments in simple text format. Bullets, numbers, and special formatting will not be retained. Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.

1. The DMSDT merged the notification requirement of Requirement R2 into Requirement R1. The DMSDT also merged notification requirement of Requirement R7 into Requirement R6 (new R5). Do you support these new requirements? If not, please explain why and provide suggested changes.

☐ Yes
☐ No
Comments:

2. The DMSDT revised the requirements for dynamic disturbance recording data based on stakeholder comments. Do you agree with the BES Elements requiring dynamic disturbance recording data listed in Requirement R5? If not, please provide technical justification.

☐ Yes
☐ No
Comments:

3. If you have any other comments that you haven’t already mentioned above, please provide them here:
Comments:

A. Introduction

1. **Title:** **Define Regional Disturbance Monitoring and Reporting Requirements**
2. **Number:** PRC-002-1
3. **Purpose:** Ensure that Regional Reliability Organizations establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of Disturbance data to facilitate analyses of events and verify system models.
4. **Applicability**
   - **4.1.** Regional Reliability Organization.
5. **Effective Date:** Nine months after BOT adoption.

B. Requirements

R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:

R1.1. Location, monitoring and recording requirements, including the following:

R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R1.1.2. Devices to be monitored.

R2. The Regional Reliability Organization shall establish the following installation requirements for fault recording:

R2.1. Location, monitoring and recording requirements, including the following:

R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R2.1.2. Elements to be monitored at each location.

R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R2.1.3.1. Three phase to neutral voltages.

R2.1.3.2. Three phase currents and neutral currents.

R2.1.3.3. Polarizing currents and voltages, if used.

R2.1.3.4. Frequency.

R2.1.3.5. Megawatts and megavars.

R2.2. Technical requirements, including the following:

R2.2.1. Recording duration requirements.

R2.2.2. Minimum sampling rate of 16 samples per cycle.

R2.2.3. Event triggering requirements.

R3. The Regional Reliability Organization shall establish the following installation requirements for dynamic Disturbance recording:

R3.1. Location, monitoring and recording requirements including the following:

R3.1.1. Criteria for equipment location giving consideration to the following:

- Site(s) in or near major load centers
- Site(s) in or near major generation clusters
- Site(s) in or near major voltage sensitive areas
- Site(s) on both sides of major transmission interfaces
- A major transmission junction
- Elements associated with Interconnection Reliability Operating Limits
- Major EHV interconnections between control areas
- Coordination with neighboring regions within the interconnection

R3.1.2. Elements and number of phases to be monitored at each location.

R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R3.1.3.1. Voltage, current and frequency.

R3.1.3.2. Megawatts and megavars.

R3.2. Technical requirements, including the following:

R3.2.1. Capability for continuous recording for devices installed after January 1, 2009.

R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.

R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following:

R4.1. Criteria for events that require the collection of data from DMEs.

R4.2. List of entities that must be provided with recorded Disturbance data.

R4.3. Timetable for response to data request.

R4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE[1] analysis tool,

R4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files[2].

R4.6. Data content requirements and guidelines.

---

[1] IEEE C37.111-1999 IEEE Standard Common Format for Transient Data Exchange for Power Systems or its successor standard

[2] Compliance with this requirement is not effective until the IEEE Standard is approved.

R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.

R6. The Regional Reliability Organization shall periodically (at least every five years) review, update and approve its Regional requirements for Disturbance monitoring and reporting.

C. Measures

M1. The Regional Reliability Organization's requirements for the installation of Disturbance Monitoring Equipment shall address Requirements 1 through 3.

M2. The Regional Reliability Organization's Disturbance monitoring data reporting requirements shall include all elements identified in Requirements 4.

M3. The Regional Reliability Organization shall have evidence it provided its Regional Disturbance monitoring and reporting requirements as required in Requirement 5.

M4. The Regional Reliability Organization shall have evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its DME requirements for three years.

The Compliance Monitor will retain its audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through providing its documentation of Disturbance Monitoring and Reporting requirements or self-certification as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exist:

2.1.1 Disturbance data reporting requirements were not specified as required in R4.1 through R4.6.

2.1.2 No evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in R6.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions exist:

2.2.1 Technical requirements were not specified for one or more types of DMEs.

2.2.2 Requirements do not provide criteria for equipment location or criteria for monitored elements or monitored quantities as required R1, R2 and R3.

2.3. Level 3: Not applicable.

2.4. Level 4: Disturbance monitoring and reporting requirements were not available or were not provided to Transmission Owners and Generator Owners.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. **Title:** **Disturbance Monitoring Equipment Installation and Data Reporting**

2. **Number:** PRC-018-1

3. **Purpose:** Ensure that Disturbance Monitoring Equipment (DME) is installed and that Disturbance data is reported in accordance with regional requirements to facilitate analyses of events.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Generator Owner.

5. **Effective Dates:** Phased in over four years after BOT adoption:

   Requirements 1 and 2:

   – 50% compliant two years after initial issuance of regional requirements per RELIABILITY STANDARD PRC-002 Requirement 5.

   – 75% compliant three years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   – 100% compliant four years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   Requirements 3 through 6:

   – 100% compliant six months after BOT adoption for already installed DME.

   – 100% compliant six months after installation for DMEs installed to meet Regional Reliability Organization requirements per reliability standard PRC-002 Requirements 1, 2 and 3.

B. Requirements

R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard PRC-002 Requirements 1-3) shall have DMEs installed that meet the following requirements:

R1.1. Internal Clocks in DME devices shall be synchronized to within 2 milliseconds or less of Universal Coordinated Time scale (UTC)

R1.2. Recorded data from each Disturbance shall be retrievable for ten calendar days..

R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization's installation requirements (reliability standard PRC-002 Requirements 1 through 3).

R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1):

R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder).

R3.2. Make and model of equipment.

R3.3. Installation location.

R3.4. Operational status.

R3.5. Date last tested.

R3.6. Monitored elements, such as transmission circuit, bus section, etc.

R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc.

R3.8. Monitored electrical quantities, such as voltage, current, etc.

R4. The Transmission Owner and Generator Owner shall each provide Disturbance data (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard PRC-002 Requirement 4).

R5. The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years.

R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:

R6.1. Maintenance and testing intervals and their basis.

R6.2. Summary of maintenance and testing procedures.

C. Measures

M1. The Transmission Owner and Generator Owner shall each have evidence that DMEs it is required to have meet the functional requirements specified in Requirement 1 and are installed in accordance with its associated Regional Reliability Organization's requirements (R2).

M2. The Transmission Owner and Generator Owner shall each maintain the data listed in Requirements 3.1 through 3.8 for the DMEs installed to meet its Regional Reliability Organization's DME installation requirements.

M2.1 The Transmission Owner and Generator Owner shall each have evidence it provided this DME data to its Regional Reliability Organization within 30 calendar days of a request.

M3. The Transmission Owner and Generator Owner shall each have evidence it retained and provided recorded Disturbance data to entities in accordance with its associated Regional Reliability Organization's Disturbance data reporting requirements. (R4 R5)

M4. Each Transmission Owner and Generator Owner that is required to install DMEs to meet its Regional Reliability Organization's DME installation requirements, shall have an associated DME maintenance and testing program as defined in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner and Generator Owner shall each retain any Disturbance data provided to the Regional Reliability Organization (Requirement 4) for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner and Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if any of the following conditions is present:

2.1.1 DMEs that meet all the Regional Reliability Organization's installation requirements (in accordance with Requirement 2) were installed at 90% or more but not all of the required locations.

2.1.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with Requirement 4) was provided for 90% or more but not all of the required locations.

2.1.3 Data on required DMEs was incomplete (in accordance with R3)

2.1.4 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, but records indicate maintenance and testing did occur within the identified intervals for the portions of the program that were documented.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions is present:

2.2.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 80% or more but less than 90% of the required locations.

2.2.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 80% or more but less than 90% of the required locations.

2.2.3 Recorded Disturbance data was not provided to all required entities (in accordance with R4)

2.2.4 Archived data was not retained for three years (in accordance with Requirement 5).

2.2.5 Documentation of the DME maintenance and testing program provided was complete as required in R6, but records indicate that maintenance and testing did not occur within the defined intervals.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions is present:

2.3.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 70% or more but less than 80% of the required locations.

2.3.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 70% or more but less than 80% of the required locations.

2.3.3 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, and records indicate implementation of the documented portions of the maintenance and testing program did not occur within the identified intervals.

2.4. Level 4: There shall be a level four non-compliance if any one of the following conditions is present:

2.4.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at less than 70% of the required locations.

2.4.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for less than 70% of the required locations.

2.4.3 DMEs that meet all functional requirements (in accordance with R1) were not installed at all required locations.

2.4.4 Documentation of the DME maintenance and testing program was not provided, or no evidence that the testing program did occur within the identified intervals

E. Regional Differences

None identified.

Consideration of Issues and Directives

Project 2007-11 Disturbance Monitoring
PRC-002-2 Disturbance Monitoring and Reporting Requirements

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"For the reasons stated in the NOPR, the Commission will not approve or remand PRC-002-1." "We agree with [American Public Power Association], Alcoa and Otter Tail that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA, Alcoa and Otter Tail's suggestions in the Reliability Standards development process as it modifies PRC-002-1 to provide missing information needed for the Commission to act on this Reliability Standard." (see below for American Public Power Association, Alcoa, and Otter Tail discussion)	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1455-56	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances. The use of recording and specifying recording data parameters, greater consistency is achieved in PRC-002-2.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in addressing the completion of this Reliability Standard."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1452	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances.
"Alcoa suggests that the ERO—instead of a Regional Entity—should define the requirements for DME and the type of report it generates. The requirements and equipment specifications should be consistent throughout North America. In addition, Alcoa suggests that the criteria for installation of such equipment should include the necessary monitoring and recording that contribute to analysis and enhance reliability."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1453	Determines the key locations for which Disturbance data must be recorded which eliminates the need for equipment requirements. PRC-002-2 specifies the storage requirements and recording format for the collected data to ensure continent-wide uniformity to expedite event analysis.
"Otter Tail suggests that PRC-002-1 should be developed on an Interconnection wide basis to ensure consistency and promote reliability of the Bulk-Power System."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards	PRC-002-2 will apply on a continent-wide basis.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
	for the Bulk-Power System (Issued March 16, 2007); Paragraph 1454	
"The Commission requires supplemental information for any Reliability Standard that currently requires a regional reliability organization to fill in missing criteria or procedures. Where important information has not yet been provided to us to enable us to complete our review, we are not in a position to approve or remand those Reliability Standards. Accordingly, we will not approve or remand such Reliability Standards until the ERO submits further information. Until such information is provided, compliance with fill-in-the-blank standards should continue on a voluntary basis, and the Commission considers compliance with such Reliability Standards to be a matter of good utility practice."	Fill-in-the-blank Consideration FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 297.	By addressing recording instead of equipment, the Drafting Team has produced a continent-wide standard to have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

Project 2007-11 – Disturbance Monitoring
PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying recording instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

As used herein, the acronym SER is Sequence of Events Recording, the acronym FR is Fault Recording, and the acronym DDR is Dynamic Disturbance Recording.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements: R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**R10**. Each Transmission Owner and Generator Owner shall time synchronize all SER, FR and DDR data for the BES bus buses identified per Requirement R1 and BES Elements identified per Requirement R5 to within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td colspan="2">Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R10 and R11.
PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R11.</td></tr>
<tr><td>R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization’s installation requirements (reliability standard PRC-002 Requirements 1 through 3).

PRC-002-1
R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:
R1.1. Location, monitoring and recording requirements, including the following:
R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).
R1.1.2. Devices to be monitored
R2. The Regional Reliability Organization</td><td>R1. Each Transmission Owner shall identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses identified per Requirement R1. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities at the BES Elements they own connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

3.1 Phase-to-neutral voltages for each phase of each specified line or BES bus.</td></tr>
</table>

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2.Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**:	3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent. R5. Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder (DDR) data is required, notify within 90 calendar days other owners, if any, of Elements connected to

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after	those BES buses that those Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1.** The BES Elements shall include the following: **5.1.1.** Generating resource(s) with: **5.1.1.1.** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. **5.1.2.** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines: • Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection or • Transfer Paths in the Western Interconnection Path Rating Catalog or • Voltage stability limited transfer paths or load serving area or • Interfaces between Balancing Authority Areas or • Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC) **5.1.3.** Each terminal of a high-voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA on the alternating

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	current (AC) portion of the converter. **5.1.4.** One or more BES Elements associated with Interconnection Reliability Operating Limits. **5.1.5.** Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program. **5.2.** The BES Elements shall include a minimum of: **5**.2.1 One BES Element **5**.2.2 One additional BES Element per each additional 3,000 MW of its historical peak system Demand. R6. Each Transmission Owner shall have DDR data for each BES Element they own as per Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	R7. Each Generator Owner shall have DDR data for each BES Element they own as per Requirement R5, to determine the following electrical quantities: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 7.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level. 7.2. The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current. 7.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 7.4. Frequency of at least one of the voltages in Requirement R7, Part 7.1. R8. Each Transmission Owner and Generator Owner that is responsible for DDR data as per Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	8.2. At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	R9. Each Transmission Owner and Generator Owner shall have DDR data, for the Elements as per Requirement R5, which conform to the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-018-1, Requirement R2 and PRC-002-1 Requirements R1-R3 are covered in PRC-002-2, Requirements R1-R9. PRC-018-1, Requirement R2 references PRC-002-1 Requirements R1-R2. PRC-002-1, Requirements R1-R3 reference equipment installation requirements for FR, SER, and DDR. The technical parameters of PRC-002-2 pertain to the characteristics and content of the recordings that are needed to facilitate event analysis.	
R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1): R3.1. Type of DME (sequence of event recorder,	None.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
fault recorder, or dynamic disturbance recorder). R3.2. Make and model of equipment. R3.3. Installation location. R3.4. Operational status. R3.5. Date last tested. R3.6. Monitored elements, such as transmission circuit, bus section, etc. R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc. R3.8.Monitored electrical quantities, such as voltage, current, etc.	
Notes: PRC-018-1, Requirement R3 is not covered in PRC-002-2. PRC-018-1 Requirement R3 refers to equipment and therefore is not mapped to PRC-002-2 which deals with recorded data and not equipment.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R4. The Transmission Owner and Generator Owner shall each **provide Disturbance data** (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard **PRC-002 Requirement 4**). **PRC-002-1** R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool.	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R11.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2 Evidence Retention** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years. The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years. The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years. The Transmission Owner and Generator Owner shall retain evidence of Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11,

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	and M12 for three calendar years. The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years. If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes: R6.1. Maintenance and testing	**R12.** Each Transmission Owner and Generator Owner, within 90 calendar days of the discovery of a failure of the SER and FR data at the BES buses identified per Requirement R1 or DDR data for the BES Elements identified per Requirement R5, shall restore the recording capability or develop a Corrective Action Plan (CAP), to be submitted to the Regional Entity, to restore the recording ability which includes a timeline for the restoration.: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
intervals and their basis. R6.2. Summary of maintenance and testing procedures.	
Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R12. PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R12 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following: R1.1.1. Criteria for equipment location (e.g.,	**R1.** Each Transmission Owner shall identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker they own connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses identified per Requirement R1. [Violation Risk Factor: Lower] [Time Horizon:

Standard PRC-002-1	Proposed Standard PRC-002-2
by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	Long-term Planning]
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R2. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g.,	**R1.** Each Transmission Owner shall identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities at the BES Elements they own connected to the BES buses

Standard PRC-002-1	Proposed Standard PRC-002-2
by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltages for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent.

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following:	**R5.** Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder (DDR) data is required, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1.** The BES Elements shall include the following: **5.1.1.** Generating resource(s) with: **5.1.1.1.** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA.

Standard PRC-002-1	Proposed Standard PRC-002-2
-Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current	**5.1.2.** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines: • Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection or • Transfer Paths in the Western Interconnection Path Rating Catalog or • Voltage stability limited transfer paths or load serving area or • Interfaces between Balancing Authority Areas or • Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC) **5.1.3.** Each terminal of a high-voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA on the alternating current (AC) portion of the converter. **5.1.4.** One or more BES Elements associated with Interconnection Reliability Operating Limits. **5.1.5**. Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program. **5.2.** The BES Elements shall include a minimum of: **5**.2.1 One BES Element **5**.2.2 One additional BES Element per each additional 3,000 MW of its historical peak system Demand.

Standard PRC-002-1	Proposed Standard PRC-002-2
and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	**R6.** Each Transmission Owner shall have DDR data for each BES Element they own as per Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. **R8.** Each Transmission Owner and Generator Owner that is responsible for DDR data as per Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz

Standard PRC-002-1	Proposed Standard PRC-002-2
	o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner shall have DDR data, for the Elements as per Requirement R5, which conform to the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-002-1, Requirement R3 is covered in PRC-002-2, Requirements R5-R6 and R8-R9.	
R4. The Regional Reliability Organization shall establish requirements for facility owners	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC:

Standard PRC-002-1	Proposed Standard PRC-002-2
to **report Disturbance data recorded** by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool, 4.5. Naming of data files in conformance with the IEEE	*[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

Standard PRC-002-1	Proposed Standard PRC-002-2
C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	
Notes: PRC-002-1, Requirement R4 is covered in PRC-002-2, Requirement R13.	
R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.	**R1.** Each Transmission Owner shall identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] **R5.** Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder (DDR) data is required, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1.** The BES Elements shall include the following: **5.1.1.** Generating resource(s) with: **5.1.1.1.** Gross individual nameplate rating greater than or equal to 500

Standard PRC-002-1	Proposed Standard PRC-002-2
	MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. **5.1.2.** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines: • Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection or • Transfer Paths in the Western Interconnection Path Rating Catalog or • Voltage stability limited transfer paths or load serving area or • Interfaces between Balancing Authority Areas or • Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC) **5.1.3.** Each terminal of a high-voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA on the alternating current (AC) portion of the converter. **5.1.4.** One or more BES Elements associated with Interconnection Reliability Operating Limits. **5.1.5**. Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program. **5.2**. The BES Elements shall include a minimum of:

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.1 One BES Element **5**.2.2 One additional BES Element per each additional 3,000 MW of its historical peak system Demand.
Notes: PRC-002-1, Requirement R5 is covered in PRC-002-2, Requirements R2, R6-R7.	
R6. The Regional Reliability Organization shall periodically (**at least every five years**) review, update and approve its Regional requirements for Disturbance monitoring and reporting.	**R1.** Each Transmission Owner shall identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] **R5.** Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder (DDR) data is required, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1.** The BES Elements shall include the following: **5.1.1.** Generating resource(s) with: **5.1.1.1.** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300

Standard PRC-002-1	Proposed Standard PRC-002-2
	MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. **5.1.2.** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines: • Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection or • Transfer Paths in the Western Interconnection Path Rating Catalog or • Voltage stability limited transfer paths or load serving area or • Interfaces between Balancing Authority Areas or • Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC) **5.1.3.** Each terminal of a high-voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA on the alternating current (AC) portion of the converter. **5.1.4.** One or more BES Elements associated with Interconnection Reliability Operating Limits. **5.1.5**. Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program. **5.2**. 	historical peak system Demand.
Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R5.	

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 80% but less than 100% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by 30 calendar days or less. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by 10 calendar days or less.
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 70% but less than or equal to 80% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 30 calendar days and less than or equal to 60 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 10 calendar days but less than or equal to 20 calendar days.
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 60% but less than or equal to 70% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 60 calendar days and less than or equal to 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 20 calendar days but less than or equal to 30 calendar days.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1for less than or equal to 60% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1but was late by greater than 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying one or more other owners by greater than 30 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R2	
Proposed VRF	**Lower**
NERC VRF Discussion	R2 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2 provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 75% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 50% but less than or equal to 75% of the total SER

VRF and VSL Justifications – PRC-002-2, R2	
	data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 10% but less than or equal to 50% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R2 had from 0% but less than or equal to 10% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3	
Proposed VRF	**Lower**
NERC VRF Discussion	R3 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R3 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 75% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 50% but less than or equal to 75% of the total set of required electrical quantities, which is the product of the total number of monitored BES

VRF and VSL Justifications – PRC-002-2, R3	
	Elements and the number of specified electrical quantities per each Element.
Proposed High VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 10% but less than or equal to 50% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 0% but less than or equal to 10% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4	
Proposed VRF	**Lower**
NERC VRF Discussion	R4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data that meets more than 75% but less than 100% of the total recording properties as specified in Requirement R4.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data that meets more than 50% but less than or equal to 75% of the total recording properties as specified in Requirement R4.

VRF and VSL Justifications – PRC-002-2, R4	
Proposed High VSL	The Transmission Owner or Generator Owner had FR data that meets more than 10% but less than or equal to 50% of the total recording properties as specified in Requirement R4.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data that meets more than 0% but less than or equal to 10% of the total recording properties as specified in Requirement R4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R5 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5 contains only one objective which identifies BES Elements within specified criteria and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R5 for more than 80% but less than 100% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R5 but was late by 30 calendar days or less.

VRF and VSL Justifications – PRC-002-2, R5	
	OR The Responsible Entity as directed by Requirement R5 was late in notifying the owners by 10 calendar days or less.
Proposed Moderate VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R5 for more than 70% but less than or equal to 80% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R5 but was late by greater than 30 calendar days and less than or equal to 60 calendar days. OR The Responsible Entity as directed by Requirement R5 was late in notifying the owners by greater than 10 calendar days but less than or equal to 20 calendar days.
Proposed High VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R5 for more than 60% but less than or equal to 70% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R5 but was late by greater than 60 calendar days and less than or equal to 90 calendar days. OR The Responsible Entity as directed by Requirement R5 was late in notifying the owners by greater than 20 calendar days but less than or equal to 30 calendar days.
Proposed Severe VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R5 for less than or equal to 60% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R5 but was late by greater than 90 calendar days. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity as directed by Requirement R5 was late in notifying one or more owners by greater than 30 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R5	
A Cumulative Number of Violations	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R6	
Proposed VRF	**Lower**
NERC VRF Discussion	R6 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R6 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R6 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 that covered more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 50% but less than or equal to

VRF and VSL Justifications – PRC-002-2, R6	
	75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Transmission Owner failed to have DDR data as directed by Requirement R6, Parts 6.1 through 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R6	
Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7	
Proposed VRF	**Lower**
NERC VRF Discussion	R7 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 that covers more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 50% but less than or equal to 75%

VRF and VSL Justifications – PRC-002-2, R7	
	of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Generator Owner failed to have DDR data as directed by Requirement R7, Parts 7.1 through 7.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R7 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R7	
Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
Proposed VRF	**Lower**
NERC VRF Discussion	R8 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes the need for continuous data recording and storage for Dynamic Disturbance Recordings established in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R8 contains only one objective to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 75% but less than 100% of the Elements they own as determined in Requirement R5.

VRF and VSL Justifications – PRC-002-2, R8	
Proposed Moderate VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 50% but less than or equal to 75% of the Elements they own as determined in Requirement R5.
Proposed High VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 0% but less than or equal to 50% of the Elements they own as determined in Requirement R5.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have continuous or non-continuous DDR data, as directed in Requirement R8, for the Elements they own as determined in Requirement R5.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R8	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R9	
Proposed VRF	**Lower**
NERC VRF Discussion	R9 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R9 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement established technical specifications for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish technical specifications for Dynamic Disturbance Recording selected in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R9 contains only one objective which is to establish technical specifications for Dynamic Disturbance Recording selected in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 75% but less than 100% of the total recording properties as specified in Requirement R9.

VRF and VSL Justifications – PRC-002-2, R9	
Proposed Moderate VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 50% but less than or equal to 75% of the total recording properties as specified in Requirement R9.
Proposed High VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 10% but less than or equal to 50% of the total recording properties as specified in Requirement R9.
Proposed Severe VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 1% but less than or equal to 10% of the total recording properties as specified in Requirement R9.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R9 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Consistency among Reliability Standards**

VRF and VSL Justifications – PRC-002-2, R9	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This requirement established technical specifications for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R10	
Proposed VRF	**Lower**
NERC VRF Discussion	R10 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R10 requires time synchronization of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations established in R1 and R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failures to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R10 contains only one objective which is to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had time synchronization for SER, FR, and DDR data for more than 90% but

VRF and VSL Justifications – PRC-002-2, R10	
	less than 100% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had time synchronization for SER, FR, and DDR data for more than 80% but less than or equal to 90% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed High VSL	The Transmission Owner or Generator Owner had time synchronization for SER, FR, and DDR data for more than 70% but less than or equal to 80% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have time synchronization for SER, FR, and DDR data for less than or equal to 70% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R10 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R10	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R11	
Proposed VRF	**Lower**
NERC VRF Discussion	R11 is administrative in nature and a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R11 provides criteria around timelines for providing the data and the data format. This is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria on providing Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R11 contains only one objective which is to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data within the specified criteria. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 30 calendar days but less than 40 calendar days from the request.

VRF and VSL Justifications – PRC-002-2, R11	
	OR The Transmission Owner or Generator Owner as directed by Requirement R11, Part 113.2 provided more than 90% but less than 100% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 90% but less than 100% in the proper data format.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 40 calendar days but less than or equal to 50 calendar days from the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.2 provided more than 80% but less than or equal to 90% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 80% but less than or equal to 90% in the proper data format.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 50 calendar days but less than or equal to 60 calendar days from the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.2 provided more than 70% but less than or equal to 80% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 70% but less than or equal to 80% in the proper data format.

VRF and VSL Justifications – PRC-002-2, R11	
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 failed to provide the requested data more than 60 calendar days from the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.2 failed to provide less than or equal to 70% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided less than or equal to 70% in the proper data format.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R11 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R11	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R12	
Proposed VRF	**Lower**
NERC VRF Discussion	R12 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 calendar days but less than 100 calendar days after discovery of the failure.

VRF and VSL Justifications – PRC-002-2, R12	
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 calendar days but less than or equal to 110 calendar days after discovery of the failure.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 calendar days but less than or equal to 120 calendar days after discovery of the failure.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 calendar days after discovery of the failure.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R12 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R12	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 80% but less than 100% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by 30 calendar days or less. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by 10 calendar days or less. ~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 80% but less than 100% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by 30 calendar days or less.~~
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 70% but less than or equal to 80% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 30 calendar days and less than or equal to 60 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 10 calendar days but less than or equal to 20 calendar days.~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 70% but less than or equal to 80% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 30 calendar days and less than or equal to 60 calendar days.~~

VRF and VSL Justifications – PRC-002-2, R1	
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1 for more than 60% but less than or equal to 70% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1 but was late by greater than 60 calendar days and less than or equal to 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying the other owners by greater than 20 calendar days but less than or equal to 30 calendar days.~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 60% but less than or equal to 70% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 60 calendar days and less than or equal to 90 calendar days.~~
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1for less than or equal to 60% of the required BES buses. OR The Transmission Owner assessed the BES buses as directed by Requirement R1but was late by greater than 90 calendar days. OR The Transmission Owner as directed by Requirement R1 was late in notifying one or more other owners by greater than 30 calendar days. ~~The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for less than or equal to 60% of the required bus locations.~~ ~~OR~~ ~~The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 90 calendar days.~~

VRF and VSL Justifications – PRC-002-2, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R1	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

Proposed VRF	**Lower**
NERC VRF Discussion	R2~~3~~ is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2~~3~~ provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2~~3~~ contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R2~~3~~	
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 75% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.~~Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 75% but less than 100% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations established in Requirement R1.~~
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 50% but less than or equal to 75% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.~~Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 50% but less than or equal to 75% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations established in Requirement R1.~~
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 10% but less than or equal to 50% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.~~Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 10% but less than or equal to 50% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations established in Requirement R1.~~
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R2 had from 0% but less than or equal to 10% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.~~Each Transmission or Generator Owner as directed by Requirement R3 implemented from 0% but less than or equal to 10% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations established in Requirement R1.~~
FERC VSL G1	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1

VRF and VSL Justifications – PRC-002-2, R2~~3~~	
Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	(enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2~~3~~ is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5	Non CIP

VRF and VSL Justifications – PRC-002-2, R2~~3~~	
Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3~~4~~	
Proposed VRF	**Lower**
NERC VRF Discussion	R3~~4~~ is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R~~4~~3 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect

VRF and VSL Justifications – PRC-002-2, R3~~4~~	
	the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3~~4~~ contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 75% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 75% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 50% but less than or equal to 75% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 50% but less than or equal to 75% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~
Proposed High VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 10% but less than or equal to 50% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that~~

VRF and VSL Justifications – PRC-002-2, R3~~4~~	
	~~covers more than 10% but less than or equal to 50% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 0% but less than or equal to 10% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 0% but less than or equal to 10% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.~~
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3~~4~~	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4~~5~~	
Proposed VRF	**Lower**
NERC VRF Discussion	R4~~5~~ is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4~~5~~ provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4~~5~~ contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data that meets more than 75% but less than 100% of the total recording properties as specified in Requirement R4.~~The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 75% but less than 100% of the total recording properties as specified in Requirement R5.~~
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data that meets

VRF and VSL Justifications – PRC-002-2, R4~~5~~	
	more than 50% but less than or equal to 75% of the total recording properties as specified in Requirement R4.~~The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 50% but less than or equal to 75% of the total recording properties as specified in Requirement R5.~~
Proposed High VSL	The Transmission Owner or Generator Owner had FR data that meets more than 10% but less than or equal to 50% of the total recording properties as specified in Requirement R4.~~The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 10% but less than or equal to 50% of the total recording properties as specified in Requirement R5.~~
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data that meets more than 0% but less than or equal to 10% of the total recording properties as specified in Requirement R4.~~The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 0% but less than or equal to 10% of the total recording properties as specified in Requirement R5.~~
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R45	
Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R~~6~~5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5~~6~~ is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R~~6~~5 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5~~6~~ contains only one objective which identifies BES Elements within specified criteria and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R5 for more than 80% but less than 100% of the required Elements. OR

should apply binary VSLs	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7~~9~~	
Proposed VRF	**Lower**
NERC VRF Discussion	R7~~9~~ is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7~~9~~ provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could

VRF and VSL Justifications – PRC-002-2, R7~~9~~	
	not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7~~9~~ contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 that covers more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.~~The Generator Owner implemented DDR as directed by Requirement R9, Parts 9.1 through 9.4 that covers more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.~~
Proposed Moderate VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.~~The Generator Owner implemented DDR as directed by Requirement R9, Parts 9.1 through 9.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.~~
Proposed High VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.~~The Generator Owner implemented DDR as directed by Requirement R9, Parts 9.1 through 9.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.~~
Proposed Severe VSL	The Generator Owner failed to have DDR data as directed by Requirement R7, Parts 7.1 through 7.4.~~The Generator Owner failed to implement DDR as directed by Requirement R9, Parts 9.1 through 9.4.~~

VRF and VSL Justifications – PRC-002-2, R7~~9~~	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R7~~9~~ is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R7~~9~~	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8~~10~~	
Proposed VRF	**Lower**
NERC VRF Discussion	R8~~10~~ is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8~~10~~ provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.

VRF and VSL Justifications – PRC-002-2, R8~~10~~	
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes the need for continuous data recording and storage for Dynamic Disturbance Recordings established in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R5~~6~~ could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R8~~10~~ contains only one objective to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 75% but less than 100% of the Elements they own as determined in Requirement R5.~~The Transmission Owner or Generator Owner implemented continuous or non-continuous DDR, as directed in Requirement R10, for more than 75% but less than 100% of the Elements they own as determined in Requirement R6.~~
Proposed Moderate VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 50% but less than or equal to 75% of the Elements they own as determined in Requirement R5.~~The Transmission Owner or Generator Owner implemented continuous or non-continuous DDR, as directed in Requirement R10, for more than 50% but less than or equal to 75% of the Elements they own as determined in Requirement R6.~~
Proposed High VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 0% but less than or equal to 50% of the Elements they own as

VRF and VSL Justifications – PRC-002-2, R8~~10~~	
	determined in Requirement R5.~~The Transmission Owner or Generator Owner implemented continuous or non-continuous DDR, as directed in Requirement R10, for more than 0% but less than or equal to 50% of the Elements they own as determined in Requirement R6.~~
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have continuous or non-continuous DDR data, as directed in Requirement R8, for the Elements they own as determined in Requirement R5.~~The Transmission Owner or Generator Owner failed to implement continuous or non-continuous DDR, as directed in Requirement R10, for the Elements they own as determined in Requirement R6.~~
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R8~~10~~ is not binary. Proposed VRF	**Lower**
NERC VRF Discussion	R124 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to

VRF and VSL Justifications – PRC-002-2, R12~~4~~	
	effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12~~4~~ provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12~~4~~ contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 calendar days but less than 100 calendar days after discovery of the failure. ~~The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 calendar days but less than 100 calendar days after discovery of the failure.~~
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 calendar days but less than or equal to 110 calendar days after discovery of the failure. ~~The~~

VRF and VSL Justifications – PRC-002-2, R1~~2~~4	
	~~Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 calendar days but less than or equal to 110 calendar days after discovery of the failure.~~
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 calendar days but less than or equal to 120 calendar days after discovery of the failure. ~~The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 calendar days but less than or equal to 120 calendar days after discovery of the failure.~~
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 calendar days after discovery of the failure. ~~The Transmission Owner or Generator Owner as directed by Requirement R14 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 calendar days after discovery of the failure.~~
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level	Guideline 2a: The VSL assignment is for R12~~4~~ is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R12~~4~~	
Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

Standards Announcement Reminder

Project 2007-11 Disturbance Monitoring

Additional Ballot and Non-Binding Poll Now Open through June 23, 2014

Now Available

An additional ballot and for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are now open through **8 p.m. Eastern on Monday, June 23, 2014**.

Background information for this project can be found on the project page.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2007-11 Disturbance Monitoring

Formal Comment Period Now Open through June 23, 2014

Upcoming:
Additional Ballot and Non-Binding Poll: June 13-23, 2014

Now Available

A 45-day formal comment period for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** is open through **8 p.m. Eastern on Monday, June 23, 2014**.

Instructions for Commenting
Please use the electronic form to submit comments on the standard. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps
An additional ballot and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **June 13-23, 2014**.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

(1) In addition to our comments we adopt the SERC PCS comments, and include them by reference. (2) As we have stated in our previous comments, we have installed over 30 PMUs on our system over the last 3 years in conjunction with our Planning Coordinator. This required significant effort and resources to perform this installation work. Even though they have not yet been needed for disturbance analysis, some operating visualization tools are being used and we have reviewed some minor perturbations. We respectfully disagree with the drafting team's brief justification in the Rationale for R5. We still believe the resultant number of PMUs which might be needed under the new standard would be burdensome to most entities. (3) Our software vendor has made known to us that they do not presently have the full capability as described in Requirement 11 implemented in our data concentrator software.

Dominion
Mike Garton
Yes
Yes
As stated in Dominion's previous comments: "PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2013, NPCC applicable entities are two years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant with this Regional Reliability Standard. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Dominion cannot support this continent-wide standard without inclusion of a variance for the NPCC Region (PRC-002-NPCC-01)." The standard drafting team (SDT) in response provided: "The DMSDT is aware that the NPCC DMSDT has been reconvened to review the Regional Standard with respect to PRC-002-2 after it is approved." While Dominion appreciates the SDT response, the fact remains that NPCC applicable entities continue to implement the FERC approved NPCC Regional Reliability Standard that could result in over/under installing DM capability when compared to PRC-002-2, once approved. Therefore, Dominion again urges the SDT to include a Variance in PRC-002-2 that excludes entities subject to PRC-002-NPCC-01 from the applicability section of this standard.

Yes
The term BES bus is not a defined term, it is only described in Step 1 of Attachment 1. Note that NERC's Definition of Bulk Electric System (Phase 2) definition applies to Elements. Requirement R3, sub-Part 3.1 requires to have "Phase-to-neutral voltages for each phase of each specified BES bus". Since BES buses, as described in Attachment 1, may not represent physical buses, this sub-Part is not clear. For example, a breaker-and-a-half design with two physical buses. A Transmission Owner (TO) might not have visibility of the BES classification of Elements it does not own. It is recommended that the TO provide the list of identified BES buses to their PC / RC. The PC/RC will review the received list from the TO, and determine if the list contains BES Elements owned by others, and notify those owners whose BES Elements may require sequence of events recording (SER) and/or fault recording (FR) data. Reference to (undefined) BES buses in Requirement R5 makes this requirement open to interpretations. Sub-Part 5.1.2 requires the inclusion of "Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity", and its bullets include stability related interfaces or other significant Flowgates, Elements associated with Interconnection Reliability Operating Limits (IROLs), and voltage stability limited transfer paths or load serving areas. The different Parts and sub-Parts of R5 could require a large number of DDRs for TOs which have Flowgates, IROLs, and /or UVLS schemes. The number of required DDRs could become significantly larger than the minimum set of one BES Element plus one additional BES Element for each additional 3,000 MW of load, which could cause excessive burden on some TOs. It is also suggested to eliminate the potential overlap of sub-Parts 5.1.2, 5.1.4, and 5.1.5 by consolidating sub-Parts. Finally, it is recommended that "One or more BES Elements associated with Interconnection Reliability Operating Limits (IROLs)" in sub-Part 5.1.4 be replaced with "Any one BES Element critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" to be consistent with the language in CIP-002-5.1. Sub-Part 5.1.4 requires clarification. The Drafting Team should consider shortening R1 by listing Parts.
Yes
There should be consistency between Parts 5.1.2, 5.1.4, and 5.1.5. The Drafting Team in 5.1.2 and 5.1.5 require DDR on ANY ONE BES Element but in 5.1.4 it uses "One or more BES Elements…". Reading the DT response to the last comment round it seems the intent was to be consistent for these three items; only one BES is required to be monitored. If true then standardize on ANY ONE BES element. Refer to the comments in Question 1.
An additional implementation requirement or effective date should be included to address the situation when after the 5 year evaluation an additional element is identified for FR or DDR to afford the TO or GO to budget and install additional equipment. The draft PRC-005-X standard included language to address this in its latest draft. Consider adding to the technical guidelines for R6 more information surrounding the allowance for the use of a common bus voltage measurement where appropriate to monitor multiple BES Elements. Suggest adding to the second paragraph in the guideline for R6: The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the Standard is not to require measurement of each BES Element where a common bus measurement is available. Where a common measurement is utilized the Owner must plan the installation such that a bus outage would not result in the DDR data to be compromised. For example,…etc….. Part 11.4 requires the use of C37.111-2013. This could be an issue if an Entity has not upgraded its equipment of firmware. In R8 an exception is allowed for DDR owners with older equipment. A similar tack should be applied here. The Standard should not force replacement. Attachment 1 does not specify how to distribute an odd number for 20% of the BES buses between 10% of the BES buses and additional 10% of the BES buses (both determined in Step 6), e.g. if twenty-one (21) buses in total are required. Requirement R8 should allow legacy equipment to have multiple triggered records which when combined into one time synchronized record make up the required length of three minutes. Requirement R11, Part 11.3 requires SER data in Comma Separated Value (.CSV) format following Attachment 2 whereas the majority of Disturbance Monitoring Equipment (DME) does not save data in this format. Can the Drafting Team provide a name of DME which gives the data in this format? Requirement R11, Part 11.4 requires FR and DDR data in C37.111 (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE) formatted files whereas the majority of DME equipment does not save data in this format. Are manually converted records acceptable? Requirement R11, Part 11.5 requires data files

to be named in conformance with C37.232 IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME) whereas the majority of DME equipment does not save data in this format.

We agree with the merging of R2 into R1, but not the revised R5 which combined R6 and R7. Please see our comments under Q2, below.
No
(a) R5 is unclear as it mixes BES Buses with BES Elements. If the responsible entity (a PC or an RC) is to identify BES Elements for which dynamic disturbance recording (DDR) data is required, then it needs to notify ALL such Elements' owners, and there is no need to mention "of BES Elements connected to those BES buses". However, if the requirement is intended to ask the responsible entity to identify BES buses for which dynamic disturbance recording (DDR) data is required, then it needs to notify the owners of the BES buses AND the owners of the BES Elements connected to these BES buses. We suggest the SDT to review the intent of the requirement, and revise it to clearly convey the requirements on what is it the responsible entity needs to identify, and to whom it needs to notify. (b) Part 5.1.2: The term "significant Flowgates" is subject to interpretation since it is not clear what "significant" really means. We suggest the SDT to clarify this term or provide more specificity. (c) Part 5.1.4: It is not clear whether or not the BES Element associated with an IROL is the monitored element or the contingent element or both. This needs to be clarified. (d) Part 5.2: This part requires adding one BES Element for each additional 3,000 MW of an entity's historical peak system Demand, but the word "its" is unclear whether it means the responsible entity (in this case the PC or RC) or the BA. We suggest to reword it to clearly convey that it is the responsible entity's area historical peak system Demand. Note that additional clarity may be needed if the "its" refers to a PC or RC area since within a PC or RC area, there may be multiple BAs and TOPs within which their system peak demand could occur at different times. Thus, Part 5.2 needs to clearly convey whether it is the total non-simultaneous peak demands of all BAs within an area, or it is the one-of highest demand of the entire area

No
The initial list of locations should come from the owners (TOs and GOs) with a subsequent review process as identified by the Responsible Entity. The Responsible Entity should have the authority to require additions as it sees necessary. Owners should provide the initial list because they have access to the information and would bear the cost of installing DDRs.
No
The reference to the WECC Path Rating Catalog should be removed because the remaining bullet points cover everything in the Path Rating Catalog. The WECC Path Rating Catalog can be changed without going through any Standard development process. Changes to the Path Rating Catalog changes Requirement impact.
Applicability section: the Responsible Entity in all Interconnections should be the Planning Coordinator or Reliability Coordinator. R5.1.2, bullet 1, the term "significant Flowgates" appears to be undefined. Does it need to be clarified? R8: undervoltage trigger set no lower than 85% of normal operating voltage – what is normal operating voltage? For a 500 kV sysem, is it 500 kV or is it the average bus voltage for a specified period of time (such as 525kV)?

Manitoba Hydro
Yes

Yes
1. Implementation Plan- The first paragraph simply describes a date that is synonymous with the Effective Date of the Standard. Accordingly, Manitoba Hydro recommends that this paragraph be abbreviated and made consistent with the third paragraph, by stating that:" Entities shall be 100% compliant on the Effective Date." 2. Similarly, the second paragraph under Implementation Plan describes a date that is three months after the Effective Date of the standard. Manitoba Hydro recommends that the wording be revised to state that:"Entities shall be 100% compliant within three months after the Effective Date. 3. R1 requires transmission Owners to notify other owners that certain BES Elements may require SER/ FR data within 90 days, however it does not specify when the 90 day period runs from. This could be interpreted as running from the Effective Date of the standard or from the day that the BES Element is identified(which could be prior to the Effective Date given that entities must be compliant with applying the methodology and identifying BES busses for which data is required as of the Effective date) . Manitoba Hydro therefore recommends that the ninety day period be clarified. 4. R5-(i) For the same reasons stated above, Manitoba Hydro recommends that the ninety day period be clarified. (ii) The contents of the notice to other owners (i.e. that certain BES elements "may" require data) conflicts with R7 which "requires" that an owner who has been notified to determine certain electrical quantities. Therefore, Manitoba Hydro recommends that the "may" in R5 be deleted.
Individual
Tracy Richardson
Springfield Utility Board
• Requirement 4, specifically 4.1, requires a single record or multiple records that include "a pre-trigger record length of at least 30 cycles for the same trigger point, or at least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder." This 32-total cycle creates a limit on SUB's ability to store event reports, and we assume is does for many others, as well. Much of the commonly used and standard software, including that used by Springfield Utility Board, utilizes a 30-cycle event report (2 cycles pre-fault and 28 cycles post-trigger. It does not seem unreasonable to change the language from 32 cycles to 30, so that entities will not incur the unnecessary expense of either purchasing new software or developing a work-around with their current software. • The "buses" language in Attachment 1, Step 7 should be clarified. SUB believes it should read "bus" and not "buses".
Individual

No
We support the merging of R2 into R1 and R7 into new R5. However, we do not support R1 Attachment 1 methodology regarding identifying BES buses for locating SER & FR devices to capture SER & FR data. See comments in question #3 for our reasoning.
No
The R5 language is confusing to me. It appears the Responsible Entity is charged with identifying Elements (not buses), but then the requirement language shifts to notifying owners of Elements connected to "those BES buses" and later reevaluating "identified buses". How are the buses "identified"? Is this an oversight based on the changes made to the earlier version of the Standard? Please clarify.
We continue to believe the Attachment 1 fault MVA threshold established in R1 to identify potential buses from which to pick locations for FR (and SER) data is too low. To provide a context for our comment, our system has a peak load of 800 MW serving approximately 110,000 customers in a service territory covering 320 square miles (less than one county) with local generating capacity of 1100 MW. This is a very compact system containing a relatively small geographic footprint with 17 BES buses as defined within this draft standard. All of these 17 BES buses have fault MVA above the 1500 MVA threshold, ranging from 8,000 MVA down to 2,900 MVA with a median value (bus 6 out of the top 11) of 5,800 MVA. The top 10 BES buses on our system all have a fault MVA above 5,000.

This PRC-002-2 draft Standard will require us to have FR data for 4 buses (20%) overall. The top 2 BES buses (10%) where FR data would be required will be electrically less than 2 miles apart. The other 2 buses (additional 10%) would be located 25 miles or less electrically from the first 2 buses regardless of how we elected to determine these locations. All this data will be electrically concentrated in a small geographical area, which doesn't appear to lead to a wide-area view of the overall BES. Additionally, several of the above mentioned buses have only two (2) BES sources (Distribution buses with only 2 transmission lines connected) or tapped buses with Distribution transformer(s) and no transmission breakers. Are these buses really important to the BES in the context of DME data? It seems the PRC-002-2 R1 Attachment 1 method only serves to unnecessarily inflate the number of BES buses on which the overall percentage of required locations will be calculated. We recognize the difficulty the SDT had in determining the appropriate coverage for FR data, but contend that a fault MVA threshold closer to 4500 MVA and an overall coverage percentage of 10% is adequate. This would still result in our system having FR data at 2 buses which could be electrically separated by approximately 25 miles. Additionally, we believe buses with only limited sources from the BES should be excluded out-of-hand by some other "test" mechanism within the Attachment 1 document or some other vehicle. Regarding R3: 1) Is it the intent of the Standard that FR data is to be determined for all currents defined on all Elements connected to a selected bus for any single fault on any Element connected to the bus? (i.e. if using digital relays for FR, do relays on each element (line or transformer) need to trigger for faults on any element connected to that bus?) 2) What are the expectations for faults and/or disturbances located remotely from the selected bus – how sensitive are they expected to be? In reality, are these FR devices expected to be a lower level disturbance recorder? 3) If data is expected to be available for conditions other than just faults, the data should not be classified as Fault Recording data or at least further definition/clarification should be provided. 4) Some of the discussion in the rationale box for R3 seems to suggest the FR data be used for fault analysis, as it applies to determining correct and incorrect breaker operations – Misoperation determination. In the case of installed modern microprocessor relays, the protective relay(s) should be able to determine the nature of the fault, the elements that operated, fault location, voltages and currents and many other particulars associated with a fault. Generally, FR is an unnecessary addition of equipment in these situations from the perspective of fault analysis to determine the correctness of protection system operation. Regarding R4: We propose changing the 30 cycle post trigger record length in the first bullet under R4.1 to a total record length of 30 cycles. The current wording requires a 32 cycle minimum total record length. We believe the 30 cycle total record length better matches existing microprocessor relay functionality for those that may wish to employ them in this fashion.

Yes
Yes
• R1: We suggest that the intent should be that the buses selected according to Attachment 1 will only be those that operate at or above 100 kv ? We believe that this should be specified in

Attachment 1. • R2: The Measure M2, Part (1), should be changed to “documents describing the device interconnections and configurations which MAY include a single design standard as representative for common installations… “. This will provide greater clarity that a single design standard is sufficient for evidence, but that it is not required. • R2, Measure M2: In addition, as acceptable evidence, the list in M2 should also include “station drawings” as allowed in M10. • R3: The Measure M3, Part (1), should be changed to “documents describing the device specifications and configurations which may include a single design standard as representative for common installations;”, similar to the wording in R2. As written, the Measure would require entities to have a “single design standard”, which is not part of the standard Requirements. In addition, a new Part (3) should be added to allow “station drawings” as permissible evidence • R3 and R4: The Generator Owner is listed here, but it is not clear what requirements apply to it, if it does not own any equipment listed in 3.1 or 3.2. In light of the SDT’s statements about the superiority of dynamic disturbance recording for generators, we strongly urge that the applicability of R3 and R4 for Generator Owners be removed. • R4: The Measure M4, Part (1), should be changed to: “(1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3)”… • R7: “Each Generator Owner shall have DDR data for each BES Element it owns and is notified according to Requirement R5, to determine the following electrical quantities…” This wording is not clear. We suggest using wording, similar to R6, “Each Generator Owner shall have DDR data for each BES Element it owns for which it received notification as identified in Requirement R5, to determine the following electrical quantities…” • R7: In Measure 7, Part (1), we suggest changing to : “(1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations;” This will allow needed flexibility in providing reasonable evidence. • R8: In Measure 8, make the same change as described above in M7. • R9: The Measure 9, Part (1), should be changed to: “(1) documents describing the device specification, configuration, or settings”. • R10: The Measure 10, Part (1), should be changed to: “(1) documents describing the device specification, configuration, or settings”. • Guidelines and Technical Basis Section , Guideline for Requirement R2, two statements are made that are at least unclear, if not contradictory: “SER data for generator breaker operations provides little useful data of generator loading.” “Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers connected to the Transmission Owner’s bus”. Please clarify or revise as necessary.

Under requirement R11.2, suggest modifying the wording to the following: The recorded data will be retained for a minimum of 10 calendar days.
Individual
Thomas Foltz
American Electric Power
No
R1: The scope for the process in Attachment 1 should be limited to only those BES buses that have local protection systems that serve to protect the connected BES elements. R1: The process for identifying BES buses within Attachment 1 could lead to a breaker protected load bus, with only two BES source lines, being in the “top 10%” of locations that must have DFR/SER. The reason for such a location being in the top 10% would be driven by its proximity to other top 10% BES buses. The Standard should allow for exclusion of such locations, provided they are substituted by the next BES bus in the list. AEP believes this change would allow DFR/SER equipment to be deployed where proper event analysis is truly needed. An alternate approach would be to completely eliminate the top 10% criteria, which would allow industry maximum flexibility in determining the most appropriate location for such installations. R1 & R5: As written, these requirements are single sentences which are five lines in length. With no transitions of thought, they are difficult to read. The

wording should be revised to break up independent thoughts so it reads more concisely. R1 & R5: The notification within 90 calendar days has no reference point. The requirements should be revised to state "… within 90 days of completing the Attachment 1 methodology" or similar wording. R1 & R5: Both requirements state "BES Elements may require…" Why is this a "may" statement? This seems to be in conflict with the beginning statement of the requirement that indicates a bright line identification of what requires monitoring. AEP recommends employing a consistent structure for R1 and R5. The criteria for R1 are contained within an appendix, while the criteria for R5 are contained within the requirement. AEP recommends modifying R1 so that the notified entity has the option to monitor either the local or the remote terminal of the subject Element.
No
While AEP has no disagreement with the Elements as specified in R5.1, the standard lacks clarity in what flexibility if any, the Responsible Entity has in selecting them. For example, the text "may require DDR data" implies some flexibility in that regard, and such flexibility should be made more explicit within the standard. It would be more clear if the minimums provided in 5.2 were provided *before* the Elements specified in 5.1 (essentially a swap of 5.1 and 5.2).
AEP believes that the wording of requirement R11.2 clearly conveys the drafting team's intent that an entity is not required to retain more than 10 days of disturbance monitoring data at any point in time. Unfortunately, this intent is blurred by the Compliance Evidence Retention's opening paragraph and the statement that "The Transmission Owner and Generator Owner shall retain evidence of Requirements R2, R3, R4, R8, R9, R10, R11, and R12… for three calendar years." The Evidence Retention, as written, could be interpreted as requiring an entity to maintain three or more years' worth of SER, FR and DDR data. The issue is further confused by the proposed PRC-002-2 RSAW in which the Evidence Requested and the Compliance Assessment Approach for R2, R3, R4, R8, R9, R10 and R11 indicate that SER, FR and DDR data is required to demonstrate compliance and imply that an entity is required to keep all SER, FR and DDR data within the audit window. AEP believes that retaining years of disturbance monitoring data is overly burdensome, provides little to no benefit to reliability and is not the intent of the drafting team. The standard should be revised to align the Compliance Evidence Retention with the Requirements and to more clearly convey the 10 day data retention requirement. The Implementation Plan includes the following "Entities shall be 100% compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list." We agree with this statement, but believe it would be more appropriate to include it within the Standard itself, rather than only within the Implementation. R1: The SDT should clarify who takes the lead role to notify other owners when there are multiple owners of a bus. Presumably it would be the company identified as the owner in the fault model being used but this should be clarified. Also, notification alone should not be sufficient in identifying monitored buses. There should be agreement from all owners that a bus should be monitored before it is included in the monitored list, unless it is in the top 10% which indicates it *must* be monitored. R2: It is unclear from the wording of R2 whether the TO/GO must monitor all circuit breakers connected to an identified bus or only circuit breakers connected to the identified bus that are associated with a BES Element. For example, would a 138 kV circuit breaker for a radial fed station service transformer be required to be monitored if it is connected to a selected bus? In this case, the station service transformer would not be a BES Element. We do not believe it would be appropriate to require SER or DFR data in this scenario, but the standard does not explicitly prevent such an interpretation. We suggest making it clear that the element is *both* connected directly to the BES buses identified in Requirement R1 *and* associated with the BES Elements at those BES buses identified in Requirement R1. R3: The Application Guide implies that GSU leads are not considered lines for this standard. The requirement should be revised to clearly indicate this. Similarly, station service or reserve transformers should likewise be explicitly excluded. R3: The callout for R3 states "The required electrical quantities may either be directly measured or derivable if sufficient FR data is captured". The allowance for derivable methods is specified only in the callout, and is not explicit within the standard itself. This allowance needs to remain somewhere in the standard. Guideline for Requirement R3: We are confused by the exclusion "For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator in case of fault on the transmission system will be captured by FR data on the transmission system." We do not understand how the generation currents could be calculated from the transmission currents for faults on the interconnection. In addition, is it the drafting team's intent to exclude most generating units from fault recording? R12:

We see no reliability benefit in sending all CAP's to the Regional Entity, and recommend revising it in consideration of Paragraph 81. Rather, it should be acceptable to only require the TO/GO to develop and execute a CAP and to make this information available to the RE within 30 calendar days of a request. AEP recommends revising the purpose statement to read "To ensure adequate data is available to NERC to facilitate event analysis of major BES disturbances. AEP recommends establishing only 5 requirements. There should be a requirement for each of the main objectives (establish a data set for FR/SER, establish a data set for DDR, provide FR/SER data upon request, provide DDR data upon request), and a single requirement for repair. AEP recommends modifying R1 so that the notified entity has the option to monitor either the local or the remote terminal of the subject Element. AEP recommends modifying R2-R4 and R6-R11 to clearly exempt data lost due to an equipment failure properly identified per R12. AEP recommends modifying R3 so that only 3 of the 4 currents are required to be recorded. Since the fourth current can be calculated by the other three, there is no reliability impact for recording only three currents.

See comments under Question 3
The three-phase short circuit level minimum of 1500 MVA at BES voltage levels is low. As a result, entities must sort through large numbers of buses when only the top 11 would need to be selected. Buses at low three-phase fault current are not typically conducive to disturbance monitoring equipment. For example, a 345 kV bus that carries 3000 amps (normal flow) would be a candidate for PRC-002 even without applying a three-phase fault. It would seem that a threshold of 10,000 MVA is technically justifiable, since most BES stations that have over 10,000 MVA of available three-phase fault current are candidates for being critical facilities that would benefit from disturbance monitoring equipment or already have such equipment installed. This would also reduce the number of buses that the TO needs to review. There is uncertainty regarding the technical justification for the "11" BES buses that is listed in Step 3 of Attachment 1. Requirement R8 does not clearly identify the data storage requirements for DDR with continuous recording capability. A 3-year period of continuous recording data per DDR location is too onerous. DDR continuous recording capability should be a minimum of 10 days per site. DDR recording(s) retained as evidence should strictly be limited to event-triggered recording by a system disturbance and where the RC, RE, or NERC requests data for the event within the 10-day time frame. Requirement R11.4's required conformance with IEEE Standard C37.111-"2013" is too onerous. This Requirement disqualifies the majority of FR and DDR equipment presently deployed. Seminole recommends revising the Requirement to require the use of IEEE Standard C37.111-"1999" or later.

Yes

Yes
In both R3 and R4 it appears the applicability is for Transmission Owners and Generator Owners but the GO typically does not own a substation bus, transformer with a low-side of >100 kV, or transmission lines (as a registered entity of GO). We believe Generator Owner should be removed from these requirements. In R5 please consider the following modifications: R5.1.2, bullet 1 – Add "as judged by the Responsible Entities" to the end of the bullet. R5.1.2, bullet 5 – Add "as judged by the Responsible Entities" to the end of the bullet. R5.2.2 – Add "within the past 10 years" to the end of the requirement to provide a reasonable and finite time frame. The NSRF interprets R11.2 to say that NERC/Regions will always submit a request for data within 10 days of an event, so it is not necessary for DME's to hold data longer than that timeframe. As this impacts the memory/storage capability of the equipment we would appreciate clarification as to how the 10 days was determined and if the SDT believes the timeframe is long enough.

Yes
Thank you SDT for your efforts we voted negative for the following reasons: This standard brings 20% of our buses into scope, which means it will bring 20% of just about everyone's buses into scope (some large companies could have hundreds of buses included). Is that really the SDT's intent? It sounded like the SDT is not expecting it to be that big of an impact. The MVA threshold needs to be re-visited to prevent excessive, unmerited impact. We do not believe that it is logical to include a bunch of buses from smaller entities that just barely cross the threshold and then only include the top 20% of companies with buses having orders of magnitude greater short circuit duty. How can the inclusion criteria be modified to make sure that we capture the appropriate points of the system based on actual risk and impact to the BES? The current criteria is too inclusive and too generic - which impacts industry unnecessarily without getting the desired result. Thank You! Bottom line, IMO, the technical basis for this standard is flawed.

We suggest that the DMSDT further clarify the Applicability of the Functional Entities in 4.1 by including a statement in the Rationale Box for Functional Entities that when Responsible Entity is used in PRC-002-2, it specifically refers to those entities listed under 4.1. This is a slightly different approach than usually taken in Applicability. Some drafting teams have adopted a convention of hyphenating terms such as 30-, 60- and 90-calendar days. We suggest the DMSDT do the same. Similarly, '30-cycle post-trigger' should also be hyphenated. We also noted that in the redline, step-up transformer was hyphenated in some places and not others. However, in the clean copy of the standard it is not hyphenated. We believe it should be. We suggest modifying the first sentence of Requirement R8 such that it reads: 'Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage.' There are a couple of instances in the 3rd paragraph of the Rationale box for R11 where 10 days is used. We believe this should be 10-calendar days. We suggest the following replacement for the 2nd item under Step 7 of Attachment 1. 'If the list has 1 to 11 BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.'

In general, several requirements stacked into one can lead to missed activities/compliance issues, but we defer judgment on this to the NERC Standards Committee review and standards development guidelines.
Yes
We still believe the "Responsible Entity" should be consistent across the Interconnections. We recommend changing this to be the Reliability Coordinator for all Interconnections.
Xcel Energy engineers have conducted a test application of the selection criteria in Attachment 1, and have concerns that some locations are identified but provide little or no value (e.g. situations where fault recording is required for busses at both ends of a short line and one of the busses has only two sources (see diagram provided separately via email to the NERC SDT Coordinator for this standard)). We recommended an ‘exception’ written into the requirements with the Responsible Entity (or RC or Regional Entity) concurrence. In R5 – please clarify if the IROLs are those established by the TP, PC, or RC. (Also note that RC established IROLs may be in the operating horizon with little or no time for entities to actually install equipment). R12 should be reworded to state “...or develop and submit to the Regional Entity...” and end after “...(CAP).” R12 – is it inferred that entities can conduct maintenance on these devices (ie – out of service) as long as they meet the 90 day requirement? If so, consider making that clear.

Note that AECI agrees with the current PRC-002-2 R5.1.2 Bullet#1 wording related to Flowgates, and appreciates this SDT's being thoughtfully responsive to prior comments. FOR: PRC-002-2, R5.1.2, Bullet #5 REMOVE: “or relatively low Available Transfer Capability (ATC)” RATIONALE: AECI believes calculated ATC is based upon many complex factors that are somewhat subjective, primarily Market related, and therefore a technically weak indicator for locating where reliability-related DDR equipment should be located.
FOR: Appendix #1, Step 6, Paragraph 2 REPLACE: “buses with the highest” WITH: “bus with the highest” RATIONALE: Clarity – As this process step seems to yield one identified bus, presumed to fill the void of its successor bullet’s 10% minimum count, the use of “required at” in conjunction with “buses” is confusing. FOR: PRC-002-2, R5.2, Guidelines AECI believes the guideline for 5.2 should provide sample calculations for the number of DDRs required: 1) for an entity having 5999 MW Historical Load, and 2)for an entity having 6000 MW Historical load. While we believe the answer for 1) is only 1 DDR, and for 2) 2 DDRs per R5.2, the Webinar presenter mentioned some expectations for Rounding which introduced uncertainty that the above example could address.

(1) Requirement R11, subsections 11.3, 11.4 and 11.5 includes prescriptive details regarding data recording and reporting. The goal of the standards development process is to develop Results Based Standards. These items are completely administrative in nature and are not results based. An entity could make a typo in formatting or when naming a file and be non-compliant with the requirement. These requirements should be removed from the standard or relocated to reference documents as described below. (2) Requirement R11, subsections 11.4 and 11.5 reference IEEE standards and software formats which are not subject to the NERC procedures for standards development and are not under the purview of the legally authorized regulatory authority. Thus these sub-requirements have no valid standing in a NERC Reliability Standard. These items are more appropriate for a reference document. Inclusion in a reference document seems to provide a better location to document specific details on requested data and can provide a more effective mechanism for revising these details at a later date in regards to the data reporting. (3) Requirement R11, subsection 11.4 specifically references “IEEE C37.111-2013”. Some older DFRs that effectively capture the needed data may not meet this requirement for the 2013 software update. Software updates may not always be reasonably accomplished with equipment, service contracts or other factors. This specificity is administrative in nature and does not contributed to a results based standard. This version requirement should be revised to allow for any software versions that the entity has access to that supports the recording and report requirements.

ITC
Yes
Yes
ITC feels that the Requirement 10 specification of + 2 milliseconds of Coordinated Universal Time (UTC) is too restrictive for a number of industry wide installed modern microprocessor based relays. These relays have proven to be reliable from a protection, SER, and FR perspective. Additionally, the present PRC-018 standard indicates that a DME’s clock shall be synchronized within 2 ms. ITC agrees the PRC-018 synchronism requirement would be acceptable for SER device clocks but not data. It is recommend that the DMSDT consider changing the tolerance level for breaker status SER to be within 10 milliseconds. This would allow the continued use of these microprocessor based relays. This will be consistent with DMSDT guidance that microprocessor relays are acceptable implementations of SER and FR.

No
We agree that DDR data should be obtained for the transmission lines from generation plants as listed in requirement 5.1.2, but not that GOs are the parties that should collect this information. DME in general should be a topic for TOs and not GOs. TOs interpret and use DME data; GOs do not. TOs generally have wide-ranging arrays of DME, continuous recording/storage infrastructure, and experts in monitoring and maintaining such equipment; GOs do not. DDR data collected on the TO's side of the generation plant battery limits would be the same as that measured on the GO's side, so one could apply the same logic as is stated on p.33 of the standard for FR data, "For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection." Moreover, as regarding assignment of responsibility for monitoring disturbances, such events are more likely to originate in the transmission system (as was the case for the Northeast blackout of 2003) than in generation plants. The SDT emphasized in its discussion of 6/11/14 with the NAGF Standards Review Team that duplication of equipment is not mandated – a GO can contract with its TO to supply the data if the TO has DME at a plant or is willing to add such equipment. We are concerned that the SDT may not have considered the difficulty in negotiating such agreements for the provision of such data or the transfer of compliance responsibilities. A requirement in the standard that TOs must coordinate with generators to provide the data where they own DME at a generation plant would be preferable if GOs have any responsibility under the standard. The least-total-cost approach should be followed in obtaining the expected reliability benefits, and we believe that centralizing DME with TOs makes more sense than splitting the responsibilities between involved entities (TOs) and those who merely hand-over recordings (GOs) for further analysis. We recommend that the SDT perform a cost-benefit analysis of the two approaches before finalizing this standard.
See comments 3a-3c below. 3a. The Guidelines and Technical Basis Section of the standard states in the first paragraph on p.33 that, "SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data." The next section (Guideline for Requirement R2) states however that "Generator Owners are included in this requirement [for SER data] because a Generator Owner may, in some instances, own breakers connected to the Transmission Owner's bus." All generator output breakers connect eventually to the transmission system however, nor is it clear why the aforementioned lack of tripping time reliability for GO sequence-of-events monitoring would apparently apply in some cases (GO SER data mandatory) and not in others (GO SER data not required). 3b. The Guideline for Requirement R3 on p.33 states that "Generator step up transformers (GSU) are excluded from the above based on the following: - Current contribution from a generator in case of fault on the transmission system will be captured by FR data on the transmission system. - For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed. The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data." This seems to fully exclude GOs from fault recording obligations, so why are GOs obligated in R3 and R4 to have FR data? 3c. Comments 3a and 3b above gain emphasis from the circumstance that it is expected that the Guidelines and technical Basis Section of the draft standard will be deleted if and when PRC-002-2 is voted-in and approved by FERC. That is, the logic by which GOs are sometimes in and sometimes out will be even more obscure than it is now. 3d. The requirements for GOs to "have" SER (R2), FR (R3 and R4) and DDR (R7) data are understood to mean that they do not need to own this equipment, and it would do just as well to have an agreement with the TO to fulfill the PRC-002-2 requirements if and where the TO already has DME on their side of the generation plant fence. This point does not come across clearly in the present text of PRC-002-2. There should be a footnote saying that "This standard defines the 'what' of DDR, not the 'how.' GOs may install DME or, where

the TO already has suitable DDR, contract with the TO." It would be still better to just drop GOs from the picture, however, per our comments above.

We suggest that the DMSDT further clarify the Applicability of the Functional Entities in 4.1 by including a statement in the Rationale Box for Functional Entities that when Responsible Entity is used in PRC-002-2, it specifically refers to those entities listed under 4.1. This is a slightly different approach than usually taken in Applicability.
Some drafting teams have adopted a convention of hyphenating terms such as 30-, 60- and 90-calendar days. We suggest the DM SDT do the same. Similarly, '30-cycle post-trigger' should also be hyphenated. We also noted that in the redline, step-up transformer was hyphenated in some places and not others. However, in the clean copy of the standard it is not hyphenated. We believe it should be. In some places in the documentation three-phase is hyphenated and in others it is not. While we think it should be, we encourage the DM SDT to be consistent. 'Disturbance' is defined in the NERC Glossary and depending upon its usage should be capitalized. The DM SDT needs to be consistent with its format. In the 2nd line of M3, insert 'that' in between 'data' and 'is'. In the 3rd line of the 1st paragraph in the Rationale Box for R5, it would be appropriate to use BES rather than spelling out Bulk Electric System. Add a hyphen to 'high-' in the 3rd line of the Rationale Box for R7. This is consistent with usage throughout the rest of the documentation. We suggest modifying the first sentence of Requirement R8 such that it reads: 'Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage.' There are a couple of instances in the 3rd paragraph of the Rationale box for R11 where 10 days is used. We believe this should be 10-calendar days. Also, in the next to last line of the last paragraph 'disturbance recording' is capitalized. It is not a defined term in the NERC Glossary and shouldn't be capitalized. This change needs to be made throughout the documentation. In the 6th line of the Rationale Box for R12, 'entity' should not be capitalized. In the VSLs for R2, insert 'Owner' between 'Transmission' and 'or' for consistency throughout the VSLs for the other requirements. We suggest the following replacement for the 2nd item under Step 7 of Attachment 1. 'If the list has 1 to 11 BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three-phase short circuit MVA as determined in Step 3. Proceed to Step 9.' 'Disturbance monitoring' is capitalized in the Introduction of the Guidelines and Technical Basis Section. Since it is not a defined term in the NERC Glossary, it shouldn't be capitalized. Modify the next to last line of the 1st paragraph in the Guideline for Requirement R1 to read '…voltage and current for individual circuits allow precise reconstruction of events of both…' Change 'disturbance' to 'disturbances' in the next to last line of the 2nd paragraph. In Item 6 on Page 32 (clean version) of the same section, insert 'to those' between 'buses' and 'with'. In the 6th bullet under Item 8 on the same page, change 'Owners'' to 'Owner's'. Hyphenate 'in-effect' in the 1st line of the 2nd paragraph of the Guideline for Requirement R3. Modify the 1st line of the Voltage Recordings section on Page 34 (clean version) to read 'Voltages are to be recorded at applicable BES buses. Note that Requirement R3 calls for the…' Delete the 's' on 'meets' in the 2nd line of the 1st paragraph of the Guideline for Requirement R4. Change 'captured' in the 1st line on Page 35 to 'captures'. In the 2nd line of the same paragraph, set the phrase 'when time synchronized to a common clock' off with commas. Delete the last sentence of the 1st full paragraph on Page 36 (clean version). It is a duplicate. Insert an 'a' between 'after' and 'fault' in the 1st line of the 1st paragraph under Guideline for Requirement R6. Replace 'has' with 'with' in the 3rd line of the 1st full paragraph on Page 37 (clean version). Near the end of that same line, there appears to be an extra space between 'Bus,' and 'would'. Skip a line and hyphenate 'in-service'. Capitalize Real Power and Reactive Power here and in the last paragraph before Guideline for Requirement R7. Add a hyphen to 'high-' at the end of the 1st line under Guideline for Requirement R7. Hyphenate 'short-term' in the 2nd line of the 1st paragraph under Guideline for Requirement R9. In the 4th line of the 2nd paragraph, insert an 'a' between 'in' and 'sampled'. Capitalize 'Requirement R1' and 'Requirement R5' in the 3rd line of the 1st paragraph under Guideline for Requirement R11. Delete the 'a' in front

of ‘Day 1’ in the 6th line of the 3rd paragraph under Guideline for Requirement R11. Insert an ‘and’ and delete the ‘it’ in the 2nd and 3rd lines of the 2nd paragraph on Page 40 (clean version). That portion of the sentence should then read ‘...Transient Data Exchange and is well established in the industry.’ Split the 2nd sentence of the 3rd paragraph on Page 40 (clean version) into two sentences such that it reads ‘...Naming Time Sequence Data Files. The first version was approved in 2007.’ In the 4th line of the 3rd paragraph on Page 40 (clean version) replace ‘was’ with ‘were’. Hyphenate ‘out-of-service’ in the paragraph under Guideline for Requirement R12. Also, there appears to be an extra space between ‘develop’ and ‘a’ in the 10th line of the same paragraph.

Tacoma Power
Yes
Tacoma Power disagrees with the need for this standard. However, assuming that this standard will likely proceed to approval, Tacoma Power takes no exception to merging these requirements.
No
It is unclear what requirements for DDR data changed. The redlined version has only superficial changes to Parts 5.1 and 5.2. Tacoma Power has some concern about the fourth bullet under Part 5.1.2: “Interfaces between Balancing Authority Areas.” While this is only one guideline that the Responsible Entity should (not must) consider, it could potentially place disproportionate burden on entities with a relatively small Balancing Authority Area.
Tacoma Power disagrees with the need for this standard and believes there are more cost effective alternatives for acquiring the data necessary for event analysis. However, assuming that this standard will likely proceed to approval, we are providing both comments for improving the draft standard and an explanation for why we believe this standard is not the appropriate method to address the perceived needs. a. Under Measurement M3, change “...of FR data is...” to “...of FR data that is...” b. Under Measurement M11, change “...evidence (electronic or hard copy) data...” to “...evidence (electronic or hard copy) that data...” c. What if FR, SER, or DDR equipment is taken out of service for maintenance and/or testing. Could this result in an automatic violation of Requirement R11, Part 11.2? Or, should this be treated like a failure under Requirement R12? d. In Attachment 1, Step 7, for cases in which the list has 11 or fewer BES buses, change “...at the BES buses with...” to “...at the BES bus with...” e. Please confirm that only the channels that trigger need to be provided upon request and that no cross-triggering between FR or SER is required. f. Requirements R3 and R4 should require the capability to record data rather than requiring data. g. The VSLs for Requirement R10 should be based on the number of missed electrical quantities rather than the number of BES buses. Otherwise, please provide guidance on how a substation with several relays correctly time stamped but one relay with an incorrect time stamp should be treated. h. Requirement R10 should be modified to have SER timestamping to +/- 40 milliseconds while maintaining the FR and DDR timestamp of +/- 2 milliseconds for two reasons. First, the breaker position indication using 52a or 52b contacts can be different than the main contacts opening and ultimate current interruption by more than 2 cycles. Typical, 52a vs 52b contacts are at least ½ of a cycle apart. Timestamping the relay input to 2 milliseconds will not actually indicate the state of the power system. Second, SEL 300 series relays timestamp SERs to the nearest quarter cycle, so a large number of installed relays would not meet the requirements for SERs. These relays do timestamp the FR to the specified accuracy, just not the SER. Alteratives to this draft standard: The 2003 outage report outlined major deficiencies with event recording, but the data recording technology has dramatically changed in the last decade. Even though no standard was in place specifying data recording, utilities have been installing GPS time stamped event recording based on

business drivers. As outlined during the CEAP report, the labor for event report alignment was reduced from 4,400 person-hours for the 2003 outage to only a week for the 2011 southwest outage. Although further reductions in event analysis SME hours would result from this standard, the compliance SME hours would dramatically increase and result in overall higher costs. As outlined in the CEAP report, most utilities already have event recording in place, or are going toward recording as part of multifunctional equipment installations. Therefore, ignoring automated event collection, the only costs that should be considered are due to the increment burdens of documenting compliance with this standard. Instead of this standard, we believe that a NERC guidance document on event reporting best practice would be equally effective while requiring very little compliance burden. In other areas, NERC is moving away from standards that require zero defects in high volume tasks. This standard requires 100% accurate time stamping of 100% of a small portion of elements, but then ignores 80% of BES buses. On a voluntary basis, we have approximately 50% of elements monitored. Thus if we supplied only the event reports required by the standard, the coverage of our system would go down dramatically. In order to meet the zero defect policy of this standard, we will have to redirect efforts from actual event analysis to documentation of event recording capability. If data recording is implemented as a standard instead of a best practice guideline, it sets the minimum bar instead of the optimal goal. Most utilities already have at least a marginal level of recording capabilities. We would prefer NERC to aim higher. The best event records occur when all data channels at a substation are recorded for a trigger on any channel for any kind of transient, including frequency or overvoltage. This level of recording is impractical to require as a standard but is already in place for many utilities. For an enforceable standard, we agree that undervoltage & current are the only reasonable triggers to require. We are concerned that the SDT appears to have based installation cost assumptions on the premise of using data stored locally on relays. If this is an enforceable standard with a zero defect requirement, utilities are in essence forced to automated event collection from relays in order to guarantee zero defects. This automated event collection then brings in large costs for communications, and for applying CIP standards to those communications. If this were a best practices document, or allowed some data gaps, local relay storage would be a reasonable assumption.

John Brockhan
CenterPoint Energy Houston Electric, LLC
Yes
Yes
1) Regarding R2, CenterPoint Energy believes that breaker open/close operations obtained from the EMS system time-stamped based on RTU scan is adequate SER data for the initial stages of event analysis before detailed disturbance data is obtained from the FR and DDR data that is ultimately required for the actual event analysis. Therefore, CNP recommends removing SER data from R10. 2) Requirement R3 states "...shall have the following FR data to determine the following electrical quantities for each of the BES Elements they own connected to the BES Buses identified in Requirement R1:". CenterPoint Energy believes this language causes confusion with regard to "determining" phase-to-neutral voltages for each phase of each specified BES Bus as required by Part 3.1. The BES Bus voltage can be "determined" by measuring/recording each phase-to-neutral voltage of each line, or by measuring/recording each phase-to-neutral voltage of a smaller subset of lines connected to a BES Bus. The Guidelines and Technical Basis Section describe measuring voltages of "each" line. For entities that are using dedicated fault recording devices, channel capacity can be an issue. In some installations, voltages from 2 or more lines, i.e. a subset of the total number of lines connected to the BES Bus, can be recorded to provide adequate phase-to-neutral voltage FR data for system disturbances obviating the need to record each phase of each line at the recorder. CNP recommends that the DMSDT reconcile the Guidelines and Technical Basis Section language with the Part 3.1 language such that BES Bus voltages can be "determined" by measuring a number of line voltages based on engineering judgment.
Individual
Kayleigh Wilkerson
Lincoln Electric System

Per Attachment 1, Step 1 utilities are instructed to “Determine a complete list of BES buses that it owns.” A complete list of BES buses could include tap buses feeding radial load where there would be no BES circuit breakers or relaying and therefore no ability to gather the data pertinent to this standard. The SDT response to LES’ previous comments stated that, “If a tapped substation was not modeled in a system study as a bus then it would not be considered a bus.” If this is the drafting team’s intent, it should be clearly stated in Step 1 that tap buses with no BES breakers or relaying are not to be included. Doing so eliminates any possible confusion associated with whether a bus has been included in a system study. Whereas a Planning study model may not include these buses, a System Protection study model would in consideration that non-BES transformer relaying at the tap has to be coordinated with relaying at adjacent substations. R11.2 specifies “The recorded data will be retrievable for the period of 10 calendar days preceding a request.” For clarity, LES suggests restating R11.2 as follows: “The recorded data will be retrievable for the period of 10 calendar days following the date that the data was recorded.” Wording it this way ensures that the 10 calendar day timeframe starts on the day that the data was recorded. If left unchanged, the existing statement would tie the 10 day timeframe to the date of the request which makes the timeframe indefinite given the fact that the requesting entity has no time limit on when a request can be made.

(1) R 5.1.2. Still seems open ended for us. The following bullet points under this requirement give reasons for concern: • Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection • Interfaces between Balancing Authority Areas • Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC) DDR are applied for stability reasons, so thermal violations, and low ATC are not valid justification. (2) Depending on how our Planning Coordinator interprets these points, we could still be put upon to install an indeterminately large number of PMUs. This language *is* a step in the right direction from the previous draft of the standard, where "all permanent Flowgates" required DDR equipment, however, our preference would still be to delete R 5.1.2 from the standard. (3) If 5.1.2 is retained, please add a section 5.3 “The number of BES Elements need not exceed one per 1000 MW of its historical peak system Demand.” This provides sufficient coverage in the Responsible Entity’s area and encourages the RE to be ‘responsible’ in applying the 5.1.2 guidelines. (4) Some software vendors do not presently have the full capability as described in Requirement 11 implemented in their equipment or DME application software. This could require change out of the existing equipment. (5) Please clarify the 3rd paragraph of Rationale for R5 by adding ‘only one’ so its consistent with Guidelines and Technical Basis section page 36:’For “major transmission interfaces” with the exception of HVDC, the DDR data is to be captured for only one BES Element, and, is obtainable from one terminal (either end) of an Element.’ Also add: ‘If the BES Element has multiple owners, each TO and / or GO will need to agree which owner will have the DDR data, and the other owners can refer to this agreement as their means of meeting their obligations.’ (6) Please add ‘If the BES Element has multiple owners, each TO (and / or GO, as appropriate)will need to agree which owner will have the DDR data (or equipment, as appropriate), and the other owners can refer to this agreement as their means of meeting their obligations.’ In the rationales for R6, R7, R8, R9, R10, R11, and R12 to be consistent with R5 and cover tie line Elements. Similarly, M6 through M12, add the option that for BES Elements with multiple owners, the TO / GO can provide an agreement stating which owner is responsible for the DDR data. (7) The standard should include direction if agreement between entities cannot be reached i.e. “In cases where agreement between entities cannot be reached, the TO/GO that necessitates DM capability is ultimately responsible for the equipment and any /all requirements.”
The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

We agree with the merging of R2 into R1, but not the revised R5 which combined R6 and R7. Please see our comments under Q2, below.
No
Please clarify in R5 whether the first use of the term “BES Elements” is intended to be used here. It appears the intent is that the responsible entities notify all owners of the BES facilities connected to the BES Buses which they have identified. In that case, that term should be “BES Buses” or both BES Elements and BES Buses. We are concerned that the last bullet in Part 5.1.2 may be interpreted to include congestion as it relates to commercial/economic use of transmission interfaces. The term “significant Flowgates” should be limited to only physical/electrical constraints and not congestion that can be mitigated by market mechanisms. Part 5.1.4 needs to clarify whether BES Elements associated with the Interconnected Reliability Operating Limit should include only the monitored element or the contingent element or both. The Rationale for R5 should include the technical reason why the “Responsible Entity” is the applicable entity for identifying buses/elements for DDR events. As stated in the Background Information of the Comment Form, the SDT states the PC or RC has the overall view of the BES for DDR. This explanation should be included in the standard. R5 is also confusing in what is the requirement for BES Element owners which have been identified as needing DDR. We recommend the following changes to ensure the DDRs are applied on the proper BES Elements: “ Each Responsible Entity shall (i) identify BES Elements for which dynamic disturbance recording (DDR) data is required, (ii) notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements WILL require DDR data upon request of the Responsible Entity, and (iii) reevaluate the identified buses at least once every five calendar years. “ We are also concerned that this requirement envelopes 3 distinct and mutually exclusive requirements, each of which apply to distinct registered entities and each having different measures. This should be separated into three requirements which will also make the measures for VSL and VRF more applicable. The distinguishing of requirements for clarity in applicability and measurement should be included as an element of the “Quality Review” prior to industry comment posting. R5.1 – The BES Elements that require monitoring shall include the following… R5.2 – The BES Elements that require monitoring in each Responsible Entity’s area shall include a minimum of… R5.1.4 requires monitoring BES Elements associated with IROLs. The requirement should only apply to IROLs that are voltage or stability limited: “One or more BES Elements associated with IROLs that are based on voltage or stability performance.”
Attachment 2: acceptable states are OPEN or CLOSE but other terminology such as TRIP, TRIP TO LOCKOUT, RECLOSE, etc. is also commonly used. The format should allow for regional variations in terminology. Otherwise, it could become time consuming for TOs and GOs to provide the SER data.

Exelon Companies
No
Exelon does not agree with the SOE/FR requirements as written but not because of the merging of the R2 and R1 requirements. We believe that there needs to be a streamlined process for entities that are modernizing their system. The SOE and FR portions of this standard are very close to 100% burden to entities that are utilizing modern microprocessor relays connected to GPS clocks for T-lines on their system as a standard. The proposal does not account sufficiently for technical changes that have occurred over the last ten years. The Attachment 1 process is overly burdensome for entities modernizing their systems. An alternative to the attachment 1 process is for an entity to

identify that 40% of its BES transmission lines (transformers need not be monitored if lines are monitored) include FR and SER capability. This would be easy to demonstrate as these types of lists are readily available already. Additionally, we believe the reference to BES Elements / Busses needs clarification. We also object to the TO having the responsibility to notify others of their need to comply with a NERC standard, "notify other owners of BES Elements connected to those BES buses".
Yes
No Commnet
R1: See comments to question 1. R2: It is not necessary to monitor circuit breaker auxiliary contacts to figure out when a circuit breaker opened or closed. Loss of current can be monitored in a fault recorder. This requirement puts a high burden on identifying print #s to show circuit breaker auxiliary contacts are connected to relays with SER capability. This effort is just not necessary based on our experience investigating thousands of operations over the years. The drafting team should eliminate this requirement or modify it to clearly state that cessation of current can be used to determine when circuit breakers open. R3: T-lines are exposed to a much higher number of faults/operations than T-transformers. Thus, modernization of T-line protection provides the greatest increase to reliability by a large margin. Having modern relays on T-lines allows for deducing current in transformers if necessary. The drafting team should concentrate on lines rather than transformers as the industry is doing. The drafting team should remove transformers from R3 since this information can be deduced from line monitoring or change R3.2.1 to state Transformers… “only when sufficient line monitoring is not present to derive transformer quantities”. R4: No comment, previous changes made by the drafting team addressed our concerns. R5: No comment, previous changes made by the drafting team addressed our concerns. R6, R7, R8: No comment. R9: The drafting team should eliminate requirement 9.1 unless they are aware of a significant portion of the industry installing equipment that doesn’t meet this requirement. To our knowledge, the main manufacturers of this equipment all easily exceed this requirement. R10: The drafting team should eliminate the requirement of within +/- 2 msec of UTC unless they are aware of a significant portion of the industry installing equipment that doesn’t meet this requirement. To our knowledge, the main manufacturers of this equipment all easily exceed this requirement. R11: No comment. R12: We’re using microprocessor relays for FR and SOE capability. They are tested under PRC-005 and alarmed upon failure. We should not have to keep track of every relay that fails on the system that we fix or replace for this standard. We have plenty of incentive to keep our relays working already and we don’t run with failed relays for 90 days. Hence, there is no need for R12 and it should be eliminated. It is 100% burden, a complete waste of engineering resources, and hence a detriment to overall reliability. If the drafting team will not eliminate this requirement, it should be re-worded such that it is very clear that we do not need to keep track of failures that are rectified within 90 days. We should not have a compliance burden to prove that we fixed something in 2 days. An overall comment is that we believe this standard is not required for FR and SOE. These functions are built in to modern relays being adopted industry-wide already. All the requirements related to FR and SOE should be eliminated and the standard written to address DDR only. It is even arguable that this standard is required to promote DDR capability as the widespread use of synchrophasors including their storage has greatly expanded since 2003.

Yes
No
We agree with the revised DDR location criteria reducing the number of monitored BES Elements and appreciate the DMSDT efforts to address that issue. However we are still concerned about the potential for an unnecessarily excessive number of required DDR locations with regard to Flowgate applications. We believe the proposed minimum criterion of “One additional BES Element for each additional 3,000 MW of its historical peak system Demand.” does specify a reasonable lower threshold which provides adequate wide area coverage and also believe there should be a similarly defined upper threshold on the number of DDR Flowgate (or DDR total) locations required. Suggest DDR Flowgate location criteria be revised to specify no more than twice the adequate minimum number of locations as follows: “Stability related interfaces or other significant Flowgates in the

NERC Book of Flowgates for the Eastern Interconnection (prioritized by the Responsible Entity with area coverage considerations and with a total of no more than one BES Element per 1,500 MW of its historical peak system Demand),"
Entities with a significant number of DDRs and have DDRs which include installations where manual data retrieval is necessary should be allowed more than 30 days to collect, format, assemble and review data for submittal. Add provision for a data request submittal extension such as "R11.1 The recorded data will be provided within 30 calendar days of a request unless an extension is granted by the requesting authority."

R1 should have some explanation for what the implementation/installation deadlines are for newly identified BES buses as part of the 5 year review. R1 states "reevaluate the identified BES buses at least once every five calendar years", should this read "reevaluate all BES buses at least once every five calendar years"? It seems that new buses may be added and existing buses in the required locations for FR may get dropped down the list and become discretionary. R2 rational states "time stamped according to Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance." Since relays and FR recorders often use separate clocks consider changing "common clock" to "time synchronized clock". R7 states: "Each Generator Owner shall have DDR data for each BES Element it owns and is notified according to Requirement R5". Should this read "Each Generator Owner shall have DDR data for each BES Element it owns as notified according to Requirement R5" instead? It seems a bit confusing how to read this requirement. It could be read that the GO "shall have DDR data for each BES Element it owns". Consider if this requirement can be clarified or restated.
No
For R5 if the Responsible Entity is slow in notifying owners where DDR data is required does this force the owners to meet the same implementation deadlines or can they extend the deadlines by the same amount of time the RE was late in getting a notification out to the owners? I bring this up because the BES owners will not have any control over the RE schedules but could be subject to shorter implementation deadlines. In addition, since there is some open ended latitude in the ability of the Responsible Entity to identify locations for DDR it is possible that large number of locations could be identified to install DDR in some areas. If this were to occur would there be a possibility for the BES owners to request additional implementation time to become compliant? Consider if some clarification could be added. One option might be to have criteria in 5.1.2 less open ended without any latitude.
It appears, for example, GSU 13.8kV generator buses that exceed the 1500MVA fault current level should be in the bus fault list for FR evaluation. If this is correct they are often ungrounded systems. Can the FR voltages and currents be monitored on the high side of GSU or a tie transformer with a BES tertiary reactor? It seems unclear what currents would be required to monitor as there would not be any ground current at these types of locations/buses if the ungrounded low side must be monitored. R3 and R4 don't specifically mention GSU transformers, GSU low side buses or BES tertiary buses which tend to be ungrounded systems. Can the drafting team clarify that for tertiary or GSUs where the generator bus (for example 13.8kV) is identified in the list of fault buses that it

would be acceptable to monitor the voltages and currents on the high side of the GSU or tie transformer? If not, clarify that only the three 13.8 line to ground voltages or 13.8kV line to line voltages are required but not the currents or at least not the ground current. Note that the option of line to ground or line to line voltages is suggested above. Some ungrounded buses may not have line to ground voltages. This may be a concern for some utilities. It seems a bit odd the DDR would be allowed to be on the GSU high side yet still require FR data using the generator bus side voltages as the standard appears to read. R7 seems to address the high or low side requirements better for DDR but clarification for what is required for GSU and generator buses for FR would be helpful since they are often ungrounded systems. For R11 it states: “Each Transmission Owner and Generator Owner shall provide all SER, FR, and DDR data for the BES buses identified in Requirement R1 and BES Elements identified in Requirement R5 to the Reliability Coordinator”. Consider clarifying this wording since it appears to require DDR data is required for R1 to be provided to the RC. R10 also appears to have this concern as well. DDR data is not required by R1, but through the use of the word “and” in R10 and R11 it appears that DDR recording may be necessary on these buses. R12: Is the CAP required to be submitted to the RE or is it upon request similar to the records? This requirement seems like it would be difficult to audit since it would be tracking work on a utilities system. I wonder if the RE is prepared to monitor this information. If they do plan to monitor this is there any other process format or forms necessary or is it understood to be an informal case by case transmittal of CAP status?

Yes
We agree with the concept of the requirement, however, we suggest moving the methodology for selecting DDR locations described in 5.1 and 5.2 to an attachment and not include it within the text of the requirement itself (similar to the SER/FR bus selection methodology in Attachment 1 for R1).
1. R1 VSL – The percentage and time basis language in the first two parts of the VSLs are confusing: it’s unclear what the percentages are referring to and what time period the assessment is being measured to. Also, the term assess is not used in the requirement or Attachment 1. The third part of the VSL is clear. Suggestion to change VSL language for the first two parts to the following language across all severity levels in the table: “The Transmission Owner identified BES buses as directed by Attachment 1 for more than 80% but less than 100% of the BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement 1 but was late 30 calendar days or less for the once every five year requirement.” 2. R5 VSL – The percentage and time basis language in the first two parts of the VSLs are confusing: it’s unclear what the percentages are referring to and what time period the assessment is being measured to. Also, the term assess is not used in the requirement or Attachment 1. The third part of the VSL is clear. Suggestion to change VSL language for the first two parts to the following language across all severity levels in the table: “The Responsible Entity identified the BES Elements as directed by Requirement R5 for more than 80% but less than 100% of the BES Elements included in R5.1. OR The Responsible Entity evaluated the BES Elements as directed by Requirement 5 but was late 30 calendar days or less for the once every five year requirement.” 3. For R3.1 – Attachment 1 states that a ring bus or breaker-and-a-half bus are considered as a single bus. Will the SDT please clarify does this mean that in a ring or breaker-and-a-half substation, only one bus needs to monitored for R3.1? 4. For R11 – We suggest moving the language describing specific formatting requirements in R11.3 through R11.5 to the Guidelines and Technical Basis section of the standard as it is administrative in nature and not performance-based. 5. For R12 – Has the SDT discussed having the entity reporting FR/SER/DDR failures report to the Responsible Entity as well as the Regional Entity, so that the Responsible Entity can look at possible alternative methods to monitor the Elements identified per R5? There may be a reliability gap if the Responsible Entity is not notified due to no requirement for the GO or TO to do so. 6. R11 VSL - The Requirements refer to days and the VSL language refers to percentages. We

ask the SDT to confirm that the interpretation of R11 VSLs below is correct. If so, we suggest changing the VSL language to the language provided below. If not, please provide the correct interpretation and possibly revised language to help assure there aren't inconsistencies in compliance and enforcement application. Lower VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided more than 9 days but less than 10 days of the requested data. Moderate VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided more than 8 days but less than 9 days of the requested data. High VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided more than 7 days but less than 8 days of the requested data. Severe VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided less than 7 days of the requested data.

No
R1 does not meet NERC principles for world-class Standards, because it includes three separately audited control activities in a single sentence: (1) identify buses, (2) notify others of buses, (3) reassess every five years. If this draft Standard is deemed necessary, Seattle recommends rewriting R1 to include three subrequirements as follows: R1. Each Transmission Owner shall: R1.1 Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1. R1.2 Notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days that those BES Elements may require SER data and/or FR data. R1.3 Reevaluate the identified BES buses at least once every five calendar years. In addition, the draft Standard does not clarify required actions should the five-year reassessment identify a different selection of buses for which monitoring now would be required. Seattle suggests that an implementation period be identified for installing SER and FR equipment for newly identified buses similar to the implementation time for the initial implementation of the Standard. Likewise, the Standard does not clarify how newly constructed buses are handled. Seattle suggests that that they be evaluated at the next 5-year reassessment, rather than individually as they are brought on line.
No
As for R1, R5 does not NERC principles for world-class Standards, because it includes three separately audited control activities in a single sentence: (1) identify Elements, (2) notify others of Elements, (3) reassess every five years. If this draft Standard is deemed necessary, Seattle recommends revising the first paragraph of R5 to include three subrequirements as follows: R5. Each Responsible Entity shall: R5.1 Identify BES Elements for which dynamic disturbance recording (DDR) data is required R5.2.Notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements may require DDR data R5.3 Reevaluate the identified buses at least once every five calendar years. And then renumber the remainder of the requirements to conform: 5.4 The BES Elements shall include the following: 5.4.1 Generating… In addition, the draft Standard does not clarify required actions should the five-year reassessment identify a different selection of Elements for which monitoring is required. Seattle suggests that an implementation period be identified for installing DDR capabilities for newly identified Elements similar to the implementation time for the initial implementation of the Standard. Likewise, the Standard does not clarify how newly constructed buses are handled. Seattle suggests that that they be evaluated at the next 5-year reassessment, rather than individually as they are brought on line.
Seattle appreciates the efforts of the Drafting Team to respond to comments received following the initial posting of this draft Standard. However, Seattle fundamentally disagrees with the approach proposed by draft PRC-002 for several reasons. First, the proposed Standard requires an entity to establish at least 43 new controls to meet the compliance assessment approaches identified in the draft RSAW, and this figure does not consider the dozen or additional controls required to ensure all Attachment 1 steps are met. For context, consider that approximately 4-5000 controls are required to meet the entire body of NERC Standards. As such proposed PRC-002 represents a 1% increase in the overall compliance burden on the electricity enterprise. Entities will be required to monitor performance of minor activities, and auditors likewise will be required to examine performance. Seattle does not believe the reliability benefit offered by this Standard warrants this new compliance

burden. Indeed each requirement of PRC-002 is identified as “Lower” for violation risk factor (the lowest rating possible), indicating that the drafting team does not consider any requirement of the Standard to have a critical impact on BES reliability. Rather this Standard supports long-term operational improvements in the BES. Seattle believes such improvements are important and supports a reasonable approach to disturbance monitoring, but does not support the complex, over-engineered Standard. The bus screening process is an example of a process that needs to be simplified. The rational does not seem to be well thought out and is certainly not easy to explain and implement (worse than the FERC Order 754 exercise that industry recently participated in). The attached Excel spreadsheet and the directions for completing it are very cumbersome and inefficient--a lot like trying to fill-out a Federal Tax form. Instead of giving an entity the metrics to be achieved, this approach attempts to create a cookbook format where data needs to be entered in one part of the spreadsheet, and then subtracted out in another part of the spreadsheet. Seattle believe appropriate and reasonable a general requirement to have disturbance monitoring, but believes the technical requirements for data type, frequency of sampling, and so forth would be better handled in a criteria or guideline document. Once such requirements are codified as federal law it is cumbersome and lengthy process to change them, yet all are aware how fast technical change has occurred in the area of disturbance monitoring. Moving the technical requirements from the Standard to a guidance document likewise would significantly reduce the compliance burden associated with the draft. Finally, Seattle requests technical justification by established for continent-wide application of a 1500 fault MVA threshold. Once established in a Standard, a technical justification will be required for any change; as such technical justification should be provided beforehand to establish the value as correct and appropriate. This value may be correct and appropriate for the NPCC area, but has not been justified in other regions. It may well be correct and appropriate, but a justification has not yet been provided.

No
see question 3
While FMPA appreciates the efforts of the SDT to address many of the specific comments received, FMPA’s position remains that a standard is not justified for Disturbance Monitoring. We believe that Disturbance Monitoring is better addressed through guidelines than through a standard. The system has changed a lot over the last 10 years since the Northeast Blackout of 2003 and we can gain much more information now from microprocessor based relays and phasor measurement units (PMUs) prevalent throughout the system. The justification for this standard is primarily based on the decade old Blackout Report and does not take into account the changes in system equipment since then. This justification was highlighted by the SDT’s response to FMPA’s prior comment about a standard not needed. SDT Response: “(1) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:…” Additionally, it should be noted that in the Executive Summary of the Cost Effectiveness Analysis Process (CEAP) Pilot for this project, the following statement was made: “The majority of CEA respondents believed the standard’s potential immediate reliability benefits were minimal.” So, with this CEAP observation along with the low approval rating of 43.29%, there is clearly some significant stakeholder concern with the justification for this standard. In light of the Paragraph 81 Project, the industry is supporting reducing and consolidating the amount of requirements. This standard meets several Paragraph 81 Criteria used to identify requirements for retirement including B1 Administrative, B2 Data Collection/Data Retention, and B4 Reporting. There are 12 requirements and over 20 sub-requirements in the current PRC002-2 draft. The amount of detail is unnecessary and poses a serious compliance burden on registered entities. While we do not believe the standard is needed, we strongly recommend that if this project goes forward, that the drafting team revise this standard to two or three requirements. We point out that the NERC Rules of Procedure have a detailed section on Disturbance Response Procedures – Appendix 8. While we recognize that the SDT has limited latitude in eliminating a project or veering from the SAR, we suggest that the Standard Committee

revisit the justification for this standard and at a minimum review the scope and prescriptiveness of the detailed requirements in light of the Paragraph 81 guidelines.

Oncor Electric Delivery LLC
Yes
Oncor supports combining identification and notification into one requirement as done in the latest draft.
No
Oncor recommends an audit curtailment be added to the DDR requirement similar to what is used in Attachment 1 for the FR's and SER's.
General: It is understood the Rationale Boxes will be retained but relocated to the "Guidelines and Technical Basis Section" of the Standard. If the "Guidelines and Technical Basis Section" cannot be used as compliance validation to auditor(s), it is imperative the requirement language be paired to the alternatives specified in the Rationale language. Oncor identified several instances where the Rationale Boxes provided much needed clarity to the Requirement itself. Incorporating the Rationale/intent language into the Requirement or Measurement itself would further clarify the Requirements resulting in a clear and mutual understanding for both the Registered Entity and the auditor(s). Therefore, Oncor recommends the DMSTD review the Requirement/Measurement language and the corresponding Rationale language to ensure there are no gaps. Specifics are provided below: R2: Legacy FR equipment installed before the Standard effective date may not be capable of embedded SOER. R2 does not afford the same caveat for older equipment where SOER is required that R8 provides for older equipment where DDR is required. Language should be added to R2 providing the option to utilize FR digitals to monitor circuit breaker position for required circuit breaker position monitoring. R1 and R5: The Implementation Plan includes specific references to timeframes for becoming fully compliant with the locations lists after approval of the standard, but the Requirement language itself does not include post-implementation "5 year re-evaluation" compliance timelines for the required reassessments. "Re-evaluation time frame implementation" language should also be included in the affected Requirements to prevent any disparity following the initial implementation and departure from the Implementation Plan. R3 and R6: A Rationale should be added that the required "electrical quantities can be determined (calculated, derived, etc.)" to R3 and R6 as described below: • The R3 Rationale explains the method of deriving electrical quantities. The language of R3.1 does not reflect the intent described in the Rationale. Specifically, whether locations where busses are effectively tied together, such as on ring or breaker-and-half bus configurations, can derive the required phase-to-neutral voltages by monitoring a minimum of two of each Phase-to-Neutral voltages, from either line terminal or bus potentials. In a typical large switching station, this could eliminate costly retrofits to literally provide all three phase-neutral voltages for "each line or bus." • The language of R6.3 does not specify the method used to provide "Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required." If a single phase voltage and current are collected for R6, is it acceptable to calculate power flows expressed on a 3 phase basis derived from single phase quantities? Allowing calculated power flow would prevent costly retrofits to literally provide 6 dedicated analog traces for each Element required to have a DDR. R10: The "Rationale for R10" language, "Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset." Hence, requested records must be supplied in UTC format, but the collected and stored format do not. Similar to the "R3 and R6" comments above, the Requirement 10 and/or M10 should incorporate the same language for both the Registered Entity and the auditor(s) clear understanding. R10: Additionally, the "Rationale for R10" language should provide a caveat to allow for manipulating event records to UTC for equipment that is synchronized but cannot time-stamp with UTC as the reference. This would be similar to the "or derived" language suggestions to Requirements R3 and R6 which would allow for legacy equipment to meet the standard as well as allow for the time-alignment for multiple FR/SOERs as M11 evidence. Similar to the "R3 and R6" comments above, the Requirement 10 and/or M10 should incorporate the same language for both the Registered Entity and the auditor(s) clear understanding. R11: (Requirement 11.4) If relays meet the requirement of a DDR, the language of R11.1 or M11 should specify that synchrophasor data is acceptable for DDR

analysis. Relay Synchrophasor data is not compatible with the legacy COMTRADE format. R11: (Requirement 11.5) Additionally, add "Rationale for R11" language, "Collected and stored data does not need to follow the "C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME)" file naming format. The data provided pursuant to a data request must be provided in the C37.232 file naming format. Similar to the "R3 and R6" comments above, the Requirement 11.5 and/or M11 should incorporate the same language for both the Registered Entity and the auditor(s) clear understanding.

No
We concur with the SDT's observation and rationale that "the requirement for DDR data for identified BES Elements…is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis." We feel that industry is not only capable of identifying the number of devices from this experience, but also where these devices should be located for dynamic disturbance recording, sequence of events recording, and fault recording purposes. We believe this standard should require an entity to generate its own methodology to make these determinations and how often. We feel the method proposed for selecting BES Elements is too broad and could be subject to interpretation from auditors when not properly followed. We also have concerns that the SDT has not identified a transition period in the standard when a Reliability Entity identifies or receives notification that they are then required to install a recording device. The only transition period the SDT has accounted for is what the SDT listed in the implementation plan and based on the effective date of the standard.
No
We disagree with the identification of BES Elements and the minimum BES Element criteria identified by the SDT. We feel that industry is capable of identifying the number of dynamic disturbance recording devices, "based upon [its] experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis." We believe this standard should require an entity to generate its own methodology to make these determinations and how often.
(1) We applaud the SDT's decision to remove the standard-only definitions provided in the previous draft revision. We also approve of the SDT's step to reduce the overall number of requirements listed in this standard. (2) However, we disagree with the SDT's claim that this standard addresses the "what" of data collected and not the "how" the data is collected. The costs of installing new equipment for the purposes of disturbance monitoring could be significant for some of our members. Moreover, industry has already benefitted from the DOE grants to install PMUs and would continue to benefit from these types of financial incentives for continual situational awareness. In its Consideration of Comments posted May 9, 2014, the SDT rebutted our previous submitted comments with references to the 2003 Blackout in the Northeast. However, it was through these financial incentives, that sufficient data was available to construct the sequence of events and other post-event analysis of disturbances for the September 8, 2011 Arizona-South California Outages. As stated within the resulting FERC-NERC Arizona-South California Outages of September 8, 2011 report generated in 2012, "PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP)." Moreover, the resulting report identified that no additional standards were necessary because of this event. We suggest NERC should develop a Reliability Guideline on this topic instead of a standard, as we do not see the cost benefit or justification to allocate resources for an issue that is not a high priority for reliability, such as cyber security. (3) We continue to have concerns that the SDT has not identified a transition period in the standard when a Reliability Entity identifies or receives notification that they are then required to install a recording device. The only transition period the SDT has accounted for is what the SDT listed in the Implementation Plan and based on the effective date of the standard. (4) We disagree with the previous response to our comments from the SDT, as cited in its Consideration of Comments posted May 9, that "to facilitate expeditious and reliable data capture, it is necessary to stipulate the data formats necessary for efficient data analysis". We feel the SDT could incorporate such stipulation in a separate technical specification or even included as reference within the standard. We feel the technical specifications listed in Requirements R8, R9, R10, and R11 would further strengthen this case, and not subject registered entities to possible

violations for every part of these requirements. We feel that technology has significantly improved since the 2003 Northeast Blackout, as manufacturers and industry have supported the need to align such devices on a common frame of time and develop related industry standards accordingly. The SDT even supports this later claim by directly referencing these standards in the text of this proposed NERC standard (see Requirement R11.4). (5) We believe numerous requirements of this Standards fall under Paragraph 81 Criteria B, and are thus unnecessary. We previously alerted the SDT to this observation and reference portions of its response, listed in its Consideration of Comments posted May 9, here. We concur with the SDT that “Disturbance Monitoring recording is necessary to ensure the reliability of the BES by providing the data for a post event analysis that can determine if system improvements are necessary to ensure reliability [and] guide real-time operating decisions.” However, we disagree that these “supportive requirements are necessary” and feel that the SDT should take some initiative. For reference, we re-list our observations below. (6) We feel Requirement R11 is arbitrary and could be subject to interpretation from auditors due to Paragraph 81 criteria. TOs and GOs could be required to prove the negative, and demonstrate that they have not received a request to provide device data to their RCs, Regional Entities, and NERC. Furthermore, this requirement meets several Paragraph 81 criteria including B1 Administrative, B2 Data Collection/Data Retention, and B4 Reporting. This requirement is administrative because it compels data formats that are immaterial to reliability with the sole purpose to simplify data collection and communication. It meets the data collection/data retention criterion because the requirement is about collecting data. It also meets the reporting criterion because it compels data reporting. We recommend the SDT should remove this requirement in its entirety. It would be more appropriate to include these specifications in a guideline. Furthermore, we feel portions of requirements R1 and R5 are “Periodic Updates” due to the need to reassess each list of affected BES Elements every five calendar years. Likewise, we feel requirements R1, R5, and R11 are “Administrative” due to the need to collect, organize, format, and then circulate data and communications sent to identified entities within a specific timeframe. We feel that several other requirements could be “Data Collection” in nature. Requirements R4.1, R4.2 require the collection of data according to specifications outlined for the minimum recording rate and data duration. Requirements R8.1 and R8.2 require the collection of data according to specifications outlined for the trigger record lengths and trigger settings. Likewise, Requirements R9.1 and R9.2 require the collection of data according to specifications outlined for input sampling rate and output recording rate. Requirement R10 requires the collection of data according to specifications outlined for time synchronization. Finally, we feel Requirement R12 is “Administrative” and “Documentation” in nature based on the need to circulate the discovery of device failure within a specific timeframe and provide a Corrective Action Plan to the Regional Entity if repair is outside this timeframe. (7) Thank you for the opportunity to comment.

Anthony Jablonski
ReliabilityFirst
ReliabilityFirst has the following comments for consideration: 1. Requirement R6, Part 6.1.3.2 - For Requirement R6, Part 6.1.3.2 if plant that has six 200 MVA units, does this plant require any DDRs? As currently written, ReliabilityFirst believes no DDRs are required at this facility. From a monitoring perspective, ReliabilityFirst believes any plant/facility that has an aggregate nameplate greater than 1000 MVA, should have equipment capable of DDR. 2. Requirement R12, Part 6.1.3.2 - ReliabilityFirst does not understand the reasoning behind requiring the submission of the timeline for restoration and a Corrective Action Plan (CAP) to the Regional Entity. Without a requirement for the applicable entity to “implement” the CAP, the Regional Entities will have little recourse and there is little value in having the CAP if there is no requirement to complete it. Theoretically, the CAP could go on in perpetuity without completion and the entity would still be compliant, but the problem would remain unresolved. Furthermore, if the requirement requiring the applicable entity to “implement” the CAP, the Regional Entities can monitor implementation through a Regional Entity monitoring method. ReliabilityFirst recommends removing the “for submission to the Regional Entity” language and include implementation language as follows: i. “…restore the recording capability or develop a timeline with milestones for completion for restoration and implement a Corrective Action Plan (CAP).” 3. VSL for Requirement R2 - ReliabilityFirst believes the gradation of

VSLs should be in 10% increments (or similar to the VSL designations for Requirement R1). As written, if an entity only had 51% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers they would only fall under the moderate VSL. ReliabilityFirst believes missing close to half of the total SER data is completely missing the intent of the requirement and should be designated as a “Severe” VSL. ReliabilityFirst has a similar comment for the VSLs associated with requirements R3, R4, R6, R7, R8 and R9.

When a relay is used to capture FR data rather than a digital fault recorder, Requirement R4.1 would necessitate a relay record length of at least 32 cycles under R4.1-bullet 1 or multiple triggers under R4.1-bullet 2. Our wide variety of relay types support records of 15, 30, 60, or 180 cycles. Current practice and preference is to use a record length of 30 cycles, trigger inclusive, which was chosen to balance the amount of information in a single record while still providing the capability in the relay to save multiple records. The 32 cycle requirement would force the use of 60 cycle event records. While many of our relays are capable of this, the practice may lead to missed event records impacting our ability to search for misoperations under PRC-004. Multiple triggering has already caused events to be missed in our system due to the limited capability of some legacy relays. A change to a record length of 30 cycles including the 2 cycles of pre-fault trigger would fit within our current practice which mitigates our capture problems.

Ingleside Cogeneration LP
Yes
Ingleside Cogeneration LP (“ICLP”) agrees that there was no reason to keep two sets of requirements for Transmission Owners, Planning Coordinators, and Reliability Coordinators to identify DME locations, and then notify other equipment owners accordingly. The merger of the two sets of requirements makes sense to us.
No
ICLP holds to its position that the 1500 MW criteria established in CIP Version 5 for Medium-Impact generation plants is also appropriate for the placement of Dynamic Disturbance Recorders. In our view, the survey that was performed by NERC when the cyber asset bright-line criteria was developed resulted in a reasonable balance between cost and reliability benefit. There has been no corresponding justification provided under Project 2007-11 that would indicate that the 1000 MW threshold is more appropriate.
ICLP has been closely following the distribution of the Cost Effectiveness Analysis Process (CEAP) survey and its results. We agree with the general findings that the existing base of Disturbance Recorders are mostly sufficient to meet PRC-002-2’s locating and capability requirements – and that the reliability benefit of adding more equipment is minimal. However, it seems to us that NERC’s and the Regional Entities’ data analysis teams feel that the information provided in the evaluation of recent events is still lacking. This conflicts with the equipment owner’s opinions and should be reconciled. Unfortunately, the only justification seems to be that the 2003 investigation recommended the action and FERC directed it be done. This is not a minor point. The benefits of reliability oversight at the national level may be the most difficult to assess, but are the most important. Every dollar spent on compliance needs to be properly allocated, otherwise it will go to less important initiatives. As such, ICLP urges that another CEAP survey be performed – but this

time by the ERO community. Any perceived value should be quantifiable, so that it may be compared to the costs we all take on.

The preparation and accuracy of the redlined version and this unofficial comment form is lacking and promotes confusion. The redlined version does not effectively show many of the numerous redlined changes from the last posting, including nearly all of R5. The comment form description of the changes to the implementation plan does not agree with the standard. From above description of changes: "The schedule for implementation is now to be at least 50% compliant within three (3) years following notification of the list, and 100% compliant within five (5) years following notification of the list. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within five (5) years following notification of the list." From the actual standard posted for comment: Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be fully compliant within four (4) years of the Effective Date. Page 11, Requirement 5 states "Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder recording (DDR) data is required, …" While page 5 (blue explanation box& Mapping document) still states "Rationale for Functional Entities: The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.
Individual
David Kiguel

Yes
No
1. R5 is unclear as to whether the responsible entity needs to identify BES buses or BES Elements on which dynamic disturbance recording data would be required. 2. Part 5.1.4: It is not clear whether or not the BES Element associated with an IROL is the monitored element or the contingent element, or both. 3. The standard should not specify a number of BES elements (minimum or otherwise) for which DDR data is required. The number of Elements must be determined as those necessary to capture the necessary data to permit the complete study of key events in the BES and should not be pre-determined in the standard.

(1) Duke Energy cannot envision the reliability benefit of including relatively low ATC as a consideration for the placement of DDR equipment in bullet 5 of R5.1.2. Duke Energy suggests the following revision: “5.1.2 Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines: • Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection, or • Transfer Paths in the Western Interconnection Path Rating Catalog, or • Voltage stability limited transfer paths or load serving area, or • Interfaces between Balancing Authority Areas, or • Areas of significant congestion or thermal violation history” If an entity is calculating ATC reliably, there should not be an area of significant congestion or thermal violation history due to the inherent margins (TRM, CBM, etc.) that are built into the ATC calculation. In addition, the ATC consideration is redundant to the previous items in the same bullet.

No
PJM signed onto the SRC’s response to this question.
PJM urges the drafting team to reconsider including some type of alternative method for determination of the BES buses requiring sequence of events recording and fault recording as stated in the BES detailed methodology included in R1 and detailed in Attachment 1 of the standard. PJM suggested an alternative method that would be less burdensome for entities working on installation of or already have installed modern equipment with FR and SOER capabilities on their circuits. PJM appreciates the drafting team’s consideration of our proposed alternative method and understands that it is not included in the draft standard presently posted. PJM feels strongly regarding inclusion of some type of alternative method and therefore will be submitting a negative ballot for the draft standard.

City of Austin dba Austin Energy (AE) agrees with the idea of streamlining requirements; however, as noted below in the general comments section (question 3), AE does not agree with this standard as a whole.
No
City of Austin dba Austin Energy (AE), as noted below in the general comments section, does not agree with this standard as a whole. However, AE would like to point out a few clean-up items to Requirement R5. (1) R5 includes the phrase “notify other owners of BES Elements connected to those BES buses”. “[T]hose BES buses” implies reference back to BES buses cited previously in the requirement, but they do not exist. R5 requires the Responsible Entity to identify BES Elements not BES buses. The simple fix is to strike “connected to those BES buses.” (2) AE believes R5 Part 5.2.2 would read better if the SDT changed the phrase "for each additional 3,000 MW” to “for every 3,000 MW.” Otherwise, the Responsible Entity is left asking “in addition to what?”
City of Austin dba Austin Energy (AE) does not agree with this standard as a whole. AE believes it is too prescriptive and unnecessary in the ERCOT region. Regional requirements for ERCOT regarding disturbance monitoring equipment exist in the ERCOT Nodal Operating Guides, Section 6.1. (http://www.ercot.com/mktrules/guides/noperating/cur). Existing requirements provide sufficient data for disturbance monitoring.

No
The Bureau of Reclamation suggests that the phrase “may require” in R1 and R5 should be changed to “require.” Once an element is identified as requiring data in R1 or R5, R2–R4 and R6–R10 require data collection without exception, so the phrase “may require” could create confusion.

a. Requirement R11, subsections 11.3, 11.4, and 11.5 do NOT have any impact on the reliability of the system. They are, in fact, entirely administrative in nature. The Results Based Standard template does not support including a requirement of these types. Efforts have been made to remove administrative-type requirements from standards. In this case, a simple mistake in formatting or when naming a file would result in non-compliance with the requirements. b. The GO requirement responsibility should be limited to making available signal sources to the adjoining TO's for the specified list of signals of interest at generating stations. In most cases the TO already owns DM equipment while the GO does not. c. We remained concerned about the cost of the needed equipment where it does already exist; but, we thank the SDT for stretching out the implementation plan which will allow the cost to be allocated over a longer period of time.

BPA does not believe this Standard should require the Transmission Owner (TO) to notify other owners of BES equipment of their compliance responsibility. BPA also believes that other TOs (in order to determine their own compliance responsibility) should use the same fault MVA data to determine busses to which they have elements connected. BPA feels this requirement, as written, places an undue compliance risk on TOs.
No
BPA feels checks and balances need to be included to ensure Responsible Entities get concurrence from affected TOs/GOs that dynamic disturbance recording (DDR) data is needed at a given location. Additionally, an IROL is defined as in the Long-Term Planning Horizon, not in the operating horizon. BPA also believes R 5.1.5 needs clarification regarding the criteria for “major voltage sensitive area,” — which is related to UVLS (for example, as represented by a metro area of 10 million people / 3000 MW). Otherwise, an isolated radial issue that doesn't impact the Interconnection may be erroneously specified.
BPA does not believe the Cost Effective Analysis Process (CEAP) uses an appropriate comparison example, without clarifying between the 2003 Interconnection wide-area, numerous-state blackout and the 2011 local-area, three-state blackout within an Interconnection, as the 2011 event would naturally take less time and data. BPA does agree, however, with the synchrophasor (PMU) data-speed impact.

Requirement R5 has the Responsible Entity (WECC RC) determining the location of Dynamic Disturbance Recorders (DDR) based on the Western Interconnection Path Rating Catalog or interfaces between Balancing Authorities (BA). WECC has never provided reasoning or justification behind the paths and the selection of the facilities included in the paths. Also the BA does not own or operate any facilities. The more appropriate entity would be the Transmission Operator to determine the interfaces in the BES.

Main issue is that “Areas of significant congestion, thermal violation history, or relatively low ATC” is very vague.
First issue is that we find the methodology for determining which BES busses may require SER or FR data to be overly complicated and difficult to follow. If the methodology is going to be this complicated, then perhaps the Planning Coordinator or Reliability Coordinator is best suited to perform this analysis so that Transmission Owners do not fall out of compliance for failing to understand an overly complicated spreadsheet with more than 17 steps to determine which busses require this equipment. The second issue is with the requirement of time synchronizing SER data to within +/- 2 milliseconds. While the intent of the standard appears to be to allow many modern existing relays that sample waveforms at 16 samples/cycle, have SER capabilities, and can synchronize to a GPS clock within less than 1 millisecond, this requirement will actually prohibit many of the relays because of the SER requirement. For example, a widely used SEL-311C relay can have its clocked synced to within 1 microsecond, the SER is only time-stamped once every quarter cycle, which is the processing interval of the processor. This means that the SER can only be accurate to within +/- 5 milliseconds. We think this may not be realized by the drafting team and/or many stakeholders. Additionally, we believe that the +/- 5 millisecond accuracy should be more than accurate enough if only a breaker status is required by SER. Two things to note: 1) the breaker 52a or 52b contact that would be input into the DFR device is a mechanical moving device that in and of itself may not be that accurate in regards to an actual indication as to whether the breaker is open or closed. These contacts can often be adjusted as to when they make and occasionally are even wrong in regards to status. 2) Each breaker requiring SER is in many cases already being monitored for currents that give a change of status as to the breaker being open or closed.
Individual

Liberty Electric Power, LLC
Generator owners should not be required to install DME. Generators do not model the BES, have no overall awareness of the state of the BES, and are not monitoring the overall state of the BES. The requirement should be, at most, to provide a signal showing breaker position to the TO. Requirements for GOs to provide equipment are properly the realm of the interconnection agreement, not a NERC standard, and the SDT is intruding on the contractual relationship between REs.

D Mason
HHWP

Attachment 1, Step 7 states: "If the list has 11 or fewer BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9." It seems that word "buses" in this sentence should be changed to "bus".

Consideration of Comments

Project 2007-11 Disturbance Monitoring

The Disturbance Monitoring Drafting Team thanks all commenters who submitted comments on the Standard Authorization Request (SAR). These standards were posted for a 45-day public comment period from May 9, 2014 through June 23, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 67 sets of comments, including comments from approximately 173 different people from approximately 111 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net . In addition, there is a NERC Reliability Standards Appeals Process.[1]

Overall Summary Consideration:

While most stakeholders agreed with the merging of the notification requirement of Requirement R2 into Requirement R1, many have voiced their concerns for various technical hurdles in adhering to the specific methodology prescribed in Attachment 1. However, it is crucial to remember the primary intent of the requirements is that the standard is designed to address "what" data is needed, not "how" it is captured. Further, industry experts continue to emphasize that "why" an event occurred is equally, if not more, valuable than "what" happened. In this sense, as long as the quantities (data) can be determined, the intent of the requirements are satisfied.

Many stakeholders were unhappy with the bulleted list in Requirement R5, Part 5.1.2, either with a single bullet or with the list altogether. The standard drafting team revised Requirement R5, Part, 5.1.2 and removed the bulleted list of "or" statements, replacing it with "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."

In Requirement R5, the use of "BES buses" was found to be confusing by many stakeholders. The use of this language was simply to provide clarity but, in response to industry's comments, the drafting team revised R5 by removing "BES buses". The Requirement now references only BES Elements.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

A number of stakeholders voiced their concerns for more precise wording of the Step 7 in Attachment 1 which stated "If the list has 11 or fewer BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA." The ambiguity arose out of the term "buses" because it could be read as requiring FR and SER data from more than one bus. Thus, Step 7 is now revised to read "If the list has 1 or more but less than or equal to 11 BES buses: FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA."

Several stakeholders also commented that Requirement R11 had no substantial impact on improving the reliability of the system. The DMSDT notes that the Requirement R11 ensures data availability from the data sources, timely retrievability of the data and common format so that the data can be read and used in the expeditious and effective analysis of events. Requirement R11 provides a reliability impact by integrating all of the previous requirements in the standard with respect to data reporting facilitate event analysis. The first two Parts of Requirement R11 specify how long an entity has to provide requested data (Part 11.1) and also limits how long data must be retained by the TO or GO (Part 11.2). Parts 11.3-11.5 ensure the uniformity and consistency of the data that is reported.

One technical change many stakeholders proposed was to revise Requirement R10 to relate to time synchronization of the device clock rather than data. The Requirement's original language called for time synchronization of SER data within +/- 2 milliseconds. Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices are within ± 2 ms accuracy will suffice with respect to providing time synchronized data. The drafting team revised Requirement R10 accordingly.

Based on stakeholder feedback, the DMSDT capitalized the defined terms System, Transmission and Disturbance. The DMSDT believes that this adds clarity regarding the requirements and rationales in PRC-002-2. In some instances, these terms appear adjacent to each other within sentences of Requirements, Rationales or Guidelines. The following instances occur:

- Transmission System
- System Disturbance
- System Demand

The DMSDT has also incorporated the defined term "Transmission Line". The DMSDT does not intend to create any new defined terms by the above uses. Each defined term stands on its own.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. **The DMSDT merged the notification requirement of Requirement R2 into Requirement R1. The DMSDT also merged the notification requirement of Requirement R7 into Requirement R6 (new R5). Do you support these new requirements? If not, please explain why and provide suggested changes.**

Summary Consideration: While most stakeholders agreed with the merging of the notification requirement of Requirement R2 into Requirement R1, many have voiced their concerns for various technical hurdles in adhering to the specific methodology prescribed in Attachment 1. However, it is crucial to remember that the primary intent of the standard's requirements is that they are designed to capture "what" data is recorded, not "how" it is recorded. Further, industry experts continue to emphasize that "why" an event occurred is equally, if not more valuable than "what" happened. In this sense, as long as the quantities (data) can be recorded or determined, the intent of the requirements are satisfied.

Organization	Yes or No	Question 1 Comment
Peak Reliability	No	The initial list of locations should come from the owners (TOs and GOs) with a subsequent review process as identified by the Responsible Entity. The Responsible Entity should have the authority to require additions as it sees necessary. Owners should provide the initial list because they have access to the information and would bear the cost of installing DDRs.
Response: FR and SER locations are determined by the Transmission Owners. The DMSDT has assigned the responsibility for DDR data locations to the Responsible Entity (Peak Reliability in WECC) because DDR data is reflective of a wide area System response and it is appropriate for the Responsible Entity to identify what BES Elements data is needed for. It is the responsibility of the RC in WECC to develop the list, but development of the DDR list can be done collaboratively through WECC committees. An initial list has already been prepared by WECC JSIS, whose members are primarily operating entities. The Responsible Entity can add or remove locations from this list per Requirement R5 for DDR data. The DMSDT considered FR and SER data as primarily localized information, with the TO being better suited to make the selections.		
ISO RTO Council Standards Review Committee	No	We agree with the merging of R2 into R1, but not the revised R5 which combined R6 and R7. Please see our comments under Q2, below.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. Please see the DMSDT response to your comments to Question 2.		
Seattle City Light	No	R1 does not meet NERC principles for world-class Standards, because it includes three separately audited control activities in a single sentence: (1) identify buses, (2) notify others of buses, (3) reassess every five years. If this draft Standard is deemed necessary, Seattle recommends rewriting R1 to include three subrequirements as follows: R1. Each Transmission Owner shall: R1.1 Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1. R1.2 Notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days that those BES Elements may require SER data and/or FR data. R1.3 Reevaluate the identified BES buses at least once every five calendar years. In addition, the draft Standard does not clarify required actions should the five-year reassessment identify a different selection of buses for which monitoring now would be required. Seattle suggests that an implementation period be identified for installing SER and FR equipment for newly identified buses similar to the implementation time for the initial implementation of the Standard. Likewise, the Standard does not clarify how newly constructed buses are handled. Seattle suggests that that they be evaluated at the next 5-year reassessment, rather than individually as they are brought on line.
Response: The Drafting Team has revised Requirement R1 as per your comments. **The Implementation Plan addresses data recording capability for newly-identified buses and BES Elements--"Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list." This language was added to Part 1.3 of the revised Requirement R1 in the standard for clarity. The Rationale Boxes for Requirements R1 and R5 explain the reevaluation interval: newly identified BES buses and BES Elements are identified at the five-year reassessment. The implementation of the reassessed list will be as per the Implementation Plan.**		

Organization	Yes or No	Question 1 Comment
As the standard is written, newly constructed BES buses or Elements are handled via the reevaluation of the identified BES buses, not individually as they are brought online.		
Florida Municipal Power Agency	No	see question 3
Response: Thank you for your comment. Please see the DMSDT responses to your comments under Question 3.		
ACES Standards Collaborators	No	We concur with the SDT's observation and rationale that "the requirement for DDR data for identified BES Elements...is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis." We feel that industry is not only capable of identifying the number of devices from this experience, but also where these devices should be located for dynamic disturbance recording, sequence of events recording, and fault recording purposes. We believe this standard should require an entity to generate its own methodology to make these determinations and how often. We feel the method proposed for selecting BES Elements is too broad and could be subject to interpretation from auditors when not properly followed. We also have concerns that the SDT has not identified a transition period in the standard when a Reliability Entity identifies or receives notification that they are then required to install a recording device. The only transition period the SDT has accounted for is what the SDT listed in the implementation plan and based on the effective date of the standard.
Response: The Standard Drafting Team, after extensive outreach to industry experts related to event analysis and Disturbance Monitoring, identified BES Elements that, if covered by disturbance recording, would significantly contribute to effective, efficient and accurate analysis. Industry experts continue to highlight that "why" an event occurred is equally valuable, if not more valuable, than "what" happened. Even with the proliferation of DDR, defining critical BES Elements requiring monitoring ensures adequate data is available for event analysis purposes. The DMSDT has outlined these BES Elements in Requirement R5, selecting		

Organization	Yes or No	Question 1 Comment
the minimum set of Elements necessary for this analysis. Allowing entities to develop their own methodology could lead to inconsistency and uncertainty in capturing the data necessary for event analysis purposes. **It must be emphasized that an entity will not be notified that it has to install recording devices. An entity will only be notified that it has to have the data for what it has been notified for. The Responsible Entity develops a list of BES Elements for which DDR data is required. That list is provided to the TOs and GOs of their respectively owned Elements. The TOs and GOs are then required to provide that DDR monitoring capability, as per the Implementation Plan. The Implementation Plan regarding the TOs and GOs required to provide DDR monitoring capability, states:** **"Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:** **• Entities shall be at least 50 percent compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.** **• Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.** **Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list."** **This addresses the transition period for the TOs and GOs to implement necessary monitoring for both the initial list developed and subsequent reassessments. The DMSDT also revised Requirement R1 to clarify the implementation of the reevaluated list.** **"1.3. Reevaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan."**		
Bureau of Reclamation	No	The Bureau of Reclamation suggests that the phrase "may require" in R1 and R5 should be changed to "require." Once an element is identified as requiring data in R1 or R5, R2-R4 and R6-R10 require data collection without exception, so the phrase "may require" could create confusion.
Response: The wording in Requirements R1 and R5 was revised, and "may" was removed from the requirement.		
Bonneville Power Administration	No	BPA does not believe this Standard should require the Transmission Owner (TO) to notify other owners of BES equipment of their compliance

Organization	Yes or No	Question 1 Comment
		responsibility. BPA also believes that other TOs (in order to determine their own compliance responsibility) should use the same fault MVA data to determine busses to which they have elements connected. BPA feels this requirement, as written, places an undue compliance risk on TOs.
Response: There are BES buses connected to BES Elements owned by different entities. The studies done by the different owners to identify monitored BES buses could yield different results for what needs to be monitored; which necessitates the notification from one Transmission Owner to another.		
Independent Electricity System Operator	No	We agree with the merging of R2 into R1, but not the revised R5 which combined R6 and R7. Please see our comments under Q2, below.
Response: Thank you the comment. Refer to the DMSDT response to your comment in Question 2.		
City Utilities of Springfield, MO	No	We support the merging of R2 into R1 and R7 into new R5. However, we do not support R1 Attachment 1 methodology regarding identifying BES buses for locating SER & FR devices to capture SER & FR data. See comments in question #3 for our reasoning.
Response: Thank you for your comment. Refer to the DMSDT response to your comment to Question 3.		
American Electric Power	No	R1: The scope for the process in Attachment 1 should be limited to only those BES buses that have local protection systems that serve to protect the connected BES elements. R1: The process for identifying BES buses within Attachment 1 could lead to a breaker protected load bus, with only two BES source lines, being in the "top 10%" of locations that must have DFR/SER. The reason for such a location being in the top 10% would be driven by its proximity to other top 10% BES buses. The Standard should allow for exclusion of such locations, provided they are substituted by the next BES bus in the list. AEP believes this change would allow DFR/SER equipment to be deployed where proper

Organization	Yes or No	Question 1 Comment
		event analysis is truly needed. An alternate approach would be to completely eliminate the top 10% criteria, which would allow industry maximum flexibility in determining the most appropriate location for such installations. R1 & R5: As written, these requirements are single sentences which are five lines in length. With no transitions of thought, they are difficult to read. The wording should be revised to break up independent thoughts so it reads more concisely. R1 & R5: The notification within 90 calendar days has no reference point. The requirements should be revised to state "... within 90 days of completing the Attachment 1 methodology" or similar wording. R1 & R5: Both requirements state "BES Elements may require..." Why is this a "may" statement? This seems to be in conflict with the beginning statement of the requirement that indicates a bright line identification of what requires monitoring. AEP recommends employing a consistent structure for R1 and R5. The criteria for R1 are contained within an appendix, while the criteria for R5 are contained within the requirement. AEP recommends modifying R1 so that the notified entity has the option to monitor either the local or the remote terminal of the subject Element.

Response:

The DMSDT notes that Requirement R1 specifies BES buses/Elements where FR and SER data (not equipment) is required to be captured. The data itself is specified in Requirement R3 which states "Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each of the BES Elements it owns connected to the BES buses identified

Organization	Yes or No	Question 1 Comment
in Requirement R1:" As long as the quantities (data) can be determined, the intent of the requirements are met. This standard identifies minimum data requirements. The DMSDT has revised Requirements R1 and R5 for clarity. The DMSDT agrees and has revised the wording to include "… within 90 calendar days of completion of Part 1.1…" and "…within 90 calendar days of completion of Part 5.1…" The DMSDT agrees and has revised the wording to remove "may" from both requirements. The DMSDT notes that Attachment 1 contains a procedure, while Requirement R5 contains bright line criteria for DDR data. It does not matter at which terminal data is captured, as long as the required data can be determined.		
City of Tallahassee	No	see response for question 3
Response: Thank you. Refer to the DMSDT response to your comment to Question 3.		
Kansas City Power & Light	No	See comments at end of form.
Response: Thank you. Refer to the DMSDT response to your comment to Question 3.		
City of Tallahassee	No	Please see comment for question 3.
Response: Thank you. Refer to the DMSDT response to your comment to Question 3.		
Exelon Companies	No	Exelon does not agree with the SOE/FR requirements as written but not because of the merging of the R2 and R1 requirements. We believe that there needs to be a streamlined process for entities that are modernizing their system. The SOE and FR portions of this standard are very close to 100% burden to entities that are utilizing modern microprocessor relays connected to GPS clocks for T-lines on their system as a standard. The

Organization	Yes or No	Question 1 Comment
		proposal does not account sufficiently for technical changes that have occurred over the last ten years. The Attachment 1 process is overly burdensome for entities modernizing their systems. An alternative to the attachment 1 process is for an entity to identify that 40% of its BES transmission lines (transformers need not be monitored if lines are monitored) include FR and SER capability. This would be easy to demonstrate as these types of lists are readily available already. Additionally, we believe the reference to BES Elements / Busses needs clarification. We also object to the TO having the responsibility to notify others of their need to comply with a NERC standard, "notify other owners of BES Elements connected to those BES buses".
Response: The standard deals with "what" data is recorded, not "how" it is recorded. Analysis of industry data submitted in response to the June 5, 2013 Request for Data verified that a straight percentage of BES Elements would not be the best way to establish what's needed to have data recorded. Also, please note that Requirement R3 states, "Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each of the BES Elements it owns connected to the BES buses identified in Requirement R1:" As long as the quantities (data) can be determined, the intent of the requirements are met. The DMSDT does not consider this methodology to be burdensome, and is practical to determine the data that is required. There are BES buses connected to BES Elements owned by different entities. The studies done by the different owners to identify monitored BES buses could yield different results for what needs to be monitored; which necessitates the notification from one Transmission Owner to another.		
City of Tallahassee	No	see comment for question 3
Response: Thank you. Refer to the DMSDT response to your comment to Question 3.		
Nebraska Public Power District	No	R1 should have some explanation for what the implementation/installation deadlines are for newly identified BES buses as part of the 5 year review. R1

Organization	Yes or No	Question 1 Comment
		states “reevaluate the identified BES buses at least once every five calendar years”, should this read “reevaluate all BES buses at least once every five calendar years”? It seems that new buses may be added and existing buses in the required locations for FR may get dropped down the list and become discretionary. R2 rational states “time stamped according to Requirement R10 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance.” Since relays and FR recorders often use separate clocks consider changing “common clock” to “time synchronized clock”. R7 states: “Each Generator Owner shall have DDR data for each BES Element it owns and is notified according to Requirement R5”. Should this read “Each Generator Owner shall have DDR data for each BES Element it owns as notified according to Requirement R5” instead? It seems a bit confusing how to read this requirement. It could be read that the GO “shall have DDR data for each BES Element it owns”. Consider if this requirement can be clarified or restated.

Response: The DMSDT agrees and has revised Requirement R1 to: “1.3 Reevaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.” The Implementation Plan specifies that "Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list." The intent is to reevaluate all BES buses every five years.

R2: The SDT agrees and has revised the wording in the Rationale Box.

R7: The SDT agrees with you and has revised Requirement R7 to mirror the wording found in Requirement R6:

> **“R7. Each Generator Owner shall have DDR data for each BES Element it owns, for which it received notification as identified in Requirement R5, to determine the following electrical quantities:”**

Organization	Yes or No	Question 1 Comment
PJM Interconnection	No	PJM signed on the SRC's response to this question.
Response: Thank you for the comment. Please see the DMSDT responses to those comments.		
Avista Utilities	No	Requirement R5 has the Responsible Entity (WECC RC) determining the location of Dynamic Disturbance Recorders (DDR) based on the Western Interconnection Path Rating Catalog or interfaces between Balancing Authorities (BA). WECC has never provided reasoning or justification behind the paths and the selection of the facilities included in the paths. Also the BA does not own or operate any facilities. The more appropriate entity would be the Transmission Operator to determine the interfaces in the BES.
Response: The bulleted components of Part 5.1.2 have been removed and replaced with: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)." The Responsible Entity has the overall view of the BES and is the appropriate entity to determine what data would need to be captured.		
Dominion	Yes	
Northeast Power Coordinating Council	Yes	The term BES bus is not a defined term, it is only described in Step 1 of Attachment 1. Note that NERC's Definition of Bulk Electric System (Phase 2) definition applies to Elements. Requirement R3, sub-Part 3.1 requires to have "Phase-to-neutral voltages for each phase of each specified BES bus". Since BES buses, as described in Attachment 1, may not represent physical buses, this sub-Part is not clear. For example, a breaker-and-a-half design with two physical buses. A Transmission Owner (TO) might not have visibility of the BES classification of Elements it does not own. It is recommended that the TO provide the list of identified BES buses to their PC / RC. The PC/RC will review the received list from the TO, and determine if the list contains BES Elements

Organization	Yes or No	Question 1 Comment
		owned by others, and notify those owners whose BES Elements may require sequence of events recording (SER) and/or fault recording (FR) data. Reference to (undefined) BES buses in Requirement R5 makes this requirement open to interpretations. Sub-Part 5.1.2 requires the inclusion of “Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity”, and its bullets include stability related interfaces or other significant Flowgates, Elements associated with Interconnection Reliability Operating Limits (IROLs), and voltage stability limited transfer paths or load serving areas. The different Parts and sub-Parts of R5 could require a large number of DDRs for TOs which have Flowgates, IROLs, and /or UVLS schemes. The number of required DDRs could become significantly larger than the minimum set of one BES Element plus one additional BES Element for each additional 3,000 MW of load, which could cause excessive burden on some TOs. It is also suggested to eliminate the potential overlap of sub-Parts 5.1.2, 5.1.4, and 5.1.5 by consolidating sub-Parts. Finally, it is recommended that "One or more BES Elements associated with Interconnection Reliability Operating Limits (IROLs)" in sub-Part 5.1.4 be replaced with “Any one BES Element critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies” to be consistent with the language in CIP-002-5.1. Sub-Part 5.1.4 requires clarification. The Drafting Team should consider shortening R1 by listing Parts.

Response: Requirement R1 specifies the identification of BES buses. Attachment 1, Step 1 says: "For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing; a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." Under a normal system

Organization	Yes or No	Question 1 Comment
configuration, the voltages around a station's bus would be the same. Just capturing the data for that "single node" of physical buses is all that is required. **The TO only has to know the classification of Elements it owns and ensure that there is data capturing capability for those Elements.** **The wording of Requirement R5, Part 5.3 was revised to remove BES buses.** **The bulleted components of sub-Part5.1.2 have been removed and replaced with: "Any one BES Element that is part of a stability or voltage related System Operating Limit (SOL).** **The wording of Requirement R5 and its Parts have been revised in response to comments received.** **Requirement R1 has been revised to break out wording into requirement Parts.**

2. **The DMSDT revised the requirements for dynamic disturbance recording data based on stakeholder comments. Do you agree with the BES Elements requiring dynamic disturbance recording data listed in Requirement R5? If not, please provide technical justification.**

Summary Consideration:

Many stakeholders were unhappy with the bulleted list in Requirement 5.1.2, either with a single bullet or with the list altogether. The standard drafting team revised R5.1.2 and removed the bulleted list of "or" statements, replacing it with "Any one BES Element that is part of a stability or voltage related System Operating Limit (SOL)"

In Requirement R5, the use of "BES buses" was found to be confusing by many stakeholders. The use of this language was simply to provide clarity but, in response to industry's comments, the drafting team revised R5 by removing "BES buses".

Organization	Yes or No	Question 2 Comment
Peak Reliability	No	The reference to the WECC Path Rating Catalog should be removed because the remaining bullet points cover everything in the Path Rating Catalog. The WECC Path Rating Catalog can be changed without going through any Standard development process. Changes to the Path Rating Catalog changes Requirement impact.
Response: The bulleted list of "or" statements has been removed from the standard and replaced with: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."		
Associated Electric Cooperative, Inc. - JRO00088	No	Note that AECI agrees with the current PRC-002-2 R5.1.2 Bullet#1 wording related to Flowgates, and appreciates this SDT's being thoughtfully responsive to prior comments.FOR: PRC-002-2, R5.1.2, Bullet #5REMOVE: "or relatively low Available Transfer Capability (ATC)"RATIONALE: AECI believes calculated ATC is based upon many complex factors that are somewhat subjective, primarily Market related, and

Organization	Yes or No	Question 2 Comment
		therefore a technically weak indicator for locating where reliability-related DDR equipment should be located.
Response: The bulleted list of "or" statements has been removed from the standard and replaced with: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."		
PPL NERC Registered Affiliates	No	We agree that DDR data should be obtained for the transmission lines from generation plants as listed in requirement 5.1.2, but not that GOs are the parties that should collect this information. DME in general should be a topic for TOs and not GOs. TOs interpret and use DME data; GOs do not. TOs generally have wide-ranging arrays of DME, continuous recording/storage infrastructure, and experts in monitoring and maintaining such equipment; GOs do not. DDR data collected on the TO's side of the generation plant battery limits would be the same as that measured on the GO's side, so one could apply the same logic as is stated on p.33 of the standard for FR data, "For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection." Moreover, as regarding assignment of responsibility for monitoring disturbances, such events are more likely to originate in the transmission system (as was the case for the Northeast blackout of 2003) than in generation plants. The SDT emphasized in its discussion of 6/11/14 with the NAGF Standards Review Team that duplication of equipment is not mandated - a GO can contract with its TO to supply the data if the TO has DME at a plant or is willing to add such equipment. We are concerned that the SDT may not have considered the difficulty in negotiating such agreements for the provision of such data or the transfer of compliance responsibilities. A requirement in the standard that TOs must coordinate with generators to provide the data where they own DME at a generation plant would be preferable if GOs have any responsibility under the standard. The least-total-cost approach should be followed in obtaining the expected reliability benefits, and we believe that centralizing DME with TOs makes more sense than splitting the responsibilities between involved entities (TOs) and those who merely hand-over

Organization	Yes or No	Question 2 Comment
		recordings (GOs) for further analysis. We recommend that the SDT perform a cost-benefit analysis of the two approaches before finalizing this standard.
Response: The Purpose of PRC-002-2 is: "To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances." It is important to note that large generating resources are an equal component to the BES and disturbances on the BES as the Transmission system. Tripping of (large) generating Facilities can, and do, pose a risk of underfrequency conditions across an Interconnection. The power grid is a giant, rotating synchronized machine with Transmission lines simply carrying the power generated by power plants. Past experience has shown that using the data from the Transmission grid is insufficient to determine the cause of generator outages. The response of the generating fleet is a strong player in the overall electrical response of the system. As in the 2003 blackout, the 2011 blackout and other blackouts, the sequence of events was able to be recreated using data across the network. Time-synchronized data greatly improved the response and understanding of time aligning the events in the 2011 blackout. However, it is crucial to note that in both cases it is still unclear why the blackout evolved and why generating resources did not respond as expected, or as studied in the power flow and dynamic simulations. For analysis, it is important to understand why the generating plant tripped offline, not when. This information is generally not available because the generating resource owners have insufficient recording capability at the plant to understand how the unit is responding during the transient System conditions. This understanding is required in order for Planners, Event Analysis staff and those responsible for the reliability of the electric grid supposed to create responsive schemes such as Underfrequency Load Shedding Schemes or Remedial Action Schemes to maintain the electrical connectivity of the grid. Generation plays a critical role in the reliability of the electrical grid, and the DMSDT feels that having generator DDR data for large generating resources is a cost effective way to ensure "adequate data to facilitate event analysis of Bulk Electric System (BES) disturbances." The standard is not concerned with "how" data recording is accomplished, but rather with "what" data is recorded. The standard allows for flexibility without being prescriptive in this respect, allowing the GO to determine the most cost-effective and least duplicative means of recording the data that is necessary for overall reliability and event analysis of the BES. The DMSDT believes that the responsibility for the data lies with the owner of the BES Elements requiring DDR data.		
SERC Protection and Controls Subcommittee	No	(1) R 5.1.2. Still seems open ended for us. The following bullet points under this requirement give reasons for concern: o Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection o Interfaces between Balancing Authority Areas o Areas of significant congestion,

Organization	Yes or No	Question 2 Comment
		thermal violation history, or relatively low Available Transfer Capability (ATC)DDR are applied for stability reasons, so thermal violations, and low ATC are not valid justification. (2) Depending on how our Planning Coordinator interprets these points, we could still be put upon to install an indeterminately large number of PMUs. This language *is* a step in the right direction from the previous draft of the standard, where "all permanent Flowgates" required DDR equipment, however, our preference would still be to delete R 5.1.2 from the standard. (3) If 5.1.2 is retained, please add a section 5.3 “The number of BES Elements need not exceed one per 1000 MW of its historical peak system Demand.” This provides sufficient coverage in the Responsible Entity’s area and encourages the RE to be ‘responsible’ in applying the 5.1.2 guidelines. (4) Some software vendors do not presently have the full capability as described in Requirement 11 implemented in their equipment or DME application software. This could require change out of the existing equipment. (5) Please clarify the 3rd paragraph of Rationale for R5 by adding ‘only one’ so its consistent with Guidelines and Technical Basis section page 36:’For “major transmission interfaces” with the exception of HVDC, the DDR data is to be captured for only one BES Element, and, is obtainable from one terminal (either end) of an Element.’ Also add: ‘If the BES Element has multiple owners, each TO and / or GO will need to agree which owner will have the DDR data, and the other owners can refer to this agreement as their means of meeting their obligations.’ (6) Please add ‘If the BES Element has multiple owners, each TO (and / or GO, as appropriate)will need to agree which owner will have the DDR data (or equipment, as appropriate), and the other owners can refer to this agreement as their means of meeting their obligations.’ In the rationales for R6, R7, R8, R9, R10, R11, and R12 to be consistent with R5 and cover tie line Elements. Similarly, M6 through M12, add

Organization	Yes or No	Question 2 Comment
		the option that for BES Elements with multiple owners, the TO / GO can provide an agreement stating which owner is responsible for the DDR data. (7) The standard should include direction if agreement between entities cannot be reached i.e. “In cases where agreement between entities cannot be reached, the TO/GO that necessitates DM capability is ultimately responsible for the equipment and any /all requirements.”

Response:

(1, 2) The bulleted list of "or" statements has been removed from the standard and replaced with: “Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).” The concept of “all permanent flowgates” and “major transmission interfaces” was removed from the standard. The more widely used SOL concept replaces these items to capture those major transmission elements.

(2, 3) The Drafting Team understands the concern with overburdening the TOs with DDR data. However, the Drafting Team does not feel that an upper threshold number for DDR coverage be placed; this could lead to insufficient DDR capability applied to the BES particularly in heavily loaded areas where DDR data would be valuable. It is expected and the intent of this standard that the flexibility provided to the Responsibility Entity can be used to utilize existing DDR capability and provide an adequate wide-area view with respect to DDR data.

(4) The draft standard does not dictate that particular DDR equipment have specified software specifications except for the output reporting rate requirement. After consulting with industry subject matter experts, the majority of existing equipment can meet the specifications put forth for data formatting. However, it is also understood that there are software tools available or can be programmed to simply convert one format of data to another format. For example, Phasor Measurement Unit data often reports in C37.118 format, but can be (and often is) converted to COMTRADE format for data sharing purposes. In addition, SER records are being requested in a .csv format to facilitate a more streamlined approach to event analysis from multiple entities, as this is often the biggest bottleneck of the event analysis process. Event records can be easily saved into a .csv format using MS Excel.

(5) The language in the requirements, Rationale Boxes, and Guidance and Technical Basis Section have been revised for consistency.

Organization	Yes or No	Question 2 Comment
		(6) It is expected that multi-owner BES Elements will be dealt with in the same manner as any other NERC Standard applicability and the DMSDT does not see the need to try to address the permutations that could possibly arise due to multiple ownership scenarios in this standard. **(7) For multiple ownership, there are already agreements that exist that define who is responsible for what.**
ISO RTO Council Standards Review Committee	No	Please clarify in R5 whether the first use of the term “BES Elements” is intended to be used here. It appears the intent is that the responsible entities notify all owners of the BES facilities connected to the BES Buses which they have identified. In that case, that term should be “BES Buses” or both BES Elements and BES Buses. We are concerned that the last bullet in Part 5.1.2 may be interpreted to include congestion as it relates to commercial/economic use of transmission interfaces. The term “significant Flowgates” should be limited to only physical/electrical constraints and not congestion that can be mitigated by market mechanisms. Part 5.1.4 needs to clarify whether BES Elements associated with the Interconnected Reliability Operating Limit should include only the monitored element or the contingent element or both. The Rationale for R5 should include the technical reason why the “Responsible Entity” is the applicable entity for identifying buses/elements for DDR events. As stated in the Background Information of the Comment Form, the SDT states the PC or RC has the overall view of the BES for DDR. This explanation should be included in the standard. R5 is also confusing in what is the requirement for BES Element owners which have been identified as needing DDR. We recommend the following changes to ensure the DDRs are applied on the proper BES Elements:” Each Responsible Entity shall (i) identify BES Elements for which dynamic disturbance recording (DDR) data is required, (ii) notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements WILL require DDR data upon

Organization	Yes or No	Question 2 Comment
		request of the Responsible Entity, and (iii) reevaluate the identified buses at least once every five calendar years. ". We are also concerned that this requirement envelopes 3 distinct and mutually exclusive requirements, each of which apply to distinct registered entities and each having different measures. This should be separated into three requirements which will also make the measures for VSL and VRF more applicable. The distinguishing of requirements for clarity in applicability and measurement should be included as an element of the "Quality Review" prior to industry comment posting. R5.1 - The BES Elements that require monitoring shall include the following...R5.2 - The BES Elements that require monitoring in each Responsible Entity's area shall include a minimum of...R5.1.4 requires monitoring BES Elements associated with IROLs. The requirement should only apply to IROLs that are voltage or stability limited: "One or more BES Elements associated with IROLs that are based on voltage or stability performance."

Response:

- **The use of "BES Buses" has been removed from the draft standard; the intent was to provide clarity, but actually resulted in confusion. The intent is that the Responsible Entity will determine BES Elements for which DDR data is required.**
- **Part 5.1.2 has been revised to remove market concerns, as well as to provide clarity: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."**
- **A description of the intended selection of IROL Element(s) has been added to the Guidelines section of the draft standard. The draft standard requires, "One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs)." Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for Cascading Outages. IROLs may be defined by a single or multiple monitored Element(s) and contingent Element(s). The Standard does not dictate whether the contingent and/or monitored Elements should be select; rather, the Standard Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL." The DMSDT has added this to the guidelines for Requirement R5.**

Organization	Yes or No	Question 2 Comment
• **Recommendations regarding the ordering and separation of the body into distinct requirement parts has been incorporated in the draft standard, separating those distinct components into parts of Requirement R5.**		
Seattle City Light	No	As for R1, R5 does not NERC principles for world-class Standards, because it includes three separately audited control activities in a single sentence: (1) identify Elements, (2) notify others of Elements, (3) reassess every five years. If this draft Standard is deemed necessary, Seattle recommends revising the first paragraph of R5 to include three subrequirements as follows: R5. Each Responsible Entity shall: R5.1 Identify BES Elements for which dynamic disturbance recording (DDR) data is required R5.2.Notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days, that those BES Elements may require DDR data R5.3 Reevaluate the identified buses at least once every five calendar years. And then renumber the remainder of the requirements to conform: 5.4 The BES Elements shall include the following: 5.4.1 Generating... In addition, the draft Standard does not clarify required actions should the five-year reassessment identify a different selection of Elements for which monitoring is required. Seattle suggests that an implementation period be identified for installing DDR capabilities for newly identified Elements similar to the implementation time for the initial implementation of the Standard. Likewise, the Standard does not clarify how newly constructed buses are handled. Seattle suggests that that they be evaluated at the next 5-year reassessment, rather than individually as they are brought on line.
Response: The SDT has revised R5 based on comments received. **The Implementation Plan addresses data capability for newly-identified buses and BES Elements: "Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list." The Rationale Boxes for Requirements R1 and R5 explain the reevaluation interval – newly-identified BES buses and BES Elements are identified at the five-year reassessment.**		

Organization	Yes or No	Question 2 Comment
Florida Municipal Power Agency	No	see question 3
Response: Thank you for your comment. Please see responses to Question 3.		
ACES Standards Collaborators	No	We disagree with the identification of BES Elements and the minimum BES Element criteria identified by the SDT. We feel that industry is capable of identifying the number of dynamic disturbance recording devices, "based upon [its] experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis." We believe this standard should require an entity to generate its own methodology to make these determinations and how often.
Response: Based on the Standard Drafting Team's experience with Disturbance Monitoring and event analysis, along with input from industry subject matter experts (SMEs), the DMSDT believes that the BES Elements outlined in the draft standard are essential for understanding a sequence of dynamic events and recreating those events in simulation to understand what happened and why it happened. The DMSDT believes that capturing these Elements will provide event analysis teams with the necessary measurements to accurately and systematically piece together large disturbances, such as blackouts or Cascading events effectively. Allowing each entity to develop their own methodology could lead to conflicting results.		
Duke Energy	No	(1) Duke Energy cannot envision the reliability benefit of including relatively low ATC as a consideration for the placement of DDR equipment in bullet 5 of R5.1.2. Duke Energy suggests the following revision:"5.1.2 Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines: o Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection, or o Transfer Paths in the Western Interconnection Path Rating Catalog, or o Voltage stability limited transfer paths or load serving area, or o Interfaces between Balancing Authority Areas, or o Areas of significant congestion or thermal violation history" If an entity is calculating ATC reliably, there should not be an area of significant congestion or thermal violation history due to the inherent

Organization	Yes or No	Question 2 Comment
		margins (TRM, CBM, etc.) that are built into the ATC calculation. In addition, the ATC consideration is redundant to the previous items in the same bullet.
Response: The Standard Drafting Team has revised Requirement R5 Part 5.1.2 to remove all commercial aspects from the requirement. Requirement 5 Part 5.1.2 now reads, "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."		
Bonneville Power Administration	No	BPA feels checks and balances need to be included to ensure Responsible Entities get concurrence from affected TOs/GOs that dynamic disturbance recording (DDR) data is needed at a given location. Additionally, an IROL is defined as in the Long-Term Planning Horizon, not in the operating horizon. BPA also believes R 5.1.5 needs clarification regarding the criteria for "major voltage sensitive area," - which is related to UVLS (for example, as represented by a metro area of 10 million people / 3000 MW). Otherwise, an isolated radial issue that doesn't impact the Interconnection may be erroneously specified.
Response: The Responsible Entity (RC or PC) assumes the responsibility for selecting BES Elements for DDR coverage because they have the best wide area view of the BES. It is expected that the RC or PC will work with the TOs/GOs to determine the most cost-effective and useful locations for DDR monitoring through the criteria put forth in this standard. The Standard Drafting Team does not feel that an upper threshold number of DDR be placed; this could lead to insufficient DDR applied to the BES, particularly in areas where DDR data would be valuable. It is expected and the intent of this standard that the flexibility provided to the Responsibility Entity can be used to leverage existing DDR equipment currently in operation and provide an adequate wide area view with respect to DDR data. **Regardless of the time horizon, if IROLs are exceeded then there is "… increased risk of voltage instability, Cascading Outages or uncontrolled separation that adversely impacts the interconnection." For this reason, the Standard Drafting Team feels that IROLs should be monitored for Disturbance Monitoring and event analysis purposes. Furthermore, in a NERC reference document (*Supporting Reference for Identification of Interconnection Reliability Operating Limits*), it states: "IROLs are monitored by the Reliability Authority. The [RA] may delegate this task to system operators working for entities performing the [TOP] function, but**		

Organization	Yes or No	Question 2 Comment
it is the [RA] that is held accountable for ensuring that IROLs aren't exceeded." This describes IROLs being monitored in Real-time to ensure they are not violated, just like System Operating Limits. **"Major voltage sensitive area," for the purpose of this standard, is meant to capture areas with in-service UVLS programs to avoid any ambiguity for what is "major voltage sensitive area." The rationale box has been updated to provide further clarification; the requirement has been modified to provide that clarification. However, the DMSDT avoided using ambiguous load density and/or power quantity thresholds. An "isolated radial issue that doesn't impact the interconnection" likely does not require a BES UVLS program to ensure voltage stability.**		
Ameren	No	(1) In addition to our comments we adopt the SERC PCS comments, and include them by reference. (2) As we have stated in our previous comments, we have installed over 30 PMUs on our system over the last 3 years in conjunction with our Planning Coordinator. This required significant effort and resources to perform this installation work. Even though they have not yet been needed for disturbance analysis, some operating visualization tools are being used and we have reviewed some minor perturbations. We respectfully disagree with the drafting team's brief justification in the Rationale for R5. We still believe the resultant number of PMUs which might be needed under the new standard would be burdensome to most entities. (3) Our software vendor has made known to us that they do not presently have the full capability as described in Requirement 11 implemented in our data concentrator software.
Response: **1. Refer to the Standard Drafting Team's response to the SERC Protection and Controls Subcommittee.** **2. After extensive outreach to industry, NERC Staff and subject matter experts in event analysis, the consensus is, and is opinion of the Standard Drafting Team, that there is insufficient wide area coverage of key Elements on the BES to facilitate accurate, effective and efficient analysis of cascading events or large disturbances. Examples of these types of events or other unexpected contingencies prove that DDR data can provide additional information otherwise currently unavailable to aid in understanding not**		

Organization	Yes or No	Question 2 Comment
only what happened, but why it happened; therein improving the reliability of the electric power grid. Per Requirement R5, your PC will be the Responsible Entity that will determine the DDR requirements. **3. It is important to note that the specifications outlined in Requirement R11 are not required of the vendors of the equipment used to capture the data. There are many offline tools currently in existence for purchase or developed by utility personnel for converting data into formats required for reporting. For example, data can be extracted from DDRs in their standard format such as C37.118 for synchrophasors, and then converted to COMTRADE format for reporting for the purposes of this standard.**		
Independent Electricity System Operator	No	(a) R5 is unclear as it mixes BES Buses with BES Elements. If the responsible entity (a PC or an RC) is to identify BES Elements for which dynamic disturbance recording (DDR) data is required, then it needs to notify ALL such Elements' owners, and there is no need to mention "of BES Elements connected to those BES buses". However, if the requirement is intended to ask the responsible entity to identify BES buses for which dynamic disturbance recording (DDR) data is required, then it needs to notify the owners of the BES buses AND the owners of the BES Elements connected to these BES buses. We suggest the SDT to review the intent of the requirement, and revise it to clearly convey the requirements on what is it the responsible entity needs to identify, and to whom it needs to notify. (b) Part 5.1.2: The term "significant Flowgates" is subject to interpretation since it is not clear what "significant" really means. We suggest the SDT to clarify this term or provide more specificity. (c) Part 5.1.4: It is not clear whether or not the BES Element associated with an IROL is the monitored element or the contingent element or both. This needs to be clarified. (d) Part 5.2: This part requires adding one BES Element for each additional 3,000 MW of an entity's historical peak system Demand, but the word "its" is unclear whether it means the responsible entity (in this case the PC or RC) or the BA. We suggest to reword it to clearly convey that it is the responsible entity's area historical peak system Demand. Note that additional clarity may be needed if the "its" refers to a PC or RC area since within a PC or RC area, there may be multiple BAs and TOPs within

Organization	Yes or No	Question 2 Comment
		which their system peak demand could occur at different times. Thus, Part 5.2 needs to clearly convey whether it is the total non-simultaneous peak demands of all BAs within an area, or it is the one-of highest demand of the entire area
Response: (a) Requirement R5 has been revised to clarify this issue by removing BES buses. (b) Requirement R5 Part 5.1.2 has been revised to remove all reference to commercial issues, and now reads: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)." (c) A description of the intended selection of IROL Element(s) has been added to the Guidelines section of the draft standard. The draft standard requires "One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs)." Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for Cascading Outages. IROLs may be defined by a single or multiple-monitored Element(s) and contingent Element(s). The standard does not dictate whether the contingent and/or monitored Elements should be select; rather, the Standard Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL. (d) The ambiguous use of "its" has been removed and replaced with the explicit "Responsible Entity." In addition, the use of "simultaneous" peak system demand has been added to clarify that physical, actual coincident peak is to be used. Further information has been provided in the Rationale and Guidelines sections to help provide clarification and direction for applying this requirement's parts.		
City Utilities of Springfield, MO	No	The R5 language is confusing to me. It appears the Responsible Entity is charged with identifying Elements (not buses), but then the requirement language shifts to notifying owners of Elements connected to "those BES buses" and later reevaluating "identified buses". How are the buses "identified"? Is this an oversight based on the changes made to the earlier version of the Standard? Please clarify.
Response: Requirement R5 has been revised to clarify this issue. The intent is that the Responsible Entity will identify BES Elements for which DDR data is required. They will then notify the owner(s) of those particular Elements that DDR data is required as per this standard. The use of "BES buses" was to simply provide clarify but industry has commented that this is confusing and has thus been removed.		

Organization	Yes or No	Question 2 Comment
American Electric Power	No	While AEP has no disagreement with the Elements as specified in R5.1, the standard lacks clarity in what flexibility if any, the Responsible Entity has in selecting them. For example, the text "may require DDR data" implies some flexibility in that regard, and such flexibility should be made more explicit within the standard. It would be more clear if the minimums provided in 5.2 were provided *before* the Elements specified in 5.1 (essentially a swap of 5.1 and 5.2).
Response: The phrase "… may require DDR data" has been revised to "… require DDR data when requested." The intent is that the standard mandates that data be furnished when requested. But how that data is collected is up to the entity required to provide that data. The standard does provide a specific set of BES Elements for which DDR data is required and selected by the Responsible Entity. For example, "major voltage sensitive areas" and "One or more BES Elements" allows for flexibility in the selection of DDR data appropriate for regional variances and different topologies. In addition, the Elements requiring DDR data need not be directly measured and can be determined or calculated assuming this derivation is accurate and time synchronized. The issue of inclusion of Elements for Requirement 5 Part 5.1 and Requirement R5 Part 5.2 has been outlined in the Rationale section of the updated draft standard.		
Seminole Electric Cooperative, Inc.	No	See comments under Question 3
Response: Thank you. Refer to the response to Question 3.		
City of Tallahassee	No	see response for question 3
Response: Thank you. Refer to the response to Question 3.		
Kansas City Power & Light	No	See comments at end of form.
Response: Thank you. Refer to the response to Question 3.		

Organization	Yes or No	Question 2 Comment
City of Tallahassee	No	Please see comment for question 3.
Response: Thank you. Refer to the response to Question 3.		
Dynegy	No	The DDR requirements for GOs are more prescriptive than other regional Criteria or Regional Standards (i.e. NPCC). Recommend the 500 MVA limit be increased.
Response: The Standard Drafting Team used the NERC GADS database to perform a more extensive analysis of generating resource sizes to better understand the coverage requirements relative to the size thresholds to ensure a cost-effective means of capturing large generating resources without overburdening the entire generation fleet across the NERC footprint. This led the DMSDT to selecting the 500 MVA threshold, which the DMSDT feels is justified and representative of a good balance between reliability and cost-effectiveness. DDR data is critical to event analysis for understanding why generating resources do or do not respond as expected. This data provides useful information as to "why" not "when" the unit responds and/or trips based on the electrical characteristics it sees at its terminals. Recording, capturing, simulating and ultimately understanding these responses improves reliability of the BES and overall electric grid.		
Tacoma Power	No	It is unclear what requirements for DDR data changed. The redlined version has only superficial changes to Parts 5.1 and 5.2. Tacoma Power has some concern about the fourth bullet under Part 5.1.2: "Interfaces between Balancing Authority Areas." While this is only one guideline that the Responsible Entity should (not must) consider, it could potentially place disproportionate burden on entities with a relatively small Balancing Authority Area.
Response: Requirement 5 Part 5.1.2 has been revised for clarity to: "Any one BES Element that is part of a stability or voltage related System Operating Limit (SOL). "		
Entergy Services, Inc.	No	We agree with the revised DDR location criteria reducing the number of monitored BES Elements and appreciate the DMSDT efforts to address that issue. However we are still concerned about the potential for an unnecessarily excessive number of required DDR locations with regard to Flowgate applications. We believe the proposed minimum criterion of "One additional BES Element for each additional

Organization	Yes or No	Question 2 Comment
		3,000 MW of its historical peak system Demand." does specify a reasonable lower threshold which provides adequate wide area coverage and also believe there should be a similarly defined upper threshold on the number of DDR Flowgate (or DDR total) locations required. Suggest DDR Flowgate location criteria be revised to specify no more than twice the adequate minimum number of locations as follows: "Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection (prioritized by the Responsible Entity with area coverage considerations and with a total of no more than one BES Element per 1,500 MW of its historical peak system Demand),"
Response: The Standard Drafting Team has spent much time regarding the selection of DDR, while both specifying specific Elements and allowing for some flexibility. The Standard Drafting Team feels the draft requirement put forth finds a good balance regarding the selected Elements. An upper limit could hinder the capture of additional data in areas that would otherwise enhance and facilitate data analysis. The DMSDT has revised Requirement R5 Part 5.2 and added clarifications to the Rationale/Guidelines to indicate that Requirement 5 Part 5.2 sets a minimum set of BES Elements, while the BES Elements identified in Requirement R5 Part 5.1 are included in the minimum set by Requirement 5 Part 5.2.		
City of Tallahassee	No	see comment for question 3
Response: Thank you. Refer to the response to Question 3.		
Nebraska Public Power District	No	For R5 if the Responsible Entity is slow in notifying owners where DDR data is required does this force the owners to meet the same implementation deadlines or can they extend the deadlines by the same amount of time the RE was late in getting a notification out to the owners? I bring this up because the BES owners will not have any control over the RE schedules but could be subject to shorter implementation deadlines. In addition, since there is some open ended latitude in the ability of the Responsible Entity to identify locations for DDR it is possible that large number of locations could be identified to install DDR in some areas. If this were to occur would there be a possibility for the BES owners to request additional implementation time

Organization	Yes or No	Question 2 Comment
		to become compliant? Consider if some clarification could be added. One option might be to have criteria in 5.1.2 less open ended without any latitude.
Response: As per the Implementation Plan, the clock starts for implementation on the Effective Date of the standard. Any issues with meeting implementation deadlines would have to be vetted through compliance. The DMSDT had previously revised the Implementation Plan to accommodate outage schedules and implementation of all requirements. Requirement R5 Part 5.1.2 has been revised to eliminate any ambiguity, and now reads: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)." **This revision eliminates the latitude for the Responsible Entity to identify an abnormally large number of locations for DDR data.**		
Oncor Electric Delivery LLC	No	Oncor recommends an audit curtailment be added to the DDR requirement similar to what is used in Attachment 1 for the FR's and SER's.
Response: The DMSDT is not aware of any audit curtailments in Attachment 1.		
Ingleside Cogeneration LP	No	ICLP holds to its position that the 1500 MW criteria established in CIP Version 5 for Medium-Impact generation plants is also appropriate for the placement of Dynamic Disturbance Recorders. In our view, the survey that was performed by NERC when the cyber asset bright-line criteria was developed resulted in a reasonable balance between cost and reliability benefit. There has been no corresponding justification provided under Project 2007-11 that would indicate that the 1000 MW threshold is more appropriate.
Response: As stated in the Guidelines and Technical Basis section of the Standard, here is the technical justification: **Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a disturbance helps the analysis of large Disturbances. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those**		

Organization	Yes or No	Question 2 Comment
thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet: • The number of individual generating units in total included in the spreadsheet. • The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP. • The total number of units within selected size boundaries. • The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds. • The information in the spreadsheet does not provide information by which the plant location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility. From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings “greater than or equal to 500 MVA.” The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47 percent of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5 percent of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, Part 5.1.2 is included to capture larger units located at large generating plants which could pose a stability risk to the System if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1000 MVA. The 300 MVA threshold was chosen based on the DMSDT’s judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. The incremental impact to the number of units requiring monitoring is expected to be relatively low.		
Northeast Utilities	No	
n/a	No	1. R5 is unclear as to whether the responsible entity needs to identify BES buses or BES Elements on which dynamic disturbance recording data would be required.

Organization	Yes or No	Question 2 Comment
		2. Part 5.1.4: It is not clear whether or not the BES Element associated with an IROL is the monitored element or the contingent element, or both. 3. The standard should not specify a number of BES elements (minimum or otherwise) for which DDR data is required. The number of Elements must be determined as those necessary to capture the necessary data to permit the complete study of key events in the BES and should not be pre-determined in the standard.
Response: Requirement R5 has been revised to clarify this issue. The intent is that the Responsible Entity will identify BES Elements for which DDR data is required. They will then notify the owner(s) of those particular Elements that DDR data is required as per this standard. The use of "BES buses" was to simply provide clarify but industry has commented that this is confusing and has thus been removed. **A description of the intended selection of IROL Element(s) has been added to the Guidelines section of the draft standard. The draft standard requires "One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs)." Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for Cascading Outages. IROLs may be defined by a single or multiple monitored Element(s) and contingent Element(s). The Standard does not dictate whether the contingent and/or monitored Elements should be select; rather, the Standard Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.** **The minimum criteria is meant to ensure a wide area coverage of DDR data across all Responsible Entities; it is expected that this minimum criteria will be met with the BES Elements defined in Requirement R5 Part R5.1, which are defined because they are critical for wide area Disturbance Monitoring and event analysis.**		
PJM Interconnection	No	PJM signed onto the SRC's response to this question.
Response: Thank you for the comment. Please see responses to those comments.		
Austin Energy	No	City of Austin dba Austin Energy (AE), as noted below in the general comments section, does not agree with this standard as a whole. However, AE would like to point out a few clean-up items to Requirement R5. (1) R5 includes the phrase "notify

Organization	Yes or No	Question 2 Comment
		other owners of BES Elements connected to those BES buses". "[T]hose BES buses" implies reference back to BES buses cited previously in the requirement, but they do not exist. R5 requires the Responsible Entity to identify BES Elements not BES buses. The simple fix is to strike "connected to those BES buses." (2) AE believes R5 Part 5.2.2 would read better if the SDT changed the phrase "for each additional 3,000 MW" to "for every 3,000 MW." Otherwise, the Responsible Entity is left asking "in addition to what?"
Response: Thank you for the comment. Requirement R5 and its rationale box have been extensively revised, including Requirement R5 Part R5.2.2. We have removed references to BES buses and Requirement R5 Part R5.2.2 has been revised to "per 3,000 MW."		
CPS Energy	No	Main issue is that "Areas of significant congestion, thermal violation history, or relatively low ATC" is very vague.
Response: The bulleted components of Requirement R5 Part R5.1.2 have been removed and replaced with: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."		
Avista Utilities	No	Requirement R5 has the Responsible Entity (WECC RC) determining the location of Dynamic Disturbance Recorders (DDR) based on the Western Interconnection Path Rating Catalog or interfaces between Balancing Authorities (BA). WECC has never provided reasoning or justification behind the paths and the selection of the facilities included in the paths. Also the BA does not own or operate any facilities. The more appropriate entity would be the Transmission Operator to determine the interfaces in the BES.
Response: The bulleted components of Requirement R5 Part R5.1.2 have been removed and replaced with: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."		
Dominion	Yes	

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	Yes	There should be consistency between Parts 5.1.2, 5.1.4, and 5.1.5. The Drafting Team in 5.1.2 and 5.1.5 require DDR on ANY ONE BES Element but in 5.1.4 it uses “One or more BES Elements...”. Reading the DT response to the last comment round it seems the intent was to be consistent for these three items; only one BES is required to be monitored. If true then standardize on ANY ONE BES element. Refer to the comments in Question 1.
Response: Thank you for the comment. These requirement parts are worded, by necessity, slightly different due to the criticality of an IROL.		
MRO NERC Standards Review Forum	Yes	
Colorado Springs Utilities	Yes	
SPP Standards Review Group	Yes	We suggest that the DMSDT further clarify the Applicability of the Functional Entities in 4.1 by including a statement in the Rationale Box for Functional Entities that when Responsible Entity is used in PRC-002-2, it specifically refers to those entities listed under 4.1. This is a slightly different approach than usually taken in Applicability.
Response: A statement in the Rationale for Functional Entities was included to provide further clarification, as requested. Thank you for your comment.		
Arizona Public Service Company	Yes	
FirstEnergy	Yes	
DTE Electric	Yes	
Bureau of Reclamation	Yes	

Organization	Yes or No	Question 2 Comment
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	
Manitoba Hydro	Yes	
American Transmission Company, LLC	Yes	
Wisconsin Electric Power Co	Yes	
Pepco Holdings Inc.	Yes	
Xcel Energy	Yes	We still believe the "Responsible Entity" should be consistent across the Interconnections. We recommend changing this to be the Reliability Coordinator for all Interconnections.
Response: The responsibilities of functional entities vary by Interconnection; and, therefore, the Responsible Entity is used to capture those variances. Referring to the NERC Reliability Functional Model, this type of analysis fits the PC better than the RC since it does not deal with ahead-of-time or Real-time functions. However, in certain areas/Interconnections, the RC is better suited to perform this analysis either through subcommittees, collaborations or internal staff.		

Organization	Yes or No	Question 2 Comment
Luminant Generation Company, LLC	Yes	
ITC	Yes	
CenterPoint Energy Houston Electric, LLC	Yes	
Exelon Companies	Yes	No Commnet
Texas Reliability Entity	Yes	We agree with the concept of the requirement, however, we suggest moving the methodology for selecting DDR locations described in 5.1 and 5.2 to an attachment and not include it within the text of the requirement itself (similar to the SER/FR bus selection methodology in Attachment 1 for R1).
Response: Attachment 1 is a multi-step mathematical methodology that needs to be separate from the body of the standard. Requirement 5 Parts R5.1 and R5.2 are written specifications that should remain in the body of the requirement to conform with the conventions of NERC Reliability Standards development.		
Idaho Power Co.	Yes

PNM	Yes	

3. If you have any other comments that you haven't already mentioned above, please provide them here

Summary Consideration:

A number of stakeholders voiced their concerns for more precise wording of the Step 7 in Attachment 1 which stated "If the list has 11 or fewer BES buses: FR and SER data is required at the BES *buses* with the highest maximum available calculated three phase short circuit MVA." The ambiguity arose out of the term "buses" because it could be read as requiring FR and SER data from more than one bus. Thus, Step 7 is now revised to read "If the list has 1 or more but less than or equal to 11 BES buses: FR and SER data is required at the BES *bus* with the highest maximum available calculated three phase short circuit MVA."

Several stakeholders also commented that Requirement R11 had no substantial impact on improving the reliability of the system. The DMSDT notes that the Requirement R11 ensures data availability from the data sources, timely retrievability of the data and common format so that the data can be read and used in the expeditious and effective analysis of events. Requirement R11 provides a reliability impact by integrating all of the previous requirements in the standard with respect to data reporting facilitate event analysis. The first two Parts of Requirement R11 specify how long an entity has to provide requested data (Part 11.1) and also limits how long data must be retained by the TO or GO (Part 11.2). Parts 11.3-11.5 ensure the uniformity and consistency of the data that is reported.

One technical change many stakeholders proposed was to revise Requirement R10 to relate to time synchronization of the device clock rather than data. The Requirement's original language called for time synchronization of SER data within +/- 2 milliseconds. Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices are within ± 2 ms accuracy will suffice with respect to providing time synchronized data. The drafting team revised Requirement R10 accordingly.

Organization	Question 3 Comment
CenterPoint Energy Houston Electric, LLC	1) Regarding R2, CenterPoint Energy believes that breaker open/close operations obtained from the EMS system time-stamped based on RTU scan is adequate SER data for the initial stages of event analysis before detailed disturbance data is obtained from the FR and DDR data that is ultimately required for the actual event analysis. Therefore, CNP recommends removing SER data from R10. 2) Requirement R3 states "...shall have the following FR data to determine the following electrical quantities for each of the BES Elements they own connected to the BES Buses identified in Requirement R1:". CenterPoint Energy believes this language causes confusion with regard to "determining" phase-to-neutral voltages for each phase of each specified BES Bus as required by Part 3.1. The BES Bus voltage can be "determined" by measuring/recording each phase-to-neutral voltage of each line, or by measuring/recording each phase-to-neutral voltage of a smaller subset of lines connected to a BES Bus. The Guidelines and Technical Basis Section describe measuring voltages of "each" line. For entities that are using dedicated fault recording devices, channel capacity can be an issue. In some installations, voltages from 2 or more lines, i.e. a subset of the total number of lines connected to the BES Bus, can be recorded to provide adequate phase-to-neutral voltage FR data for system disturbances obviating the need to record each phase of each line at the recorder. CNP recommends that the DMSDT reconcile the Guidelines and Technical Basis Section language with the Part 3.1 language such that BES Bus voltages can be "determined" by measuring a number of line voltages based on engineering judgment.

Response:

1. SER is included in Requirement R10 to ensure accuracy to facilitate event reconstruction and analysis. The requirement has been revised to relate to time synchronization of the device clock rather than data. All modern digital SERs have an internal clock accuracy of much tighter than what has been specified in the standard.

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following specifications: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.

Organization	Question 3 Comment
10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC. **2. The wording of the Guidelines for Requirement R3 was revised to: "Voltages are recorded or accurately determined at applicable BES buses."**	
Nebraska Pubilic Power District	It appears, for example, GSU 13.8kV generator buses that exceed the 1500MVA fault current level should be in the bus fault list for FR evaluation. If this is correct they are often ungrounded systems. Can the FR voltages and currents be monitored on the high side of GSU or a tie transformer with a BES tertiary reactor? It seems unclear what currents would be required to monitor as there would not be any ground current at these types of locations/buses if the ungrounded low side must be monitored. R3 and R4 don't specifically mention GSU transformers, GSU low side buses or BES tertiary buses which tend to be ungrounded systems. Can the drafting team clarify that for tertiary or GSUs where the generator bus (for example 13.8kV) is identified in the list of fault buses that it would be acceptable to monitor the voltages and currents on the high side of the GSU or tie transformer? If not, clarify that only the three 13.8 line to ground voltages or 13.8kV line to line voltages are required but not the currents or at least not the ground current. Note that the option of line to ground or line to line voltages is suggested above. Some ungrounded buses may not have line to ground voltages. This may be a concern for some utilities. It seems a bit odd the DDR would be allowed to be on the GSU high side yet still require FR data using the generator bus side voltages as the standard appears to read. R7 seems to address the high or low side requirements better for DDR but clarification for what is required for GSU and generator buses for FR would be helpful since they are often ungrounded systems. For R11 it states: "Each Transmission Owner and Generator Owner shall provide all SER, FR, and DDR data for the BES buses identified in Requirement R1 and BES Elements identified in Requirement R5 to the Reliability Coordinator". Consider clarifying this wording since it appears to require DDR data is required for R1 to be provided to the RC. R10 also appears to have this concern as well. DDR data is not required by R1, but through the use of the word "and" in R10 and R11 it appears that DDR recording may be necessary on these buses. R12: Is the CAP required to be submitted to the RE or is it upon request similar to the records? This requirement seems like it would be difficult to audit since it would be tracking work on a utilities

Organization	Question 3 Comment
	system. I wonder if the RE is prepared to monitor this information. If they do plan to monitor this is there any other process format or forms necessary or is it understood to be an informal case by case transmittal of CAP status?
Response: Requirement R1 and Attachment 1 applies to Transmission Owners and will exclude Generator Owner 13.8kV buses. **Requirement R11 and R10: The drafting team has revised the language to reflect your concern. Both requirements now read "…all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements…"** **The wording in Requirement R12 was revised to clarify that the CAP is to be submitted to the Regional Entity within 90 days and implemented as follows:** **R12. Each Transmission Owner and Generator Owner shall, within 90 calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]** • **Restore the recording capability, or** • **Submit a Corrective Action Plan (CAP), to the Regional Entity and implement it.**	
Luminant Generation Company, LLC	(1) Requirement R11, subsections 11.3, 11.4 and 11.5 includes prescriptive details regarding data recording and reporting. The goal of the standards development process is to develop Results Based Standards. These items are completely administrative in nature and are not results based. An entity could make a typo in formatting or when naming a file and be non-compliant with the requirement. These requirements should be removed from the standard or relocated to reference documents as described below. (2) Requirement R11, subsections 11.4 and 11.5 reference IEEE standards and software formats which are not subject to the NERC procedures for standards development and are not under the purview of the legally authorized regulatory authority. Thus these sub-requirements have no valid standing in a NERC Reliability Standard. These items are more appropriate for a reference document. Inclusion in a reference document seems to provide a better location to document specific details on requested data and can provide a more effective mechanism for revising these details at a later date in regards to the data reporting.

Organization	Question 3 Comment
	(3) Requirement R11, subsection 11.4 specifically references "IEEE C37.111-2013". Some older DFRs that effectively capture the needed data may not meet this requirement for the 2013 software update. Software updates may not always be reasonably accomplished with equipment, service contracts or other factors. This specificity is administrative in nature and does not contributed to a results based standard. This version requirement should be revised to allow for any software versions that the entity has access to that supports the recording and report requirements.
Response: **1. Requirement 11 Parts R11.3, R11.4, and R11.5 facilitate event analysis by ensuring the result of consistency in data to be reported.** **2. Regarding Requirement 11 Parts R11.4 and R11.5 are needed to ensure consistency in the data reported, the analysis of the 2003 Northeast Blackout was hampered by the inconsistent data formats presented to the investigators.** **3. Consistency in data format is important for efficient and expeditious event analysis. The standard does not require that the recording of data be done in a particular format. The data needs to be in the specified format and this can be accomplished for older formats using conversion software.**	
ACES Standards Collaborators	(1) We applaud the SDT's decision to remove the standard-only definitions provided in the previous draft revision. We also approve of the SDT's step to reduce the overall number of requirements listed in this standard. (2) However, we disagree with the SDT's claim that this standard addresses the "what" of data collected and not the "how" the data is collected. The costs of installing new equipment for the purposes of disturbance monitoring could be significant for some of our members. Moreover, industry has already benefitted from the DOE grants to install PMUs and would continue to benefit from these types of financial incentives for continual situational awareness. In its Consideration of Comments posted May 9, 2014, the SDT rebutted our previous submitted comments with references to the 2003 Blackout in the Northeast. However, it was through these financial incentives, that sufficient data was available to construct the sequence of events and other post-event analysis of disturbances for the September 8, 2011 Arizona-South California Outages. As

Organization	Question 3 Comment
	stated within the resulting FERC-NERC Arizona-South California Outages of September 8, 2011 report generated in 2012, "PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP)." Moreover, the resulting report identified that no additional standards were necessary because of this event. We suggest NERC should develop a Reliability Guideline on this topic instead of a standard, as we do not see the cost benefit or justification to allocate resources for an issue that is not a high priority for reliability, such as cyber security. (3) We continue to have concerns that the SDT has not identified a transition period in the standard when a Reliability Entity identifies or receives notification that they are then required to install a recording device. The only transition period the SDT has accounted for is what the SDT listed in the Implementation Plan and based on the effective date of the standard. e(4) We disagree with the previous response to our comments from the SDT, as cited in its Consideration of Comments posted May 9, that "to facilitate expeditious and reliable data capture, it is necessary to stipulate the data formats necessary for efficient data analysis". We feel the SDT could incorporate such stipulation in a separate technical specification or even included as reference within the standard. We feel the technical specifications listed in Requirements R8, R9, R10, and R11 would further strengthen this case, and not subject registered entities to possible violations for every part of these requirements. We feel that technology has significantly improved since the 2003 Northeast Blackout, as manufacturers and industry have supported the need to align such devices on a common frame of time and develop related industry standards accordingly. The SDT even supports this later claim by directly referencing these standards in the text of this proposed NERC standard (see Requirement R11.4). (5) We believe numerous requirements of this Standards fall under Paragraph 81 Criteria B, and are thus unnecessary. We previously alerted the SDT to this observation and reference portions of its response, listed in its Consideration of Comments posted May 9, here. We concur with the SDT that "Disturbance Monitoring recording is necessary to ensure the reliability of the BES by providing the data for a post event analysis that can determine if system improvements are necessary to ensure reliability [and] guide real-time operating decisions." However, we disagree that these "supportive

Organization	Question 3 Comment
	requirements are necessary" and feel that the SDT should take some initiative. For reference, we re-list our observations below. (6) We feel Requirement R11 is arbitrary and could be subject to interpretation from auditors due to Paragraph 81 criteria. TOs and GOs could be required to prove the negative, and demonstrate that they have not received a request to provide device data to their RCs, Regional Entities, and NERC. Furthermore, this requirement meets several Paragraph 81 criteria including B1 Administrative, B2 Data Collection/Data Retention, and B4 Reporting. This requirement is administrative because it compels data formats that are immaterial to reliability with the sole purpose to simplify data collection and communication. It meets the data collection/data retention criterion because the requirement is about collecting data. It also meets the reporting criterion because it compels data reporting. We recommend the SDT should remove this requirement in its entirety. It would be more appropriate to include these specifications in a guideline. Furthermore, we feel portions of requirements R1 and R5 are "Periodic Updates" due to the need to reassess each list of affected BES Elements every five calendar years. Likewise, we feel requirements R1, R5, and R11 are "Administrative" due to the need to collect, organize, format, and then circulate data and communications sent to identified entities within a specific timeframe. We feel that several other requirements could be "Data Collection" in nature. Requirements R4.1, R4.2 require the collection of data according to specifications outlined for the minimum recording rate and data duration. Requirements R8.1 and R8.2 require the collection of data according to specifications outlined for the trigger record lengths and trigger settings. Likewise, Requirements R9.1 and R9.2 require the collection of data according to specifications outlined for input sampling rate and output recording rate. Requirement R10 requires the collection of data according to specifications outlined for time synchronization. Finally, we feel Requirement R12 is "Administrative" and "Documentation" in nature based on the need to circulate the discovery of device failure within a specific timeframe and provide a Corrective Action Plan to the Regional Entity if repair is outside this timeframe. (7) Thank you for the opportunity to comment.
Response:	

Organization	Question 3 Comment
1. Thank you for the comment. 2. The intent of Project 2007-11 is to ensure that there is adequate Disturbance Monitoring data available for event analysis. PMUs are considered DDR, but for a more complete analysis SER and FR data is also needed. SER and FR data is also useful to make Real-time operating decisions. DDR is particularly helpful to analyze generator trips. A guideline will not ensure that there is adequate data available for event analysis as guidelines are unenforceable. As a result of the 2011 Southwest Outage settlement, FERC requires additional PMUs to be installed for reliability enhancements. 3. The standard does not address “how” the data is recorded, and the Implementation Plan defines the requirements for recording capability. In the Implementation Plan, there is a statement regarding compliance for a reassessed list: “Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list.” This language is reflected in the revised Requirements R1 and R5. 4. The Standard Drafting Team discussed the importance of stipulating formats with event analysis SMEs, and, because of its importance, it was decided to incorporate those parameters in the standard. If the data specifications are included in a separate guidance document, there would be no requirement for consistent data to be available for analysis. 5. Thank you for the comment. 6. Uniform data formats are essential to expeditious and efficient data analysis. Because of its importance and necessity in the resulting capture of usable data, Requirement R11 will be maintained. Paragraph 81 is intended to provide an initial review of requirements that may not provide reliability benefit, it is not intended as a blanket reason to remove requirements from standards and is not used by auditors. PRC-002-2 is being developed as a result of an industry accepted recommendation from the 2003 Blackout Report: “Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed. A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices.” NERC Planning Standard I.F — Disturbance Monitoring does require location of recording devices for disturbance analysis. Often time, recorders are available, but they are not synchronized to a time standard. All digital fault recorders, digital event recorders, and power system disturbance recorders should be time stamped at the point of observation with a precise Global Positioning	

Organization	Question 3 Comment
Satellite (GPS) synchronizing signal. Recording and time-synchronization equipment should be monitored and calibrated to assure accuracy and reliability. **Time-synchronized devices, such as phasor measurement units, can also be beneficial for monitoring a wide-area view of power system conditions in real-time, such as demonstrated in WECC with their wide area Monitoring System (WAMS).** **Recommendation 12a: The reliability regions, coordinated through the NERC Planning Committee, shall within one year define regional criteria for the application of synchronized recording devices in power plants and substations. Regions are requested to facilitate the installation of an appropriate number, type, and location of devices within the region as soon as practical to allow accurate recording of future system disturbances and to facilitate benchmarking of simulation studies by comparison to actual disturbances.** **Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization and, as necessary, install additional dynamic recorders."** **7. The Drafting Team thanks you for your comments.**	
Texas Reliability Entity	1. R1 VSL - The percentage and time basis language in the first two parts of the VSLs are confusing: it's unclear what the percentages are referring to and what time period the assessment is being measured to. Also, the term assess is not used in the requirement or Attachment 1. The third part of the VSL is clear. Suggestion to change VSL language for the first two parts to the following language across all severity levels in the table: "The Transmission Owner identified BES buses as directed by Attachment 1 for more than 80% but less than 100% of the BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement 1 but was late 30 calendar days or less for the once every five year requirement." 2. R5 VSL - The percentage and time basis language in the first two parts of the VSLs are confusing: it's unclear what the percentages are referring to and what time period the assessment is being measured to. Also, the term assess is not used in the requirement or Attachment 1. The third part of the VSL is clear. Suggestion to change VSL language for the first two parts to the following language across all severity levels in the table:" The Responsible Entity identified the BES Elements as directed by Requirement R5 for more than 80% but less than 100% of the BES Elements included

Organization	Question 3 Comment
	in R5.1. OR The Responsible Entity evaluated the BES Elements as directed by Requirement 5 but was late 30 calendar days or less for the once every five year requirement.” 3. For R3.1 - Attachment 1 states that a ring bus or breaker-and-a-half bus are considered as a single bus. Will the SDT please clarify does this mean that in a ring or breaker-and-a-half substation, only one bus needs to monitored for R3.1? 4. For R11 - We suggest moving the language describing specific formatting requirements in R11.3 through R11.5 to the Guidelines and Technical Basis section of the standard as it is administrative in nature and not performance-based. 5. For R12 - Has the SDT discussed having the entity reporting FR/SER/DDR failures report to the Responsible Entity as well as the Regional Entity, so that the Responsible Entity can look at possible alternative methods to monitor the Elements identified per R5? There may be a reliability gap if the Responsible Entity is not notified due to no requirement for the GO or TO to do so. 6. R11 VSL - The Requirements refer to days and the VSL language refers to percentages. We ask the SDT to confirm that the interpretation of R11 VSLs below is correct. If so, we suggest changing the VSL language to the language provided below. If not, please provide the correct interpretation and possibly revised language to help assure there aren’t inconsistencies in compliance and enforcement application. Lower VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided more than 9 days but less than 10 days of the requested data. Moderate VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided more than 8 days but less than 9 days of the requested data. High VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided more than 7 days but less than 8 days of the requested data. Severe VSL: The Transmission Owner or Generator Owner as directed by Requirement 11, Part 11.2, provided less than 7 days of the requested data.
Response: 1. The wording of the VSLs for requirement R1 were revised to reflect revisions to the requirements as well as to add clarifications that you requested.	

Organization	Question 3 Comment
2. The wording of the VSLs for requirement R5 were revised to reflect revisions to the requirements as well as to add clarifications that you requested. **3. For monitoring any particular BES Element, you must be able to determine the appropriate voltages per Requirement R3.** **4. Requirement R11 Parts R11.3, R11.4, and R11.5 will remain with the standard. They are important to the effective analysis of system disturbances. Requirement R11 Parts R11.3, R11.4, and R11.5 facilitate event analysis by ensuring the result of consistency in data to be reported.** **5. The Standard Drafting Team discussed the submission of Corrective Action Plans to the Responsible Entity. It was decided to just have the CAPs go to the Regional Entity because the Regional Entity is in a better position to have an overview of the data recording capability for its area.** **6. The time period in Requirement R11 Part R11.2 does not refer to a quantity of data, but to the time period that the required data must be retrievable for. The percentages refer to how much of the sought after data was produced. The wording of the VSLs for Requirement R11 were revised for clarification by removing the reference to Requirement R11 Part R11.2.**	
Manitoba Hydro	1. Implementation Plan- The first paragraph simply describes a date that is synonymous with the Effective Date of the Standard. Accordingly, Manitoba Hydro recommends that this paragraph be abbreviated and made consistent with the third paragraph, by stating that:" Entities shall be 100% compliant on the Effective Date." 2. Similarly, the second paragraph under Implementation Plan describes a date that is three months after the Effective Date of the standard. Manitoba Hydro recommends that the wording be revised to state that: "Entities shall be 100% compliant within three months after the Effective Date. 3. R1 requires transmission Owners to notify other owners that certain BES Elements may require SER/ FR data within 90 days, however it does not specify when the 90 day period runs from. This could be interpreted as running from the Effective Date of the standard or from the day that the BES Element is identified(which could be prior to the Effective Date given that entities must be compliant with applying the methodology and identifying BES busses for which data is required as of the Effective date) . Manitoba Hydro therefore recommends that the ninety day period be clarified.

Organization	Question 3 Comment
	4. R5-(i) For the same reasons stated above, Manitoba Hydro recommends that the ninety day period be clarified. (ii) The contents of the notice to other owners (i.e. that certain BES elements “may” require data) conflicts with R7 which “requires” that an owner who has been notified to determine certain electrical quantities. Therefore, Manitoba Hydro recommends that the “may” in R5 be deleted.
Response: **1., 2.--The Effective Date section addresses the standard as a whole. The subsequent paragraphs refer to different requirements.** **3. The Requirement R1 wording says that Transmission Owners will identify the BES buses, and notify other owners within 90 calendar days. The clock starts when the Transmission Owner identifies the BES buses that have BES Elements connected to it that are owned by others.** **4. Refer to the preceding regarding the ninety-day comment. Requirement R5 stipulates that the Responsible Entity determines the BES Elements for data and has been extensively revised. The DMSDT has removed “may” from R5. Requirement R7 is needed to further specify what data is being looked for.**	
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	a. Requirement R11, subsections 11.3, 11.4, and 11.5 do NOT have any impact on the reliability of the system. They are, in fact, entirely administrative in nature. The Results Based Standard template does not support including a requirement of these types. Efforts have been made to remove administrative-type requirements from standards. In this case, a simple mistake in formatting or when naming a file would result in non-compliance with the requirements. b. The GO requirement responsibility should be limited to making available signal sources to the adjoining TO’s for the specified list of signals of interest at generating stations. In most cases the TO already owns DM equipment while the GO does not. c. We remained concerned about the cost of the needed equipment where it does already exist; but, we thank the SDT for stretching out the implementation plan which will allow the cost to be allocated over a longer period of time.
Response:	

Organization	Question 3 Comment
a. Formatting and naming were specified to ensure uniformity in recorded data submission to facilitate event analysis. **b. The standard is just concerned with "what" data is captured, not "how" the data is captured. If the Transmission Owner owns DM equipment on the high side, then the Generation Owner may coordinate with the Transmission Owner for data applicable under the standard. Ultimately, the GO is responsible for having the data to be able to determine the applicable quantities under this standard as the existence of the generator necessitates the need for the DDR data.** **c. Thank you for the comment.**	
Wisconsin Electric Power Co	o R1: We suggest that the intent should be that the buses selected according to Attachment 1 will only be those that operate at or above 100 kv ? We believe that this should be specified in Attachment 1. o R2: The Measure M2, Part (1), should be changed to “documents describing the device interconnections and configurations which MAY include a single design standard as representative for common installations... “. This will provide greater clarity that a single design standard is sufficient for evidence, but that it is not required. o R2, Measure M2: In addition, as acceptable evidence, the list in M2 should also include “station drawings” as allowed in M10. o R3: The Measure M3, Part (1), should be changed to “documents describing the device specifications and configurations which may include a single design standard as representative for common installations;”, similar to the wording in R2. As written, the Measure would require entities to have a “single design standard”, which is not part of the standard Requirements. In addition, a new Part (3) should be added to allow “station drawings” as permissible evidence o R3 and R4: The Generator Owner is listed here, but it is not clear what requirements apply to it, if it does not own any equipment listed in 3.1 or 3.2. In light of the SDT’s statements about the superiority of dynamic disturbance recording for generators, we strongly urge that the applicability of R3 and R4 for Generator Owners be removed. o R4: The Measure M4, Part (1), should be changed to: “(1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3)”...

Organization	Question 3 Comment
	o R7: "Each Generator Owner shall have DDR data for each BES Element it owns and is notified according to Requirement R5, to determine the following electrical quantities..." This wording is not clear. We suggest using wording, similar to R6, "Each Generator Owner shall have DDR data for each BES Element it owns for which it received notification as identified in Requirement R5, to determine the following electrical quantities..." o R7: In Measure 7, Part (1), we suggest changing to : "(1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations;" This will allow needed flexibility in providing reasonable evidence. o R8: In Measure 8, make the same change as described above in M7. o R9: The Measure 9, Part (1), should be changed to: "(1) documents describing the device specification, configuration, or settings". o R10: The Measure 10, Part (1), should be changed to: "(1) documents describing the device specification, configuration, or settings". o Guidelines and Technical Basis Section , Guideline for Requirement R2, two statements are made that are at least unclear, if not contradictory: "SER data for generator breaker operations provides little useful data of generator loading." "Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers connected to the Transmission Owner's bus". Please clarify or revise as necessary.
Response: Buses used in Requirement R1 are identified as BES buses, and will have to conform to the definition of BES. The voltage level does not have to be specified in Attachment 1. **The wording of Measure M2 was revised, as requested.** **The wording of Measure M3 was revised, as requested.** **Generator Owner is used in Requirements R3 and R4 because a Generator Owner may own BES Elements connected to the BES buses identified in Requirement R1.** **The wording of Measure M4 was revised, as requested.**	

Organization	Question 3 Comment
The wording of Requirement R7 was revised, as requested. **The wording of Measure M7 was revised, as requested.** **The wording of Measure M8 was revised, as requested.** **The wording of Measure M9 was revised, as requested.** **The wording of Measure M10 was revised, as requested.** **In the Guideline for Requirement R2, SER data for a generator breaker just gives the breaker position, and not the generator's load. For disturbance analysis, it is important to know the position of every breaker connected to identified BES buses.**	
Springfield Utility Board	o Requirement 4, specifically 4.1, requires a single record or multiple records that include "a pre-trigger record length of at least 30 cycles for the same trigger point, or at least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder." This 32-total cycle creates a limit on SUB's ability to store event reports, and we assume is does for many others, as well. Much of the commonly used and standard software, including that used by Springfield Utility Board, utilizes a 30-cycle event report (2 cycles pre-fault and 28 cycles post-trigger. It does not seem unreasonable to change the language from 32 cycles to 30, so that entities will not incur the unnecessary expense of either purchasing new software or developing a work-around with their current software. o The "buses" language in Attachment 1, Step 7 should be clarified. SUB believes it should read "bus" and not "buses".
Response: The overall record length of 32 cycles is commonly employed in industry, and is not an unreasonable specification. Requirement R4 Part R4.1 allows for multiple records, as noted in the second bullet: "At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder." **The wording in Attachment 1, Step 7 was revised, as suggested.**	
American Electric Power	AEP believes that the wording of requirement R11.2 clearly conveys the drafting team's intent that an entity is not required to retain more than 10 days of disturbance monitoring data at any point in time. Unfortunately, this intent is blurred by the Compliance Evidence Retention's opening

Organization	Question 3 Comment
	paragraph and the statement that "The Transmission Owner and Generator Owner shall retain evidence of Requirements R2, R3, R4, R8, R9, R10, R11, and R12... for three calendar years." The Evidence Retention, as written, could be interpreted as requiring an entity to maintain three or more years' worth of SER, FR and DDR data. The issue is further confused by the proposed PRC-002-2 RSAW in which the Evidence Requested and the Compliance Assessment Approach for R2, R3, R4, R8, R9, R10 and R11 indicate that SER, FR and DDR data is required to demonstrate compliance and imply that an entity is required to keep all SER, FR and DDR data within the audit window. AEP believes that retaining years of disturbance monitoring data is overly burdensome, provides little to no benefit to reliability and is not the intent of the drafting team. The standard should be revised to align the Compliance Evidence Retention with the Requirements and to more clearly convey the 10 day data retention requirement. The Implementation Plan includes the following "Entities shall be 100% compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list." We agree with this statement, but believe it would be more appropriate to include it within the Standard itself, rather than only within the Implementation. R1: The SDT should clarify who takes the lead role to notify other owners when there are multiple owners of a bus. Presumably it would be the company identified as the owner in the fault model being used but this should be clarified. Also, notification alone should not be sufficient in identifying monitored buses. There should be agreement from all owners that a bus should be monitored before it is included in the monitored list, unless it is in the top 10% which indicates it *must* be monitored. R2: It is unclear from the wording of R2 whether the TO/GO must monitor all circuit breakers connected to an identified bus or only circuit breakers connected to the identified bus that are associated with a BES Element. For example, would a 138 kV circuit breaker for a radial fed station service transformer be required to be monitored if it is connected to a selected bus? In this case, the station service transformer would not be a BES Element. We do not believe it would be appropriate to require SER or DFR data in this scenario, but the standard does not explicitly prevent such an interpretation. We suggest making it clear that the element is *both* connected directly to

Organization	Question 3 Comment
	the BES buses identified in Requirement R1 *and* associated with the BES Elements at those BES buses identified in Requirement R1. R3: The Application Guide implies that GSU leads are not considered lines for this standard. The requirement should be revised to clearly indicate this. Similarly, station service or reserve transformers should likewise be explicitly excluded. R3: The callout for R3 states "The required electrical quantities may either be directly measured or derivable if sufficient FR data is captured". The allowance for derivable methods is specified only in the callout, and is not explicit within the standard itself. This allowance needs to remain somewhere in the standard. Guideline for Requirement R3: We are confused by the exclusion "For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator in case of fault on the transmission system will be captured by FR data on the transmission system." We do not understand how the generation currents could be calculated from the transmission currents for faults on the interconnection. In addition, is it the drafting team's intent to exclude most generating units from fault recording? R12: We see no reliability benefit in sending all CAP's to the Regional Entity, and recommend revising it in consideration of Paragraph 81. Rather, it should be acceptable to only require the TO/GO to develop and execute a CAP and to make this information available to the RE within 30 calendar days of a request. AEP recommends revising the purpose statement to read "To ensure adequate data is available to NERC to facilitate event analysis of major BES disturbances. AEP recommends establishing only 5 requirements. There should be a requirement for each of the main objectives (establish a data set for FR/SER, establish a data set for DDR, provide FR/SER data upon request, provide DDR data upon request), and a single requirement for repair. AEP recommends modifying R1 so that the notified entity has the option to monitor either the local or the remote terminal of the subject Element. AEP recommends modifying R2-R4 and R6-R11 to clearly exempt data lost due to an equipment failure properly identified per R12.

Organization	Question 3 Comment
	AEP recommends modifying R3 so that only 3 of the 4 currents are required to be recorded. Since the fourth current can be calculated by the other three, there is no reliability impact for recording only three currents.

Response: The intent of the retention period is for the entity to retain the data that has been requested for a disturbance only. The DMSDT has revised the Data Retention section to:

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The drafting team has added a reference to the Implementation Plan in Requirements R1 and R5.

Regarding Requirement R1, Transmission Owners have to communicate the ownership of BES elements connected to a BES bus. The Standard Drafting Team discussed having a "lead" Transmission Owner. It was decided that that would lead to unneeded complexities in the requirement. Specifying agreements is outside the scope of this standard.

Regarding Requirement R2, the Rationale Box for R2 explains: "The intent is to capture SER data (opening/closing) for the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus."

Requirement R3 only applies to BES buses or BES Elements. The DMSDT believes that the requirement is clear as written. Also, the requirement was revised to explicitly state the TO/GO "shall have FR data to *determine* the following electrical quantities…" The drafting team revised the rationale to replace "derivable" to "determinable."

For faults on the Interconnection to generating facilities, the FR data from the transmission substation will capture enough data whereby the data for flow down the Interconnection can be calculated using Kirchoff's Law. Generating units are not included in the FR data capture capability.

Requirement R12: The Standard Drafting Team felt that it is important that the Regional Entity be aware of data recording capability that was out of service. The requirement allows 90 calendar days to determine a timeline for repair or replacement and for a CAP to be submitted to the Regional Entity. The requirement was revised to:

R12. Each Transmission Owner and Generator Owner shall, within 90 calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

- **Restore the recording capability, or**
- **Submit a Corrective Action Plan (CAP), to the Regional Entity and implement it.**

Organization	Question 3 Comment
The Purpose reflects the importance of entities having adequate data recording capability to facilitate their own analysis of events, and develop solutions to prevent those events from recurring. It is beneficial for generators to have DDR to analyze why machines tripped or how they behaved during system disturbances. The Standard Drafting Team combined and edited requirements from the November posting to reflect comments received. The remaining requirements reflect the Standard Drafting Team supporting the Purpose of the standard. The Rationale Box for Requirement R3 explains the need for the three phase currents and the residual or neutral current. Note that Requirement R3 reads "...to determine the following electrical quantities..."	
Northeast Power Coordinating Council	An additional implementation requirement or effective date should be included to address the situation when after the 5 year evaluation an additional element is identified for FR or DDR to afford the TO or GO to budget and install additional equipment. The draft PRC-005-X standard included language to address this in its latest draft. Consider adding to the technical guidelines for R6 more information surrounding the allowance for the use of a common bus voltage measurement where appropriate to monitor multiple BES Elements. Suggest adding to the second paragraph in the guideline for R6: The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the Standard is not to require measurement of each BES Element where a common bus measurement is available. Where a common measurement is utilized the Owner must plan the installation such that a bus outage would not result in the DDR data to be compromised. For example,...etc..... Part 11.4 requires the use of C37.111-2013. This could be an issue if an Entity has not upgraded its equipment of firmware. In R8 an exception is allowed for DDR owners with older equipment. A similar tack should be applied here. The Standard should not force replacement. Attachment 1 does not specify how to distribute an odd number for 20% of the BES buses between 10% of the BES buses and additional 10% of the BES buses (both determined in Step 6), e.g. if twenty-one (21) buses in total are required.

Organization	Question 3 Comment
	Requirement R8 should allow legacy equipment to have multiple triggered records which when combined into one time synchronized record make up the required length of three minutes. Requirement R11, Part 11.3 requires SER data in Comma Separated Value (.CSV) format following Attachment 2 whereas the majority of Disturbance Monitoring Equipment (DME) does not save data in this format. Can the Drafting Team provide a name of DME which gives the data in this format? Requirement R11, Part 11.4 requires FR and DDR data in C37.111 (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE) formatted files whereas the majority of DME equipment does not save data in this format. Are manually converted records acceptable? Requirement R11, Part 11.5 requires data files to be named in conformance with C37.232 IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME) whereas the majority of DME equipment does not save data in this format.

Response: It is stated on Page 4 of the Implementation Plan that: "Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list."

The drafting team added the sentence, "The intent of the Standard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available." The DMSDT did not believe that the second sentence is necessary as a lead-in to the example.

The drafting team agrees that there is inconsistency between requirements for using older equipment and data format. The version of COMTRADE has been revised to 1999 or later.

Whether an odd or even number of buses should not affect the distribution of buses. The requirement is for a minimum of 20 percent so you need to round up.

Combining multiple triggered records to one time synchronized record of at least three minutes in length is acceptable.

The drafting team can provide manufacturer information, but does not believe it is appropriate to provide that in a public record. Feel free to contact a member of the team for this information. The format specified in Requirement 11 Part R11.3 is for

Organization	Question 3 Comment
consistency. The standard addresses "what" data is captured, not "how" it is captured. The equipment to capture the data to conform to the standard is readily available. **Regarding Requirement 11 Part R11.4, manually converted records are acceptable, as long as the data is submitted in the specified format.** **Regardless of the file naming convention of your equipment, for consistency, submitted data files are to be named in accordance with Requirement 11 Part R11.5. You may save your files internally using any file naming convention you desire.**	
Peak Reliability	Applicability section: the Responsible Entity in all Interconnections should be the Planning Coordinator or Reliability Coordinator. R5.1.2, bullet 1, the term “significant Flowgates” appears to be undefined. Does it need to be clarified? R8: undervoltage trigger set no lower than 85% of normal operating voltage - what is normal operating voltage? For a 500 kV system, is it 500 kV or is it the average bus voltage for a specified period of time (such as 525kV)?
Response: Applicability: The responsibility of determining these locations fall on the PC, per the Functional Model. In some areas, this responsibility has been assumed by the RC and that is reflected in the applicability for the standard. **Requirement R5 Part R5.1.2 – all flowgate information has been removed. Requirement 5 Part R5.1.2 now reads “Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).”** **Requirement R8: The normal operating voltage is intended to be what voltage a system would normally be operated based on scheduled voltages.**	
Dominion	As stated in Dominion’s previous comments: “PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2013, NPCC applicable entities are two years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant with this Regional Reliability Standard. The development of a continent-wide NERC Reliability

Organization	Question 3 Comment
	Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Dominion cannot support this continent-wide standard without inclusion of a variance for the NPCC Region (PRC-002-NPCC-01).” The standard drafting team (SDT) in response provided:” The DMSDT is aware that the NPCC DMSDT has been reconvened to review the Regional Standard with respect to PRC-002-2 after it is approved.” While Dominion appreciates the SDT response, the fact remains that NPCC applicable entities continue to implement the FERC approved NPCC Regional Reliability Standard that could result in over/under installing DM capability when compared to PRC-002-2, once approved. Therefore, Dominion again urges the SDT to include a Variance in PRC-002-2 that excludes entities subject to PRC-002-NPCC-01 from the applicability section of this standard.
Response: The Standard Drafting Team has taken into consideration the approved and in-place NPCC PRC-002-NPCC-01. The Standard Drafting Team is aware that PRC-002-NPCC-01 applies to the BPS as defined in the NPCC A-10 Criteria. While that is not as comprehensive as the new BES and in force BES definition, PRC-002-2 is about "what" data is captured, not "how" the data is captured. It is impossible to make a blanket statement that meeting the requirements of PRC-002-NPCC-01 will meet the requirements of PRC-002-2. The Standard Drafting Team is sure that at the least, meeting PRC-002-NPCC-01 will provide a very good foundation for having the capability to capture the data asked for in PRC-002-2. If "over installing" Disturbance Monitoring capability was done, from an engineering and operations perspective that is only positive. The DMSDT is coordinating with NPCC to retire PRC-002-NPCC-01 upon approval of PRC-002-2.	
American Transmission Company, LLC	ATC asks that the SDT consider the following recommended changes to add clarity to the subrequirements: R5.1.2, bullet 1 - Add “as judged by the Responsible Entities,” to end of statement. R5.1.2, bullet 4 - Add “(not local Balancing Authorities)” after “Balancing Authority.” R5.1.2, bullet 5 - Add “as judged by the Responsible Entities,” to end of statement. R5.2.2 - Add “within the past 10 years” to the end of statement for time clarity.

Organization	Question 3 Comment
Response: Regarding Requirement 5 Part R5.1.2, the bulleted list has been deleted and the language is now "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)." **It is not necessary to be restrictive on the time frame for the historical peak system Demand in Requirement 5 Part R5.2.2.**	
HHWP	Attachment 1, Step 7 states: "If the list has 11 or fewer BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9."It seems that word "buses" in this sentence should be changed to "bus".
Response: "Buses" was changed to bus.	
ISO RTO Council Standards Review Committee	Attachment 2: acceptable states are OPEN or CLOSE but other terminology such as TRIP, TRIP TO LOCKOUT, RECLOSE, etc. is also commonly used. The format should allow for regional variations in terminology. Otherwise, it could become time consuming for TOs and GOs to provide the SER data.
Response: The DMSDT agrees and has revised the footnote in Attachment 2 to read: OPEN" and "CLOSE" are used as examples. Other terminology such as TRIP, TRIP TO LOCKOUT, RECLOSE, etc. is also acceptable.	
Bonneville Power Administration	BPA does not believe the Cost Effective Analysis Process (CEAP) uses an appropriate comparison example, without clarifying between the 2003 Interconnection wide-area, numerous-state blackout and the 2011 local-area, three-state blackout within an Interconnection, as the 2011 event would naturally take less time and data. BPA does agree, however, with the synchrophasor (PMU) data-speed impact.
Response: Thank you for the comment.	
Austin Energy	City of Austin dba Austin Energy (AE) does not agree with this standard as a whole. AE believes it is too prescriptive and unnecessary in the ERCOT region. Regional requirements for ERCOT regarding disturbance monitoring equipment exist in the ERCOT Nodal Operating Guides, Section 6.1.

Organization	Question 3 Comment
	(http://www.ercot.com/mktrules/guides/noperating/cur). Existing requirements provide sufficient data for disturbance monitoring.
Response: Thank you for your comment. The standard drafting team notes that the ERCOT Operating Guide is not a standard and is not enforceable. PRC-002-2 is a proposed mandatory standard and its requirements were directed at "what" data is captured, not "how" it is captured.	
Puget Sound Energy	Could we use one BES location for both DDR equipment and FR/SER equipment?
Response: As long as the standard's requirements are met, one location could be used for SER, FR and DDR capture.	
Entergy Services, Inc.	Entities with a significant number of DDRs and have DDRs which include installations where manual data retrieval is necessary should be allowed more than 30 days to collect, format, assemble and review data for submittal. Add provision for a data request submittal extension such as "R11.1 The recorded data will be provided within 30 calendar days of a request unless an extension is granted by the requesting authority."
Response: The Standard Drafting Team has added your requested language to Requirement R11 Part R11.1 regarding an extension.	
CPS Energy	First issue is that we find the methodology for determining which BES busses may require SER or FR data to be overly complicated and difficult to follow. If the methodology is going to be this complicated, then perhaps the Planning Coordinator or Reliability Coordinator is best suited to perform this analysis so that Transmission Owners do not fall out of compliance for failing to understand an overly complicated spreadsheet with more than 17 steps to determine which busses require this equipment. The second issue is with the requirement of time synchronizing SER data to within +/- 2 milliseconds. While the intent of the standard appears to be to allow many modern existing relays that sample waveforms at 16 samples/cycle, have SER capabilities, and can synchronize to a GPS clock within less than 1 millisecond, this requirement will actually prohibit many of the relays because of the SER requirement. For example, a widely used SEL-311C relay can have its clocked

Organization	Question 3 Comment
	synced to within 1 microsecond, the SER is only time-stamped once every quarter cycle, which is the processing interval of the processor. This means that the SER can only be accurate to within +/- 5 milliseconds. We think this may not be realized by the drafting team and/or many stakeholders. Additionally, we believe that the +/- 5 millisecond accuracy should be more than accurate enough if only a breaker status is required by SER. Two things to note: 1) the breaker 52a or 52b contact that would be input into the DFR device is a mechanical moving device that in and of itself may not be that accurate in regards to an actual indication as to whether the breaker is open or closed. These contacts can often be adjusted as to when they make and occasionally are even wrong in regards to status. 2) Each breaker requiring SER is in many cases already being monitored for currents that give a change of status as to the breaker being open or closed.
Response: The Transmission Owner is the appropriate entity to perform the analysis for BES buses because the Transmission Owner is more familiar with the intricacies of its system than the Planning Coordinator or Reliability Coordinator. **Requirement R10 has been revised to relate to time synchronization of the device clock rather than data. All modern digital SERs have an internal clock accuracy of much tighter than what has been specified in the standard.** **"R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following specifications: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]** **10.1 Synchronization to Coordinated Universal Time (UTC), with or without a local time offset.** **10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC."** **The Standard Drafting Team acknowledges that the auxiliary switch or other inputs to SER for breaker status are not precise. Current through a breaker may be zero without a breaker opening. Breaker position status data is necessary for disturbance analysis. For multiple feeder tripout disturbances, circuit breaker SER data has been useful in making timely restoration decisions.**	
Associated Electric Cooperative, Inc. - JRO00088	FOR: Appendix #1, Step 6, Paragraph 2REPLACE: "buses with the highest" WITH: "bus with the highest" RATIONALE: Clarity - As this process step seems to yield one identified bus, presumed to

Organization	Question 3 Comment
	fill the void of its successor bullet's 10% minimum count, the use of "required at" in conjunction with "buses" is confusing. FOR: PRC-002-2, R5.2, Guidelines ECI believes the guideline for 5.2 should provide sample calculations for the number of DDRs required: 1) for an entity having 5999 MW Historical Load, and 2)for an entity having 6000 MW Historical load. While we believe the answer for 1) is only 1 DDR, and for 2) 2 DDRs per R5.2, the Webinar presenter mentioned some expectations for Rounding which introduced uncertainty that the above example could address.
Response: The drafting team has revised "buses" to "bus" as requested. **Requirement R5 Part R5.2: Your answers are correct. Part 5.2 has been revised to:** **5.2 Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:** **5.2.1 One BES Element** **5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak system Demand.**	
Oncor Electric Delivery LLC	General: It is understood the Rationale Boxes will be retained but relocated to the "Guidelines and Technical Basis Section" of the Standard. If the "Guidelines and Technical Basis Section" cannot be used as compliance validation to auditor(s), it is imperative the requirement language be paired to the alternatives specified in the Rationale language. Oncor identified several instances where the Rationale Boxes provided much needed clarity to the Requirement itself. Incorporating the Rationale/intent language into the Requirement or Measurement itself would further clarify the Requirements resulting in a clear and mutual understanding for both the Registered Entity and the auditor(s). Therefore, Oncor recommends the DMSTD review the Requirement/Measurement language and the corresponding Rationale language to ensure there are no gaps. Specifics are provided below: R2: Legacy FR equipment installed before the Standard effective date may not be capable of embedded SOER. R2 does not afford the same caveat for older equipment where SOER is required that R8 provides for older equipment where DDR is required. Language should be added to R2

Organization	Question 3 Comment
	providing the option to utilize FR digitals to monitor circuit breaker position for required circuit breaker position monitoring.R1 and R5: The Implementation Plan includes specific references to timeframes for becoming fully compliant with the locations lists after approval of the standard, but the Requirement language itself does not include post-implementation "5 year re-evaluation" compliance timelines for the required reassessments. "Re-evaluation time frame implementation" language should also be included in the affected Requirements to prevent any disparity following the initial implementation and departure from the Implementation Plan. R3 and R6: A Rationale should be added that the required "electrical quantities can be determined (calculated, derived, etc.)" to R3 and R6 as described below: o The R3 Rationale explains the method of deriving electrical quantities. The language of R3.1 does not reflect the intent described in the Rationale. Specifically, whether locations where busses are effectively tied together, such as on ring or breaker-and-half bus configurations, can derive the required phase-to-neutral voltages by monitoring a minimum of two of each Phase-to-Neutral voltages, from either line terminal or bus potentials. In a typical large switching station, this could eliminate costly retrofits to literally provide all three phase-neutral voltages for "each line or bus." o The language of R6.3 does not specify the method used to provide "Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required." If a single phase voltage and current are collected for R6, is it acceptable to calculate power flows expressed on a 3 phase basis derived from single phase quantities? Allowing calculated power flow would prevent costly retrofits to literally provide 6 dedicated analog traces for each Element required to have a DDR.R10: The "Rationale for R10" language, "Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset." Hence, requested records must be supplied in UTC format, but the collected and stored format do not. Similar to the "R3 and R6" comments above, the Requirement 10 and/or M10 should incorporate the same language for both the Registered Entity and the auditor(s) clear understanding.R10: Additionally, the "Rationale for R10" language should provide a caveat to allow for manipulating event records to UTC for equipment that is synchronized but cannot time-stamp with UTC as the reference. This would be similar to the "or derived" language suggestions to Requirements R3 and R6 which would allow for legacy equipment to meet the standard as well as allow for the time-alignment for multiple FR/SOERs as M11 evidence. Similar to

Organization	Question 3 Comment
	the "R3 and R6" comments above, the Requirement 10 and/or M10 should incorporate the same language for both the Registered Entity and the auditor(s) clear understanding.R11: (Requirement 11.4) If relays meet the requirement of a DDR, the language of R11.1 or M11 should specify that synchrophasor data is acceptable for DDR analysis. Relay Synchrophasor data is not compatible with the legacy COMTRADE format.R11: (Requirement 11.5) Additionally, add "Rationale for R11" language, "Collected and stored data does not need to follow the "C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME)" file naming format. The data provided pursuant to a data request must be provided in the C37.232 file naming format. Similar to the "R3 and R6" comments above, the Requirement 11.5 and/or M11 should incorporate the same language for both the Registered Entity and the auditor(s) clear understanding.
Response: The intent of a rationale box is to explain and clarify the intentions of the associated sections of the standard. After approval, the rationale boxes will be moved to the end of the standard, prior to the Guidelines and Technical Basis Section. The requirements of the standard are what will be audited; the rationale boxes are for an entity's or auditor's reference. The Standard Drafting Team reviewed the requirements and their associated rationale boxes to ensure consistency and completeness. **Requirement R2--PRC-002-2 addresses "what" data is recorded, not "how" it is recorded. Because of the significant differences between legacy DDR equipment and modern continuously recording DDR equipment it was necessary to address those differences in the standard.** **Requirements R1 and R5--The Implementation Plan specifies that: "Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list."** **Requirements R3 and R6--The wording in the rationale boxes for Requirements R3 and R6 was revised to clarify the intention of the requirements. Having adequate electrical quantities to calculate or derive other electrical quantities is the intent of these requirements.** **Requirement R10--The wording in the rationale box for Requirement R10 was revised for clarity. Data provided must be in the UTC format. The standard is addressing in what format the data must be provided.** **Requirement R11--Data must be provided in the formats specified to ensure uniformity to aid event analysis.**	
Liberty Electric Power, LLC	Generator owners should not be required to install DME. Generators do not model the BES, have no overall awareness of the state of the BES, and are not monitoring the overall state of the BES.

Organization	Question 3 Comment
	The requirement should be, at most, to provide a signal showing breaker position to the TO. Requirements for GOs to provide equipment are properly the realm of the interconnection agreement, not a NERC standard, and the SDT is intruding on the contractual relationship between REs.
Response: The standard deals with "what" data is captured, not "how" it is captured. It is not intended to require redundant data capture. The goal of the standard is that the data be captured. The SDT disagrees with any statement or implication that GOs should not be responsible for DDR data in PRC-002-2. Whether a GO has need or use for DDR data for its units does not impact the grid's need for it for event analysis – which benefits all users, owners and operators of the BES - after a system event. And it is consistent and logical practice in all NERC standards that owners of BES equipment are responsible to provide data required by that standard, for the BES equipment they own. Consequently GOs are correctly responsible in PRC-002-2 for the DDR data required from their units by the standard, not others such as TOs.	
Ingleside Cogeneration LP	ICLP has been closely following the distribution of the Cost Effectiveness Analysis Process (CEAP) survey and its results. We agree with the general findings that the existing base of Disturbance Recorders are mostly sufficient to meet PRC-002-2's locating and capability requirements - and that the reliability benefit of adding more equipment is minimal. However, it seems to us that NERC's and the Regional Entities' data analysis teams feel that the information provided in the evaluation of recent events is still lacking. This conflicts with the equipment owner's opinions and should be reconciled. Unfortunately, the only justification seems to be that the 2003 investigation recommended the action and FERC directed it be done. This is not a minor point. The benefits of reliability oversight at the national level may be the most difficult to assess, but are the most important. Every dollar spent on compliance needs to be properly allocated, otherwise it will go to less important initiatives. As such, ICLP urges that another CEAP survey be performed - but this time by the ERO community. Any perceived value should be quantifiable, so that it may be compared to the costs we all take on.
Response: Thank you for the comment. The CEAP process was performed and endorsed by the NERC Standards Committee for this standard. It is not meant to be a cost/benefit analysis. It is intended to be a cost-effectiveness analysis to provide stakeholders an	

Organization	Question 3 Comment
opportunity to provide potential costs associated with the standard, as well as potential alternative solutions that would meet the intent of the standard.	
MRO NERC Standards Review Forum	In both R3 and R4 it appears the applicability is for Transmission Owners and Generator Owners but the GO typically does not own a substation bus, transformer with a low-side of >100 kV, or transmission lines (as a registered entity of GO). We believe Generator Owner should be removed from these requirements. In R5 please consider the following modifications:R5.1.2, bullet 1 - Add "as judged by the Responsible Entities" to the end of the bullet.R5.1.2, bullet 5 - Add "as judged by the Responsible Entities" to the end of the bullet. R5.2.2 - Add "within the past 10 years" to the end of the requirement to provide a reasonable and finite time frame. The NSRF interprets R11.2 to say that NERC/Regions will always submit a request for data within 10 days of an event, so it is not necessary for DME's to hold data longer than that timeframe. As this impacts the memory/storage capability of the equipment we would appreciate clarification as to how the 10 days was determined and if the SDT believes the timeframe is long enough.
Response: The DMSDT disagrees with any statement or implication that GOs should not be responsible for DDR data in PRC-002-2. Whether a GO has need or use for DDR data for its units does not impact the grid's need for it for event analysis – which benefits all users owners and operators of the BES - after a system event. And it is consistent and logical practice in all NERC standards that owners of BES equipment are responsible to provide data required by that standard, for the BES equipment they own. Consequently GOs are correctly responsible in PRC-002-2 for the DDR data required from their units by the standard, not others such as TOs. **Regarding Requirement 5 Part R5.1.2, the bullets have been removed and the sub-part revised to: "Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL)."** **Requirement R5 Part R5.2.2: It is not necessary to be restrictive on the timeframe for the historical peak system Demand in Requirement R5 Part R5.2.2.**	

Organization	Question 3 Comment
Your interpretation is correct. Data will be requested soon after a major incident. The Drafting also considered available storage capabilities, and it judged 10 calendar days to be an appropriate timeframe.	
ITC	ITC feels that the Requirement 10 specification of + 2 milliseconds of Coordinated Universal Time (UTC) is too restrictive for a number of industry wide installed modern microprocessor based relays. These relays have proven to be reliable from a protection, SER, and FR perspective. Additionally, the present PRC-018 standard indicates that a DME's clock shall be synchronized within 2 ms. ITC agrees the PRC-018 synchronism requirement would be acceptable for SER device clocks but not data. It is recommend that the DMSDT consider changing the tolerance level for breaker status SER to be within 10 milliseconds. This would allow the continued use of these microprocessor based relays. This will be consistent with DMSDT guidance that microprocessor relays are acceptable implementations of SER and FR.
Response: Requirement R10 has been revised to relate to time synchronization of the device clock rather than data. All modern digital SERs have an internal clock accuracy of much tighter than what has been specified in the standard. **"R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 that meet the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]** **10.1 Synchronization to Coordinated Universal Time (UTC), time stamped with or without a local time offset.** **10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC."**	
Lincoln Electric System	Per Attachment 1, Step 1 utilities are instructed to "Determine a complete list of BES buses that it owns." A complete list of BES buses could include tap buses feeding radial load where there would be no BES circuit breakers or relaying and therefore no ability to gather the data pertinent to this standard. The SDT response to LES' previous comments stated that, "If a tapped substation was not modeled in a system study as a bus then it would not be considered a bus." If this is the drafting team's intent, it should be clearly stated in Step 1 that tap buses with no BES breakers or relaying are not to be included. Doing so eliminates any possible confusion associated with

Organization	Question 3 Comment
	whether a bus has been included in a system study. Whereas a Planning study model may not include these buses, a System Protection study model would in consideration that non-BES transformer relaying at the tap has to be coordinated with relaying at adjacent substations. R11.2 specifies "The recorded data will be retrievable for the period of 10 calendar days preceding a request." For clarity, LES suggests restating R11.2 as follows: "The recorded data will be retrievable for the period of 10 calendar days following the date that the data was recorded." Wording it this way ensures that the 10 calendar day timeframe starts on the day that the data was recorded. If left unchanged, the existing statement would tie the 10 day timeframe to the date of the request which makes the timeframe indefinite given the fact that the requesting entity has no time limit on when a request can be made.
Response: The DMSDT has revised the first sentence to: "For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid." The wording of Requirement R11 Part R11.2 was revised as suggested.	
PJM Interconnection	PJM urges the drafting team to reconsider including some type of alternative method for determination of the BES buses requiring sequence of events recording and fault recording as stated in the BES detailed methodology included in R1 and detailed in Attachment 1 of the standard. PJM suggested an alternative method that would be less burdensome for entities working on installation of or already have installed modern equipment with FR and SOER capabilities on their circuits. PJM appreciates the drafting team's consideration of our proposed alternative method and understands that it is not included in the draft standard presently posted. PJM feels strongly regarding inclusion of some type of alternative method and therefore will be submitting a negative ballot for the draft standard.
Response: The Standard Drafting Team evaluated methods of determining how to locate SER and FR data recording capability, and decided on Attachment 1 as being the best universally-applicable option. The DMSDT does not believe that the methodology is burdensome. The methodology only asks for BES buses rather than line terminals and only requires at least 20 percent coverage. This reduces the compliance burden for each entity.	

Organization	Question 3 Comment
Exelon Companies	R1: See comments to question 1. R2: It is not necessary to monitor circuit breaker auxiliary contacts to figure out when a circuit breaker opened or closed. Loss of current can be monitored in a fault recorder. This requirement puts a high burden on identifying print #s to show circuit breaker auxiliary contacts are connected to relays with SER capability. This effort is just not necessary based on our experience investigating thousands of operations over the years. The drafting team should eliminate this requirement or modify it to clearly state that cessation of current can be used to determine when circuit breakers open. R3: T-lines are exposed to a much higher number of faults/operations than T-transformers. Thus, modernization of T-line protection provides the greatest increase to reliability by a large margin. Having modern relays on T-lines allows for deducing current in transformers if necessary. The drafting team should concentrate on lines rather than transformers as the industry is doing. The drafting team should remove transformers from R3 since this information can be deduced from line monitoring or change R3.2.1 to state Transformers... “only when sufficient line monitoring is not present to derive transformer quantities”. R4: No comment, previous changes made by the drafting team addressed our concerns. R5: No comment, previous changes made by the drafting team addressed our concerns. R6, R7, R8: No comment. R9: The drafting team should eliminate requirement 9.1 unless they are aware of a significant portion of the industry installing equipment that doesn’t meet this requirement. To our knowledge, the main manufacturers of this equipment all easily exceed this requirement. R10: The drafting team should eliminate the requirement of within +/- 2 msec of UTC unless they are aware of a significant portion of the industry installing equipment that doesn’t meet this requirement. To our knowledge, the main manufacturers of this equipment all easily exceed this requirement. R11: No comment.

Organization	Question 3 Comment
	R12: We're using microprocessor relays for FR and SOE capability. They are tested under PRC-005 and alarmed upon failure. We should not have to keep track of every relay that fails on the system that we fix or replace for this standard. We have plenty of incentive to keep our relays working already and we don't run with failed relays for 90 days. Hence, there is no need for R12 and it should be eliminated. It is 100% burden, a complete waste of engineering resources, and hence a detriment to overall reliability. If the drafting team will not eliminate this requirement, it should be re-worded such that it is very clear that we do not need to keep track of failures that are rectified within 90 days. We should not have a compliance burden to prove that we fixed something in 2 days. An overall comment is that we believe this standard is not required for FR and SOE. These functions are built in to modern relays being adopted industry-wide already. All the requirements related to FR and SOE should be eliminated and the standard written to address DDR only. It is even arguable that this standard is required to promote DDR capability as the widespread use of synchrophasors including their storage has greatly expanded since 2003.
Response: R1: Please see responses to Question 1. **Requirement R2: Current through a breaker may be zero without a breaker opening. Breaker position status data is necessary for disturbance analysis. For multiple feeder tripout disturbances, circuit breaker SER data has been useful in making timely restoration decisions.** **Requirement R3: Requirement R3 states "...to determine..." As you intimate, an entity just has to be able to determine the quantities in the requirement.** **Requirement R9 Part R9.1: Even though 960 samples per second is common in industry, Requirement R9 Part R9.1 was included to ensure adequate accuracy for calculations.** **Requirement R10: Even though +/- 2 miliseconds is common in industry, Requirement R10 was included to ensure adequate accuracy for calculations. R10 was also revised to provide clarity:**	

Organization	Question 3 Comment
“R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 that meet the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 10.1 Synchronization to Coordinated Universal Time (UTC), time stamped with or without a local time offset. 10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.” R12: If you have compliance data for PRC-005 that meets the requirements in Requirement R12, then you can use the same data for compliance with PRC-002, Requirement R12. Requirement R12 stipulates that for a failure of recording capability an entity has ninety 90 calendar days to get it restored, or file a Corrective Action Plan. SCADA logs could also be used as evidence and this has been added to the measure. PRC-002-2 ensures that there will be "...adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances." This includes FR and SER data as they are critical items that assist in determining what happened during a disturbance.	
ReliabilityFirst	ReliabilityFirst has the following comments for consideration: 1. Requirement R6, Part 6.1.3.2 - For Requirement R6, Part 6.1.3.2 if plant that has six 200 MVA units, does this plant require any DDRs? As currently written, ReliabilityFirst believes no DDRs are required at this facility. From a monitoring perspective, ReliabilityFirst believes any plant/facility that has an aggregate nameplate greater than 1000 MVA, should have equipment capable of DDR. 2. Requirement R12, Part 6.1.3.2 - ReliabilityFirst does not understand the reasoning behind requiring the submission of the timeline for restoration and a Corrective Action Plan (CAP) to the Regional Entity. Without a requirement for the applicable entity to “implement” the CAP, the Regional Entities will have little recourse and there is little value in having the CAP if there is no requirement to complete it. Theoretically, the CAP could go on in perpetuity without completion and the entity would still be compliant, but the problem would remain unresolved. Furthermore, if the requirement requiring the applicable entity to “implement” the CAP, the Regional Entities can monitor implementation through a Regional Entity monitoring method. ReliabilityFirst recommends removing the “for submission to the Regional Entity” language and include

Organization	Question 3 Comment
	implementation language as follows:i. "...restore the recording capability or develop a timeline with milestones for completion for restoration and implement a Corrective Action Plan (CAP)." 3. VSL for Requirement R2 - ReliabilityFirst believes the gradation of VSLs should be in 10% increments (or similar to the VSL designations for Requirement R1). As written, if an entity only had 51% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers they would only fall under the moderate VSL. ReliabilityFirst believes missing close to half of the total SER data is completely missing the intent of the requirement and should be designated as a "Severe" VSL. ReliabilityFirst has a similar comment for the VSLs associated with requirements R3, R4, R6, R7, R8 and R9.

Response:

1. The reference is to Requirement R5 Part R5.1.1. A plant with six 200MVA machines would not be required to have DDR. The Standard Drafting Team intended to establish generating resource monitoring requirements to develop a foundation for which data is required to be captured.

2. Referring to Requirement R12, the Standard Drafting Team decided to have the CAP submitted to the Regional Entity because of its overview of the system. Corrective Action Plan is defined in the NERC Glossary of Terms as:

A list of actions and an associated timetable for implementation to remedy a specific problem.

The CAP therefore, would include a timeline for restoration. The Drafting Team did not want to get more specific on milestones for restoration of the capability because from experience it is unrealistic to place milestones on returning the capability to service because of uncertainties in supply and delivery of what is needed to make restoration. The Drafting Team revised the wording in the requirement and Rationale Box. The Regional Entity would determine if the timetable was acceptable.

R12. Each Transmission Owner and Generator Owner shall, within 90 calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

- **Restore the recording capability, or**
- **Submit a Corrective Action Plan (CAP), to the Regional Entity and implement it.**

3. The DMSDT concurs and has made the revisions as suggested.

Organization	Question 3 Comment
Seattle City Light	Seattle appreciates the efforts of the Drafting Team to respond to comments received following the initial posting of this draft Standard. However, Seattle fundamentally disagrees with the approach proposed by draft PRC-002 for several reasons. 1. First, the proposed Standard requires an entity to establish at least 43 new controls to meet the compliance assessment approaches identified in the draft RSAW, and this figure does not consider the dozen or additional controls required to ensure all Attachment 1 steps are met. For context, consider that approximately 4-5000 controls are required to meet the entire body of NERC Standards. As such proposed PRC-002 represents a 1% increase in the overall compliance burden on the electricity enterprise. Entities will be required to monitor performance of minor activities, and auditors likewise will be required to examine performance. Seattle does not believe the reliability benefit offered by this Standard warrants this new compliance burden. Indeed each requirement of PRC-002 is identified as “Lower” for violation risk factor (the lowest rating possible), indicating that the drafting team does not consider any requirement of the Standard to have a critical impact on BES reliability. Rather this Standard supports long-term operational improvements in the BES. Seattle believes such improvements are important and supports a reasonable approach to disturbance monitoring, but does not support the complex, over-engineered Standard. 2. The bus screening process is an example of a process that needs to be simplified. The rational does not seem to be well thought out and is certainly not easy to explain and implement (worse than the FERC Order 754 exercise that industry recently participated in). The attached Excel spreadsheet and the directions for completing it are very cumbersome and inefficient--a lot like trying to fill-out a Federal Tax form. Instead of giving an entity the metrics to be achieved, this approach attempts to create a cookbook format where data needs to be entered in one part of the spreadsheet, and then subtracted out in another part of the spreadsheet. 3. Seattle believe appropriate and reasonable a general requirement to have disturbance monitoring, but believes the technical requirements for data type, frequency of sampling, and so forth would be better handled in a criteria or guideline document. Once such requirements are codified as federal law it is cumbersome and lengthy process to change them, yet all are aware how fast technical change has occurred in the area of disturbance monitoring. Moving

Organization	Question 3 Comment
	the technical requirements from the Standard to a guidance document likewise would significantly reduce the compliance burden associated with the draft. 4. Finally, Seattle requests technical justification by established for continent-wide application of a 1500 fault MVA threshold. Once established in a Standard, a technical justification will be required for any change; as such technical justification should be provided beforehand to establish the value as correct and appropriate. This value may be correct and appropriate for the NPCC area, but has not been justified in other regions. It may well be correct and appropriate, but a justification has not yet been provided.

Response:

1. The need for the development of a standard rather than criteria or a guideline for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:

"Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed.

A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices."

The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.

The Lower Violation Risk Factor was selected for the PRC-002-2 requirements because they do immediately affect the real-time electrical state or capability of the bulk electric system.

2. The bus identification process provides a consistent method to be able to define for what BES Elements data needs to be captured.

3. PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that might arise from the technological advances being made to record the data.

Organization	Question 3 Comment
4. The 1500 MVA value was arrived at based on three phase fault MVA data collected from industry from the June 5, 2013 Informal Request for Information posting.	
PPL NERC Registered Affiliates	See comments 3a-3c below. 3a. The Guidelines and Technical Basis Section of the standard states in the first paragraph on p.33 that, "SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data." The next section (Guideline for Requirement R2) states however that "Generator Owners are included in this requirement [for SER data] because a Generator Owner may, in some instances, own breakers connected to the Transmission Owner's bus." All generator output breakers connect eventually to the transmission system however, nor is it clear why the aforementioned lack of tripping time reliability for GO sequence-of-events monitoring would apparently apply in some cases (GO SER data mandatory) and not in others (GO SER data not required). 3b. The Guideline for Requirement R3 on p.33 states that "Generator step up transformers (GSU) are excluded from the above based on the following:- Current contribution from a generator in case of fault on the transmission system will be captured by FR data on the transmission system.- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed. The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data." This seems to fully exclude GOs from fault recording obligations, so why are GOs obligated in R3 and R4 to have FR data? 3c. Comments 3a and 3b above gain emphasis from the circumstance that it is expected that the Guidelines and technical Basis Section of the draft standard will be deleted if and when PRC-002-2 is voted-in and approved by FERC. That is, the logic by which GOs are sometimes in and sometimes out will be even more obscure than it is now.

Organization	Question 3 Comment
	3d. The requirements for GOs to "have" SER (R2), FR (R3 and R4) and DDR (R7) data are understood to mean that they do not need to own this equipment, and it would do just as well to have an agreement with the TO to fulfill the PRC-002-2 requirements if and where the TO already has DME on their side of the generation plant fence. This point does not come across clearly in the present text of PRC-002-2. There should be a footnote saying that "This standard defines the 'what' of DDR, not the 'how.' GOs may install DME or, where the TO already has suitable DDR, contract with the TO." It would be still better to just drop GOs from the picture, however, per our comments above.
Response: **3a. While DDR data more accurately reveals how a generator is behaving, SER data for breakers connected to a transmission system bus is useful in determining fault clearing times, and identifying interrupting device problems. The intent is to have SER data for generator output breakers connected directly to a Transmission Owner's Bus. SER and FR data is needed to analyze "fast" disturbances on the BES, not the slowly evolving disturbances captured effectively by DDR. The wording of the Guideline for Requirement R2 was revised.** **3b. Requirements R3 and R4 apply to GOs to ensure that data is collected for transmission system BES Elements a GO might own.** **3c. The Guidelines and Technical Basis Section stays with the materials for the standard after the standard is approved by FERC. The Standard Drafting Team is revising the Guidelines and Technical Basis Section to ensure consistency.** **3d. As stated, the standard does not deal with "how" data is recorded, but "what" data is recorded. Because of the importance of generator response to system disturbances, the GO is needed to be included in this standard. A statement has been added to the Introduction of the Guidelines and Technical Basis Section to reinforce the "what" versus "how."**	
SPP Standards Review Group	Some drafting teams have adopted a convention of hyphenating terms such as 30-, 60- and 90-calendar days. We suggest the DM SDT do the same. Similarly, '30-cycle post-trigger' should also be hyphenated. We also noted that in the redline, step-up transformer was hyphenated in some places and not others. However, in the clean copy of the standard it is not hyphenated. We believe it should be. In some places in the documentation three-phase is hyphenated and in others it is not. While we think it should be, we encourage the DM SDT to be consistent. 'Disturbance' is defined in the NERC Glossary and depending upon its usage should be capitalized. The DM SDT needs to be

Organization	Question 3 Comment
	consistent with its format. In the 2nd line of M3, insert 'that' in between 'data' and 'is'. In the 3rd line of the 1st paragraph in the Rationale Box for R5, it would be appropriate to use BES rather than spelling out Bulk Electric System. Add a hyphen to 'high-' in the 3rd line of the Rationale Box for R7. This is consistent with usage throughout the rest of the documentation. We suggest modifying the first sentence of Requirement R8 such that it reads: 'Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage.' There are a couple of instances in the 3rd paragraph of the Rationale box for R11 where 10 days is used. We believe this should be 10-calendar days. Also, in the next to last line of the last paragraph 'disturbance recording' is capitalized. It is not a defined term in the NERC Glossary and shouldn't be capitalized. This change needs to be made throughout the documentation. In the 6th line of the Rationale Box for R12, 'entity' should not be capitalized. In the VSLs for R2, insert 'Owner' between 'Transmission' and 'or' for consistency throughout the VSLs for the other requirements. We suggest the following replacement for the 2nd item under Step 7 of Attachment 1. 'If the list has 1 to 11 BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three-phase short circuit MVA as determined in Step 3. Proceed to Step 9.''Disturbance monitoring' is capitalized in the Introduction of the Guidelines and Technical Basis Section. Since it is not a defined term in the NERC Glossary, it shouldn't be capitalized. Modify the next to last line of the 1st paragraph in the Guideline for Requirement R1 to read '...voltage and current for individual circuits allow precise reconstruction of events of both...' Change 'disturbance' to 'disturbances' in the next to last line of the 2nd paragraph. In Item 6 on Page 32 (clean version) of the same section, insert 'to those' between 'buses' and 'with'. In the 6th bullet under Item 8 on the same page, change 'Owners'' to 'Owner's'. Hyphenate 'in-effect' in the 1st line of the 2nd paragraph of the Guideline for Requirement R3. Modify the 1st line of the Voltage Recordings section on Page 34 (clean version) to read 'Voltages are to be recorded at applicable BES buses. Note that Requirement R3 calls for the...'Delete the 's' on 'meets' in the 2nd line of the 1st paragraph of the Guideline for Requirement R4. Change 'captured' in the 1st line on Page 35 to 'captures'. In the 2nd line of the same paragraph, set the phrase 'when time synchronized to a common clock' off with commas. Delete the last sentence of the 1st full paragraph on Page 36 (clean version). It is a duplicate. Insert an 'a' between 'after' and 'fault' in the 1st line of the 1st paragraph under Guideline for Requirement R6.Replace 'has' with

Organization	Question 3 Comment
	'with' in the 3rd line of the 1st full paragraph on Page 37 (clean version). Near the end of that same line, there appears to be an extra space between 'Bus,' and 'would'. Skip a line and hyphenate 'in-service'. Capitalize Real Power and Reactive Power here and in the last paragraph before Guideline for Requirement R7. Add a hyphen to 'high-' at the end of the 1st line under Guideline for Requirement R7.Hyphenate 'short-term' in the 2nd line of the 1st paragraph under Guideline for Requirement R9. In the 4th line of the 2nd paragraph, insert an 'a' between 'in' and 'sampled'. Capitalize 'Requirement R1' and 'Requirement R5' in the 3rd line of the 1st paragraph under Guideline for Requirement R11. Delete the 'a' in front of 'Day 1' in the 6th line of the 3rd paragraph under Guideline for Requirement R11. Insert an 'and' and delete the 'it' in the 2nd and 3rd lines of the 2nd paragraph on Page 40 (clean version). That portion of the sentence should then read '...Transient Data Exchange and is well established in the industry.' Split the 2nd sentence of the 3rd paragraph on Page 40 (clean version) into two sentences such that it reads '...Naming Time Sequence Data Files. The first version was approved in 2007.' In the 4th line of the 3rd paragraph on Page 40 (clean version) replace 'was' with 'were'. Hyphenate 'out-of-service' in the paragraph under Guideline for Requirement R12. Also, there appears to be an extra space between 'develop' and 'a' in the 10th line of the same paragraph.
Response: The wording and punctuation in the standard has been reviewed, revised, and made consistent. Terms using "calendar date" have been hyphenated throughout as well as step-up and 30-cycle post-trigger. The DMSDT capitalized Disturbance as well as System and Transmission throughout the standard where appropriate. The other grammar and syntax changes that you suggested were incorporated into the standard.	
PNM	Suggested rewording of R12 to clearly state submission of CAP is required. "...develop a timeline for restoration and submit a Corrective Action Plan (CAP) to Regional Entity."
Response: The wording of Requirement R12 was revised to specify submittal of a CAP as well as implementation of the CAP.	
Tacoma Power	Tacoma Power disagrees with the need for this standard and believes there are more cost effective alternatives for acquiring the data necessary for event analysis. However, assuming that this standard will likely proceed to approval, we are providing both comments for improving the draft

Organization	Question 3 Comment
	standard and an explanation for why we believe this standard is not the appropriate method to address the perceived needs. a. Under Measurement M3, change “...of FR data is...” to “...of FR data that is...” b. Under Measurement M11, change “...evidence (electronic or hard copy) data...” to “...evidence (electronic or hard copy) that data...” c. What if FR, SER, or DDR equipment is taken out of service for maintenance and/or testing. Could this result in an automatic violation of Requirement R11, Part 11.2? Or, should this be treated like a failure under Requirement R12? d. In Attachment 1, Step 7, for cases in which the list has 11 or fewer BES buses, change “...at the BES buses with...” to “...at the BES bus with...” e. Please confirm that only the channels that trigger need to be provided upon request and that no cross-triggering between FR or SER is required. f. Requirements R3 and R4 should require the capability to record data rather than requiring data. g. The VSLs for Requirement R10 should be based on the number of missed electrical quantities rather than the number of BES buses. Otherwise, please provide guidance on how a substation with several relays correctly time stamped but one relay with an incorrect time stamp should be treated. h. Requirement R10 should be modified to have SER timestamping to +/- 40 milliseconds while maintaining the FR and DDR timestamp of +/- 2 milliseconds for two reasons. First, the breaker position indication using 52a or 52b contacts can be different than the main contacts opening and ultimate current interruption by more than 2 cycles. Typical, 52a vs 52b contacts are at least Â½ of a cycle apart. Timestamping the relay input to 2 milliseconds will not actually indicate the state of the power system. Second, SEL 300 series relays timestamp SERs to the nearest quarter cycle, so a large number of installed relays would not meet the requirements for SERs. These relays do timestamp the FR to the specified accuracy, just not the SER.Alteratives to this draft standard:The 2003 outage report outlined major deficiencies with event recording, but the data recording technology has dramatically changed in the last decade. Even though no standard was in place

Organization	Question 3 Comment
	specifying data recording, utilities have been installing GPS time stamped event recording based on business drivers. As outlined during the CEAP report, the labor for event report alignment was reduced from 4,400 person-hours for the 2003 outage to only a week for the 2011 southwest outage. Although further reductions in event analysis SME hours would result from this standard, the compliance SME hours would dramatically increase and result in overall higher costs. As outlined in the CEAP report, most utilities already have event recording in place, or are going toward recording as part of multifunctional equipment installations. Therefore, ignoring automated event collection, the only costs that should be considered are due to the increment burdens of documenting compliance with this standard. Instead of this standard, we believe that a NERC guidance document on event reporting best practice would be equally effective while requiring very little compliance burden. In other areas, NERC is moving away from standards that require zero defects in high volume tasks. This standard requires 100% accurate time stamping of 100% of a small portion of elements, but then ignores 80% of BES buses. On a voluntary basis, we have approximately 50% of elements monitored. Thus if we supplied only the event reports required by the standard, the coverage of our system would go down dramatically. In order to meet the zero defect policy of this standard, we will have to redirect efforts from actual event analysis to documentation of event recording capability. If data recording is implemented as a standard instead of a best practice guideline, it sets the minimum bar instead of the optimal goal. Most utilities already have at least a marginal level of recording capabilities. We would prefer NERC to aim higher. The best event records occur when all data channels at a substation are recorded for a trigger on any channel for any kind of transient, including frequency or overvoltage. This level of recording is impractical to require as a standard but is already in place for many utilities. For an enforceable standard, we agree that undervoltage & current are the only reasonable triggers to require.We are concerned that the SDT appears to have based installation cost assumptions on the premise of using data stored locally on relays. If this is an enforceable standard with a zero defect requirement, utilities are in essence forced to automated event collection from relays in order to guarantee zero defects. This automated event collection then brings in large costs for communications, and for applying CIP standards to those communications. If this were a best practices document, or allowed some data gaps, local relay storage would be a reasonable assumption.

Organization	Question 3 Comment
Response: **a. The wording of Measure M3 has been revised.** **b. The wording of Measure M11 has been revised.** **c. The Rationale Box and Guideline for Requirement R12 explain that any recording capability outage greater than 90 calendar days is treated as a failure of recording capability.** **d. The wording in Attachment 1, Step 7 has been revised.** **e. The triggered channel data will be requested after a system disturbance. The appropriate triggering implemented to capture the desired data is the intent of PRC-002-2.** **f. The standard is about "what" data is recorded, not "how" it is recorded.** **g. The VSLs correctly reflect the necessities for correctly collecting data. The time stamp associated with the data collected for a BES Element must be correct.** **h. PRC-002-2 is about "what" data is recorded, not "how" the data is recorded. Requirement R10 was revised to address synchronization to Coordinated Universal Time, and synchronized device clock accuracy to +/- 2msec to reflect equipment realities. It is understood that there are many entities that have the capabilities called for in the standard in place already, but the intent of the standard is to ensure there are no gaps. Having recording capability beyond what is required in the standard is an engineering, planning, and operational plus. It is difficult, if not impossible, to quantify the costs of implementing lessons learned from events analysis made possible by the availability of system data.**	
~~City of Tallahassee~~	~~TAL believes that this standard is not justified, either from technical or cost benefit perspectives, and we believe that measurement devices for purposes of post-mortem analysis of events ought to be addressed through guidelines rather than a standard.~~
~~City of Tallahassee~~	~~TAL believes that this standard is not justified, either from technical or cost benefit perspectives, and we believe that measurement devices for purposes of post-mortem analysis of events ought to be addressed through guidelines rather than a standard.~~

Organization	Question 3 Comment
City of Tallahassee	TAL believes that this standard is not justified, either from technical or cost benefit perspectives, and we believe that measurement devices for purposes of post-mortem analysis of events ought to be addressed through guidelines rather than a standard.
Response: The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report: **"Recommendation 12: Install Additional Time-Synchronized Recording Devices as Needed.** **A valuable lesson from the August 14 blackout is the importance of having time-synchronized system data recorders. NERC investigators labored over thousands of data items to synchronize the sequence of events, much like putting together small pieces of a very large puzzle. That process would have been significantly improved and sped up if there had been a sufficient number of synchronized data recording devices."** **The Disturbance monitoring recordings can be used to improve reliability by providing information that can guide operators in better real-time system management (real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.** **Event analysis allows industry to take steps to prevent recurrence of an incident. This standard will ensure that there are no gaps in the data, and sufficient and complete data is available for this analysis. DDR is especially useful in analyzing generator performance and response. It is difficult, if not impossible, to quantify the costs of implementing lessons learned from events analysis made possible by the availability of system data.**	
Colorado Springs Utilities	Thank you SDT for your efforts we voted negative for the following reasons:This standard brings 20% of our buses into scope, which means it will bring 20% of just about everyone's buses into scope (some large companies could have hundreds of buses included). Is that really the SDT's intent? It sounded like the SDT is not expecting it to be that big of an impact. The MVA threshold needs to be re-visited to prevent excessive, unmerited impact. We do not believe that it is logical to include a bunch of buses from smaller entities that just barely cross the threshold and then only include the top 20% of companies with buses having orders of magnitude greater short circuit duty. How can the inclusion criteria be modified to make sure that we capture the appropriate points of the system based on actual risk and impact to the BES? The current criteria is too inclusive and too

Organization	Question 3 Comment
	generic - which impacts industry unnecessarily without getting the desired result.Thank You!Bottom line, IMO, the technical basis for this standard is flawed.
Response: After a review of the data received from the June 5, 2013 Request for Information, the Drafting Team decided upon the numbers used in the standard, and that the implementation of the standard to those identified BES buses and BES Elements would provide adequate system Disturbance Monitoring. The recording capabilities would provide adequate data to reconstruct a major system incident, and allow an analysis that could prevent a future recurrence. Note that the standard allows an entity to determine quantities.	
JEA	The 1500MVA threshold is too low and needs to be increased.
Response: The Standard Drafting Team is made up of members from different size entities, and received input from the June 5, 2013 Request for Information posting from across the continent to determine the numbers and philosophies used in Attachment 1.	
SERC Protection and Controls Subcommitee	The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: Thank you for your comments.	
Northeast Utilities	The preparation and accuracy of the redlined version and this unofficial comment form is lacking and promotes confusion. The redlined version does not effectively show many of the numerous redlined changes from the last posting, including nearly all of R5. The comment form description of the changes to the implementation plan does not agree with the standard. From above description of changes:"The schedule for implementation is now to be at least 50% compliant within three (3) years following notification of the list, and 100% compliant within five (5) years following notification of the list. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within five (5) years following notification of the list."From the actual standard posted for comment:Entities shall be at least 50% compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective

Organization	Question 3 Comment
	Date. Entities that own only one (1) identified BES bus location, Element, or generating unit shall be fully compliant within four (4) years of the Effective Date. Page 11, Requirement 5 states “Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder recording (DDR) data is required, ...”While page 5 (blue explanation box& Mapping document) still states “Rationale for Functional Entities: The Responsible Entity - the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection - has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which dynamic disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.
Response: There were problems encountered in finalizing the clean and redlined versions of PRC-002-2 and its Implementation Plan for the posting. Regarding the implementation for requirements R2-R4, R6-R11, **"Entities shall be at least 50 percent compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.** **Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.** **Entities shall be 100 percent compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list."** **Because DDR is useful for analyzing slowly evolving widespread system disturbances, the Responsible Entity (PC or RC), is in the best position to determine from where DDR data should be captured.** **The standard and its Rationale Boxes and Guidelines have been reviewed for consistency and revised accordingly.**	
Seminole Electric Cooperative, Inc.	The three-phase short circuit level minimum of 1500 MVA at BES voltage levels is low. As a result, entities must sort through large numbers of buses when only the top 11 would need to be selected. Buses at low three-phase fault current are not typically conducive to disturbance monitoring equipment. For example, a 345 kV bus that carries 3000 amps (normal flow) would be a candidate for PRC-002 even without applying a three-phase fault. It would seem that a threshold of 10,000 MVA is technically justifiable, since most BES stations that have over 10,000 MVA of available

Organization	Question 3 Comment
	three-phase fault current are candidates for being critical facilities that would benefit from disturbance monitoring equipment or already have such equipment installed. This would also reduce the number of buses that the TO needs to review.There is uncertainty regarding the technical justification for the "11" BES buses that is listed in Step 3 of Attachment 1. Requirement R8 does not clearly identify the data storage requirements for DDR with continuous recording capability. A 3-year period of continuous recording data per DDR location is too onerous. DDR continuous recording capability should be a minimum of 10 days per site. DDR recording(s) retained as evidence should strictly be limited to event-triggered recording by a system disturbance and where the RC, RE, or NERC requests data for the event within the 10-day time frame.Requirement R11.4's required conformance with IEEE Standard C37.111-"2013" is too onerous. This Requirement disqualifies the majority of FR and DDR equipment presently deployed. Seminole recommends revising the Requirement to require the use of IEEE Standard C37.111-"1999" or later.
Response: The Drafting Team is made up of members from different size entities, and received input from across the continent to determine the numbers and philosophies used in Attachment 1. The numbers chosen were the most appropriate to use after reviewing the data on hand from the June 5, 2013 Request for Information. Eleven were chosen as the number of buses specified in Step 3 of Attachment 1 after review of the data received from the June 5, 2013 Request for Information from industry, and the judgment of the Drafting Team from Real-time experiences. **The intent of the retention period is for the entity to retain the data that has been requested for a triggered disturbance only.** **Requirement 11 Part R11.2 has been revised.** **Requirement 11 Part R11.4 was revised to read C37.111-1999.**	
Pepco Holdings Inc.	Under requirement R11.2, suggest modifying the wording to the following: The recorded data will be retained for a minimum of 10 calendar days.
Response: Requirement 11 Part R11.2 has been revised to clarify that data retention is for a disturbance.	

Organization	Question 3 Comment
City Utilities of Springfield, MO	We continue to believe the Attachment 1 fault MVA threshold established in R1 to identify potential buses from which to pick locations for FR (and SER) data is too low. To provide a context for our comment, our system has a peak load of 800 MW serving approximately 110,000 customers in a service territory covering 320 square miles (less than one county) with local generating capacity of 1100 MW. This is a very compact system containing a relatively small geographic footprint with 17 BES buses as defined within this draft standard. All of these 17 BES buses have fault MVA above the 1500 MVA threshold, ranging from 8,000 MVA down to 2,900 MVA with a median value (bus 6 out of the top 11) of 5,800 MVA. The top 10 BES buses on our system all have a fault MVA above 5,000. This PRC-002-2 draft Standard will require us to have FR data for 4 buses (20%) overall. The top 2 BES buses (10%) where FR data would be required will be electrically less than 2 miles apart. The other 2 buses (additional 10%) would be located 25 miles or less electrically from the first 2 buses regardless of how we elected to determine these locations. All this data will be electrically concentrated in a small geographical area, which doesn’t appear to lead to a wide-area view of the overall BES. Additionally, several of the above mentioned buses have only two (2) BES sources (Distribution buses with only 2 transmission lines connected) or tapped buses with Distribution transformer(s) and no transmission breakers. Are these buses really important to the BES in the context of DME data? It seems the PRC-002-2 R1 Attachment 1 method only serves to unnecessarily inflate the number of BES buses on which the overall percentage of required locations will be calculated. We recognize the difficulty the SDT had in determining the appropriate coverage for FR data, but contend that a fault MVA threshold closer to 4500 MVA and an overall coverage percentage of 10% is adequate. This would still result in our system having FR data at 2 buses which could be electrically separated by approximately 25 miles. Additionally, we believe buses with only limited sources from the BES should be excluded out-of-hand by some other “test” mechanism within the Attachment 1 document or some other vehicle. Regarding R3: 1) Is it the intent of the Standard that FR data is to be determined for all currents defined on all Elements connected to a selected bus for any single fault on any Element connected to the bus? (i.e. if using digital relays for FR, do relays on each element (line or transformer) need to trigger for faults on any element connected to that bus?)

Organization	Question 3 Comment
	2) What are the expectations for faults and/or disturbances located remotely from the selected bus - how sensitive are they expected to be? In reality, are these FR devices expected to be a lower level disturbance recorder? 3) If data is expected to be available for conditions other than just faults, the data should not be classified as Fault Recording data or at least further definition/clarification should be provided. 4) Some of the discussion in the rationale box for R3 seems to suggest the FR data be used for fault analysis, as it applies to determining correct and incorrect breaker operations - Misoperation determination. In the case of installed modern microprocessor relays, the protective relay(s) should be able to determine the nature of the fault, the elements that operated, fault location, voltages and currents and many other particulars associated with a fault. Generally, FR is an unnecessary addition of equipment in these situations from the perspective of fault analysis to determine the correctness of protection system operation. 5) Regarding R4: We propose changing the 30 cycle post trigger record length in the first bullet under R4.1 to a total record length of 30 cycles. The current wording requires a 32 cycle minimum total record length. We believe the 30 cycle total record length better matches existing microprocessor relay functionality for those that may wish to employ them in this fashion.
Response: The Standard Drafting Team is made up of members from different size entities, and received input from across the continent to determine the numbers and philosophies used in Attachment 1. The numbers chosen were the most appropriate to use after reviewing the data on hand. The Standard Drafting Team recognized that load dense areas' data may be required from stations that are only blocks apart. Note that the Requirements say to be able to determine--if data can be determined for an Element, the data does not have to be captured for that Element. To clarify what buses need consideration, From Attachment 1, Step 1: "For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus." 1. Requirement R3 stipulates that data is to be captured for "... each of the BES Elements it owns connected to the BES buses identified in Requirement R..." Sensitivity of the triggering for data capture depends on the parameters of the BES.	

Organization	Question 3 Comment
2. Data has to be captured for the identified BES Elements. Again, the sensitivity of the triggering depends on engineering judgment and the parameters of the BES. The standard is about "what" data is recorded, not "how" it is recorded. FR data conveys information different from DDR data, and is not intended to replace DDR data. **3. DDR would capture "slowly" evolving system conditions and disturbances that might not involve faults.** **4. FR data has been used successfully in rapid system restorations following multiple feeder tripouts to help expeditiously determine the faulted Element, and thus allow restoration of unfaulted facilities. The data provided by microprocessor relays may be used to satisfy Requirement R3.** **5. The Standard Drafting Team has revised the total record length to 30 cycles as suggested.**	
Kansas City Power & Light	We suggest that the DMSDT further clarify the Applicability of the Functional Entities in 4.1 by including a statement in the Rationale Box for Functional Entities that when Responsible Entity is used in PRC-002-2, it specifically refers to those entities listed under 4.1. This is a slightly different approach than usually taken in Applicability. Some drafting teams have adopted a convention of hyphenating terms such as 30-, 60- and 90-calendar days. We suggest the DMSDT do the same. Similarly, '30-cycle post-trigger' should also be hyphenated. We also noted that in the redline, step-up transformer was hyphenated in some places and not others. However, in the clean copy of the standard it is not hyphenated. We believe it should be. We suggest modifying the first sentence of Requirement R8 such that it reads: 'Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage.' There are a couple of instances in the 3rd paragraph of the Rationale box for R11 where 10 days is used. We believe this should be 10-calendar days. We suggest the following replacement for the 2nd item under Step 7 of Attachment 1. 'If the list has 1 to 11 BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.'

Organization	Question 3 Comment
Response: The rationale box for functional entities was revised to clarify the meaning of the use of Responsible Entity in PRC-002-2. **The text was reviewed and revised to ensure consistency in the use of hyphenation, punctuation and grammar.** **The wording in Requirement R8 was revised.** **The wording in the rationale box for Requirement R11 was revised.** **The wording for Attachment 1, Step 7 was revised.**	
Idaho Power Co.	When a relay is used to capture FR data rather than a digital fault recorder, Requirement R4.1 would necessitate a relay record length of at least 32 cycles under R4.1-bullet 1 or multiple triggers under R4.1-bullet 2. Our wide variety of relay types support records of 15, 30, 60, or 180 cycles. Current practice and preference is to use a record length of 30 cycles, trigger inclusive, which was chosen to balance the amount of information in a single record while still providing the capability in the relay to save multiple records. The 32 cycle requirement would force the use of 60 cycle event records. While many of our relays are capable of this, the practice may lead to missed event records impacting our ability to search for misoperations under PRC-004.Multiple triggering has already caused events to be missed in our system due to the limited capability of some legacy relays. A change to a record length of 30 cycles including the 2 cycles of pre-fault trigger would fit within our current practice which mitigates our capture problems.
Response: The Standard Drafting Team discussed changing the overall record length of 32 cycles. It is commonly employed in industry, and is not an unreasonable specification nor difficult to implement.	
Florida Municipal Power Agency	While FMPA appreciates the efforts of the SDT to address many of the specific comments received, FMPA's position remains that a standard is not justified for Disturbance Monitoring. We believe that Disturbance Monitoring is better addressed through guidelines than through a standard. The system has changed a lot over the last 10 years since the Northeast Blackout of 2003 and we can gain much more information now from microprocessor based relays and phasor measurement units (PMUs) prevalent throughout the system. The justification for this standard is primarily based on the decade old Blackout Report and does not take into account the changes in system

Organization	Question 3 Comment
	equipment since then. This justification was highlighted by the SDT's response to FMPA's prior comment about a standard not needed. SDT Response: "(1) The need for the development of a standard for Disturbance Monitoring was accentuated by the lack of information available to analyze the 2003 Blackout in the Northeast. From the August 14, 2003, Blackout Final NERC Report:..."Additionally, it should be noted that in the Executive Summary of the Cost Effectiveness Analysis Process (CEAP) Pilot for this project, the following statement was made: "The majority of CEA respondents believed the standard's potential immediate reliability benefits were minimal." So, with this CEAP observation along with the low approval rating of 43.29%, there is clearly some significant stakeholder concern with the justification for this standard.In light of the Paragraph 81 Project, the industry is supporting reducing and consolidating the amount of requirements. This standard meets several Paragraph 81 Criteria used to identify requirements for retirement including B1 Administrative, B2 Data Collection/Data Retention, and B4 Reporting. There are 12 requirements and over 20 sub-requirements in the current PRC002-2 draft. The amount of detail is unnecessary and poses a serious compliance burden on registered entities. While we do not believe the standard is needed, we strongly recommend that if this project goes forward, that the drafting team revise this standard to two or three requirements. We point out that the NERC Rules of Procedure have a detailed section on Disturbance Response Procedures - Appendix 8.While we recognize that the SDT has limited latitude in eliminating a project or veering from the SAR, we suggest that the Standard Committee revisit the justification for this standard and at a minimum review the scope and prescriptiveness of the detailed requirements in light of the Paragraph 81 guidelines.

Response: The Standard Drafting Team realizes that improvements have been made to Disturbance Monitoring technology since the 2003 Northeast Blackout. That does not guarantee universal implementation, thus necessitating the need for the standard.

PRC-002-2 addresses "what" data is recorded, not "how" the data is recorded. This approach eliminates the complications that might arise from the technological advances being made to record the data.

The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better Real-time system management (Real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events.

Organization	Question 3 Comment
Xcel Energy	Xcel Energy engineers have conducted a test application of the selection criteria in Attachment 1, and have concerns that some locations are identified but provide little or no value (e.g. situations where fault recording is required for busses at both ends of a short line and one of the busses has only two sources (see diagram provided separately via email to the NERC SDT Coordinator for this standard)). We recommended an 'exception' written into the requirements with the Responsible Entity (or RC or Regional Entity) concurrence. In R5 - please clarify if the IROLs are those established by the TP, PC, or RC. (Also note that RC established IROLs may be in the operating horizon with little or no time for entities to actually install equipment).R12 should be reworded to state "...or develop and submit to the Regional Entity..." and end after "...(CAP)." R12 - is it inferred that entities can conduct maintenance on these devices (ie - out of service) as long as they meet the 90 day requirement? If so, consider making that clear.
Response: In developing Attachment 1, the Standard Drafting Team recognized that electrically close bus locations (referring to the diagram provided by Xcel Energy) would possibly diminish the overall "needed" number of locations to capture adequate SER and FR data for because of the possible concentration of load. The Standard Drafting Team considered this, and is addressed in Steps 7 and 8 of Attachment 1. **Because Requirement R5 pertains to the Responsible Entity (as used in the standard), the Responsible Entity is responsible for establishing the IROLs.** **The wording of Requirement R12 and its rationale box have been revised. Entities can conduct maintenance as long as the 90 calendar day requirement is met. That is also explained in the Guideline for Requirement R12.**	

ADDITIONAL COMMENTS:

Calpine Corporation
Hamid Zakery

. I had trouble with submitting comments. We appreciated the hard work demonstrated by the SDT and NERC members with this draft standard. I voted no for the following reasons:

1. Requirement R1 of the draft standard states each "Transmission owners shall identify BES buses for which SER and FR data is required....". Do elements connected to these bused include generators? We believe examples by illustration can provide much needed clarity.

Response: BES Elements connected to the identified BES buses do include generators. Generator Interconnections are not required to have FR, but generator breakers directly connected to an identified BES bus need to be included in SER data capture.

2. Are FRs required at all generating stations that are connected to the BES regardless of size and connected BES voltage? We believe installation of FR at generating facilities connected to voltages <200 kv is too aggressive and will impose significant resources requirements without contributing much benefit for the BES reliability. Has the feasibility of installing DME at a generating facility with one or two units to monitor 4-8 data points @ voltages <200 Kv been evaluated. While members of vertically integrated utilities can utilize a DME for both their transmission and generation data points, a non-vertically integrated generator owner is required by draft standard to install a DME for 3-4 data points. We suggest FR installation BES voltages greater than 200 kv with single generator rating of 500 MVA and an aggregate generation of 1500 MVA at a single site.

Response: FR is not required for generators and their interconnections to the BES. PRC-002-2 addresses "what" data is recorded, not "how" it is recorded. Requirement R3 specifies that the electrical quantities can be "determined." The Rationale Box and Guideline for Requirement R3 have been revised and provide clarification.

3. The initial standard drafting team had performed studies and was recommending FR and DDR installation at 345 kv and higher voltages based on specific requirements that supported improving BES stability and reliability. We ask that current SDT to demonstrate basis/rational for the DME (FR & DDR) need at all BES voltage levels. A rough breakdown statistics on number of FR that will be required by R1 and R3 of the draft standard and implied reliability benefit by each requirement at each BES voltage level will be very beneficial. Also, several NERC Regions had previously developed DME criteria with FR and DDR requirement at >200 KV BES voltage levels. The Only region will region with DME requirements at all BES voltages was NPCC. Has the SDT team discussed DME requirements by Region or interconnection?

Response: The Standard Drafting Team is aware of the requirements in the Regions. PRC-00-2 is designed to address the capturing of data, and having adequate data available to be able to determine disturbance quantities. PRC-002-2 addresses "what" data is captured, not "how" it is captured.

Portland General Electric Company
Angela Gaines

Portland General Electric appreciates the drafting team's efforts regarding the project. After additional review, PGE has no concerns regarding the proposed standard. The negative votes were cast in error.

Response: The Standard Drafting Team thanks you for your comment.

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Disturbance Monitoring Standard Drafting Team (DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The draft standard was posted for a 45-day formal comment period February 2-March 18, 2009.
5. The project was placed into informal development the fall of 2010.
6. The project was placed into formal development January 2013.
7. Nominations for two additional DMSDT members were solicited April 12 – 25, 2013.
8. Three additional DMSDT members were added May 22, 2013.
9. Industry webinars were held May 22, 2013, June 12, 2014, and August 21, 2014.
10. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.
11. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.
12. The draft standard was posted for a 45-day concurrent comment and ballot period May 9 – June 25, 2014 (ballot was extended to achieve quorum).

Description of Current Draft

This is the fourth draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	September, 2014
Final Ballot	October, 2014
BOT Adoption	November, 2014

Effective Dates

Version History

Version	Date	Action	Change Tracking
2.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the Rationale Boxes will be moved to the Guidelines and Technical Basis Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate analysis of Bulk Electric System (BES) Disturbances.
4. **Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities:

When the term "Responsible Entity" is used in PRC-002-2, it specifically refers to those entities listed under 4.1. The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those BES Elements selected.

BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

B. Requirements and Measures

R1. Each Transmission Owner shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.

1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.

1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data is required, identified in accordance with PRC-002-2, Attachment 1, and evidence that all BES buses have been re-evaluated within the required interval under Requirement R1. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Attachment 1 provides a uniform methodology to identify those BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a Transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of Transmission Lines and other BES Elements connected to the BES bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on System reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause wide-area or cascading System events, so SER and FR data from those BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment.

Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data is required based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and System topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses.

Each Transmission Owner must re-evaluate the list of BES buses at least every five calendar years to address System changes since the previous evaluation. Changes to the BES do not mandate immediate inclusion of BES buses into the in force list, but the list of BES buses will be re-evaluated at least every five calendar years to address System changes since the previous evaluation.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90-calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings; or (3) station drawings.

Rationale for R2:

The intent is to capture SER data for the status (open/close) of the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a time synchronized clock, provides the basis for assembling the detailed sequence of events timeline of a power System Disturbance. Other status monitoring nomenclature can be used for devices other than circuit breakers.

R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltage for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission Lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data that is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R3:

The required electrical quantities may either be directly measured or determinable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all BES bus phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for System Disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer. Generator step-up transformers (GSUs) and leads that connect the GSU transformer(s) to the Transmission System that are used exclusively to export energy directly from a BES generating unit or generating plant are excluded from Requirement R3 because the fault current contribution from a generator to a fault on the Transmission System will be captured by FR data on the Transmission System, and Transmission System FR will capture faults on the generator interconnection.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. Evidence may include, but is not limited to: (1)

documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power System operations and determination if operations were as intended. System faults generally persist for a short time period, thus a 30 cycle total minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time-synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles total.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1 Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following:

5.1.1 Generating resource(s) with:

5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA.

5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL).

5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.

5.2 Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:

5.2.1 One BES Element; and

5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.

5.3 Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested.

5.4 Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the re-evaluated list of BES Elements as per the Implementation Plan.

M5. The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for which DDR data is required, developed in accordance with Requirement R5, Part 5.1 and Part 5.2; and re-evaluated in accordance with Part 5.4. The Responsible Entity has dated evidence (electronic or hard copy) that each Transmission Owner or Generator Owner has been notified in accordance with Requirement 5, Part 5.3. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

DDR is used for capturing the BES transient and post-transient response following Disturbances, and the data is used for event analysis and validating System performance. DDR plays a critical role in wide-area Disturbance analysis, and Requirement R5 ensures there is adequate wide-area coverage of DDR data for specific BES Elements to facilitate accurate and efficient event analysis. The Responsible Entity has the best wide-area view of the System and needs to ensure that there are sufficient BES Elements identified for DDR data capture. The identification of BES Elements requiring DDR data as per Requirement R5 is based upon industry experience with wide-area Disturbance analysis and the need for adequate data to facilitate event analysis. Ensuring data is captured for these BES Elements will significantly improve the accuracy of analysis and understanding why an event occurred, not simply what occurred.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-evaluation of the list is a reasonable interval for this review. Changes to the BES do not mandate immediate inclusion of BES Elements into the in force list, but the list of BES Elements will be re-evaluated at least every five calendar years to address System changes since the previous evaluation. However, this Standard does not preclude the Responsible Entity from performing this re-evaluation more frequently to capture updated BES Elements.

The Responsible Entity, for the purposes of this standard, is defined as the PC or RC depending upon Interconnection, because they have the best overall perspective for determining wide-area DDR coverage. The Planning Coordinator and Reliability Coordinator assume different functions across the continent; therefore the Responsible Entity is defined in the Applicability Section and used throughout this standard.

The Responsible Entity must notify all owners of the selected BES Elements that DDR data is required for this Standard. The Responsible Entity is only required to share the list of selected BES Elements that each Transmission Owner and Generator Owner respectively owns, not the entire list. This communication of selected BES Elements is required to ensure that the owners of the respective BES Elements are aware of their responsibilities under this standard.

Implementation of the monitoring equipment is the responsibility of the respective Transmission Owners and Generator Owners, the timeline for installing this capability is outlined in the Implementation Plan, and starts from notification of the list from the Responsible Entity. Data for each BES Element as defined by the Responsible Entity must be provided; however, this data can be either directly measured or accurately calculated. With the exception of HVDC circuits, DDR data is only required for one end or terminal of the BES Elements selected. For example, DDR data must be provided for at least one terminal of a Transmission Line or generator step-up (GSU) transformer, but not both terminals. For an interconnection between two Responsible Entities, each Responsible Entity will consider this interconnection independently, and are expected to work cooperatively to determine how to monitor the BES Elements that require DDR data. For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.

Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified BES Element in Requirement R5, Part 5.1; monitoring these BES Elements with DDR will facilitate thorough and informative event analysis of wide-area Disturbances on the BES. Part 5.2 is included to ensure wide-area coverage across all Responsible Entities. It is intended that each Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous peak System Demand.

R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R6:

DDR is used to measure transient response to System Disturbances during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the BES buses within a location are at the same frequency, one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a BES bus are closed.

R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R7:
A crucial part of wide-area Disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up transformer (GSU) measuring the specified electrical quantities to adequately capture generator response. This standard defines the ‘what’ of DDR, not the ‘how’. Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

8.2 At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recordings and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R8:

Large scale System outages generally are an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specification, device configuration, or settings; or (2) actual data recordings (R9, Part 9.2).

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power System Disturbances.

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.

10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specification, configuration, or setting; (2) time synchronization indication or status; or 3) station drawings.

Rationale for R10:

NOTE: The rationale for R10 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.

Time synchronization of Disturbance monitoring data is essential for time alignment of large volumes of geographically dispersed records from diverse recording sources. Coordinated Universal Time (UTC) is a recognized time standard that utilizes atomic clocks for generating precision time measurements. All data must be provided in UTC formatted time either with or without the local time offset, expressed as a negative number (the difference between UTC and the local time zone where the measurements are recorded).

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.

R11. Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.

11.2 Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor.

11.3 SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2.

11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later.

11.5 Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records; (2) documents describing data storage capability, device specification, configuration or settings; or (3) actual data recordings.

Rationale for R11:

NOTE: The rationale for R11 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.

Wide-area Disturbance analysis includes data recording from many devices and entities. Standardized formatting and naming conventions of these files significantly improves timely analysis.

Providing the data within 30-calendar days (or the granted extension time), subject to Part 11.1, allows for reasonable time to collect the data and perform any necessary computations or formatting.

Data is required to be retrievable for 10-calendar days inclusive of the day the data was recorded, i.e. a 10calendar day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10-calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requestor of data has to be aware of the Part 11.1 10-calendar day retrievability because requiring data retention for a longer period of time is expensive and unnecessary.

SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve the data format for event records, enabling the use of software tools for analyzing the SER data.

Part 11.4 specifies FR and DDR data files be provided in conformance with IEEE C37.111, IEEE Standard for Common Format for Transient Exchange (COMTRADE), revision 1999 or later. The use of IEEE C37.111-1999 or later is well established in the industry. C37.111-2013 is a version of COMTRADE that includes an annex describing the application of the COMTRADE standard to synchrophasor data; however, version C37.111-1999 is commonly used in the industry today.

Part 11.5 uses a standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), for providing Disturbance monitoring data. This file format allows a streamlined analysis of large Disturbances, and includes critical records such as local time offset associated with the synchronization of the data.

R12. Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- Restore the recording capability, or
- Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date of the data recording was restored, (3) SCADA records, or (4) dated CAP transmittals to the Regional Entity and evidence that it implemented the CAP.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90-calendar days to ensure that adequate data is available for event analysis. If the Disturbance monitoring capability cannot be restored within 90-calendar days (e.g. budget cycle, service crews, vendors, needed outages, etc.), the entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. It is treated as a failure if the recording capability is out of service for maintenance and/or testing for greater than 90-calendar days. An outage of the monitored BES Element does not constitute a failure of the Disturbance monitoring capability.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Attachment 1

Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for sequence of events recording (SER) and Fault recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20 percent.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1500 MVA or
- 20 percent of median MVA level determined in Step 5.

Step 7. If there are no BES buses on the list: the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

If the list has 1 or more but less than or equal to 11 BES buses: FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.

If the list has more than 11 BES buses: SER and FR data is required on at least the 10 percent of the BES buses determined in Step 6 with the highest maximum

available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20 percent of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for SER and FR data. The following BES bus locations are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident Transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

PRC-002-2 addresses “what” data is recorded, not “how” it is recorded.

Guideline for Requirement R1:

Sequence of events and fault recording for the analysis, reconstruction, and reporting of System Disturbances is important. However, SER and FR data is not required at every BES bus on the BES to conduct adequate or thorough analysis of a Disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuits allows the precise reconstruction of events of both localized and wide-area Disturbances.

More quality information is always better than less when performing event analysis. However, 100 percent coverage of all BES Elements is not practical nor required for effective analysis of wide-area Disturbances. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses with breakers where crucial information is available when required.
2. Avoid excessive overlap of coverage.
3. Avoid gaps in critical coverage.
4. Provide coverage of BES Elements that could propagate a Disturbance.
5. Avoid mandates to cover BES Elements that are more likely to be a casualty of a Disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of Transmission Lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of Transmission Systems throughout the continent to analyze Transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause Cascading.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater System impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for Systems with more than 11 BES buses with three phase short circuit levels above 1500 MVA.

1. Total number of BES buses in the Transmission System under evaluation.
   a. Only tangible substation or switchyard buses are included.
   b. Pseudo buses created for analysis purposes in System models are excluded.
2. Determine the three phase short circuit MVA for each BES bus.
3. Exclude BES buses from the list with short circuit levels below 1500 MVA.
4. Determine the median short circuit for the top 11 BES buses on the list (position number 6).
5. Multiply median short circuit level by 20 percent.
6. Reduce the list of BES buses to those with short circuit levels higher than 20 percent of the median.
7. Apply SER and FR at BES buses with short circuit levels in the top 10 percent of the list (from 6).
8. Apply SER and FR at BES buses at an additional 10 percent of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
   - Electrically distant BES buses or electrically distant from other DME devices

- Voltage sensitive areas
- Cohesive load and generation zones
- BES buses with a relatively high number of incident Transmission circuits
- BES buses with reactive power devices
- Major facilities interconnecting outside the Transmission Owner's area.

For event analysis purposes, more valuable information is attained about generators and their response to System events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The re-evaluation interval of five years was chosen based on the experience of the DMSDT to address changing System configurations while creating balance in the frequency of re-evaluations.

Guideline for Requirement R2:

Analyses of wide-area Disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the Disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. However, generator breakers directly connected to an identified BES bus are required to have SER data captured. It is important in event analysis to know when a BES bus is cleared regardless of a generator's loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's BES bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The BES Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission Lines

Only those BES Elements that are identified as BES as defined in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100 kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step-up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the Transmission System will be captured by FR data on the Transmission System.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the Transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities
For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings
The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a Transmission System is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_{r,}$ is calculated as a sum of vectors of three phase currents:
$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings
Voltages are to be recorded or accurately determined at applicable BES buses.

Guideline for Requirement R4:

Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection System operations after a fault to determine if a protection System operated as designed. Generally speaking, BES faults persist for a very short time period, approximately 1 to 30 cycles, thus a 30 cycle record length provides adequate data. Multiple records allow for legacy microprocessor relays which, when time synchronized to a common clock, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles total.

A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for FR.

FR triggers can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, sub-Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, sub-Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area Disturbance monitoring to determine the System's electromechanical transient and post-transient response and validate System model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the System's dynamic response and ensuring sufficient coverage to determine System performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historical simultaneous peak System Demand. This DDR data is included to provide adequate System wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a Disturbance helps the analysis of large Disturbances. Having data regarding generator dynamic response to Disturbances greatly improves understanding of ***why*** an event occurs rather than what occurred. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.

- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.

The information in the spreadsheet does not provide information by which the plant information location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, sub-Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings “greater than or equal to 500 MVA”. The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47 percent of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5 percent of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, sub-Part 5.1.1 is included to capture larger units located at large generating plants which could pose a stability risk to the System if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1000 MVA. The 300 MVA threshold was chosen based on the DMSDT’s judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. For combined cycle plants where only one generator has a rating greater than or equal to 300MVA, that is the only generator that would need DDR.

Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability have a significant impact on BES reliability and performance. Therefore, at least one BES Element of an SOL should be monitored.

The draft standard requires “One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs).” Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored BES Element(s) and contingent BES Element(s). The standard does not dictate selection of the contingent and/or monitored BES Elements. Rather the Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area’s response to large System excursions (voltage, frequency, etc.).

Guideline for Requirement R6:

DDR data shows transient response to System Disturbances after a fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the Standard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available. For example, a breaker-and-a-half or double-bus configuration with a North (or East) Bus and South (or West) Bus, would require both buses to have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current recording is also acceptable.

For all circuits where current recording is required, Real and Reactive Power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6 apply to Requirement R7. Since either the high- or low-side windings of the generator step-up transformer (GSU) may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for Requirement R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Wide-area System outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This

drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high- or low-frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in System frequency which could be caused by large changes in generation or load, or possibly changes in System impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85 percent is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power System to a Disturbance and is used for analyzing complex power System events. This recording is typically used to capture short-term and long-term Disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency of a sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other Disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general, dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of Disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating

precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment.

Time synchronization accuracy is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

Guideline for Requirement R11:

This requirement directs the applicable entities, upon requests from the Responsible Entity, Regional Entity or NERC, to provide SER and FR data for BES buses determined in Requirement R1 and DDR data for BES Elements determined as per Requirement R5. To facilitate the analysis of BES Disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30-calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor. An entity may request an extension of the 30-day submission requirement. If granted by the requestor, the entity must submit the data within the approved extended time.

Requirement R11, Part 11.2 specifies that the minimum time period of 10-calendar days inclusive of the day the data was recorded for which the data will be retrievable. With the equipment in use that has the capability of recording data, having the data retrievable for the 10-calendar days is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10-calendar day time frame, an incident occurs on Day 1. If a request for data is made on Day 6, then that data has to be provided to the requestor within 30-calendar days after a request or a granted time extension. However, if a request for the

data is made on Day 11, that is outside the 10-calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power System Disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange and is well established in the industry. It is necessary to specify a standard format as multiple submissions of data from many sources will be incorporated to provide a detailed analysis of a power System Disturbance. The latest revision of COMTRADE (C37.111-2013) includes an annex describing the application of the COMTRADE standard to synchophasor data.

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files. The first version was approved in 2007. From the August 14, 2003 blackout there were thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and it was therefore difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and Generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements, which were established in Requirements R1 and R5. The owners are to restore the capability within 90-calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a “reasonable” amount of capability out-of-service does not result in lack of sufficient data for coverage of the System. Furthermore, 90-calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to restore the capability within 90-calendar days, the requirement further provides that, for such cases, the entity submit a Corrective Action Plan (CAP) to the Regional Entity and implement it. These actions are considered to be appropriate to provide for robust and adequate data availability.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.

2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.

3. Nominations for the Disturbance Monitoring Standard Drafting Team (DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.

~~3.~~4. The draft standard was posted for a 45-day formal comment period February 2-March 18, 2009.

~~4.~~5. The project was placed into informal development the fall of 2010.

~~5.~~6. The project was placed into formal development January 2013.

~~6.~~7. Nominations for two additional DMSDT members were solicited April 12 – 25, 2013.

~~7.~~8. Three additional DMSDT members were added May 22, 2013.

~~8.~~9. Industry webinar was held May 22, 2013; June 12, 2014 and August 21, 2014.

~~9.~~10. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.

11. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.

~~10.~~12. The draft standard was posted for a 45-day concurrent comment and ballot period May 9 – June 25, 2014 (ballot was extended to achieve quorum).

Description of Current Draft

This is the fourth~~second~~ draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	September~~May~~ 2014
Final Ballot	October~~July~~ 2014
BOT Adoption	November~~August~~ 2014

Effective Dates

See Implementation Plan

~~The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~Implementation Plan~~.

~~Implementation Plan for PRC-002-2 Requirements R1 and R5:~~

~~Entities shall be 100% percent compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~Implementation Plan for PRC-002-2 Requirement R12:~~

~~Entities shall be 100~~ percent~~% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:~~

~~Entities shall be at least 50%~~ percent ~~compliant within four (4) years of the Effective Date of PRC-002-2 and fully compliant within six (6) years of the Effective Date.~~

~~Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the Effective Date.~~

~~Entities shall be 100%~~ percent ~~compliant with a reassessed list from Requirement R1 or R5 within three (3) years following notification of the list.~~

Version History

2.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the Rationale Boxes will be moved to the Guidelines and Technical Basis Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate ~~event~~ analysis of Bulk Electric System (BES) D~~d~~isturbances.
4. **Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities:

When the term "Responsible Entity" is used in PRC-002-2, it specifically refers to those entities listed under 4.1. The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic ~~d~~Disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.

BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their ~~s~~Systems to determine tho~~e~~se buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

B. Requirements and Measures

R1. Each Transmission Owner shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. I~~i~~dentify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1;

1.2. ~~, n~~Notify other owners of BES Elements connected to those BES buses, if any, within 90-~~-~~calendar days of completion of Part 1.1 that those BES Elements ~~may~~ require SER data and/or FR data;~~, and~~

~~**1.1.**~~**1.3.** R~~r~~e-evaluate all ~~the identified~~ BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. ~~*[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data is~~are~~ required, identified in accordance with PRC-002-2, Attachment 1, and evidence that all~~the~~ BES buses~~ identification~~ have~~s~~ been re-evaluated ~~-~~within the required interval under Requirement R1. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. ~~Requirement R1~~Attachment 1 provides~~directs~~ a uniform methodology to identify tho~~e~~se BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a T~~t~~ransmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of T~~t~~ransmission L~~l~~ines and other Elements connected to the bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on ~~s~~System reliability and performance. ~~-~~Conversely, BES buses with very low short circuit MVA levels seldom cause ~~large~~ Wide-area or cascading ~~s~~System events, so SER and FR data from tho~~e~~se BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. ~~-~~Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. ~~Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection.~~

Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data is~~are~~ required, based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. ~~-~~This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and ~~s~~System topology of Transmission Owners across all Interconnections. ~~–~~Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data is~~are~~ required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their ~~s~~Systems to determine these buses. ~~SER and~~From ~~FR data will include generating resource contributions to an event~~ can be determined. ~~DDR data better shows generator response to disturbances.~~

Each Transmission Owner must re-evaluate the list of BES buses at least every five calendar years to address ~~s~~System changes since the previous evaluation. Changes to the BES do not mandate immediate inclusion of BES buses into the in force list, but the list of BES buses will be re-evaluated at least every five calendar years to address System changes since the previous evaluation.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90-calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it~~they~~ owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses~~ identified in Requirement R1~~. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which may~~can~~ include a single design standard as representative for common installations; or (2) actual data recordings; or (3) station drawings.

Rationale for R2:

The intent is to capture SER data for the status (open~~ing~~/close~~ing~~) o~~f~~~~or~~ the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a time synchronized ~~common~~ clock, provides the basis for assembling the detailed sequence of events timeline of a power S~~s~~ystem ~~d~~Disturbance. Other status monitoring ~~indications~~nomenclature can be used for devices other than circuit breakers.

R3. Each Transmission Owner and Generator Owner shall have ~~the following~~ FR data to determine the following electrical quantities for each triggered FR for~~of~~ the BES Elements it~~they~~ owns connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltage~~s~~ for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission ~~l~~Lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data that is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations which may include~~ing~~ a single design standard as a representation for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R3:

The required electrical quantities may either be directly measured or ~~derivable~~ determinable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for ~~s~~System D~~d~~isturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer. Generator step up transformers (GSU) and leads that connect the GSU transformer(s) to the Transmission System that are used exclusively to export energy directly from a BES generating unit or generating plant are excluded from ~~the above~~Requirement R3 because the fault current contribution from a generator in case of fault on the T~~t~~ransmission ~~s~~System will be captured by FR data on the T~~t~~ransmission S~~s~~ystem, and T~~t~~ransmission ~~s~~System FR will see faults on the generator interconnection.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a total ~~post-trigger~~ record length of at least 30 cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. ~~-~~Evidence may include, but is not limited to: (1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power ~~s~~System operations and determination if operations were as designed. System faults generally persist for a short time period, thus, a 30 cycle ~~post-trigger~~total minimum record length is adequate. ~~-~~Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 contiguous cycles total~~post-trigger~~.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1 ~~shall I~~identify BES Elements for which dynamic ~~d~~Disturbance recording (DDR) data is required, including the following:

5.1.1 Generating resource(s) with:

5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA.

5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL).

5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.

5.2 Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:

5.2.1 One BES Element

5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.

5.3 Notify all owners of identified BES Elements, ~~connected to those BES buses, if any,~~ within 90~~-~~calendar days of completion of Part 5.1, that their respective ~~those~~ BES Elements ~~may~~ require DDR data when requested.

5.4 Reevaluate all~~the identified buses~~ BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan.

~~*[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~

~~**5.1** The BES Elements shall include the following:~~

~~**5.1.1** Generating resource(s) with:~~

~~Gross individual nameplate rating greater than or equal to 500 MVA, or~~

~~Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.~~

~~**5.1.2** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines:~~

- ~~Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection, or~~
- ~~Transfer Paths in the Western Interconnection Path Rating Catalog, or~~
- ~~Voltage stability limited transfer paths or load serving area, or~~
- ~~Interfaces between Balancing Authority Areas, or~~
- ~~Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC).~~

~~**5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.~~

~~**5.1.4** One or more BES Elements associated with Interconnection Reliability Operating Limits (IROLs).~~

~~**5.1.5** Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program.~~

~~**5.2** The BES Elements shall include a minimum of:~~

~~**5.2.1** One BES Element.~~

~~**5.2.2** One additional BES Element for each additional 3,000 MW of its historical peak system Demand.~~

M5. The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for which DDR data is required, ~~identifi~~developed in accordance with Requirement R5, Part 5.1 and Part 5.2; and re-evaluated in accordance with Part 5.4. ~~assessed within the required interval,~~ The Responsible Entity has dated evidence (electronic or hard copy) ~~of notification to~~that each Transmission Owner or Generator Owner has been notified in accordance with Requirement 5, Part 5.3.~~of Elements identified in Requirement R5.~~ Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

NOTE: The rationale for R5 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.

DDR is used for capturing the Bulk Electric System transient and post-transient response following disturbances, and the data is used for event analysis and validating System performance. DDR plays a critical role in wide-area disturbance analysis, and Requirement R5 ensures there is adequate wide-area coverage of DDR data for specific BES Elements to facilitate accurate and efficient event analysis. The Responsible Entity has the best wide-area view of the System and needs to ensure that there are sufficient BES Elements identified for DDR data capture. The identification of BES Elements requiring DDR data as per Requirement R5 is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis. Ensuring data is captured for these BES Elements will significantly improve the accuracy of analysis and understanding why an event occurred not simply what occurred.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-assessment of the list is a reasonable interval for this review. Changes to the BES do not instigate inclusion into the existing list, and will be incorporated into the selection process at the subsequent re-assessment. However, this Standard does not preclude the Responsible Entity from performing this re-assessment more frequently to capture updated BES Elements.

The Responsible Entity, for the purposes of this standard, is defined as the PC or RC depending upon Interconnection, because they have the best overall perspective for determining wide-area DDR coverage and BES Elements. The Planning Coordinator and Reliability Coordinator assume different functions across the continent; therefore the Responsible Entity is defined in the Applicability Section and used throughout this standard.

The Responsible Entity must notify all owners of the selected BES Elements that DDR data is required for this Standard. The Responsible Entity is only required to share the list of selected Elements that each Transmission Owner and Generator Owner respectively owns, not the entire list. This communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard.

Implementation of the monitoring equipment is the responsibility of the respective Transmission Owners and Generator Owners, and the timeline for installing this capability is outlined in the Implementation Plan, and starts from notification of the list from the Responsible Entity. Data for each BES Element as defined by the Responsible Entity must be provided; however, this data can be either directly measured or accurately calculated. With the exception of HVDC circuits, DDR data is only required for one end or terminal of the Elements selected. For example, DDR data must be provided for at least one end of a Transmission Line or Generator Step-Up (GSU) transformer but not both ends. For an interconnection between two Responsible Entities, each Responsible Entity will consider this interconnection independently and are expected to work cooperatively to determine the BES Elements that require DDR data and how to monitor them. For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.

Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified BES Element in Requirement R5, Part 5.1; monitoring these Elements with DDR will facilitate thorough and informative event analysis of large disturbances on the BES. Part 5.2 is included to ensure wide-area coverage across all Responsible Entities; it is intended that each Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous peak System Demand.

~~R5.~~R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5~~, to determine the following electrical quantities~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R6:

DDR~~ynamic disturbance recording~~ is used ~~for measurement of~~to measure transient response to ~~s~~System ~~d~~Disturbances during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the buses within a location are at the same frequency one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a S~~s~~ystem configuration assuming all normally closed circuit breakers on a bus are closed.

~~R6.~~R7. Each Generator Owner shall have DDR data to determine the following electrical quantities ~~have DDR data~~ for each BES Element it owns~~,~~ for which it received ~~and is~~ notification~~ed according to~~ as identified in Requirement R5~~, to determine the following electrical quantities~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step up (GSU) transformer high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R7:

A crucial part of wide-area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high or low-side of the generator step up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how'. Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

~~R7.~~R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

8.2 At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recordings and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R8:

Large scale ~~s~~System outages generally are an evolving sequence of events that occur over an extended period of time, making DDR essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

~~R8.~~R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet~~conforms to~~ the following~~ technical specifications~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specification~~, and~~ device configuration, or settings;~~,~~ or

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle~~,~~ on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power ~~s~~System ~~d~~Disturbances.

(2) actual data recordings (R9, Part 9.2).

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and ~~,~~ FR~~ and DDR~~ data for the BES ~~-~~buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 that meet the following:~~o within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset.~~ *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1 Synchronization to Coordinated Universal Time (UTC)~~,~~ with or without a local time offset.

10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specification~~, and~~ configuration, or setting; ~~or~~ (2) time synchronization indication or status; or 3) station drawings~~actual data recordings~~.

Rationale for R10:

NOTE: The rationale for R10 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.

Time synchronization of disturbance monitoring data is essential for time alignment of large volumes of geographically dispersed records from diverse recording sources. Coordinated Universal Time (UTC) is a recognized time standard that utilizes atomic clocks for generating precision time measurements. All data must be provided in UTC formatted time either with or without the local time offset, expressed as a negative number (the difference between UTC and the local time zone where the measurements are recorded).

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.

R11. Each Transmission Owner and Generator Owner shall provide, upon request, all SER and~~,~~ FR~~, and DDR~~ data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity~~liability Coordinator~~, Regional Entity, or NERC in accordance with the following~~ requiremnts: as follows~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 ~~The recorded d~~Data will be retrievable for the period of 10 ~~-~~calendar days, inclusive of the day the data was recorded ~~preceding a request~~.

11.2 ~~The recorded d~~Data subject to Part 11.1 will be provided within 30 ~~-~~calendar days of a request unless and extension is granted by the requestor.

~~**11.2** The recorded data will be retrievable for the period of 10 calendar days preceding a request.~~

11.3 SER data will be provided in ASCII Comma Separated Value (~~-~~CSV) format following Attachment 2.

11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with~~electronic~~ C37.111, (~~C37.111-19992013 or later)~~ IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later~~formatted files~~.

11.5 Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME)~~.~~, revision C37.232-2011 or later.

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records;~~,~~ (2) documents describing data storage capability, device specification,~~, and~~ configuration or settings;~~,~~ or (3) actual data recordings.

Rationale for R11:

NOTE: The rationale for R11 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.

Wide-area disturbance analysis includes data recording from many devices and entities. Standardized formatting and naming conventions of these files significantly improves timely analysis.

Providing the data within 30-~~-~~calendar days (or the granted extension time), subject to Part 11.1, allows for reasonable time to collect the data and perform any necessary computations or formatting.

Data is required to be retrievable for 10~~-~~calendar days inclusive of the day the data was recorded, i.e. a 10-day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requester of data has to be aware of the Part 11.1 10-day retrievability because requiring data retention for longer is expensive and unrealistic.

SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve a common data format for event records, enabling the use of software tools for analyzing the SER data.

Part 11.4 specifies FR and DDR data files be provided in conformance with IEEE C37.111, IEEE Standard for Common Format for Transient Exchange (COMTRADE), revision 1999 or later. IEEE C37.111-1999 or later is well established in the industry. C37.111-2013 is a version of COMTRADE that includes an annex describing the application of the COMTRADE standard to synchrophasor data; however, version C37.111-1999 is commonly used in the industry today.

Part 11.5 uses a standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), for providing disturbance monitoring data. This file format allows a streamlined analysis of large disturbances, and includes critical records such as local time offset associated with the synchronization of the data.

R12. Each Transmission Owner and Generator Owner shall, within 90-~~-~~calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- R~~r~~estore the recording capability, or ~~develop a timeline for restoration and a~~
- Submit a Corrective Action Plan (CAP) ~~for submission~~ to the Regional Entity and implement it. ~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date of the data recording was restored, (3) SCADA records, or (4~~3~~) dated CAP transmittals to the Regional Entity and evidence that it implemented the CAP.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90-~~-~~calendar days to ensure that adequate data is available for event analysis. ~~Therefore, it is required to return the data recording capability to service within 90 calendar days of a discovery of failure.~~ If the Disturbance Monitoring ~~Equipment (DME)~~ capability cannot be ~~returned to service~~restored within 90 calendar days (e.g. budget cycle, service crews, vendors, needed outages, etc.), the ~~E~~entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timetable~~line~~ required for the CAP depends on the entity and the type of data required.~~. , and the would be able to effectively manage the CAP. For example, DDR data from a generator may not be restored until the next outage cycle.~~ ~~I~~ It is treated as a failure if the recording capability is out of service for maintenance and/or testing for greater than 90-calendar days~~ that would be treated as a failure.~~.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per~~of~~ Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Attachment 1

Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for Sequence of Events Recording (SER) and Fault Recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20%.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1500 MVA or
- 20% of median MVA level determined in Step 5.

Step 7. If there are no BES buses on the list: the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

If the list has 1 or more but less than 11 ~~or fewer~~ BES buses: FR and SER data is required at the BES bus~~es~~ with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9.

If the list has more than 11 BES buses: SER and FR data is required on at least the 10% of the BES buses~~,~~ determined in Step 6~~,~~ with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20% of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner’s discretion, to provide maximum wide-area coverage for SER and FR data, therefore the following types of BES buses are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident T~~t~~ransmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner’s area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance Monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance Monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a ~~s~~System configuration assuming all normally closed circuit breakers on a bus are closed~~. ~~.

PRC-002-2 addresses "what" data is recorded, not "how" it is recorded.

Guideline for Requirement R1:

Sequence of events and fault records for the analysis, reconstruction, and reporting of ~~s~~System ~~d~~Disturbances is important. However, SER and FR data are not required at every BES bus on the BES to conduct adequate or thorough analysis of a ~~d~~Disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual ~~circuit sallow~~circuits allow precise reconstruction of events of both localized and wide-area D~~d~~isturbances.

In addition, more quality information is always better than less when performing event analysis. However, 100% coverage of all elements is not practical nor required for effective analysis of wide-area D~~d~~isturbance. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses with breakers where crucial information is available when required.
2. ~~Excessive overlap of coverage is avoided.~~Avoid excessive overlap of coverage.
3. Avoid gaps in critical coverage.
4. Provide coverage of ~~system~~ BES ~~e~~Elements that could propagate a D~~d~~isturbance.
5. Avoid mandates to cover ~~system~~ BES ~~e~~Elements that are more likely to be a casualty of a ~~d~~Disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of T~~t~~ransmission ~~l~~Lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish bright line criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of ~~t~~Transmission ~~s~~Systems throughout the continent to analyze ~~t~~Transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright-line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause ~~electric system c~~Cascading ~~outages~~.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater ~~s~~System impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for ~~s~~Systems with more than 11 BES buses with three phase short circuit levels above 1500 MVA.

1. Total number of BES buses in the T~~t~~ransmission S~~s~~ystem under evaluation.
   a. Only tangible substation or switchyard buses are included.
   b. Pseudo buses created for analysis purposes in ~~s~~System models are excluded.
2. Determine the three phase short circuit MVA for each bus.
3. Exclude buses from the list with short circuit levels below 1500 MVA.
4. Determine the median short circuit for the top 11 buses on the list (position number 6).
5. Multiply median short circuit level by 20%.
6. Reduce the list of BES buses with short circuit levels higher than 20% of the median.
7. Apply SER and FR at buses with short circuit levels in the top 10% of the list (from 6).
8. Apply SER and FR at buses at an additional 10% of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
   - Electrically distant BES buses or electrically distant from other DME devices
   - Voltage sensitive areas
   - Cohesive load and generation zones

- BES buses with a relatively high number of incident T~~t~~ransmission circuits
- BES buses with reactive power devices
- Major facilities interconnecting outside the Transmission Owners' area.

For event analysis purposes, more valuable information is attained about generators and their response to ~~s~~System events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The reevaluation interval of five years was chosen based upon the experience of the DMSDT to address changing S~~s~~ystem configurations while creating balance in the frequency of reevaluations.

Guideline for Requirement R2:

Analyses of wide-area D~~d~~isturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the D~~d~~isturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. However, generator breakers directly connected to an identified BES bus are required to have SER data captured. It is important in event analysis to know when a bus is cleared regardless of a generator's loading. ~~SER data for generator breaker operations provides little useful data of generator loading.~~

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's BES bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission L~~l~~ines

Only those Elements that are identified as BES as ~~identified~~ defined in the latest in~~-~~effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100 kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the T~~t~~ransmission S~~s~~ystem will be captured by FR data on the ~~t~~Transmission S~~s~~ystem.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the ~~t~~Transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities

For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings

The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a T~~t~~ransmission ~~s~~System is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120◦, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:

$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings

Voltages are ~~to be~~ recorded or accurately determined at applicable BES buses. ~~Note that the Requirement calls for the voltages to be determinable. There are two options for recording phase-to-neutral voltages at applicable BES buses:~~

~~1. At terminals of each line. This option would apply to lines that have a full set of VTs/CVTs required for distance protections, which is quite common in practice.~~

~~2. At a particular BES bus, in which case all the BES Elements connected to that common BES bus are covered.~~

Guideline for Requirement R4:

~~This requirement directs the applicable entities having FR determined as identified in Requirement R1 that meets the following:~~

~~Requirement R4, Part 4.1 specifies the minimum amount of FR data.~~ Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection ~~s~~System operations after a fault to determine if a protection S~~s~~ystem operated as designed. Generally speaking, BES faults ~~and the system's response to them~~ persist for~~occur within~~ a very short time period, approximately 1 to 30 cycles, thus a 30 cycle ~~post- trigger~~ record length provides~~captured~~ adequate data. Multiple records allow for legacy microprocessor relays which, when time synchronized to a common clock, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 cycle ~~post trigger~~ data.

~~Requirement R4, Part 4.2 specifies the minimum recording rate of FR data.~~ A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SER.

~~Requirement R4, Part 4.3 specifies the minimum triggers to ensure FR data is available. A trigger is a set point on an oscilloscope or FR device. The~~FR triggers can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, sub-Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, sub-Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area ~~d~~Disturbance monitoring to determine the ~~s~~System's electromechanical transient and post-transient response and validate ~~s~~System model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the ~~s~~System's dynamic response and ensuring sufficient coverage to determine ~~s~~System performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historic peak Demand. This DDR data is included to provide adequate ~~s~~System wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a D~~d~~isturbance helps the analysis of large Disturbances. Having data regarding generator dynamic response to Disturbances greatly improves understanding of ***why*** an event occurs rather than what occurred. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.
- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.
- The information in the spreadsheet does not provide information by which the plant location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings "greater than or equal to 500 MVA". The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5% of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, Part 5.1.2 is included to capture larger units located at large generating plants which could pose a stability risk to the S~~s~~ystem if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1000 MVA. The 300 MVA threshold was chosen based on the DMSDT's judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. For combined cycle plants where only one generator has a rating greater than or equal to 300MVA, that is the only generator that would need DDR.

~~Major transmission interfaces are explicitly defined based on the Interconnection since a common naming convention for these interfaces does not exist. However, this data may be calculated, rather than directly measured, if the accurate quantity can be derived (e.g. either end of the Flowgate line could be monitored since the other end could be derived). In the Western Interconnection, these major transmission interfaces are defined by the Regional Entity. In the ERCOT and Quebec Interconnections, the Responsible Entity will be required to identify those interfaces that are deemed significant enough to require monitoring (i.e. are utilized for real-time limits such as System Operating Limits or "contingencies"). Only one BES Element associated with a major transmission interface needs DDR data capability.~~

Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability a have significant impact on the reliability and performance. Therefore, at least one BES Element of an SOL should be monitored. Interconnection Reliability Operating Limits (IROLs) are also included because the risk of violating these limits poses a risk to System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored Element(s) and contingent Element(s). The Standard does not dictate whether the contingent and/or monitored Elements should be selected; rather, this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

The draft standard requires "One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs)." Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to ~~s~~System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored Element(s) and contingent Element(s). The Standard does not dictate whether the contingent and/or monitored Elements should be select; rather, the Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability could be captured on the BES. For example, a major 500kV or 230kV substation on the EHV S~~s~~ystem close to the load pocket where the UVLS is deployed would likely be a valuable BES Element for DDR coverage and would aid in post-disturbance analysis of the load area's response to large S~~s~~ystem deviations (voltage, frequency, etc.). ~~It is intended to have DDR data for "Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program."~~

Guideline for Requirement R6:

DDR data shows transient response to S~~s~~ystem D~~d~~isturbances after the fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the Standard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available. For example, a breaker-and-a-half or double bus configuration that has a North (or East) Bus and South (or West) Bus,~~-~~ would require ~~that~~ both buses to~~should~~ have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a ~~s~~System configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current record is also acceptable.

For all circuits where current recording is required, real and reactive power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6~~,~~ apply to Requirement R7. Since either~~ of~~ the high or low-side windings of the generator step up (GSU) transformer may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for Requirement R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a S~~s~~ystem configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Large scale S~~s~~ystem outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high or low frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in ~~s~~System frequency which could be caused by large changes in generation or load, or possibly changes in S~~s~~ystem impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85% is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power Ssystem to a dDisturbance and is used for analyzing complex power Ssystem events. This recording is typically used to capture short term and long term Ddisturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency in sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other dDisturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of diDsturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Time synchronization Aaccuracy ~~of ±2 milliseconds for time synchronization~~ is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

“Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…”

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

“Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…”

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

~~The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.~~

~~Stored data does not need to be maintained in UTC format. The data provided pursuant to a data request must be provided in UTC format with or without local time offset.~~

Guideline for Requirement R11:

This requirement directs the applicable entities, ~~that~~ upon requests from the Responsible Entity~~liability Coordinator~~, Regional Entity or NERC, to provide SER ~~,~~and FR data for BES buses determined in requirement R1 and DDR data for BES Elements determined per requirement R5. To facilitate the analysis of BES D~~d~~isturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30-~~-~~calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor. An entity may request an extension of the 30-day submission requirement. If granted by the requestor, the entity must submit the data within the approved extended time.

Requirement R11, Part 11.2 specifies that the minimum time period of 10-~~-~~calendar days inclusive of the day the data was recorded for which the data will be retrievable ~~preceding a request~~. With the equipment in use that has the capability of recording data, having the data retrievable for the 10-~~-~~calendar days ~~preceding a request is~~ realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10-~~-~~calendar day time frame, an incident occurs on ~~a~~ Day 1. If a request for data is made on Day 6, then that data has to be provided to the requester within 30-~~-~~calendar days after a request or a granted time extension. However, if a request for the data is made on Day 11, that is outside the 10-~~-~~calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (~~.~~CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power ~~s~~System D~~d~~isturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange and ~~it~~ is well established in the industry. It is necessary to specify a standard format as multiple submissions of data from many sources~~it~~ will be incorporated ~~with other submitted data~~ to provide a detailed analysis of a power ~~s~~System ~~d~~Disturbance. The latest revision of COMTRADE (C37.111-2013) includes an annex describing the application of the COMTRADE standard to synchophasor data. ~~is a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data.~~

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for~~ the~~ naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files; the first version was approved in 2007. From the August 14, 2003 blackout there ~~was~~were thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and ~~because of that it became~~was therefore difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and G~~g~~enerator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements, which had been established in Requirements R1 and R5.~~, and that are found to be out of service.~~ The owners are to restore~~turn~~ the capability ~~to service~~ within 90-calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a "reasonable" amount of capability out of service does not result in lack of sufficient data for coverage of the S~~s~~ystem. Furthermore, 90-~~-~~calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to restore~~turn~~ the capability ~~to service~~ within 90-calendar days, the requirement further provides that, for such cases, the entity submit ~~must develop a time~~table~~line and~~ a Corrective Action Plan (CAP) ~~for submission~~ to the Regional Entity and implement it. These actions are considered to be appropriate to provide for robust and adequate data availability.

Implementation Plan

Project 2007-11 Disturbance Monitoring

Requested Approvals
- PRC-002-2 Disturbance Monitoring and Reporting Requirements

Requested Retirements
- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals
- None

Applicable Entities
- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary
- None

Background
The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES.
2. A significant amount of sequence of events recording (SER), fault recording (FR), and dynamic Disturbance recording (DDR) capability already exists on the BES. The monitoring requirements in this standard align with industry practices. Therefore, many existing recordings can satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses they own. Therefore, six (6) months is adequate time for generating the list of BES buses following the methodology described in Attachment 1 (for Requirement R1).

4. Responsible entities have the relevant data and information pertaining to the BES Elements requiring DDR and six (6) months is adequate time for working with any affected entities and generating the list of BES Elements.
5. The nine (9) month time period for R12 includes the six (6) month implementation for R1 and R5, and a three (3) month additional time period to make notifications. The nine (9) months for R12 implementation is reasonable for the contents of that requirement.
6. A total percentage of BES buses and BES Elements established in Requirements R1 and R5 respectively are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many monitoring requirements will become compliant without significant changes to recording capability.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the entities.
8. Implementation of Disturbance monitoring recording following changes to the system are addressed by following re-evaluation of the lists as per Requirement R1 and Requirement R5.
9. Implementing SER, FR, and DDR capability may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners probably will have more BES Elements requiring SER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes scheduling outages into account.
10. An entity owning only one (1) identified BES bus, BES Element, or generating unit is allowed six (6) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or capability that could impact implementation timelines for the respective entities.

General Considerations

Each Transmission Owner and Generator Owner subject to PRC-018-1 shall maintain the ability to provide Disturbance monitoring data using current methods required by PRC-018-1 until the entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities with regard to their current Disturbance data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the effective date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance monitoring and reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the effective date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100 percent compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100 percent compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50 percent compliant within four (4) years of the effective date of PRC-002-2 and fully compliant within six (6) years of the effective date.

Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the effective date.

Entities shall be 100 percent compliant with a re-evaluated list from Requirement R1 or R5 within three (3) years following the notification by the TO or the Responsible Entity that re-evaluated the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the appropriate regional standards development process.

- PRC-002-2 Requirement R3 stipulates data must be captured by FR to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of DDR data for HVDC. PRC-002-NPCC-01 does not specify HVDC for DDR.
- PRC-002-2 Requirement R8 recognizes DDR that is not continuous, and includes triggering data for DDR that is not continuous. PRC-002-NPCC-01 stipulates that dynamic Disturbance recorders installed after that standard was approved have to be continuous, but does not address legacy devices.

Background

The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES.
2. A significant amount of sequence of events recording (SER), fault recording (FR), and dynamic ~~d~~Disturbance recording (DDR) capability already exists on the BES. The monitoring requirements in this standard align with industry practices. Therefore, many existing recordings can satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses they own. Therefore, six (6) months is adequate time for generating the list of BES buses ~~locations~~ following the methodology described in Attachment 1 (for Requirement R1).

4. Responsible ~~E~~entities have the relevant data and information pertaining to the BES Elements requiring DDR and six (6) months is adequate time for working with any affected entities and generating the list of BES Elements.
5. The nine (9) month time period for R12 includes the six (6) month implementation for R1 and R5, and a three (3) month additional time period to make notifications. The nine (9) months for R12 implementation is reasonable for the contents of that requirement.
6. A total percentage ~~(%)~~ of BES buses and BES Elements established in Requirements R1 and R5 respectively~~,~~ are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many monitoring requirements will become compliant without significant ~~incremental~~ changes to recording capability.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the ~~E~~entities.
8. Implementation of ~~d~~Disturbance monitoring recording following changes to the system are addressed by following re-evaluation~~assessment~~ of the lists as per Requirement R1 and Requirement R5.
9. Implementing SER, FR, and DDR capability may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners probably will have more BES Elements requiring SER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes scheduling outages into account.
10. An ~~E~~entity owning only one (1) identified BES bus, BES Element, or generating unit is allowed six (6) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or capability that could impact implementation timelines for the respective ~~E~~entities.

General Considerations

Each Transmission Owner and Generator Owner subject to PRC-018-1 shall maintain the ability to provide Disturbance monitoring data using current methods required by PRC-018-1 until the entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities with regard to their current Disturbance data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the ~~E~~effective ~~D~~date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance ~~M~~monitoring and ~~R~~reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the ~~E~~effective ~~D~~date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100~~%~~ percent compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100~~%~~ percent compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50~~%~~ percent compliant within four (4) years of the ~~E~~effective ~~D~~date of PRC-002-2 and fully compliant within six (6) years of the ~~E~~effective ~~D~~date.

Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the ~~E~~effective ~~D~~date.

Entities shall be 100~~%~~ percent compliant with a re-evaluated~~assessed~~ list from Requirement R1 or R5 within three (3) years following the notification by the TO or the Responsible Entity that re-evaluated ~~of~~ the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the appropriate regional standards development process.

- ~~The following conflicts~~ PRC-002-2 Requirement R3 stipulates data must be captured by FR~~fault recording~~ to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of DDR~~dynamic disturbance recording~~ data for HVDC. PRC-002-NPCC-01 does not specify HVDC for DDR.
- PRC-002-2 Requirement R8 recognizes ~~dynamic disturbance recording~~DDR that is not continuous, and includes triggering data for DDR that is not continuous. PRC-002-NPCC-01 stipulates that ~~addresses~~ dynamic ~~d~~Disturbance recorders installed after that ~~e~~ standard was approved have to be continuous, but does not address ~~mention~~ legacy devices.

The DMSDT developed this Excel Workbook is designed to assist Transmission Owners in using the Median Method for determining monitoring bus locations for Fault Recording and Sequence of Events Recording on their individual systems.

Instructions for use:

For Transmission Owners Only:

1	Organize your short circuit data in the format shown on the Data Input worksheet
2	Your short circuit data should use three phase short circuit with your selected pre-fault voltage
3	Your short circuit data should be ordered from highest three phase short circuit MVA value to lowest three phase short circuit MVA value for all buses greater than 100 kV
4	Your short circuit data should either eliminate or commonly identify non-real buses, zero buses, pseudo buses, or buses which are used for modeling purposes only, by using a common designation for all these type buses that can be eliminated from the Median calculation. It is most common to identify these non-real buses with the number "0" in the bus coded number field.
5	The Data Input Worksheet is designed to have you copy your properly formatted and sorted three phase MVA short circuit data into rows starting at column A row 6 of the worksheet.
6	Data Input, Col. F, is the most important column, it must have the three phase MVA short circuit data values, sorted from highest MVA to lowest MVA. The MVA values in column F, as sorted from highest to lowest MVA, should include all voltage levels greater than or equal to 100 kV.
7	Once you input all of your short circuit data into the Data Input worksheet starting at Column A Row 6, the values in cells B2, B3 and B4 should all be equal. These values should equal the number of rows of short circuit data that you have input. Copy Cell B2 using Cntrl C, then Paste Value, Special value only, back into Cell B2. This should be the total number of rows contained in the data set.
8	If you have zero numbered buses, or pseudo buses, commonly identified by say a number 0 in the bus coded number column, then you need to determine the number of zero numbered buses that are included in this data set.
9	For you to be able to determine this zero bus coded number, you need to select your entire data set, including the header row, from column / row A5 to G___(last row of data). As an example, if your data contains 100 rows, then your highlighted area for sorting and filtering should be A5 to G105. Then using the sort filter command, turn on Filter
10	Once the Filter is on, go to the bus coded number column, pull down the Filter and select only the zero bus coded number rows. The values in cells B3, and B4 should now be equal and indicate the number of zero numbered buses in your data set.
11	We want to store the zero numbered bus rows (number) into cell B4 as a value. To do this, select Cell B4, hit Cntrl C, then hit paste special, value only. This now repalces the formula in Cell B4 with the value of zero buses in the data set.
12	Now we wish to eliminate the zero bus rows from the rest of our data processing, so in the bus coded number column, we want to filter out the zero bus rows, so we reverse the pull down selection by selecting all rows, except the zero bus coded numbered rows. Leave this Filter in place for the rest of the Median method process.
13	If Cell B4 contains the number zero, then Cell F2 should now contain the 6th value down from the highest short circuit MVA value, and Cell G2 should contain 20% of the Cell F2 value. If Cell F2's value is greater than 1500 MVA this is the new lowest MVA value to be used to determine the number of Median selected buses. If the value in F2 is less than 1500 MVA, then we will use 1500 MVA as the lowest value to select the number of Median buses.
14	If Cell B4 contains a value greater than zero, then Cell F2 needs to be replaced with the MVA value contained in the 11th row, column F of the filtered data set. If the value in F2 is less than 1500 MVA then we will use 1500 MVA as the lowest value to select the number of Median buses.
15	With the Filter still applied to our data set, and zero buses deselected, we will need to use the F2 value to apply as the value used for the MVA column pull down.
16	Using Column F, MVA value pull down, use the Number Filter function, greater than or equal to the F2 value. With this Filter F2 number value applied, now Cntrl C Cell C2, and replace C2 with paste special, value only. This now is the number of buses selected by the Median method.
17	You are Finished!!! The number in Cell C2 indicates the number of Median method selected buses, D2 contains the number of total FR and SOER locations, E2 shows the number of FR / SOER for the Top 10% buses and F2 shows the number of FR / SOER for the Distributed 10% buses.
Notes:	Example 1 (Ex 1 without zero buses) is an additional worksheet shown for a system that does not contains any zero buses. All zero bus entries have been eliminated from the data set.
Notes:	Example 2 (Ex 2 with zero buses) is an additional worksheet shown for a system that contains zero buses. Note for a system that contains zero buses, you must observe the row 11, column F MVA value, and place it into Cell F2. In example 2, this MVA value is equal to 5685 MVA, based on the data set provided.

Unofficial Comment Form

Project 2007-11 Disturbance Monitoring

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the Standard. The electronic comment form must be completed by 8 p.m. Eastern on **October 21, 2014**.

If you have questions please contact Stephen Crutchfield via email or by telephone at 609-651-9455.

Click here for the Project Page.

Background Information

Project 2007-11 Disturbance Monitoring was initiated to replace the existing fill-in-the-blank Standard PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements with a more comprehensive standard. (Fill-in-the-blank standards are those standards that depend on regional criteria or procedures not currently contained within certain Reliability Standards, but which are needed to provide additional requirements for implementing the standards within the regions.) The DMSDT posted a draft standard for a 45-day comment/ballot period May 9- June 25, 2014. Based on the comments received from stakeholders, the DMSDT has revised the standard.

The DMSDT has performed significant outreach to better understand issues raised by stakeholders during the most recent posting and ballot period. This has resulted in revisions to the requirements, measures and rationales of the standard. One major point of emphasis is that the Transmission Owner or Generator Owner only has to be able to determine the quantities specified in the appropriate requirements.

The major issues related to PRC-002-2 that were raised by stakeholders include:

Commenters suggested that Requirement R1 should be separated into distinct Parts rather than having the requirement contained in a single sentence. The DMSDT revised R1 to contain distinct Parts:

R1. Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

- **1.1.** Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1;
- **1.2.** Notify other owners of BES Elements connected to those BES buses, if any, within 90 calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data;

1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

Some stakeholders voiced their concerns for more precise wording of Step 7 in previously posted Attachment 1 which stated “If the list has 11 or fewer BES buses: FR and SER data is required at the BES buses with the highest maximum available calculated three phase short circuit MVA.” The ambiguity arose out of the term “buses” because it could be read as requiring FR and SER data from more than one bus. Thus, Step 7 is now revised to read “If the list has 1 or more but less than or equal to 11 BES buses: FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA.”

Commenters suggested clarifications to the rationales and a few of the requirements. The DMSDT has made extensive revisions to the rationales for Requirements R5, R10 and R11. These revisions provide clarity with regard to BES buses for DDR data, time synchronization for DDR and the length of time DDR data must be made available. Because of the extensive revisions made, the contents of the Rationale Boxes are “clean”.
Many stakeholders were unhappy with the bulleted list in Requirement R5, Part 5.1.2, either with a single bullet or with the list altogether. The standard DMSDT revised Requirement R5, Part, 5.1.2 and removed the bulleted list of “or” statements, replacing it with “Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).”

In Requirement R5, the use of “BES buses” was found to be confusing by many stakeholders. The use of this language was simply to provide clarity but, in response to industry’s comments, the DMSDT revised R5 by removing “BES buses”. The Requirement now references only BES Elements.

One technical change many stakeholders proposed was to revise Requirement R10 to relate to time synchronization of the device clock rather than data. The Requirement’s original language called for time synchronization of SER data within +/- 2 milliseconds. Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices are within ± 2 ms accuracy will suffice with respect to providing time synchronized data. The DMSDT revised Requirement R10 accordingly.

Several stakeholders also commented that Requirement R11 had no substantial impact on improving the reliability of the system. The DMSDT notes that the Requirement R11 ensures data availability from the data sources, timely retrievability of the data and common format so that the data can be read and used in the expeditious and effective analysis of events. Requirement R11 provides a reliability impact by integrating all of the previous requirements in the standard with respect to data reporting to facilitate event analysis. The first two Parts of Requirement R11 specify how long an entity has to provide requested data (Part 11.1) and also limits how long data must be retained by the TO or GO (Part 11.2). Parts 11.3-11.5 ensure the uniformity and consistency of the data that is reported.

Based on stakeholder feedback, the DMSDT capitalized the defined terms System, Transmission and Disturbance. The DMSDT believes that this adds clarity regarding the requirements and rationales in PRC-002-2. In some instances, these terms appear adjacent to each other within sentences of Requirements, Rationales or Guidelines. The following instances occur:

- Transmission System
- System Disturbance
- System Demand

The DMSDT has also incorporated the defined term “Transmission Line”. The DMSDT does not intend to create any new defined terms by the above uses. Each defined term stands on its own.

**Please use the* [electronic form](#) *to submit your final comments to NERC.*

You do not have to answer all questions. Enter All Comments in Simple Text Format.
Bullets, numbers, and special formatting will not be retained. Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. The DMSDT revised the requirements for dynamic Disturbance recording (DDR) data based on stakeholder comments (see background section above). Do you agree with the BES Elements requiring DDR data listed in Requirement R5? If not, please provide technical justification.

☐ Yes
☐ No
Comments:

2. The DMSDT revised Requirements R10 regarding time synchronization of data and added explanation regarding time synchronization as follows to the rationale:

> "Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the standard devices used for monitoring are within ± 2 ms accuracy will suffice with respect to providing time synchronized data."

Do you support these revisions? If not, please explain why and provide suggested changes.

☐ Yes
☐ No
Comments:

3. If you have any other comments that you haven't already mentioned above, please provide them here:
Comments:

A. Introduction

1. **Title:** **Define Regional Disturbance Monitoring and Reporting Requirements**
2. **Number:** PRC-002-1
3. **Purpose:** Ensure that Regional Reliability Organizations establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of Disturbance data to facilitate analyses of events and verify system models.
4. **Applicability**
   4.1. Regional Reliability Organization.
5. **Effective Date:** Nine months after BOT adoption.

B. Requirements

R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:

R1.1. Location, monitoring and recording requirements, including the following:

R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R1.1.2. Devices to be monitored.

R2. The Regional Reliability Organization shall establish the following installation requirements for fault recording:

R2.1. Location, monitoring and recording requirements, including the following:

R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R2.1.2. Elements to be monitored at each location.

R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R2.1.3.1. Three phase to neutral voltages.

R2.1.3.2. Three phase currents and neutral currents.

R2.1.3.3. Polarizing currents and voltages, if used.

R2.1.3.4. Frequency.

R2.1.3.5. Megawatts and megavars.

R2.2. Technical requirements, including the following:

R2.2.1. Recording duration requirements.

R2.2.2. Minimum sampling rate of 16 samples per cycle.

R2.2.3. Event triggering requirements.

R3. The Regional Reliability Organization shall establish the following installation requirements for dynamic Disturbance recording:

R3.1. Location, monitoring and recording requirements including the following:

R3.1.1. Criteria for equipment location giving consideration to the following:

- Site(s) in or near major load centers
- Site(s) in or near major generation clusters
- Site(s) in or near major voltage sensitive areas
- Site(s) on both sides of major transmission interfaces
- A major transmission junction
- Elements associated with Interconnection Reliability Operating Limits
- Major EHV interconnections between control areas
- Coordination with neighboring regions within the interconnection

R3.1.2. Elements and number of phases to be monitored at each location.

R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R3.1.3.1. Voltage, current and frequency.

R3.1.3.2. Megawatts and megavars.

R3.2. Technical requirements, including the following:

R3.2.1. Capability for continuous recording for devices installed after January 1, 2009.

R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.

R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following:

R4.1. Criteria for events that require the collection of data from DMEs.

R4.2. List of entities that must be provided with recorded Disturbance data.

R4.3. Timetable for response to data request.

R4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE[1] analysis tool,

R4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files[2].

R4.6. Data content requirements and guidelines.

---

[1] IEEE C37.111-1999 IEEE Standard Common Format for Transient Data Exchange for Power Systems or its successor standard

[2] Compliance with this requirement is not effective until the IEEE Standard is approved.

R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.

R6. The Regional Reliability Organization shall periodically (at least every five years) review, update and approve its Regional requirements for Disturbance monitoring and reporting.

C. Measures

M1. The Regional Reliability Organization's requirements for the installation of Disturbance Monitoring Equipment shall address Requirements 1 through 3.

M2. The Regional Reliability Organization's Disturbance monitoring data reporting requirements shall include all elements identified in Requirements 4.

M3. The Regional Reliability Organization shall have evidence it provided its Regional Disturbance monitoring and reporting requirements as required in Requirement 5.

M4. The Regional Reliability Organization shall have evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its DME requirements for three years.

The Compliance Monitor will retain its audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through providing its documentation of Disturbance Monitoring and Reporting requirements or self-certification as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exist:

2.1.1 Disturbance data reporting requirements were not specified as required in R4.1 through R4.6.

2.1.2 No evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in R6.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions exist:

2.2.1 Technical requirements were not specified for one or more types of DMEs.

2.2.2 Requirements do not provide criteria for equipment location or criteria for monitored elements or monitored quantities as required R1, R2 and R3.

2.3. Level 3: Not applicable.

2.4. Level 4: Disturbance monitoring and reporting requirements were not available or were not provided to Transmission Owners and Generator Owners.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. **Title:** **Disturbance Monitoring Equipment Installation and Data Reporting**

2. **Number:** PRC-018-1

3. **Purpose:** Ensure that Disturbance Monitoring Equipment (DME) is installed and that Disturbance data is reported in accordance with regional requirements to facilitate analyses of events.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Generator Owner.

5. **Effective Dates:** Phased in over four years after BOT adoption:

   Requirements 1 and 2:

   – 50% compliant two years after initial issuance of regional requirements per RELIABILITY STANDARD PRC-002 Requirement 5.

   – 75% compliant three years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   – 100% compliant four years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   Requirements 3 through 6:

   – 100% compliant six months after BOT adoption for already installed DME.

   – 100% compliant six months after installation for DMEs installed to meet Regional Reliability Organization requirements per reliability standard PRC-002 Requirements 1, 2 and 3.

B. Requirements

R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard PRC-002 Requirements 1-3) shall have DMEs installed that meet the following requirements:

R1.1. Internal Clocks in DME devices shall be synchronized to within 2 milliseconds or less of Universal Coordinated Time scale (UTC)

R1.2. Recorded data from each Disturbance shall be retrievable for ten calendar days..

R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization's installation requirements (reliability standard PRC-002 Requirements 1 through 3).

R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1):

R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder).

R3.2. Make and model of equipment.

R3.3. Installation location.

R3.4. Operational status.

R3.5. Date last tested.

R3.6. Monitored elements, such as transmission circuit, bus section, etc.

R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc.

R3.8. Monitored electrical quantities, such as voltage, current, etc.

R4. The Transmission Owner and Generator Owner shall each provide Disturbance data (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard PRC-002 Requirement 4).

R5. The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years.

R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:

R6.1. Maintenance and testing intervals and their basis.

R6.2. Summary of maintenance and testing procedures.

C. Measures

M1. The Transmission Owner and Generator Owner shall each have evidence that DMEs it is required to have meet the functional requirements specified in Requirement 1 and are installed in accordance with its associated Regional Reliability Organization's requirements (R2).

M2. The Transmission Owner and Generator Owner shall each maintain the data listed in Requirements 3.1 through 3.8 for the DMEs installed to meet its Regional Reliability Organization's DME installation requirements.

M2.1 The Transmission Owner and Generator Owner shall each have evidence it provided this DME data to its Regional Reliability Organization within 30 calendar days of a request.

M3. The Transmission Owner and Generator Owner shall each have evidence it retained and provided recorded Disturbance data to entities in accordance with its associated Regional Reliability Organization's Disturbance data reporting requirements. (R4 R5)

M4. Each Transmission Owner and Generator Owner that is required to install DMEs to meet its Regional Reliability Organization's DME installation requirements, shall have an associated DME maintenance and testing program as defined in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner and Generator Owner shall each retain any Disturbance data provided to the Regional Reliability Organization (Requirement 4) for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner and Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if any of the following conditions is present:

2.1.1 DMEs that meet all the Regional Reliability Organization's installation requirements (in accordance with Requirement 2) were installed at 90% or more but not all of the required locations.

2.1.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with Requirement 4) was provided for 90% or more but not all of the required locations.

2.1.3 Data on required DMEs was incomplete (in accordance with R3)

2.1.4 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, but records indicate maintenance and testing did occur within the identified intervals for the portions of the program that were documented.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions is present:

2.2.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 80% or more but less than 90% of the required locations.

2.2.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 80% or more but less than 90% of the required locations.

2.2.3 Recorded Disturbance data was not provided to all required entities (in accordance with R4)

2.2.4 Archived data was not retained for three years (in accordance with Requirement 5).

2.2.5 Documentation of the DME maintenance and testing program provided was complete as required in R6, but records indicate that maintenance and testing did not occur within the defined intervals.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions is present:

2.3.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 70% or more but less than 80% of the required locations.

2.3.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 70% or more but less than 80% of the required locations.

2.3.3 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, and records indicate implementation of the documented portions of the maintenance and testing program did not occur within the identified intervals.

2.4. Level 4: There shall be a level four non-compliance if any one of the following conditions is present:

2.4.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at less than 70% of the required locations.

2.4.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for less than 70% of the required locations.

2.4.3 DMEs that meet all functional requirements (in accordance with R1) were not installed at all required locations.

2.4.4 Documentation of the DME maintenance and testing program was not provided, or no evidence that the testing program did occur within the identified intervals

E. Regional Differences

None identified.

Consideration of Issues and Directives

Project 2007-11 Disturbance Monitoring
PRC-002-2 Disturbance Monitoring and Reporting Requirements

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"For the reasons stated in the NOPR, the Commission will not approve or remand PRC-002-1." "We agree with [American Public Power Association], Alcoa and Otter Tail that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA, Alcoa and Otter Tail's suggestions in the Reliability Standards development process as it modifies PRC-002-1 to provide missing information needed for the Commission to act on this Reliability Standard." (see below for American Public Power Association, Alcoa, and Otter Tail discussion)	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1455-56	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances. The use of recording and specifying recording data parameters, greater consistency is achieved in PRC-002-2.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in addressing the completion of this Reliability Standard."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1452	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances.
"Alcoa suggests that the ERO—instead of a Regional Entity—should define the requirements for DME and the type of report it generates. The requirements and equipment specifications should be consistent throughout North America. In addition, Alcoa suggests that the criteria for installation of such equipment should include the necessary monitoring and recording that contribute to analysis and enhance reliability."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1453	Determines the key locations for which Disturbance data must be recorded which eliminates the need for equipment requirements. PRC-002-2 specifies the storage requirements and recording format for the collected data to ensure continent-wide uniformity to expedite event analysis.
"Otter Tail suggests that PRC-002-1 should be developed on an Interconnection wide basis to ensure consistency and promote reliability of the Bulk-Power System."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards	PRC-002-2 will apply on a continent-wide basis.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
	for the Bulk-Power System (Issued March 16, 2007); Paragraph 1454	
"The Commission requires supplemental information for any Reliability Standard that currently requires a regional reliability organization to fill in missing criteria or procedures. Where important information has not yet been provided to us to enable us to complete our review, we are not in a position to approve or remand those Reliability Standards. Accordingly, we will not approve or remand such Reliability Standards until the ERO submits further information. Until such information is provided, compliance with fill-in-the-blank standards should continue on a voluntary basis, and the Commission considers compliance with such Reliability Standards to be a matter of good utility practice."	Fill-in-the-blank Consideration FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 297.	By addressing recording instead of equipment, the Drafting Team has produced a continent-wide standard to have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

Project 2007-11 – Disturbance Monitoring

PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying data instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements:	**R10.** Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset. 10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**R11.** Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1** Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded. **11.2** Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor. **11.3** SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2. **11.4** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later. **11.5** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.
Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R10 and R11.	

<table>
<tr><th>Standard PRC-018-1 (To be Retired)
FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td colspan="2">PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R11.</td></tr>
<tr><td>R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization’s installation requirements (reliability standard PRC-002 Requirements 1 through 3).

PRC-002-1
R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:
R1.1. Location, monitoring and recording requirements, including the following:
R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).
R1.1.2. Devices to be monitored</td><td>R1. Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.
1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.
1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns</td></tr>
</table>

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2.Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation	connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **3.1** Phase-to-neutral voltage for each phase of each specified BES bus. **3.2** Each phase current and the residual or neutral current for the following BES Elements: **3.2.1** Transformers that have a low-side operating voltage of 100kV or above. **3.2.2** Transmission Lines. **R4.** Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point, or • At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder. **4.2** A minimum recording rate of 16 samples per cycle. **4.3** Trigger settings for at least the following: **4.3.1** Neutral (residual) overcurrent. **4.3.2** Phase undervoltage or overcurrent.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
requirements for **dynamic Disturbance recording**: R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following:	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	**5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan. R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **6.1** One phase-to-neutral or positive sequence voltage. **6.2** The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. **6.3** Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required. **6.4** Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for wich it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	7.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level. 7.2. The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current. 7.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 7.4. Frequency of at least one of the voltages in Requirement R7, Part 7.1. R8. Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz

<table>
<tr><th>Standard PRC-018-1 (To be Retired)
FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td></td><td>

Rate of change of frequency trigger set at:

Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec
Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec
ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec
Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec

Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds

R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
9.1 Input sampling rate of at least 960 samples per second.
9.2 Output recording rate of electrical quantities of at least 30 times per second.
</td></tr>
<tr><td colspan="2">Notes: PRC-018-1, Requirement R2 and PRC-002-1 Requirements R1-R3 are covered in PRC-002-2, Requirements R1-R9. PRC-018-1, Requirement R2 references PRC-002-1 Requirements R1-R2. PRC-002-1, Requirements R1-R3 reference equipment installation requirements for FR, SER, and DDR. The technical parameters of PRC-002-2 pertain to the characteristics and content of the recordings that are needed to facilitate event analysis.</td></tr>

<tr><td>R4. The Transmission Owner and Generator Owner shall each provide Disturbance data (recorded by DMEs) in accordance with its Regional Reliability Organization’s requirements (reliability standard PRC-002 Requirement 4).

PRC-002-1

R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following:

4.1. Criteria for events that require the collection of data from DMEs.

4.2. List of entities that must be provided with recorded Disturbance data.

4.3. Timetable for response to data request.

4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool.</td><td>R11. Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

11.1. The recorded data will be provided within 30 calendar days of a request.

11.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request.

11.3. SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2.

11.4. FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later.

11.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.</td></tr>
</table>

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R11.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2 Evidence Retention** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years. The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years. The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years. The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years. If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:	**R12.** Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the SER, FR or DDR data either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* • Restore the recording capability, or • Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R6.1. Maintenance and testing intervals and their basis. R6.2. Summary of maintenance and testing procedures.	
Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R12. PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R12 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data;

Standard PRC-002-1	Proposed Standard PRC-002-2
R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R2. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1;

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements they own connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltage for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission Lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include:

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	• A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent.
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

Standard PRC-002-1	Proposed Standard PRC-002-2
consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored	**5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element **5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan. **R6.** Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notifications as identified in

Standard PRC-002-1	Proposed Standard PRC-002-2
element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. **R8.** Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified as per Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz

Standard PRC-002-1	Proposed Standard PRC-002-2
	o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-002-1, Requirement R3 is covered in PRC-002-2, Requirements R5-R6 and R8-R9.	
R4. The Regional Reliability Organization shall establish requirements for facility owners	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per

Standard PRC-002-1	Proposed Standard PRC-002-2
to **report Disturbance data recorded** by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool, 4.5. Naming of data files in conformance with the IEEE	Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-002-1	Proposed Standard PRC-002-2
C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	
Notes: PRC-002-1, Requirement R4 is covered in PRC-002-2, Requirement R13.	
R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R5 is covered in PRC-002-2, Requirements R2, R6-R7.	
R6. The Regional Reliability Organization shall periodically (**at least every five years**) review, update and approve its Regional requirements for Disturbance monitoring and reporting.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R5.	

Project 2007-11 – Disturbance Monitoring

PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying ~~recording~~ data instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

~~As used herein, the acronym SER is Sequence of Events Recording, the acronym FR is Fault Recording, and the acronym DDR is Dynamic Disturbance Recording.~~

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements: R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**R10**. Each Transmission Owner and Generator Owner shall time synchronize all SER and, FR and DDR data for the BES bus buses identified per Requirement R1 and DDR data for the BES Elements identified per Requirement R5 that meet the following:~~to within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset.~~ *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* *10.1 Synchronization to Coordinated Universal Time (UTC), with or without a local time offset.* *10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.* **R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, ~~(C37.111-2013 or later)~~ IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later ~~formatted files~~.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	11.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.
Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R10 and R11. PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R11.	
R2. The Transmission Owner and Generator Owner shall each **install DMEs in accordance with** its Regional Reliability Organization's installation requirements (reliability standard **PRC-002 Requirements 1 through 3**). **PRC-002-1** R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event**	**R1.** Each Transmission Owner ~~shall identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years.~~ [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
recording: R1.1. Location, monitoring and recording requirements, including the following: R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2.Technical requirements, including the following:	90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it~~they~~ owns connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses~~ identified per Requirement R1~~. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for ~~at~~ the BES Elements it~~they~~ owns connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltages for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission ~~l~~Lines.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element	R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total~~post-trigger~~ record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent. R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element **5.2.2** One BES Element per 3,000 MW of the Responsible Entity’s historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan. ~~R5. Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable)~~

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	~~shall identify BES Elements for which dynamic disturbance recorder (DDR) data is required, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~ ~~**5.1.** The BES Elements shall include the following:~~ ~~**5.1.1.** Generating resource(s) with:~~ ~~**5.1.1.1.** Gross individual nameplate rating greater than or equal to 500 MVA.~~ ~~**5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA.~~ ~~**5.1.2.** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines:~~ • ~~Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection or~~ • ~~Transfer Paths in the Western Interconnection Path Rating Catalog or~~ • ~~Voltage stability limited transfer paths or load serving area or~~ • ~~Interfaces between Balancing Authority Areas or~~ • ~~Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC)~~

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	~~5.1.3. Each terminal of a high-voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA on the alternating current (AC) portion of the converter.~~ ~~5.1.4. One or more BES Elements associated with Interconnection Reliability Operating Limits.~~ ~~5.1.5. Any one BES Element within a major voltage sensitive area with an in-service undervoltage load shedding (UVLS) program.~~ ~~5.2. The BES Elements shall include a minimum of:~~ ~~5.2.1 One BES Element~~ ~~5.2.2 One additional BES Element per each additional 3,000 MW of its historical peak system Demand.~~ R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5~~, to determine the following electrical quantities~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for wich it received notification as identified ~~in~~per Requirement R5~~, to determine the following electrical quantities~~: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 7.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level. 7.2. The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current. 7.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 7.4. Frequency of at least one of the voltages in Requirement R7, Part 7.1. R8. Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified in~~as per~~ Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers:

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	• Off nominal frequency trigger set at: | | Low | High | o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets ~~, which conform to~~ the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-018-1, Requirement R2 and PRC-002-1 Requirements R1-R3 are covered in PRC-002-2, Requirements R1-R9. PRC-018-1, Requirement R2 references PRC-002-1 Requirements R1-R2. PRC-002-1, Requirements R1-R3 reference equipment installation requirements for FR, SER, and DDR. The technical parameters of PRC-002-2 pertain to the characteristics and content of the recordings that are needed to facilitate event analysis.	
R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1): R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder). R3.2. Make and model of equipment.	None.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.3. Installation location. R3.4. Operational status. R3.5. Date last tested. R3.6. Monitored elements, such as transmission circuit, bus section, etc. R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc. R3.8.Monitored electrical quantities, such as voltage, current, etc.	
Notes: PRC-018-1, Requirement R3 is not covered in PRC-002-2. PRC-018-1 Requirement R3 refers to equipment and therefore is not mapped to PRC-002-2 which deals with recorded data and not equipment.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R4. The Transmission Owner and Generator Owner shall each **provide Disturbance data** (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard **PRC-002 Requirement 4**). **PRC-002-1** R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool.	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later. ~~**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~ ~~**11.1.** The recorded data will be provided within 30 calendar days of a request.~~

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	~~11.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request.~~ ~~11.3. SER data will be provided in Comma Separated Value (.CSV) format following Attachment 2.~~ ~~11.4. FR and DDR data will be provided in electronic C37.111, (C37.111-2013 or later) IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files.~~ ~~11.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).~~

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R11.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2 Evidence Retention** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years. The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years. The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years. The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per~~of~~ Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years. The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years. If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes: R6.1. Maintenance and testing	**R12.** Each Transmission Owner and Generator Owner shall, within 90--calendar days of the discovery of a failure of the SER, ~~and~~ FR or DDR data either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* • ~~, shall r~~Restore the recording capability, or • ~~develop~~Submit a Corrective Action Plan (CAP)~~, to be submitted~~ to the Regional Entity~~,~~ and implement it.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
intervals and their basis. R6.2. Summary of maintenance and testing procedures.	
Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R12. PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R12 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following: R1.1.1. Criteria for equipment location (e.g.,	**R1.** Each Transmission Owner shall: ~~identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years.~~ [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within

Standard PRC-002-1	Proposed Standard PRC-002-2
by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it~~they~~ owns connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses~~ identified per Requirement R1~~. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R2. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements,	**R1.** Each Transmission Owner shall:~~ identify BES buses for which sequence of events recorder (SER) and fault recorder (FR) data is required by using the methodology in PRC-002-2, Attachment 1, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses that those Elements may require SER data and/or FR data, and reevaluate the identified buses at least once every five calendar years.~~ [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault

Standard PRC-002-1	Proposed Standard PRC-002-2
including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for~~at~~ the BES Elements they own connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltage~~s~~ for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission ~~l~~Lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total~~post-trigger~~ record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent.
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

Standard PRC-002-1	Proposed Standard PRC-002-2
equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored	**5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element **5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan. ~~**R5.** Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which dynamic disturbance recorder (DDR) data is required, notify within 90 calendar days other owners, if any, of Elements connected to those BES buses~~

Standard PRC-002-1	Proposed Standard PRC-002-2
element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	~~that those Elements may require DDR data, and reevaluate the identified buses at least once every five calendar years.~~ ~~*[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~ ~~**5.1.** The BES Elements shall include the following:~~ ~~**5.1.1.** Generating resource(s) with:~~ ~~**5.1.1.1.** Gross individual nameplate rating greater than or equal to 500 MVA.~~ ~~**5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA.~~ ~~**5.1.2.** Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. Selection of major transmission interfaces should consider the following guidelines:~~ • ~~Stability related interfaces or other significant Flowgates in the NERC Book of Flowgates for the Eastern Interconnection or~~ • ~~Transfer Paths in the Western Interconnection Path Rating Catalog or~~ • ~~Voltage stability limited transfer paths or load serving area or~~ • ~~Interfaces between Balancing Authority Areas or~~ • ~~Areas of significant congestion, thermal violation history, or relatively low Available Transfer Capability (ATC)~~ ~~**5.1.3.** Each terminal of a high-voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA on the alternating current (AC) portion of the converter.~~ ~~**5.1.4.** One or more BES Elements associated with Interconnection Reliability~~

Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R5.	

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5-calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 80% but less than 100% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by 30-calendar days or less. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by 10-calendar days or less.
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 70% but less than or equal to 80% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 30-calendar days and less than or equal to 60-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 10-calendar days but less than or equal to 20-calendar days.
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 60% but less than or equal to 70% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 60-calendar days and less than or equal to 90-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 20-calendar days but less than or equal to 30-calendar days.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for less than or equal to 60% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 90-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying one or more other owners by greater than 30-calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R1	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R2	
Proposed VRF	**Lower**
NERC VRF Discussion	R2 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2 provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 80% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 70% but less than or equal to 80% of the total SER

VRF and VSL Justifications – PRC-002-2, R2	
	data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 60% but less than or equal to 70% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R2 for less than or equal to 50% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3	
Proposed VRF	**Lower**
NERC VRF Discussion	R3 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R3 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 80% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 70% but less than or equal to 80% of the total set of required electrical quantities, which is the product of the total number of monitored BES

VRF and VSL Justifications – PRC-002-2, R3	
	Elements and the number of specified electrical quantities per each Element.
Proposed High VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 60% but less than or equal to 57% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers less than or equal to 60% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4	
Proposed VRF	**Lower**
NERC VRF Discussion	R4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data that meets more than 80% but less than 100% of the total recording properties as specified in Requirement R4.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data that meets more than 70% but less than or equal to 80% of the total recording properties as specified in Requirement R4.

VRF and VSL Justifications – PRC-002-2, R4	
Proposed High VSL	The Transmission Owner or Generator Owner had FR data that meets more than 60% but less than or equal to 70% of the total recording properties as specified in Requirement R4.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data that meets less than or equal to 60% of the total recording properties as specified in Requirement R4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R5 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5 contains only one objective which identifies BES Elements within specified criteria and to review the list every 5-calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity identified the Elements for which DDR data is required as directed by Requirement R5 for more than 80% but less than 100% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by 30-calendar days or less. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by 10-calendar days or less.
Proposed Moderate VSL	The Responsible Entity identified the Elements for which DDR is required as directed by Requirement R5 for more than 70% but less than or equal to 80% of the required Elements included in Part 5.1. OR The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 30-calendar days and less than or equal to 60-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 10-calendar days but less than or equal to 20-calendar days.
Proposed High VSL	The Responsible Entity identified the Elements for which DDR data is requires as directed by Requirement R5 for more than 60% but less than or equal to 70% of the required Elements included in Part 5.1. OR The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 60-calendar days and less than or equal to 90-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 20-calendar days but less than or equal to 30-calendar days.
Proposed Severe VSL	The Responsible Entity identified the Elements for which DDR data is required as directed by Requirement R5 for less than or equal to 60% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 90-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying one or more owners by greater than 30-calendar days. OR The Responsible Entity failed to ensure a minimum DDR coverage per Part 5.2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R5	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R6	
Proposed VRF	**Lower**
NERC VRF Discussion	R6 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R6 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R6 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R6	
Proposed Lower VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 that covered more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Transmission Owner failed to have DDR data as directed by Requirement R6, Parts 6.1 through 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R6	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7	
Proposed VRF	**Lower**
NERC VRF Discussion	R7 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R7	
Proposed Lower VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 that covers more than 80% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 70% but less than or equal to 80% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 60% but less than or equal to 70% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Generator Owner failed to have DDR data as directed by Requirement R7, Parts 7.1 through 7.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R7 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R7	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
Proposed VRF	**Lower**
NERC VRF Discussion	R8 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes the need for continuous data recording and storage for Dynamic Disturbance Recordings established in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R8 contains only one objective to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R6. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R8	
Proposed Lower VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 80% but less than 100% of the Elements they own as determined in Requirement R5.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 70% but less than or equal to 80% of the Elements they own as determined in Requirement R5.
Proposed High VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 6% but less than or equal to 70% of the Elements they own as determined in Requirement R5.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have continuous or non-continuous DDR data, as directed in Requirement R8, for the Elements they own as determined in Requirement R5.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R8	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R9	
Proposed VRF	**Lower**
NERC VRF Discussion	R9 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R9 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement established technical specifications for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish technical specifications for Dynamic Disturbance Recording selected in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R9 contains only one objective which is to establish technical specifications for Dynamic Disturbance Recording selected in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 80% but less than 100% of the total recording properties as specified in Requirement R9.

VRF and VSL Justifications – PRC-002-2, R9	
Proposed Moderate VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 70% but less than or equal to 80% of the total recording properties as specified in Requirement R9.
Proposed High VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 60% but less than or equal to 70% of the total recording properties as specified in Requirement R9.
Proposed Severe VSL	The Transmission Owner or Generator Owner had DDR data that meets less than or equal to 60% of the total recording properties as specified in Requirement R9.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R9 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Consistency among Reliability Standards**

VRF and VSL Justifications – PRC-002-2, R9	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This requirement established technical specifications for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R10	
Proposed VRF	**Lower**
NERC VRF Discussion	R10 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R10 requires time synchronization of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations established in R1 and R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failures to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R10 contains only one objective which is to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 90% but less than 100% of the bus

VRF and VSL Justifications – PRC-002-2, R10	
	locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 80% but less than or equal to 90% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed High VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 70% but less than or equal to 80% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for less than or equal to 70% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R10 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R10	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R11	
Proposed VRF	**Lower**
NERC VRF Discussion	R11 is administrative in nature and a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R11 provides criteria around timelines for providing the data and the data format. This is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria on providing Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R11 contains only one objective which is to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data within the specified criteria. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 30-

VRF and VSL Justifications – PRC-002-2, R11	
	calendar days but less than 40-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 90% but less than 100% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 90% but less than 100% in the proper data format.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 40-calendar days but less than or equal to 50-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 80% but less than or equal to 90% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 80% but less than or equal to 90% in the proper data format.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 50-calendar days but less than or equal to 60-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 70% but less than or equal to 80% of the requested data. OR

VRF and VSL Justifications – PRC-002-2, R11	
	The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 70% but less than or equal to 80% in the proper data format.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 failed to provide the requested data more than 60-calendar days after the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11 failed to provide less than or equal to 70% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided less than or equal to 70% in the proper data format.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R11 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R11	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R12	
Proposed VRF	**Lower**
NERC VRF Discussion	R12 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action

VRF and VSL Justifications – PRC-002-2, R12	
	Plan to the Regional Entity more than 90-calendar days but less than 100-calendar days after discovery of the failure.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100-calendar days but less than or equal to 110-calendar days after discovery of the failure.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110-calendar days but less than or equal to 120-calendar days after discovery of the failure. OR The Transmission Owner or Generator Owner as directed by Requirement R12 submitted a CAP to the Regional Entity but failed to implement it.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120-calendar days after discovery of the failure. OR Transmission Owner or Generator Owner as directed by Requirement R12 failed to restore the recording capability and failed to submit a CAP to the Regional Entity.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure	Guideline 2a: The VSL assignment is for R12 is not binary.

VRF and VSL Justifications – PRC-002-2, R12	
Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

implementation should account for their interdependence	

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5 ~~calendar~~ calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 80% but less than 100% of the required BES buses that they own. OR The Transmission Owner evaluated~~assessed~~ the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by 30 ~~calendar~~ calendar days or less. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by 10 ~~calendar~~ calendar days or less.
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 70% but less than or equal to 80% of the required BES buses that they own. OR The Transmission Owner evaluated~~assessed~~ the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 30 ~~calendar~~ calendar days and less than or equal to 60 ~~calendar~~ calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 10 ~~calendar~~ calendar days but less than or equal to 20 ~~calendar~~ calendar days.
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 60% but less than or equal to 70% of the required BES buses that they own. OR The Transmission Owner evaluated~~assessed~~ the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 60 ~~calendar~~ calendar days and less than or equal to 90 ~~calendar~~ calendar days. OR

VRF and VSL Justifications – PRC-002-2, R1	
	The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 20 ~~calendar~~ calendar days but less than or equal to 30 ~~calendar~~ calendar days.
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for less than or equal to 60% of the required BES buses that they own. OR The Transmission Owner ~~assessed~~ evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 90 ~~calendar~~ calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying one or more other owners by greater than 30 ~~calendar~~ calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R1	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R2	
Proposed VRF	**Lower**
NERC VRF Discussion	R2 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2 provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 80~~75~~% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 7~~5~~0% but less than or equal to 80~~75~~% of the total

VRF and VSL Justifications – PRC-002-2, R2	
	SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 6~~1~~0% but less than or equal to 7~~5~~0% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R2 for ~~had from 0% but~~ less than or equal to 5~~1~~0% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3	
Proposed VRF	**Lower**
NERC VRF Discussion	R3 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R3 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 80~~75~~% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 7~~5~~0% but less than or equal to 80~~75~~% of the total set of required electrical quantities, which is the product of the total number of monitored BES

VRF and VSL Justifications – PRC-002-2, R3	
	Elements and the number of specified electrical quantities per each Element.
Proposed High VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 6~~1~~0% but less than or equal to 57~~0~~% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers ~~more than 0% but~~ less than or equal to 6~~1~~0% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4	
Proposed VRF	**Lower**
NERC VRF Discussion	R4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data that meets more than 80~~75~~% but less than 100% of the total recording properties as specified in Requirement R4.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data that meets more than 7~~5~~0% but less than or equal to 80~~75~~% of the total recording properties as specified in Requirement R4.

VRF and VSL Justifications – PRC-002-2, R4	
Proposed High VSL	The Transmission Owner or Generator Owner had FR data that meets more than 6~~1~~0% but less than or equal to 7~~5~~0% of the total recording properties as specified in Requirement R4.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data that meets ~~more than 0% but~~ less than or equal to 6~~1~~0% of the total recording properties as specified in Requirement R4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R5 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5 contains only one objective which identifies BES Elements within specified criteria and to review the list every 5 ~~calendar~~ calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity ~~accurately~~ identified the Elements for which DDR data is required as directed by Requirement R5 for more than 80% but less than 100% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity ~~assessed~~ identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by 30 ~~calendar~~ calendar days or less. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by 10 ~~calendar~~ calendar days or less.
Proposed Moderate VSL	The Responsible Entity ~~accurately~~ identified the Elements for which DDR is required as directed by Requirement R5 for more than 70% but less than or equal to 80% of the required Elements included in Part 5.1. OR The Responsible Entity identified~~assessed~~ the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 30 ~~calendar~~ calendar days and less than or equal to 60 ~~calendar~~ calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 10 ~~calendar~~ calendar days but less than or equal to 20 ~~calendar~~ calendar days.
Proposed High VSL	The Responsible Entity ~~accurately~~ identified the Elements for which DDR data is requires as directed by Requirement R5 for more than 60% but less than or equal to 70% of the required Elements included in Part 5.1. OR The Responsible Entity identified ~~assessed~~ the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 60 ~~calendar~~ calendar days and less than or equal to 90 ~~calendar~~ calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 20 ~~calendar~~ calendar days but less than or equal to 30 ~~calendar~~ calendar days.

VRF and VSL Justifications – PRC-002-2, R5	
Proposed Severe VSL	The Responsible Entity ~~accurately~~ identified the Elements for which DDR data is required as directed by Requirement R5 for less than or equal to 60% of the required Elements included in Part 5.1. OR The Responsible Entity identified ~~assessed~~ the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 90 ~~calendar~~ calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying one or more owners by greater than 30 ~~calendar~~ calendar days. OR The Responsible Entity failed to ensure a minimum DDR coverage per Part 5.2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R5	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R6	
Proposed VRF	**Lower**
NERC VRF Discussion	R6 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R6 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.

VRF and VSL Justifications – PRC-002-2, R6	
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R6 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 that covered more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Transmission Owner failed to have DDR data as directed by Requirement R6, Parts 6.1 through 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R6	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7	
Proposed VRF	**Lower**
NERC VRF Discussion	R7 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.

VRF and VSL Justifications – PRC-002-2, R7	
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 that covers more than 80~~75~~% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 7~~5~~0% but less than or equal to 80~~75~~% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 60% but less than or equal to 7~~5~~0% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Generator Owner failed to have DDR data as directed by Requirement R7, Parts 7.1 through 7.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	Guideline 2a: The VSL assignment is for R7 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R7	
Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
Proposed VRF	**Lower**
NERC VRF Discussion	R8 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes the need for continuous data recording and storage for Dynamic Disturbance Recordings established in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.

VRF and VSL Justifications – PRC-002-2, R8	
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R8 contains only one objective to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 80~~75~~% but less than 100% of the Elements they own as determined in Requirement R5.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 7~~5~~0% but less than or equal to 80~~75~~% of the Elements they own as determined in Requirement R5.
Proposed High VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 6~~0~~% but less than or equal to 7~~5~~0% of the Elements they own as determined in Requirement R5.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have continuous or non-continuous DDR data, as directed in Requirement R8, for the Elements they own as determined in Requirement R5.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b:

VRF and VSL Justifications – PRC-002-2, R8	
in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
account for their interdependence	

VRF and VSL Justifications – PRC-002-2, R9	
Proposed VRF	**Lower**
NERC VRF Discussion	R9 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R9 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement established technical specifications for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish technical specifications for Dynamic Disturbance Recording selected in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.

VRF and VSL Justifications – PRC-002-2, R9	
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R9 contains only one objective which is to establish technical specifications for Dynamic Disturbance Recording selected in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 80~~75~~% but less than 100% of the total recording properties as specified in Requirement R9.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 7~~5~~0% but less than or equal to 80~~75~~% of the total recording properties as specified in Requirement R9.
Proposed High VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 6~~1~~0% but less than or equal to 7~~5~~0% of the total recording properties as specified in Requirement R9.
Proposed Severe VSL	The Transmission Owner or Generator Owner had DDR data that meets ~~more than 1% but~~ less than or equal to 6~~1~~0% of the total recording properties as specified in Requirement R9.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level	Guideline 2a: The VSL assignment is for R9 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R9	
Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	**Guideline 3- Consistency among Reliability Standards** This requirement established technical specifications for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R10	
Proposed VRF	**Lower**
NERC VRF Discussion	R10 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R10 requires time synchronization of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations established in R1 and R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failures to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation**

VRF and VSL Justifications – PRC-002-2, R10	
	R10 contains only one objective which is to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 90% but less than 100% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 80% but less than or equal to 90% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed High VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 70% but less than or equal to 80% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for less than or equal to 70% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2	Guideline 2a: The VSL assignment is for R10 is not binary.

VRF and VSL Justifications – PRC-002-2, R10	
Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing	Non CIP

VRF and VSL Justifications – PRC-002-2, R10	
interdependent tasks of documentation and implementation should account for their interdependence	

VRF and VSL Justifications – PRC-002-2, R11	
Proposed VRF	**Lower**
NERC VRF Discussion	R11 is administrative in nature and a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R11 provides criteria around timelines for providing the data and the data format. This is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria on providing Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF

VRF and VSL Justifications – PRC-002-2, R11	
	for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R11 contains only one objective which is to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data within the specified criteria. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 30 ~~calendar~~ calendar days but less than 40 ~~calendar~~ calendar days ~~from~~ after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11~~, Part 113.2~~ provided more than 90% but less than 100% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 90% but less than 100% in the proper data format.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 40 ~~calendar~~ calendar days but less than or equal to 50 ~~calendar~~ calendar days after~~from~~ the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11~~, Part 11.2~~ provided more than 80% but less than or equal to 90% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 80% but less than or equal to 90% in the proper data format.

VRF and VSL Justifications – PRC-002-2, R11	
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 50 ~~calendar~~ calendar days but less than or equal to 60 ~~calendar~~ calendar days after~~from~~ the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11~~, Part 11.2~~ provided more than 70% but less than or equal to 80% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 70% but less than or equal to 80% in the proper data format.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 failed to provide the requested data more than 60 ~~calendar~~ calendar days ~~from~~ after the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11~~, Part 11.2~~ failed to provide less than or equal to 70% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided less than or equal to 70% in the proper data format.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2	Guideline 2a:

VRF and VSL Justifications – PRC-002-2, R11	
Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The VSL assignment is for R11 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing	Non CIP

VRF and VSL Justifications – PRC-002-2, R11	
interdependent tasks of documentation and implementation should account for their interdependence	

VRF and VSL Justifications – PRC-002-2, R12	
Proposed VRF	**Lower**
NERC VRF Discussion	R12 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this

VRF and VSL Justifications – PRC-002-2, R12	
	requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 ~~calendar~~ calendar days but less than 100 ~~calendar~~ calendar days after discovery of the failure.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 ~~calendar~~ calendar days but less than or equal to 110 ~~calendar~~ calendar days after discovery of the failure.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 ~~calendar~~ calendar days but less than or equal to 120 ~~calendar~~ calendar days after discovery of the failure. OR The Transmission Owner or Generator Owner as directed by Requirement R12 submitted a CAP to the Regional Entity but failed to implement it.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 ~~calendar~~ calendar days after discovery of the failure. OR Transmission Owner or Generator Owner as directed by Requirement R12 failed to restore the recording capability and failed to submit a CAP to the Regional Entity.

VRF and VSL Justifications – PRC-002-2, R12	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R12 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R12	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

Standards Announcement Reminder

Project 2007-11 Disturbance Monitoring
PRC-002-2

Additional Ballot and Non-Binding Poll Now Open through October 22, 2014

Now Available

An additional ballot and for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are now open through **8 p.m. Eastern on Wednesday, October 22, 2014.**

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Note: If a member cast a vote in the initial ballot, that vote **will not** carry over to the additional ballot. It is the responsibility of the registered voter in the ballot pool to cast a vote again in the additional ballots. To ensure a quorum is reached, if you do not want to vote affirmative or negative, please cast an abstention.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Stephen Crutchfield,

Standards Developer, or at 609-651-9455.

Project 2007-11 Disturbance Monitoring - PRC-002-2

Formal Comment Period Now Open through October 21, 2014

Now Available

A 45-day formal comment period for two of the **Project 2007-11 Disturbance Monitoring PRC-002-2** is open through **8 p.m. Eastern on Tuesday, October 21, 2014.**

Instructions for Commenting

Please use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, please contact Arielle Cunningham. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An additional ballot period for the standards will be conducted **October 10-21, 2014.**

Note: If a member cast a vote in the initial ballot, that vote **will not** carry over to the additional ballot. It is the responsibility of the registered voter in the ballot pool to cast a vote again in the additional ballots. To ensure a quorum is reached, if you do not want to vote affirmative or negative, please cast an abstention.

Include the Quebec Interconnection in the Introduction Section 4 Applicability. Add to “4.1 The Responsible entity is:” 4.1.4 Quebec Interconnection - Planning Coordinator or Reliability Coordinator As an alternative, define a Responsible Entity for non-specified Interconnection areas. M12 – Remove “of”. Requirement R1, Part 1.2 requires from each Transmission Owner (TO) to notify other owners of BES Elements connected to identified BES buses. It is recommended to revise Part 1.2 to read that each TO provides the list of identified BES buses to their PC / RC who will notify those owners whose BES Elements require SER data and/or FR data. The PC / RC has more authority to maintain a master list of BES buses that require SER and FR data that can provide maximum wide-area coverage. This may avoid TO’s being challenged regarding BES bus selection. Requirement R11, Part 11.3. requires SER data in Comma Separated Value (.CSV) format following Attachment 2 whereas the majority of Disturbance Monitoring Equipment (DME) does not save data in this format. If large data volumes are requested then TO / GO should have their say to the requestor about when they can provide the data in (.CSV) format. Some DME produces records from which SER data would need to be manually extracted, which is very time-consuming. However, the same SER data can be visually seen using COMTRADE viewing software. The standard should not make a file format (such as .CSV) a mandatory requirement. Additionally, Part 11.3 asks to combine SER data from multiple DME devices and from multiple stations. This could be very time consuming and subject to errors.
Individual
Joe O'Brien on behalf of Chirag Patel
NIPSCO

Yes
R3 , GSU transformers are excluded based on the drafting team’s assumption that a fault on the transmission system would be captured by FR data on the Transmission System equipment (line, bus terminals) which is an accurate assumption except for faults on the bus itself. In certain configurations where multiple GSU units terminate into a single Transmission Bus, it is uncertain if this could indeed be calculated as stated by deciphering the contribution from various units. As stated in the current draft of PRC-002-2 Pg 39 of 46 top of page, current calculations would not be required from the GSU terminals of each generator since they can be readily calculated if needed, which is not an accurate statement in all configurations. This leaves what could be a substantial gap for bus faults or for configurations where multiple units of different sizes terminate on separate terminals of the transmission bus. Example would be a large Transmission Substation with a breaker and half configuration with 4 GSU units all terminating on separate terminals into the transmission bus. These units could be of different size and fuel source (Coal units, gas turbines, etc) all terminating to the same transmission bus leaving a substantial gap in FR recording data since the only thing that will be captured is the aggregate of the generation through calculation for external faults, and only simulated data for bus faults. Generators are typically the most significant contributor to transient and sub-transient local fault current at or near larger generation facilities, and also the most susceptible cause of cascading which may result from instability following a system disturbance. Therefore, this requirement would not provide the required data to decipher problem areas on specific generators that may have truly been the root cause without extensive simulation of data using, what would then be, calculated empirical data, not real captured data. This exclusion only appears beneficial for external close in faults and configurations where either a single GSU is connected to the transmission system or a single collector bus with an aggregate GSU source from many of the same units are connected to a Transmission Bus. For the purposes of the standard, exclusions should not be granted to generation terminals since it would result in a discriminatory practice. All significant sources of fault current on an applicable BES Transmission Bus should be deemed equally important for capturing FR data and the only exclusions should be to terminals or elements which only provide load.

Lincoln Electric System
No
Within the Rationale for Requirement R10, it is unclear which device the drafting team intends to be synchronized to within +/- 2 milliseconds of UTC. Although the last paragraph of the Rationale for R10 states that the “accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment”, the following sentence states that “the equipment used to measure the electrical quantities must be synchronized to +/-2 ms accuracy”. This creates confusion in terms of whether the accuracy requirement applies to the clock used for synchronizing the monitoring equipment, to the monitoring equipment itself, or to both. Recommend additional clarification be included within the Rationale for R10 or else to R10.2 to prevent further confusion.
Yes
As currently written, LES is having difficulty following Attachment 1 due to the confusing references. At a minimum, recommend clarification be added as to what “list” each step in the attachment is referring to, considering that the “list” may change throughout the steps. For example, in Step 3, does the “list” in the second sentence refer to the list created in the first sentence, or is it referring to the “list” created in Step 2? Or should the second sentence in Step 3 be moved to Step 2? Without additional clarification, it is difficult for an entity to determine how to proceed through the steps in the attachment, especially Step 7.
Individual
Amy Casuscelli
Xcel Energy

Yes
In response to Xcel Energy’s comment in the previous ballot, the drafting team states that changes were made in Step 7 and 8 to recognize that requiring close busses have date recording equipment would not provide significant value. However, a review of these steps in the redline document does not show that changes were made to address this issue. The drafting team did add language in the Rationale box under Requirement 3 addressing busses serving only generators but it is not clear how this rationale statement is made part of the requirements. Because of the perceived conflict in the rationale compared to the requirement, Xcel Energy is voting negative on the standard. We believe that the rationale statement is correct but the change has not been implemented in the requirement and associated calculation. Please correct this oversight. Thank you for your effort on this issue.
Group
Seattle City Light
Paul Haase
Yes
Seattle City Light does not support this Standard as structured or as written. We believe siting of monitoring equipment should be coordinated at a higher (regional or sub-regional) level to promote the most cost-effective installations. We do not believe the proposed level of technical detail (which changes constantly as technologies improve and change) is appropriate to a federal Standard (which is very difficult and slow to update and change). Finally, if a Standard something like the proposed approach is necessary, we find the 1500 MVA fault duty values to be low by a factor of 3 or 4, if not perhaps by a factor of 10.

Yes
We believe that Requirement R5 as written would require the addition of about a dozen additional PMUs to our system. For us this number would be much more manageable than the number called for in earlier drafts of this standard. Because this draft targets monitoring generators of significant size, disturbance monitors can potentially generate disturbance data useful in refining dynamic model representations for this equipment over time.
Yes
Based on our experience it would be difficult to keep communications network delays within the +/- 2 millisecond window. In our opinion, a reasonable approach would be to limit this requirement to the synchronizing clock equipment as shown in the modified draft standard, which would be feasible and sufficient.
Yes
To help assure the ability to meet the 90-day time limit for Requirement R12, we believe that it may be necessary to have at least one spare of each model of PMU installed on the system on hand for use in replacing a failed unit in a timely manner.

Ingleside Cogeneration LP
No
Ingleside Cogeneration L.P. (ICLP) agrees with the extensive and consistent negative response from a number of respondents to the previous posting regarding DDR. We (and they) believe that R5 will unnecessarily over-drive the deployment of phase measurement units (PMUs). PMUs are a fast improving technology and the DDR owners will quickly find that their equipment is obsolescent. We can agree that PMUs must be deployed in critical areas regardless, but do not see the same sense of urgency for locations of lesser BES importance. Specifically as a GO, ICLP agrees with the criteria developed in PRC-023 and CIP-002 to establish critical generation facilities. In our view, this would be those whose aggregate output exceeds 1500 MVA and attach to the BES at 200 kV or more. (Of course, there must be special consideration for facilities that are part of a SOL/IROL, but those locations are already captured in R5.) After the industry gains familiarity with PMU technology, further integration at lower capacities and voltages may be considered. By then, there will be far more exciting and useful options available – and will no doubt prove to be more useful to investigators trying to consolidate data related to a wide-area outage.

Individual
Mark Wilson
Independent Electricity System Operator
Yes
We agree with the changes made to the BES Elements requiring data listed in R5, but have concerns over the other changes to R5 (and R1). Please see our comments under Q3.
Yes
Yes
We generally agree with all the proposed changes. However, the addition of the phrase “and implement the reevaluated list of BES buses as per the Implementation Plan” to Part 1.3 and the phrase “and implement the reevaluated list of BES Elements as per the Implementation Plan” to Part 5.4 is unnecessary which makes the requirement out of date over time. The implementation timeframe should be stipulated in the Implementation Plan, not in the requirements. We suggest the SDT to make this change, which can be regarded as not having material impact to the intent of the

concerned requirements and hence may not require another round of successive balloting if this draft receives 2/3 majority support at the ballot.

AEP recommends modifying R2-R4 and R6-R11 to clearly exempt data lost due to an equipment failure properly identified per R12. Our concern on this matter has led, in part, to our decision to vote negative on the standard. R3: The Application Guide implies that GSU leads are not considered lines for this standard. The requirement should be revised to clearly indicate this. Similarly, station service or reserve transformers should likewise be explicitly excluded. Our concern on this matter has led, in part, to our decision to vote negative on the standard. As stated in our previous comments, AEP recommends modifying R3 so that only three of the four currents are required to be recorded. Since the fourth current can be calculated by the other three, there is no reliability impact for recording only three currents. The drafting team responded by saying “The Rationale Box for Requirement R3 explains the need for the three phase currents and the residual or neutral current”, however it is not necessary to monitor all these quantities to provide the data mandated by R3. It is clear from the rationale section for R3 that GSU transformers are excluded from the requirement. However, R3 states “Each TO *and GO* shall have FR data...for the BES Elements it owns connected to the BES buses…”. The requirement should be revised to align with the exclusion provided stated in the rationale section. R12: We see no reliability benefit in sending all CAP’s to the Regional Entity, and recommend revising it in consideration of Paragraph 81. Rather, it should be acceptable to only require the TO/GO to develop and execute a CAP and to make this information available to the RE within 30 calendar days of a request. R2: We believe that it is clear that the TO/GO must have SER data for circuit breaker position as it related to the following BES elements connected to a BES bus; BES Transmission Lines, BES Transformers and BES Generator feeds. Does this Requirement also apply to circuit breakers/circuit switchers that serve BES shunt capacitors/reactors?
Individual
John Pearson/Matt Goldberg
ISO New England
No
By definition, SOLs do not impact other areas and, for that reason, it would be more appropriate to leave the determination regarding monitoring of SOLs up to the Responsible Entity. Accordingly, Requirement 5.1.2 should be deleted. However, if Requirement 5.1.2 is not deleted, then the words “Any one” in Requirement 5.1.2 should be replaced with the words “One or more.” This will make it clear that the Responsible Entity is required to select one (or more) BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL) and will also make Requirement 5.1.2 consistent with Requirement 5.1.4, which already uses the words “One or more.” In Requirement 5.1.3, the word “circuit” should be replaced with the word “interconnection” or the word “facility” to ensure that back-to-back HVDC is monitored; these types of interconnections are being planned for New England and the word “circuit” may create confusion about monitoring them. Also, to make Requirement 5.1.3 clearer, the words “…for which the Responsible Entity is responsible” should be added at the end of the sentence. The words “Any one” should also be replaced with the words “One or more” in Requirement 5.1.5. Again, this will make it clear that the Responsible Entity is required to select one (or more) BES Element within a major voltage sensitive area as defined by an area with an in-service UVLS program, and will make the requirement consistent with Requirement 5.1.4.
Yes
Yes

The triggers described in the first two bullets of Requirement 8.2 should be clarified to include the duration that the Standard Drafting Team based them on. Otherwise, the data produced may be inconsistent across interconnections and may be subject to different interpretations. Requirement 11.3 should be deleted because providing the data in formats other than ASCII Comma Separated Value (.CSV) should be allowed. In other words, the requirement should not prescribe a data format.

Regional DME criteria in RF was 1000 MVA, Exelon thinks the threshold in R5 should be raised to the 1000 MVA per the RF Criteria.
Requirement R7.1: For clarity consider replacing the first comma with “or” to read “One phase-to-neutral or phase-to-phase or positive sequence voltage……” R7.2: Similar comment - for clarity, consider rewording to replace the commas with “or” to read “The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7.1 or phase current(s) for any phase-to-phase voltages or positive sequence current.” R9.3 requires an output recording rate of at least 30 times per second while the existing NPCC and RFC-CRITERIA-PRC-002-01 requires a recording rate of 6 times per second. Some of the equipment in question was installed in the last several years to meet the RF stadnard/criteria. To meet this new requirement legacy devices will need to be either upgraded or replaced because the higher recording rate will mean they cannot hold a continuous 10 day record. Relaxing the recording output rate to the existing 6 times per second would be sufficient to allow these devices to be compliant with the requirement. The implementation plan for PRC-002-2 includes the following installation requirement for newly-added buses from the re-evaluation process: “Entities shall be 100 percent compliant with a re-evaluated assessed list from Requirement R1 or R5 within three (3) years following the notification by the TO or the Responsible Entity that re-evaluated of the list.” The requirement for a 3-yr compliance period will conflict with previously scheduled and planned outage / maintenance cycles . Modifying outage cycles with the time necessary to specify and acquire new equipment will be disruptive. In place of a prescriptive cycle requirement, we propose the requirement be changed to say, Entities shall submit a plan to be 100% compliant with a re-evaluated list from requirements R1 and R5 within 180 days following notification by the TO/Responsible Entity. This plan should include expected completion date(s) justified by outage constraints, equipment lead times and availability. R12 and/or M12 should be modified. We will be using microprocessor relays that also provide protection for SER, FR, and DDR functions. Microprocessor relays that provide protection functions are not allowed to be out of service following a failure for anywhere near 90 days. In addition, we have these relays on all 200kV and above lines. Thus, the failure of one device is not too important from a DME standpoint. Given all this, this requirement is unnecessary for an entity using microprocessor relays as described. We propose that M12 states that protective relaying also used as DME is excluded from this requirement since it is inherent that it will be fixed in less than 90 days. Keeping data to show that relay failures were repaired in less than 90 days is an unnecessary administratve burden and does not contribute to reliable operations. The standard should recognize the varying technologies are used to perform this function and not create administrative burdens. An alternative might be to change the measure to state that if an event occurs that requires RRO or NERC investigation sufficient data was made available to NERC or the RRO to support the event investigation. This will eliminate the need to keep records proving that equipment was fixed in a timely manner.

No
City Utilities of Springfield, Missouri supports the comments submitted by the SPP Standards Review Group.
Yes
City Utilities of Springfield, Missouri supports the comments submitted by the SPP Standards Review Group and the following additional suggestions: Regarding R1 and Attachment 1: We continue to believe the Attachment 1 fault MVA threshold established in R1 to identify potential buses from which to pick locations for FR (and SER) data is too low. All of the BES buses on our system have fault MVA above the 1500 MVA threshold and no reduction to the number of buses on our list occurs by application of the steps outlined in Attachment 1. Given the size of our utility, it seems odd to us that all of our buses are considered “key” to the BES. Regarding R3: We continue to believe it is not necessary to be able to determine the electrical quantities associated with every element connected to a bus for a fault on one element of the bus. Rather, we believe that if devices are present to capture sufficient data necessary to determine the required quantities associated with the “faulted” element, that is sufficient for fault analysis. We believe it is sufficient for an entity to be able to determine fault location, fault type, cause of relay operation and the currents and voltages required by this proposed Standard associated with the faulted element for the purposes of Fault Recording. This seems to meet the intent voiced in the “Rationale for R3”. Please clarify the purpose of requiring electrical quantities be determined for all elements connected to a bus for a fault on any element of that bus if the required quantities associated with the faulted element can be determined. Also, it seems to us that comments regarding determining correct operations of the protection system within the proposed Standard and guidelines document are out of scope for this Standard and are already covered in other NERC Standards, PRC-004 specifically. Regarding R4: We appreciate the SDT revising the total record length in the first bullet under R4.1 from at least 32 cycles to at least 30 cycles. Regarding R10: We appreciate the SDT’s clarification that the time synchronization pertains to the device clock.

ACES Standards Collaborators
Brian Van Gheem
No
We appreciate the DMSDT’s decision to incorporate more explanation in the rationales of this standard based on its extensive outreach to event analysis subject matter experts. We feel that the DMSDT has taken steps to answer some of the concerns regarding the requirements that seek to find “why” an event occurred. However, we continue to disagree that the standard addresses the “what” of data collection and not the “how” the data is collected. How is an entity going to provide data if it does not have the equipment present to collect it? The fundamental principles of this standard seem flawed when the purpose of this standard is to have “adequate data available to facilitate analysis of BES Disturbances.” We feel NERC can communicate the intent of collecting data for the purposes of explaining why an event occurred through a Reliability Guideline instead of an enforceable standard. NERC already has enforceable standards on reporting events, monitoring system conditions, and identifying entity-to-entity data specifications. The data collected and available through these existing standards are through “proactive” devices and applications, which entities then generally archive for historical and training purposes. We believe sufficient data is already available, as evident with the data available to construct the sequence of events and other post-event analysis of disturbances for the September 8, 2011 Arizona-South California Outages. As stated within the resulting FERC-NERC Arizona-South California Outages of September 8, 2011 report generated in 2012, “PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP).” The resulting report identified no additional standards because of this event. By continuing to pursue an

enforceable standard to address outdated recommendations from the 2003 Blackout in the Northeast does not seem cost effective for both industry and NERC. A Reliability Guideline will not deter industry from installing additional or maintaining existing event recording devices. However, it gives industry an opportunity to balance the risk of not installing or maintaining such devices with pursing advancements in technologies with the more "proactive" and "preventable" devices and initiatives.
No
We feel that NERC can communicate technical specifications for data collection explaining why an event occurred through a Reliability Guideline. As stated on the NERC web site, "reliability guidelines are documents that suggest approaches or behavior in a given technical area for the purpose of improving reliability." We feel NERC and industry jointly pursuing a Reliability Guideline on this topic collaboratively would be better use of time and resources.
Yes
(1) When compared to other enforceable standards, the number of requirements identified in this standard is greater than the number of requirements currently enforceable for standards related to event reporting and entity-to-entity data specifications. We continue to believe that many of these requirements are unnecessary and fall under Paragraph 81 Criteria B. However, if the DMSDT feels that such information is "essential to expeditious and efficient data analysis," we believe these technical specifications could be included in a technical guideline or Compliance Section attached to this standard. Requirements R4 and R9 regarding data sampling and requirement R10 regarding time synchronization are just three of the numerous specifications listed in this standard. Requirement R11 identifies the data format and nomenclature expected for entities to follow. Even the current requirements associated with the Disturbance Control Standard, NERC Standard BAL-002-1, do not identify the data format as a requirement. Moreover, the individual parts of requirement R11 cite various IEEE standards and specifications, references the DMSDT could identify as footnotes. Many other SDTs, such as the one that developed NERC Standard PRC-023-2, relocated their technical information to other appropriate areas or documents. Likewise, requirement R8 identifies system conditions that are necessary to trigger the initiation of data recording if continuous data recording is unavailable. We believe the DMSDT should move these technical specifications to an appendix of the standard and not identify them as enforceable requirements. (2) We concur with the DMSDT that the term "BES buses" provides confusion. We believe requirements R1.1 and R1.3 should be rewritten to "BES Elements connected to a BES bus" to alleviate any further confusion. (3) We believe the term "and/or" listed in Requirement R1.2 could provide confusion. We recommend change the requirement to read, "Notify, within 90-calendar days, other owners of BES buses identified within R1.1 that require SER data and FR data." (4) We believe the DMSDT should remove references to the Implementation Plan, as embedded directly within the requirement text, and incorporated this information into an "Effective Date" entry listed under the Introduction (Section A) of this standard. Such references include R1.3 and R5.4. (5) We believe the DMSDT should remove the reference to "local time offset" in Requirement R10.1. Its reference to the time listed in SER and FR data and their synchronization to Coordinated Universal Time (UTC) is an unnecessary addition to the text of this requirement. (6) Requirement R11 identifies that entities are required to provide all SER and FR data, upon request, to the Regional Entity and NERC. NERC already defines this mechanism in Section 1600 of the NERC Rules of Procedures. We suggest the DMSDT remove all references to the Regional Entity and NERC from this requirement. (7) Requirement R12 states that an entity should first submit a Corrective Action Plan (CAP) to its Regional Entity and then implement the plan. We recommend the DMSDT follow a similar approach taken in NERC Standard PRC-004-3, where the entity is first required to develop a CAP and then required to implement and provide updates until the plan is completed. Both industry and NERC have already reviewed this language and the standard is currently on file with FERC. (8) The term "Responsible Entity" is already a defined term in Appendix 2 of the NERC Rules of Procedures. We recommend the DMSDT revise all references to Responsible Entity within this standard accordingly. (9) We continue to disagree with the DMSDT that this standard addresses the "what" of data collected and not "how" the data is collected. The costs of installing new equipment for the purposes of disturbance monitoring could be significant for some of our members. Moreover, industry has already benefitted from the DOE grants to install PMUs and would continue to benefit from these types of financial incentives for continual situational awareness. The DMSDT continues to rebut our previously submitted comments with references to the 2003 Blackout in the Northeast. However, it

was through these financial incentives, that sufficient data was available to construct the sequence of events and other post-event analysis of disturbances for the September 8, 2011 Arizona-South California Outages. As stated within the resulting FERC-NERC Arizona-South California Outages of September 8, 2011 report generated in 2012, “PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP).” Moreover, the resulting report identified that no additional standards were necessary because of this event. We suggest NERC should develop a Reliability Guideline on this topic instead of a standard, as we do not see the cost benefit or justification to allocate resources for an issue that is not a high priority for reliability. (10) Thank you for the opportunity to comment.

Luminant Generation Company, LLC
Yes
Yes
Luminant is specifically concerned about the administrative requirements in the standard related to reporting formats. Luminant does not disagree with the desire or benefit of standardized reporting, however, we believe specific data and reporting formats do not belong in the standard requirements. The ERO already has the authority to request data and reports in specific forms or formats. (1) Requirement R11, subsections 11.3, 11.4 and 11.5 includes prescriptive details regarding data recording and reporting. The goal of the standards development process is to develop Results Based Standards. We reiterate our concern that these items are completely administrative in nature and are not results based. An entity could make a typo in formatting or when naming a file and be non-compliant with the requirement. These requirements should be removed from the standard or relocated to reference documents. (2) Requirement R11, subsections 11.4 and 11.5 reference IEEE standards and software formats which are not subject to the NERC procedures for standards development and are not under the purview of the legally authorized regulatory authority. Thus these sub-requirements have no valid standing in a NERC Reliability Standard. These items are more appropriate for a reference document. Inclusion in a reference document seems to provide a better location to document specific details on requested data and can provide a more effective mechanism for revising these details at a later date in regards to the data reporting. The requesting agency has the right to ask for data in any prescribed format they desire, but this should not be identified in the standard. (3) Requirement R11, subsection 11.4 specifically references “IEEE C37.111-2013”. We reiterate our previously submitted comment on the version specification. The SDT response focused on conversion software. Some older DFRs that effectively capture the needed data may not meet this requirement for the “2013”. Software updates may not always be reasonably accomplished with equipment, service contracts or other factors. This 2013 mandate is administrative in nature and does not contributed to a results based standard nor improve BES reliability. This version requirement should be revised to allow for any versions that the entity has access to that supports the recording and report requirements.

See comments in Question #3.
Yes
Project 2007-11 Disturbance Monitoring was initiated to replace the existing fill-in-the-blank Reliability Standard PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements with a more comprehensive standard. Project 2007-11 began in March 2007 with the objective to develop a continent-wide Disturbance Monitoring (DM) Reliability Standard. One Regional Entity (NPCC) developed a DM Regional Reliability Standard (FERC approved) in absence of a continent-

wide standard. Dominion does not support this Reliability Standard and recommends that the SDT consider the following: 1. Is a continent-wide DM Reliability Standard necessary? With the exception of NPCC, no other Regional Entity has a Regional Reliability Standard for DM. Perhaps existing regional guidance/practices employed since 2007 are sufficient. There has been many new installations of DM equipment since the Version 0 fill in the blank standard was remanded back to NERC. Perhaps a suitable alternative to a standard would be for NERC to issue guidance similar to guidance that was issued for cold weather preparedness in lieu of a standard. 2. Duplicity and/or differences between Regional Reliability Standard and continent-wide Reliability Standard. Specifically: Dominion remains concerned that PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2014, NPCC applicable entities are three years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Once approved, NPCC applicable entities must comply with both PRC-002-2 and PRC-002-NPCC-01, requiring those entities to review and determine the more stringent requirements between the regional and continent-wide standards. Dominion cannot support this continent-wide standard without inclusion of a variance for the NPCC Region (PRC-002-NPCC-01). 3. Equipment installation may be necessary to obtain the data specified in the Reliability Standard. Considering the criteria, some merchant generators, but not all, will incur costs that are not recoverable to install the equipment. This results in an unfair competitive advantage for some market participants. 4. Please consider the following items for consistency: M1 needs to be updated to include Parts 1.1, 1.2, and 1.3, similar to how M4 and M5 included the Parts. R11.1 should be reworded to include the word “consecutive” to read “period of 10 consecutive calendar days” and change test from “the data was recorded” to “the data was requested.”

RelliabilityFirst
No
ReliabilityFirst votes in the Affirmative and believes the standard helps ensure that adequate data is available to facilitate analysis of Bulk Electric System (BES) Disturbances. This standard also removes the “fill in the blank” aspects of the old PRC-002 and PRC-018 standards. ReliabilityFirst offers the following comments for consideration: 1. Requirement R5, Part 5.3 - Requirement R5, Part 5.3 requires notification within 90- calendar days of completion of Part 5.1, but then goes on to state “when requested”. ReliabilityFirst questions whether the intent is “within 90-calendar days” or “when requested”. ReliabilityFirst believes the SDT should choose one or the other. 2. Requirement R5, Part 5.4 - Requirement R5, Part 5.4 references an “Implementation Plan” and it is unclear to ReliabilityFirst how this will be enforced. The Implementation Plan only speaks to the initial identification of buses and does not address the re-evaluation of the list. Furthermore, a NERC Reliability Standard should not have requirements that reference documents which are outside of the standard. ReliabilityFirst suggests this reference to Implementation Plan be removed from Part 5.4.
Yes

R5 5.2 states “5.2 Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: 5.2.1 One BES Element; and 5.2.2 One BES Element per 3,000 MW of the Responsible Entity’s historical simultaneous peak System Demand.” Please explain how “Ensure a minimum DDR coverage” relates to the implementation plan where 100% compliance is required within 6 months of approvals. What is R5.2 acceptable evidence after 6 months? Is this just an identification requirement that the planning coordinator must provide in this 6 month time frame? This question arises because “Ensure” is used instead of “Identify”. R5 question: For example, a utility has two DDRs on its system because it has two generating resources greater than 500 MVA at two separate locations. If this utility also has 3,030 MW peak demand will the two DDRs on its system satisfy R5.2? In addition to these comments, we also support the comments provided by SPP.
No
We support the comments provided by SPP.
R11 requires “Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.” It appears a chattering contact could easily fill up an SER or FR device in a matter of minutes or less if it occurs near an event. It is difficult to control or address these issues but they could be a serious impact to the 10 calendar day requirement. Is there a way to minimize this requirement such that event triggers or SERs don’t need to be decreased to help ensure data has less chance of being overwritten? Some microprocessor relays only hold 12 event records so this is more difficult to guarantee data is available this long. In addition it is possible to have more than 12 operations within 10 days during stormy periods. It would seem this case would not allow the data to be available in a relay for the required time. This requirement could force utilities to eliminate many older microprocessor relays on the system that have limited programming and memory capability where the risk for non-compliance could be too great. If this happens then the assertion that many of devices are already on the system that meet the recording requirements is not a generally true statement. Consider removal of this 11.1 requirement since this capability is not entirely under the control of the owner. M1 question: Do we need to just show we sent a notification within 90 days to other owners of BES elements for an identified bus or also show a response? Just showing we sent the notification in good faith is preferred. R12 question: The implementation plan states we have 9 months after approval to be 100% compliant for R12. Does this mean we need to be compliant for R12 with elements as they become compliant in R2, 3, 4, 6, 7, 8, 9, 10 and 11 over the implementation time frame? For example, since it could be 4 years and only 50% of elements and their recording capabilities will be compliant how is requirement R12 applied to locations not yet compliant? R4 states: “Trigger settings for at least the following: 4.3.1 Neutral (residual) overcurrent. 4.3.2 Phase undervoltage or overcurrent.” Is it possible to allow additional “OR” statements for 4.3.2? Many relays used for FR will use the phase impedance zone reaches to trigger records. This can clearly define the reach for data to be triggered where defining an under voltage or overcurrent may be more difficult to control the reach. There is some concern with overwriting data in the relays with settings that are less intuitive for controlling how often a device may trigger. We strongly recommend allowing phase distance reaches as trigger points. In past comments it may have appeared to be suggested as overcurrent or distance be included but what was meant was to have both as part of an OR statement. Suggestion: Phase under voltage or overcurrent or distance reach. R12 states “Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.” Should the RE or regional entity be listed in the Applicability section? For some registered entities the Planning Coordinator and the Regional Entity may not be the same. In addition to these comments, we also support the comments submitted by SPP.

Oncor Electric Delivery LLC
No
In the rationale for R5 it states “For an interconnection between two TO’s, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.” We do not think the Responsibility Entity should determine if the TO or GO will provide the data. Oncor recommends that if there is an

interconnection between a TO and GO at the same BES location then the requirement should fall upon the GO. However if the TO has the data then the GO can contract with the TO for the data as mentioned in the rationale for R7 below: “Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.”
Yes
Yes
We recommend the following language from the R7 to be used in R3 “Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.” As currently written the rationale in R3 places the burden on the TO when the GO should be held responsible. It is not a "given" that the TO FR is already monitoring GO generator breakers due to the legal deregulation splitting of asset ownership and monitoring isolation between TO/GO interfaces. In regards to R2 and R11.3 we recommend a similar provision for Legacy devices be provided as done in R8. We recommend the following verbiage be added: “If the FR equipment was installed prior to the effective date of this standard and is not capable of SER recording, Breaker position must be monitored by a digital element in the FR.” Oncor recommends the following verbiage be added after the last sentence in the Guideline for Requirement R6 and R7: “The R6.3 and R7.3 assumption is that there is a balanced 3 phase system so calculating 3 phase power based on single phase voltage and current quantities is acceptable”

Texas Reliability Entity
Yes
Yes
Yes
1) Requirement R12: Texas Reliability Entity, Inc. (Texas RE) reiterates the concern raised during the previous ballot period that the Regional Entity is the appropriate entity to receive a TO or GO's Corrective Action Plan (CAP) as written in this requirement. Based on the language in the "Rationale for Functional Entities," it appears that either the Planning Coordinator (PC) or the Reliability Coordinator (RC) should be the recipient of the CAP. The Rationale for Functional Entities states that the "The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required." Since the PC or RC is responsible for determining which BES Element data is needed, then they arguably need to know when there is a failure of the recording capability for that data and what the CAP is to restore the recording capability. The PC or the RC are in a better position to evaluate whether a CAP has been implemented. Therefore, submitting the CAP to the PC or RC is more appropriate than submitting the CAP to the Regional Entity as it will likely enhance reliability. Texas RE recommends the SDT change the second bullet under Requirement R12 from the "Regional Entity" to the "Responsible Entity." 2) Requirement R1 VSLs: The language within the first "OR" of the Lower VSL states the TO was late by 30 calendar days or less for Parts R1.1 and 1.3. Texas RE has two concerns regarding the language: A) Texas RE is not clear on what the VSL criteria of 30, 60, 90 or more than 90 calendar days is measuring against. Would the SDT please explain what the TO would be late for since Requirement R1.1 has no time criteria? B) Texas RE requests the SDT consider whether the VSLs for re-evaluating all BES buses at least once every five calendar years for Part R1.3 is appropriate. For an evaluation that is deemed sufficient to be performed at a frequency of every five years, it would seem that being late by 30, 60, 90 or 90-plus days might not be the correct timeframe for assessing the severity of a violation. Texas RE suggests assigning criteria on quarters. So that a Lower VSL would be late by one quarter, Moderate VSL would be late by two quarters, High VSL would be late by three quarters and Severe VSL would be late by four quarters based on the previous evaluation date.

Peak Reliability
Jared Shakespeare
No
The Requirement should be revised to include "in its area" to allow for multiple Responsible entities in an Interconnection. R5.2: "DDR coverage" should be changed to "DDR coverage identification." It is not reasonable that the Responsible Entity ensure DDRs are placed into service, rather that they are identified and notification sent to owners. R5.3: Currently in the Western Interconnection, there is no established mechanism to determine BES Element owners. Also, the phrase "require DDR data when requested" is confusing. Is the Responsible Entity only required to notify owners that DDR is required and data may be requested in the future? Peak recommends rewording the Requirement to better reflect the intent. R5.4: "and implement the reevaluated list of BES Elements as per the Implementation Plan" should be deleted because it's not the responsibility of the Responsible Entity to implement, only to identify and notify. Deleting that phrase will make it consistent with R5.3.
No

"that meet the following" should be "to meet the following". Using "that" implies that the data that doesn't meet those requirements isn't applicable. We assume the SDT meant to convert all data to meet the time-synchronization requirements.
Yes
R12: "to the Regional Entity" should be "to the Regional Entity and to the Responsible Entity". This will ensure the Responsible Entity is aware of data outages.

PPL NERC Registered Affiliates
Stephen J. Berger
Yes
Yes
These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. We agree that DDR data should be obtained for the transmission lines from generation plants as listed in requirement 5, but not that GOs are the parties that should collect this information (R7). There has been much discussion between the North American Generator Forum (NAGF) and the Disturbance Monitoring Standard Development Team (DMSDT) regarding assignment of responsibility for monitoring disturbances, and we believe GOs should be excluded for the following reasons: - TOs interpret and use DME data; GOs do not. - TOs generally have wide-ranging arrays of DME, continuous recording/storage infrastructure, and experts in monitoring and maintaining such equipment; GOs do not. - DDR data collected on the TO's side of the generation plant battery limits would be the same as that measured on the GO's side. - Disturbances are more likely to originate in the transmission system than in generation plants (as was the case for the Northeast blackout of 2003), and responsibility should rest with the party causing the need for monitoring. We understand that duplication of equipment is not mandated – a GO could contract with it's TO to supply DDR data. It may not be possible to negotiate such agreements, however, due to the impracticality of transferring compliance responsibilities and the GO risk exposure if TOs commit to sharing data but not to achieving PRC-002-2 compliance. The NAGF attempted to find common ground with the DMSDT by recommending that the standard should at least state that TOs are responsible for providing DDR data if they already have such equipment at plants, but this request was evidently rejected, and R7 as presently written is therefore likely to lead to widespread wasteful duplication of equipment and effort. The least-total-cost approach should be followed in obtaining the expected reliability benefits, and we believe that centralizing DME with TOs makes more sense than splitting the responsibilities between involved entities (TOs) and those who merely hand-over recordings (GOs) for further analysis. The entire subject of DME should be a TO matter and applicable to the TO's DME equipment that is already installed.

1. AECI agrees with the SDT's list of elements. 2. Would the SDT provide some further clarification on exactly what "DDR coverage" would be considered? Further, some unofficial guidance was given to the effect that, neighboring entities DDR systems could be used for evidence if all required DDR data is collected by that unit. 5.3 goes on to state that notification to these entities is required, however provision of that data by the entity is not. Does the SDT believe the current language has sufficient measures to facilitate this "sharing" of DDR equipment?

The minimum requirements in R5.1 should be eliminated because they are overly inclusive. The Requirement should just be limited to R5.2 requirements. NU's Responsible Entity is on record as having adequate DDR monitoring for the region as such this requirement would add 20 DDR's to the region 10 in NU's footprint. The approximate cost to the region would be about $3 million with no benefit to system reliability.
No
NU does not support the revision to R10. NU has researched and found that there can be as much as 10 ms difference between the clock and time stamp. Recommend the SDT R10 should be returned to the previous draft

TAL believe that disturbance monitoring though good for event analysis will provide little improvement in the reliability of the BES. Disturbance monitoring should be recommended to utilities through guidelines instead of through mandated standards. The amount of additional work required by utilities to install, maintain, and, likely the most demanding task, documentation/maintenance of compliance records with this proposed standard will not offset the small benefit seen by the collection of disturbance data.

It needs to be clear that 5.1.2 and 5.1.4 are dealing with SOLs and IROLs established for the Planning Horizon by the Planning Coordinator or Transmission Planner. Reliability Coordinator SOL methodologies are dealing with a shorter timeframe, in the Operating Horizon, within which it may not be possible to engineer, procure, and install the equipment necessary to meet the requirement, especially as the results of the application of the SOL methodologies may be changing as system conditions change. Also, the revised RSAW does not give any guidance to the auditor as to which set of SOLs and IROLs (Planning Horizon or Operating Horizon) to be looking at. There are some PCs that only have one BES bus, so 5.2 as written would require them to have a disproportionately higher percentage of DDR coverage than larger entities. FMPA suggests 5.2.1 be deleted in order to achieve a fairer tier to required DDR coverage. At the very least, 5.2.1 should be changed to “One BES Element; or” which we believe is what the drafting team intended. Taken together, 5.2.1 and 5.2.2 means at least two BES Elements need DDR coverage. Note that the clean version has 5.2.1 written as “One BES Element; and” while the redline version has it written as “One BES Element”
No
The requirement language still speaks to synchronizing the data even though the rationale states it should be the equipment and not the data that is mandated. There is also a grammar problem with the addition of the phrase “that meet the following:”. We believe it was intended that the equipment meet the 10.1 and 10.2 criteria and not the data or the BES Elements as it is worded. FMPA suggests the following language: “Each Transmission Owner and Generator Owner shall time synchronize all SER and FR equipment for the BES buses identified in Requirement R1 and all DDR equipment for the BES Elements identified in Requirement R5 to meet the following:”
FMPA believes the standard, as written, places an onerous burden upon small Transmission Owners and Planning Coordinators that may only have one or two BES buses. The language and methodology effectively guarantee that such small entities must install equipment and report data under the standard. In R1, FMPA believes the Responsible Entity should be the one applying the methodology in Attachment 1 instead of the Transmission Owner. It is more appropriate from a Functional Model perspective to have the Planning Coordinator, for example, obligate the Generator Owner to the requirements that follow. Also, the Responsible Entity has the wide area view that will allow for more dispersed equipment, and lessen the potential for duplicative coverage. The Responsible Entity may need to use data from the Transmission Owners in its area, but once it has the data the formula in Attachment 1 can be followed. There are logical problems, as well as, issues with the inherent tiering between smaller entities and larger entities with Attachment 1. In Step 2, 1500 MVA is too low for small entities with few busses because they are either in remote locations and pose little risk of causing wide-area events or are located near facilities of a large neighbor that drive up the short circuit MVA level of the buses they own. In the latter case, the neighboring facilities would be better candidates for SER and FR data and there would be no value in having additional data from the nearby facilities just because there is a different responsible entity. The main issue hinges upon the fact that the 1500 MVA threshold works well as an initial tool for evaluating large systems with many buses but does not work well as a singular and final compliance

threshold (which is what it becomes for small entities). FMPA suggests raising the 1500 MVA criteria in Step 2 to at least 3000 MVA (or higher) for entities with 11 buses or fewer in their system. Step 3, as worded, is confusing because it causes a list of 11 buses to be determined and then causes steps to be skipped if there are 11 or fewer buses, which will always be the case. FMPA suggests replacing in Step 2 the phrase "If there are no buses on the resulting list, proceed to Step 7." with "If the list has 11 or fewer buses, proceed to Step 7." and deleting the same phrase from Step 3. Zero is fewer than 11, so we believe this results in what the drafting team intended. In Step 7, the reference to Step 3 should be a reference to Step 2. The word "the" should be deleted in the phrase "at least the 10 percent". FMPA appreciates the SDT comment responses. Unfortunately, these responses do not mitigate the concerns raised in general about the need for the standard versus a guideline. Plus not all of our comments were addressed. Our prior concerns still remain in addition to some additional concerns. SDT Response 1:"The Standard Drafting Team realizes that improvements have been made to Disturbance Monitoring technology since the 2003 Northeast Blackout. That does not guarantee universal implementation, thus necessitating the need for the standard." --While the SDT may "realize" that improvements have been made over the last decade, the SDT has not provided a risk assessment to quantify the need for a standard versus a guideline recognizing the technology advances and PMU equipment installed through the DOE Smart Grid program over the last decade. A risk assessment would be a beneficial exercise to identify gaps first, as opposed to taking a broad brush approach. It would also provide for more focused impact and faster results. SDT Response 2: "PRC-002-2 addresses "what" data is recorded, not "how" the data is recorded. This approach eliminates the complications that might arise from the technological advances being made to record the data" --The fact that this standard is requiring data vs equipment does not mitigate the fact that equipment will need to be installed which raises a cost recovery concern that needs to be addressed. SDT Response 3: "The Disturbance Monitoring recordings can be used to improve reliability by providing information that can guide operators in better Real-time system management (Real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events." --Guiding operators goes beyond the scope of the standard for a number of reasons, but most importantly due to the fact the Time Horizon is "Long Term Planning" and not "Real-time Operations". This raises another concern, which is with regard to the purpose of the standard which now states: "To have adequate data available to facilitate ("event" has been removed) analysis of Bulk Electric System (BES) Disturbances (now upper case)". By removing "event" and capitalizing "Disturbance", which is very broadly defined in the NERC Glossary, this broadens the scope of the purpose of this standard. In R11, there is no defined need for which a Responsible Entity, Regional Entity or NERC can request all SER, FR and DDR data. FMPA believes criteria for making a data request is needed.

1. It is believed that direct P & Q measurements are not required and the DDR can calculate these from measured voltages and currents- We recommend that the SDT clarify this in the Requirement or Rational box. 2. We would like the SDT to consider an alternative approach to this subject. It would be to have to have NERC or the RE’s develop a map of the BES with the locations of current DME, then determine the areas where additional DME is needed to analyze a system event? This would eliminate the shotgun approach of basing the install on MW values, and insure that the program is cost effective. Some of the Reliability Entities may already have enough recording equipment. For example RFC may have a map of their footprint from their 2010 data request.

CenterPoint Energy Houston Electric
Yes
Yes
Yes
As stated in comments previously submitted regarding requirement R10 in conjunction with requirement R2, CenterPoint Energy continues to propose that UTC time synchronized DFR and DDR data is the final analysis tool and that, given the infrequent nature of wide area events, breaker state change SER data obtained from EMS systems provides adequate resolution for the initial phases of event analysis investigation. In CenterPoint Energy’s opinion the SDT has not provided sufficient justification to require such high resolution data in regards to breaker open/close SER data. While CenterPoint Energy recognizes this fine level of data may enhance analysis of a wide area event, the 2003 Blackout as well as other analysis’ of more recent wide area events indicates that this level of data is not critical to performing an accurate event analysis. CenterPoint Energy is concerned that this requirement may lead to applicable entities having to install additional SER equipment, communications infrastructure, or data gathering devices to be used only in the rare event that a wide area system disturbance occurs. Therefore, CNP recommends removing SER data from R10.

Yes
City of Austin dba Austin Energy (AE) does not agree with this standard as a whole because it is too prescriptive and unnecessary in the ERCOT Region. Regional requirements for the ERCOT Region regarding disturbance monitoring equipment exist in the ERCOT Nodal Operating Guides, Section 6.1. (http://www.ercot.com/mktrules/guides/noperating/cur). Existing requirements provide sufficient data for disturbance monitoring and analysis. AE recognizes, as the SDT pointed out, the ERCOT requirement is not a NERC Reliability Standard. However, AE disagrees with the SDT's comment that the ERCOT requirements are not enforceable. Entities in the ERCOT Region must comply with the ERCOT requirements or face penalty by the Public Utility Commission of Texas (PUCT). Further, compliance with ERCOT requirements is monitored and enforced by Texas Reliability Entity, Inc. (Texas RE). AE suggests the SDT consider a regional variance for the ERCOT Region, because sufficient requirements already exist.

a) R3 could refer to R4 (see R4) in regards to details for each triggered FR. b) R8 discusses "continuous data and storage", whereas R11 states that data shall be retrievable for 10 days (presumably following an event), as data retention for longer is expensive and unrealistic. The statements in R8 and R11 may need clarification as to how much data needs to be held in memory before it is overwritten. Data from a catastrophic event may fill a recorder much more quickly than baseline data.

While the revision is acceptable and allows the use of microprocessor relays, it would be much better to simply state an accuracy of the data as opposed to the device. With the way it is currently written, potentially a device itself could be synchronized very accurately to a clock while the data it records isn't required to have a specific measure of synchronization accuracy seems odd.
Still feel that the method for determining the busses is too complicated. While we agree that the methodology needs to have consistency, it needs to be made simpler. The spreadsheet is terrible. The examples are difficult to follow and a guide with screenshots needs to be provided to help follow along. For example, how does B3 become a hard-coded example of 64 in both examples when there

is nothing in the instructional steps indicating that this value needs to be changed? With hard to follow example, how can we be confident that we are following the procedure correctly to stay in compliance with our own data? The spreadsheet should be simplified to have users enter data without the zero busses, this may help to reduce the number of steps. A better way would be to write a program or something or make the planning coordinators produce the values generated by the spreadsheets. Also, bus fault MVA needs to be defined. Is this based on fault current and nominal voltages or pre-fault voltages? Are there any modeling requirements for generating the fault values? What needs to be recorded for each event - every terminal at a recorder location or just the faulted terminal? If we have microprocessor relays with GPS clock synchronization at every terminal in our system, would that be adequate enough - to capture each fault at the terminal where the fault was located?

Part 5.2 - We do not fully understand exactly what Part 5.2 is requiring. The rational for Part 5.2 states that a 'Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous System Demand.' This we understand. The confusion comes from the phrase 'inclusive of those BES Elements identified in Part 5.1'. Does this mean the Elements selected must come from those Elements identified in Part 5.1? If that's the case, we suggest changing the phrase to 'from the BES Elements identified in Part 5.1'. Additionally, tying the requirement for DDR data to 3,000 MW of load seems arbitrary. Does the DMSDT have any data or other justification supporting this requirement? Wouldn't it be more meaningful to tie this requirement to system topology and connectivity? Rationale for R5 - Use lower case 'standard' in the 2nd line of the 4th paragraph. Insert 'of' between 'understanding' and 'why' in the last line of the 1st paragraph.
No
We suggest the wording in R10 be changed to read: '…identified in Requirement R5 to meet the following:'.
PRC-002-2 Thank you for the clarification in the Applicability Section regarding the use of 'Responsible Entity'. Rationale for R1 - In the 3rd line of the 4th paragraph, the phrase '…into the in force list,…' is used. Shouldn't this be '…into the currently enforced list,…' or '…into the current list,…'? Also, there is a font issue with the inserted sentence. Rationale for R4 - Hyphenate '30-cycle total minimum record length' and '30-contiguous cycles'. Rationale for R11 - Insert a hyphen and a space in '10-calendar day' at the beginning of the 2nd line of the 3rd paragraph. Attachment 1 R1, Step 7-Thank you for the additional clarification in Step 7. Guideline for Requirement R4-Hyphenate '30-cycle record length' in the 4th line of the 1st paragraph and '30-contiguous cycles' in the last line of the 1st paragraph. We recommend that all changes we proposed to be made to the standard be reflected in the RSAW as well. We would ask that the drafting team take into consideration our suggestion to review the language mentioned in reference to the term 'list' in Attachment 1. Our concern at this point would be…. the term presents some confusion in how it's being used in the Steps of the documentation. For example in Step 3, we are not sure what 'list' you are referring to and will this term take on the same meaning as mentioned in the previous Steps (1 and 2)? We would request that you provide more clarity on which 'list' you are referring to and what data should be included in this process.
Group

Kathleen Black
No
The MVA level for generation is still a concern, but it is understood that this change will not be considered by the SDT. Will the Responsible Entity work to insure that the DDR equipment at shared GO/TO facilities is not duplicated? Also, it is suggested that the Responsible Entity include in their identification criteria an evaluation of monitored quantities versus installation expense. It seems unreasonable to require DDR data at a location where only two monitored quantities are needed.

John Merrell
Tacoma Power
No
Tacoma Power agrees that most of the revisions outlined above are improvements but we still believe that the standard as written requires utilities to spend more effort documenting data recording than necessary to reliably operate the BES. For example, within the WECC footprint there are 49 generators in WECC that meet the 500 MW threshold in R5.1.1.1. The minimum required number of DDRs based on load per R.5.2.2 is 52 generators. Thus the first 1/6th of the proposed requirement provides 94% of the prudent DDRs. Although we have not analyzed exactly how many DDRs will be required for R5.1.2 through R5.1.5, it is clear that the 1 per 3000 MW specified R5.2.2 has little correlation to how many are currently specified by R5.1. Instead, R5.2.2 should provide regulatory certainty by specifying a maximum number of DDRs that would be required to be documented as compliant with this NERC standard. We disagree with the changes to R5.1.5. Although a UVLS program is an indicator of a major voltage sensitive area, UVLS should not be the definition of “major voltage sensitive area.” There are remote portions of the system that may have UVLS, but they would not be classified as “major” since they have significantly less than 300 MW of load.
No
The revision now specifies the properties of the equipment, rather than specifying the accuracy of the SER and FR data. Under the revision, a utility could use the SCADA master at their control center as the SER recorder as long as the SCADA master met the synchronization requirement, irrespective of the communication delays between substations and the control center.
Yes
Although we agree focusing on “what” data rather than “how” data is a good idea, Measures M2 and M3 parts (1) and (3) are not consistent with that philosophy. Documented design specifications or station drawings are not evidence that the owner actually has SER/FR data; these documents are simply evidence of “how” the data might be captured rather than “what” data is actually being captured. In order to address the inconsistency between the requirement and the measure, the term “recording capability” should be inserted after the word “data” in Requirements R2 and R3. As currently written, this standard has a zero defect approach. A single missing piece of data is not a threat to the BES when analyzing historical events. In addition to the PRC-002-2 required recordings, most utilities have been installing microprocessor based relays with data recording capabilities. Requirement R5, Part 5.2.2, does not use the word ‘additional,’ but the Rationale for R5 does. If a Responsible Entity has 3,000 MW of historical simultaneous peak System Demand, are they required to have (at minimum) 1 or 2 locations with DDR? Requirement R5, Part 5.4, requires the Responsible Entity to implement the reevaluated list of BES Elements. However, the discussion in the Rationale for R5 says that the Transmission Owner and Generator Owner are responsible for implementation. It is understood that the Rationale for R5 is what is intended. Requirement R5, Part 5.4, ought to be amended to be consistent. In Measurement M9, it appears that the text “(R9, Part 9.1)” may be missing. In Requirement R11, Part 11.2, change “...unless and extension...” to “...unless an extension...” Requirement R11, Part 11.1, will likely drive (1) automatic event retrieval from relays used for FR/SER, (2) restriction of event triggers in relays (to the detriment of the entity’s other business objectives as they try to assure compliance for all scenarios), and/or (3) installation of dedicated FR equipment (or new relays) with large buffers. Buffers in many types of relays used for FR/SER could easily be overwritten within 10 calendar days, depending upon what event triggers are set up and power system conditions. It seems like the implementation plan for Requirements R2-R4 and/or R6-R11 in response re-evaluated lists from Requirement R1 or R5 should be included in the body of the standard. Implementation Plans are normally valid only for the initial phase-in of a standard (or new version of a standard). The response to a re-evaluated list is an ongoing activity.

Yes
ERCOT agrees with the changes made to the BES Elements requiring data listed in R5, but have a concern over the other changes to R5 (and R1). Please see the comments provided in response to Q3.
Yes
Yes
ERCOT generally agrees with all the proposed changes and proposes some additional clarifications as provided below: • The addition of the phrase "and implement the reevaluated list of BES buses as per the Implementation Plan" to Part 1.3 and the phrase "and implement the reevaluated list of BES Elements as per the Implementation Plan" to Part 5.4 is unnecessary and makes the requirement out of date over time. The implementation timeframe should be stipulated in the Implementation Plan, not in the requirements. • R5.1.4 should be revised to state: One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL). • An additional sub-requirement should be added as R5.1.6, stating: 5.1.6 Any one BES Element that has previously demonstrated localized dynamic oscillations. • An additional sub-requirement should be added as R 5.1.7, stating: 5.1.7 Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. • Additionally, ERCOT respectfully submits that the RC/PC does not implement the plan, the TOs/GOs do (see paragraph 5 of Rationale for R5.) Accordingly, ERCOT recommends that R5.4 be revised to strike the last phrase as shown below: 5.4 Reevaluate all the identified buses BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part 5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan. • Requirement R8 should include a trigger for dynamic oscillations with less than 5% damping (whether local or inter-area). Requirement R8.2 should be reworded to identify triggers that are appropriate for the reasoning for the DDR identified in R5. For example, it is more appropriate for the trigger to be based on voltage for voltage sensitive areas. Gen locations would most likely trigger off (at least) frequency. ERCOT also recommends that the SDT consider the appropriate trigger for angular stability locations. For ERCOT, the off nominal frequency trigger should be set at 59.4 and 60.6 for ERCOT. This would give some additional bandwidth before entering 1st stage UFLS and catch the high frequency setpoint where generators should not trip off within 9 min. Additionally, the undervoltage trigger should be set consistently with that of the UVLS in the area. To set the trigger below the UVLS scheme would not utilize the equipment appropriately and the recording should be utilized to capture any UVLS event that would actually activate.

Bonneville Power Administration
Andrea Jessup
No
R5.1.1 BPA believes gross individual nameplate rating greater than or equal to 500 MVA seems an appropriate measure for DDR as does aggregate gross plant/facility rating of 1000MVA. However, the 300MVA individual nameplate rating appears arbitrary and unnecessary. Facilities with greater than 1000MVA aggregate nameplate rating should have DDR capabilities associated with the point of interconnection regardless of individual unit size. R5.1.4 BPA believes the number of items selected under this requirement must be limited within the standard given that the Responsible Entity is requiring the Transmission Operator to invest money in the installation of DDR equipment and infrastructure based on the selection of “One or more BES Elements.” The Transmission Operator must be given the authority to select alternate elements for DDR monitoring as well the flexibility to defer or refuse to install monitoring on some elements for reasonable cause. BPA believes this would provide a more prudent balance between the need for monitoring and the cost of installation and maintenance.
No
BPA feels the designation of a minimum clock accuracy adds to the compliance burden that must be met by the Owner while providing no incremental benefit to the reliability of the system. Almost all dedicated FR and SER equipment exceeds this threshold making the requirement irrelevant. Relay based event monitoring equipment may not meet this requirement and would therefore need to be replaced while providing no incremental increase in the quality of the data provided. This requirement would be better communicated in a NERC guidance document.
Yes
BPA believes the authority and responsibility for installing Adequate FR, SER, and DDR equipment must be left to the individual TOs and GOs. These are the parties who will fund these, who know the system best and who will ultimately be responsible for the analysis of system events. It is appropriate that the Responsible Entity request desired locations for this equipment but the final siting decisions must be left to the Owner. Transmission and Generation Owners have long known the value of accurate and comprehensive disturbance monitoring for the purpose of system event analysis. BPA believes it is presumptive to assume that this new methodology for FR and SER placement will provide adequate data for system event analysis. Out of necessity most Transmission and Generation owners have already developed proven strategies for disturbance monitoring on their systems. BPA believes this standard should require Entities to develop their own methodology for monitoring. BPA believes Requirements 11.3, 11.4 and 11.5 go too far in stipulating the file format and naming convention for event data submissions. This is in direct conflict with the DMSDTs’ statement: “The standard deals with "what" data is recorded, not "how" it is recorded.” File formatting is an administrative detail and does not warrant regulatory scrutiny. BPA does not believe this Standard should require the Transmission Owner (TO) to notify other owners of BES equipment of their compliance responsibility with respect to this standard. As written, the notification requirement in R1.2 places an undue compliance risk on TOs and should be removed. BPA also believes the rationale of R3/M3 is a little flawed (if more than one GSU source is connected to the bus then excluding 4 won’t allow direct derivation of total fault current on the bus. This would be indirectly derived by comparison of the fault study results.

Consideration of Comments

Project 2007-11 Disturbance Monitoring

The Project 2007-11 Disturbance Monitoring Drafting Team thanks all commenters who submitted comments on the standard. These standards were posted for a 45-day public comment period from September 5, 2014 through October 21, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 51 sets of comments, including comments from approximately 137 different people from approximately 109 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format in this Consideration of Comments on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net . In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration:

Stakeholder comments reflected that there were still questions regarding the standard addressing "what" data is captured, not "how" it is captured. The responses emphasized that quantities for fault recorder and dynamic disturbance recorder data can be determined (i.e. mathematically calculated from other data).

Stakeholders provided comments suggesting development of a guideline rather than a standard. A guideline will not ensure that there is adequate data available for event analysis continent-wide. Moreover, guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. The North American SynchroPhasor Initiative (NSAPI) has shown that the use of DDR data can dramatically improve modeling to reflect real system responses to Disturbances. DDR data may also be used for Real-time system operating management, especially in making restoration decisions.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Based on stakeholder comments, the Drafting Team made the following clarifying revisions to the standard:

- Added “4.1.4 Quebec Interconnection – Planning Coordinator or Reliability Coordinator” to the Applicability section.
- Revised “interval” to “intervals” in Measure M1.
- Revised “the in force list” to “the currently enforced list” in Rationale for Requirement R1.
- Added wording to the Rationale for Requirement R3 similar to language found in the Rationale for R7.
- Revised Requirement R5, Part 5.2 from “Ensure” to “Identify” to be consistent with Requirement R5, Part 5.1.
- Added (R9, Part 9.1; R9, Part 9.2) to Measure M9.
- Removed the “Note” regarding the extensive revisions from previous posting at the beginning of Rationales for Requirements R10 and R11.
- Revised “devices” to “devices internal clock” in the Rationale for Requirement R10.
- Corrected spacing, hyphenation and capitalization errors.

Comment Form Questions:

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

Summary Consideration:

Organization	Agree	Supporting Comments of “Entity Name”
N/A	N/A	N/A

1. **The DMSDT revised the requirements for Dynamic Disturbance Recorder (DDR) data based on stakeholder comments (see background section above). Do you agree with the BES Elements requiring DDR data listed in Requirement R5? If not, please provide technical justification**

Summary Consideration: Stakeholders comments reflected that there were still questions regarding the standard addressing "what" data is captured, not "how" it is captured. The responses emphasized that quantities for FR and DDR can be determined (i.e. mathematically calculated from other data). A standard is needed because a guideline would be unenforceable. Grammatical revisions and corrections to the standard were addressed.

Organization	Yes or No	Question 1 Comment
ACES Standards Collaborators	No	We appreciate the DMSDT's decision to incorporate more explanation in the rationales of this standard based on its extensive outreach to event analysis subject matter experts. We feel that the DMSDT has taken steps to answer some of the concerns regarding the requirements that seek to find "why" an event occurred. However, we continue to disagree that the standard addresses the "what" of data collection and not the "how" the data is collected. How is an entity going to provide data if it does not have the equipment present to collect it? The fundamental principles of this standard seem flawed when the purpose of this standard is to have "adequate data available to facilitate analysis of BES Disturbances." We feel NERC can communicate the intent of collecting data for the purposes of explaining why an event occurred through a Reliability Guideline instead of an enforceable standard. NERC already has enforceable standards on reporting events, monitoring system conditions, and identifying entity-to-entity data specifications. The data collected and available through these existing standards are through "proactive" devices and applications, which entities then generally archive for historical and training purposes. We believe sufficient data is already available, as evident with the data available to construct the sequence of events and other post-event analysis of disturbances for the September 8, 2011 Arizona-South California

Organization	Yes or No	Question 1 Comment
		Outages. As stated within the resulting FERC-NERC Arizona-South California Outages of September 8, 2011 report generated in 2012, “PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP).” The resulting report identified no additional standards because of this event. By continuing to pursue an enforceable standard to address outdated recommendations from the 2003 Blackout in the Northeast does not seem cost effective for both industry and NERC. A Reliability Guideline will not deter industry from installing additional or maintaining existing event recording devices. However, it gives industry an opportunity to balance the risk of not installing or maintaining such devices with pursing advancements in technologies with the more “proactive” and “preventable” devices and initiatives.
Response: Thank you for your comments. **For FR and DDR, the requirements specify that the electrical quantities can be determined (i.e. mathematically calculated from other data). Equipment is needed to capture only enough data to make the determination. A guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used for Real-time system operating management.**		
Dominion	No	See comments in Question #3.
Response: Thank you for your comments.		
Peak Reliability	No	The Requirement should be revised to include "in its area" to allow for multiple Responsible entities in an Interconnection. R5.2: "DDR coverage" should be changed to "DDR coverage identification." It is not reasonable that the Responsible Entity ensure DDRs are placed into service rather that they are identified and notification sent to owners.

Organization	Yes or No	Question 1 Comment
		R5.3: Currently in the Western Interconnection, there is no established mechanism to determine BES Element owners. Also, the phrase "require DDR data when requested" is confusing. Is the Responsible Entity only required to notify owners that DDR is required and data may be requested in the future? Peak recommends rewording the Requirement to better reflect the intent. R5.4: "and implement the reevaluated list of BES Elements as per the Implementation Plan" should be deleted because it's not the responsibility of the Responsible Entity to implement, only to identify and notify. Deleting that phrase will make it consistent with R5.3.
Response: Thank you for your comments. **Requirement R5 was not revised to include the suggested language. Reliability Coordinator Area is a defined term while Planning Coordinator area is not. The Drafting Team believed that inclusion of this could cause confusion.** **The intent of Requirement R5, Part 5.2 is to ensure that there is DDR data captured for the particular Element, which identifies what is needed. Requirement R5, Part 5.2 is to ensure that there is data capture, "how" it is done is not the intent of the Part.** **Requirement R5, Part 5.3--The identification of the owner/owners of a BES Element should be readily available. Requirement R5, Part 5.3 dictates that the owners of the identified BES Elements that require data for that BES Element have it available anytime, because it can be requested at any time.** **Requirement R5, Part 5.4 was revised to remove ", and" and replace it with "to".**		
Florida Municipal Power Agency	No	It needs to be clear that 5.1.2 and 5.1.4 are dealing with SOLs and IROLs established for the Planning Horizon by the Planning Coordinator or Transmission Planner. Reliability Coordinator SOL methodologies are dealing with a shorter timeframe, in the Operating Horizon, within which it may not be possible to engineer, procure, and install the equipment necessary to meet the requirement, especially as the results of the

Organization	Yes or No	Question 1 Comment
		application of the SOL methodologies may be changing as system conditions change. Also, the revised RSAW does not give any guidance to the auditor as to which set of SOLs and IROLs (Planning Horizon or Operating Horizon) to be looking at. There are some PCs that only have one BES bus, so 5.2 as written would require them to have a disproportionately higher percentage of DDR coverage than larger entities. FMPA suggests 5.2.1 be deleted in order to achieve a fairer tier to required DDR coverage. At the very least, 5.2.1 should be changed to “One BES Element; or” which we believe is what the Drafting Team intended. Taken together, 5.2.1 and 5.2.2 means at least two BES Elements need DDR coverage. Note that the clean version has 5.2.1 written as “One BES Element; and” while the redline version has it written as “One BES Element”

Response: Thank you for your comments.

PRC-002-2 deals with capturing Real-time data, and as such the data captured as specified in Requirement R5, sub-Parts 5.1.2 and 5.1.4 needs to deal with in-use SOLs and IROLs. The time frames in the Implementation Plan are adequate and realistic for an entity to be able to establish data capture capability. Requirements R6 and R7 specify that DDR data is to be determined (i.e. mathematically calculated from other data).

The comment regarding the RSAW has been given to NERC compliance staff.

Requirement R5, Part 5.2 was included to ensure that “gaps” in DDR coverage were filled. The Rationale Box for Requirement R5 explains Part 5.2.

Organization	Yes or No	Question 1 Comment
SPP Standards Review Group	No	Part 5.2 - We do not fully understand exactly what Part 5.2 is requiring. The rational for Part 5.2 states that a ‘Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous System Demand.’ This we understand. The confusion comes from the phrase ‘inclusive of those BES Elements

Organization	Yes or No	Question 1 Comment
		identified in Part 5.1'. Does this mean the Elements selected must come from those Elements identified in Part 5.1? If that's the case, we suggest changing the phrase to 'from the BES Elements identified in Part 5.1'. Additionally, tying the requirement for DDR data to 3,000 MW of load seems arbitrary. Does the DMSDT have any data or other justification supporting this requirement? Wouldn't it be more meaningful to tie this requirement to system topology and connectivity? Rationale for R5 - Use lower case 'standard' in the 2nd line of the 4th paragraph. Insert 'of' between 'understanding' and 'why' in the last line of the 1st paragraph.
Response: Thank you for your comments. **The "inclusive" language of Part 5.2 was intended to avoid imposing additional data requirements. If an entity has two BES Elements identified in Part 5.1, then no further data is required. The 3,000 MW value selected for Requirement R5, sub-Part 5.2.2 was selected by the Drafting Team from experience and judgment. The Drafting Team has made the wording revisions suggested for the Rationale Box for Requirement R5.**		
DTE Electric Co.	No	The MVA level for generation is still a concern, but it is understood that this change will not be considered by the SDT. Will the Responsible Entity work to insure that the DDR equipment at shared GO/TO facilities is not duplicated? Also, it is suggested that the Responsible Entity include in their identification criteria an evaluation of monitored quantities versus installation expense. It seems unreasonable to require DDR data at a location where only two monitored quantities are needed.
Response: Thank you for your comment. **The standard addresses "what" data is captured, not "how" it is captured. The Responsible Entity, having wide-area oversight, should not prescribe duplicate data. Requirements R6 and R7 specify that DDR data can be determined (i.e. mathematically**		

Organization	Yes or No	Question 1 Comment
calculated from other data). If it is determined that there are only two monitored quantities, the reason for monitoring those two quantities is to ensure that there are no gaps in data coverage.		
National Grid	No	R5 / R5.1.2 may result in the implementation of more DDR equipment than is necessary for wide-area disturbance event analysis. Preliminary Planning Coordinator analysis indicates this concern.
Response: Thank you for your comment. **PRC-002-2 is not about "how" disturbance monitoring data is captured, but "what" data is captured. Requirements R6 and R7 also state that DDR can be determined (i.e. mathematically calculated from other data), which influences how much equipment needs to be installed to capture data for the identified Bulk Electric System Elements.**		
Bonneville Power Administration	No	R5.1.1 BPA believes gross individual nameplate rating greater than or equal to 500 MVA seems an appropriate measure for DDR as does aggregate gross plant/facility rating of 1000MVA. However, the 300MVA individual nameplate rating appears arbitrary and unnecessary. Facilities with greater than 1000MVA aggregate nameplate rating should have DDR capabilities associated with the point of interconnection regardless of individual unit size. R5.1.4 BPA believes the number of items selected under this requirement must be limited within the standard given that the Responsible Entity is requiring the Transmission Operator to invest money in the installation of DDR equipment and infrastructure based on the selection of "One or more BES Elements." The Transmission Operator must be given the authority to select alternate elements for DDR monitoring as well the flexibility to defer or refuse to install monitoring on some elements for reasonable cause. BPA believes this would provide a more prudent balance between the need for monitoring and the cost of installation and maintenance.
Response: Thank you for your comments.		

Organization	Yes or No	Question 1 Comment
Requirement R5, sub-Part 5.1.1--refer to the Guidelines and Technical Basis Section. For slowly evolving system disturbances, it is important to monitor individual generator response which would not be achieved from DDR at a multiple unit facility interconnection point. **Requirement R5, sub-Part 5.1.4--the Responsible Entity has the wide-area system overview to select the BES Elements that need DDR data captured. Requirement R5, sub-Part 5.1.4 "One or more BES Elements…" gives the Responsible Entity the leeway to have DDR for the appropriate BES Elements for meaningful data capture.**		
Ingleside Cogeneration LP	No	Ingleside Cogeneration L.P. (ICLP) agrees with the extensive and consistent negative response from a number of respondents to the previous posting regarding DDR. We (and they) believe that R5 will unnecessarily over-drive the deployment of phase measurement units (PMUs). PMUs are a fast improving technology and the DDR owners will quickly find that their equipment is obsolescent. We can agree that PMUs must be deployed in critical areas regardless, but do not see the same sense of urgency for locations of lesser BES importance. Specifically as a GO, ICLP agrees with the criteria developed in PRC-023 and CIP-002 to establish critical generation facilities. In our view, this would be those whose aggregate output exceeds 1500 MVA and attach to the BES at 200 kV or more. (Of course, there must be special consideration for facilities that are part of a SOL/IROL, but those locations are already captured in R5.) After the industry gains familiarity with PMU technology, further integration at lower capacities and voltages may be considered. By then, there will be far more exciting and useful options available - and will no doubt prove to be more useful to investigators trying to consolidate data related to a wide-area outage.
Response: Thank you for your comment. **Data acquisition for the BES Elements identified in Requirement R5 are necessary to ensure proper and expeditious event analysis. That data needed will not change in the future, and advances in data capture technology will only result in improvement.**		

Organization	Yes or No	Question 1 Comment
ISO New England	No	By definition, SOLs do not impact other areas and, for that reason, it would be more appropriate to leave the determination regarding monitoring of SOLs up to the Responsible Entity. Accordingly, Requirement 5.1.2 should be deleted. However, if Requirement 5.1.2 is not deleted, then the words “Any one” in Requirement 5.1.2 should be replaced with the words “One or more.” This will make it clear that the Responsible Entity is required to select one (or more) BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL) and will also make Requirement 5.1.2 consistent with Requirement 5.1.4, which already uses the words “One or more.” In Requirement 5.1.3, the word “circuit” should be replaced with the word “interconnection” or the word “facility” to ensure that back-to-back HVDC is monitored; these types of interconnections are being planned for New England and the word “circuit” may create confusion about monitoring them. Also, to make Requirement 5.1.3 clearer, the words “...for which the Responsible Entity is responsible” should be added at the end of the sentence. The words “Any one” should also be replaced with the words “One or more” in Requirement 5.1.5. Again, this will make it clear that the Responsible Entity is required to select one (or more) BES Element within a major voltage sensitive area as defined by an area with an in-service UVLS program, and will make the requirement consistent with Requirement 5.1.4.
Response: Thank you for your comments. **The Drafting Team has retained the original language of each Part. The intent of the Drafting Team is to only require one BES Element for Requirement R5, Parts 5.1.2 and Part 5.1.5.**		

Organization	Yes or No	Question 1 Comment
Requirement R5, sub-Part 5.1.3--The Drafting Team believes that the existing language is sufficient to capture both HVDC lines and back-to-back converters. Adding the words “for which the Responsible Entity is responsible” does not provide additional clarity.		
Exelon Companies	No	Regional DME criteria in RF was 1000 MVA, Exelon thinks the threshold in R5 should be raised to the 1000 MVA per the RF Criteria.
Response: Thank you for your comment. **Assuming that RF is referring to the 500MVA gross individual nameplate rating in Requirement R5, sub-Part 5.1.1.1, the Guidelines and Technical Basis Section for Requirement R5 explains the selection of that value.**		
City Utilities of Springfield, Missouri	No	City Utilities of Springfield, Missouri supports the comments submitted by the SPP Standards Review Group.
Response: Thank you for your comments. **Refer to the response to the SPP Standards Review Group.**		
RelliabilityFirst	No	ReliabilityFirst votes in the Affirmative and believes the standard helps ensure that adequate data is available to facilitate analysis of Bulk Electric System (BES) Disturbances. This standard also removes the “fill in the blank” aspects of the old PRC-002 and PRC-018 standards. ReliabilityFirst offers the following comments for consideration: 1. Requirement R5, Part 5.3 - Requirement R5, Part 5.3 requires notification within 90- calendar days of completion of Part 5.1, but then goes on to state “when requested”. ReliabilityFirst questions whether the intent is “within 90-calendar days” or “when requested”. ReliabilityFirst believes the SDT should choose one or the other. 2. Requirement R5, Part 5.4 - Requirement R5, Part 5.4 references an “Implementation Plan” and it is unclear to ReliabilityFirst how this will be enforced. The Implementation Plan only speaks to the initial identification

Organization	Yes or No	Question 1 Comment
		of buses and does not address the re-evaluation of the list. Furthermore, a NERC Reliability Standard should not have requirements that reference documents which are outside of the standard. ReliabilityFirst suggests this reference to Implementation Plan be removed from Part 5.4.
Response: Thank you for your comments. **The "when requested" aspect of Requirement R5, Part 5.3 is intended to relate to the data being in accordance with Requirement R11 and is not related to the notification.** **Requirement R5, Part 5.4--On Page 4 of the Implementation Plan under Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11: compliance with the re-evaluated list is addressed. The reference to the Implementation Plan was added for clarity in response to comments received from previous postings.**		
Nebraska Public Power District	No	R5 5.2 states "5.2 Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: 5.2.1 One BES Element; and 5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand." Please explain how "Ensure a minimum DDR coverage" relates to the implementation plan where 100% compliance is required within 6 months of approvals. What is R5.2 acceptable evidence after 6 months? Is this just an identification requirement that the planning coordinator must provide in this 6 month time frame? This question arises because "Ensure" is used instead of "Identify". R5 question: For example, a utility has two DDRs on its system because it has two generating resources greater than 500 MVA at two separate locations. If this utility also has 3,030 MW peak demand will the two DDRs on its system satisfy R5.2? In addition to these comments, we also support the comments provided by SPP.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. **Requirement R5, Part 5.2--"ensure" has been replaced by "identify" as suggested. This aligns Requirement R5, Part 5.2 with 5.1 and the intent to identify those BES Elements for coverage.** **To satisfy Requirement R5, Part 5.2, data has to be captured for "One BES element, and "One BES Element per 3,000 MW…". DDR data for the two generating resources would satisfy Requirement R5, Part 5.2.** **Refer to the response to the SPP Standards Review Group.**		
	No	In the rationale for R5 it states "For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data." We do not think the Responsibility Entity should determine if the TO or GO will provide the data. Oncor recommends that if there is an interconnection between a TO and GO at the same BES location then the requirement should fall upon the GO. However if the TO has the data then the GO can contract with the TO for the data as mentioned in the rationale for R7 below:" Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data."
Oncor Electric Delivery LLC	No	In the rationale for R5 it states "For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data." We do not think the Responsibility Entity should determine if the TO or GO will provide the data. Oncor recommends that if there is an interconnection between a TO and GO at the same BES location then the requirement should fall upon the GO. However if the TO has the data then the GO can contract with the TO for the data as mentioned in the rationale for R7 below:" Generator Owners may install

Organization	Yes or No	Question 1 Comment
		this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.”
Response: Thank you for your comment. **The Responsible Entity determines what data is required, and is in the best position to determine what entity will provide it. The word “determine” is used in Requirement R7, and the Responsible Entity should take that into consideration.**		
Northeast Utilities	No	The minimum requirements in R5.1 should be eliminated because they are overly inclusive. The Requirement should just be limited to R5.2 requirements. NU’s Responsible Entity is on record as having adequate DDR monitoring for the region as such this requirement would add 20 DDR’s to the region 10 in NU’s footprint. The approximate cost to the region would be about $3 million with no benefit to system reliability.
Response: Thank you for your comment. **The BES Elements were specified in Requirement R5, Part 5.1 to ensure that adequate data would be provided for an event analysis. PRC-002-2 is not about “how” the data is captured, but “what” data is captured. Requirements R6 and R7 include the word “determine” which is intended to allow mathematical calculation or derivation of values from other data.**		
City of Tallahassee	No	TAL believes that disturbance monitoring, though good for event analysis, will provide little improvement in the reliability of the BES. Disturbance monitoring should be recommended to utilities through guidelines instead of through mandated standards. The amount of additional work required by utilities to install, maintain, and, likely the most demanding task, documentation/maintenance of compliance records with this proposed standard will not offset the small benefit seen by the collection of disturbance data.
Response: Thank you for your comment.		

Organization	Yes or No	Question 1 Comment
For FR and DDR, the requirements specify that the electrical quantities can be determined (i.e. mathematically calculated from other data). Equipment is needed to capture only enough data to make the determination. A guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. The North American SynchroPhasor Initiative (NSAPI) has shown that the use of DDR date can dramatically improve modeling to reflect real system responses to disturbances. DDR data may also be used for Real-time system operating management, especially in making restoration decisions.		
Tacoma Power	No	Tacoma Power agrees that most of the revisions outlined above are improvements but we still believe that the standard as written requires utilities to spend more effort documenting data recording than necessary to reliably operate the BES. For example, within the WECC footprint there are 49 generators in WECC that meet the 500 MW threshold in R5.1.1.1. The minimum required number of DDRs based on load per R.5.2.2 is 52 generators. Thus the first 1/6th of the proposed requirement provides 94% of the prudent DDRs. Although we have not analyzed exactly how many DDRs will be required for R5.1.2 through R5.1.5, it is clear that the 1 per 3000 MW specified R5.2.2 has little correlation to how many are currently specified by R5.1. Instead, R5.2.2 should provide regulatory certainty by specifying a maximum number of DDRs that would be required to be documented as compliant with this NERC standard. We disagree with the changes to R5.1.5. Although a UVLS program is an indicator of a major voltage sensitive area, UVLS should not be the definition of “major voltage sensitive area.” There are remote portions of the system that may have UVLS, but they would not be classified as “major” since they have significantly less than 300 MW of load.
Response: Thank you for your comments. **Requirement R5, Part 5.2 is intended for the Responsible Entity to ensure that there are no gaps in DDR data for the BES. If an entity has had BES Elements identified in Requirement R5, Part 5.1 that meet these minimums, there are no additional DDR**		

Organization	Yes or No	Question 1 Comment
locations required. For example, if an entity has 6,500 MW of peak System Demand, that entity would be required, under Requirement R5, Part 5.2 to have DDR data for 3 BES Elements. If that entity has had 3 BES Elements identified in Requirement R5, Part 5.1, then they have met Requirement R5, Part 5.2. **Requirement R5, sub-Part 5.1.5: The Drafting Team notes that a remote portion of the system will not likely have any impact to BES reliability. The intent of having the DDR data is to analyze disturbances. From the Guidelines and Technical Basis Section of the standard for Requirement R5:** **"Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area's response to large System excursions (voltage, frequency, etc.)."**

Associated Electric Cooperative, Inc.	Yes	1. AECI agrees with the SDT's list of elements. 2. Would the SDT provide some further clarification on exactly what "DDR coverage" would be considered? Further, some unofficial guidance was given to the effect that, neighboring entities DDR systems could be used for evidence if all required DDR data is collected by that unit. 5.3 goes on to state that notification to these entities is required, however provision of that data by the entity is not. Does the SDT believe the current

Organization	Yes or No	Question 1 Comment
		language has sufficient measures to facilitate this "sharing" of DDR equipment?
Response: Thank you for your comments. **DDR coverage is referring to DDR data capture for the BES Elements identified in Requirement R5, Part 5.1. PRC-002-2 is not about "how" data is captured, but "what" data is captured. The standard is concerned with ensuring that adequate data is captured for event analysis. The Requirements for data (R6 and R7) allow the data to be determined (i.e. mathematically calculated). If a neighboring entity has sufficient data to determine the quantities required, an entity may implement a data sharing arrangement. Those details are left to the entity. Requirement R5, Part 5.3 does state that DDR data just be provided when requested. The actual request and provision of data is addressed in Requirement R11.**

CPS Energy	Yes	
Alliant Energy	Yes	

2. **The DMSDT revised Requirements R10 regarding time synchronization of data and added explanation regarding time synchronization as follows to the rationale: "Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the standard devices used for monitoring are within ± 2 ms accuracy will suffice with respect to providing time synchronized data." Do you support these revisions? If not, please explain why and provide suggested changes**

Summary Consideration: Stakeholders provided comments suggesting development of a guideline rather than a standard. A standard is needed because a guideline would be unenforceable. The Rationale for Requirement R10 addressed stakeholders concerns expressed in the comments received. Grammatical revisions and corrections to the standard were addressed.

Organization	Yes or No	Question 2 Comment
ACES Standards Collaborators	No	We feel that NERC can communicate technical specifications for data collection explaining why an event occurred through a Reliability Guideline. As stated on the NERC web site, "reliability guidelines are documents that suggest approaches or behavior in a given technical area for the purpose of improving reliability." We feel NERC and industry jointly pursuing a Reliability Guideline on this topic collaboratively would be better use of time and resources.
Response: Thank you for your comment. **Because it is necessary to ensure time synchronization of data to facilitate analysis, it is necessary to be included in the standard because guidelines are unenforceable.**		
Dominion	No	See comments in Question #3.
Response: Thank you for your comments. **Please see responses to your comments under Question 3.**		

Organization	Yes or No	Question 2 Comment
Peak Reliability	No	"that meet the following" should be "to meet the following". Using "that" implies that the data that doesn't meet those requirements isn't applicable. We assume the SDT meant to convert all data to meet the time-synchronization requirements.
Response: Thank you for your comment. **Requirement R10 was revised as suggested.**		
Florida Municipal Power Agency	No	The requirement language still speaks to synchronizing the data even though the rationale states it should be the equipment and not the data that is mandated. There is also a grammar problem with the addition of the phrase “that meet the following:”. We believe it was intended that the equipment meet the 10.1 and 10.2 criteria and not the data or the BES Elements as it is worded. FMPA suggests the following language:” Each Transmission Owner and Generator Owner shall time synchronize all SER and FR equipment for the BES buses identified in Requirement R1 and all DDR equipment for the BES Elements identified in Requirement R5 to meet the following:”
Response: Thank you for your comment. **Requirement R10 was revised by changing “that” to “to. The remainder of the original language was retained as the Drafting Team feels that the language is clear in its intent.**		
SPP Standards Review Group	No	We suggest the wording in R10 be changed to read: ‘...identified in Requirement R5 to meet the following:’.
Response: Thank you for your comment. **Requirement R10 was revised as suggested.**		
Bonneville Power Administration	No	BPA feels the designation of a minimum clock accuracy adds to the compliance burden that must be met by the Owner while providing no incremental benefit to the reliability of the system. Almost all dedicated FR and SER equipment exceeds this threshold making the requirement irrelevant. Relay based event monitoring

Organization	Yes or No	Question 2 Comment
		equipment may not meet this requirement and would therefore need to be replaced while providing no incremental increase in the quality of the data provided. This requirement would be better communicated in a NERC guidance document.
Response: Thank you for your comment. **Because it is necessary to ensure time synchronization of data to facilitate analysis, it is necessary to be included in the standard because guidelines are unenforceable.**		
Lincoln Electric System	No	Within the Rationale for Requirement R10, it is unclear which device the Drafting Team intends to be synchronized to within +/- 2 milliseconds of UTC. Although the last paragraph of the Rationale for R10 states that the “accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment”, the following sentence states that “the equipment used to measure the electrical quantities must be synchronized to +/-2 ms accuracy”. This creates confusion in terms of whether the accuracy requirement applies to the clock used for synchronizing the monitoring equipment, to the monitoring equipment itself, or to both. Recommend additional clarification be included within the Rationale for R10 or else to R10.2 to prevent further confusion.
Response: Thank you for your comment. **The Drafting Team replaced the word “devices” in the last sentence of the Rationale to “devices internal clocks”.**		
City Utilities of Springfield, Missouri	No	City Utilities of Springfield, Missouri supports the comments submitted by the SPP Standards Review Group.
Response: Thank you for your comments. **Refer to the responses to the SPP Standards Review Group.**		
Nebraska Public Power District	No	We support the comments provided by SPP.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comments. **Refer to the responses to the SPP Standards Review Group.**		
Northeast Utilities	No	NU does not support the revision to R10. NU has researched and found that there can be as much as 10 ms difference between the clock and time stamp. Recommend the SDT R10 should be returned to the previous draft
Response: Thank you for your comment. **Requirement R10 was previously revised to address synchronization of only the time clock in recognition of the time difference between the clock and time stamp. Refer to the Rationale for R10.** **Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring device clocks are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.**		
City of Tallahassee	No	TAL believes that disturbance monitoring, though good for event analysis, will provide little improvement in the reliability of the BES. Disturbance monitoring should be recommended to utilities through guidelines instead of through mandated standards. The amount of additional work required by utilities to install, maintain, and, likely the most demanding task, documentation/maintenance of compliance records with this proposed standard will not offset the small benefit seen by the collection of disturbance data.
Response: Thank you for your comment. **A guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. 3. **If you have any other comments that you haven't already mentioned above, please provide them here**

Summary Consideration: The inclusion of the reference to the Implementation Plan in the standard was raised by the stakeholders. The inclusion of the Implementation Plan was added for clarity in response to comments received from previous postings. There were alternatives submitted to the specification of ASCII .CSV in Part 11.3. .CSV was specified to ensure consistency of data submitted. Regarding the submission of the CAP to the Regional Entity (Requirement R12) it was decided to just have the CAPs go to the Regional Entity because the Regional Entity is in a better position to have an overview of the data recording capability for its area. Comments regarding Attachment 1 were addressed in the responses. Concerns over triggered DDR were raised and addressed in the responses. The need for specific DDR data from individual generators versus combined data from the Transmission System was explained because of the importance of generator behavior during System Disturbances. DDR data being used to analyze slowly

evolving System Disturbances was emphasized in the responses to comments. Grammatical revisions and corrections to the standard were addressed.

ISO/RTO Council Standards Review Committee (SRC)	No	We generally agree with all the proposed changes. However, the addition of the phrase "and implement the reevaluated list of BES buses as per the Implementation Plan" to Part 1.3 and the phrase "and implement the reevaluated list of BES Elements as per the Implementation Plan" to Part 5.4 is unnecessary and which makes the requirement out of date over time. The implementation timeframe should be stipulated in the Implementation Plan, not in the requirements. We suggest the SDT to make this change, which can be regarded as not having material impact to the intent of the concerned requirements and hence may not require another round of successive balloting if this draft receives 2/3 majority support at the ballot
Response: Thank you for your comment. **On Page 4 of the Implementation Plan under Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11: compliance with the re-evaluated list is addressed. The reference to the Implementation Plan in Requirement R1, Part 1.3 and Requirement R5, Part 5.4 was added for clarity in response to comments received from previous postings.**

Northeast Power Coordinating Council	Yes	Include the Quebec Interconnection in the Introduction Section 4 Applicability. Add to “4.1 The Responsible entity is:” 4.1.4 Quebec Interconnection - Planning Coordinator or Reliability Coordinator. As an alternative, define a Responsible Entity for non-specified Interconnection areas. M12 - Remove “of”. Requirement R1, Part 1.2 requires from each Transmission Owner (TO) to notify other owners of BES Elements connected to identified BES buses. It is recommended to revise Part 1.2 to read that each TO provides the list of identified BES buses to their PC / RC who will notify those owners whose BES Elements require SER data and/or FR data. The PC / RC has more authority to maintain a master list of BES buses that require SER and FR data that can provide maximum wide-area coverage. This may avoid TO’s being challenged regarding BES bus selection. Requirement R11, Part 11.3. requires SER data in Comma Separated Value (.CSV) format following Attachment 2 whereas the majority of Disturbance Monitoring Equipment (DME) does not save data in this format. If large data volumes are requested then TO / GO should have their say to the requestor about when they can provide the data in (.CSV) format. Some DME produces records from which SER data would need to be manually extracted, which is very time-consuming. However, the same SER data can be visually seen using COMTRADE viewing software. The standard

Organization	Yes or No	Question 3 Comment
		should not make a file format (such as .CSV) a mandatory requirement. Additionally, Part 11.3 asks to combine SER data from multiple DME devices and from multiple stations. This could be very time consuming and subject to errors.
Response: Thank you for your comments. **The Quebec Interconnection was added as suggested to the Applicability section.** **"of" was removed from M12.** **The TO is in the best position to evaluate what BES Elements in its area will require Disturbance monitoring, and is in the best position to make the notifications.** **Regarding Requirement R11, Part 11.3, refer to the Rationale Box for Requirement R11:** **"SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve a common data format for event records, enabling the use of software tools for analyzing the SER data."**		
Seattle City Light	Yes	Seattle City Light does not support this Standard as structured or as written. We believe siting of monitoring equipment should be coordinated at a higher (regional or sub-regional) level to promote the most cost-effective installations. We do not believe the proposed level of technical detail (which changes constantly as technologies improve and change) is appropriate to a federal Standard (which is very difficult and slow to update and change). Finally, if a Standard something like the proposed approach is necessary, we find the 1500 MVA fault duty values to be low by a factor of 3 or 4, if not perhaps by a factor of 10.
Response: Thank you for your comment. **PRC-002-2 does not address "how" data is captured, but "what" data is captured. The technical requirements identified are minimum requirements, and as technology improves those requirements will be recognizably exceeded. The 1,500 MVA three phase short circuit was chosen based on input from across the continent and the Drafting Team's judgment.**		

Organization	Yes or No	Question 3 Comment
MRO NERC Standards Review Forum	Yes	
ACES Standards Collaborators	Yes	(1) When compared to other enforceable standards, the number of requirements identified in this standard is greater than the number of requirements currently enforceable for standards related to event reporting and entity-to-entity data specifications. We continue to believe that many of these requirements are unnecessary and fall under Paragraph 81 Criteria B. However, if the DMSDT feels that such information is "essential to expeditious and efficient data analysis," we believe these technical specifications could be included in a technical guideline or Compliance Section attached to this standard. Requirements R4 and R9 regarding data sampling and requirement R10 regarding time synchronization are just three of the numerous specifications listed in this standard. Requirement R11 identifies the data format and nomenclature expected for entities to follow. Even the current requirements associated with the Disturbance Control Standard, NERC Standard BAL-002-1, do not identify the data format as a requirement. Moreover, the individual parts of requirement R11 cite various IEEE standards and specifications, references the DMSDT could identify as footnotes. Many other SDTs, such as the one that developed NERC Standard PRC-023-2, relocated their technical information to other appropriate areas or documents. Likewise, requirement R8 identifies system conditions that are necessary to trigger the initiation of data recording if continuous data recording is unavailable. We believe the DMSDT should move these technical specifications to an appendix of the standard and not identify them as enforceable requirements. (2) We concur with the DMSDT that the term "BES buses" provides confusion. We believe requirements R1.1 and R1.3 should be rewritten to "BES Elements connected to a BES bus" to alleviate any further confusion.

Organization	Yes or No	Question 3 Comment
		(3) We believe the term “and/or” listed in Requirement R1.2 could provide confusion. We recommend change the requirement to read, “Notify, within 90-calendar days, other owners of BES buses identified within R1.1 that require SER data and FR data.” (4) We believe the DMSDT should remove references to the Implementation Plan, as embedded directly within the requirement text, and incorporated this information into an “Effective Date” entry listed under the Introduction (Section A) of this standard. Such references include R1.3 and R5.4. (5) We believe the DMSDT should remove the reference to “local time offset” in Requirement R10.1. Its reference to the time listed in SER and FR data and their synchronization to Coordinated Universal Time (UTC) is an unnecessary addition to the text of this requirement. (6) Requirement R11 identifies that entities are required to provide all SER and FR data, upon request, to the Regional Entity and NERC. NERC already defines this mechanism in Section 1600 of the NERC Rules of Procedures. We suggest the DMSDT remove all references to the Regional Entity and NERC from this requirement. (7) Requirement R12 states that an entity should first submit a Corrective Action Plan (CAP) to its Regional Entity and then implement the plan. We recommend the DMSDT follow a similar approach taken in NERC Standard PRC-004-3, where the entity is first required to develop a CAP and then required to implement and provide updates until the plan is completed. Both industry and NERC have already reviewed this language and the standard is currently on file with FERC. (8) The term “Responsible Entity” is already a defined term in Appendix 2 of the NERC Rules of Procedures. We recommend the DMSDT revise all references to Responsible Entity within this standard accordingly. (9) We continue to disagree with the DMSDT that this standard addresses the “what” of data collected and not “how” the data is collected. The costs of installing new equipment for the purposes of disturbance monitoring could be significant for some of our members. Moreover, industry has already benefitted from the DOE grants to

Organization	Yes or No	Question 3 Comment
		install PMUs and would continue to benefit from these types of financial incentives for continual situational awareness. The DMSDT continues to rebut our previously submitted comments with references to the 2003 Blackout in the Northeast. However, it was through these financial incentives, that sufficient data was available to construct the sequence of events and other post-event analysis of disturbances for the September 8, 2011 Arizona-South California Outages. As stated within the resulting FERC-NERC Arizona-South California Outages of September 8, 2011 report generated in 2012, "PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP)." Moreover, the resulting report identified that no additional standards were necessary because of this event. We suggest NERC should develop a Reliability Guideline on this topic instead of a standard, as we do not see the cost benefit or justification to allocate resources for an issue that is not a high priority for reliability.(10) Thank you for the opportunity to comment.

Response: Thank you for your comments.

1) **The technical specifications are included because a guideline will not ensure that they are adhered to. The technical specifications were included to ensure that the data captured would be able to be expeditiously analyzed. Guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used for Real-time system operating management, especially in making restoration decisions.**
2) **Requirement R1 was revised to clarify BES Elements connected to BES buses (Part 1.2) in the last revision. BES buses are the foundation for determining what data needs to be captured.**
3) **Requirement R1, Part 1.2 has "and/or" because not all BES buses have BES Elements that require both SER and FR data. In some instances, the requirement will be only for SER or FR data.**
4) **The reference to the Implementation Plan was added for clarity in response to comments received from previous postings.**
5) **Local time offset was included to accommodate entities that synchronize device clocks to their local time.**
6) **Requirement R11--The Drafting Team felt it necessary to specify who requests the data. A Section 1600 data request is very different from a data request under this standard.**

Organization	Yes or No	Question 3 Comment
7) Requirement R12 was written to realistically address recording capability failure. Implementation of the CAP requires the entity to perform the actions necessary to restore the data recording capability. 8) Responsible Entity as defined in the Applicability (section 4.1) is solely for use in PRC-002-2. This "Responsible Entity" for Requirement R5 varies by Interconnection. 9) PRC-002-2 addresses "what", not "how". Requirements R3, R6 and R7 include "to determine" which directly influences what capability is needed for System Disturbance monitoring. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. The North American SynchroPhasor Initiative (NSAPI) has shown that the use of DDR date can dramatically improve modeling to reflect real System responses to Disturbances. DDR data may also be used for Real-time System operating management, especially in making restoration decisions.		
Dominion	Yes	Project 2007-11 Disturbance Monitoring was initiated to replace the existing fill-in-the-blank Reliability Standard PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements with a more comprehensive standard. Project 2007-11 began in March 2007 with the objective to develop a continent-wide Disturbance Monitoring (DM) Reliability Standard. One Regional Entity (NPCC) developed a DM Regional Reliability Standard (FERC approved) in absence of a continent-wide standard. Dominion does not support this Reliability Standard and recommends that the SDT consider the following: 1. Is a continent-wide DM Reliability Standard necessary? With the exception of NPCC, no other Regional Entity has a Regional Reliability Standard for DM. Perhaps existing regional guidance/practices employed since 2007 are sufficient. There has been many new installations of DM equipment since the Version 0 fill in the blank standard was remanded back to NERC. Perhaps a suitable alternative to a standard would be for NERC to issue guidance similar to guidance that was issued for cold weather preparedness in lieu of a standard. 2. Duplicity and/or differences between Regional Reliability Standard and continent-wide Reliability Standard. Specifically: Dominion remains concerned that PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance

Organization	Yes or No	Question 3 Comment
		Monitoring. As of October 20, 2014, NPCC applicable entities are three years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Once approved, NPCC applicable entities must comply with both PRC-002-2 and PRC-002-NPCC-01, requiring those entities to review and determine the more stringent requirements between the regional and continent-wide standards. Dominion cannot support this continent-wide standard without inclusion of a variance for the NPCC Region (PRC-002-NPCC-01). 3. Equipment installation may be necessary to obtain the data specified in the Reliability Standard. Considering the criteria, some merchant generators, but not all, will incur costs that are not recoverable to install the equipment. This results in an unfair competitive advantage for some market participants. 4. Please consider the following items for consistency:M1 needs to be updated to include Parts 1.1, 1.2, and 1.3, similar to how M4 and M5 included the Parts. R11.1 should be reworded to include the word “consecutive” to read “period of 10 consecutive calendar days” and change test from “the data was recorded” to “the data was requested.”

Response: Thank you for your comments.

1. Project 2007-11 – Disturbance Monitoring was initiated to address the existing PRC-002-1 “fill in the blank” standard. FERC did not approve or remand PRC-002-1 in its Order No. 693 (March 16, 2007) because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. This project intends to address FERC concerns in Order 693, specifically the “fill in the blank” aspects of PRC-002-1, and PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting (to be retired upon approval of PRC-002-2). PRC-002-2 is intended to ensure that there are no gaps in Disturbance monitoring data coverage continent-wide for System disturbances. A

Organization	Yes or No	Question 3 Comment
guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. The North American SynchroPhasor Initiative (NSAPI) has shown that the use of DDR date can dramatically improve modeling to reflect real system responses to Disturbances. DDR data may also be used for Real-time system operating management, especially in making restoration decisions. 2. After approval of PRC-002-2, PRC-002-NPCC-01 will have to be reviewed for duplication of requirements. It is possible that NPCC will determine that PRC-002-NPCC-01 can be retired. Because PRC-002-2 deals with "what", not "how", complying with PRC-002-NPCC-01 might meet many, if not all of the requirements of PRC-002-2. 3. PRC-002-2 is just concerned with the capture of data and reporting of electrical quantities. It should be noted that entities may determine the required electrical quantities specified by using data from other sources. This includes a GO obtaining data from a TO to be able to determine their required electrical quantities. 4. Measure M1: The original language was retained as the use of "Requirement R1" covers all of the Parts. Requirement R11, Part 11.1 was not revised to add the word "consecutive" because the Drafting Team believes this is clear within the requirement. Changing "the data was recorded" to "the data was requested" would change the intent of the requirement. As written, Requirement R11, Part 11.1 limits the amount of data storage required to 10 days. Basing the storage on the request would create a potentially unlimited storage requirement. The use of the word "recorded" is appropriate.		
Peak Reliability	Yes	R12: "to the Regional Entity" should be "to the Regional Entity and to the Responsible Entity". This will ensure the Responsible Entity is aware of data outages.
Response: Thank you for your comment. The Standard Drafting Team discussed the submission of Corrective Action Plans to the Responsible Entity. It was decided to have the CAPs just go to the Regional Entity because the Regional Entity is in a better position to have an overview of the data recording capability for its entire area.		

Organization	Yes or No	Question 3 Comment
Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	Yes	1. It is believed that direct P & Q measurements are not required and the DDR can calculate these from measured voltages and currents- We recommend that the SDT clarify this in the Requirement or Rational box. 2. We would like the SDT to consider an alternative approach to this subject. It would be to have to have NERC or the RE's develop a map of the BES with the locations of current DME, then determine the areas where additional DME is needed to analyze a system event? This would eliminate the shotgun approach of basing the install on MW values, and insure that the program is cost effective. Some of the Reliability Entities may already have enough recording equipment. For example RFC may have a map of their footprint from their 2010 data request.
Response: Thank you for your comments. **1. Requirements R6 and R7 stipulate "data to determine" the quantities of concern. The Rationale for Requirement R6 also states this.** **2. After review of the BES buses identified by the Attachment 1 process, it was judged that this gives adequate coverage of the BES for Disturbance monitoring.**		
PacifiCorp	Yes	Regarding requirement in 5.1.5: This requirement is very vague - "major voltage sensitive area" is not a defined term. I Recommend it be revised to reference UVLS programs that are required to maintain compliance with the TPL standards, or possibly place a MW limit of 300 or more MW of load shedding to qualify for consideration.
Response: Thank you for your comment. **Refer to the Guidelines and Technical Basis Section for Requirement R5.** **"Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could**		

Organization	Yes or No	Question 3 Comment
be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area's response to large System excursions (voltage, frequency, etc.).”		
Puget Sound Energy	Yes	a) R3 could refer to R4 (see R4) in regards to details for each triggered FR. b) R8 discusses "continuous data and storage", whereas R11 states that data shall be retrievable for 10 days (presumably following an event), as data retention for longer is expensive and unrealistic. The statements in R8 and R11 may need clarification as to how much data needs to be held in memory before it is overwritten. Data from a catastrophic event may fill a recorder much more quickly than baseline data.
Response: Thank you for your comment. **The Drafting Team believes that the reference in Requirement R4 to Requirement R3 is adequate.** **Please refer to the Rationale for Requirement R11. The Drafting Team concurs that longer data retention periods are unrealistic. Requirement R11, Part 11.1 was not revised. As written, Part 11.1 limits the amount of data storage required to 10 days. The Drafting Team does not believe that additional clarifications are necessary.**		
Bonneville Power Administration	Yes	BPA believes the authority and responsibility for installing Adequate FR, SER, and DDR equipment must be left to the individual TOs and GOs. These are the parties who will fund these, who know the system best and who will ultimately be responsible for the analysis of system events. It is appropriate that the Responsible Entity request desired locations for this equipment but the final siting decisions must be left to the Owner. Transmission and Generation Owners have long known the value of accurate and comprehensive disturbance monitoring for the purpose of system event analysis. BPA believes it is presumptive to assume that this new methodology for FR and SER placement will provide adequate data for system event analysis. Out of necessity most Transmission and Generation owners have already developed proven strategies for disturbance monitoring on their systems. BPA believes this standard should require Entities to develop their own methodology for monitoring. BPA believes Requirements 11.3, 11.4 and 11.5 go too far in stipulating the file format and naming

Organization	Yes or No	Question 3 Comment
		convention for event data submissions. This is in direct conflict with the DMSDTs' statement: "The standard deals with "what" data is recorded, not "how" it is recorded." File formatting is an administrative detail and does not warrant regulatory scrutiny. BPA does not believe this Standard should require the Transmission Owner (TO) to notify other owners of BES equipment of their compliance responsibility with respect to this standard. As written, the notification requirement in R1.2 places an undue compliance risk on TOs and should be removed. BPA also believes the rationale of R3/M3 is a little flawed (if more than one GSU source is connected to the bus then excluding 4 won't allow direct derivation of total fault current on the bus. This would be indirectly derived by comparison of the fault study results.
Response: Thank you for your comments. **Because of its wide-area view, the Responsible Entity is most suited to determine the locations for DDR. Requirement R11, Parts 11.3, 11.4, and 11.5 ensure a consistency in data to facilitate evaluation and analysis. Requirement R3 for FR stipulates data "to determine" the electrical quantities. If an entity can calculate the quantities using other data, that is sufficient for this standard.**		
NIPSCO	Yes	R3 , GSU transformers are excluded based on the Drafting Team's assumption that a fault on the transmission system would be captured by FR data on the Transmission System equipment (line, bus terminals) which is an accurate assumption except for faults on the bus itself. In certain configurations where multiple GSU units terminate into a single Transmission Bus, it is uncertain if this could indeed be calculated as stated by deciphering the contribution from various units. As stated in the current draft of PRC-002-2 Pg 39 of 46 top of page, current calculations would not be required from the GSU terminals of each generator since they can be readily calculated if needed, which is not an accurate statement in all configurations. This leaves what could be a substantial gap for bus faults or for configurations where multiple units of different sizes terminate on separate terminals of the transmission bus. Example would be a large Transmission Substation with a breaker and half configuration with 4 GSU units all terminating on separate terminals into the

Organization	Yes or No	Question 3 Comment
		transmission bus. These units could be of different size and fuel source (Coal units, gas turbines, etc) all terminating to the same transmission bus leaving a substantial gap in FR recording data since the only thing that will be captured is the aggregate of the generation through calculation for external faults, and only simulated data for bus faults. Generators are typically the most significant contributor to transient and sub-transient local fault current at or near larger generation facilities, and also the most susceptible cause of cascading which may result from instability following a system disturbance. Therefore, this requirement would not provide the required data to decipher problem areas on specific generators that may have truly been the root cause without extensive simulation of data using, what would then be, calculated empirical data, not real captured data. This exclusion only appears beneficial for external close in faults and configurations where either a single GSU is connected to the transmission system or a single collector bus with an aggregate GSU source from many of the same units are connected to a Transmission Bus. For the purposes of the standard, exclusions should not be granted to generation terminals since it would result in a discriminatory practice. All significant sources of fault current on an applicable BES Transmission Bus should be deemed equally important for capturing FR data and the only exclusions should be to terminals or elements which only provide load.
Response: Thank you for your comments. **FR data for bus faults is obtainable by FR triggers set to see the bus faults. For the example described with multiple GSU units terminating on separate terminals at a BES bus, calculated data would be used to determine the electrical quantities specified.**		
Lincoln Electric System	Yes	As currently written, LES is having difficulty following Attachment 1 due to the confusing references. At a minimum, recommend clarification be added as to what “list” each step in the attachment is referring to, considering that the “list” may change throughout the steps. For example, in Step 3, does the “list” in the second sentence refer to the list created in the first sentence, or is it referring to the “list” created in Step 2? Or should the second sentence in Step 3 be moved to Step 2?

Organization	Yes or No	Question 3 Comment
		Without additional clarification, it is difficult for an entity to determine how to proceed through the steps in the attachment, especially Step 7.
Response: Thank you for your comment. **The steps of Attachment 1 are sequential. An entity should follow them in order to complete the requirement. For example, the list of BES Buses developed per Step 2 is a reduction of the list developed in Step 1. Step 3 further refines the list of BES buses. Step 7 provides possible scenarios and only one will apply depending on the result of Step 6.**		
Xcel Energy	Yes	In response to Xcel Energy's comment in the previous ballot, the Drafting Team states that changes were made in Step 7 and 8 to recognize that requiring close busses have date recording equipment would not provide significant value. However, a review of these steps in the redline document does not show that changes were made to address this issue. The Drafting Team did add language in the Rationale box under Requirement 3 addressing busses serving only generators but it is not clear how this rationale statement is made part of the requirements. Because of the perceived conflict in the rationale compared to the requirement, Xcel Energy is voting negative on the standard. We believe that the rationale statement is correct but the change has not been implemented in the requirement and associated calculation. Please correct this oversight. Thank you for your effort on this issue.
Response: Thank you for your comment. **Requirement R3 addresses "FR data to determine…". Because quantities can be determined (i.e. mathematically calculated from other data), for electrically close buses, recording capability would not be needed on each bus. In order to help Drafting Teams expand on the concepts and intent of the requirements, rationale boxes were added to the standard. The rationales are designed to provide entities and auditors with the intent of the Drafting Team during the development of the standard. The rationales are moved to the Guidelines and Technical Basis Section of the standard once the standard is approved and will remain there.**		
Ameren	Yes	To help assure the ability to meet the 90-day time limit for Requirement R12, we believe that it may be necessary to have at least one spare of each model of PMU installed on the system on hand for use in replacing a failed unit in a timely manner.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comment.		
Independent Electricity System Operator	Yes	We generally agree with all the proposed changes. However, the addition of the phrase “and implement the reevaluated list of BES buses as per the Implementation Plan” to Part 1.3 and the phrase “and implement the reevaluated list of BES Elements as per the Implementation Plan” to Part 5.4 is unnecessary which makes the requirement out of date over time. The implementation timeframe should be stipulated in the Implementation Plan, not in the requirements. We suggest the SDT to make this change, which can be regarded as not having material impact to the intent of the concerned requirements and hence may not require another round of successive balloting if this draft receives 2/3 majority support at the ballot.
Response: Thank you for your comments. **On Page 4 of the Implementation Plan under Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11: compliance with the re-evaluated list is addressed. The reference to the Implementation Plan in Requirement R1, Part 1.3 and Requirement R5, Part 5.4 was added for clarity in response to comments received from previous postings.**		
American Electric Power	Yes	AEP recommends modifying R2-R4 and R6-R11 to clearly exempt data lost due to an equipment failure properly identified per R12. Our concern on this matter has led, in part, to our decision to vote negative on the standard. R3: The Application Guide implies that GSU leads are not considered lines for this standard. The requirement should be revised to clearly indicate this. Similarly, station service or reserve transformers should likewise be explicitly excluded. Our concern on this matter has led, in part, to our decision to vote negative on the standard. As stated in our previous comments, AEP recommends modifying R3 so that only three of the four currents are required to be recorded. Since the fourth current can be calculated by the other three, there is no reliability impact for recording only three currents. The Drafting Team responded by saying “The Rationale Box for Requirement R3 explains the need for the three phase currents and the residual or neutral current”, however it is not necessary to monitor all these quantities to

Organization	Yes or No	Question 3 Comment
		provide the data mandated by R3.It is clear from the rationale section for R3 that GSU transformers are excluded from the requirement. However, R3 states "Each TO *and GO* shall have FR data...for the BES Elements it owns connected to the BES buses...". The requirement should be revised to align with the exclusion provided stated in the rationale section. R12: We see no reliability benefit in sending all CAP's to the Regional Entity, and recommend revising it in consideration of Paragraph 81. Rather, it should be acceptable to only require the TO/GO to develop and execute a CAP and to make this information available to the RE within 30 calendar days of a request.R2: We believe that it is clear that the TO/GO must have SER data for circuit breaker position as it related to the following BES elements connected to a BES bus; BES Transmission Lines, BES Transformers and BES Generator feeds. Does this Requirement also apply to circuit breakers/circuit switchers that serve BES shunt capacitors/reactors?

Response: Thank you for your comments.

Data capability lost due to equipment failure is addressed by Requirement R12 and does not need to be explicitly referenced in other requirements.

Regarding the handling of a GSU and its leads, refer to the Rationale for Requirement R3. Also, as per Requirement R3, the quantities can be determined (i.e. mathematically calculated from other data). The Rationale for Requirement R3 was previously revised to replace derivable with determinable. GSU low side voltages are below 100kV. In order to help Drafting Teams expand on the concepts and intent of the requirements, rationale boxes were added to the standard. The rationales are designed to provide entities and auditors with the intent of the Drafting Team during the development of the standard. The rationales are moved the Guidelines and Technical Basis Section of the standard once the standard is approved and will remain there.

The Drafting Team discussed the submission of Corrective Action Plans to the Responsible Entity. It was decided to have the CAPs just go to the Regional Entity because the Regional Entity is in a better position to have an overview of the data recording capability for its entire area. The timetable is discussed in the Rationale for Requirement R12. Requirement R2 applies to all breakers connected to the BES buses defined in Requirement R1.

Organization	Yes or No	Question 3 Comment
ISO New England	Yes	The triggers described in the first two bullets of Requirement 8.2 should be clarified to include the duration that the Standard Drafting Team based them on. Otherwise, the data produced may be inconsistent across interconnections and may be subject to different interpretations. Requirement 11.3 should be deleted because providing the data in formats other than ASCII Comma Separated Value (.CSV) should be allowed. In other words, the requirement should not prescribe a data format.
Response: Thank you for your comments. **Information from the Drafting Team members and industry indicated that there are very few triggered DDR recorders in service. Most DDR recorders are continuous not needing triggering. DDR data capture is for slowly evolving system conditions. Entities owning triggered DDR recorders would have the trigger durations set appropriately, and the duration of triggering quantities was judged not to be a problem. The Drafting Team did not think it necessary to add trigger duration to the requirement. Regarding Requirement R11, Part 11.3, refer to the Rationale Box for Requirement R11:** **"SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve a common data format for event records, enabling the use of software tools for analyzing the SER data."**		
City Utilities of Springfield, Missouri	Yes	City Utilities of Springfield, Missouri supports the comments submitted by the SPP Standards Review Group and the following additional suggestions: Regarding R1 and Attachment 1: We continue to believe the Attachment 1 fault MVA threshold established in R1 to identify potential buses from which to pick locations for FR (and SER) data is too low. All of the BES buses on our system have fault MVA above the 1500 MVA threshold and no reduction to the number of buses on our list occurs by application of the steps outlined in Attachment 1. Given the size of our utility, it seems odd to us that all of our buses are considered "key" to the BES. Regarding R3: We continue to believe it is not necessary to be able to determine the electrical quantities associated with every element connected to a bus for a fault on

Organization	Yes or No	Question 3 Comment
		one element of the bus. Rather, we believe that if devices are present to capture sufficient data necessary to determine the required quantities associated with the "faulted" element, that is sufficient for fault analysis. We believe it is sufficient for an entity to be able to determine fault location, fault type, cause of relay operation and the currents and voltages required by this proposed Standard associated with the faulted element for the purposes of Fault Recording. This seems to meet the intent voiced in the "Rationale for R3". Please clarify the purpose of requiring electrical quantities be determined for all elements connected to a bus for a fault on any element of that bus if the required quantities associated with the faulted element can be determined. Also, it seems to us that comments regarding determining correct operations of the protection system within the proposed Standard and guidelines document are out of scope for this Standard and are already covered in other NERC Standards, PRC-004 specifically. Regarding R4:We appreciate the SDT revising the total record length in the first bullet under R4.1 from at least 32 cycles to at least 30 cycles. Regarding R10:We appreciate the SDT's clarification that the time synchronization pertains to the device clock.
Response: Thank you for your comments. **Refer to the responses to the SPP Standards Review Group.** **R1: The 1,500 MVA three phase short circuit was chosen based on input from across the continent and the Drafting Team's judgment. The resulting list of BES buses will not be burdensome for implementation.** **R3: Requirement R3 specifies the quantities "for each triggered FR…". Electrical quantities determined (i.e. mathematically calculated from other data) for all Bulk Electric System Elements connected to a bus helps explain System response to a fault.**		
Luminant Generation Company, LLC	Yes	Luminant is specifically concerned about the administrative requirements in the standard related to reporting formats. Luminant does not disagree with the desire or benefit of standardized reporting, however, we believe specific data and reporting

Organization	Yes or No	Question 3 Comment
		formats do not belong in the standard requirements. The ERO already has the authority to request data and reports in specific forms or formats. (1) Requirement R11, subsections 11.3, 11.4 and 11.5 includes prescriptive details regarding data recording and reporting. The goal of the standards development process is to develop Results Based Standards. We reiterate our concern that these items are completely administrative in nature and are not results based. An entity could make a typo in formatting or when naming a file and be non-compliant with the requirement. These requirements should be removed from the standard or relocated to reference documents. (2) Requirement R11, subsections 11.4 and 11.5 reference IEEE standards and software formats which are not subject to the NERC procedures for standards development and are not under the purview of the legally authorized regulatory authority. Thus these sub-requirements have no valid standing in a NERC Reliability Standard. These items are more appropriate for a reference document. Inclusion in a reference document seems to provide a better location to document specific details on requested data and can provide a more effective mechanism for revising these details at a later date in regards to the data reporting. The requesting agency has the right to ask for data in any prescribed format they desire, but this should not be identified in the standard. (3) Requirement R11, subsection 11.4 specifically references “IEEE C37.111-2013”. We reiterate our previously submitted comment on the version specification. The SDT response focused on conversion software. Some older DFRs that effectively capture the needed data may not meet this requirement for the “2013”. Software updates may not always be reasonably accomplished with equipment, service contracts or other factors. This 2013 mandate is administrative in nature and does not contributed to a results based standard nor improve BES reliability. This version requirement should be revised to allow for any versions that the entity has access to that supports the recording and report requirements.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments. **1. Because standardized formats result in the expeditious and effective analysis of System Disturbances they were included in Requirement R11. Having the formats in the standard make them enforceable.** **2. IEEE Standards are referenced to ensure consistency and adherence to them is enforceable as they are part of the standard.** **3. Requirement R11, Part 11.4 was revised prior to the last posting to remove the 2013 requirement. "11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later."**		
RelliabilityFirst	Yes	ReliabilityFirst votes in the Affirmative and believes the standard helps ensure that adequate data is available to facilitate analysis of Bulk Electric System (BES) Disturbances. This standard also removes the "fill in the blank" aspects of the old PRC-002 and PRC-018 standards. ReliabilityFirst offers the following comments for consideration: 1. Requirement R1, Part 1.3 - Requirement R1, Part 1.3 references an "Implementation Plan" and it is unclear to ReliabilityFirst how this will be enforced. The posted PRC-00202 Implementation Plan only speaks to the initial identification of buses and does not address the re-evaluation of the list. Furthermore, a NERC Reliability Standard should not have requirements which reference documents which are outside of the standard. ReliabilityFirst suggests this reference to Implementation Plan be removed from Part 1.3.
Response: Thank you for your comment. **Compliance with a re-evaluated list is addressed on Page 4 of the Implementation Plan.** **The reference to the Implementation Plan was added for clarity in response to comments received from previous postings.**		
Oncor Electric Delivery LLC	Yes	We recommend the following language from the R7 to be used in R3 "Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, the Generator

Organization	Yes or No	Question 3 Comment
		Owner is still responsible for the provision of this data." As currently written the rationale in R3 places the burden on the TO when the GO should be held responsible. It is not a "given" that the TO FR is already monitoring GO generator breakers due to the legal deregulation splitting of asset ownership and monitoring isolation between TO/GO interfaces. In regards to R2 and R11.3 we recommend a similar provision for Legacy devices be provided as done in R8. We recommend the following verbiage be added:"If the FR equipment was installed prior to the effective date of this standard and is not capable of SER recording, Breaker position must be monitored by a digital element in the FR."Oncor recommends the following verbiage be added after the last sentence in the Guideline for Requirement R6 and R7: "The R6.3 and R7.3 assumption is that there is a balanced 3 phase system so calculating 3 phase power based on single phase voltage and current quantities is acceptable"
Oncor Electric Delivery LLC	Yes	We recommend the following language from the R7 to be used in R3 "Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data." As currently written the rationale in R3 places the burden on the TO when the GO should be held responsible. Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments. **The suggested wording was added to the Rationale for R3.** **PRC-002-2 deals addresses "what" data is recorded, not "how" the data is recorded. It is up to the TO or GO, as applicable, to make provisions to capture SER data. SER data recording is not as parameter dependent as DDR (requirement R8).** **The sections in the Guidelines and Technical Basis Section for Requirements R6 and R7 address balanced operating conditions as stated on Page 38 (Guidelines and Technical Basis Section) of the standard. The Drafting Team does not believe that further clarifications are necessary.**		
Texas Reliability Entity	Yes	1) Requirement R12: Texas Reliability Entity, Inc. (Texas RE) reiterates the concern raised during the previous ballot period that the Regional Entity is the appropriate entity to receive a TO or GO's Corrective Action Plan (CAP) as written in this requirement. Based on the language in the "Rationale for Functional Entities," it appears that either the Planning Coordinator (PC) or the Reliability Coordinator (RC) should be the recipient of the CAP. The Rationale for Functional Entities states that the "The Responsible Entity - the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection - has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required." Since the PC or RC is responsible for determining which BES Element data is needed, then they arguably need to know when there is a failure of the recording capability for that data and what the CAP is to restore the recording capability. The PC or the RC are in a better position to evaluate whether a CAP has been implemented. Therefore, submitting the CAP to the PC or RC is more appropriate than submitting the CAP to the Regional Entity as it will likely enhance reliability. Texas RE recommends the SDT change the second bullet under Requirement R12 from the "Regional Entity" to the "Responsible Entity." 2) Requirement R1 VSLs: The language within the first "OR" of the Lower VSL states the TO was late by 30 calendar days or less for Parts R1.1 and 1.3. Texas RE has two concerns regarding the language: A) Texas RE is not clear on what the VSL criteria of 30, 60, 90 or more than 90 calendar days is measuring against. Would the SDT please

Organization	Yes or No	Question 3 Comment
		explain what the TO would be late for since Requirement R1.1 has no time criteria? B) Texas RE requests the SDT consider whether the VSLs for re-evaluating all BES buses at least once every five calendar years for Part R1.3 is appropriate. For an evaluation that is deemed sufficient to be performed at a frequency of every five years, it would seem that being late by 30, 60, 90 or 90-plus days might not be the correct timeframe for assessing the severity of a violation. Texas RE suggests assigning criteria on quarters. So that a Lower VSL would be late by one quarter, Moderate VSL would be late by two quarters, High VSL would be late by three quarters and Severe VSL would be late by four quarters based on the previous evaluation date.
Response: Thank you for your comments. **1. The Drafting Team discussed the submission of Corrective Action Plans to the Responsible Entity. It was decided to have the CAPs just go to the Regional Entity because the Regional Entity is in a better position to have an overview of the data recording capability for its entire area. The timetable is discussed in the Rationale for R12. Requirement R2 applies to all breakers connected to the BES buses defined in Requirement R1.** **2. A. The Implementation Plan for Requirement R1 stipulates that an entity shall be 100 percent compliant within six months after approval. The 30, 60, 90 days refers to days past the 100 percent compliance date.** **2. B. Requirement R1, Part 1.3 is intended to consider changes in Disturbance monitoring necessitated by System changes. The VSL time periods are appropriate for the intention.**		
City of Tallahassee, TAL	Yes	TAL believe that disturbance monitoring though good for event analysis will provide little improvement in the reliability of the BES. Disturbance monitoring should be recommended to utilities through guidelines instead of through mandated standards. The amount of additional work required by utilities to install, maintain, and, likely the most demanding task, documentation/maintenance of compliance records with this proposed standard will not offset the small benefit seen by the collection of disturbance data.
City of Tallahassee	Yes	TAL believes that disturbance monitoring though good for event analysis will provide little improvement in the reliability of the BES. Disturbance monitoring should be

Organization	Yes or No	Question 3 Comment
		recommended to utilities through guidelines instead of through mandated standards. The amount of additional work required by utilities to install, maintain, and, likely the most demanding task, documentation/maintenance of compliance records with this proposed standard will not offset the small benefit seen by the collection of disturbance data.
Response: Thank you for your comment. **A guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. (Same comment for Question 2).**		
American Transmission Company LLC	Yes	ATC recommends correcting the typographical error in Requirement 11.2. The text should read, “Data subject to Part 11.1 will be provided within 30 calendar days of a request unless an extension is granted by the requestor.”
Response: Thank you for your comment. **The Drafting Team used hyphenated dates throughout the standard.**		
CenterPoint Energy Houston Electric	Yes	As stated in comments previously submitted regarding requirement R10 in conjunction with requirement R2, CenterPoint Energy continues to propose that UTC time synchronized DFR and DDR data is the final analysis tool and that, given the infrequent nature of wide area events, breaker state change SER data obtained from EMS systems provides adequate resolution for the initial phases of event analysis investigation. In CenterPoint Energy’s opinion the SDT has not provided sufficient justification to require such high resolution data in regards to breaker open/close SER data. While CenterPoint Energy recognizes this fine level of data may enhance analysis of a wide area event, the 2003 Blackout as well as other analysis’ of more recent wide area events indicates that this level of data is not critical to performing an accurate event analysis. CenterPoint Energy is concerned that this requirement may lead to applicable entities having to install additional SER equipment, communications infrastructure, or data gathering devices to be used only in the rare

Organization	Yes or No	Question 3 Comment
		event that a wide area system disturbance occurs. Therefore, CNP recommends removing SER data from R10.
Response: Thank you for your comment. **With the improvements in technology since the 2003 Blackout, Disturbance analysis should take advantage of those for refinements and the development of more accurate and precise findings. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. The North American SynchroPhasor Initiative (NSAPI) has shown that the use of DDR date can dramatically improve modeling to reflect real system responses to disturbances. DDR data may also be used for Real-time system operating management, especially in making restoration decisions.**		
Liberty Electric Power LLC	Yes	Disturbance monitoring Requirements should be established by the Regional Entity based on their overview of the BES, and monitoring equipment installed and maintained by the TO's to meet the requirements. GO's shoeuld not be included in the standard.
Response: Thank you for your comment. **It is important for event analysis to know generator behavior during the event. The Transmission System influences generation, and generation influences the Transmission System.**		
Director, Reliability Compliance	Yes	City of Austin dba Austin Energy (AE) does not agree with this standard as a whole because it is too prescriptive and unnecessary in the ERCOT Region. Regional requirements for the ERCOT Region regarding disturbance monitoring equipment exist in the ERCOT Nodal Operating Guides, Section 6.1. (http://www.ercot.com/mktrules/guides/noperating/cur). Existing requirements provide sufficient data for disturbance monitoring and analysis. AE recognizes, as the SDT pointed out, the ERCOT requirement is not a NERC Reliability Standard. However, AE disagrees with the SDT’s comment that the ERCOT requirements are not enforceable. Entities in the ERCOT Region must comply with the ERCOT requirements or face penalty by the Public Utility Commission of Texas (PUCT). Further, compliance

Organization	Yes or No	Question 3 Comment
		with ERCOT requirements is monitored and enforced by Texas Reliability Entity, Inc. (Texas RE). AE suggests the SDT consider a regional variance for the ERCOT Region, because sufficient requirements already exist.
Response: Thank you for your comments. **There must be uniformity continent-wide and in NERC for standards, and PRC-002-2 sets the foundation for Disturbance monitoring.**		
Tacoma Power	Yes	Although we agree focusing on “what” data rather than “how” data is a good idea, Measures M2 and M3 parts (1) and (3) are not consistent with that philosophy. Documented design specifications or station drawings are not evidence that the owner actually has SER/FR data; these documents are simply evidence of “how” the data might be captured rather than “what” data is actually being captured. In order to address the inconsistency between the requirement and the measure, the term “recording capability” should be inserted after the word “data” in Requirements R2 and R3. As currently written, this standard has a zero defect approach. A single missing piece of data is not a threat to the BES when analyzing historical events. In addition to the PRC-002-2 required recordings, most utilities have been installing microprocessor based relays with data recording capabilities. Requirement R5, Part 5.2.2, does not use the word ‘additional,’ but the Rationale for R5 does. If a Responsible Entity has 3,000 MW of historical simultaneous peak System Demand, are they required to have (at minimum) 1 or 2 locations with DDR? Requirement R5, Part 5.4, requires the Responsible Entity to implement the reevaluated list of BES Elements. However, the discussion in the Rationale for R5 says that the Transmission Owner and Generator Owner are responsible for implementation. It is understood that the Rationale for R5 is what is intended. Requirement R5, Part 5.4, ought to be amended to be consistent. In Measurement M9, it appears that the text “(R9, Part 9.1)” may be missing.

Organization	Yes or No	Question 3 Comment
		In Requirement R11, Part 11.2, change "...unless and extension..." to "...unless an extension..." Requirement R11, Part 11.1, will likely drive (1) automatic event retrieval from relays used for FR/SER, (2) restriction of event triggers in relays (to the detriment of the entity's other business objectives as they try to assure compliance for all scenarios), and/or (3) installation of dedicated FR equipment (or new relays) with large buffers. Buffers in many types of relays used for FR/SER could easily be overwritten within 10 calendar days, depending upon what event triggers are set up and power system conditions. It seems like the implementation plan for Requirements R2-R4 and/or R6-R11 in response re-evaluated lists from Requirement R1 or R5 should be included in the body of the standard. Implementation Plans are normally valid only for the initial phase-in of a standard (or new version of a standard). The response to a re-evaluated list is an ongoing activity.

Response: Thank you for your comments.

Measures M2 and M3 indicate the choices an entity has for showing compliance with the related Requirements which includes "how" the data is captured.

The sub-Parts under Requirement R5, Part 5.2 are an "and" statement. DDR coverage would be required for one BES Element, and one additional Bulk Electric System Element per 3,000 MW of peak System Demand.

Requirement R5 pertains to the Responsible Entity, and Requirement R5, Part 5.4 has the Responsible Entity notifying owners. The Rationale is intended to be an explanation of Requirement R5.

The reference to Requirement R9, Part 9.2 in Measure M9 was revised to add (R9, Part 9.1; R9, Part 9.2) to Item (1) of Measure M9.

Requirement R11 Part 11.2 was revised previously to "unless an extension" ("and" was corrected to "an").

Refer to the Rationale for Requirement R11.

Organization	Yes or No	Question 3 Comment
"Data is required to be retrievable for 10-calendar days inclusive of the day the data was recorded, i.e. a 10-calendar day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10-calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requestor of data has to be aware of the Part 11.1 10-calendar day retrievability because requiring data retention for a longer period of time is expensive and unnecessary." **The reference to the Implementation Plan in the standard was added for clarity in response to comments received from previous postings. A section of the Implementation Plan refers to the re-evaluated lists.**		
Electric Reliability Council of Texas, Inc.	Yes	ERCOT generally agrees with all the proposed changes and proposes some additional clarifications as provided below: o The addition of the phrase "and implement the reevaluated list of BES buses as per the Implementation Plan" to Part 1.3 and the phrase "and implement the reevaluated list of BES Elements as per the Implementation Plan" to Part 5.4 is unnecessary and makes the requirement out of date over time. The implementation timeframe should be stipulated in the Implementation Plan, not in the requirements. o R5.1.4 should be revised to state: One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL). o An additional sub-requirement should be added as R5.1.6, stating:5.1.6 Any one BES Element that has previously demonstrated localized dynamic oscillations. o An additional sub-requirement should be added as R 5.1.7, stating:5.1.7 Any one BES Element associated with major transmission interfaces, as defined by the Responsible Entity. o Additionally, ERCOT respectfully submits that the RC/PC does not implement the plan, the TOs/GOs do (see paragraph 5 of Rationale for R5.) Accordingly, ERCOT recommends that R5.4 be revised to strike the last phrase as shown below: 5.4 Reevaluate all the identified buses BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2 and notify owners in accordance with Part

Organization	Yes or No	Question 3 Comment
		5.3, and implement the reevaluated list of BES Elements as per the Implementation Plan. o Requirement R8 should include a trigger for dynamic oscillations with less than 5% damping (whether local or inter-area).Requirement R8.2 should be reworded to identify triggers that are appropriate for the reasoning for the DDR identified in R5. For example, it is more appropriate for the trigger to be based on voltage for voltage sensitive areas. Gen locations would most likely trigger off (at least) frequency. ERCOT also recommends that the SDT consider the appropriate trigger for angular stability locations. For ERCOT, the off nominal frequency trigger should be set at 59.4 and 60.6 for ERCOT. This would give some additional bandwidth before entering 1st stage UFLS and catch the high frequency setpoint where generators should not trip off within 9 min. Additionally, the undervoltage trigger should be set consistently with that of the UVLS in the area. To set the trigger below the UVLS scheme would not utilize the equipment appropriately and the recording should be utilized to capture any UVLS event that would actually activate.

Response: Thank you for your comments.

The reference to the Implementation Plan in the standard was added for clarity in response to comments received from previous postings. A section of the Implementation Plan refers to the re-evaluated lists.

The wording in Requirement R5, Part 5.1.4 was revised as such for the previous posting.

Regarding adding additional sub-Parts, an entity can capture data for any Bulk Electric System Element that has exhibited extraordinary behavior during System Disturbances. Language such as “major transmission interfaces” was removed from previous versions because stakeholders felt that it was ambiguous and unenforceable.

Requirement R5 pertains to the Responsible Entity, and the Responsible Entity has implementation responsibilities. The TO and GO are involved with the implementation of Requirement R5. The Implementation Plan addresses the re-evaluation.

Information from the Drafting Team members and industry indicated that there are very few triggered DDR recorders in service. The triggers listed in the requirement will not be expanded.

Organization	Yes or No	Question 3 Comment
PPL NERC Registered Affiliates		These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. We agree that DDR data should be obtained for the transmission lines from generation plants as listed in requirement 5, but not that GOs are the parties that should collect this information (R7). There has been much discussion between the North American Generator Forum (NAGF) and the Disturbance Monitoring Standard Development Team (DMSDT) regarding assignment of responsibility for monitoring disturbances, and we believe GOs should be excluded for the following reasons:- TOs interpret and use DME data; GOs do not. - TOs generally have wide-ranging arrays of DME, continuous recording/storage infrastructure, and experts in monitoring and maintaining such equipment; GOs do not. - DDR data collected on the TO's side of the generation plant battery limits would be the same as that measured on the GO's side. - Disturbances are more likely to originate in the transmission system than in generation plants (as was the case for the Northeast blackout of 2003), and responsibility should rest with the party causing the need for monitoring. We understand that duplication of equipment is not mandated - a GO could contract with it's TO to supply DDR data. It may not be possible to negotiate such agreements, however, due to the impracticality of transferring compliance responsibilities and the GO risk exposure if TOs commit to sharing data but not to achieving PRC-002-2 compliance. The NAGF attempted to find common ground with the DMSDT by recommending that the standard should at least state that TOs are responsible for providing DDR data if they already have such equipment at plants, but this request was evidently rejected, and R7 as presently written is therefore likely to lead to widespread wasteful duplication of equipment and effort. The least-total-cost approach should be followed in obtaining the expected reliability benefits, and we believe that centralizing DME with TOs makes more sense than splitting the

Organization	Yes or No	Question 3 Comment
		responsibilities between involved entities (TOs) and those who merely hand-over recordings (GOs) for further analysis. The entire subject of DME should be a TO matter and applicable to the TO's DME equipment that is already installed.
Response: Thank you for your comments. **GOs can use DDR to observe a generator's response to slowly evolving System Disturbances. Generator performance is crucial for event analysis, regardless of what initiated the disturbance.** **DDR data collected by the TO will generally be reflective of the entire System contribution. It is important to have DDR data dedicated to monitoring a generator's performance. The GO is responsible for supplying the data and it is up to the GO to determine the best course of action to provide that data.**		
Florida Municipal Power Agency		FMPA believes the standard, as written, places an onerous burden upon small Transmission Owners and Planning Coordinators that may only have one or two BES buses. The language and methodology effectively guarantee that such small entities must install equipment and report data under the standard. In R1, FMPA believes the Responsible Entity should be the one applying the methodology in Attachment 1 instead of the Transmission Owner. It is more appropriate from a Functional Model perspective to have the Planning Coordinator, for example, obligate the Generator Owner to the requirements that follow. Also, the Responsible Entity has the wide area view that will allow for more dispersed equipment, and lessen the potential for duplicative coverage. The Responsible Entity may need to use data from the Transmission Owners in its area, but once it has the data the formula in Attachment 1 can be followed. There are logical problems, as well as, issues with the inherent tiering between smaller entities and larger entities with Attachment 1.In Step 2, 1500 MVA is too low for small entities with few busses because they are either in remote locations and pose little risk of causing wide-area events or are located near facilities of a large neighbor that drive up the short circuit MVA level of the buses they own. In the latter case, the neighboring facilities would be better candidates for SER and FR data and there would be no value in having additional data from the nearby facilities just because there is a different responsible entity. The main issue hinges upon the

Organization	Yes or No	Question 3 Comment
		fact that the 1500 MVA threshold works well as an initial tool for evaluating large systems with many buses but does not work well as a singular and final compliance threshold (which is what it becomes for small entities). FMPA suggests raising the 1500 MVA criteria in Step 2 to at least 3000 MVA (or higher) for entities with 11 buses or fewer in their system. Step 3, as worded, is confusing because it causes a list of 11 buses to be determined and then causes steps to be skipped if there are 11 or fewer buses, which will always be the case. FMPA suggests replacing in Step 2 the phrase “If there are no buses on the resulting list, proceed to Step 7.” with “If the list has 11 or fewer buses, proceed to Step 7.” and deleting the same phrase from Step 3. Zero is fewer than 11, so we believe this results in what the Drafting Team intended. In Step 7, the reference to Step 3 should be a reference to Step 2. The word “the” should be deleted in the phrase “at least the 10 percent”. FMPA appreciates the SDT comment responses. Unfortunately, these responses do not mitigate the concerns raised in general about the need for the standard versus a guideline. Plus not all of our comments were addressed. Our prior concerns still remain in addition to some additional concerns. SDT Response 1:”The Standard Drafting Team realizes that improvements have been made to Disturbance Monitoring technology since the 2003 Northeast Blackout. That does not guarantee universal implementation, thus necessitating the need for the standard.”--While the SDT may “realize” that improvements have been made over the last decade, the SDT has not provided a risk assessment to quantify the need for a standard versus a guideline recognizing the technology advances and PMU equipment installed through the DOE Smart Grid program over the last decade. A risk assessment would be a beneficial exercise to identify gaps first, as opposed to taking a broad brush approach. It would also provide for more focused impact and faster results.SDT Response 2: “PRC-002-2 addresses “what” data is recorded, not “how” the data is recorded. This approach eliminates the complications that might arise from the technological advances being made to record the data”--The fact that this standard is requiring data vs equipment does not mitigate the fact that equipment will need to be installed which raises a cost recovery concern that needs to be addressed.SDT Response 3: “The Disturbance Monitoring

Organization	Yes or No	Question 3 Comment
		recordings can be used to improve reliability by providing information that can guide operators in better Real-time system management (Real-time system management includes providing information to make BES and facility restoration decisions), and facilitate the evaluation of system performance during and after abnormal system events."--Guiding operators goes beyond the scope of the standard for a number of reasons, but most importantly due to the fact the Time Horizon is "Long Term Planning" and not "Real-time Operations". This raises another concern, which is with regard to the purpose of the standard which now states: "To have adequate data available to facilitate ("event" has been removed) analysis of Bulk Electric System (BES) Disturbances (now upper case)". By removing "event" and capitalizing "Disturbance", which is very broadly defined in the NERC Glossary, this broadens the scope of the purpose of this standard. In R11, there is no defined need for which a Responsible Entity, Regional Entity or NERC can request all SER, FR and DDR data. FMPA believes criteria for making a data request is needed.

Response: Thank you for your comments.

For FR and DDR, the Requirements specify that the electrical quantities can be determined (i.e. mathematically calculated from other data). Equipment is needed to capture only enough data to make the determination. A guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. The existing standards do not mandate the collection of the needed data for event analysis. The data mandated by PRC-002-2 can also be used in the refinement of models. The North American SynchroPhasor Initiative (NSAPI) has shown that the use of DDR date can dramatically improve modeling to reflect real system responses to disturbances. DDR data may also be used for Real-time system operating management, especially in making restoration decisions.

The TO is the appropriate entity in R1 because the TO is more familiar with its System's behavior than the Responsible Entity would be.

The 1,500 MVA three phase short circuit value was chosen based on input from across the continent and the Drafting Team's judgment.

The Steps in Attachment 1 are sequential, and achieve the intended result. In Step 7 the commas were removed, and "the" is appropriate.

Organization	Yes or No	Question 3 Comment
A guideline will not ensure that there is adequate data available for event analysis continent-wide; guidelines are unenforceable. **The standard is addressing data for the analysis of BES Disturbances. It is not necessary to specify the criteria for making a data request.**		
SPP Standards Review Group		PRC-002-2Thank you for the clarification in the Applicability Section regarding the use of 'Responsible Entity'. Rationale for R1 - In the 3rd line of the 4th paragraph, the phrase '...into the in force list,...' is used. Shouldn't this be '...into the currently enforced list,...' or '...into the current list,...'? Also, there is a font issue with the inserted sentence. Rationale for R4 - Hyphenate '30-cycle total minimum record length' and '30-contiguous cycles'. Rationale for R11 - Insert a hyphen and a space in '10-calendar day' at the beginning of the 2nd line of the 3rd paragraph. Attachment 1 R1, Step 7-Thank you for the additional clarification in Step 7. Guideline for Requirement R4-Hyphenate '30-cycle record length' in the 4th line of the 1st paragraph and '30-contiguous cycles' in the last line of the 1st paragraph. We recommend that all changes we proposed to be made to the standard be reflected in the RSAW as well. We would ask that the Drafting Team take into consideration our suggestion to review the language mentioned in reference to the term 'list' in Attachment 1. Our concern at this point would be.... the term presents some confusion in how it's being used in the Steps of the documentation. For example in Step 3, we are not sure what 'list' you are referring to and will this term take on the same meaning as mentioned in the previous Steps (1 and 2)? We would request that you provide more clarity on which 'list' you are referring to and what data should be included in this process.
Response: Thank you for your comments.		

Organization	Yes or No	Question 3 Comment
The wording in the Rationale for Requirement R1 was revised to “currently enforced list”. The Rationales for Requirements R4 and R11 were updated as suggested as well, and the Guidelines for Requirement R4. **The Drafting Team will forward the updated standard to the NERC compliance for inclusion in the final RSAW.** **Regarding the use of “list” in Attachment 1, the lists are sequential as are the steps. For example, the list developed in Step 2 is a reduction of the list developed in Step 1, and so on.**		
DTE Electric Co.		No Comments
Exelon Companies		Requirement R7.1: For clarity consider replacing the first comma with “or” to read “One phase-to-neutral or phase-to-phase or positive sequence voltage......”R7.2: Similar comment - for clarity, consider rewording to replace the commas with “or” to read “The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7.1 or phase current(s) for any phase-to-phase voltages or positive sequence current.” R9.3 requires an output recording rate of at least 30 times per second while the existing NPCC and RFC-CRITERIA-PRC-002-01 requires a recording rate of 6 times per second. Some of the equipment in question was installed in the last several years to meet the RF stadnard/criteria. To meet this new requirement legacy devices will need to be either upgraded or replaced because the higher recording rate will mean they cannot hold a continuous 10 day record. Relaxing the recording output rate to the existing 6 times per second would be sufficient to allow these devices to be compliant with the requirement. The implementation plan for PRC-002-2 includes the following installation requirement for newly-added buses from the re-evaluation process: “Entities shall be 100 percent compliant with a re-evaluated assessed list from Requirement R1 or R5 within three (3) years following the notification by the TO or the Responsible Entity that re-evaluated of the list.”The requirement for a 3-yr compliance period will conflict with previously scheduled and planned outage / maintenance cycles . Modifying outage cycles with the time necessary to specify and acquire new

Organization	Yes or No	Question 3 Comment
		equipment will be disruptive. In place of a prescriptive cycle requirement, we propose the requirement be changed to say, Entities shall submit a plan to be 100% compliant with a re-evaluated list from requirements R1 and R5 within 180 days following notification by the TO/Responsible Entity. This plan should include expected completion date(s) justified by outage constraints, equipment lead times and availability. R12 and/or M12 should be modified. We will be using microprocessor relays that also provide protection for SER, FR, and DDR functions. Microprocessor relays that provide protection functions are not allowed to be out of service following a failure for anywhere near 90 days. In addition, we have these relays on all 200kV and above lines. Thus, the failure of one device is not too important from a DME standpoint. Given all this, this requirement is unnecessary for an entity using microprocessor relays as described.We propose that M12 states that protective relaying also used as DME is excluded from this requirement since it is inherent that it will be fixed in less than 90 days. Keeping data to show that relay failures were repaired in less than 90 days is an unnecessary administratve burden and does not contribute to reliable operations. The standard should recognize the varying technologies are used to perform this function and not create administrative burdens.An alternative might be to change the measure to state that if an event occurs that requires RRO or NERC investigation sufficient data was made available to NERC or the RRO to support the event investigation. This will eliminate the need to keep records proving that equipment was fixed in a timely manner.

Response: Thank you for your comments.

The Drafting Team retained the original language of the Requirement R7, Parts 7.1 and 7.2.

The Drafting Team selected the times per second output recording rate in Requirement R9, Part 9.2 based on their experience and industry input.

The three year compliance period in the Implementation Plan for a re-evaluated list was selected by the Drafting Team because it felt three years was adequate to account for maintenance and outage cycles.

Organization	Yes or No	Question 3 Comment
Requirement R12 was included with the intent to ensure that one entity, the Regional Entity, would be aware of the status of the in service recording capability in its area to ensure that adequate recording capability was available.		
Nebraska Public Power District		R11 requires “Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.” It appears a chattering contact could easily fill up an SER or FR device in a matter of minutes or less if it occurs near an event. It is difficult to control or address these issues but they could be a serious impact to the 10 calendar day requirement. Is there a way to minimize this requirement such that event triggers or SERs don’t need to be decreased to help ensure data has less chance of being overwritten? Some microprocessor relays only hold 12 event records so this is more difficult to guarantee data is available this long. In addition it is possible to have more than 12 operations within 10 days during stormy periods. It would seem this case would not allow the data to be available in a relay for the required time. This requirement could force utilities to eliminate many older microprocessor relays on the system that have limited programming and memory capability where the risk for non-compliance could be too great. If this happens then the assertion that many of devices are already on the system that meet the recording requirements is not a generally true statement. Consider removal of this 11.1 requirement since this capability is not entirely under the control of the owner. M1 question: Do we need to just show we sent a notification within 90 days to other owners of BES elements for an identified bus or also show a response? Just showing we sent the notification in good faith is preferred.\ R12 question: The implementation plan states we have 9 months after approval to be 100% compliant for R12. Does this mean we need to be compliant for R12 with elements as they become compliant in R2, 3, 4, 6, 7, 8, 9, 10 and 11 over the implementation time frame? For example, since it could be 4 years and only 50% of elements and their recording capabilities will be compliant how is requirement R12 applied to locations not yet compliant?

Organization	Yes or No	Question 3 Comment
		R4 states: “Trigger settings for at least the following: 4.3.1 Neutral (residual) overcurrent. 4.3.2 Phase undervoltage or overcurrent.” Is it possible to allow additional “OR” statements for 4.3.2?Many relays used for FR will use the phase impedance zone reaches to trigger records. This can clearly define the reach for data to be triggered where defining an under voltage or overcurrent may be more difficult to control the reach. There is some concern with overwriting data in the relays with settings that are less intuitive for controlling how often a device may trigger. We strongly recommend allowing phase distance reaches as trigger points. In past comments it may have appeared to be suggested as overcurrent or distance be included but what was meant was to have both as part of an OR statement. Suggestion: Phase under voltage or overcurrent or distance reach. R12 states “Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.” Should the RE or regional entity be listed in the Applicability section? For some registered entities the Planning Coordinator and the Regional Entity may not be the same. In addition to these comments, we also support the comments submitted by SPP.

Response: Thank you for your comments.

The Drafting Team considered available storage capabilities, and it judged 10-calendar days to be an appropriate time frame.

The intention of Measure M1 is for an entity to have evidence of having made a notification.

Requirement R12 compliance only applies to items that have become compliant.

Requirement R4, Part 4.3 specifies “Trigger settings for at least the following:”. Phase distance triggering can be used in addition to the triggers listed.

The Regional Entity is not responsible for any of the requirements, and therefore does not need to be included in the Applicability section.

Refer to the responses to the SPP Standards Review Group comments.

Organization	Yes or No	Question 3 Comment
CPS Energy		Still feel that the method for determining the busses is too complicated. While we agree that the methodology needs to have consistency, it needs to be made simpler. The spreadsheet is terrible. The examples are difficult to follow and a guide with screenshots needs to be provided to help follow along. For example, how does B3 become a hard-coded example of 64 in both examples when there is nothing in the instructional steps indicating that this value needs to be changed? With hard to follow example, how can we be confident that we are following the procedure correctly to stay in compliance with our own data? The spreadsheet should be simplified to have users enter data without the zero busses, this may help to reduce the number of steps. A better way would be to write a program or something or make the planning coordinators produce the values generated by the spreadsheets. Also, bus fault MVA needs to be defined. Is this based on fault current and nominal voltages or pre-fault voltages? Are there any modeling requirements for generating the fault values? What needs to be recorded for each event - every terminal at a recorder location or just the faulted terminal? If we have microprocessor relays with GPS clock synchronization at every terminal in our system, would that be adequate enough - to capture each fault at the terminal where the fault was located?
Response: Thank you for your comments. **Fault MVA calculations are based on using industry accepted parameters. An entity has to determine the adequacy of its Disturbance monitoring recording capability to capture what data is required.**		
Alliant Energy		Consider revising Requirement R8 so that it refers to continuous recording and storage necessary to meet Requirement R11. Otherwise, it leaves the interpretation open that the user needs continuous unlimited storage of data.
Response: Thank you for your comment. **The Rationale for Requirement R11 addresses your concern.**		

END OF REPORT

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Disturbance Monitoring Standard Drafting Team (DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The draft standard was posted for a 45-day formal comment period February 2-March 18, 2009.
5. The project was placed into informal development the fall of 2010.
6. The project was placed into formal development January 2013.
7. Nominations for two additional DMSDT members were solicited April 12 – 25, 2013.
8. Three additional DMSDT members were added May 22, 2013.
9. Industry webinars were held May 22, 2013, June 12, 2014, and August 21, 2014.
10. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.
11. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.
12. The draft standard was posted for a 45-day concurrent comment and ballot period May 9 – June 25, 2014 (ballot was extended to achieve quorum).

Description of Current Draft

This is the fourth draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	September, 2014
Final Ballot	October, 2014
BOT Adoption	November, 2014

Effective Dates

See Implementation Plan

Version	Date	Action	Change Tracking
2.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the Rationale Boxes will be moved to the Guidelines and Technical Basis Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate analysis of Bulk Electric System (BES) Disturbances.
4. **Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT Interconnection – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.1.4 Quebec Interconnection – Planning Coordinator or Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities:

When the term "Responsible Entity" is used in PRC-002-2, it specifically refers to those entities listed under 4.1. The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those BES Elements selected.

BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

B. Requirements and Measures

R1. Each Transmission Owner shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.

1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.

1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data is required, identified in accordance with PRC-002-2, Attachment 1, and evidence that all BES buses have been re-evaluated within the required intervals under Requirement R1. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Attachment 1 provides a uniform methodology to identify those BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a Transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of Transmission Lines and other BES Elements connected to the BES bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on System reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause wide-area or cascading System events, so SER and FR data from those BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment.

Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data is required based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and System topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses.

Each Transmission Owner must re-evaluate the list of BES buses at least every five calendar years to address System changes since the previous evaluation. Changes to the BES do not mandate immediate inclusion of BES buses into the currently enforced list, but the list of BES buses will be re-evaluated at least every five calendar years to address System changes since the previous evaluation.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90-calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings; or (3) station drawings.

Rationale for R2:

The intent is to capture SER data for the status (open/close) of the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a time synchronized clock, provides the basis for assembling the detailed sequence of events timeline of a power System Disturbance. Other status monitoring nomenclature can be used for devices other than circuit breakers.

R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltage for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission Lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data that is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R3:

The required electrical quantities may either be directly measured or determinable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all BES bus phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for System Disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer. Generator step-up transformers (GSUs) and leads that connect the GSU transformer(s) to the Transmission System that are used exclusively to export energy directly from a BES generating unit or generating plant are excluded from Requirement R3 because the fault current contribution from a generator to a fault on the Transmission System will be captured by FR data on the Transmission System, and Transmission System FR will capture faults on the generator interconnection.

Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, when required, the Generator Owner is still responsible for the provision of this data.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a total record length of at least 30-cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. Evidence may include, but is not limited to: (1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power System operations and determination if operations were as intended. System faults generally persist for a short time period, thus a 30-cycle total minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time-synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30-contiguous cycles total.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1 Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following:

5.1.1 Generating resource(s) with:

5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA.

5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1,000 MVA.

5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL).

5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.

5.2 Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:

5.2.1 One BES Element; and

5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.

5.3 Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested.

5.4 Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the re-evaluated list of BES Elements as per the Implementation Plan.

M5. The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for which DDR data is required, developed in accordance with Requirement R5, Part 5.1 and Part 5.2; and re-evaluated in accordance with Part 5.4. The Responsible Entity has dated evidence (electronic or hard copy) that each Transmission Owner or Generator Owner has been notified in accordance with Requirement 5, Part 5.3. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

DDR is used for capturing the BES transient and post-transient response following Disturbances, and the data is used for event analysis and validating System performance. DDR plays a critical role in wide-area Disturbance analysis, and Requirement R5 ensures there is adequate wide-area coverage of DDR data for specific BES Elements to facilitate accurate and efficient event analysis. The Responsible Entity has the best wide-area view of the System and needs to ensure that there are sufficient BES Elements identified for DDR data capture. The identification of BES Elements requiring DDR data as per Requirement R5 is based upon industry experience with wide-area Disturbance analysis and the need for adequate data to facilitate event analysis. Ensuring data is captured for these BES Elements will significantly improve the accuracy of analysis and understanding of why an event occurred, not simply what occurred.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-evaluation of the list is a reasonable interval for this review. Changes to the BES do not mandate immediate inclusion of BES Elements into the in force list, but the list of BES Elements will be re-evaluated at least every five calendar years to address System changes since the previous evaluation. However, this standard does not preclude the Responsible Entity from performing this re-evaluation more frequently to capture updated BES Elements.

The Responsible Entity, for the purposes of this standard, is defined as the PC or RC depending upon Interconnection, because they have the best overall perspective for determining wide-area DDR coverage. The Planning Coordinator and Reliability Coordinator assume different functions across the continent; therefore the Responsible Entity is defined in the Applicability Section and used throughout this standard.

The Responsible Entity must notify all owners of the selected BES Elements that DDR data is required for this standard. The Responsible Entity is only required to share the list of selected BES Elements that each Transmission Owner and Generator Owner respectively owns, not the entire list. This communication of selected BES Elements is required to ensure that the owners of the respective BES Elements are aware of their responsibilities under this standard.

Implementation of the monitoring equipment is the responsibility of the respective Transmission Owners and Generator Owners, the timeline for installing this capability is outlined in the Implementation Plan, and starts from notification of the list from the Responsible Entity. Data for each BES Element as defined by the

Responsible Entity must be provided; however, this data can be either directly measured or accurately calculated. With the exception of HVDC circuits, DDR data is only required for one end or terminal of the BES Elements selected. For example, DDR data must be provided for at least one terminal of a Transmission Line or generator step-up (GSU) transformer, but not both terminals. For an interconnection between two Responsible Entities, each Responsible Entity will consider this interconnection independently, and are expected to work cooperatively to determine how to monitor the BES Elements that require DDR data. For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.

Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified BES Element in Requirement R5, Part 5.1; monitoring these BES Elements with DDR will facilitate thorough and informative event analysis of wide-area Disturbances on the BES. Part 5.2 is included to ensure wide-area coverage across all Responsible Entities. It is intended that each Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous peak System Demand.

R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R6:

DDR is used to measure transient response to System Disturbances during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the BES buses within a location are at the same frequency, one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a BES bus are closed.

R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R7:

A crucial part of wide-area Disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up transformer (GSU) measuring the specified electrical quantities to adequately capture generator response. This standard defines the ‘what’ of DDR, not the ‘how’. Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

8.2 At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recordings and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R8:

Large scale System outages generally are an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specification, device configuration, or settings (R9, Part 9.1; R9, Part 9.2); or (2) actual data recordings (R9, Part 9.2).

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power System Disturbances.

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.

10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specification, configuration, or setting; (2) time synchronization indication or status; or 3) station drawings.

Rationale for R10:

Time synchronization of Disturbance monitoring data is essential for time alignment of large volumes of geographically dispersed records from diverse recording sources. Coordinated Universal Time (UTC) is a recognized time standard that utilizes atomic clocks for generating precision time measurements. All data must be provided in UTC formatted time either with or without the local time offset, expressed as a negative number (the difference between UTC and the local time zone where the measurements are recorded).

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices internal clocks are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.

R11. Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.

11.2 Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor.

11.3 SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2.

11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later.

11.5 Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records; (2) documents describing data storage capability, device specification, configuration or settings; or (3) actual data recordings.

Rationale for R11:

Wide-area Disturbance analysis includes data recording from many devices and entities. Standardized formatting and naming conventions of these files significantly improves timely analysis.

Providing the data within 30-calendar days (or the granted extension time), subject to Part 11.1, allows for reasonable time to collect the data and perform any necessary computations or formatting.

Data is required to be retrievable for 10-calendar days inclusive of the day the data was recorded, i.e. a 10-calendar day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10-calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requestor of data has to be aware of the Part 11.1 10-calendar day retrievability because requiring data retention for a longer period of time is expensive and unnecessary.

SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve the data format for event records, enabling the use of software tools for analyzing the SER data.

Part 11.4 specifies FR and DDR data files be provided in conformance with IEEE C37.111, IEEE Standard for Common Format for Transient Exchange (COMTRADE), revision 1999 or later. The use of IEEE C37.111-1999 or later is well established in the industry. C37.111-2013 is a version of COMTRADE that includes an annex describing the application of the COMTRADE standard to synchrophasor data; however, version C37.111-1999 is commonly used in the industry today.

Part 11.5 uses a standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), for providing Disturbance monitoring data. This file format allows a streamlined analysis of large Disturbances, and includes critical records such as local time offset associated with the synchronization of the data.

R12. Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- Restore the recording capability, or
- Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, (3) SCADA records, or (4) dated CAP transmittals to the Regional Entity and evidence that it implemented the CAP.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90-calendar days to ensure that adequate data is available for event analysis. If the Disturbance monitoring capability cannot be restored within 90-calendar days (e.g. budget cycle, service crews, vendors, needed outages, etc.), the entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. It is treated as a failure if the recording capability is out of service for maintenance and/or testing for greater than 90-calendar days. An outage of the monitored BES Element does not constitute a failure of the Disturbance monitoring capability.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for sequence of events recording (SER) and Fault recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1,500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20 percent.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1,500 MVA or
- 20 percent of median MVA level determined in Step 5.

Step 7. <u>If there are no BES buses on the list:</u> the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

<u>If the list has 1 or more but less than or equal to 11 BES buses:</u> FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.

<u>If the list has more than 11 BES buses: SER and FR</u> data is required on at least the 10 percent of the BES buses determined in Step 6 with the highest maximum

available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20 percent of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for SER and FR data. The following BES bus locations are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident Transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

PRC-002-2 addresses “what” data is recorded, not “how” it is recorded.

Guideline for Requirement R1:

Sequence of events and fault recording for the analysis, reconstruction, and reporting of System Disturbances is important. However, SER and FR data is not required at every BES bus on the BES to conduct adequate or thorough analysis of a Disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuits allows the precise reconstruction of events of both localized and wide-area Disturbances.

More quality information is always better than less when performing event analysis. However, 100 percent coverage of all BES Elements is not practical nor required for effective analysis of wide-area Disturbances. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses with breakers where crucial information is available when required.
2. Avoid excessive overlap of coverage.
3. Avoid gaps in critical coverage.
4. Provide coverage of BES Elements that could propagate a Disturbance.
5. Avoid mandates to cover BES Elements that are more likely to be a casualty of a Disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of Transmission Lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of Transmission Systems throughout the continent to analyze Transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause Cascading.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater System impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for Systems with more than 11 BES buses with three phase short circuit levels above 1,500 MVA.

1. Total number of BES buses in the Transmission System under evaluation.
    a. Only tangible substation or switchyard buses are included.
    b. Pseudo buses created for analysis purposes in System models are excluded.
2. Determine the three phase short circuit MVA for each BES bus.
3. Exclude BES buses from the list with short circuit levels below 1,500 MVA.
4. Determine the median short circuit for the top 11 BES buses on the list (position number 6).
5. Multiply median short circuit level by 20 percent.
6. Reduce the list of BES buses to those with short circuit levels higher than 20 percent of the median.
7. Apply SER and FR at BES buses with short circuit levels in the top 10 percent of the list (from 6).
8. Apply SER and FR at BES buses at an additional 10 percent of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
    - Electrically distant BES buses or electrically distant from other DME devices

- Voltage sensitive areas
- Cohesive load and generation zones
- BES buses with a relatively high number of incident Transmission circuits
- BES buses with reactive power devices
- Major facilities interconnecting outside the Transmission Owner's area.

For event analysis purposes, more valuable information is attained about generators and their response to System events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The re-evaluation interval of five years was chosen based on the experience of the DMSDT to address changing System configurations while creating balance in the frequency of re-evaluations.

Guideline for Requirement R2:

Analyses of wide-area Disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the Disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. However, generator breakers directly connected to an identified BES bus are required to have SER data captured. It is important in event analysis to know when a BES bus is cleared regardless of a generator's loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's BES bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The BES Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission Lines

Only those BES Elements that are identified as BES as defined in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step-up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the Transmission System will be captured by FR data on the Transmission System.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the Transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities
For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings
The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a Transmission System is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:
$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings
Voltages are to be recorded or accurately determined at applicable BES buses.

Guideline for Requirement R4:

Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection System operations after a fault to determine if a protection System operated as designed. Generally speaking, BES faults persist for a very short time period, approximately 1 to 30 cycles, thus a 30-cycle record length provides adequate data. Multiple records allow for legacy microprocessor relays which, when time synchronized to a common clock, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30-contiguous cycles total.

A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for FR.

FR triggers can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, sub-Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, sub-Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area Disturbance monitoring to determine the System's electromechanical transient and post-transient response and validate System model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the System's dynamic response and ensuring sufficient coverage to determine System performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historical simultaneous peak System Demand. This DDR data is included to provide adequate System wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a Disturbance helps the analysis of large Disturbances. Having data regarding generator dynamic response to Disturbances greatly improves understanding of ***why*** an event occurs rather than what occurred. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.

- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.

The information in the spreadsheet does not provide information by which the plant information location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, sub-Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings “greater than or equal to 500 MVA”. The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47 percent of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5 percent of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, sub-Part 5.1.1 is included to capture larger units located at large generating plants which could pose a stability risk to the System if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1,000 MVA. The 300 MVA threshold was chosen based on the DMSDT’s judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. For combined cycle plants where only one generator has a rating greater than or equal to 300MVA, that is the only generator that would need DDR.

Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability have a significant impact on BES reliability and performance. Therefore, at least one BES Element of an SOL should be monitored.

The draft standard requires “One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs).” Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored BES Element(s) and contingent BES Element(s). The standard does not dictate selection of the contingent and/or monitored BES Elements. Rather the Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area’s response to large System excursions (voltage, frequency, etc.).

Guideline for Requirement R6:

DDR data shows transient response to System Disturbances after a fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the standard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available. For example, a breaker-and-a-half or double-bus configuration with a North (or East) Bus and South (or West) Bus, would require both buses to have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current recording is also acceptable.

For all circuits where current recording is required, Real and Reactive Power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6 apply to Requirement R7. Since either the high- or low-side windings of the generator step-up transformer (GSU) may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for Requirement R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Wide-area System outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This

drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high- or low-frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in System frequency which could be caused by large changes in generation or load, or possibly changes in System impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85 percent is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power System to a Disturbance and is used for analyzing complex power System events. This recording is typically used to capture short-term and long-term Disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency of a sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other Disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general, dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of Disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating

precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment.

Time synchronization accuracy is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

Guideline for Requirement R11:

This requirement directs the applicable entities, upon requests from the Responsible Entity, Regional Entity or NERC, to provide SER and FR data for BES buses determined in Requirement R1 and DDR data for BES Elements determined as per Requirement R5. To facilitate the analysis of BES Disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30-calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor. An entity may request an extension of the 30-day submission requirement. If granted by the requestor, the entity must submit the data within the approved extended time.

Requirement R11, Part 11.2 specifies that the minimum time period of 10-calendar days inclusive of the day the data was recorded for which the data will be retrievable. With the equipment in use that has the capability of recording data, having the data retrievable for the 10-calendar days is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10-calendar day time frame, an incident occurs on Day 1. If a request for data is made on Day 6, then that data has to be provided to the requestor within 30-calendar days after a request or a granted time extension. However, if a request for the

data is made on Day 11, that is outside the 10-calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power System Disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange and is well established in the industry. It is necessary to specify a standard format as multiple submissions of data from many sources will be incorporated to provide a detailed analysis of a power System Disturbance. The latest revision of COMTRADE (C37.111-2013) includes an annex describing the application of the COMTRADE standard to synchophasor data.

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files. The first version was approved in 2007. From the August 14, 2003 blackout there were thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and it was therefore difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and Generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements, which were established in Requirements R1 and R5. The owners are to restore the capability within 90-calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a “reasonable” amount of capability out-of-service does not result in lack of sufficient data for coverage of the System. Furthermore, 90-calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to restore the capability within 90-calendar days, the requirement further provides that, for such cases, the entity submit a Corrective Action Plan (CAP) to the Regional Entity and implement it. These actions are considered to be appropriate to provide for robust and adequate data availability.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Disturbance Monitoring Standard Drafting Team (DMSDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The draft standard was posted for a 45-day formal comment period February 2-March 18, 2009.
5. The project was placed into informal development the fall of 2010.
6. The project was placed into formal development January 2013.
7. Nominations for two additional DMSDT members were solicited April 12 – 25, 2013.
8. Three additional DMSDT members were added May 22, 2013.
9. Industry webinars were held May 22, 2013, June 12, 2014, and August 21, 2014.
10. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.
11. The draft standard was posted for a 45-day concurrent comment and ballot period November 1 – December 16, 2013.
12. The draft standard was posted for a 45-day concurrent comment and ballot period May 9 – June 25, 2014 (ballot was extended to achieve quorum).

Description of Current Draft

This is the fourth draft of the proposed standard and is being posted for stakeholder comments and additional ballot. This draft includes the modifications based on comments submitted by stakeholders.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	September, 2014
Final Ballot	October, 2014
BOT Adoption	November, 2014

Effective Dates

Version	Date	Action	Change Tracking
2.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

When this standard has received ballot approval, the Rationale Boxes will be moved to the Guidelines and Technical Basis Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate analysis of Bulk Electric System (BES) Disturbances.
4. **Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT Interconnection – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.1.4 Quebec Interconnection – Planning Coordinator or Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

Rationale for Functional Entities: When the term “Responsible Entity” is used in PRC-002-2, it specifically refers to those entities listed under 4.1. The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection ~~–~~has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those BES Elements selected. BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

B. Requirements and Measures

R1. Each Transmission Owner shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.

1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.

1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data is required, identified in accordance with PRC-002-2, Attachment 1, and evidence that~~-~~ all BES buses~~-~~ have been re-evaluated within the required intervals under Requirement R1. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

Rationale for R1: Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Attachment 1 provides a uniform methodology to identify those BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a Transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of Transmission Lines and other BES Elements connected to the BES bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on System reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause wide-area or cascading System events, so SER and FR data from those BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment. Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data is required based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and System topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure

sufficient distribution.

BES buses where SER and FR data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses.

Each Transmission Owner must re-evaluate the list of BES buses at least every five calendar years to address System changes since the previous evaluation. Changes to the BES do not mandate immediate inclusion of BES buses into the currently ~~in~~ enforced list, but the list of BES buses will be re-evaluated at least every five calendar years to address System changes since the previous evaluation.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90-calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings; or (3) station drawings.

Rationale for R2:

The intent is to capture SER data for the status (open/close) of the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a time synchronized clock, provides the basis for assembling the detailed sequence of events timeline of a power System Disturbance. Other status monitoring nomenclature can be used for devices other than circuit breakers.

R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltage for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission Lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data that is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R3:

The required electrical quantities may either be directly measured or determinable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all BES bus phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for System Disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer. Generator step-up transformers (GSUs) and leads that connect the GSU transformer(s) to the Transmission System that are used exclusively to export energy directly from a BES generating unit or generating plant are excluded from Requirement R3 because the fault current contribution from a generator to a fault on the Transmission System will be captured by FR data on the Transmission System, and Transmission System FR will capture faults on the generator interconnection.

Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, when required, the Generator Owner is still responsible for the provision of this data.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a total record length of at least 30~~-~~cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. Evidence may include, but is not limited to: (1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power System operations and determination if operations were as intended. System faults generally persist for a short time period, thus a 30 ~~-~~cycle total minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time-synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30 ~~-~~contiguous cycles total.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1 Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following:

5.1.1 Generating resource(s) with:

5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA.

5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1,000 MVA.

5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL).

5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.

5.2 ~~Ensure~~ Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:

5.2.1 One BES Element; and

5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.

5.3 Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested.

5.4 Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3~~, and~~ to implement the re-evaluated list of BES Elements as per the Implementation Plan.

M5. The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for which DDR data is required, developed in accordance with Requirement R5, Part 5.1 and Part 5.2; and re-evaluated in accordance with Part 5.4. The Responsible Entity has dated evidence (electronic or hard copy) that each Transmission Owner or Generator Owner has been notified in accordance with Requirement 5, Part 5.3. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R5:

DDR is used for capturing the BES transient and post-transient response following Disturbances, and the data is used for event analysis and validating System performance. DDR plays a critical role in wide-area Disturbance analysis, and Requirement R5 ensures there is adequate wide-area coverage of DDR data for specific BES Elements to facilitate accurate and efficient event analysis. The Responsible Entity has the best wide-area view of the System and needs to ensure that there are sufficient BES Elements identified for DDR data capture. The identification of BES Elements requiring DDR data as per Requirement R5 is based upon industry experience with wide-area Disturbance analysis and the need for adequate data to facilitate event analysis. Ensuring data is captured for these BES Elements will significantly improve the accuracy of analysis and understanding of why an event occurred, not simply what occurred.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-evaluation of the list is a reasonable interval for this review. Changes to the BES do not mandate immediate inclusion of BES Elements into the in force list, but the list of BES Elements will be re-evaluated at least every five calendar years to address System changes since the previous evaluation. ~~—~~However, this ~~S~~standard does not preclude the Responsible Entity from performing this re-evaluation more frequently to capture updated BES Elements.

The Responsible Entity, for the purposes of this standard, is defined as the PC or RC depending upon Interconnection, because they have the best overall perspective for determining wide-area DDR coverage. The Planning Coordinator and Reliability Coordinator assume different functions across the continent; therefore the Responsible Entity is defined in the Applicability Section and used throughout this standard.

The Responsible Entity must notify all owners of the selected BES Elements that DDR data is required for this ~~S~~standard. The Responsible Entity is only required to share the list of selected BES Elements that each Transmission Owner and Generator Owner respectively owns, not the entire list. This communication of selected BES Elements is required to ensure that the owners of the respective BES Elements are aware of their responsibilities under this standard.

Implementation of the monitoring equipment is the responsibility of the respective Transmission Owners and Generator Owners, the timeline for installing this capability is outlined in the Implementation Plan, and starts from notification of the list from the Responsible Entity. Data for each BES Element as defined by the Responsible Entity must be provided; however, this data can be either directly measured or accurately calculated. With the exception of HVDC circuits, DDR data is only required for one end or terminal of the BES

Elements selected. For example, DDR data must be provided for at least one terminal of a Transmission Line or generator step-up (GSU) transformer, but not both terminals. For an interconnection between two Responsible Entities, each Responsible Entity will consider this interconnection independently, and are expected to work cooperatively to determine how to monitor the BES Elements that require DDR data. For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.

Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified BES Element in Requirement R5, Part 5.1; monitoring these BES Elements with DDR will facilitate thorough and informative event analysis of wide-area Disturbances on the BES. Part 5.2 is included to ensure wide-area coverage across all Responsible Entities. It is intended that each Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous peak System Demand.

R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R6:

DDR is used to measure transient response to System Disturbances during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the BES buses within a location are at the same frequency, one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a BES bus are closed.

R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

Rationale for R7:
A crucial part of wide-area Disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up transformer (GSU) measuring the specified electrical quantities to adequately capture generator response. This standard defines the ‘what’ of DDR, not the ‘how’. Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

8.2 At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recordings and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings.

Rationale for R8:

Large scale System outages generally are an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specification, device configuration, or settings (R9, Part 9.1; R9, Part 9.2); or (2) actual data recordings (R9, Part 9.2).

Rationale for R9:

An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power System Disturbances.

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to~~hat~~ meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.

10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specification, configuration, or setting; (2) time synchronization indication or status; or 3) station drawings.

Rationale for R10:

~~NOTE: The rationale for R10 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.~~

Time synchronization of Disturbance monitoring data is essential for time alignment of large volumes of geographically dispersed records from diverse recording sources. Coordinated Universal Time (UTC) is a recognized time standard that utilizes atomic clocks for generating precision time measurements. All data must be provided in UTC formatted time either with or without the local time offset, expressed as a negative number (the difference between UTC and the local time zone where the measurements are recorded).

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices internal clocks are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.

R11. Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.

11.2 Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor.

11.3 SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2.

11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later.

11.5 Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records; (2) documents describing data storage capability, device specification, configuration or settings; or (3) actual data recordings.

Rationale for R11:

~~NOTE: The rationale for R11 was extensively revised since the last posting. To make reading easier, only the clean version of the language is included here.~~

Wide-area Disturbance analysis includes data recording from many devices and entities. Standardized formatting and naming conventions of these files significantly improves timely analysis.

Providing the data within 30-calendar days (or the granted extension time), subject to Part 11.1, allows for reasonable time to collect the data and perform any necessary computations or formatting.

Data is required to be retrievable for 10-calendar days inclusive of the day the data was recorded, i.e. a 10-calendar day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10-calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requestor of data has to be aware of the Part 11.1 10-calendar day retrievability because requiring data retention for a longer period of time is expensive and unnecessary.

SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve the data format for event records, enabling the use of software tools for analyzing the SER data.

Part 11.4 specifies FR and DDR data files be provided in conformance with IEEE C37.111, IEEE Standard for Common Format for Transient Exchange (COMTRADE), revision 1999 or later. The use of IEEE C37.111-1999 or later is well established in the industry. C37.111-2013 is a version of COMTRADE that includes an annex describing the application of the COMTRADE standard to synchrophasor data; however, version C37.111-1999 is commonly used in the industry today.

Part 11.5 uses a standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), for providing Disturbance monitoring data. This file format allows a streamlined analysis of large Disturbances, and includes critical records such as local time offset associated with the synchronization of the data.

R12. Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- Restore the recording capability, or
- Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date ~~of~~ the data recording was restored, (3) SCADA records, or (4) dated CAP transmittals to the Regional Entity and evidence that it implemented the CAP.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90-calendar days to ensure that adequate data is available for event analysis. If the Disturbance monitoring capability cannot be restored within 90-calendar days (e.g. budget cycle, service crews, vendors, needed outages, etc.), the entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. It is treated as a failure if the recording capability is out of service for maintenance and/or testing for greater than 90-calendar days. An outage of the monitored BES Element does not constitute a failure of the Disturbance monitoring capability.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Table of Compliance Elements

Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for sequence of events recording (SER) and Fault recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1,500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20 percent.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1,500 MVA or
- 20 percent of median MVA level determined in Step 5.

Step 7. If there are no BES buses on the list: the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

If the list has 1 or more but less than or equal to 11 BES buses: FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.

If the list has more than 11 BES buses: SER and FR data is required on at least the 10 percent of the BES buses determined in Step 6 with the highest maximum

available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20 percent of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for SER and FR data. The following BES bus locations are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident Transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

PRC-002-2 addresses "what" data is recorded, not "how" it is recorded.

Guideline for Requirement R1:

Sequence of events and fault recording for the analysis, reconstruction, and reporting of System Disturbances is important. However, SER and FR data is not required at every BES bus on the BES to conduct adequate or thorough analysis of a Disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuits allows the precise reconstruction of events of both localized and wide-area Disturbances.

More quality information is always better than less when performing event analysis. However, 100 percent coverage of all BES Elements is not practical nor required for effective analysis of wide-area Disturbances. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses with breakers where crucial information is available when required.
2. Avoid excessive overlap of coverage.
3. Avoid gaps in critical coverage.
4. Provide coverage of BES Elements that could propagate a Disturbance.
5. Avoid mandates to cover BES Elements that are more likely to be a casualty of a Disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of Transmission Lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of Transmission Systems throughout the continent to analyze Transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause Cascading.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater System impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for Systems with more than 11 BES buses with three phase short circuit levels above 1,500 MVA.

1. Total number of BES buses in the Transmission System under evaluation.
   a. Only tangible substation or switchyard buses are included.
   b. Pseudo buses created for analysis purposes in System models are excluded.
2. Determine the three phase short circuit MVA for each BES bus.
3. Exclude BES buses from the list with short circuit levels below 1,500 MVA.
4. Determine the median short circuit for the top 11 BES buses on the list (position number 6).
5. Multiply median short circuit level by 20 percent.
6. Reduce the list of BES buses to those with short circuit levels higher than 20 percent of the median.
7. Apply SER and FR at BES buses with short circuit levels in the top 10 percent of the list (from 6).
8. Apply SER and FR at BES buses at an additional 10 percent of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
   - Electrically distant BES buses or electrically distant from other DME devices

- Voltage sensitive areas
- Cohesive load and generation zones
- BES buses with a relatively high number of incident Transmission circuits
- BES buses with reactive power devices
- Major facilities interconnecting outside the Transmission Owner's area.

For event analysis purposes, more valuable information is attained about generators and their response to System events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The re-evaluation interval of five years was chosen based on the experience of the DMSDT to address changing System configurations while creating balance in the frequency of re-evaluations.

Guideline for Requirement R2:

Analyses of wide-area Disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the Disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. However, generator breakers directly connected to an identified BES bus are required to have SER data captured. It is important in event analysis to know when a BES bus is cleared regardless of a generator's loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's BES bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The BES Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission Lines

Only those BES Elements that are identified as BES as defined in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100~~-~~kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step-up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the Transmission System will be captured by FR data on the Transmission System.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the Transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities
For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings
The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a Transmission System is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:
$\mathbf{I}_r = 3\bullet\mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings
Voltages are to be recorded or accurately determined at applicable BES buses.

Guideline for Requirement R4:

Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection System operations after a fault to determine if a protection System operated as designed. Generally speaking, BES faults persist for a very short time period, approximately 1 to 30 cycles, thus a 30-~~-~~cycle record length provides adequate data. Multiple records allow for legacy microprocessor relays which, when time synchronized to a common clock, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30~~-~~-contiguous cycles total.

A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for FR.

FR triggers can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, sub-Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, sub-Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area Disturbance monitoring to determine the System's electromechanical transient and post-transient response and validate System model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the System's dynamic response and ensuring sufficient coverage to determine System performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historical simultaneous peak System Demand. This DDR data is included to provide adequate System wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a Disturbance helps the analysis of large Disturbances. Having data regarding generator dynamic response to Disturbances greatly improves understanding of ***why*** an event occurs rather than what occurred. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.

- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.

The information in the spreadsheet does not provide information by which the plant information location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, sub-Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings “greater than or equal to 500 MVA”. The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47 percent of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5 percent of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, sub-Part 5.1.1 is included to capture larger units located at large generating plants which could pose a stability risk to the System if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1,000 MVA. The 300 MVA threshold was chosen based on the DMSDT’s judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. For combined cycle plants where only one generator has a rating greater than or equal to 300MVA, that is the only generator that would need DDR.

Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability have a significant impact on BES reliability and performance. Therefore, at least one BES Element of an SOL should be monitored.

The draft standard requires “One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs).” Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored BES Element(s) and contingent BES Element(s). The standard does not dictate selection of the contingent and/or monitored BES Elements. Rather the Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area’s response to large System excursions (voltage, frequency, etc.).

Guideline for Requirement R6:

DDR data shows transient response to System Disturbances after a fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the s~~S~~tandard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available. For example, a breaker-and-a-half or double-bus configuration with a North (or East) Bus and South (or West) Bus, would require both buses to have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current recording is also acceptable.

For all circuits where current recording is required, Real and Reactive Power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6 apply to Requirement R7. Since either the high- or low-side windings of the generator step-up transformer (GSU) may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for Requirement R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Wide-area System outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This

drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high- or low-frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in System frequency which could be caused by large changes in generation or load, or possibly changes in System impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85 percent is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power System to a Disturbance and is used for analyzing complex power System events. This recording is typically used to capture short-term and long-term Disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency of a sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other Disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general, dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of Disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating

precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment.

Time synchronization accuracy is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

"Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…"

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

Guideline for Requirement R11:

This requirement directs the applicable entities, upon requests from the Responsible Entity, Regional Entity or NERC, to provide SER and FR data for BES buses determined in Requirement R1 and DDR data for BES Elements determined as per Requirement R5. To facilitate the analysis of BES Disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30-calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor. An entity may request an extension of the 30-day submission requirement. If granted by the requestor, the entity must submit the data within the approved extended time.

Requirement R11, Part 11.2 specifies that the minimum time period of 10-calendar days inclusive of the day the data was recorded for which the data will be retrievable. With the equipment in use that has the capability of recording data, having the data retrievable for the 10-calendar days is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10-calendar day time frame, an incident occurs on Day 1. If a request for data is made on Day 6, then that data has to be provided to the requestor within 30-calendar days after a request or a granted time extension. However, if a request for the

data is made on Day 11, that is outside the 10-calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power System Disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange and is well established in the industry. It is necessary to specify a standard format as multiple submissions of data from many sources will be incorporated to provide a detailed analysis of a power System Disturbance. The latest revision of COMTRADE (C37.111-2013) includes an annex describing the application of the COMTRADE standard to synchophasor data.

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files. The first version was approved in 2007. From the August 14, 2003 blackout there were thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and it was therefore difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and Generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements, which were established in Requirements R1 and R5. The owners are to restore the capability within 90-calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a "reasonable" amount of capability out-of-service does not result in lack of sufficient data for coverage of the System. Furthermore, 90-calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to restore the capability within 90-calendar days, the requirement further provides that, for such cases, the entity submit a Corrective Action Plan (CAP) to the Regional Entity and implement it. These actions are considered to be appropriate to provide for robust and adequate data availability.

Implementation Plan

Project 2007-11 Disturbance Monitoring

Requested Approvals

- PRC-002-2 Disturbance Monitoring and Reporting Requirements

Requested Retirements

- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals

- None

Applicable Entities

- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary

- None

Background

The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES.
2. A significant amount of sequence of events recording (SER), fault recording (FR), and dynamic Disturbance recording (DDR) capability already exists on the BES. The monitoring requirements in this standard align with industry practices. Therefore, many existing recordings can satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses they own. Therefore, six (6) months is adequate time for generating the list of BES buses following the methodology described in Attachment 1 (for Requirement R1).

4. Responsible entities have the relevant data and information pertaining to the BES Elements requiring DDR and six (6) months is adequate time for working with any affected entities and generating the list of BES Elements.
5. The nine (9) month time period for R12 includes the six (6) month implementation for R1 and R5, and a three (3) month additional time period to make notifications. The nine (9) months for R12 implementation is reasonable for the contents of that requirement.
6. A total percentage of BES buses and BES Elements established in Requirements R1 and R5 respectively are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many monitoring requirements will become compliant without significant changes to recording capability.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the entities.
8. Implementation of Disturbance monitoring recording following changes to the system are addressed by following re-evaluation of the lists as per Requirement R1 and Requirement R5.
9. Implementing SER, FR, and DDR capability may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners probably will have more BES Elements requiring SER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes scheduling outages into account.
10. An entity owning only one (1) identified BES bus, BES Element, or generating unit is allowed six (6) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or capability that could impact implementation timelines for the respective entities.

General Considerations

Each Transmission Owner and Generator Owner subject to PRC-018-1 shall maintain the ability to provide Disturbance monitoring data using current methods required by PRC-018-1 until the entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities with regard to their current Disturbance data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the effective date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance monitoring and reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the effective date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100 percent compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100 percent compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50 percent compliant within four (4) years of the effective date of PRC-002-2 and fully compliant within six (6) years of the effective date.

Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the effective date.

Entities shall be 100 percent compliant with a re-evaluated list from Requirement R1 or R5 within three (3) years following the notification by the TO or the Responsible Entity that re-evaluated the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the appropriate regional standards development process.

- PRC-002-2 Requirement R3 stipulates data must be captured by FR to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of DDR data for HVDC. PRC-002-NPCC-01 does not specify HVDC for DDR.
- PRC-002-2 Requirement R8 recognizes DDR that is not continuous, and includes triggering data for DDR that is not continuous. PRC-002-NPCC-01 stipulates that dynamic Disturbance recorders installed after that standard was approved have to be continuous, but does not address legacy devices.

The DMSDT developed this Excel Workbook is designed to assist Transmission Owners in using the Median Method for determining monitoring bus locations for Fault Recording and Sequence of Events Recording on their individual systems.

Instructions for use:

For Transmission Owners Only:

1	Organize your short circuit data in the format shown on the Data Input worksheet
2	Your short circuit data should use three phase short circuit with your selected pre-fault voltage
3	Your short circuit data should be ordered from highest three phase short circuit MVA value to lowest three phase short circuit MVA value for all buses greater than 100 kV
4	Your short circuit data should either eliminate or commonly identify non-real buses, zero buses, pseudo buses, or buses which are used for modeling purposes only, by using a common designation for all these type buses that can be eliminated from the Median calculation. It is most common to identify these non-real buses with the number "0" in the bus coded number field.
5	The Data Input Worksheet is designed to have you copy your properly formatted and sorted three phase MVA short circuit data into rows starting at column A row 6 of the worksheet.
6	Data Input, Col. F, is the most important column, it must have the three phase MVA short circuit data values, sorted from highest MVA to lowest MVA. The MVA values in column F, as sorted from highest to lowest MVA, should include all voltage levels greater than or equal to 100 kV.
7	Once you input all of your short circuit data into the Data Input worksheet starting at Column A Row 6, the values in cells B2, B3 and B4 should all be equal. These values should equal the number of rows of short circuit data that you have input. Copy Cell B2 using Cntrl C, then Paste Value, Special value only, back into Cell B2. This should be the total number of rows contained in the data set.
8	If you have zero numbered buses, or pseudo buses, commonly identified by say a number 0 in the bus coded number column, then you need to determine the number of zero numbered buses that are included in this data set.
9	For you to be able to determine this zero bus coded number, you need to select your entire data set, including the header row, from column / row A5 to G___(last row of data). As an example, if your data contains 100 rows, then your highlighted area for sorting and filtering should be A5 to G105. Then using the sort filter command, turn on Filter
10	Once the Filter is on, go to the bus coded number column, pull down the Filter and select only the zero bus coded number rows. The values in cells B3, and B4 should now be equal and indicate the number of zero numbered buses in your data set.
11	We want to store the zero numbered bus rows (number) into cell B4 as a value. To do this, select Cell B4, hit Cntrl C, then hit paste special, value only. This now repalces the formula in Cell B4 with the value of zero buses in the data set.
12	Now we wish to eliminate the zero bus rows from the rest of our data processing, so in the bus coded number column, we want to filter out the zero bus rows, so we reverse the pull down selection by selecting all rows, except the zero bus coded numbered rows. Leave this Filter in place for the rest of the Median method process.
13	If Cell B4 contains the number zero, then Cell F2 should now contain the 6th value down from the highest short circuit MVA value, and Cell G2 should contain 20% of the Cell F2 value. If Cell F2's value is greater than 1500 MVA this is the new lowest MVA value to be used to determine the number of Median selected buses. If the value in F2 is less than 1500 MVA, then we will use 1500 MVA as the lowest value to select the number of Median buses.
14	If Cell B4 contains a value greater than zero, then Cell F2 needs to be replaced with the MVA value contained in the 11th row, column F of the filtered data set. If the value in F2 is less than 1500 MVA then we will use 1500 MVA as the lowest value to select the number of Median buses.
15	With the Filter still applied to our data set, and zero buses deselected, we will need to use the F2 value to apply as the value used for the MVA column pull down.
16	Using Column F, MVA value pull down, use the Number Filter function, greater than or equal to the F2 value. With this Filter F2 number value applied, now Cntrl C Cell C2, and replace C2 with paste special, value only. This now is the number of buses selected by the Median method.
17	You are Finished!!! The number in Cell C2 indicates the number of Median method selected buses, D2 contains the number of total FR and SOER locations, E2 shows the number of FR / SOER for the Top 10% buses and F2 shows the number of FR / SOER for the Distributed 10% buses.
Notes:	Example 1 (Ex 1 without zero buses) is an additional worksheet shown for a system that does not contains any zero buses. All zero bus entries have been eliminated from the data set.
Notes:	Example 2 (Ex 2 with zero buses) is an additional worksheet shown for a system that contains zero buses. Note for a system that contains zero buses, you must observe the row 11, column F MVA value, and place it into Cell F2. In example 2, this MVA value is equal to 5685 MVA, based on the data set provided.

A. Introduction

1. **Title:** **Define Regional Disturbance Monitoring and Reporting Requirements**
2. **Number:** PRC-002-1
3. **Purpose:** Ensure that Regional Reliability Organizations establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of Disturbance data to facilitate analyses of events and verify system models.
4. **Applicability**

   4.1. Regional Reliability Organization.
5. **Effective Date:** Nine months after BOT adoption.

B. Requirements

R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:

R1.1. Location, monitoring and recording requirements, including the following:

R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R1.1.2. Devices to be monitored.

R2. The Regional Reliability Organization shall establish the following installation requirements for fault recording:

R2.1. Location, monitoring and recording requirements, including the following:

R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R2.1.2. Elements to be monitored at each location.

R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R2.1.3.1. Three phase to neutral voltages.

R2.1.3.2. Three phase currents and neutral currents.

R2.1.3.3. Polarizing currents and voltages, if used.

R2.1.3.4. Frequency.

R2.1.3.5. Megawatts and megavars.

R2.2. Technical requirements, including the following:

R2.2.1. Recording duration requirements.

R2.2.2. Minimum sampling rate of 16 samples per cycle.

R2.2.3. Event triggering requirements.

R3. The Regional Reliability Organization shall establish the following installation requirements for dynamic Disturbance recording:

R3.1. Location, monitoring and recording requirements including the following:

R3.1.1. Criteria for equipment location giving consideration to the following:

- Site(s) in or near major load centers
- Site(s) in or near major generation clusters
- Site(s) in or near major voltage sensitive areas
- Site(s) on both sides of major transmission interfaces
- A major transmission junction
- Elements associated with Interconnection Reliability Operating Limits
- Major EHV interconnections between control areas
- Coordination with neighboring regions within the interconnection

R3.1.2. Elements and number of phases to be monitored at each location.

R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R3.1.3.1. Voltage, current and frequency.

R3.1.3.2. Megawatts and megavars.

R3.2. Technical requirements, including the following:

R3.2.1. Capability for continuous recording for devices installed after January 1, 2009.

R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.

R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following:

R4.1. Criteria for events that require the collection of data from DMEs.

R4.2. List of entities that must be provided with recorded Disturbance data.

R4.3. Timetable for response to data request.

R4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE[1] analysis tool,

R4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files[2].

R4.6. Data content requirements and guidelines.

---

[1] IEEE C37.111-1999 IEEE Standard Common Format for Transient Data Exchange for Power Systems or its successor standard

[2] Compliance with this requirement is not effective until the IEEE Standard is approved.

R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.

R6. The Regional Reliability Organization shall periodically (at least every five years) review, update and approve its Regional requirements for Disturbance monitoring and reporting.

C. Measures

M1. The Regional Reliability Organization's requirements for the installation of Disturbance Monitoring Equipment shall address Requirements 1 through 3.

M2. The Regional Reliability Organization's Disturbance monitoring data reporting requirements shall include all elements identified in Requirements 4.

M3. The Regional Reliability Organization shall have evidence it provided its Regional Disturbance monitoring and reporting requirements as required in Requirement 5.

M4. The Regional Reliability Organization shall have evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its DME requirements for three years.

The Compliance Monitor will retain its audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through providing its documentation of Disturbance Monitoring and Reporting requirements or self-certification as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exist:

2.1.1 Disturbance data reporting requirements were not specified as required in R4.1 through R4.6.

2.1.2 No evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in R6.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions exist:

2.2.1 Technical requirements were not specified for one or more types of DMEs.

2.2.2 Requirements do not provide criteria for equipment location or criteria for monitored elements or monitored quantities as required R1, R2 and R3.

2.3. **Level 3:** Not applicable.

2.4. **Level 4:** Disturbance monitoring and reporting requirements were not available or were not provided to Transmission Owners and Generator Owners.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. **Title:** **Disturbance Monitoring Equipment Installation and Data Reporting**

2. **Number:** PRC-018-1

3. **Purpose:** Ensure that Disturbance Monitoring Equipment (DME) is installed and that Disturbance data is reported in accordance with regional requirements to facilitate analyses of events.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Generator Owner.

5. **Effective Dates:** Phased in over four years after BOT adoption:

   Requirements 1 and 2:

   – 50% compliant two years after initial issuance of regional requirements per RELIABILITY STANDARD PRC-002 Requirement 5.

   – 75% compliant three years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   – 100% compliant four years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   Requirements 3 through 6:

   – 100% compliant six months after BOT adoption for already installed DME.

   – 100% compliant six months after installation for DMEs installed to meet Regional Reliability Organization requirements per reliability standard PRC-002 Requirements 1, 2 and 3.

B. Requirements

R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard PRC-002 Requirements 1-3) shall have DMEs installed that meet the following requirements:

R1.1. Internal Clocks in DME devices shall be synchronized to within 2 milliseconds or less of Universal Coordinated Time scale (UTC)

R1.2. Recorded data from each Disturbance shall be retrievable for ten calendar days..

R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization's installation requirements (reliability standard PRC-002 Requirements 1 through 3).

R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1):

R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder).

R3.2. Make and model of equipment.

R3.3. Installation location.

R3.4. Operational status.

R3.5. Date last tested.

R3.6. Monitored elements, such as transmission circuit, bus section, etc.

R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc.

R3.8. Monitored electrical quantities, such as voltage, current, etc.

R4. The Transmission Owner and Generator Owner shall each provide Disturbance data (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard PRC-002 Requirement 4).

R5. The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years.

R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:

R6.1. Maintenance and testing intervals and their basis.

R6.2. Summary of maintenance and testing procedures.

C. Measures

M1. The Transmission Owner and Generator Owner shall each have evidence that DMEs it is required to have meet the functional requirements specified in Requirement 1 and are installed in accordance with its associated Regional Reliability Organization's requirements (R2).

M2. The Transmission Owner and Generator Owner shall each maintain the data listed in Requirements 3.1 through 3.8 for the DMEs installed to meet its Regional Reliability Organization's DME installation requirements.

M2.1 The Transmission Owner and Generator Owner shall each have evidence it provided this DME data to its Regional Reliability Organization within 30 calendar days of a request.

M3. The Transmission Owner and Generator Owner shall each have evidence it retained and provided recorded Disturbance data to entities in accordance with its associated Regional Reliability Organization's Disturbance data reporting requirements. (R4 R5)

M4. Each Transmission Owner and Generator Owner that is required to install DMEs to meet its Regional Reliability Organization's DME installation requirements, shall have an associated DME maintenance and testing program as defined in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner and Generator Owner shall each retain any Disturbance data provided to the Regional Reliability Organization (Requirement 4) for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner and Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if any of the following conditions is present:

2.1.1 DMEs that meet all the Regional Reliability Organization's installation requirements (in accordance with Requirement 2) were installed at 90% or more but not all of the required locations.

2.1.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with Requirement 4) was provided for 90% or more but not all of the required locations.

2.1.3 Data on required DMEs was incomplete (in accordance with R3)

2.1.4 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, but records indicate maintenance and testing did occur within the identified intervals for the portions of the program that were documented.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions is present:

2.2.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 80% or more but less than 90% of the required locations.

2.2.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 80% or more but less than 90% of the required locations.

2.2.3 Recorded Disturbance data was not provided to all required entities (in accordance with R4)

2.2.4 Archived data was not retained for three years (in accordance with Requirement 5).

2.2.5 Documentation of the DME maintenance and testing program provided was complete as required in R6, but records indicate that maintenance and testing did not occur within the defined intervals.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions is present:

2.3.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 70% or more but less than 80% of the required locations.

2.3.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 70% or more but less than 80% of the required locations.

2.3.3 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, and records indicate implementation of the documented portions of the maintenance and testing program did not occur within the identified intervals.

2.4. Level 4: There shall be a level four non-compliance if any one of the following conditions is present:

2.4.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at less than 70% of the required locations.

2.4.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for less than 70% of the required locations.

2.4.3 DMEs that meet all functional requirements (in accordance with R1) were not installed at all required locations.

2.4.4 Documentation of the DME maintenance and testing program was not provided, or no evidence that the testing program did occur within the identified intervals

E. Regional Differences

None identified.

Consideration of Issues and Directives

Project 2007-11 Disturbance Monitoring
PRC-002-2 Disturbance Monitoring and Reporting Requirements

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"For the reasons stated in the NOPR, the Commission will not approve or remand PRC-002-1." "We agree with [American Public Power Association], Alcoa and Otter Tail that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA, Alcoa and Otter Tail's suggestions in the Reliability Standards development process as it modifies PRC-002-1 to provide missing information needed for the Commission to act on this Reliability Standard." (see below for American Public Power Association, Alcoa, and Otter Tail discussion)	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1455-56	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances. The use of recording and specifying recording data parameters, greater consistency is achieved in PRC-002-2.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in addressing the completion of this Reliability Standard."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1452	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances.
"Alcoa suggests that the ERO—instead of a Regional Entity—should define the requirements for DME and the type of report it generates. The requirements and equipment specifications should be consistent throughout North America. In addition, Alcoa suggests that the criteria for installation of such equipment should include the necessary monitoring and recording that contribute to analysis and enhance reliability."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1453	Determines the key locations for which Disturbance data must be recorded which eliminates the need for equipment requirements. PRC-002-2 specifies the storage requirements and recording format for the collected data to ensure continent-wide uniformity to expedite event analysis.
"Otter Tail suggests that PRC-002-1 should be developed on an Interconnection wide basis to ensure consistency and promote reliability of the Bulk-Power System."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards	PRC-002-2 will apply on a continent-wide basis.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
	for the Bulk-Power System (Issued March 16, 2007); Paragraph 1454	
"The Commission requires supplemental information for any Reliability Standard that currently requires a regional reliability organization to fill in missing criteria or procedures. Where important information has not yet been provided to us to enable us to complete our review, we are not in a position to approve or remand those Reliability Standards. Accordingly, we will not approve or remand such Reliability Standards until the ERO submits further information. Until such information is provided, compliance with fill-in-the-blank standards should continue on a voluntary basis, and the Commission considers compliance with such Reliability Standards to be a matter of good utility practice."	Fill-in-the-blank Consideration FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 297.	By addressing recording instead of equipment, the Drafting Team has produced a continent-wide standard to have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

Project 2007-11 – Disturbance Monitoring

PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying data instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

Standard PRC-018-1 (To be Retired) **FERC Approved**	**Proposed Standard PRC-002-2**
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements:	**R10.** Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset. 10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**R11.** Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1** Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded. **11.2** Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor. **11.3** SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2. **11.4** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later. **11.5** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.
Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R10 and R11.	

<table>
<tr><th>Standard PRC-018-1 (To be Retired)
FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td colspan="2">PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R11.</td></tr>
<tr><td>R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization’s installation requirements (reliability standard PRC-002 Requirements 1 through 3).

PRC-002-1
R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:
R1.1. Location, monitoring and recording requirements, including the following:

R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).
R1.1.2. Devices to be monitored</td><td>R1. Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.
1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.
1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns</td></tr>
</table>

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2.Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation	connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **3.1** Phase-to-neutral voltage for each phase of each specified BES bus. **3.2** Each phase current and the residual or neutral current for the following BES Elements: **3.2.1** Transformers that have a low-side operating voltage of 100kV or above. **3.2.2** Transmission Lines. **R4.** Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point, or • At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder. **4.2** A minimum recording rate of 16 samples per cycle. **4.3** Trigger settings for at least the following: **4.3.1** Neutral (residual) overcurrent. **4.3.2** Phase undervoltage or overcurrent.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
requirements for **dynamic Disturbance recording**: R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following:	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	**5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan. R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **6.1** One phase-to-neutral or positive sequence voltage. **6.2** The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. **6.3** Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required. **6.4** Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for wich it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

<table>
<tr><th>Standard PRC-018-1 (To be Retired)

<tr><td></td><td>
7.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level.
7.2. The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.
7.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required.
7.4. Frequency of at least one of the voltages in Requirement R7, Part 7.1.
R8. Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
8.1. Triggered record lengths of at least three minutes.
8.2. At least one of the following three triggers:
Off nominal frequency trigger set at:
<table>
<tr><th></th><th>Low</th><th>High</th></tr>
<tr><td>o Eastern Interconnection</td><td><59.75 Hz</td><td>>61.0 Hz</td></tr>
<tr><td>o Western Interconnection</td><td><59.55 Hz</td><td>>61.0 Hz</td></tr>
<tr><td>o ERCOT Interconnection</td><td><59.35 Hz</td><td>>61.0 Hz</td></tr>
<tr><td>o Hydro-Quebec Interconnection</td><td><58.55 Hz</td><td>>61.5 Hz</td></tr>
</table>
</td></tr>

each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1): R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder). R3.2. Make and model of equipment. R3.3. Installation location. R3.4. Operational status. R3.5. Date last tested. R3.6. Monitored elements, such as transmission circuit, bus section, etc. R3.7. Monitored devices, such as circuit breaker,	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
disconnect status, alarms, etc. R3.8.Monitored electrical quantities, such as voltage, current, etc.	
Notes: PRC-018-1, Requirement R3 is not covered in PRC-002-2. PRC-018-1 Requirement R3 refers to equipment and therefore is not mapped to PRC-002-2 which deals with recorded data and not equipment.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R4. The Transmission Owner and Generator Owner shall each **provide Disturbance data** (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard **PRC-002 Requirement 4**). **PRC-002-1** R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool.	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R11.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2 Evidence Retention** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years. The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years. The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years. The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years. If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:	**R12.** Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the SER, FR or DDR data either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* • Restore the recording capability, or • Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R6.1. Maintenance and testing intervals and their basis. R6.2. Summary of maintenance and testing procedures.	
Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R12. PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R12 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data;

Standard PRC-002-1	Proposed Standard PRC-002-2
R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R2. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1;

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements they own connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltage for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission Lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include:

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	• A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent.
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

Standard PRC-002-1	Proposed Standard PRC-002-2
consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored	**5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element **5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan. **R6.** Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notifications as identified in

Standard PRC-002-1	Proposed Standard PRC-002-2
element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. **R8.** Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified as per Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz

Standard PRC-002-1	Proposed Standard PRC-002-2
	o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-002-1, Requirement R3 is covered in PRC-002-2, Requirements R5-R6 and R8-R9.	
R4. The Regional Reliability Organization shall establish requirements for facility owners	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per

Standard PRC-002-1	Proposed Standard PRC-002-2
to **report Disturbance data recorded** by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool, 4.5. Naming of data files in conformance with the IEEE	Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-002-1	Proposed Standard PRC-002-2
C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	
Notes: PRC-002-1, Requirement R4 is covered in PRC-002-2, Requirement R13.	
R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R5 is covered in PRC-002-2, Requirements R2, R6-R7.	
R6. The Regional Reliability Organization shall periodically (**at least every five years**) review, update and approve its Regional requirements for Disturbance monitoring and reporting.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R5.	

Project 2007-11 – Disturbance Monitoring

PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying data instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements:	**R10.** Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to~~hat~~ meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset. 10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**R11.** Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1** Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded. **11.2** Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor. **11.3** SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2. **11.4** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later. **11.5** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.
Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R10 and R11.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R11.	
R2. The Transmission Owner and Generator Owner shall each **install DMEs in accordance with** its Regional Reliability Organization's installation requirements (reliability standard **PRC-002 Requirements 1 through 3**). **PRC-002-1** R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following: R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	**R1.** Each Transmission Owner shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1. 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data. 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2.Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation	connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **3.1** Phase-to-neutral voltage for each phase of each specified BES bus. **3.2** Each phase current and the residual or neutral current for the following BES Elements: **3.2.1** Transformers that have a low-side operating voltage of 100kV or above. **3.2.2** Transmission Lines. **R4.** Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point, or • At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder. **4.2** A minimum recording rate of 16 samples per cycle. **4.3** Trigger settings for at least the following: **4.3.1** Neutral (residual) overcurrent. **4.3.2** Phase undervoltage or overcurrent.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
requirements for **dynamic Disturbance recording**: R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following:	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** ~~Ensure~~Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	**5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3~~, and~~ to implement the reevaluated list of BES Elements as per the Implementation Plan. R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **6.1** One phase-to-neutral or positive sequence voltage. **6.2** The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. **6.3** Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required. **6.4** Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for wich it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	7.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level. 7.2. The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current. 7.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 7.4. Frequency of at least one of the voltages in Requirement R7, Part 7.1. R8. Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	• Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-018-1, Requirement R2 and PRC-002-1 Requirements R1-R3 are covered in PRC-002-2, Requirements R1-R9. PRC-018-1, Requirement R2 references PRC-002-1 Requirements R1-R2. PRC-002-1, Requirements R1-R3 reference equipment installation requirements for FR, SER, and DDR. The technical parameters of PRC-002-2 pertain to the characteristics and content of the recordings that are needed to facilitate event analysis.	
R3. The Transmission Owner and Generator Owner shall	None.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1): R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder). R3.2. Make and model of equipment. R3.3. Installation location. R3.4. Operational status. R3.5. Date last tested. R3.6. Monitored elements, such as transmission circuit, bus section, etc. R3.7. Monitored devices, such as circuit breaker,	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
disconnect status, alarms, etc. R3.8.Monitored electrical quantities, such as voltage, current, etc.	
Notes: PRC-018-1, Requirement R3 is not covered in PRC-002-2. PRC-018-1 Requirement R3 refers to equipment and therefore is not mapped to PRC-002-2 which deals with recorded data and not equipment.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R4. The Transmission Owner and Generator Owner shall each **provide Disturbance data** (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard **PRC-002 Requirement 4**). **PRC-002-1** R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool.	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R11.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2 Evidence Retention** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years. The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years. The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years. The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years. If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:	**R12.** Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the SER, FR or DDR data either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* • Restore the recording capability, or • Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

<table>
<tr><th>Standard PRC-018-1 (To be Retired)
FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td>R6.1. Maintenance and testing intervals and their basis.

R6.2. Summary of maintenance and testing procedures.</td><td></td></tr>
<tr><td colspan="2">Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R12.

PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R12 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.</td></tr>

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data;

Standard PRC-002-1	Proposed Standard PRC-002-2
R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R2. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1;

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements they own connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltage for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission Lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include:

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	• A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent.
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

Standard PRC-002-1	Proposed Standard PRC-002-2
consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored	**5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element **5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to~~, and~~ implement the reevaluated list of BES Elements as per the Implementation Plan. **R6.** Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notifications as identified in

Standard PRC-002-1	Proposed Standard PRC-002-2
element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. **R8.** Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified as per Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz

Standard PRC-002-1	Proposed Standard PRC-002-2
	o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-002-1, Requirement R3 is covered in PRC-002-2, Requirements R5-R6 and R8-R9.	
R4. The Regional Reliability Organization shall establish requirements for facility owners	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per

Standard PRC-002-1	Proposed Standard PRC-002-2
to **report Disturbance data recorded** by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool, 4.5. Naming of data files in conformance with the IEEE	Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-002-1	Proposed Standard PRC-002-2
C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	
Notes: PRC-002-1, Requirement R4 is covered in PRC-002-2, Requirement R13.	
R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to~~, and~~ implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R5 is covered in PRC-002-2, Requirements R2, R6-R7.	
R6. The Regional Reliability Organization shall periodically (**at least every five years**) review, update and approve its Regional requirements for Disturbance monitoring and reporting.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to~~, and~~ implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R5.	

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5-calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 80% but less than 100% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by 30-calendar days or less. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by 10-calendar days or less.
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 70% but less than or equal to 80% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 30-calendar days and less than or equal to 60-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 10-calendar days but less than or equal to 20-calendar days.
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 60% but less than or equal to 70% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 60-calendar days and less than or equal to 90-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 20-calendar days but less than or equal to 30-calendar days.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for less than or equal to 60% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 90-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying one or more other owners by greater than 30-calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R1	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R2	
Proposed VRF	**Lower**
NERC VRF Discussion	R2 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2 provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 80% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 70% but less than or equal to 80% of the total SER

VRF and VSL Justifications – PRC-002-2, R2	
	data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 60% but less than or equal to 70% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R2 for less than or equal to 50% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3	
Proposed VRF	**Lower**
NERC VRF Discussion	R3 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R3 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 80% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 70% but less than or equal to 80% of the total set of required electrical quantities, which is the product of the total number of monitored BES

VRF and VSL Justifications – PRC-002-2, R3	
	Elements and the number of specified electrical quantities per each Element.
Proposed High VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 60% but less than or equal to 57% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers less than or equal to 60% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4	
Proposed VRF	**Lower**
NERC VRF Discussion	R4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data that meets more than 80% but less than 100% of the total recording properties as specified in Requirement R4.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data that meets more than 70% but less than or equal to 80% of the total recording properties as specified in Requirement R4.

VRF and VSL Justifications – PRC-002-2, R4	
Proposed High VSL	The Transmission Owner or Generator Owner had FR data that meets more than 60% but less than or equal to 70% of the total recording properties as specified in Requirement R4.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data that meets less than or equal to 60% of the total recording properties as specified in Requirement R4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R5 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5 contains only one objective which identifies BES Elements within specified criteria and to review the list every 5-calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity identified the Elements for which DDR data is required as directed by Requirement R5 for more than 80% but less than 100% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by 30-calendar days or less. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by 10-calendar days or less.
Proposed Moderate VSL	The Responsible Entity identified the Elements for which DDR is required as directed by Requirement R5 for more than 70% but less than or equal to 80% of the required Elements included in Part 5.1. OR The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 30-calendar days and less than or equal to 60-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 10-calendar days but less than or equal to 20-calendar days.
Proposed High VSL	The Responsible Entity identified the Elements for which DDR data is requires as directed by Requirement R5 for more than 60% but less than or equal to 70% of the required Elements included in Part 5.1. OR The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 60-calendar days and less than or equal to 90-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 20-calendar days but less than or equal to 30-calendar days.
Proposed Severe VSL	The Responsible Entity identified the Elements for which DDR data is required as directed by Requirement R5 for less than or equal to 60% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 90-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying one or more owners by greater than 30-calendar days. OR The Responsible Entity failed to ensure a minimum DDR coverage per Part 5.2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R5	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R6	
Proposed VRF	**Lower**
NERC VRF Discussion	R6 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R6 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R6 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R6	
Proposed Lower VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 that covered more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Transmission Owner failed to have DDR data as directed by Requirement R6, Parts 6.1 through 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R6	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7	
Proposed VRF	**Lower**
NERC VRF Discussion	R7 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R7	
Proposed Lower VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 that covers more than 80% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 70% but less than or equal to 80% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 60% but less than or equal to 70% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Generator Owner failed to have DDR data as directed by Requirement R7, Parts 7.1 through 7.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R7 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R7	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
Proposed VRF	**Lower**
NERC VRF Discussion	R8 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes the need for continuous data recording and storage for Dynamic Disturbance Recordings established in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R8 contains only one objective to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R6. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R8	
Proposed Lower VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 80% but less than 100% of the Elements they own as determined in Requirement R5.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 70% but less than or equal to 80% of the Elements they own as determined in Requirement R5.
Proposed High VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 6% but less than or equal to 70% of the Elements they own as determined in Requirement R5.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have continuous or non-continuous DDR data, as directed in Requirement R8, for the Elements they own as determined in Requirement R5.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R8	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R9	
Proposed VRF	**Lower**
NERC VRF Discussion	R9 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R9 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement established technical specifications for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish technical specifications for Dynamic Disturbance Recording selected in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R9 contains only one objective which is to establish technical specifications for Dynamic Disturbance Recording selected in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 80% but less than 100% of the total recording properties as specified in Requirement R9.

VRF and VSL Justifications – PRC-002-2, R9	
Proposed Moderate VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 70% but less than or equal to 80% of the total recording properties as specified in Requirement R9.
Proposed High VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 60% but less than or equal to 70% of the total recording properties as specified in Requirement R9.
Proposed Severe VSL	The Transmission Owner or Generator Owner had DDR data that meets less than or equal to 60% of the total recording properties as specified in Requirement R9.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R9 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Consistency among Reliability Standards**

VRF and VSL Justifications – PRC-002-2, R9	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This requirement established technical specifications for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R10	
Proposed VRF	**Lower**
NERC VRF Discussion	R10 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R10 requires time synchronization of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations established in R1 and R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failures to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R10 contains only one objective which is to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 90% but less than 100% of the bus

VRF and VSL Justifications – PRC-002-2, R10	
	locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 80% but less than or equal to 90% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed High VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 70% but less than or equal to 80% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for less than or equal to 70% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R10 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R10	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R11	
Proposed VRF	**Lower**
NERC VRF Discussion	R11 is administrative in nature and a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R11 provides criteria around timelines for providing the data and the data format. This is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria on providing Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R11 contains only one objective which is to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data within the specified criteria. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 30-

VRF and VSL Justifications – PRC-002-2, R11	
	calendar days but less than 40-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 90% but less than 100% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 90% but less than 100% in the proper data format.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 40-calendar days but less than or equal to 50-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 80% but less than or equal to 90% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 80% but less than or equal to 90% in the proper data format.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 50-calendar days but less than or equal to 60-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 70% but less than or equal to 80% of the requested data. OR

VRF and VSL Justifications – PRC-002-2, R11	
	The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 70% but less than or equal to 80% in the proper data format.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 failed to provide the requested data more than 60-calendar days after the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11 failed to provide less than or equal to 70% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided less than or equal to 70% in the proper data format.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R11 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R11	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R12	
Proposed VRF	**Lower**
NERC VRF Discussion	R12 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action

VRF and VSL Justifications – PRC-002-2, R12	
	Plan to the Regional Entity more than 90-calendar days but less than 100-calendar days after discovery of the failure.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100-calendar days but less than or equal to 110-calendar days after discovery of the failure.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110-calendar days but less than or equal to 120-calendar days after discovery of the failure. OR The Transmission Owner or Generator Owner as directed by Requirement R12 submitted a CAP to the Regional Entity but failed to implement it.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120-calendar days after discovery of the failure. OR Transmission Owner or Generator Owner as directed by Requirement R12 failed to restore the recording capability and failed to submit a CAP to the Regional Entity.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure	Guideline 2a: The VSL assignment is for R12 is not binary.

VRF and VSL Justifications – PRC-002-2, R12	
Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and	Non CIP

VRF and VSL Justifications – PRC-002-2, R12	
implementation should account for their interdependence	

Standards Announcement

Project 2007-11 Disturbance Monitoring - PRC-002-2

Final Ballot Now Open through November 6, 2014

Now Available

A final ballot for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** is open through **8 p.m. Eastern, Thursday, November 6, 2014.**

Background information for this project can be found on the project page.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a vote during the last ballot window may cast a vote in the final ballot window. If a ballot pool member cast a vote in the previous ballot and does not participate in the final ballot, that member's vote will be carried over in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps

The voting results for the standard will be posted and announced after the ballot window closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Stephen Crutchfield, Standards Developer, or at 609-651-9455.

Standards Announcement

Project 2007-11 Disturbance Monitoring

Final Ballot Results

Now Available

A final ballot for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** concluded at **8 p.m. Eastern, Thursday, November 6, 2014**.

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

PRC-002-2
Quorum/Approval
81.89% / 68.51%

Background information for this project can be found on the project page.

Next Steps

The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Standards Developer, Stephen Crutchfield (via email), or by telephone at 609-651-9455.

Project 2007-11 Disturbance Monitoring

Name and Title	Company and Address	Contact Info	Bio
Lee Pedowicz	Northeast Power Coordinating Council, Inc. 1040 Avenue of the Americas 10th Floor New York, New York 10018-3703	212-840-1070 ext 7061 lpedowicz@npcc.org	Lee Pedowicz is the Chair of the Drafting Team for Project 2007-11, Disturbance Monitoring, and the Manager, Reliability Standards for NPCC. Lee began his career with NPCC in November, 2007. He is responsible for submitting comments to relevant NERC and industry postings on behalf of NPCC, and coordinating NPCC's Regional Standards Committee meetings. Prior to joining NPCC, Lee was a Senior System Operator for Consolidated Edison in New York City responsible for the real-time on watch operation of the Con Edison electric and steam systems. The position was responsible for maintaining reliable real-time operating conditions, responding to system emergencies, and scheduling equipment outages. Lee was also a Manager in the Protective Systems Testing Department responsible for all aspects of protective relaying maintenance and testing, and the testing of transmission and distribution system equipment. Lee also worked for the Long Island Lighting Company in its Relay Department as a Field Supervisor, and as an Engineer in the Independent Safety Engineering Group at the Shoreham Nuclear Power Station. Lee's experience also includes design work with American Electric Power, and Sargent and Lundy Engineers. Lee received his Master of Science in electric power system engineering from the Ohio State

Name and Title	Company and Address	Contact Info	Bio
			University, and his Bachelor of Science in Electrical Engineering from Washington University in Saint Louis. Lee completed the General Electric Company Power System Engineering Course. Lee is a licensed Professional Engineer in the State of New York, and a NERC Certified System Operator--Reliability.
Farrokh (Frank) Habibi-Ashrafi, Lead Senior Egineer	Southern California Edison, Advanced Technology 14799 Chestnut St. Westminster, CA 92683	714-934-0821 Farrokh.habibiashrafi@sce.com	Dr. Farrokh Habibi-Ashrafi is a Lead Senior Engineer in the Advanced Technology Organization of Southern California Edison Company (SCE). He has been working at SCE for more than 17 years, with 10 years of it as a Senior Protection Engineer. At his present position, he is performing studies in development of Phasor Measurement Technology, and advanced protection and control applications at SCE. Prior to joining SCE, Dr. Habibi-Ashrafi was Principal Manager of the Everest Engineering Company providing Substation Engineering and Design to electric utilities in California. Dr. Habibi-Ashrafi received his Engineering degree in Electrical and Mechanical Engineering from University of Tehran, and Ph.D. in electrical engineering from University of Southern California, Los Angeles. He is a registered professional electrical engineer in State of California.

NERC

Name and Title	Company and Address	Contact Info	Bio
Alan D. Baker	Florida Power & Light Company 700 Universe Blvd. Juno Beach , FL 33407 Mailstop: PDL/PDC	(561) 845-4861 alan.baker@fpl.com	Alan Baker graduated from University of Florida in 1981 with a BSEE degree. Alan has thirty four years of electric utility experience, primarily in protection and control engineering. He hold a P.E. license in electrical engineering from the state of Florida. Alan is currently a Principal Engineer at FP&L providing technical service support in communication, relay testing and serves as the SME for DDRs and generation protection.
Daniel J. Hansen	NRG Energy, Inc 1000 Main St. Houston, TX 77002	832-357-7271 Daniel.Hansen@nrg.com	Dan Hansen is an electrical engineer and a registered P.E. in the State of Texas. Dan received an undergraduate degree from Lamar University and a graduate degree from the University of Houston, both in electrical engineering. He has thirty-five years of experience in the field of power generation, including new plant design and construction, retrofit design for small to large projects, commissioning, operations, and maintenance support. Specific areas of expertise have included generating station protective relaying and generator excitation controls. Companies worked for include Houston Lighting & Power, Reliant Energy, RRI Energy, GenOn Energy, and NRG Energy.
Tim Kucey Manager NERC/CIP Standards & Compliance	PSEG Fossil LLC 80 Park Plaza T25B Newark NJ 07102	Timothy.kucey@pseg.com 973-430-5416	Tim Kucey joined the Project 2007-11 DM SDT in May 2013. He has 29 years of Electrical/Power Systems engineering experience in: bulk power systems; industrial and power systems monitoring and control (DCS, EMS, SCADA RTU,

Name and Title	Company and Address	Contact Info	Bio
			instruments); NERC/ERO standards and CMEP; regulatory agency permitting and oversight. He joined PSEG in his present capacity in September 2011. He was a Team Lead for the NERC 2003 Northeast Blackout Investigation, and also support to the US-Canada Power System Outage Task Force's blackout report, while a staff member of Canada's National Energy Board (NEB), from 2002 to 2005. He was a member of NERC's Compliance and Enforcement Group, from late 2005 until joining PSEG, as Manager of Enforcement & Mitigation and later Manager of NOP Development. Prior to joining the NEB Tim spent eight years (1994-2002) in technical commercial roles in the process monitoring and controls industry with GE Harris/GE Power, Fisher-Rosemount and Moore Process Automation. His start in the utility industry was with TransAlta Utilities, from mid-1985 to mid-1994, in several vertically-integrated utility engineering roles. Tim holds a Bachelor of Arts degree and a Bachelor of Engineering degree (Electrical with power systems/facilities/machines concentration) from the University of Saskatchewan, in Canada. Tim is also a current member of NPCC's PRC-002-NPCC regional reliability standard review team.

Jack Soehren Principal Engineer	ITC Holdings 27175 Energy Way Novi, Michigan 48377	248-946-3290 jsoehren@ itctransco.com	Jack Soehren is a Principal Engineer of ITC Holdings Corp. Michigan Relay Performance group a position he has held since the start of his career with ITC in June 2003. Prior to joining ITC, Jack was a Senior Engineer at Detroit Edison in the Relay Performance group. Overall, Jack was with Detroit Edison for 9 years. Jack was a member of the ReliabilityFirst PRC-002 Disturbance Monitoring drafting team and a member of the ECAR 2003 blackout Major System Disturbance Analysis Task Force. Jack has participated as a working group member within the IEEE Power System Relay Committee which produced technical reports most notably the 2004 and 2009 revisions to the report “Understanding Microprocessor-Based Technology Applied to Relaying” and the 2008 report “Performance of Relaying during Wide-Area Stressed Conditions”. Jack is a six-year veteran of the US Navy in which he served on board the USS South Carolina, CGN-37, as a mechanical operator in the nuclear powered propulsion plants. Jack received his Bachelor of Science in Electrical Engineering from the University of Michigan.
Vladimir Stanisic Senior Engineer	AESI Inc - Engineering and Management Consultants 775 Main Street East, Suite 1B, Milton, Ontario, L9T 3Z3	905-875-2075 ext. 253 vladimirs@aesi-inc.com	Vlad Stanisic has over 29 years of diverse and progressive career in planning, design, project management and construction of utility and industrial electric power systems and facilities. His expertise includes protection and controls (P&C), power generation operations and business development. He is currently with AESI Inc., Engineering and Management Consultants. His previous employers include Ontario Hydro (Ontario Power Generation) and BC Hydro

			where he served in a variety of engineering, project management and regulatory roles. Following 2003 Blackout Vlad was a key member of OPG's task force assessing the performance of the power plants prior to and following the system collapse and formulating the follow-up actions. Vlad received a Master of Electrical Engineering degree, Power Systems, from the University of Belgrade and has done postgraduate work at the University of Toronto. He is a registered professional engineer in Ontario and British Columbia, a Licensed Professional Engineer of Yugoslavia, and a member of CIGRE (Study Committee C1 – Power System Development and Economics). Vlad maintains an active role in North American electric reliability programs and initiatives.
Ryan Quint	Dominion Technical Solutions, Inc.	804-771-4850 ryan.d.quint@dom.com	Ryan Quint is a Transmission Planning Engineer with Dominion Virginia Power. His primary responsibilities include developing wide area applications and tools, events analysis, cascading analysis and simulations, and dynamic load modeling. Prior to joining DVP, Ryan worked at Bonneville Power Administration in Customer Service Engineering, Remedial Action Scheme Design, Measurement Systems Laboratory, Transmission Planning, and Long Range Transmission Planning. He is active in the power industry as a member of IEEE Power and Energy Society as well as CIGRE. Ryan is also Co-Chair of the North American Synchrophasor Initiative Engineering Analysis Task Team and Chair of the North American Transmission Forum Dynamic Load Modeling Working Group.

			Ryan received his Bachelor of Science in Electrical Engineering from University of Washington in 2010, and Master of Science and Doctor of Philosophy degrees from Virginia Tech in 2012 and 2013, respectively.
Stephen Crutchfield - Standards Developer	North American Electric Reliability Corporation 3343 Peachtree Road, NE 4th Floor East Tower – Suite 400 Atlanta, GA 30326	609-651-9455 Stephen.crutchfield@nerc.net	Stephen Crutchfield is the NERC Staff Coordinator for Project 2007-11, Disturbance Monitoring. Stephen began his career with NERC in May 2007. Prior to joining NERC, Stephen was a Project Manager with Shaw Energy Delivery Services, managing engineering and construction projects in the substation and transmission line fields. Stephen's background also includes experience with PJM as Manager of RTO Integration, working on the operations and markets integration of new members (AEP, ComEd, Dayton, Dominion and Duquesne) into PJM and southern seams operations issues with Progress Energy, Duke and TVA. Stephen also helped lead the team that was developing GridSouth in the dual roles of Organization Architect and Manager of Customer Support. Prior to GridSouth, Stephen was the Manager of Power System Operations Training at Progress Energy where he spent over 10 years training System Operators and Engineers. Overall, Stephen was with Progress Energy for 16 years. Stephen received his Bachelor of Arts in Physics from the University of Virginia and Masters of Science in Electrical Engineering from North Carolina State University. Stephen holds a Master of Science in Management degree, also from North Carolina State University.
