FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)** **)**	**Docket No. ____________**

PETITION OF THE
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION
FOR APPROVAL OF PROPOSED RELIABILITY STANDARD
PRC-002-2

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5[2] of the Federal Energy Regulatory Commission's ("FERC" or "Commission") regulations, the North American Electric Reliability Corporation ("NERC")[3] hereby submits for Commission approval proposed Reliability Standard PRC-002-2 (Disturbance Monitoring and Reporting Requirements) (Exhibit A). NERC requests that the Commission approve the proposed Reliability Standard and find that it is just, reasonable, not unduly discriminatory or preferential, and in the public interest.[4] NERC also requests approval of: (i) the Implementation Plan for the proposed Reliability Standard (Exhibit B); (ii) the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") (Exhibits A and F); and (iii) the retirement of Reliability Standards PRC-002-1 (Define Regional Disturbance Monitoring and Reporting Requirements)

---

1 16 U.S.C. § 824o (2012).

2 18 C.F.R. § 39.5 (2014).

3 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006).

4 Unless otherwise designated, capitalized terms shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards* ("NERC Glossary of Terms"), *available at* http://www.nerc.com/files/Glossary_of_Terms.pdf.

and PRC-018-1 (Disturbance Monitoring Equipment Installation and Data Reporting) as listed in the Implementation Plan.

As required by Section 39.5(a)[5] of the Commission's regulations, this petition presents the technical basis and purpose of proposed Reliability Standard PRC-002-2, a summary of the development history (Exhibit G), and a demonstration that the proposed Reliability Standard meets the criteria identified by the Commission in Order No. 672[6] (Exhibit D). This petition also provides background on Recommendations No. 24 and No. 28 in the U.S.-Canada Power System Outage Task Force ("Task Force"), *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations* ("Final Blackout Report") and how the proposed Reliability Standard implements these Task Force Recommendations.[7] The NERC Board of Trustees ("NERC Board") adopted proposed Reliability Standard PRC-002-2 on November 13, 2014.

I. <u>EXECUTIVE SUMMARY</u>

Proposed PRC-002-2 contains the Requirements necessary to facilitate the analysis of Disturbances on the Bulk-Power System. The proposed Reliability Standard defines what sequence of events ("SER") recording, fault recording ("FR"), and dynamic Disturbance recording ("DDR") data should be recorded and how it should be reported.

III. BACKGROUND

A. Regulatory Framework

By enacting the Energy Policy Act of 2005,[9] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Nation's Bulk-Power System, and with the duties of certifying an Electric Reliability Organization ("ERO") that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1)[10] of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-

[8] Persons to be included on the Commission's service list are identified by an asterisk. NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203 (2014), to allow the inclusion of more than two persons on the service list in this proceeding.

[9] 16 U.S.C. § 824o (2012).

[10] *Id.* § 824(b)(1).

approved Reliability Standards. Section 215(d)(5)[11] of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard. Section 39.5(a)[12] of the Commission's regulations requires the ERO to file with the Commission for its approval each Reliability Standard that the ERO proposes should become mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes should be made effective.

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA[13] and Section 39.5(c)[14] of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.

B. NERC Reliability Standards Development Procedure

The proposed Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[15] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards

---

[11] *Id.* § 824o(d)(5).

[12] 18 C.F.R. § 39.5(a).

[13] 16 U.S.C. § 824o(d)(2).

[14] 18 C.F.R. § 39.5(c)(1).

[15] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672 at P 334, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006) ("Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by FERC.").

Development) of its Rules of Procedure and the NERC Standard Processes Manual.[16] In its order certifying NERC as the Commission's Electric Reliability Organization, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards[17] and thus satisfies certain of the criteria for approving Reliability Standards.[18] The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders, and stakeholders must approve, and the NERC Board of Trustees must adopt a Reliability Standard before the Reliability Standard is submitted to the Commission for approval.

C. 2003 Blackout Report Recommendations No. 24 and No. 28

On August 14, 2003, large portions of the Midwest and Northeast United States and Ontario, Canada, experienced an electric power blackout ("2003 Blackout").[19] The next day, the joint U.S.-Canada Task Force was established to investigate the causes of the blackout and how to reduce the possibility of future outages. The Task Force's work was divided into two phases as follows:

- Phase I: Investigate the outage to determine its causes and why it was not contained.
- Phase II: Develop recommendations to reduce the possibility of future outages and minimize the scope of any that occur.[20]

20 *Id.*

In November 2003, the Task Force issued the Interim Blackout Report, describing its investigation and findings and identifying the causes of the blackout.[21]

1. <u>NERC Board Recommendation 12 and 2003 Blackout Recommendation No. 28</u>

On February 10, 2004, after taking the findings of the Interim Blackout Report into account, the NERC Board approved a series of actions and strategic and technical initiatives intended to protect the reliability of the North American Bulk Electric System ("NERC Board Recommendations").[22] Among its actions, the NERC Board issued Recommendation 12 to install additional time-synchronized recording devices as needed and Recommendation 14 to improve system modeling data and data exchange practices.

NERC Board Recommendation 12a directed the reliability regions to define, within one year, regional criteria for the application of synchronized recording devices in power plants and substations. Regions were requested to facilitate the installation of an appropriate number, type and location of devices within the region as soon as practical to allow accurate recording of future system Disturbances and to facilitate benchmarking of simulation studies by comparison to actual Disturbances.[23] NERC Board Recommendation 12b directed facilities owners, in accordance with regional criteria, to upgrade existing dynamic recorders to include Global Positioning Satellite ("GPS") time synchronization and, as necessary, install additional dynamic recorders.[24]

23 NERC Board Actions at 207.

24 *Id*.

The Final Blackout Report, issued on April 5, 2004, verifies and expands the findings of the Interim Blackout Report. On certain subjects, the Task Force advocated for broader measures than those in the NERC Board Recommendations, including in Task Force Recommendation No. 28 to require use of time-synchronized data recorders.[25] The Task Force explained that a valuable lesson from the 2003 Blackout is the importance of having time-synchronized system data recorders. The Task Force noted that the investigation would have been significantly faster and easier if there had been wider use of synchronized data recording devices. The Task Force also stated that NERC Planning Standard I.F, Disturbance Monitoring, required the use of recording devices for Disturbance analysis.[26]

On the day of the blackout, time recorders were frequently used, but not synchronized to a time standard. The Task Force explained that, at a relatively modest cost, all digital fault recorders, digital event recorders, and power system Disturbance recorders can and should be time-stamped at the point of observation using a GPS synchronizing signal. The Task Force also explained that recording and time synchronization equipment should be monitored and calibrated to assure accuracy and reliability. The Task Force made the following four observations in Task Force Recommendation No. 28 to provide a broader approach than that proposed by the NERC Board:

> A. FERC and appropriate authorities in Canada should require the use of data recorders synchronized by signals from the Global Positioning System (GPS) on all categories of facilities whose data may be needed to investigate future system Disturbances, outages, or blackouts.
>
> B. NERC, reliability coordinators, control areas, and transmission owners should determine where high speed power system Disturbance recorders are needed on the system, and ensure that

[25] Final Blackout Report at 162.
[26] *Id*.

> they are installed by December 31, 2004.
>
> C. NERC should establish data recording protocols.
>
> D. FERC and appropriate authorities in Canada should ensure that the investments called for in this recommendation will be recoverable through transmission rates.

Following through on the Task Force Recommendation No. 28, NERC addressed items A, B, and C above through a single effort. The NERC Planning Committee's Interconnection Dynamics Working Group ("IDWG") examined NERC's Reliability Standards on Disturbance monitoring as well as existing interconnection-wide practices and concluded that the NERC Disturbance monitoring standards and related regional requirements were inadequate. The IDWG developed a set of recommendations for specific improvements in its final report, *Review of Regional Disturbance Monitoring Equipment*, which addresses both Recommendation 12 of the NERC Board Recommendations and the Task Force Recommendation No. 28.[27] The NERC Board adopted this report at its May 2005 meeting.[28] The report identified that the NERC Disturbance monitoring standards addressed only new equipment and:

(1) do not address time synchronization on existing installations;

(2) do not specify the process for identifying locations;

(3) do not specify the process for ensuring additional installations; and

(4) do not specify that dynamic recording devices or sequence-of-event recorders are necessary to meet Disturbance monitoring equipment requirements.[29]

---

27 *See* NERC Planning Committee Mar. 16-17, 2005 Meeting, Agenda Item 6: IDWG Report at Att. A.

28 *See* NERC Board May 3, 2005 Meeting Complete Agenda Package, Agenda Item 11b: *Review of Regional Disturbance Monitoring Equipment – Recommendation 12a, available at* http://www.nerc.com/gov/bot/Agenda%20Minutes%20and%20Highlights%20DL/2005/BOT_Complete_Agenda_Package_0505.pdf.

29 *See* NERC Board May 3, 2005 Meeting, Item 11b IDWG Presentation on Review of Regional Disturbance Monitoring Equipment. This presentation is included in the Complete Agenda package

The report also identified that regional "Disturbance Monitoring" requirements and processes were deficient and inconsistent among the regions. These recommendations and input from the IDWG would translate into two Reliability Standards. Reliability Standard PRC-002-0 was revised and separated into two Reliability Standards—PRC-002-1 (Define Regional Disturbance Monitoring and Reporting Requirements) and PRC-018-1 (Disturbance Monitoring Equipment Installation and Data Reporting). In the Task Force's *Final Report on Implementation of Task Force Recommendations* ("Blackout Implementation Report"), the Task Force noted that completion and approval by applicable regulatory authorities in the United States and Canada of any standard was required to fully implement Task Force Recommendation 28.A, 28.B, and 28.C.[30]

2. <u>NERC Board Recommendation 14 and 2003 Blackout Recommendation No. 24</u>

The NERC Board Recommendations also included Recommendation 14 to improve system modeling data and data exchange practices. Recommendation 14 directs the regional reliability councils to establish and begin implementing criteria and procedures for validating data used in power flow models and dynamic simulations by benchmarking model data with actual system performance. The Recommendation also instructed that validated modeling data must be exchanged on an inter-regional basis as needed for reliable system planning and operation.

Task Force Recommendation No. 24 relates to improving the quality of system modeling data and data exchange practices. The Task Force states in Recommendation No. 24 that it strongly supports NERC Board Recommendation 14. The Task Force further recommended that

---

[30] *See* Blackout Implementation Report at 37 (Sept. 2006), *available at* http://energy.gov/sites/prod/files/oeprod/DocumentsandMedia/BlackoutFinalImplementationReport(2).pdf.

FERC and appropriate authorities in Canada require all generators, regardless of ownership, to collect and submit generator data to NERC, using a regulator-approved template. The Task Force noted that after-the-fact models developed to simulate the conditions and events in the blackout established that the dynamic modeling assumptions for generator and load power factors in regional planning and operating models were frequently inaccurate.

While NERC directly addressed Recommendation No. 24 through other standard development work, a mandatory and enforceable Reliability Standard for Disturbance monitoring further supports the implementation of this Trask Force Recommendation. The Task Force noted in the Blackout Implementation Report:

> …new [Board-approved] standards, along with standards previously approved by the NERC Board of Trustees in February 2005 as part of the "Version 0" standards, represent a comprehensive set of standards for steady-state and dynamics system data reporting, modeling and simulation, and model validation that address this recommendation.[31]

The Version 0 standards included PRC-002-0, which was not ultimately approved by the Commission, as noted in Section D below.

D. History of PRC-002 and PRC-018

On April 4, 2006, as modified on August 28, 2006, NERC submitted to the Commission a petition seeking approval of an initial set of 107 proposed Reliability Standards.[32] NERC included PRC-002-0 in its April 4th Petition. NERC replaced this version with PRC-002-1 and also submitted PRC-018-1 for Commission approval in its August 28th Petition.[33] Both requirements in the original version 0 standard were substantially revised and four new

---

31 Blackout Implementation Report at 35.

32 *See* NERC Apr. 4, 2006 and Aug. 28, 2006 Petitions in FERC Docket No. RM06-16-000.

33 *See* NERC Aug. 28 2006 Petition *available at* http://www.nerc.com/FilingsOrders/us/NERC%20Filings%20to%20FERC%20DL/FERC_Filing_Proposed_Reliability_Standards_Docket_RM06-16-000.pdf.

requirements were added. PRC-002-1 requires the Regional Reliability Organizations to establish requirements for installation of Disturbance Monitoring Equipment and reporting of Disturbance data to facilitate analyses of events and verify system models. PRC-018-1 is designed to ensure that Disturbance Monitoring Equipment is installed and that Disturbance data is reported in accordance with regional requirements to facilitate analyses of events.

In Order No. 693, the Commission identified Reliability Standard PRC-002-1 as a "fill-in-the-blank" standard that should be modified to apply, through the Functional Model, to the users, owners and operators of the Bulk-Power System that are responsible for providing information.[34] As a result, the Commission decided not to approve or remand PRC-002-1.[35] The Commission agreed with various commenters to the *Notice of Proposed Rulemaking* preceding Order No. 693 that greater continent-wide consistency could be achieved in this Reliability Standard.[36] The Commission directed the ERO to consider the comments of the American Public Power Association, Alcoa, Inc., and Otter Tail Power Company as it modifies PRC-002-1 to provide missing information needed for the Commission to act on PRC-002.[37] These comments are provided in Exhibit E: *Consideration of Issues and Directives*. Generally, the comments called for revisions to PRC-002-1 to provide greater consistency in this Reliability Standard and a continent-wide approach.

In addition, the Commission approved PRC-018-1 as mandatory and enforceable.[38] In its determination and in light of the approval status of PRC-002-1, the Commission stated applicable entities were expected to comply with PRC-018-1, and the procedures specified in

---

34 Order No. 693 at PP 77-78.
35 *Id.* at P 1455.
36 *Id.* at P 1456.
37 *Id*.
38 *Id*. at P 1551.

PRC-002-1 would be provided pursuant to the data gathering provisions of the ERO's Rules of Procedure and the Commission's ability to obtain information.[39]

E. History of Project 2007-11 Disturbance Monitoring

NERC initiated Project 2007-11 to address Commission concerns in Order No. 693, specifically the "fill in the blank" aspects in both Reliability Standards PRC-002-1 and PRC-018-1. A standard authorization request to initiate the project was initially posted in 2007 with a scope of reviewing both standards and merging them into one replacement standard. In 2010, the Standards Committee prioritized ongoing work, which resulted in moving Project 2007-11 to informal development status. In its 2013 work plan, the Standards Committee changed the status to "formal development" as part of the effort to address pending projects.

The standard drafting team revised the standard authorization request to focus the standard on creating a results-based approach to the capture of data , instead of prescriptive requirements on equipment necessary to capture the data. The standard drafting team also added the Reliability Coordinator and Planning Coordinator as applicable entities in the standard authorization request to allow the standard drafting team to assign responsibility for specifying and collecting needed dynamic Disturbance data.

IV. <u>JUSTIFICATION FOR APPROVAL</u>

As discussed in Exhibit D and below, the proposed Reliability Standard PRC-002-2, satisfies the Commission's criteria in Order No. 672 and is just, reasonable, not unduly discriminatory or preferential, and in the public interest. Proposed PRC-002-2 contains the Requirements necessary to facilitate the analysis of Disturbances on the Bulk-Power System.

---

[39] *Id*. at P 1550.

The proposed Reliability Standard contains twelve Requirements, which collectively define what SER, FR, and DDR data should be recorded and how it should be reported.

The following section broadly describes Disturbance monitoring, explains the purpose of proposed Reliability Standard PRC-002-2, provides a description of and the technical basis for the requirements, and describes how the proposed Reliability Standard improves reliability as compared to prior versions. This section also provides a brief summary of how the proposed Reliability Standards satisfies the outstanding Commission directives from Order No. 693 related to PRC-002-1, fully implements Task Force Recommendation No. 28, and contributes to NERC's efforts to implement Task Force Recommendation No. 24. Finally, this section includes a discussion of the enforceability of the proposed Reliability Standard.

A. Disturbance Monitoring

The NERC Glossary defines a "Disturbance" as;

> 1. An unplanned event that produces an abnormal system condition.
>
> 2. Any perturbation to the electric system.
>
> 3. The unexpected change in [Area Control Error] that is caused by the sudden failure of generation or interruption of load.[40]

It is important that Disturbances are monitored and analyzed so that the Bulk-Power System may be planned and operated to avoid instability, separation and Cascading failures. As defined in the NERC Glossary, Disturbance Monitoring Equipment consists of devices capable of monitoring and recording system data pertaining to a Disturbance.[41] The definition includes various types of recorders. Sequence of event recorders record equipment response to the event.

---

[40] NERC Glossary at 30.

[41] The definition also provides that "Phasor Measurement Units and any other equipment that meets the functional requirements of DMEs may qualify as DMEs."

This includes opening and closing of breakers and switches used to isolate faulted equipment. Fault recorders record actual waveform data replicating the system primary voltages and currents. This may include protective relays. Dynamic Disturbance recorders record incidents that portray power system behavior during dynamic events such as low-frequency (0.1 Hz – 3 Hz) oscillations and abnormal frequency or voltage excursions.

Analysis of the data captured under the proposed Requirements of PRC-002-2 can be used to improve the accuracy of planning and operating models and to identify risks to the Bulk-Power System that might not have been previously identified. DDR data is needed to compare actual system performance with expected system performance under Disturbance conditions. The results of the comparison of actual system performance with expected system performance under Disturbance conditions allow engineers to improve system models that are used for both planning and operating the Bulk-Power System. For example, current, voltage and frequency waveforms for actual and expected system performance can be compared and revisions can be made to the model to have the simulated waveforms more closely match the actual waveforms under Disturbance conditions. These revised models result in more accurate planning studies and, result in more accurate contingency analysis performed in near real-time.

B. Proposed Reliability Standard PRC-002-2

1. Purpose of and Types of Data Covered in Proposed PRC-002-2

The purpose of proposed Reliability Standard PRC-002-2 is to have adequate data available to facilitate analysis of Bulk Electric System Disturbances. The proposed Reliability Standard focuses on ensuring that the requisite data is captured and the Requirements constitute a results-based approach to capturing data.[42] The proposed Reliability Standard consolidates the current PRC-002-1 Reliability Standard and pertinent requirements of PRC-018-1 and improves reliability by providing personnel with necessary data to enable more effective post event analysis. The collected information can also be used to verify system models.

The proposed Reliability Standard includes coverage for SER, FR, and DDR data. SER and FR data can be used for the analysis, reconstruction, and reporting of Disturbances. Knowing the exact time of a breaker change of state and the waveforms of current, voltage and frequency for individual circuits allows the precise reconstruction of events for both localized and wide-area Disturbances. Analyses of wide-area Disturbances often begin by evaluation of SER data to help determine the initiating event(s) and to follow the Disturbance propagation. The recording of breaker operations helps to determine the interruption of line flows at a particular bus. However, under the proposed Reliability Standard, SER and FR data is not universally required since data from each bus is not necessary to be able to conduct an adequate or thorough analysis of a Disturbance. FR data also augments SERs in evaluating circuit breaker operation.

DDR data, which is also addressed in proposed PRC-002-2, is used to determine the Bulk-Power System's electromechanical transient and post-transient response and to validate system model performance. DDR data location is typically based on studies which include angular, frequency, voltage, and oscillation stability factors. However, to adequately monitor the Bulk-Power System's dynamic response and to ensure sufficient data to determine Bulk-Power System performance, DDR data is required for key Elements in addition to a minimum

---

[42] The original SAR for this proposed Reliability Standard was focused on requirements for the installation of the equipment necessary to capture Disturbance monitoring data. The standard drafting team felt it was best to describe the performance requirements (using a risk-based approach) rather than prescribing necessary equipment.

requirement of DDR coverage based on an entity's peak system demand. Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these generators during a Disturbance helps the analysis of large Disturbances. DDR data shows transient response to Bulk-Power System Disturbances after a fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

DDR data contains the dynamic response of a power System to a Disturbance and is used for analyzing complex power System events. This recording is typically used to capture short-term and long-term Disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

Entities responsible for the Requirements in proposed PRC-002-2 and an explanation of each Requirement are included below. Additional technical support for each of these sections is included in the *Guidelines and Technical Basis Section* of the proposed Reliability Standard in Exhibit A.

2. Applicable Entities

4. Applicability:

Functional Entities:

4.1 *The Responsible Entity is:*

- ***4.1.1*** *Eastern Interconnection – Planning Coordinator*
- ***4.1.2*** *ERCOT Interconnection – Planning Coordinator or Reliability Coordinator*
- ***4.1.3*** *Western Interconnection – Reliability Coordinator*
- ***4.1.4*** *Quebec Interconnection – Planning Coordinator or Reliability Coordinator*

4.2 *Transmission Owner*

4.3 *Generator Owner*

The proposed Reliability Standard applies to the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection. In the Eastern Interconnection, the Planning Coordinator is the responsible entity. In the Western Interconnection, the Reliability Coordinator is the responsible entity. In ERCOT and the Quebec Interconnections, either the Planning Coordinator or the Reliability Coordinator is the responsible entity. The proposed Reliability Standard also applies to Transmission Owners and Generator Owners.

The Planning Coordinator or the Reliability Coordinator, as applicable, has the best wide-area view of the Bulk Electric System and is most suited to be responsible for determining the Bulk Electric System Elements for which dynamic DDR data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate dynamic Disturbance recording data is available for those Bulk Electric System Elements selected.

Bulk Electric System buses where SER and FR data is necessary are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses. The Transmission Owners and Generator Owners that own Bulk Electric System Elements on those buses will have the responsibility for ensuring that adequate data is available.

3. Proposed Requirements

(1) Requirement R1

R1. *Each Transmission Owner shall*: *[Violation Risk Factor: Lower] [Time Horizon: Long- term Planning]*

1.1. *Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.*

1.2. *Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES*

Elements require SER data and/or FR data.

1.3. *Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.*

Requirement R1 requires Transmission Owners to identify BES buses for which SER and FR data is required, provide notification to other owners of BES Elements connected to those particular BES buses that SER and FR data is necessary, and re-evaluate all BES buses every five years. This information, taken collectively, will allow for analysis and reconstruction of Bulk Electric System events.

Sequence of events and fault recording data for the analysis, reconstruction, and reporting of Disturbances is important in order to be able to analyze the Disturbance. The exact time of a breaker change of state and the waveforms of current, voltage and current for individual circuits allows the precise reconstruction of events for both localized and wide-area Disturbances. Analyses of wide-area Disturbances often begin by evaluation of SER data to help determine the initiating event(s) and to follow the Disturbance propagation. The recording of breaker operations helps to determine the interruption of line flows at a particular bus. As a general principle, more quality data is better when performing Disturbance analysis. However, one-hundred percent coverage of all Elements is not practical, cost-effective, nor required for effective analysis of wide-area Disturbances. Selectivity in the required buses to monitor is important to identify key buses with breakers where crucial information is available when required to analyze a Disturbance. Selectivity will also avoid excessive overlap of coverage and avoid gaps in critical coverage. The selection should provide coverage of Elements that could propagate a Disturbance, but avoid mandating coverage of Elements that are more likely to be a casualty of a Disturbance rather than a cause. The selection should ultimately establish selection criteria to provide effective coverage in different regions of the continent.

Each Part of Requirement R1 is described separately below and identifies the methodology designed by the standard drafting team for proper selection.

(a) Part 1.1

Part 1.1 requires Transmission Owners to identify buses for which SER and FR data is required. Transmission Owners are identified as the applicable entity in this Requirement because Transmission Owners have the required tools, information, and working knowledge of their systems to best determine buses where SER and FR data is required. The Requirement also specifies a consistent methodology to identify those buses in *Attachment 1: Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data*.

Analysis and reconstruction of Disturbances requires SER and FR data from key buses. Attachment 1 provides a uniform methodology (Median Method) to identify those BES buses. Review of actual short circuit data received from the industry in response to the drafting team's data request (June 5, 2013 through July 5, 2013) showed a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the Bulk-Power System based on (i) its voltage level, (ii) the number of Transmission Lines and other Elements connected to the BES bus, and (iii) the number and size of generating units connected to the bus. Buses with a large short circuit MVA level are Elements that have a significant effect on System reliability and performance. Conversely, buses with very low short circuit MVA levels seldom cause wide-area or Cascading Disturbances, so SER and FR data from those Elements are not as significant for Disturbance analysis. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment.

Under proposed PRC-002-2, there are a minimum number of buses for which SER and FR data is required based on the short circuit level. With the objective of having sufficient data for Disturbance analysis, the drafting team developed the procedure in Attachment 1 that utilizes the maximum available calculated three-phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and system topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution (see Step 8 discussion below). A description of how the standard drafting team arrived at this approach is included in the Guidelines and Technical Basis of Requirement R1 in the proposed Reliability Standard. The method employed is voltage level independent, is likely to select buses near large generation centers, and is likely to select buses where delayed clearing can cause Cascading. It also selects buses directly correlated to the Universal Power Transfer equation, which means that lower line impedance leads to increased power flows and greater system impact.

Attachment 1 provides a process for determining buses that require FR and SER data. Attachment 1 also notes that, for this standard, a single bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.[43]

[43] *See* PRC-002-2, Attachment 1 at Step 1.

In Attachment 1, Transmission Owners are first required to determine a complete list of buses that they own. Next, Transmission Owners reduce this list to only those BES buses that have a maximum available calculated three phase short circuit MVA of 1,500 MVA or greater. The standard drafting team chose the threshold MVA values based on engineering and operational experience from analyzing and reviewing the short circuit data received from industry in response to a data request issued during the standard development process. This analysis showed a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the Bulk-Power System. The correlation was based on: (i) voltage level; (ii) the number of Transmission Lines and other Elements connected to the bus; and (iii) the number and size of generating units connected to the bus. Buses with a large short circuit MVA level significantly affect system reliability and performance, while buses with very low short circuit MVA levels are not as significant.[44] As a result, the standard drafting team included the narrowing of the buses covered by the standard based on the stated MVA value in Attachment 1, Step 2.

In Step 3, Transmission Owners must determine the eleven BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. The standard drafting team chose eleven BES buses because, in the judgment of the drafting team, a sufficient number of buses is necessary to accomplish the data coverage being sought for Disturbance analysis. Because the methodology stipulated the use of the median or middle value, eleven is used to provide five buses above and five buses below the median. In Step 4, Transmission Owners calculate the median MVA level of the eleven BES buses from Step 3, and in Step 5, determine a value that is twenty percent of this median MVA level from Step 4. The purpose of

---

[44] BES buses with very low short circuit MVA levels seldom cause wide-area or Cascading System Disturbances.

this calculation is to provide a more narrowed scope for larger Transmission Owners that might have a large number of buses with a three-phase short circuit MVA level at 1500 MVA or above. This limits the number of buses for FR and SER data required under the standard for such entities while still providing adequate data for Disturbance analysis.

Step 6 again requires Transmission Owners to reduce the list to only those that have a maximum available calculated three-phase short circuit MVA higher than the greater of either 1,500 MVA or twenty percent of the median MVA level determined in Step 5.

Finally, Step 7 begins to identify the necessary buses. If there are no buses on the list by Step 7, the procedure is complete and no FR and SER data will be required. If the list has one or more but less than or equal to eleven buses, FR and SER data is required at the bus with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. If the list has more than eleven BES buses, SER and FR data is required on at least 10 percent of the BES buses determined in Step 6 with the highest maximum available calculated three-phase short circuit MVA.

To assure that adequate numbers of buses are included for collection of SER and FR data, Step 8 requires SER and FR data at additional buses from the list determined in Step 6. The aggregate of the number of buses determined in Step 7 and buses included through Step 8 must be at least twenty percent of the BES buses determined in Step 6. The remaining locations needed to meet this test are selected at the Transmission Owner's discretion to provide maximum wide-area coverage for SER and FR data based on each Transmission Owner's unique System configuration. Attachment 1 recommends the following BES bus locations:

- Electrically distant buses or electrically distant from other DME devices;
- Voltage sensitive areas;
- Cohesive load and generation zones;
- BES buses with a relatively high number of incident Transmission circuits;

- BES buses with reactive power devices; and
- Major Facilities interconnecting outside the Transmission Owner's area.

These locations are derived from PRC-002-1 and were reviewed and confirmed for inclusion by the standard drafting team as valuable information to inform the selection of locations.

Step 9 finally explains that the applicable buses subject to Requirement R1 is the collective total from Steps 7 and 8.

(b) Part 1.2

Part 1.2 requires Transmission Owners to notify other owners of Elements connected to those buses, if any, within 90-calendar days of completion of Part 1.1, that those Elements require SER data and/or FR data. Notification is necessary because these buses may be owned by more than one entity. The ninety calendar-day notification period gives the Transmission Owners adequate time to make appropriate determinations and notifications.

(c) Part 1.3

Part 1.3 requires each Transmission Owner to re-evaluate the bus list by repeating the performance in Parts 1.1 and Parts 1.2 at least every five (5) calendar years to account for system changes. The standard drafting team determined that the five (5) calendar year re-evaluation of the list of identified Elements is a reasonable interval based on its experience with changes to the Bulk-Power System that may affect SER and FR data requirements.

(2) Requirement R2

> ***R2.*** *Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

Requirement R2 is intended to capture SER data for the status (open/close) of the circuit breakers that can interrupt the current flow through each Element connected to a bus identified in Requirement R1. Analyses of wide-area Disturbances often begin by evaluation of SERs to help determine the initiating Disturbance(s) and follow the Disturbance propagation throughout the Bulk-Power System. Recording of breaker operations helps to determine a timeline for status changes in circuit breaker positioning during a Disturbance. Generator Owners are included in this Requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's bus. Each breaker status change will be time stamped according to Requirement R10 to a time-synchronized clock.

(3) Requirement R3

R3. *Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1*: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 *Phase-to-neutral voltage for each phase of each specified BES bus.*

3.2 *Each phase current and the residual or neutral current for the following BES Elements:*

3.2.1 *Transformers that have a low-side operating voltage of 100kV or above.*

3.2.2 *Transmission Lines.*

Requirement R3 requires the Transmission Owner and Generator to have FR data to determine certain electrical quantities. In order to cover all possible fault types, all bus phase-to-neutral voltages are required to be determinable for each bus identified in Requirement R1. The required electrical quantities may be either directly measured or determinable if sufficient FR data is captured.[45] For Disturbance analysis, bus voltage data is sufficient. To distinguish between phase faults and ground faults, phase and residual currents are required. Furthermore, it

[45] *E.g.* residual or neutral current if the phase currents are directly measured.

allows Transmission Owners and Generator Owners to determine the location of the fault and the cause of relay operation(s).

For transformers operating with a low-side voltage of 100kV or above, the required data can come from either the high-side or low-side of the transformer. However, generator step-up transformers ("GSUs") and the leads connecting the GSU transformer(s) to the Transmission System that exclusively export energy directly from a generating unit or plant are excluded from Requirement R3 because the FR data on the transmission system captures the faults on the generator interconnection. The Generator Owners may install the FR data capability or contract with the Transmission Owners that already have suitable FR data for the provision of the data to determine the required electrical quantities.

(4) Requirement R4

R4. *Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 *A single record or multiple records that include:*

- *A pre-trigger record length of at least two cycles and a total record length of at least 30-cycles for the same trigger point, or*
- *At least two cycles of the pre-trigger data, the first three cycles of the post- trigger data, and the final cycle of the fault as seen by the fault recorder.*

4.2 *A minimum recording rate of 16 samples per cycle.*
4.3 *Trigger settings for at least the following:*

4.3.1 *Neutral (residual) overcurrent.*
4.3.2 *Phase undervoltage or overcurrent.*

Requirement R4 provides for time stamped pre- and post- trigger fault data that aids in analyzing system performance during fault conditions and determining whether the performance was as intended. System faults generally last for a short time period and having a 30-cycle total minimum record length is adequate to capture such data. The requirement allows an entity to provide multiple records. This allows time-synchronized legacy microprocessor relays to meet the requirement when the equipment is not capable of providing fault data in a single record of 30-contiguous cycles. Moreover, the minimum recording rate must be 16 samples per cycle (960 Hz) to get sufficient point and wave data for recreating accurate fault conditions.

(5) Requirement R5

R5. *Each Responsible Entity shall: [Violation Risk Factor: Lower] [Time Horizon: Long- term Planning]*

5.1 *Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following:*

5.1.1 *Generating resource(s) with:*

5.1.1.1 *Gross individual nameplate rating greater than or equal to 500 MVA.*

5.1.1.2 *Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1,000 MVA.*

5.1.2 *Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).*

5.1.3 *Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.*

5.1.4 *One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL).*

5.1.5 *Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.*

5.2 *Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:*

5.2.1 *One BES Element; and*

5.2.2 *One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.*

5.3 *Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested.*

5.4 *Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the re-evaluated list of BES Elements as per the Implementation Plan.*

Requirement R5 provides that each Responsible Entity will have DDR data for one Element and at least one additional Element per 3,000 MW of its historical simultaneous peak system demand. Furthermore, Requirement R5 ensures that there is adequate wide-area coverage of DDR data for specific Elements to facilitate accurate and efficient Disturbance analysis. Monitoring the Elements required for DDR data will facilitate thorough and informative Disturbance analysis of wide-area Disturbances on the Bulk-Power System.[46]

Ensuring that data for these Elements is captured significantly improves the accuracy of the analysis and understanding of why a Disturbance occurred, not simply what occurred. DDR plays a critical role in wide-area Disturbance analysis as it is used for capturing the transient and post-transient response. Such data is used for Disturbance analysis and for validating Bulk-Power System performance. Each Responsible Entity (Reliability Coordinator or Planning Coordinator) must ensure that there are sufficient Elements identified for DDR data capture because they have the best wide-area view of the system. Identifying the Elements requiring DDR data per Requirement R5 is based on industry experience with wide area Disturbance analysis and the need for adequate data to facilitate Disturbance analysis.

The standard drafting team decided that the five (5) calendar year re-evaluation of the list of identified Elements is a reasonable interval based on its experience with changes to the Bulk-Power System that may affect DDR data requirements. However, this standard does not preclude the Responsible Entity from performing this re-evaluation more frequently to capture

---

[46] Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified Element in Requirement R5, part 5.1. Part 5.2 ensures wide-area coverage across all Responsible Entities.

updated Elements. Changes to the bulk power system do not mandate immediate inclusion of Elements into the in-force list, but the Elements must be re-evaluated at least every five (5) calendar years per Requirement R5, Part 5.4.

The Transmission Owners and Generator Owners whose Elements were selected must be notified to ensure that each Owner is aware of its responsibilities. The Responsible Entities (Planning Coordinator or Reliability Coordinator as applicable) must notify all Owners of the selected Elements that DDR data is required when requested per Requirement R5, Part 5.3. However, notification must only include the list of selected Elements that each Transmission Owner and Generator Owner respectively owns and not the entire list. Furthermore, the Responsible Entities must include the specific data for each Element in the notification.[47]

Each Transmission and Generator Owner is responsible for the provision of data for the Elements identified in Requirement R5 and subject to the conditions specified in Requirements R6-R11. The Implementation Plan allows each Transmission Owner and Generator owner to phase-in the data provision Requirements of the proposed Reliability Standard.

DDR data is only required for one end or terminal of the Elements that were selected, except for high-voltage, direct current circuits.[48] For an interconnection between two Responsible Entities, each must consider this interconnection independently and work together to determine how to monitor the Elements requiring DDR data. For an interconnection between two Transmission Owners or a Transmission Owner and a Generator Owner, the Responsible Entity must determine which entity will provide the DDR data and respectively notify the owners of such determination.

---

[47] This data can either be directly measured or accurately calculated.

[48] For example, DDR data must be provided for at least one terminal of a Transmission Line or GSU transformer, but not both terminals.

(6) Requirement R6

R6. *Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- ***6.1*** *One phase-to-neutral or positive sequence voltage.*
- ***6.2*** *The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.*
- ***6.3*** *Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.*
- ***6.4*** *Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.*

Requirement R6 allows the Transmission Owner to determine (calculate, derive, etc.) the electrical quantities specified in Parts 6.1-6.4 for Disturbance analysis. DDR is used to measure transient response to system Disturbances during a relatively balanced post-fault condition. Providing a phase-to-neutral voltage or positive sequence voltage is sufficient to measure the transient response. Furthermore, since all of the buses within a particular location are at the same frequency, one frequency measurement is adequate.[49]

(7) Requirement R7

R7. *Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- ***7.1*** *One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level.*
- ***7.2*** *The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.*
- ***7.3*** *Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current*

[49] The data requirements for proposed PRC-002-2 are based on a System configuration assuming that all normally closed circuit breakers on a BES bus are closed.

measurements are required.
7.4 *Frequency of at least one of the voltages in Requirement R7, Part 7.1.*

Requirement R7 ensures that generator data is available to determine the electrical quantities specified in Parts 7.1-7.4. A crucial part of wide-area Disturbance analysis is understanding the dynamic response of generating resources. Requiring Generator Owners to have DDR data at either the high or low-side of the GSU to determine the specified electrical quantities to adequately capture generator responses is necessary for the analysis of a Disturbance. Each Generator Owner is responsible for providing the necessary DDR data and may contract with the Transmission Owners that already have suitable DDR data for provision of such data.

(8) Requirement R8

R8. *Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 *Triggered record lengths of at least three minutes.*

8.2 *At least one of the following three triggers:*

- *Off nominal frequency trigger set at:*

	Low	*High*
o *Eastern Interconnection*	*<59.75 Hz*	*>61.0 Hz*
o *Western Interconnection*	*<59.55 Hz*	*>61.0 Hz*
o *ERCOT Interconnection*	*<59.35 Hz*	*>61.0 Hz*
o *Hydro-Quebec Interconnection*	*<58.55 Hz*	*>61.5 Hz*

- *Rate of change of frequency trigger set at:*

o *Eastern Interconnection*	*< -0.03125 Hz/sec*	*> 0.125 Hz/sec*
o *Western Interconnection*	*< -0.05625 Hz/sec*	*> 0.125 Hz/sec*
o *ERCOT Interconnection*	*< -0.08125 Hz/sec*	*> 0.125 Hz/sec*

o *Hydro-Quebec Interconnection*	*< -0.18125 Hz/sec*	*> 0.1875 Hz/sec*

- *Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds.*

Requirement R8 ensures that DDR data is available on a continuous basis so that pre- and post-contingency timeframes can be analyzed. This continuous recording of data allows analysis for the evolving sequence of events that occur over an extended period of time, which may lead to large-scale system outages. DDR data is essential to this analysis process. Providing available data pre and post-contingency helps identify the causes and effects of each event leading to the outages. Continuously recording and storing such data is necessary to ensure that sufficient data is available for the entire Disturbance. Legacy DDR data recording equipment may not have the capability to record continuously. Therefore, to accommodate its use for the purpose of this standard, triggered records that meet the criteria of Parts 8.1 and 8.2 are acceptable if the equipment is installed prior to proposed PRC-002-2's effective date.[50]

(9) Requirement R9

R9. *Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 *Input sampling rate of at least 960 samples per second.*
9.2 *Output recording rate of electrical quantities of at least 30 times per second.*

Requirement R9 ensures consistency in DDR data sampling rates as well as the output recording rate. Using an input sampling rate of at least 960 samples per second (which

50 Frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery.

corresponds to 16 samples per cycle) on the input side of the DDR equipment ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency. Moreover, using an output rate recording rate of electrical quantities of at least 30 times per second provides these adequate recording speeds[51] to monitor low frequency oscillations during a Disturbance.

(10) Requirement R10

> ***R10.*** *Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*
>
> *10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.*
> 10.2 *Synchronized device clock accuracy within ± 2 milliseconds of UTC.*

Requirement R10 ensures time synchronization of large volumes of geographically dispersed records from diverse recording sources critical to Disturbance monitoring. SER, FR and DDR data are required to be time-synchronized using the Coordinated Universal Time ("UTC") standard and formatted either with or without local time offsets. [52] The accuracy of the time synchronization applies only to the clock used by the monitoring equipment.[53] However, the time synchronization of the data itself is not required because of the inherent delays associated with measuring the electrical quantities (data) and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc.

---

[51] An output-recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device.

[52] UTC is a recognized time standard that uses atomic clocks for generating precision time measurements. Local time offsets are expressed as a negative number (i.e. the difference between UTC and the local time zone where the measurements are recorded).

[53] The equipment used to measure the electrical quantities (FR, SER and DDR data) must be time synchronized to ± 2m/s accuracy.

Therefore, ensuring that the monitoring devices' internal clocks are within ± 2m/s accuracy is sufficient for time-synchronized data.

(11) Requirement R11

> ***R11.*** *Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*
>
> ***11.1*** *Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.*
>
> ***11.2*** *Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor.*
>
> ***11.3*** *SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2.*
>
> ***11.4*** *FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later.*
>
> ***11.5*** *Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.*

Requirement R11 standardizes formatting and naming of wide-area Disturbance data that significantly improves timely analysis.[54] Requirement R11 further provides for a reasonable time-period (30 calendar days) to collect data and perform any necessary calculations or formatting. Additionally, Requirement R11 provides for a practical time limit (10 calendar days) on the amount of time data must be stored and informs the requesting entities how long the data will be available. Retaining the data for any longer than 10 calendar days would be expensive and unnecessary. Any SER data recorded must be stored in simple ASCII.CSV format because

[54] Note that wide-area Disturbance analysis includes data recording from many devices and entities.

it will significantly improve data analysis for event records and enable using software tools to analyze SER data.[55] Part 11.4 provides for a well-established industry-standard formatting of FR and DDR data files,[56] while Part 11.5's standardized naming format provides for a streamlined analysis of large Disturbances, and includes critical records such as local time offset associated with the synchronization of the data.[57]

(12) Requirement R12

> ***R12.*** *Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*
>
> - *Restore the recording capability, or*
> - *Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.*

Requirement R12 ensures that all Transmission Owners and Generator Owners who own equipment used in collecting the required data have the ability to correct any failures and ensure the data is available for Disturbance analysis. However, an outage of the monitored Element does not constitute a failure of the Disturbance monitoring recording capability. Each Transmission and Generator Owner must restore recording capability within ninety calendar days. In the event the repairs cannot be made within 90 calendar days, the entity must develop a Corrective Action Plan ("CAP") for restoring the data recording capability.[58] The CAP timeline depends on the entity and type of data required.

---

55 ASCII.CSV format is outlined in Attachment 2. Either equipment can provide the data in this format or a simple conversion program can be used to convert files into this format.

56 Part 11.4 provides standard format IEEE c37.111, which is the IEEE Standard for Common Format for Transient Exchange (COMTRADE) revision 1999 or later.

57 Part 11.5 uses the standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), used for providing Disturbance monitoring data.

58 An entity may not be able to restore the data recording capability for a variety of reasons, such as budget cycle, service crew availability, vendor availability, needing to order parts or equipment, needed outages, etc.

4. Improvements and Consideration of Commission Directives

Proposed PRC-002-2 improves upon Reliability Standards PRC-002-1 and PRC-018-1. Proposed PRC-002-2 creates a single, consolidated Disturbance monitoring Reliability Standard. Proposed PRC-002-2 also includes revisions to remove "fill-in-the-blank" aspects in both Reliability Standards in response to Order No. 693. The proposed Reliability Standard is no longer dependent on regional criteria to provide appropriate data. This creates greater consistently in the data recordation and will allow for data to be compared across the continent during analysis of Bulk-Power System Disturbances. The proposed Reliability Standard also provides a consistent, continent-wide approach to determining what data must be recorded for analysis of Disturbances in response to the Commission's determinations and commenter suggestions in Order No. 693.

The emphasis in proposed PRC-002-2 has shifted from the prior Reliability Standards to reflect what Bulk Electric System data is captured rather than on the method for how Disturbance monitoring data is captured. There are a variety of ways to capture the data proposed PRC-002-2 addresses, and existing and currently available equipment can meet the Requirements of this standard. As a result, the proposed Reliability Standard improves data capturing practices while providing efficiency in the approach taken by utilizing existing methods for data collection. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of data capture.

In some instances, the Requirements of the proposed Reliability Standard are prescriptive in their nature. For example, Requirement R10 specifies a time synchronization requirement of ± 2m/s accuracy and the use of UTC. Task Force Recommendation No. 28 specifically called for a requirement to have time-synchronized data. In order to meet this Recommendation, Requirement R10 was developed to ensure that both existing and future installations of recording capability could meet the time synchronization requirement. Other instances of prescriptive Requirements are necessary to ensure that the intent of Recommendation No. 28 is realized. The Recommendation also stated:

> The Task Force supports the intent of this requirement strongly, but it recommends a broader approach:
>
> A. FERC and appropriate authorities in Canada should require the use of data recorders synchronized by signals from the Global Positioning System (GPS) on all categories of facilities whose data may be needed to investigate future system Disturbances, outages, or blackouts.
>
> B. NERC, reliability coordinators, control areas, and transmission owners should determine where high speed power system Disturbance recorders are needed on the system, and ensure that they are installed by December 31, 2004.
>
> C. NERC should establish data recording protocols.

The standard drafting team took these recommendations into consideration when developing the proposed Reliability Standard. Specific data recording protocols were included to address the concerns stated in the Final Blackout Report including the importance of having time-synchronized system data recorders. As noted in the Final Blackout Report, "the Task Force's investigators labored over thousands of data items to determine the sequence of events, much like putting together small pieces of a very large puzzle."[59] This process could have been significantly faster and easier if there had been wider use of synchronized data recording devices.

In summary, Commission approval of this proposed Reliability Standard will meet the Commission directives in Order No. 693 and complete work to implement multiple Recommendations from the both the NERC Board and the Task Force. It will also improve

---

analysis and modeling of Disturbances to assist in preventing future Disturbances in support of Task Force Recommendation No. 24 by including a version of PRC-002 in the NERC Reliability Standards that is mandatory and enforceable.

C. Enforceability of Proposed Reliability Standard

The proposed Reliability Standard PRC-002-2 includes Measures that support each Requirement to help ensure that the Requirements will be enforced in a clear, consistent, non-preferential manner and without prejudice to any party. The proposed Reliability Standard also includes VRFs and VSLs for each Requirement. The VRFs and VSLs for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment. A detailed analysis of the assignment of VRFs and the VSLs for proposed PRC-002-2 is included as Exhibit F.

V. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- the proposed Reliability Standard in Exhibit A;
- the other associated elements in the Reliability Standard in Exhibit A including the VRFs and VSLs (Exhibits A and F); and
- the Implementation Plan, including the noted retirements, included in Exhibit B.

Respectfully submitted,

/s/ William H. Edwards

Date: December 15, 2014

Exhibit A

Proposed Reliability Standard PRC-002-2

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate analysis of Bulk Electric System (BES) Disturbances.
4. **Applicability:**

    Functional Entities:

    4.1 The Responsible Entity is:

    4.1.1 Eastern Interconnection – Planning Coordinator

    4.1.2 ERCOT Interconnection – Planning Coordinator or Reliability Coordinator

    4.1.3 Western Interconnection – Reliability Coordinator

    4.1.4 Quebec Interconnection – Planning Coordinator or Reliability Coordinator

    4.2 Transmission Owner

    4.3 Generator Owner

5. **Effective Dates:**

    See Implementation Plan

B. Requirements and Measures

R1. Each Transmission Owner shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.

1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.

1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data is required, identified in accordance with PRC-002-2, Attachment 1, and evidence that all BES buses have been re-evaluated within the required intervals under Requirement R1. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings; or (3) station drawings.

R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltage for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission Lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data that is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a total record length of at least 30-cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. Evidence may include, but is not limited to: (1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1 Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following:

5.1.1 Generating resource(s) with:

5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA.

5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1,000 MVA.

5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL).

5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.

5.2 Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:

5.2.1 One BES Element; and

5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.

5.3 Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested.

5.4 Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the re-evaluated list of BES Elements as per the Implementation Plan.

M5. The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for which DDR data is required, developed in accordance with Requirement R5, Part 5.1 and Part 5.2; and re-evaluated in accordance with Part 5.4. The Responsible Entity has dated evidence (electronic or hard copy) that each Transmission Owner or Generator

Owner has been notified in accordance with Requirement 5, Part 5.3. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1 One phase-to-neutral or positive sequence voltage.

6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

8.2 At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recordings and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings.

R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of at least 960 samples per second.

9.2 Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specification, device configuration, or settings (R9, Part 9.1; R9, Part 9.2); or (2) actual data recordings (R9, Part 9.2).

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.

10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specification, configuration, or setting; (2) time synchronization indication or status; or 3) station drawings.

R11. Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.

11.2 Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor.

11.3 SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2.

11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later.

11.5 Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records; (2) documents describing data storage capability, device specification, configuration or settings; or (3) actual data recordings.

R12. Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- Restore the recording capability, or
- Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, (3) SCADA records, or (4) dated CAP transmittals to the Regional Entity and evidence that it implemented the CAP.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

Attachment 1

Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for sequence of events recording (SER) and Fault recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1,500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20 percent.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1,500 MVA or
- 20 percent of median MVA level determined in Step 5.

Step 7. <u>If there are no BES buses on the list:</u> the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

<u>If the list has 1 or more but less than or equal to 11 BES buses:</u> FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.

If the list has more than 11 BES buses: SER and FR data is required on at least the 10 percent of the BES buses determined in Step 6 with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20 percent of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for SER and FR data. The following BES bus locations are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident Transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Attachment 2

Sequence of Events Recording (SER) Data Format

(Requirement R11, Part 11.3)

Date, Time, Local Time Code, Substation, Device, State[1]

08/27/13, 23:58:57.110, -5, Sub 1, Breaker 1, Close

R10	TO | GO	X		
R11	TO | GO		X	
R12	TO | GO			X

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Functional Entities:

When the term "Responsible Entity" is used in PRC-002-2, it specifically refers to those entities listed under 4.1. The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those BES Elements selected. BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Attachment 1 provides a uniform methodology to identify those BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a Transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of Transmission Lines and other BES Elements connected to the BES bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on System reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause wide-area or cascading System events, so SER and FR data from those BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment.

Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data is required based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and System topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses.

Each Transmission Owner must re-evaluate the list of BES buses at least every five calendar years to address System changes since the previous evaluation. Changes to the BES do not mandate immediate inclusion of BES buses into the currently enforced list, but the list of BES buses will be re-evaluated at least every five calendar years to address System changes since the previous evaluation.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90-calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

Rationale for R2:
The intent is to capture SER data for the status (open/close) of the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a time synchronized clock, provides the basis for assembling the detailed sequence of events timeline of a power System Disturbance. Other status monitoring nomenclature can be used for devices other than circuit breakers.

Rationale for R3:
The required electrical quantities may either be directly measured or determinable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all BES bus phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for System Disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer. Generator step-up transformers (GSUs) and leads that connect the GSU transformer(s) to the Transmission System that are used exclusively to export energy directly from a BES generating unit or generating plant are excluded from Requirement R3 because the fault current contribution from a generator to a fault on the Transmission System will be captured by FR data on the Transmission System, and Transmission System FR will capture faults on the generator interconnection.

Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, when required, the Generator Owner is still responsible for the provision of this data.

Rationale for R4:
Time stamped pre- and post-trigger fault data aid in the analysis of power System operations and determination if operations were as intended. System faults generally persist for a short time period, thus a 30-cycle total minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time-synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30-contiguous cycles total.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

Rationale for R5:
DDR is used for capturing the BES transient and post-transient response following Disturbances, and the data is used for event analysis and validating System performance. DDR plays a critical role in wide-area Disturbance analysis, and Requirement R5 ensures there is adequate wide-area coverage of DDR data for specific BES Elements to facilitate accurate and efficient event analysis. The Responsible Entity has the best wide-area view of the System and needs to ensure that there are sufficient BES Elements identified for DDR data capture. The identification of BES Elements requiring DDR data as per Requirement R5 is based upon industry experience with wide-area Disturbance analysis and the need for adequate data to facilitate event analysis. Ensuring data is captured for these BES Elements will significantly improve the accuracy of analysis and understanding of why an event occurred, not simply what occurred.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-evaluation of the list is a reasonable interval for this review. Changes to the BES do not mandate immediate inclusion of BES Elements into the in force list, but the list of BES Elements will be re-evaluated at least every five calendar years to address System changes since the previous evaluation. However, this standard does not preclude the Responsible Entity from performing this re-evaluation more frequently to capture updated BES Elements.

The Responsible Entity, for the purposes of this standard, is defined as the PC or RC depending upon Interconnection, because they have the best overall perspective for determining wide-area DDR coverage. The Planning Coordinator and Reliability Coordinator assume different functions across the continent; therefore the Responsible Entity is defined in the Applicability Section and used throughout this standard.

The Responsible Entity must notify all owners of the selected BES Elements that DDR data is required for this standard. The Responsible Entity is only required to share the list of selected BES Elements that each Transmission Owner and Generator Owner respectively owns, not the entire list. This communication of selected BES Elements is required to ensure that the owners of the respective BES Elements are aware of their responsibilities under this standard.

Implementation of the monitoring equipment is the responsibility of the respective Transmission Owners and Generator Owners, the timeline for installing this capability is outlined in the Implementation Plan, and starts from notification of the list from the Responsible Entity. Data for each BES Element as defined by the Responsible Entity must be provided; however, this data can be either directly measured or accurately calculated. With the exception of HVDC circuits, DDR data is only required for one end or terminal of the BES Elements selected. For example, DDR data must be provided for at least one terminal of a Transmission Line or generator step-up (GSU) transformer, but not both terminals. For an interconnection between two Responsible Entities, each Responsible Entity will consider this interconnection independently, and are expected to work cooperatively to determine how to monitor the BES Elements that require DDR data. For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.

Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified BES Element in Requirement R5, Part 5.1; monitoring these BES Elements with DDR will facilitate thorough and informative event analysis of wide-area Disturbances on the BES. Part 5.2 is included to ensure wide-area coverage across all Responsible Entities. It is intended that each Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous peak System Demand.

Rationale for R6:
DDR is used to measure transient response to System Disturbances during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the BES buses within a location are at the same frequency, one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a BES bus are closed.

Rationale for R7:
A crucial part of wide-area Disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up transformer (GSU) measuring the specified electrical quantities to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how'. Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

Rationale for R8:
Large scale System outages generally are an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.

Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

Rationale for R9:
An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.
An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power System Disturbances.

Rationale for R10:
Time synchronization of Disturbance monitoring data is essential for time alignment of large volumes of geographically dispersed records from diverse recording sources. Coordinated Universal Time (UTC) is a recognized time standard that utilizes atomic clocks for generating precision time measurements. All data must be provided in UTC formatted time either with or without the local time offset, expressed as a negative number (the difference between UTC and the local time zone where the measurements are recorded).
Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices internal clocks are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.

Rationale for R11:
Wide-area Disturbance analysis includes data recording from many devices and entities. Standardized formatting and naming conventions of these files significantly improves timely analysis.

Providing the data within 30-calendar days (or the granted extension time), subject to Part 11.1, allows for reasonable time to collect the data and perform any necessary computations or formatting.

Data is required to be retrievable for 10-calendar days inclusive of the day the data was recorded, i.e. a 10-calendar day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10-

calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requestor of data has to be aware of the Part 11.1 10-calendar day retrievability because requiring data retention for a longer period of time is expensive and unnecessary.

SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve the data format for event records, enabling the use of software tools for analyzing the SER data.

Part 11.4 specifies FR and DDR data files be provided in conformance with IEEE C37.111, IEEE Standard for Common Format for Transient Exchange (COMTRADE), revision 1999 or later. The use of IEEE C37.111-1999 or later is well established in the industry. C37.111-2013 is a version of COMTRADE that includes an annex describing the application of the COMTRADE standard to synchrophasor data; however, version C37.111-1999 is commonly used in the industry today.

Part 11.5 uses a standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), for providing Disturbance monitoring data. This file format allows a streamlined analysis of large Disturbances, and includes critical records such as local time offset associated with the synchronization of the data.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90-calendar days to ensure that adequate data is available for event analysis. If the Disturbance monitoring capability cannot be restored within 90-calendar days (e.g. budget cycle, service crews, vendors, needed outages, etc.), the entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. It is treated as a failure if the recording capability is out of service for maintenance and/or testing for greater than 90-calendar days. An outage of the monitored BES Element does not constitute a failure of the Disturbance monitoring capability.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

PRC-002-2 addresses “what” data is recorded, not “how” it is recorded.

Guideline for Requirement R1:

Sequence of events and fault recording for the analysis, reconstruction, and reporting of System Disturbances is important. However, SER and FR data is not required at every BES bus on the BES to conduct adequate or thorough analysis of a Disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuits allows the precise reconstruction of events of both localized and wide-area Disturbances.

More quality information is always better than less when performing event analysis. However, 100 percent coverage of all BES Elements is not practical nor required for effective analysis of wide-area Disturbances. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses with breakers where crucial information is available when required.
2. Avoid excessive overlap of coverage.
3. Avoid gaps in critical coverage.
4. Provide coverage of BES Elements that could propagate a Disturbance.
5. Avoid mandates to cover BES Elements that are more likely to be a casualty of a Disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of Transmission Lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of Transmission Systems throughout the continent to analyze Transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause Cascading.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater System impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for Systems with more than 11 BES buses with three phase short circuit levels above 1,500 MVA.

1. Total number of BES buses in the Transmission System under evaluation.
   a. Only tangible substation or switchyard buses are included.
   b. Pseudo buses created for analysis purposes in System models are excluded.
2. Determine the three phase short circuit MVA for each BES bus.
3. Exclude BES buses from the list with short circuit levels below 1,500 MVA.
4. Determine the median short circuit for the top 11 BES buses on the list (position number 6).
5. Multiply median short circuit level by 20 percent.
6. Reduce the list of BES buses to those with short circuit levels higher than 20 percent of the median.
7. Apply SER and FR at BES buses with short circuit levels in the top 10 percent of the list (from 6).

8. Apply SER and FR at BES buses at an additional 10 percent of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
    - Electrically distant BES buses or electrically distant from other DME devices
    - Voltage sensitive areas
    - Cohesive load and generation zones
    - BES buses with a relatively high number of incident Transmission circuits
    - BES buses with reactive power devices
    - Major facilities interconnecting outside the Transmission Owner's area.

For event analysis purposes, more valuable information is attained about generators and their response to System events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The re-evaluation interval of five years was chosen based on the experience of the DMSDT to address changing System configurations while creating balance in the frequency of re-evaluations.

Guideline for Requirement R2:

Analyses of wide-area Disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the Disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. However, generator breakers directly connected to an identified BES bus are required to have SER data captured. It is important in event analysis to know when a BES bus is cleared regardless of a generator's loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's BES bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The BES Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission Lines

Only those BES Elements that are identified as BES as defined in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step-up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the Transmission System will be captured by FR data on the Transmission System.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the Transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities

For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings

The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a Transmission System is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:

$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings

Voltages are to be recorded or accurately determined at applicable BES buses.

Guideline for Requirement R4:

Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection System operations after a fault to determine if a protection System operated as designed. Generally speaking, BES faults persist for a very short time period, approximately 1 to 30 cycles, thus a 30-cycle record length provides adequate data. Multiple records allow for legacy microprocessor relays which, when time synchronized to a common clock, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30-contiguous cycles total.

A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for FR.

FR triggers can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, sub-Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, sub-Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area Disturbance monitoring to determine the System's electromechanical transient and post-transient response and validate System model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the System's dynamic response and ensuring sufficient coverage to determine System performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historical simultaneous peak System Demand. This DDR data is included to provide adequate System wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a Disturbance helps the analysis of large Disturbances. Having data regarding generator dynamic response to Disturbances greatly improves understanding of ***why*** an event occurs rather than what occurred. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.
- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.

The information in the spreadsheet does not provide information by which the plant information location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, sub-Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings "greater than or equal to 500 MVA". The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47 percent of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5 percent of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, sub-Part 5.1.1 is included to capture larger units located at large generating plants which could pose a stability risk to the System if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1,000 MVA. The 300 MVA threshold was chosen based on the DMSDT's judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. For combined cycle plants where only one generator has a rating greater than or equal to 300MVA, that is the only generator that would need DDR.

Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability have a significant impact on BES reliability and performance. Therefore, at least one BES Element of an SOL should be monitored.

The draft standard requires "One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs)." Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored BES

Element(s) and contingent BES Element(s). The standard does not dictate selection of the contingent and/or monitored BES Elements. Rather the Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area's response to large System excursions (voltage, frequency, etc.).

Guideline for Requirement R6:

DDR data shows transient response to System Disturbances after a fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the standard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available. For example, a breaker-and-a-half or double-bus configuration with a North (or East) Bus and South (or West) Bus, would require both buses to have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current recording is also acceptable.

For all circuits where current recording is required, Real and Reactive Power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6 apply to Requirement R7. Since either the high- or low-side windings of the generator step-up transformer (GSU) may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for Requirement R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Wide-area System outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high- or low-frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in System frequency which could be caused by large changes in generation or load, or possibly changes in System impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85 percent is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power System to a Disturbance and is used for analyzing complex power System events. This recording is typically used to capture short-term and long-term Disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency of a sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other Disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general, dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of Disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment.

Time synchronization accuracy is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

“Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…”

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

“Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…”

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

Guideline for Requirement R11:

This requirement directs the applicable entities, upon requests from the Responsible Entity, Regional Entity or NERC, to provide SER and FR data for BES buses determined in Requirement R1 and DDR data for BES Elements determined as per Requirement R5. To facilitate the analysis of BES Disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30-calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor. An entity may request an extension of the 30-day submission requirement. If granted by the requestor, the entity must submit the data within the approved extended time.

Requirement R11, Part 11.2 specifies that the minimum time period of 10-calendar days inclusive of the day the data was recorded for which the data will be retrievable. With the equipment in use that has the capability of recording data, having the data retrievable for the 10-calendar days is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10-calendar day time frame, an incident occurs on Day 1. If a request for data is made on Day 6, then that data has to be provided to the requestor within 30-calendar days after a request or a granted time extension. However, if a request for the data is made on Day 11, that is outside the 10-calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power System Disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange and is well established in the industry. It is necessary to specify a standard format as multiple submissions of data from many sources will be incorporated to provide a detailed analysis of a power System Disturbance. The latest revision of COMTRADE (C37.111-2013) includes an annex describing the application of the COMTRADE standard to synchophasor data.

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files. The first version was approved in 2007. From the August 14, 2003 blackout there were thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and it was therefore difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and Generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements, which were established in Requirements R1 and R5. The owners are to restore the capability within 90-calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a “reasonable” amount of capability out-of-service does not result in lack of sufficient data for coverage of the System. Furthermore, 90-calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to restore the capability within 90-calendar days, the requirement further provides that, for such cases, the entity submit a Corrective Action Plan (CAP) to the Regional Entity and implement it. These actions are considered to be appropriate to provide for robust and adequate data availability.

A. Introduction

1. **Title:** ~~Define Regional~~ Disturbance Monitoring and Reporting Requirements

2. **Number:** PRC-002-~~1~~2

~~3. **Purpose:** Ensure that Regional Reliability Organizations establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of Disturbance data to facilitate analyses of events and verify system models.~~

3. **Purpose:** To have adequate data available to facilitate analysis of Bulk Electric System (BES) Disturbances.

4. **Applicability:**

~~Regional~~ Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT Interconnection – Planning Coordinator or Reliability Coordinator

~~**4.1.**~~ **4.1.3** Western Interconnection – Reliability ~~Organization.~~Coordinator

4.1.4 Quebec Interconnection – Planning Coordinator or Reliability Coordinator

4.2 Transmission Owner

4.3 Generator Owner

~~5.~~ 5. **Effective** ~~Date: **Nine months after BOT adoption.**~~ **Dates:**

See Implementation Plan

B. Requirements and Measures

R1. ~~The Regional Reliability Organization~~Each Transmission Owner shall ~~establish the following installation requirements~~: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~**R1.**~~**1.1.** Identify BES buses for which sequence of ~~event~~events recording~~:~~ (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.

1.2. ~~Location, monitoring and recording requirements~~Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.

1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

M1. The Transmission Owner has a dated (electronic or hard copy) list of BES buses for which SER and FR data is required, identified in accordance with PRC-002-2, Attachment 1, and evidence that all BES buses have been re-evaluated within the required intervals under Requirement R1. The Transmission Owner will also have dated (electronic or hard copy) evidence that it notified other owners in accordance with Requirement R1.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of SER data for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device interconnections and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings; or (3) station drawings.

R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1 Phase-to-neutral voltage for each phase of each specified BES bus.

3.2 Each phase current and the residual or neutral current for the following BES Elements:

3.2.1 Transformers that have a low-side operating voltage of 100kV or above.

3.2.2 Transmission Lines.

M3. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of FR data that is sufficient to determine electrical quantities as specified in Requirement R3. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1 A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a total record length of at least 30-cycles for the same trigger point, or
- At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder.

4.2 A minimum recording rate of 16 samples per cycle.

4.3 Trigger settings for at least the following:

4.3.1 Neutral (residual) overcurrent.

4.3.2 Phase undervoltage or overcurrent.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that FR data meets Requirement R4. Evidence may include, but is not limited to: (1) documents describing the device specification (R4, Part 4.2) and device configuration or settings (R4, Parts 4.1 and 4.3), or (2) actual data recordings or derivations.

R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~**R1.1.**~~**5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following:

- ~~Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).~~
- ~~Devices to be monitored.~~

~~**R2.** The Regional Reliability Organization shall establish the following installation requirements for fault recording:~~

~~**2.1.** Location, monitoring and recording requirements, including the following:~~

- ~~Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).~~

5.1.1 Generating resource(s) with:

5.1.1.1 Gross individual nameplate rating greater than or equal to 500 MVA.

5.1.1.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1,000 MVA.

5.1.2 Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).

5.1.3 Each terminal of a high voltage direct current (HVDC) circuit with a nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter.

5.1.4 One or more BES Elements ~~to be monitored~~that are part of an Interconnection Reliability Operating Limit (IROL).

5.1.5 Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program.

5.2 Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least:

5.2.1 One BES Element; and

5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand.

5.3 Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested.

5.4 Re-evaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the re-evaluated list of BES Elements as per the Implementation Plan.

~~P2.1.2.~~**M5.** The Responsible Entity has a dated (electronic or hard copy) list of BES Elements for which DDR data is required, developed in accordance with Requirement R5, Part 5.1 and Part 5.2; and re-evaluated in accordance with Part 5.4. The Responsible Entity has dated evidence (electronic or hard copy) that each ~~location.~~Transmission Owner or Generator Owner has been notified in accordance with Requirement 5, Part 5.3. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

- ~~Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:~~

R6. ~~Three~~Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~R2.1.3.1.~~**6.1** One phase-~~-~~to-~~-~~neutral ~~voltages~~or positive sequence voltage.

~~2.1..2. Three phase currents and neutral currents.~~

~~2.1..3. Polarizing currents and voltages, if used.~~

~~2.1..4. Frequency.~~

~~2.1..5. Megawatts and megavars.~~

~~Technical requirements, including~~**6.2** The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current.

6.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1.

M6. The Transmission Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R6. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

7.1 One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up transformer (GSU) high-side or low-side voltage level.

7.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

7.3 Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required.

7.4 Frequency of at least one of the voltages in Requirement R7, Part 7.1.

M7. The Generator Owner has evidence (electronic or hard copy) of DDR data to determine electrical quantities as specified in Requirement R7. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings or derivations; or (3) station drawings.

R8. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1 Triggered record lengths of at least three minutes.

~~**R2.2.**~~**8.2** At least one of the following~~:~~ three triggers:

- ~~Recording duration requirements.~~

- ~~Minimum~~
  - Off nominal frequency trigger set at:

	Low	High
○ Eastern Interconnection	<59.75 Hz	>61.0 Hz
○ Western Interconnection	<59.55 Hz	>61.0 Hz
○ ERCOT Interconnection	<59.35 Hz	>61.0 Hz
○ Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

○ Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
○ Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
○ ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
○ Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set no lower than 85 percent of normal operating voltage for a duration of 5 seconds.

M8. Each Transmission Owner and Generator Owner has dated evidence (electronic or hard copy) of data recordings and storage in accordance with Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations, which may include a single design standard as representative for common installations; or (2) actual data recordings.

R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 Input sampling rate of ~~16 samples per cycle.~~

~~Event triggering requirements.~~

~~**R2.** The Regional Reliability Organization shall establish the following installation requirements for dynamic Disturbance recording:~~

~~**2.2.** Location, monitoring and recording requirements including the following:~~

- ~~Criteria for equipment location giving consideration to the following:~~
  - ~~Site(s) in or near major load centers~~
  - ~~Site(s) in or near major generation clusters~~
  - ~~Site(s) in or near major voltage sensitive areas~~
  - ~~Site(s) on both sides of major transmission interfaces~~
  - ~~A major transmission junction~~
  - ~~Elements associated with Interconnection Reliability Operating Limits~~
  - ~~Major EHV interconnections between control areas~~
  - ~~Coordination with neighboring regions within the interconnection~~
- ~~Elements and number of phases to be monitored at each location.~~
- ~~Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:~~

~~**2.2..0.** Voltage, current and frequency.~~

~~**2.2..0.** Megawatts and megavars.~~

~~**2.2.** Technical requirements, including the following:~~

- ~~Capability for continuous recording for devices installed after January 1, 2009.~~

~~P3.2.2.Each device shall sample data at a rate of~~ at least 960 samples per second ~~and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.~~ .

~~The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following:~~

~~**3.0.** Criteria for events that require the collection of data from DMEs.~~

~~**3.0.** List of entities that must be provided with recorded Disturbance data.~~

~~**3.0.** Timetable for response to data request.~~

~~3.1. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE[1] analysis tool,~~

~~Naming of data files~~**9.2** Output recording rate of electrical quantities of at least 30 times per second.

M9. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that DDR data meets Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specification, device configuration, or settings (R9, Part 9.1; R9, Part 9.2); or (2) actual data recordings (R9, Part 9.2).

R10. Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset.

10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

M10. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) of time synchronization described in Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specification, configuration, or setting; (2) time synchronization indication or status; or 3) station drawings.

R11. Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1 Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded.

11.2 Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor.

11.3 SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2.

~~[1] IEEE C37.111-1999 IEEE Standard Common Format for Transient Data Exchange for Power Systems or its successor standard~~

11.4 FR and DDR data will be provided in electronic files that are formatted in conformance with ~~the IEEE~~ C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later.

~~R4.5.~~11.5 Data files will be named in conformance with C37.232 ~~Recommended Practice~~, IEEE Standard for Common Format for Naming Time Sequence Data Files[2]~~.~~ (COMNAME), revision C37.232-2011 or later.

~~3.2. Data content requirements and guidelines.~~

~~R3. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.~~

~~R3. The Regional Reliability Organization shall periodically (at least every five years) review, update and approve its Regional requirements for Disturbance monitoring and reporting.~~

~~D. Measures~~

~~M0. The Regional Reliability Organization's requirements for the installation of Disturbance Monitoring Equipment shall address Requirements 1 through 3.~~

~~M0. The Regional Reliability Organization's Disturbance monitoring data reporting requirements shall include all elements identified in Requirements 4.~~

~~M0. The Regional Reliability Organization shall have evidence it provided its Regional Disturbance monitoring and reporting requirements as required in Requirement 5.~~

~~M0. The Regional Reliability Organization shall have evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in Requirement 6.~~

M11. The Transmission Owner or Generator Owner has evidence (electronic or hard copy) that data was submitted upon request in accordance with Requirement R11. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records; (2) documents describing data storage capability, device specification, configuration or settings; or (3) actual data recordings.

R12. Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the recording capability for the SER, FR or DDR data, either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- Restore the recording capability, or
- Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

~~[2] Compliance with this requirement is not effective until the IEEE Standard is approved.~~

M12. The Transmission Owner or Generator Owner has dated evidence (electronic or hard copy) that meets Requirement R12. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, (3) SCADA records, or (4) dated CAP transmittals to the Regional Entity and evidence that it implemented the CAP.

~~D.~~C. Compliance

1. Compliance Monitoring Process

1.1. Compliance ~~Monitoring Responsibility~~Enforcement Authority

As defined in the NERC~~.~~

~~1.2.~~ Rules of Procedure, "Compliance ~~**Monitoring Period and Reset Time Frame**~~

~~One calendar year.~~

~~**1.2. Data Retention**~~

~~The~~ Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability ~~Organization shall retain documentation of its DME requirements for three years~~Standards.

~~The Compliance Monitor will retain its audit data for three years.~~

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years.

The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is completed and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

~~The Regional Reliability Organization shall demonstrate compliance through providing its documentation of Disturbance Monitoring and Reporting requirements or self-certification as determined by the Compliance Monitor.~~

~~**2. Levels of Non-Compliance**~~

~~**2.1. Level 1:** There shall be a level one non-compliance if either of the following conditions exist:~~

~~**2.1.1** Disturbance data reporting requirements were not specified as required in R4.1 through R4.6.~~

~~**2.1.2** No evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in R6.~~

~~**2.2. Level 2:** There shall be a level two non-compliance if any of the following conditions exist:~~

~~**2.2.1** Technical requirements were not specified for one or more types of DMEs.~~

~~**2.2.2** Requirements do not provide criteria for equipment location or criteria for monitored elements or monitored quantities as required R1, R2 and R3.~~

~~**2.3. Level 3:** Not applicable.~~

~~**2.4. Level 4:** Disturbance monitoring and reporting requirements were not available or were not provided to Transmission Owners and Generator Owners.~~

~~D. Regional Differences~~

~~None identified.~~

None

Attachment 1

Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data

(Requirement R1)

To identify monitored BES buses for sequence of events recording (SER) and Fault recording (FR) data required by Requirement 1, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES buses that it owns.

For the purposes of this standard, a single BES bus includes physical buses with breakers connected at the same voltage level within the same physical location sharing a common ground grid. These buses may be modeled or represented by a single node in fault studies. For example, ring bus or breaker-and-a-half bus configurations are considered to be a single bus.

Step 2. Reduce the list to those BES buses that have a maximum available calculated three phase short circuit MVA of 1,500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES buses on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer buses, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 BES buses determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20 percent.

Step 6. Reduce the BES buses on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

- 1,500 MVA or
- 20 percent of median MVA level determined in Step 5.

Step 7. If there are no BES buses on the list: the procedure is complete and no FR and SER data will be required. Proceed to Step 9.

If the list has 1 or more but less than or equal to 11 BES buses: FR and SER data is required at the BES bus with the highest maximum available calculated three phase short circuit MVA as determined in Step 3. Proceed to Step 9.

If the list has more than 11 BES buses: SER and FR data is required on at least the 10 percent of the BES buses determined in Step 6 with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. SER and FR data is required at additional BES buses on the list determined in Step 6. The aggregate of the number of BES buses determined in Step 7 and this Step will be at least 20 percent of the BES buses determined in Step 6.

The additional BES buses are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for SER and FR data. The following BES bus locations are recommended:

- Electrically distant buses or electrically distant from other DME devices.
- Voltage sensitive areas.
- Cohesive load and generation zones.
- BES buses with a relatively high number of incident Transmission circuits.
- BES buses with reactive power devices.
- Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored BES buses for SER and FR data for Requirement R1 is the aggregate of the BES buses determined in Steps 7 and 8.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Functional Entities:

When the term "Responsible Entity" is used in PRC-002-2, it specifically refers to those entities listed under 4.1. The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the BES Elements for which dynamic Disturbance recording (DDR) data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those BES Elements selected. BES buses where sequence of events recording (SER) and fault recording (FR) data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses. The Transmission Owners and Generator Owners that own BES Elements on those BES buses will have the responsibility for ensuring that adequate data is available.

Rationale for R1:

Analysis and reconstruction of BES events requires SER and FR data from key BES buses. Attachment 1 provides a uniform methodology to identify those BES buses. Repeated testing of the Attachment 1 methodology has demonstrated the proper distribution of SER and FR data collection. Review of actual BES short circuit data received from the industry in response to the DMSDT's data request (June 5, 2013 through July 5, 2013) illuminated a strong correlation between the available short circuit MVA at a Transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of Transmission Lines and other BES Elements connected to the BES bus, and (iii) the number and size of generating units connected to the bus. BES buses with a large short circuit MVA level are BES Elements that have a significant effect on System reliability and performance. Conversely, BES buses with very low short circuit MVA levels seldom cause wide-area or cascading System events, so SER and FR data from those BES Elements are not as significant. After analyzing and reviewing the collected data submittals from across the continent, the threshold MVA values were chosen to provide sufficient data for event analysis using engineering and operational judgment.

Concerns have existed that the defined methodology for bus selection will overly concentrate data to selected BES buses. For the purpose of PRC-002-2, there are a minimum number of BES buses for which SER and FR data is required based on the short circuit level. With these concepts and the objective being sufficient recording coverage for event analysis, the DMSDT developed the procedure in Attachment 1 that utilizes the maximum available calculated three phase short circuit MVA. This methodology ensures comparable and sufficient coverage for SER and FR data regardless of variations in the size and System topology of Transmission Owners across all Interconnections. Additionally, this methodology provides a degree of flexibility for the use of judgment in the selection process to ensure sufficient distribution.

BES buses where SER and FR data is required are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their Systems to determine those buses.

Each Transmission Owner must re-evaluate the list of BES buses at least every five calendar years to address System changes since the previous evaluation. Changes to the BES do not mandate immediate inclusion of BES buses into the currently enforced list, but the list of BES buses will be re-evaluated at least every five calendar years to address System changes since the previous evaluation.

Since there may be multiple owners of equipment that comprise a BES bus, the notification required in R1 is necessary to ensure all owners are notified.

A 90-calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

Rationale for R2:
The intent is to capture SER data for the status (open/close) of the circuit breakers that can interrupt the current flow through each BES Element connected to a BES bus. Change of state of circuit breaker position, time stamped according to Requirement R10 to a time synchronized clock, provides the basis for assembling the detailed sequence of events timeline of a power System Disturbance. Other status monitoring nomenclature can be used for devices other than circuit breakers.

Rationale for R3:
The required electrical quantities may either be directly measured or determinable if sufficient FR data is captured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all BES bus phase-to-neutral voltages are required to be determinable for each BES bus identified in Requirement R1. BES bus voltage data is adequate for System Disturbance analysis. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation. For transformers (Part 3.2.1), the data may be from either the high-side or the low-side of the transformer. Generator step-up transformers (GSUs) and leads that connect the GSU transformer(s) to the Transmission System that are used exclusively to export energy directly from a BES generating unit or generating plant are excluded from Requirement R3 because the fault current contribution from a generator to a fault on the Transmission System will be captured by FR data on the Transmission System, and Transmission System FR will capture faults on the generator interconnection.

Generator Owners may install this capability or, where the Transmission Owners already have suitable FR data, contract with the Transmission Owner. However, when required, the Generator Owner is still responsible for the provision of this data.

Rationale for R4:

Time stamped pre- and post-trigger fault data aid in the analysis of power System operations and determination if operations were as intended. System faults generally persist for a short time period, thus a 30-cycle total minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time-synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30-contiguous cycles total.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point on wave data for recreating accurate fault conditions.

Rationale for R5:

DDR is used for capturing the BES transient and post-transient response following Disturbances, and the data is used for event analysis and validating System performance. DDR plays a critical role in wide-area Disturbance analysis, and Requirement R5 ensures there is adequate wide-area coverage of DDR data for specific BES Elements to facilitate accurate and efficient event analysis. The Responsible Entity has the best wide-area view of the System and needs to ensure that there are sufficient BES Elements identified for DDR data capture. The identification of BES Elements requiring DDR data as per Requirement R5 is based upon industry experience with wide-area Disturbance analysis and the need for adequate data to facilitate event analysis. Ensuring data is captured for these BES Elements will significantly improve the accuracy of analysis and understanding of why an event occurred, not simply what occurred.

From its experience with changes to the Bulk Electric System that would affect DDR, the DMSDT decided that the five calendar year re-evaluation of the list is a reasonable interval for this review. Changes to the BES do not mandate immediate inclusion of BES Elements into the in force list, but the list of BES Elements will be re-evaluated at least every five calendar years to address System changes since the previous evaluation. However, this standard does not preclude the Responsible Entity from performing this re-evaluation more frequently to capture updated BES Elements.

The Responsible Entity, for the purposes of this standard, is defined as the PC or RC depending upon Interconnection, because they have the best overall perspective for determining wide-area DDR coverage. The Planning Coordinator and Reliability Coordinator assume different functions across the continent; therefore the Responsible Entity is defined in the Applicability Section and used throughout this standard.

The Responsible Entity must notify all owners of the selected BES Elements that DDR data is required for this standard. The Responsible Entity is only required to share the list of selected BES Elements that each Transmission Owner and Generator Owner respectively owns, not the entire list. This communication of selected BES Elements is required to ensure that the owners of the respective BES Elements are aware of their responsibilities under this standard.

Implementation of the monitoring equipment is the responsibility of the respective Transmission Owners and Generator Owners, the timeline for installing this capability is outlined in the Implementation Plan, and starts from notification of the list from the Responsible Entity. Data for each BES Element as defined by the Responsible Entity must be provided; however, this data can be either directly measured or accurately calculated. With the exception of HVDC circuits, DDR data is only required for one end or terminal of the BES Elements selected. For example, DDR data must be provided for at least one terminal of a Transmission Line or generator step-up (GSU) transformer, but not both terminals. For an interconnection between two Responsible Entities, each Responsible Entity will consider this interconnection independently, and are expected to work cooperatively to determine how to monitor the BES Elements that require DDR data. For an interconnection between two TO's, or a TO and a GO, the Responsible Entity will determine which entity will provide the data. The Responsible Entity will notify the owners that their BES Elements require DDR data.

Refer to the Guidelines and Technical Basis Section for more detail on the rationale and technical reasoning for each identified BES Element in Requirement R5, Part 5.1; monitoring these BES Elements with DDR will facilitate thorough and informative event analysis of wide-area Disturbances on the BES. Part 5.2 is included to ensure wide-area coverage across all Responsible Entities. It is intended that each Responsible Entity will have DDR data for one BES Element and at least one additional BES Element per 3,000 MW of its historical simultaneous peak System Demand.

Rationale for R6:

DDR is used to measure transient response to System Disturbances during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage. The electrical quantities can be determined (calculated, derived, etc.).

Because all of the BES buses within a location are at the same frequency, one frequency measurement is adequate.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a BES bus are closed.

Rationale for R7:

A crucial part of wide-area Disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up transformer (GSU) measuring the specified electrical quantities to adequately capture generator response. This standard defines the 'what' of DDR, not the 'how'. Generator Owners may install this capability or, where the Transmission Owners already have suitable DDR data, contract with the Transmission Owner. However, the Generator Owner is still responsible for the provision of this data.

Rationale for R8:

Large scale System outages generally are an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Data available pre- and

post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data is available for the entire event.
Existing DDR data recording across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

Rationale for R9:
An input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.
An output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor the low frequency oscillations typically of interest during power System Disturbances.

Rationale for R10:
Time synchronization of Disturbance monitoring data is essential for time alignment of large volumes of geographically dispersed records from diverse recording sources. Coordinated Universal Time (UTC) is a recognized time standard that utilizes atomic clocks for generating precision time measurements. All data must be provided in UTC formatted time either with or without the local time offset, expressed as a negative number (the difference between UTC and the local time zone where the measurements are recorded).
Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment. The equipment used to measure the electrical quantities must be time synchronized to ± 2 ms accuracy; however, accuracy of the application of this time stamp and therefore the accuracy of the data itself is not mandated. This is because of inherent delays associated with measuring the electrical quantities and events such as breaker closing, measurement transport delays, algorithm and measurement calculation techniques, etc. Ensuring that the monitoring devices internal clocks are within ± 2 ms accuracy will suffice with respect to providing time synchronized data.

Rationale for R11:
Wide-area Disturbance analysis includes data recording from many devices and entities. Standardized formatting and naming conventions of these files significantly improves timely analysis.

Providing the data within 30-calendar days (or the granted extension time), subject to Part 11.1, allows for reasonable time to collect the data and perform any necessary computations or formatting.

Data is required to be retrievable for 10-calendar days inclusive of the day the data was recorded, i.e. a 10-calendar day rolling window of available data. Data hold requests are usually initiated the same or next day following a major event for which data is requested. A 10-calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities as to how long the data will be available. The requestor of data has to be aware of the Part 11.1 10-calendar day retrievability because requiring data retention for a longer period of time is expensive and unnecessary.

SER data shall be provided in a simple ASCII .CSV format as outlined in Attachment 2. Either equipment can provide the data or a simple conversion program can be used to convert files into this format. This will significantly improve the data format for event records, enabling the use of software tools for analyzing the SER data.

Part 11.4 specifies FR and DDR data files be provided in conformance with IEEE C37.111, IEEE Standard for Common Format for Transient Exchange (COMTRADE), revision 1999 or later. The use of IEEE C37.111-1999 or later is well established in the industry. C37.111-2013 is a version of COMTRADE that includes an annex describing the application of the COMTRADE standard to synchrophasor data; however, version C37.111-1999 is commonly used in the industry today.

Part 11.5 uses a standardized naming format, C37.232-2011, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), for providing Disturbance monitoring data. This file format allows a streamlined analysis of large Disturbances, and includes critical records such as local time offset associated with the synchronization of the data.

Rationale for R12:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures within 90-calendar days to ensure that adequate data is available for event analysis. If the Disturbance monitoring capability cannot be restored within 90-calendar days (e.g. budget cycle, service crews, vendors, needed outages, etc.), the entity must develop a Corrective Action Plan (CAP) for restoring the data recording capability. The timeline required for the CAP depends on the entity and the type of data required. It is treated as a failure if the recording capability is out of service for maintenance and/or testing for greater than 90-calendar days. An outage of the monitored BES Element does not constitute a failure of the Disturbance monitoring capability.

Guidelines and Technical Basis Section

Introduction

The emphasis of PRC-002-2 is not on how Disturbance monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of BES data capture.

The data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

PRC-002-2 addresses "what" data is recorded, not "how" it is recorded.

Guideline for Requirement R1:

Sequence of events and fault recording for the analysis, reconstruction, and reporting of System Disturbances is important. However, SER and FR data is not required at every BES bus on the BES to conduct adequate or thorough analysis of a Disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuits allows the precise reconstruction of events of both localized and wide-area Disturbances.

More quality information is always better than less when performing event analysis. However, 100 percent coverage of all BES Elements is not practical nor required for effective analysis of wide-area Disturbances. Therefore, selectivity of required BES buses to monitor is important for the following reasons:

1. Identify key BES buses with breakers where crucial information is available when required.
2. Avoid excessive overlap of coverage.
3. Avoid gaps in critical coverage.
4. Provide coverage of BES Elements that could propagate a Disturbance.
5. Avoid mandates to cover BES Elements that are more likely to be a casualty of a Disturbance rather than a cause.
6. Establish selection criteria to provide effective coverage in different regions of the continent.

The major characteristics available to determine the selection process are:

1. System voltage level;
2. The number of Transmission Lines into a substation or switchyard;
3. The number and size of connected generating units;
4. The available short circuit levels.

Although it is straightforward to establish criteria for the application of identified BES buses, analysis was required to establish a sound technical basis to fulfill the required objectives.

To answer these questions and establish criteria for BES buses of SER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The MVA Team collected information from a wide variety of Transmission Systems throughout the continent to analyze Transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SER and FR coverage, based solely upon simple, bright line characteristics, such as the number of lines into a substation or switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Methodology for Selecting Buses for Capturing Sequence of Events Recording (SER) and Fault Recording (FR) Data is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent.
2. It is likely to select buses near large generation centers.
3. It is likely to select buses where delayed clearing can cause Cascading.
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater System impact.

To perform the calculations of Attachment 1, the following information below is required and the following steps (provided in summary form) are required for Systems with more than 11 BES buses with three phase short circuit levels above 1,500 MVA.

1. Total number of BES buses in the Transmission System under evaluation.
    a. Only tangible substation or switchyard buses are included.
    b. Pseudo buses created for analysis purposes in System models are excluded.
2. Determine the three phase short circuit MVA for each BES bus.
3. Exclude BES buses from the list with short circuit levels below 1,500 MVA.
4. Determine the median short circuit for the top 11 BES buses on the list (position number 6).
5. Multiply median short circuit level by 20 percent.
6. Reduce the list of BES buses to those with short circuit levels higher than 20 percent of the median.

7. Apply SER and FR at BES buses with short circuit levels in the top 10 percent of the list (from 6).
8. Apply SER and FR at BES buses at an additional 10 percent of the list using engineering judgment, and allowing flexibility to factor in the following considerations:
   - Electrically distant BES buses or electrically distant from other DME devices
   - Voltage sensitive areas
   - Cohesive load and generation zones
   - BES buses with a relatively high number of incident Transmission circuits
   - BES buses with reactive power devices
   - Major facilities interconnecting outside the Transmission Owner's area.

For event analysis purposes, more valuable information is attained about generators and their response to System events pre- and post-contingency through DDR data versus SER or FR records. SER data of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). As a result, this standard only requires DDR data.

The re-evaluation interval of five years was chosen based on the experience of the DMSDT to address changing System configurations while creating balance in the frequency of re-evaluations.

Guideline for Requirement R2:

Analyses of wide-area Disturbances often begin by evaluation of SERs to help determine the initiating event(s) and follow the Disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR data, since generator loading can be essentially zero regardless of breaker position. However, generator breakers directly connected to an identified BES bus are required to have SER data captured. It is important in event analysis to know when a BES bus is cleared regardless of a generator's loading.

Generator Owners are included in this requirement because a Generator Owner may, in some instances, own breakers directly connected to the Transmission Owner's BES bus.

Guideline for Requirement R3:

The BES buses for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The BES Elements connected to those BES buses for which FR data is required include:

- Transformers with a low-side operating voltage of 100kV or above
- Transmission Lines

Only those BES Elements that are identified as BES as defined in the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100kV are not included.

FR data must be determinable from each terminal of a BES Element connected to applicable BES buses.

Generator step-up transformers (GSU) are excluded from the above based on the following:

- Current contribution from a generator in case of fault on the Transmission System will be captured by FR data on the Transmission System.
- For faults on the interconnection to generating facilities it is sufficient to have fault current data from the Transmission station end of the interconnection. Current contribution from a generator can be readily calculated if needed.

The DMSDT, after consulting with NERC's Event Analysis group, determined that DDR data from selected generator locations was more important for event analysis than FR data.

Recording of Electrical Quantities
For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FR data it is possible to determine all fault types. FR data also augments SERs in evaluating circuit breaker operation.

Current Recordings
The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a Transmission System is generally well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_r$, is calculated as a sum of vectors of three phase currents:

$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's Law. Fault currents for one of the BES Elements connected to a particular BES bus can be derived as a vectorial sum of fault currents recorded at the other BES Elements connected to that BES bus.

Voltage Recordings
Voltages are to be recorded or accurately determined at applicable BES buses.

Guideline for Requirement R4:

Pre- and post-trigger fault data along with the SER breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection System operations after a fault to determine if a protection System operated as designed. Generally speaking, BES faults persist for a very short time period, approximately 1 to 30 cycles, thus a 30-cycle record length provides adequate data. Multiple records allow for legacy microprocessor relays which, when time synchronized to a common clock, are capable of providing adequate fault data but not capable of providing fault data in a single record with 30-contiguous cycles total.

A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for FR.

FR triggers can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R4, sub-Part 4.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R4, sub-Part 4.3.2 specifies a phase undervoltage or overcurrent trigger for phase-to-phase faults.

Guideline for Requirement R5:

DDR data is used for wide-area Disturbance monitoring to determine the System's electromechanical transient and post-transient response and validate System model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the System's dynamic response and ensuring sufficient coverage to determine System performance, DDR is required for key BES Elements in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient DDR data capture for, at a minimum, one BES Element and then one additional BES Element per 3,000 MW of historical simultaneous peak System Demand. This DDR data is included to provide adequate System wide coverage across an Interconnection. To clarify, if any of the key BES Elements requiring DDR monitoring are within the Responsible Entity's area, DDR data capability is required. If a Responsible Entity (PC or RC) does not meet the requirements of Part 5.1, additional coverage had to be specified.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a Disturbance helps the analysis of large Disturbances. Having data regarding generator dynamic response to Disturbances greatly improves understanding of ***why*** an event occurs rather than what occurred. To determine and provide the basis for unit size criteria, the DMSDT acquired specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which was reported in 2013 to the NERC GADS program. The DMSDT analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The DMSDT determined the following basic information about the generating units of interest (current North America fleet, i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.
- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.

The information in the spreadsheet does not provide information by which the plant information location of each unit can be determined, i.e. the DMSDT could not use the information to determine which units were located together at a given generation site or facility.

From this information, the DMSDT was able to reasonably speculate the generating unit size thresholds proposed in Requirement R5, sub-Part 5.1.1 of the standard. Generating resources intended for DDR data recording are those individual units with gross nameplate ratings "greater than or equal to 500 MVA". The 500 MVA individual unit size threshold was selected because this number roughly accounts for 47 percent of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5 percent of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R5, sub-Part 5.1.1 is included to capture larger units located at large generating plants which could pose a stability risk to the System if multiple large units were lost due to electrical or non-electrical contingencies. For generating plants, each individual generator at the plant/facility with a gross nameplate rating greater than or equal to 300 MVA must have DDR where the gross nameplate rating of the plant/facility is greater than or equal to 1,000 MVA. The 300 MVA threshold was chosen based on the DMSDT's judgment and experience. The incremental impact to the number of units requiring monitoring is expected to be relatively low. For combined cycle plants where only one generator has a rating greater than or equal to 300MVA, that is the only generator that would need DDR.

Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability have a significant impact on BES reliability and performance. Therefore, at least one BES Element of an SOL should be monitored.

The draft standard requires "One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROLs)." Interconnection Reliability Operating Limits (IROLs) are included because the risk of violating these limits poses a risk to System stability and the potential for cascading outages. IROLs may be defined by a single or multiple monitored BES Element(s) and contingent BES Element(s). The standard does not dictate selection of the contingent and/or monitored BES Elements. Rather the Drafting Team believes this determination is best made by the Responsible Entity for each IROL considered based on the severity of violating this IROL.

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are generally areas of significant Demand. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective BES Element to monitor for DDR such that action of the UVLS or voltage instability on the BES could be captured. For example, a major 500kV or 230kV substation on the EHV System close to the load pocket where the UVLS is deployed would likely be a valuable electrical location for DDR coverage and would aid in post-Disturbance analysis of the load area's response to large System excursions (voltage, frequency, etc.).

Guideline for Requirement R6:

DDR data shows transient response to System Disturbances after a fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of BES Elements defined by the Responsible Entity (PC or RC) in Requirement R5. The intent of the standard is not to require a separate voltage measurement of each BES Element where a common bus voltage measurement is available. For example, a breaker-and-a-half or double-bus configuration with a North (or East) Bus and South (or West) Bus, would require both buses to have voltage recording because either can be taken out of service indefinitely with the targeted BES Element remaining in service. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either of the bus voltage sources to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

It must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current recording is also acceptable.

For all circuits where current recording is required, Real and Reactive Power will be recorded on a three phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R7:

All Guidelines specified for Requirement R6 apply to Requirement R7. Since either the high- or low-side windings of the generator step-up transformer (GSU) may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As was explained in the Guideline for Requirement R6, the BES is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Again it must be emphasized that the data requirements for PRC-002-2 are based on a System configuration assuming all normally closed circuit breakers on a bus are closed.

Guideline for Requirement R8:

Wide-area System outages are generally an evolving sequence of events that occur over an extended period of time, making DDR data essential for event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the BES Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist for some BES Elements that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R8, Part 8.2:

- Off nominal frequency triggers are used to capture high- or low-frequency excursions of significant size based on the Interconnection size and inertia.
- Rate of change of frequency triggers are used to capture major changes in System frequency which could be caused by large changes in generation or load, or possibly changes in System impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR) events. A sustained voltage of 85 percent is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R9:

DDR data contains the dynamic response of a power System to a Disturbance and is used for analyzing complex power System events. This recording is typically used to capture short-term and long-term Disturbances, such as a power swing. Since the data of interest is changing over time, DDR data is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in FR data.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency of a sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better the representation. In the abnormal conditions of interest (e.g. faults or other Disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general, dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R10: Time synchronization of Disturbance monitoring data allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of time synchronization applies only to the clock used for synchronizing the monitoring equipment.

Time synchronization accuracy is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

“Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…”

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

"Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…"

From NPCC's SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

Guideline for Requirement R11:

This requirement directs the applicable entities, upon requests from the Responsible Entity, Regional Entity or NERC, to provide SER and FR data for BES buses determined in Requirement R1 and DDR data for BES Elements determined as per Requirement R5. To facilitate the analysis of BES Disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R11, Part 11.1 specifies the maximum time frame of 30-calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor. An entity may request an extension of the 30-day submission requirement. If granted by the requestor, the entity must submit the data within the approved extended time.

Requirement R11, Part 11.2 specifies that the minimum time period of 10-calendar days inclusive of the day the data was recorded for which the data will be retrievable. With the equipment in use that has the capability of recording data, having the data retrievable for the 10-calendar days is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days. To clarify the 10-calendar day time frame, an incident occurs on Day 1. If a request for data is made on Day 6, then that data has to be provided to the requestor within 30-calendar days after a request or a granted time extension. However, if a request for the data is made on Day 11, that is outside the 10-calendar days specified in the requirement, and an entity would not be out of compliance if it did not have the data.

Requirement R11, Part 11.3 specifies a Comma Separated Value (CSV) format according to Attachment 2 for the SER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power System Disturbance.

Requirement R11, Part 11.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange and is well established in the industry. It is necessary to specify a standard format as multiple submissions of data from many sources will be incorporated to provide a detailed analysis of a power System Disturbance. The latest revision of COMTRADE (C37.111-2013) includes an annex describing the application of the COMTRADE standard to synchophasor data.

Requirement R11, Part 11.5 specifies the IEEE C37.232 COMNAME format for naming the data files of the SER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files. The first version was approved in 2007. From the August 14, 2003 blackout there were thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and it was therefore difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in its initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of its top ten recommendations.

Guideline for Requirement R12:

This requirement directs the respective owners of Transmission and Generator equipment to be alert to the proper functioning of equipment used for SER, FR, and DDR data capabilities for the BES buses and BES Elements, which were established in Requirements R1 and R5. The owners are to restore the capability within 90-calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a “reasonable” amount of capability out-of-service does not result in lack of sufficient data for coverage of the System. Furthermore, 90-calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to restore the capability within 90-calendar days, the requirement further provides that, for such cases, the entity submit a Corrective Action Plan (CAP) to the Regional Entity and implement it. These actions are considered to be appropriate to provide for robust and adequate data availability.

Implementation Plan

Project 2007-11 Disturbance Monitoring

Requested Approvals
- PRC-002-2 Disturbance Monitoring and Reporting Requirements

Requested Retirements
- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals
- None

Applicable Entities
- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary
- None

Background
The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the BES.
2. A significant amount of sequence of events recording (SER), fault recording (FR), and dynamic Disturbance recording (DDR) capability already exists on the BES. The monitoring requirements in this standard align with industry practices. Therefore, many existing recordings can satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the BES buses they own. Therefore, six (6) months is adequate time for generating the list of BES buses following the methodology described in Attachment 1 (for Requirement R1).

4. Responsible entities have the relevant data and information pertaining to the BES Elements requiring DDR and six (6) months is adequate time for working with any affected entities and generating the list of BES Elements.
5. The nine (9) month time period for R12 includes the six (6) month implementation for R1 and R5, and a three (3) month additional time period to make notifications. The nine (9) months for R12 implementation is reasonable for the contents of that requirement.
6. A total percentage of BES buses and BES Elements established in Requirements R1 and R5 respectively are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many monitoring requirements will become compliant without significant changes to recording capability.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the entities.
8. Implementation of Disturbance monitoring recording following changes to the system are addressed by following re-evaluation of the lists as per Requirement R1 and Requirement R5.
9. Implementing SER, FR, and DDR capability may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners probably will have more BES Elements requiring SER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes scheduling outages into account.
10. An entity owning only one (1) identified BES bus, BES Element, or generating unit is allowed six (6) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or capability that could impact implementation timelines for the respective entities.

General Considerations

Each Transmission Owner and Generator Owner subject to PRC-018-1 shall maintain the ability to provide Disturbance monitoring data using current methods required by PRC-018-1 until the entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities with regard to their current Disturbance data.

Effective Date

The standard shall become effective on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter six (6) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Standard(s) for Retirement

PRC-002-1 Midnight of the day immediately prior to the effective date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity's Disturbance monitoring and reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.

PRC-018-1 Midnight of the day immediately prior to six (6) years after the effective date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Implementation Plan for PRC-002-2 Requirements R1 and R5:

Entities shall be 100 percent compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six (6) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirement R12:

Entities shall be 100 percent compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is nine (9) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R3, R4, R6, R7, R8, R9, R10, R11:

Entities shall be at least 50 percent compliant within four (4) years of the effective date of PRC-002-2 and fully compliant within six (6) years of the effective date.

Entities that own only one (1) identified BES bus, BES Element, or generating unit shall be fully compliant within six (6) years of the effective date.

Entities shall be 100 percent compliant with a re-evaluated list from Requirement R1 or R5 within three (3) years following the notification by the TO or the Responsible Entity that re-evaluated the list.

Conforming Changes to Other Standards

Where conflicts between the continent-wide standard PRC-002-2 and a regional standard exist, entities should comply with PRC-002-2. Conflicts will be addressed in the appropriate regional standards development process.

- PRC-002-2 Requirement R3 stipulates data must be captured by FR to determine electrical quantities. PRC-002-NPCC-01 Requirement R3 stipulates the recording of those quantities.
- PRC-002-2 Requirement R5 stipulates the capture of DDR data for HVDC. PRC-002-NPCC-01 does not specify HVDC for DDR.
- PRC-002-2 Requirement R8 recognizes DDR that is not continuous, and includes triggering data for DDR that is not continuous. PRC-002-NPCC-01 stipulates that dynamic Disturbance recorders installed after that standard was approved have to be continuous, but does not address legacy devices.

Exhibit C

Mapping Document

Project 2007-11 – Disturbance Monitoring

PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying data instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements:	**R10.** Each Transmission Owner and Generator Owner shall time synchronize all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 10.1 Synchronization to Coordinated Universal Time (UTC) with or without a local time offset. 10.2 Synchronized device clock accuracy within ± 2 milliseconds of UTC.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**R11.** Each Transmission Owner and Generator Owner shall provide, upon request, all SER and FR data for the BES buses identified in Requirement R1 and DDR data for the BES Elements identified in Requirement R5 to the Responsible Entity, Regional Entity, or NERC in accordance with the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1** Data will be retrievable for the period of 10-calendar days, inclusive of the day the data was recorded. **11.2** Data subject to Part 11.1 will be provided within 30-calendar days of a request unless an extension is granted by the requestor. **11.3** SER data will be provided in ASCII Comma Separated Value (CSV) format following Attachment 2. **11.4** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, (IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111-1999 or later. **11.5** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.
Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R10 and R11.	

<table>
<tr><th>Standard PRC-018-1 (To be Retired)
FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td colspan="2">PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R11.</td></tr>
<tr><td>R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization’s installation requirements (reliability standard PRC-002 Requirements 1 through 3).

PRC-002-1
R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:
R1.1. Location, monitoring and recording requirements, including the following:

R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).
R1.1.2. Devices to be monitored</td><td>R1. Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1.
1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1, that those BES Elements require SER data and/or FR data.
1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the re-evaluated list of BES buses as per the Implementation Plan.

R2. Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified in Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
R3. Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements it owns</td></tr>
</table>

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2.Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation	connected to the BES buses identified in Requirement R1: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **3.1** Phase-to-neutral voltage for each phase of each specified BES bus. **3.2** Each phase current and the residual or neutral current for the following BES Elements: **3.2.1** Transformers that have a low-side operating voltage of 100kV or above. **3.2.2** Transmission Lines. **R4.** Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point, or • At least two cycles of the pre-trigger data, the first three cycles of the post-trigger data, and the final cycle of the fault as seen by the fault recorder. **4.2** A minimum recording rate of 16 samples per cycle. **4.3** Trigger settings for at least the following: **4.3.1** Neutral (residual) overcurrent. **4.3.2** Phase undervoltage or overcurrent.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
requirements for **dynamic Disturbance recording**: R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following:	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Identify a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	**5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan. R6. Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notification as identified in Requirement R5: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **6.1** One phase-to-neutral or positive sequence voltage. **6.2** The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. **6.3** Real Power and Reactive Power flows expressed on a three phase basis corresponding to all circuits where current measurements are required. **6.4** Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. R7. Each Generator Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for wich it received notification as identified in Requirement R5: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	7.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level. 7.2. The phase current for the same phase at the same voltage in Requirement R7, Part 7.1, phase current(s) for any phase-to-phase voltages, or positive sequence current. 7.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 7.4. Frequency of at least one of the voltages in Requirement R7, Part 7.1. R8. Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified in Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	• Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-018-1, Requirement R2 and PRC-002-1 Requirements R1-R3 are covered in PRC-002-2, Requirements R1-R9. PRC-018-1, Requirement R2 references PRC-002-1 Requirements R1-R2. PRC-002-1, Requirements R1-R3 reference equipment installation requirements for FR, SER, and DDR. The technical parameters of PRC-002-2 pertain to the characteristics and content of the recordings that are needed to facilitate event analysis.	
R3. The Transmission Owner and Generator Owner shall	None.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region’s installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1): R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder). R3.2. Make and model of equipment. R3.3. Installation location. R3.4. Operational status. R3.5. Date last tested. R3.6. Monitored elements, such as transmission circuit, bus section, etc. R3.7. Monitored devices, such as circuit breaker,	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
disconnect status, alarms, etc. R3.8.Monitored electrical quantities, such as voltage, current, etc.	
Notes: PRC-018-1, Requirement R3 is not covered in PRC-002-2. PRC-018-1 Requirement R3 refers to equipment and therefore is not mapped to PRC-002-2 which deals with recorded data and not equipment.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R4. The Transmission Owner and Generator Owner shall each **provide Disturbance data** (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard **PRC-002 Requirement 4**). **PRC-002-1** R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool.	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R11.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2 Evidence Retention** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirement R1, Measure M1 for five calendar years. The Transmission Owner shall retain evidence of Requirement R6, Measure M6 for three calendar years. The Generator Owner shall retain evidence of Requirement R7, Measure M7 for three calendar years.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	The Transmission Owner and Generator Owner shall retain evidence of requested data provided as per Requirements R2, R3, R4, R8, R9, R10, R11, and R12, Measures M2, M3, M4, M8, M9, M10, M11, and M12 for three calendar years. The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirement R5, Measure M5 for five calendar years. If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:	**R12.** Each Transmission Owner and Generator Owner shall, within 90-calendar days of the discovery of a failure of the SER, FR or DDR data either: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* • Restore the recording capability, or • Submit a Corrective Action Plan (CAP) to the Regional Entity and implement it.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R6.1. Maintenance and testing intervals and their basis. R6.2. Summary of maintenance and testing procedures.	
Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R12. PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R12 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data;

Standard PRC-002-1	Proposed Standard PRC-002-2
R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R2.** Each Transmission Owner and Generator Owner shall have SER data for circuit breaker position (open/close) for each circuit breaker it owns connected directly to the BES buses identified per Requirement R1 and associated with the BES Elements at those BES buses. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R2. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements, including the following:	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1;

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan. **R3.** Each Transmission Owner and Generator Owner shall have FR data to determine the following electrical quantities for each triggered FR for the BES Elements they own connected to the BES buses identified per Requirement R1: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 3.1 Phase-to-neutral voltage for each phase of each specified line or BES bus. 3.2 Each phase current and the residual or neutral current for the following BES Elements: 3.2.1. Transformers that have a low-side operating voltage of 100kV or above. 3.2.2. Transmission Lines. R4. Each Transmission Owner and Generator Owner shall have FR data as specified in Requirement R3 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **4.1** A single record or multiple records that include:

Standard PRC-002-1	Proposed Standard PRC-002-2
R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	• A pre-trigger record length of at least two cycles and a total record length of at least 30 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault as seen by the fault recorder. **4.2.** A minimum recording rate of 16 samples per cycle. **4.3.** Trigger settings for at least the following: **4.3.1.** Neutral (residual) overcurrent. **4.3.2.** Phase undervoltage or overcurrent.
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA.

Standard PRC-002-1	Proposed Standard PRC-002-2
consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored	**5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element **5.2.2** One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan. **R6.** Each Transmission Owner shall have DDR data to determine the following electrical quantities for each BES Element it owns for which it received notifications as identified in

Standard PRC-002-1	Proposed Standard PRC-002-2
element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	Requirement R5, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 6.1 One phase-to-neutral or positive sequence voltage. 6.2 The phase current for the same phase at the same voltage corresponding to the voltage in Requirement R6, Part 6.1, or the positive sequence current. 6.3 Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 6.4 Frequency of any one of the voltage(s) in Requirement R6, Part 6.1. **R8.** Each Transmission Owner and Generator Owner that is responsible for DDR data for the BES Elements identified as per Requirement R5 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 8.1. Triggered record lengths of at least three minutes. **8.2.** At least one of the following three triggers: • Off nominal frequency trigger set at: Low / High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz

Standard PRC-002-1	Proposed Standard PRC-002-2
	o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set no lower than 85% of normal operating voltage for a duration of 5 seconds R9. Each Transmission Owner and Generator Owner responsible for DDR data for the BES Elements identified in Requirement R5 shall have DDR data that meets the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* 9.1 Input sampling rate of at least 960 samples per second. 9.2 Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-002-1, Requirement R3 is covered in PRC-002-2, Requirements R5-R6 and R8-R9.	
R4. The Regional Reliability Organization shall establish requirements for facility owners	**R11.** Each Transmission Owner and Generator Owner shall provide SER, FR, and DDR data for the BES bus locations identified per Requirement R1 and BES Elements identified per

Standard PRC-002-1	Proposed Standard PRC-002-2
to **report Disturbance data recorded** by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool, 4.5. Naming of data files in conformance with the IEEE	Requirement R5 to the Reliability Coordinator, Regional Entity, or NERC: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **11.1.** The recorded data will be provided within 30 calendar days of a request. **11.2.** The recorded data will be retrievable for the period of 10 calendar days preceding a request. **11.3.** SER data will be provided in ASCII Comma Separated Value (.CSV) format following Attachment 2. **11.4.** FR and DDR data will be provided in electronic files that are formatted in conformance with C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), revision C37.111.1999 or later. **11.5.** Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME), revision C37.232-2011 or later.

Standard PRC-002-1	Proposed Standard PRC-002-2
C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	
Notes: PRC-002-1, Requirement R4 is covered in PRC-002-2, Requirement R13.	
R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R5 is covered in PRC-002-2, Requirements R2, R6-R7.	
R6. The Regional Reliability Organization shall periodically (**at least every five years**) review, update and approve its Regional requirements for Disturbance monitoring and reporting.	**R1.** Each Transmission Owner shall: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning] 1.1. Identify BES buses for which sequence of events recording (SER) and fault recording (FR) data is required by using the methodology in PRC-002-2, Attachment 1; 1.2. Notify other owners of BES Elements connected to those BES buses, if any, within 90-calendar days of completion of Part 1.1 that those BES Elements require SER data and/or FR data; 1.3. Re-evaluate all BES buses at least once every five calendar years in accordance with Part 1.1 and notify other owners, if any, in accordance with Part 1.2, and implement the reevaluated list of BES buses as per the Implementation Plan.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R5. Each Responsible Entity shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]* **5.1** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.1** Generating resource(s) with: **5.1.1.1** Gross individual nameplate rating greater than or equal to 500 MVA. **5.1.1.2** Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000 MVA. **5.1.2** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL). **5.1.3** Each terminal of a high voltage direct current (HVDC) circuit with nameplate rating greater than or equal to 300 MVA, on the alternating current (AC) portion of the converter. **5.1.4** One or more BES Elements that are part of an Interconnection Reliability Operating Limits (IROL). **5.1.5** Any one BES Element within a major voltage sensitive area as defined by an area with an in-service undervoltage load shedding (UVLS) program. **5.2** Ensure a minimum DDR coverage, inclusive of those BES Elements identified in Part 5.1, of at least: **5.2.1** One BES Element

Standard PRC-002-1	Proposed Standard PRC-002-2
	5.2.2 One BES Element per 3,000 MW of the Responsible Entity's historical simultaneous peak System Demand. **5.3** Notify all owners of identified BES Elements, within 90-calendar days of completion of Part 5.1, that their respective BES Elements require DDR data when requested. **5.4** Reevaluate all BES Elements at least once every five calendar years in accordance with Parts 5.1 and 5.2, and notify owners in accordance with Part 5.3 to implement the reevaluated list of BES Elements as per the Implementation Plan.
Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R5.	

Exhibit D

Order No. 672 Criteria

Exhibit D
<u>Order No. 672 Criteria</u>

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standard has met or exceeded the criteria:

1. **Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.**[2]

The purpose of proposed Reliability Standard PRC-002-2 is to have adequate data available to facilitate analysis of Bulk Electric System Disturbances. The proposed Reliability Standard focuses on ensuring that the requisite data is captured and the Requirements reflect a results-based approach to capturing data, rather than on equipment necessary to capture the data. The proposed Reliability Standard consolidates the current PRC-002-1 Reliability Standard and pertinent Requirements of PRC-018-1 and improves reliability by providing personnel with

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[2] Order No. 672 at P 321. The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.

Order No. 672 at P 324. The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.

necessary data to enable more effective post event analysis. The collected information can also be used to verify system models.

The proposed Reliability Standard includes coverage for sequence of events ("SER") recording, fault recording ("FR"), and dynamic disturbance recording ("DDR") data. SER and FR data can be used for the analysis, reconstruction, and reporting of Disturbances. Knowing the exact time of a breaker change of state and the waveforms of current, voltage and frequency for individual circuits allows the precise reconstruction of events for both localized and wide-area Disturbances. Analyses of wide-area Disturbances often begin by evaluation of SER data to help determine the initiating event(s) and to follow the Disturbance propagation. The recording of breaker operations helps to determine the interruption of line flows at a particular bus. However, under the proposed Reliability Standard, SER and FR data is not required since data from each bus is not necessary to be able to conduct an adequate or thorough analysis of a Disturbance. FR data also augments SERs in evaluating circuit breaker operation. DDR data, which is also addressed in proposed PRC-002-2, is used to determine the Bulk-Power System's electromechanical transient and post-transient response and to validate system model performance.

Proposed PRC-002-2 contains a technically sound means for determining what data needs to be captured. NERC provides a detailed explanation of each Requirement in the Petition. Broadly, the emphasis in proposed PRC-002-2 has shifted from the prior Reliability Standards to reflect what Bulk Electric System data is captured rather than on the method and equipment for how Disturbance monitoring data is captured. A variety of ways exist to capture the data proposed PRC-002-2 addresses, and existing and currently available equipment can meet the Requirements of this standard. As a result, the proposed Reliability Standard improves data capturing practices while providing efficiency in the approach taken by utilizing existing methods for data collection. PRC-002-2 also addresses the importance of addressing the availability of Disturbance monitoring capability to ensure the completeness of data capture.

2. **Proposed Reliability Standards must be applicable only to users, owners and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[3]**

The proposed Reliability Standard applies to the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection. In the Eastern Interconnection, the Planning Coordinator is the responsible entity. In the Western Interconnection, the Reliability Coordinator is the responsible entity. In ERCOT and the Quebec Interconnections, either the Planning Coordinator or the Reliability Coordinator is the responsible entity. The proposed Reliability Standard also applies to Transmission Owners and Generator Owners.

The Planning Coordinator or the Reliability Coordinator, as applicable, has the best wide-area view of the Bulk Electric System and is most suited to be responsible for determining the Bulk Electric System Elements for which dynamic DDR data is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate dynamic Disturbance recording data is available for those Bulk Electric System Elements selected.

3. **A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[4]**

---

[3] Order No. 672 at P 322. The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.

Order No. 672 at P 325. The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.

[4] Order No. 672 at P 326. The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment. The assignments of the severity levels for the VSLs are consistent with the corresponding Requirement and will ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, and support uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standard includes clear and understandable consequences. Justification and explanation of the VRFs and VSLs is included in Exhibit F.

4. A proposed Reliability Standard must identify clear and objective criterion or measure for compliance, so that it can be enforced in a consistent and non-preferential manner.[5]

The proposed Reliability Standard contains Measures that support the Requirements by clearly identifying what is required and how the Requirements will be measured for compliance. The Measures are listed after each of the Requirements of the proposed PRC-002-2 Reliability Standard and provide clarity on types of evidence to support each Requirement, which will allow the Requirements to be enforced in a consistent and non-preferential manner.

5. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently — but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[6]

The proposed Reliability Standard achieves its reliability goal effectively and efficiently in accordance with Order No. 672. As noted in Criteria 1 above, the proposed Reliability Standard improves data capturing practices while providing efficiency in the approach taken by utilizing

---

[5] Order No. 672 at P 327. There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.

[6] Order No. 672 at P 328. The proposed Reliability Standard does not necessarily have to reflect the optimal method, or "best practice," for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.

existing methods for data collection. The proposed Reliability Standard also provides a consistent, continent-wide methodology for determining what SER, FR, and DDR data entities must capture in order to analyze Disturbances on the Bulk-Power System.

6. **Proposed Reliability Standards cannot be "lowest common denominator," *i.e.*, cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[7]**

The proposed Reliability Standard does not reflect a "lowest common denominator" approach. The standard drafting team continuously sought to meet industry concerns and continue to maintain essential elements in the proposed Reliability Standard to effectively meet the purpose statement of the proposed Reliability Standard. The standard drafting team conducted a data request of industry, hosted industry webinars, consulted with NERC Events Analysis staff, and reviewed the lessons of the 2003 Final Blackout Report to ensure that the proposed Reliability Standard satisfied the Task Force's Recommendation Nos. 24 and 28.

7. **Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[8]**

---

[7] Order No. 672 at P 329. The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice — the so-called "lowest common denominator" — if such practice does not adequately protect Bulk-Power System reliability. Although FERC will give due weight to the technical expertise of the ERO, we will not hesitate to remand a proposed Reliability Standard if we are convinced it is not adequate to protect reliability.

Order No. 672 at P 330. A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a "lowest common denominator" Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.

[8] Order No. 672 at P 331. A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional

The proposed Reliability Standard applies throughout North America and does not favor one geographic area or regional model. The Northeast Power Coordinating Council's ("NPCC") regional Reliability Standard PRC-002-NPCC-01 (Disturbance Monitoring) was considered by the standard drafting team during development. The Implementation Plan notes specific Requirements that may need to be revised as a result of the final Requirements in proposed PRC-002-2. NPCC will open a standard development project to address any conflict or overlap between the two Reliability Standards. The Implementation Plan notes that where the two conflict, entities should comply with the proposed continent-wide Reliability Standard. The regional Reliability Standard requires Transmission Owners and Generator Owners to provide recording capability necessary to monitor the response of the Bulk-Power System to system Disturbances, including scheduled and unscheduled outages; requires each Reliability Coordinator to establish requirements for its area's DR needs; and establishes Disturbance data reporting requirements.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[9]

Proposed Reliability Standard PRC-002-2 has no undue negative effect on competition and does not unreasonably restrict transmission or generation operation on the Bulk-Power System.

---

model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.

[9] Order No. 672 at P 332. As directed by section 215 of the FPA, FERC itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.

9. The implementation time for the proposed Reliability Standard is reasonable.[10]

The time for transition in the Implementation Plan is reasonable and has included a phased-in approach. A phased approach to implementation recognizes that progress will be made while attempting to minimize any significant impact to the entities during transition. Implementing SER, FR, and DDR capabilities may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of twenty-four months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners probably will have more BES Elements requiring SER, FR, and DDR and may have to schedule outages across its system. The Implementation Plan takes scheduling outages into account in the timeframes set for the proposed Reliability Standard. Compliance with PRC-018-1 will continue throughout the phased-in implementation. According to the Implementation Plan, each Transmission Owner and Generator Owner subject to PRC-018-1 must maintain the ability to provide Disturbance monitoring data using current methods required by PRC-018-1 until the entity meets the requirements of PRC-002-2 in accordance with the Implementation Plan.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[11]

The proposed Reliability Standard was developed in accordance with NERC's Commission-approved, ANSI- accredited processes for developing and approving Reliability Standards.

---

10 Order No. 672 at P 333. In considering whether a proposed Reliability Standard is just and reasonable, FERC will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.

11 Order No. 672 at P 334. Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by FERC.

Exhibit G includes a summary of the standard development proceedings, and details the processes followed to develop the Reliability Standard. These processes included, among other things, multiple comment periods, pre-ballot review periods, and balloting periods. Additionally, all meetings of the standard drafting team were properly noticed and open to the public.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[12]

NERC has not identified competing public interests regarding the request for approval of the proposed Reliability Standard. No comments were received that indicated the proposed Reliability Standard conflicts with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[13]

Proposed PRC-002-2 requires certain Generator Owners to record data and provide it upon request. The location for recording data is determined by the Transmission Owner under Requirement R1 and by the Responsible Entity under Requirement R5. In most cases, in order for the recording data to function properly, the installation of this recording data capability would be on the Generator Owners' equipment. Some Generator Owners have expressed concern that they do not have an avenue to recover the cost associated with implementation of this standard and that they cannot successfully compete in the market with these increased costs. While NERC understands the concern, NERC does not have the authority to include a cost recovery mechanism in the proposed Reliability Standard. However, the standard drafting team

---

[12] Order No. 672 at P 335. Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.

[13] Order No. 672 at P 323. In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.

made every effort to design Requirements that provided flexibility in aspects of the proposed Reliability Standard, while maintaining the data coverage needed to adequately analyze Disturbances.

Exhibit E

Consideration of Issues and Directives

Consideration of Issues and Directives

Project 2007-11 Disturbance Monitoring

PRC-002-2 Disturbance Monitoring and Reporting Requirements

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
“For the reasons stated in the NOPR, the Commission will not approve or remand PRC-002-1.” “We agree with [American Public Power Association], Alcoa and Otter Tail that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA, Alcoa and Otter Tail’s suggestions in the Reliability Standards development process as it modifies PRC-002-1 to provide missing information needed for the Commission to act on this Reliability Standard.” (see below for American Public Power Association, Alcoa, and Otter Tail discussion)	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1455-56	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances. The use of recording and specifying recording data parameters, greater consistency is achieved in PRC-002-2.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in addressing the completion of this Reliability Standard."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1452	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances.
"Alcoa suggests that the ERO—instead of a Regional Entity—should define the requirements for DME and the type of report it generates. The requirements and equipment specifications should be consistent throughout North America. In addition, Alcoa suggests that the criteria for installation of such equipment should include the necessary monitoring and recording that contribute to analysis and enhance reliability."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1453	Determines the key locations for which Disturbance data must be recorded which eliminates the need for equipment requirements. PRC-002-2 specifies the storage requirements and recording format for the collected data to ensure continent-wide uniformity to expedite event analysis.
"Otter Tail suggests that PRC-002-1 should be developed on an Interconnection wide basis to ensure consistency and promote reliability of the Bulk-Power System."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards	PRC-002-2 will apply on a continent-wide basis.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
	for the Bulk-Power System (Issued March 16, 2007); Paragraph 1454	
"The Commission requires supplemental information for any Reliability Standard that currently requires a regional reliability organization to fill in missing criteria or procedures. Where important information has not yet been provided to us to enable us to complete our review, we are not in a position to approve or remand those Reliability Standards. Accordingly, we will not approve or remand such Reliability Standards until the ERO submits further information. Until such information is provided, compliance with fill-in-the-blank standards should continue on a voluntary basis, and the Commission considers compliance with such Reliability Standards to be a matter of good utility practice."	Fill-in-the-blank Consideration FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 297.	By addressing recording instead of equipment, the Drafting Team has produced a continent-wide standard to have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5-calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 80% but less than 100% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by 30-calendar days or less. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by 10-calendar days or less.
Proposed Moderate VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 70% but less than or equal to 80% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 30-calendar days and less than or equal to 60-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 10-calendar days but less than or equal to 20-calendar days.
Proposed High VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for more than 60% but less than or equal to 70% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 60-calendar days and less than or equal to 90-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying the other owners by greater than 20-calendar days but less than or equal to 30-calendar days.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Severe VSL	The Transmission Owner identified the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 for less than or equal to 60% of the required BES buses that they own. OR The Transmission Owner evaluated the BES buses as directed by Requirement R1, Part 1.1 or Part 1.3 but was late by greater than 90-calendar days. OR The Transmission Owner as directed by Requirement R1, Part 1.2 was late in notifying one or more other owners by greater than 30-calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R1	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R2	
Proposed VRF	**Lower**
NERC VRF Discussion	R2 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2 provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 80% but less than 100% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 70% but less than or equal to 80% of the total SER

VRF and VSL Justifications – PRC-002-2, R2	
	data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R2 had more than 60% but less than or equal to 70% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R2 for less than or equal to 50% of the total SER data for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3	
Proposed VRF	**Lower**
NERC VRF Discussion	R3 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R3 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 80% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 70% but less than or equal to 80% of the total set of required electrical quantities, which is the product of the total number of monitored BES

VRF and VSL Justifications – PRC-002-2, R3	
	Elements and the number of specified electrical quantities per each Element.
Proposed High VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers more than 60% but less than or equal to 57% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data as directed by Requirement R3, Parts 3.1 and 3.2 that covers less than or equal to 60% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4	
Proposed VRF	**Lower**
NERC VRF Discussion	R4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had FR data that meets more than 80% but less than 100% of the total recording properties as specified in Requirement R4.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had FR data that meets more than 70% but less than or equal to 80% of the total recording properties as specified in Requirement R4.

VRF and VSL Justifications – PRC-002-2, R4	
Proposed High VSL	The Transmission Owner or Generator Owner had FR data that meets more than 60% but less than or equal to 70% of the total recording properties as specified in Requirement R4.
Proposed Severe VSL	The Transmission Owner or Generator Owner had FR data that meets less than or equal to 60% of the total recording properties as specified in Requirement R4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R4	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R5 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5 contains only one objective which identifies BES Elements within specified criteria and to review the list every 5-calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity identified the Elements for which DDR data is required as directed by Requirement R5 for more than 80% but less than 100% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by 30-calendar days or less. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by 10-calendar days or less.
Proposed Moderate VSL	The Responsible Entity identified the Elements for which DDR is required as directed by Requirement R5 for more than 70% but less than or equal to 80% of the required Elements included in Part 5.1. OR The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 30-calendar days and less than or equal to 60-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 10-calendar days but less than or equal to 20-calendar days.
Proposed High VSL	The Responsible Entity identified the Elements for which DDR data is requires as directed by Requirement R5 for more than 60% but less than or equal to 70% of the required Elements included in Part 5.1. OR The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 60-calendar days and less than or equal to 90-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying the owners by greater than 20-calendar days but less than or equal to 30-calendar days.
Proposed Severe VSL	The Responsible Entity identified the Elements for which DDR data is required as directed by Requirement R5 for less than or equal to 60% of the required Elements included in Part 5.1. OR

VRF and VSL Justifications – PRC-002-2, R5	
	The Responsible Entity identified the Elements for DDR as directed by Requirement R5, Part 5.1 or Part 5.4 but was late by greater than 90-calendar days. OR The Responsible Entity as directed by Requirement R5, Part 5.3 was late in notifying one or more owners by greater than 30-calendar days. OR The Responsible Entity failed to ensure a minimum DDR coverage per Part 5.2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R5	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R6	
Proposed VRF	**Lower**
NERC VRF Discussion	R6 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R6 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R6 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R6	
Proposed Lower VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 that covered more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Transmission Owner had DDR data as directed by Requirement R6, Parts 6.1 through 6.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Transmission Owner failed to have DDR data as directed by Requirement R6, Parts 6.1 through 6.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R6	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7	
Proposed VRF	**Lower**
NERC VRF Discussion	R7 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R7	
Proposed Lower VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 that covers more than 80% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 70% but less than or equal to 80% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Generator Owner had DDR data as directed by Requirement R7, Parts 7.1 through 7.4 for more than 60% but less than or equal to 70% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Generator Owner failed to have DDR data as directed by Requirement R7, Parts 7.1 through 7.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R7 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R7	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
Proposed VRF	**Lower**
NERC VRF Discussion	R8 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes the need for continuous data recording and storage for Dynamic Disturbance Recordings established in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R8 contains only one objective to establish continuous data recording and storage for Dynamic Disturbance Recordings established in R6. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R8	
Proposed Lower VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 80% but less than 100% of the Elements they own as determined in Requirement R5.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 70% but less than or equal to 80% of the Elements they own as determined in Requirement R5.
Proposed High VSL	The Transmission Owner or Generator Owner had continuous or non-continuous DDR data, as directed in Requirement R8, for more than 6% but less than or equal to 70% of the Elements they own as determined in Requirement R5.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have continuous or non-continuous DDR data, as directed in Requirement R8, for the Elements they own as determined in Requirement R5.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R8	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R9	
Proposed VRF	**Lower**
NERC VRF Discussion	R9 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R9 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement established technical specifications for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish technical specifications for Dynamic Disturbance Recording selected in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R9 contains only one objective which is to establish technical specifications for Dynamic Disturbance Recording selected in R6. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 80% but less than 100% of the total recording properties as specified in Requirement R9.

VRF and VSL Justifications – PRC-002-2, R9	
Proposed Moderate VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 70% but less than or equal to 80% of the total recording properties as specified in Requirement R9.
Proposed High VSL	The Transmission Owner or Generator Owner had DDR data that meets more than 60% but less than or equal to 70% of the total recording properties as specified in Requirement R9.
Proposed Severe VSL	The Transmission Owner or Generator Owner had DDR data that meets less than or equal to 60% of the total recording properties as specified in Requirement R9.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R9 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	**Guideline 3- Consistency among Reliability Standards**

VRF and VSL Justifications – PRC-002-2, R9	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This requirement established technical specifications for Dynamic Disturbance Recording selected in R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R10	
Proposed VRF	**Lower**
NERC VRF Discussion	R10 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R10 requires time synchronization of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations established in R1 and R5. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failures to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R10 contains only one objective which is to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 90% but less than 100% of the bus

VRF and VSL Justifications – PRC-002-2, R10	
	locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Moderate VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 80% but less than or equal to 90% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed High VSL	The Transmission Owner or Generator Owner had time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for more than 70% but less than or equal to 80% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to have time synchronization per Requirement R10, Parts 10.1 and 10.2 for SER, FR, and DDR data for less than or equal to 70% of the bus locations as per Requirements R1 and Elements as per Requirement R5 as directed by Requirement R10.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R10 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R10	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R11	
Proposed VRF	**Lower**
NERC VRF Discussion	R11 is administrative in nature and a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R11 provides criteria around timelines for providing the data and the data format. This is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria on providing Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R5 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R11 contains only one objective which is to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data within the specified criteria. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 30-

VRF and VSL Justifications – PRC-002-2, R11	
	calendar days but less than 40-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 90% but less than 100% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 90% but less than 100% in the proper data format.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 40-calendar days but less than or equal to 50-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 80% but less than or equal to 90% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 80% but less than or equal to 90% in the proper data format.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 provided the requested data more than 50-calendar days but less than or equal to 60-calendar days after the request unless an extension was granted by the requesting authority. OR The Transmission Owner or Generator Owner as directed by Requirement R11 provided more than 70% but less than or equal to 80% of the requested data. OR

VRF and VSL Justifications – PRC-002-2, R11	
	The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided more than 70% but less than or equal to 80% in the proper data format.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R11, Part 11.1 failed to provide the requested data more than 60-calendar days after the request. OR The Transmission Owner or Generator Owner as directed by Requirement R11 failed to provide less than or equal to 70% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R11, Parts 11.3 through 11.5 provided less than or equal to 70% in the proper data format.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent	Guideline 2a: The VSL assignment is for R11 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R11	
Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R12	
Proposed VRF	**Lower**
NERC VRF Discussion	R12 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action

VRF and VSL Justifications – PRC-002-2, R12	
	Plan to the Regional Entity more than 90-calendar days but less than 100-calendar days after discovery of the failure.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100-calendar days but less than or equal to 110-calendar days after discovery of the failure.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110-calendar days but less than or equal to 120-calendar days after discovery of the failure. OR The Transmission Owner or Generator Owner as directed by Requirement R12 submitted a CAP to the Regional Entity but failed to implement it.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R12 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120-calendar days after discovery of the failure. OR Transmission Owner or Generator Owner as directed by Requirement R12 failed to restore the recording capability and failed to submit a CAP to the Regional Entity.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure	Guideline 2a: The VSL assignment is for R12 is not binary.

VRF and VSL Justifications – PRC-002-2, R12	
Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and	Non CIP

VRF and VSL Justifications – PRC-002-2, R12	
implementation should account for their interdependence	

Exhibit G

Summary of Development History and Complete Record of Development

Exhibit G: Summary of Development History

The development record for proposed Reliability Standard PRC-002-2 is summarized below.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give “due weight” to the technical expertise of the ERO[1]. The technical expertise of the ERO is derived from the standard drafting team. For this project, the standard drafting team consisted of industry experts, all with a diverse set of experiences. A roster of the standard drafting team members is included in Exhibit **H**.

II. Standard Development History

A. Standard Authorization Request Development

A Standard Authorization Request (“SAR”) for Project 2007-11 Disturbance Monitoring was posted for a 30-day Comment Period from March 22 through April 20, 2007.

B. First Posting

Proposed Reliability Standard PRC-002-2 was posted for a 45-day public comment period from February 2, 2009 to March 18, 2009. There were 62 sets of comments, including comments from more than 130 different individuals from over 70 companies, representing 8 of the 10 industry segments. The standard drafting team considered stakeholder comments regarding proposed Reliability Standard PRC-002-2 and suggested changes to the standard. However, the Project was moved back into informal development by the Standards Committee. Upon reinitiating formal development in

[1] Section 215(d)(2) of the Federal Power Act; 16 U.S.C. §824(d) (2) (2012).

2013, the standard drafting team considered the suggest changes in its revisions to the proposed standard, but created a new version.

C. Revised SAR

A revised SAR was posted for a 30-day comment period from May 5, 2013 to June 3, 2013.

D. Informal Request for Information

To provide input to the standard drafting team on the design of the proposed standard, the standard drafting team posted an informal request for information is for a 30-day period from June 5, 2013 through July 5, 2013.

E. Second Posting

Proposed Reliability Standard PRC-002-2 was posted for a 45-day public comment period, including a 10-day ballot from November 1, 2013 to December 16, 2013. There were 76 sets of comments, including comments from approximately 205 different individuals from approximately 157 companies, representing all 10 industry segments. . The proposed Reliability Standard received a quorum of 82.25% and an approval of 43.29%. A summary consideration of the comments and the changes made to the draft are included in the Consideration of Comments for Draft 2 included in the complete development record

F. Third Posting

Proposed Reliability Standard PRC-002-2 was posted for an additional 45-day public comment period, including a 10-day ballot from May 9, 2014 and June 25, 2014. The proposed Reliability Standard received a quorum of 77.69% and an approval of 52.29%. A summary consideration of the comments and the changes made to the draft are included in the Consideration of Comments for Draft 3 included in the complete development record.

G. Fourth Posting

Proposed Reliability Standard PRC-002-2 was posted for an additional 45-day public comment period, including a 10-day ballot from September 5, 2014 and October 21, 2014. The proposed Reliability Standard received a quorum of 77.69% and an approval of 71.38%. A summary consideration of the comments and the non-substantive changes made to the draft are included in the Consideration of Comments for Draft 4 included in the complete development record.

H. Final Ballot

Proposed Reliability Standard PRC-002-2 was posted for a final 10-day ballot from October 28, 2014 and November 6, 2014. The proposed Reliability Standard received a quorum of 81.89% and an approval of 68.51%.

I. Board of Trustees Adoption

Proposed Reliability Standard PRC-002-2 was adopted by the NERC Board of Trustees on November 13, 2014.

Project 2007-11 Disturbance Monitoring

Status:
PRC-002-2 - Disturbance Monitoring and Reporting Requirements was adopted by the NERC Board of Trustees November 13, 2014 and is pending regulatory approval.

Background:
This project was initiated to address an existing “fill in the blank” standard. FERC did not approve or remand PRC-002-1 in Order 693 because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. FERC did approve PRC-018-1 in Order 693. Similar to PRC-002-1, PRC-018-1 contained Regional Reliability Organization requirements, but FERC stated that the requirements are clear enough to be enforced. This project intends to address FERC concerns in Order 693, specifically the “fill in the blank” aspects in both standards. A SAR to initiate the project was initially posted in 2007 with a scope of reviewing both standards and merging them into one replacement standard. A standard drafting team was appointed by the Standards Committee in 2007, who drafted PRC-002-2, which was posted for a 45-day formal comment period in early 2009. The standard was posted for initial comments during February and March of 2009. In 2010 the Standards Committee decided to prioritize its work, which resulted in moving Project 2007-11 Disturbance Monitoring to informal development. Responses to the comments for the 45-day formal posting were developed, but not posted because of the change to informal development. In its 2013 work plan, the Standards Committee changed the status to formal development as part of the effort to address pending projects.

The drafting team revised the SAR to focus the project on a results-based approach to the capture of data, instead of prescriptive requirements on equipment necessary to capture the data. The drafting team believed that it was best to describe the performance requirements (using a risk-based approach) rather than prescribing necessary equipment. Also, the Reliability Coordinator and Planning Coordinator were added as applicable entities to ensure that the responsibility for specifying and collecting needed disturbance data can be appropriately assigned. The revised SAR was approved by the Standards Committee on May 2, 2013 to be posted for a 30-day informal comment period.

Purpose / Industry Need:
To establish requirements for collection and reporting of disturbance data to facilitate analyses of events and verify system models. This project involves modifying two standards:

- PRC-002 — Define and Document Disturbance Monitoring and Equipment Requirements
- PRC-018 — Disturbance Monitoring Equipment Installation and Data

The project involves replacing "fill-in-the-blank" requirements currently assigned to the Regional Reliability Organization, with continent-wide requirements that are applicable to other functional entities. As envisioned, each region will supplement PRC-002 with a regional standard that includes additional requirements. The project also involves bringing the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure.

Maureen E. Long
Standards Process Manager

February 26, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement
Nomination Period Opens for SAR Drafting Team

The Standards Committee (SC) announces the following standards actions:

Nominations for Project 2007-11 — Disturbance Monitoring SAR Drafting Team (February 26–March 9, 2007)

The Standards Committee is seeking industry experts to serve on the Project 2007-11 — Disturbance Monitoring SAR Drafting Team. If you are interested in serving on this team, please complete this nomination form and return it to Richard Schneider (Richard.schneider@nerc.net) no later than March 9, 2007.

A draft SAR for Project 2007-11— Disturbance Monitoring has been appended to the nomination form to aid in the understanding of the work to be performed by this SAR drafting team (this SAR will be posted for public comment at a later date). The draft SAR calls for the modification of the following standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data

This project involves upgrading the overall quality of these two standards; eliminating some gaps in the requirements; eliminating some ambiguity; and eliminating some "fill-in-the-blank" components.

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Standard Authorization Request Form

Title of Proposed Standard:	Disturbance Monitoring (Project 2007-11)
Request Date:	March 1, 2007

SAR Requester Information

Name:	Robert W. Millard on behalf of the Regional Reliability Standards Working Group	***SAR Type (Check one box.)***	
Company:	Reliability*First* Corporation	☐	New Standard
Telephone:	(708) 588-9886	☒	Revision to Existing Standard
Fax:	(330) 456-3648	☐	Withdrawal of Existing Standard
E-mail:	bob.millard@rfirst.org	☐	Urgent Action

Purpose *(Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)*

To establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models.

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV Planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV Planning Measures. As the Electric Reliability Organization begins enforcing compliance with Reliability Standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable Reliability Standards. The Version 0 standards and the translation of Phase III & IV Planning Measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. The Version 0 standards, Phase III & IV standards, and recent updates were put in place as a temporary starting point to start-up the Electric Reliability Organization and begin enforcement of mandatory standards. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 and Phase III & IV translations.

Industry Need *(Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)*

1. Provide an adequate level of reliability for the North American bulk power systems — ensure the standards are complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure they are enforceable as mandatory reliability standards with financial penalties — ensure

   (a) the applicability to bulk power system owners, operators, and users, and as appropriate particular classes of facilities, is clearly defined,

   (b) the purpose, requirements, and measures are results-focused and unambiguous and

   (c) the consequences of violating the requirements are clear.
3. Consider comments received during the initial development of this set of standards and other comments received from ERO regulatory authorities and stakeholders as described in the Detailed Description section below.
4. Bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.
5. Satisfy the standards procedure requirement for five-year review of the standards.

Brief Description *(Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)*

PRC-002 and PRC-018 were approved in 2006.

PRC-002 is one of four reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard. The standard drafting team (SDT) will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The SDT shall determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

The SDT shall consider comments and issues as described in the Detailed Description section and Attachment 1 below for drafting and including other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders through the standards development procedure, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability and Market Interface Principles

Applicable Reliability Principles (Check all boxes that apply.)	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☐	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an essential requirement of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description *(Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)*

1. The SDT shall consider the following comments (excerpted from NERC's Reliability Standards Development Plan: 2007-2009) which attempt to capture comments from the:
    - FERC NOPR (Docket # RM06-16-00 dated October 20, 2006),
    - FERC staff report dated May 11, 2006 concerning NERC standards submitted with ERO application, and
    - Regional Fill-in-the-Blank Team (RRSWG – a NERC working group involved with regional standards development).
    - Phase III & IV Standard Drafting Team
    - Violation Risk Factors Drafting Team

    PRC-002 Define and Document Disturbance Monitoring Equipment Requirements

    FERC NOPR

    - Commission will not propose to accept or remand this Reliability Standard until the ERO submits additional information related to the fill-in-the-blank aspects of this standard as further defined below under "Regional Fill-in-the-Blank Team Comments".

    FERC Staff Report

    - This standard designates RROs as the applicable entity. Staff is concerned about the appropriateness of RROs serving as the applicable entity in the new mandatory standards structure. These standards have been referred to as "fill-in-the-blank" standards (see comments under "Regional Fill-in-the-Blank Team Comments" below).

    Phase III/IV comments

    - There are no criteria that the RROs must use in specifying the process for identifying locations where DMEs are required (to be addressed when considering issues under "Regional Fill-in-the-Blank Team Comments" below).

    Violation Risk Factor Drafting Team Comments

    - R1 - This standard and all related sub requirements are after the fact data analysis.

    Regional Fill-in-the-Blank Team Comments

    - Determine what elements (if any) should be included in the North American standard and what elements should be included in the regional standards.
    - Development of regional standards needs to be coordinated with regional entities.
    - Regional entities should be notified to begin process for developing regional standards once the standard drafting team has determined what elements should be included in the continent-wide standard and what elements should be included in the regional standards.

    PRC-018 Disturbance Monitoring Equipment Installation and Data

    Violation Risk Factor Drafting Team Comments

    - R3.4, 3.5, 3.6, 3.7 – Requirements as written are ambiguous and need more clearly defined.

2. The SDT will bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.

3. The SDT should also consider any other issues that were not completely captured but were stated or referenced in the above materials.

Attachment 1

Excerpts from the *Reliability Standards Development Procedure Manual, Version 6* and the *ERO Rules of Procedure*:

(The drafting team will reference and follow, as appropriate, the following guidelines *(or later version as appropriate)* in determining what changes to make to the standards to bring them into conformance with these guidelines.)

Standard Review Guidelines

Applicability

Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose

Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements

Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability

Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations

Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness

Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance

In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language

Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality

Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements

In general, requirements for entities to have ‘capabilities’ (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to ‘maintain’ their capabilities.

Consistent Terminology

To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a ‘unique’ definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Mitigation Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.

- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. (‘Violation severity levels’ replace existing ‘levels of non-compliance.’) The violation severity levels may be applied for each requirement or combined to cover multiple requirements, as long as it is clear which requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

Compliance Monitor

Replace, ‘Regional Reliability Organization’ with ‘Regional Entity’

Fill-in-the-blank Requirements

Do not include any ‘fill-in-the-blank’ requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization

Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates

Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply.

If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan.

Associated Documents

If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, ‘Associated Documents’.

Functional Model Version 3

Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Maureen E. Long
Standards Process Manager

March 22, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement: Comment Period Opens

The Standards Committee (SC) announces the following standards action:

SAR for Disturbance Monitoring (Project 2007-11) Posted for 30-day Comment Period March 22–April 20, 2007

The SAR for Project 2007-11 proposes modifying the following two standards:

- PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
- PRC-018 — Disturbance Monitoring Equipment Installation and Data

PRC-002 is one of four reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The modifications will consider issues raised by FERC and stakeholders about these standards, and will bring the standards into conformance with the *ERO Rules of Procedure* and the latest version of the *Reliability Standards Development Procedure.* Please use the comment form to provide comments on this SAR.

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

Background Information

This project involves revising the requirements in the following two standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data Reporting

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV measures. As the electric reliability organization begins enforcing compliance with reliability standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable reliability standards. The Version 0 standards and the translation of Phase III & IV planning measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 translation.

The PRC-002 revision and new PRC-018 were recently approved in 2006. In conjunction with this project, the standard drafting team will collect feedback on the strengths and weaknesses of this set of standards from the Operating and Planning Committees and from compliance personnel. The data collected will be used to modify these standards.

PRC-002 is one of the few reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The Federal Energy Regulatory Commission has determined that it will not approve PRC-002 in its current form because the requirements are assigned to the Regional Reliability Organization rather than to a functional entity that is an 'owner, operator, or user' of the bulk power system. The requirements in PRC-002 establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. This standard addresses some of the recommendations from the studies conducted following the blackout of August 2003.

The standard drafting team will work with stakeholders to review PRC-002 and each of the current regional disturbance monitoring equipment requirements to determine which requirements should be continent-wide requirements and which requirements should be included in regional standards. The requirements in PRC-018 will be revised to properly reference these changes.

The standard drafting team may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

   We do not think there is a reliability-related need to revise PRC-002 and PRC-018. However, we do agree that it will be a worthwhile effort to revise the two standards to make them: enforceable by FERC, more compatable with each other, and to address FERC staff and FERC comments.

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: RFC is in the process of developing a Disturbance Monitoring Equipment standard based on NERC standards PRC-002 and PRC-018. The SAR requires the SDT to review PRC-002 and each of the current regional programs developed in accordance to that standard. The SAR should be revised to require the SDT to review and address the current regional programs developed in accordance to PRC-018.

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: It appears this question is worded incorrectly such that it requires an explanation for a "Yes" response rather than an explanation for a "No" response.

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments: Please revise the Brief Description to include any special considerations for PRC-018 similar to the special considerations for PRC-002. Perhaps the last paragraph is applicable to both PRC-002 and PRC-018 standards but it is not clear. For the Applicable Reliability Principles Table on page 4, boxes 5 and 7 should also be checked since they refer to system monitoring.

Please use this form to submit comments on the proposed SAR for Disturbance Monitoring. Comments must be submitted by **April 20, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "DME SAR" in the subject line. If you have questions please contact **David Taylor** at David.Taylor@nerc.net or by telephone at 609-452-8060.

Background Information

This project involves revising the requirements in the following two standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data Reporting

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV measures. As the electric reliability organization begins enforcing compliance with reliability standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable reliability standards. The Version 0 standards and the translation of Phase III & IV planning measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 translation.

The PRC-002 revision and new PRC-018 were recently approved in 2006. In conjunction with this project, the standard drafting team will collect feedback on the strengths and weaknesses of this set of standards from the Operating and Planning Committees and from compliance personnel. The data collected will be used to modify these standards.

PRC-002 is one of the few reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The Federal Energy Regulatory Commission has determined that it will not approve PRC-002 in its current form because the requirements are assigned to the Regional Reliability Organization rather than to a functional entity that is an ‘owner, operator, or user’ of the bulk power system. The requirements in PRC-002 establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. This standard addresses some of the recommendations from the studies conducted following the blackout of August 2003.

The standard drafting team will work with stakeholders to review PRC-002 and each of the current regional disturbance monitoring equipment requirements to determine which requirements should be continent-wide requirements and which requirements should be included in regional standards. The requirements in PRC-018 will be revised to properly reference these changes.

The standard drafting team may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments:
   The SDT should pose questions regarding:
   (1a) whether or not NERC should require data recording performance requirements that can only be met by purchasing specific assets

   (1b) if it is sufficient to mandate what information and performance is required rather than the hardware itself (it should accomplish the same results but would avoid the issue of asset purchasing)

   (1c) should assets per se be handled by the certification / recertification process - if the entity does not have the equipment, then it can not be certified; and if it doesn't continue to meet the requirements, it would not be able to meet compliance objectives

   (2) If the PRC-002 requirements were not interconnection-wide, then DT should ask whether or not the obligation for the DME characteristic plans be assigned to the PC or TOP rather than the Regional Entity? PCs and TOPs have a better understanding of their own locality than would a region that may be tempted to homogenize the characteristic requirements

   (3) should ad hoc hardware details (sampling rates, file naming; format) be left to NAESB rather than NERC? Reliability only needs the information - efficiency and commonality would seem to be more related to Business Practices

Please use this form to submit comments on the proposed SAR for Disturbance Monitoring. PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV measures. As the electric reliability organization begins enforcing compliance with reliability standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable reliability standards. The Version 0 standards and the translation of Phase III & IV planning measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 translation.

The PRC-002 revision and new PRC-018 were recently approved in 2006. In conjunction with this project, the standard drafting team will collect feedback on the strengths and weaknesses of this set of standards from the Operating and Planning Committees and from compliance personnel. The data collected will be used to modify these standards.

PRC-002 is one of the few reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The Federal Energy Regulatory Commission has determined that it will not approve PRC-002 in its current form because the requirements are assigned to the Regional Reliability Organization rather than to a functional entity that is an 'owner, operator, or user' of the bulk power system. The requirements in PRC-002 establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. This standard addresses some of the recommendations from the studies conducted following the blackout of August 2003.

The standard drafting team will work with stakeholders to review PRC-002 and each of the current regional disturbance monitoring equipment requirements to determine which requirements should be continent-wide requirements and which requirements should be included in regional standards. The requirements in PRC-018 will be revised to properly reference these changes.

The standard drafting team may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: PRC-002: Part of the concern stated in the SAR is the development of criteria for the need for DME, criteria for the placement of DME, criteria for DME monitoring and data capture & retention, and other criteria for data reporting and program review is too open and needs to be tightened. This standard is targeted at a regional level and is an appropriate designation as different regions may have different DME needs. As an example, dense transmission systems with shorter transmission facilities and tight interconnections will have different dynamic characteristics of interest than transmission systems that are much less dense with longer transmission facilities and not as many interconnections. It is appropriate for members of regional operations to work with their regions to establish and document their DME individual regional needs. I am concerned regarding the statement that the standard as written needs to be further defined to eliminate the "fill in the blank" perception. Responding yes, as long this standard does not get so prescriptive that it stifles the abiltiy of the regional entities to develop DME criteria that fits their regional configurations and system characteristics.

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments:

Please use this form to submit comments on the proposed SAR for Disturbance Monitoring. Comments must be submitted by **April 20, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "DME SAR" in the subject line. If you have questions please contact **David Taylor** at David.Taylor@nerc.net or by telephone at 609-452-8060.

Background Information

This project involves revising the requirements in the following two standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data Reporting

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV measures. As the electric reliability organization begins enforcing compliance with reliability standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable reliability standards. The Version 0 standards and the translation of Phase III & IV planning measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 translation.

The PRC-002 revision and new PRC-018 were recently approved in 2006. In conjunction with this project, the standard drafting team will collect feedback on the strengths and weaknesses of this set of standards from the Operating and Planning Committees and from compliance personnel. The data collected will be used to modify these standards.

PRC-002 is one of the few reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The Federal Energy Regulatory Commission has determined that it will not approve PRC-002 in its current form because the requirements are assigned to the Regional Reliability Organization rather than to a functional entity that is an 'owner, operator, or user' of the bulk power system. The requirements in PRC-002 establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. This standard addresses some of the recommendations from the studies conducted following the blackout of August 2003.

The standard drafting team will work with stakeholders to review PRC-002 and each of the current regional disturbance monitoring equipment requirements to determine which requirements should be continent-wide requirements and which requirements should be included in regional standards. The requirements in PRC-018 will be revised to properly reference these changes.

The standard drafting team may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another?

   ☒ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: While the information provided by DME provides value and contributes to reliability, we need to rethink how we apply compliance to technical standards.

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: Assuming that this is handled as a technical standard.

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: It would appear that a Yes answer would need to provide supporting information. There appears to be haste in assembling this comment form.

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments: This particular proposed standard appears to fall into the category of a Technical Standard (refer to the Reliability Standards Development Procedure). The intent of this type of standard is that it measures something or provides information downstream in the reliability process. There is a need for such standards, but they shouldn't be handled the same way as a performance standard (failure of which directly impacts reliability).The FERC Order on the standards suggested NERC could look at creating an "administrative infraction" category for compliance. It seems we have the opportunity to address the fact that there is a need for such standards, but they need to be treated differently than performance or preparedness standards. We don't need to onerous penalties if their DFR encounters a temporary problem or a legacy piece of equipment doesn't provide all the data at the rate required in the new standard.

   ☐ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments: This proposed standard (SAR) could be considered a technical standard that measures something or provides information to the reliability processes. Failure to meet this standard would not have an immediate effect on reliability. Therefore, the violation risk factors, mitigation time horizon, and violation severity levels should not be as severe as a performance standard. While the standard provides criteria for disturbance monitoring equipment and for collection of data, failure to fully meet these criteria at all times is not a serious reliability concern.

Please use this form to submit comments on the proposed SAR for Disturbance Monitoring. Comments must be submitted by **April 20, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "DME SAR" in the subject line. If you have questions please contact **David Taylor** at David.Taylor@nerc.net or by telephone at 609-452-8060.

Background Information

This project involves revising the requirements in the following two standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data Reporting

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV measures. As the electric reliability organization begins enforcing compliance with reliability standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable reliability standards. The Version 0 standards and the translation of Phase III & IV planning measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 translation.

The PRC-002 revision and new PRC-018 were recently approved in 2006. In conjunction with this project, the standard drafting team will collect feedback on the strengths and weaknesses of this set of standards from the Operating and Planning Committees and from compliance personnel. The data collected will be used to modify these standards.

PRC-002 is one of the few reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The Federal Energy Regulatory Commission has determined that it will not approve PRC-002 in its current form because the requirements are assigned to the Regional Reliability Organization rather than to a functional entity that is an 'owner, operator, or user' of the bulk power system. The requirements in PRC-002 establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. This standard addresses some of the recommendations from the studies conducted following the blackout of August 2003.

The standard drafting team will work with stakeholders to review PRC-002 and each of the current regional disturbance monitoring equipment requirements to determine which requirements should be continent-wide requirements and which requirements should be included in regional standards. The requirements in PRC-018 will be revised to properly reference these changes.

The standard drafting team may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)?

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments: We agree with the project scope as described in the SAR, however please see response to question 4 below.

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments: Interconnected Phasor Measurement Unit (PMU) networks such as North American SynchoPhasor Initiative (NASPI) are not now covered in PRC-002 and PRC-18. We believe this SAR should be revised to indicate that standards relating to such PMU networks are not to be added in these revisions. We believe there should be a separate standard addressing PMU networks. Our reasons for this position are 1) There is enough for 2007-11 to deal with as it is. 2) Composition of the drafting teams for these two efforts should be different. As already indicated in the NERC Glossary definition of Disturbance Monitoring Equipment (DME), equipment that meets the funtional requirements of DME may be identified as a PMU, and any DME may certainly have a PMU output, but PMU network related standards should be addressed in a sepatate standards document.

Comment Form — 1st Draft of SAR for Disturbance Monitoring Project 2007-11

Please use this form to submit comments on the proposed SAR for Disturbance Monitoring. Comments must be submitted by **April 20, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "DME SAR" in the subject line. If you have questions please contact **David Taylor** at David.Taylor@nerc.net or by telephone at 609-452-8060.

Background Information

This project involves revising the requirements in the following two standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data Reporting

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV measures. As the electric reliability organization begins enforcing compliance with reliability standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable reliability standards. The Version 0 standards and the translation of Phase III & IV planning measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 translation.

The PRC-002 revision and new PRC-018 were recently approved in 2006. In conjunction with this project, the standard drafting team will collect feedback on the strengths and weaknesses of this set of standards from the Operating and Planning Committees and from compliance personnel. The data collected will be used to modify these standards.

PRC-002 is one of the few reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard.

The Federal Energy Regulatory Commission has determined that it will not approve PRC-002 in its current form because the requirements are assigned to the Regional Reliability Organization rather than to a functional entity that is an 'owner, operator, or user' of the bulk power system. The requirements in PRC-002 establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. This standard addresses some of the recommendations from the studies conducted following the blackout of August 2003.

The standard drafting team will work with stakeholders to review PRC-002 and each of the current regional disturbance monitoring equipment requirements to determine which requirements should be continent-wide requirements and which requirements should be included in regional standards. The requirements in PRC-018 will be revised to properly reference these changes.

The standard drafting team may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

   ☒ Yes

   ☐ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11?

   ☐ Yes

   ☒ No

   If "No," please explain why in the comment area below and provide supporting information. Comments:

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.
   Comments:

The Disturbance Monitoring SAR drafting team thanks all those who submitted comments on Draft 1 of the Disturbance Monitoring SAR. This SAR was posted for a 30-day public comment period from March 22 through April 20, 2007. The requester asked stakeholders to provide feedback on the SAR through a special SAR Comment Form. There were 18 sets of comments submitted, including comments from 75 different people from more than 50 organizations representing 8 of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received, the SAR drafting team recommends that the Standards Committee accept the revised SAR for Project 2007-11 Disturbance Monitoring for revision of standards:

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data

In response to the comments received, the SAR drafting team has revised the SAR for Project 2007-11 Disturbance Monitoring to add clarification as suggested:

1. The box for item 5 on the Applicable Reliability Principle table of the SAR ("Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems") has been checked.
2. The box for item 7 on the Applicable Reliability Principle table of the SAR ("The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis") has been checked.
3. The last paragraph of the Brief Description of the SAR was modified to begin with "When revising PRC-002 and PRC-018 the SDT will ….".
4. The following sentence was added to the end of the Brief Description of the SAR: "Note: Phasor measurement networks are to be addressed by Project 2008-06."

In addition, the SAR drafting team noted one comment outside the scope of responsibility of the SAR drafting team to resolve. This particular comment has been noted and added as Attachment 2 to the SAR for resolution during standard drafting.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/Disturbance_Monitoring_Project_2007-11.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

Index to Questions, Comments, and Responses

1. Do you believe that there is a reliability-related need to address revisions to PRC-002 and PRC-018 — disturbance equipment installation, monitoring, and reporting so that both standards are enforceable and complement one another? If "No," please explain.

Summary Consideration: Almost all commenters indicated they do think there is a reliability-related need to revise PRC-002 and PRC-018. One commenter suggested that Reliability Principle #5 applies to these two standards and the drafting team revised the SAR to include that principle:

> 5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.

Question #1			
Commenter	**Yes**	**No**	**Comment**
Entergy Services		☑	We do not think there is a reliability-related need to revise PRC-002 and PRC-018. However, we do agree that it will be a worthwhile effort to revise the two standards to make them: enforceable by FERC, more compatable with each other, and to address FERC staff and FERC comments.
Response: Thank you for the comment. The SAR drafting team will proceed with our recommendation for the revision of PRC-002 and PRC-018.			
Midwest SCG	☑	☑	While the information provided by DME provides value and contributes to reliability, we need to rethink how we apply compliance to technical standards.
Response: Compliance is an issue the SAR drafting team cannot respond to; however, the standard drafting team for Project 2007-11 will be required to propose the compliance elements of these standards and Midwest SCG can comment on the compliance elements when the standards are posted for public comment.			
KCP&L	☑		PRC-002: Part of the concern stated in the SAR is the development of criteria for the need for DME, criteria for the placement of DME, criteria for DME monitoring and data capture & retention, and other criteria for data reporting and program review is too open and needs to be tightened. This standard is targeted at a regional level and is an appropriate designation as different regions may have different DME needs. As an example, dense transmission systems with shorter transmission facilities and tight interconnections will have different dynamic characteristics of interest than transmission

Question #1			
Commenter	**Yes**	**No**	**Comment**
			systems that are much less dense with longer transmission facilities and not as many interconnections. It is appropriate for members of regional operations to work with their regions to establish and document their DME individual regional needs. I am concerned regarding the statement that the standard as written needs to be further defined to eliminate the "fill in the blank" perception. Responding yes, as long this standard does not get so prescriptive that it stifles the ability of the regional entities to develop DME criteria that fits their regional configurations and system characteristics.
Response: PRC-002 is a fill-in-the-blank standard which is being revised as directed by FERC. It is anticipated that as part of this Project 2007-11 an over-arching continent-wide PRC-002 standard will be developed and coordinated with the development of eight regional standards. You will have the opportunity to comment on the continent-wide and related regional standards as they are posted for public comment. You can then comment on the individual standards and to the extent that you feel either is so prescriptive that it stifles the ability of the regional entities to develop DME criteria that fit their regional configurations and system characteristics you may comment accordingly.			
Manitoba Hydro	☑		It seems that Applicable Reliability Principle number 5, Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems, should also be checked as disturbance monitoring is an important system monitoring function in addition to real-time monitoring.
Response: The SAR drafting team agrees with your comment and has checked the box for item 5 on the Applicable Reliability Principle table of the SAR.

2. Do you agree with the scope of the proposed project (the scope includes all the items noted in the SAR as well as other improvements to the standards that meet the consensus of stakeholders, consistent with establishing high quality, enforceable, and technically sufficient bulk power system reliability standards)? If "No," please explain.

Summary Consideration: Almost all commenters indicated agreement with the scope of the proposed SAR. One commenter indicated that the SAR should be revised to require the SDT to revise and address current regional programs developed in accordance with PRC-018, and the drafting team modified the SAR in support of the intent of this comment.

Question #2			
Commenter	**Yes**	**No**	**Comment**
FirstEnergy		☑	RFC is in the process of developing a Disturbance Monitoring Equipment standard based on NERC standards PRC-002 and PRC-018. The SAR requires the SDT to review PRC-002 and each of the current regional programs developed in accordance to that standard. The SAR should be revised to require the SDT to review and address the current regional programs developed in accordance to PRC-018.
Response: The SAR drafting Team modified the last paragraph of the Brief Description of the SAR to begin with "When revising PRC-002 and PRC-018 the SDT will ….".			
Midwest SCG	☑		Assuming that this is handled as a technical standard.
Response: The standards process requires that all standards be addressed through the same puplic posting and commenting process.			
NYISO	☑		We agree with the project scope as described in the SAR, however please see response to question 4 below.
Response: Please see the response to the comments on question 4.

3. Are there additional revisions beyond those identified in the SAR that should be addressed within the scope of this Project 2007-11? If "No," please explain.

Summary Consideration: There was an error on the comment form, and the statement that asked, 'If 'No' please explain – should have asked, 'If 'Yes' please explain. Stakeholders did not provide a list of additional revisions for inclusion in the scope of this project.

Question #3			
Commenter	**Yes**	**No**	**Comment**
Dominion VA Power		☑	There are specific changes needed, but the general SAR process steps listed should identify needed changes. Details can be worked out during drafting of changes.
Response: Thank you for your comment. The SAR drafting team encourages your review and comment on the standard itself when it is posted for comment.			
Southern Company Transmission		☑	The question should say if commenter said "yes", provide supporting information.
Response: The SAR drafting team agrees with your comment.			
FirstEnergy		☑	It appears this question is worded incorrectly such that it requires an explanation for a "Yes" response rather than an explanation for a "No" response.
Response: The SAR drafting team agrees with your comment.			
Manitoba Hydro		☑	Comments need to be provided for a "Yes" response.
Response: The SAR drafting team agrees with your comment.			
Midwest SCG		☑	It would appear that a Yes answer would need to provide supporting information. There appears to be haste in assembling this comment form.
Response:			

Question #3			
Commenter	**Yes**	**No**	**Comment**
The SAR drafting team agrees that a "Yes" answer would need to provide supporting information.

4. Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.

Summary Consideration: Almost all commenters indicated they do think there is a reliability-related need to revise PRC-002 and PRC-018.

- One commenter suggested that Reliability Principle #5 and Reliability Principle #7 apply to these two standards and the drafting team revised the SAR to include these principles:
  5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
  7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
- One commenter suggested clarifying that Phasor Measurement Networks are outside the scope of this SAR and the drafting team modified the SAR to include a phrase indicating that Phasor Measurement Networks will be addressed in Project 2008-06.
- One set of commenters suggested industry discussion on some of the technical details within the scope of the standards addressed by this SAR and the drafting team added this list of issues to the SAR as topics to be addressed by the standard drafting team.

Question #4	
Commenter	**Comment**
FirstEnergy	Please revise the Brief Description to include any special conside The SAR drafting team added the following clarifying sentence to the Brief Description of the SAR: “Phasor measurement networks are to be addressed by Project 2008-06.” rations for PRC-018 similar to the special considerations for PRC-002. Perhaps the last paragraph is applicable to both PRC-002 and PRC-018 standards but it is not clear. For the Applicable Reliability Principles Table on page 4, boxes 5 and 7 should also be checked since they refer to system monitoring.
Response: The SAR drafting Team modified the last paragraph of the Brief Description of the SAR to begin with “When revising PRC-002 and PRC-018 the SDT will ….”. In addition, Boxes 5 and 7 have been checked on the Applicable Reliability Principle table of the SAR.	
MRO Members	This proposed standard (SAR) could be considered a technical standard that measures something or

<table>
<tr><th colspan="2">Question #4</th></tr>
<tr><th>Commenter</th><th>Comment</th></tr>
<tr><td></td><td>provides information to the reliability processes. Failure to meet this standard would not have an immediate effect on reliability. Therefore, the violation risk factors, mitigation time horizon, and violation severity levels should not be as severe as a performance standard. While the standard provides criteria for disturbance monitoring equipment and for collection of data, failure to fully meet these criteria at all times is not a serious reliability concern.</td></tr>
<tr><td colspan="2">Response:

Compliance is an issue the SAR drafting team cannot respond to; however, the standard drafting team for Project 2007-11 will be required to propose the compliance elements of these standards and MRO Members can comment on the compliance elements when the standards are posted for public comment.</td></tr>
<tr><td>NYISO</td><td>Interconnected Phasor Measurement Unit (PMU) networks such as North American SynchoPhasor Initiative (NASPI) are not now covered in PRC-002 and PRC-18. We believe this SAR should be revised to indicate that standards relating to such PMU networks are not to be added in these revisions. We believe there should be a separate standard addressing PMU networks. Our reasons for this position are 1) There is enough for 2007-11 to deal with as it is. 2) Composition of the drafting teams for these two efforts should be different. As already indicated in the NERC Glossary definition of Disturbance Monitoring Equipment (DME), equipment that meets the functional requirements of DME may be identified as a PMU, and any DME may certainly have a PMU output, but PMU network related standards should be addressed in a separate standards document.</td></tr>
<tr><td colspan="2">Response:

The SAR drafting team added the following clarifying sentence to the Brief Description of the SAR:

“Phasor measurement networks are to be addressed by Project 2008-06.”</td></tr>
<tr><td>IRC SRC</td><td>The SDT should pose questions regarding:
(1a) whether or not NERC should require data recording performance requirements that can only be met by purchasing specific assets

(1b) if it is sufficient to mandate what information and performance is required rather than the hardware itself (it should accomplish the same results but would avoid the issue of asset purchasing)

(1c) should assets per se be handled by the certification / recertification process - if the entity does not have the equipment, then it can not be certified; and if it doesn't continue to meet the requirements, it would not be able to meet compliance objectives</td></tr>
</table>

Question #4	
Commenter	**Comment**
	(2) If the PRC-002 requirements were not interconnection-wide, then DT should ask whether or not the obligation for the DME characteristic plans be assigned to the PC or TOP rather than the Regional Entity? PCs and TOPs have a better understanding of their own locality than would a region that may be tempted to homogenize the characteristic requirements (3) should ad hoc hardware details (sampling rates, file naming; format) be left to NAESB rather than NERC? Reliability only needs the information - efficiency and commonality would seem to be more related to Business Practices.
Response: The IRC SRC raises questions which are outside the responsibility of the SAR drafting team. It is anticipated that as part of this Project 2007-11 PRC-002 and PRC-018 will be revised and coordinated with the development of eight related regional standards. You will have the opportunity to comment on the continent-wide and related regional standards as they are posted for public comment. The SAR drafting team also encourages members of the IRC SRC to actively participate in the standards development processes at the continent-wide and regional levels. The SAR drafting team will note IRC SRC's comments in the SAR for consideration by the standard drafting team during the development of the standard.	
Midwest SCG	This particular proposed standard appears to fall into the category of a Technical Standard (refer to the Reliability Standards Development Procedure). The intent of this type of standard is that it measures something or provides information downstream in the reliability process. There is a need for such standards, but they shouldn't be handled the same way as a performance standard (failure of which directly impacts reliability).The FERC Order on the standards suggested NERC could look at creating an "administrative infraction" category for compliance. It seems we have the opportunity to address the fact that there is a need for such standards, but they need to be treated differently than performance or preparedness standards. We don't need to onerous penalties if their DFR encounters a temporary problem or a legacy piece of equipment doesn't provide all the data at the rate required in the new standard.
Response: Compliance is an issue the SAR drafting team cannot respond to; however, the standard drafting team for Project 2007-11 will be required to propose the compliance elements of these standards and Midwest SCG can comment on the compliance elements when the standards are posted for public comment.	
Dominion VA Power	No comments until first draft is posted.
ERCOT	No further comments at this time.

Question #4	
Commenter	**Comment**
Manitoba Hydro	There are no comments to submit at this time.
NPCC CP9 RSWG	No further comment at this time.

Standard Authorization Request Form

Title of Proposed Standard:	Disturbance Monitoring (Project 2007-11)
Request Date: Revised Date:	March 1, 2007 May 21, 2007

SAR Requester Information

Name:	Robert W. Millard on behalf of the Regional Reliability Standards Working Group	***SAR Type (Check one box.)***	
Company:	Reliability*First* Corporation	☐	New Standard
Telephone:	(708) 588-9886	☒	Revision to Existing Standard
Fax:	(330) 456-3648	☐	Withdrawal of Existing Standard
E-mail:	bob.millard@rfirst.org	☐	Urgent Action

Purpose *(Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)*

To establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models.

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV Planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV Planning Measures. As the Electric Reliability Organization begins enforcing compliance with Reliability Standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable Reliability Standards. The Version 0 standards and the translation of Phase III & IV Planning Measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. The Version 0 standards, Phase III & IV standards, and recent updates were put in place as a temporary starting point to start-up the Electric Reliability Organization and begin enforcement of mandatory standards. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 and Phase III & IV translations.

Industry Need *(Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)*

1. Provide an adequate level of reliability for the North American bulk power systems — ensure the standards are complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure they are enforceable as mandatory reliability standards with financial penalties — ensure

   (a) the applicability to bulk power system owners, operators, and users, and as appropriate particular classes of facilities, is clearly defined,

   (b) the purpose, requirements, and measures are results-focused and unambiguous and

   (c) the consequences of violating the requirements are clear.
3. Consider comments received during the initial development of this set of standards and other comments received from ERO regulatory authorities and stakeholders as described in the Detailed Description section below.
4. Bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.
5. Satisfy the standards procedure requirement for five-year review of the standards.

Brief Description *(Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)*

PRC-002 and PRC-018 were approved in 2006.

PRC-002 is one of four reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard. The standard drafting team (SDT) will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The SDT shall determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

When revising PRC-002 and PRC-018 the SDT will, the SDT shall consider comments and issues as described in the Detailed Description section and Attachment 1 below for drafting and including other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders through the standards development procedure, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Note: Phasor measurement networks are to be addressed by Project 2008-06.

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability and Market Interface Principles

Applicable Reliability Principles (Check all boxes that apply.)	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☒	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an essential requirement of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description *(Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)*

1. The SDT shall consider the following comments (excerpted from NERC's Reliability Standards Development Plan: 2007-2009) which attempt to capture comments from the:
    - FERC NOPR (Docket # RM06-16-00 dated October 20, 2006),
    - FERC staff report dated May 11, 2006 concerning NERC standards submitted with ERO application, and
    - Regional Fill-in-the-Blank Team (RRSWG – a NERC working group involved with regional standards development).
    - Phase III & IV Standard Drafting Team
    - Violation Risk Factors Drafting Team

    PRC-002 Define and Document Disturbance Monitoring Equipment Requirements

    FERC NOPR

    - Commission will not propose to accept or remand this Reliability Standard until the ERO submits additional information related to the fill-in-the-blank aspects of this standard as further defined below under "Regional Fill-in-the-Blank Team Comments".

    FERC Staff Report

    - This standard designates RROs as the applicable entity. Staff is concerned about the appropriateness of RROs serving as the applicable entity in the new mandatory standards structure. These standards have been referred to as "fill-in-the-blank" standards (see comments under "Regional Fill-in-the-Blank Team Comments" below).

    Phase III/IV comments

    - There are no criteria that the RROs must use in specifying the process for identifying locations where DMEs are required (to be addressed when considering issues under "Regional Fill-in-the-Blank Team Comments" below).

    Violation Risk Factor Drafting Team Comments

    - R1 - This standard and all related sub requirements are after the fact data analysis.

    Regional Fill-in-the-Blank Team Comments

    - Determine what elements (if any) should be included in the North American standard and what elements should be included in the regional standards.
    - Development of regional standards needs to be coordinated with regional entities.
    - Regional entities should be notified to begin process for developing regional standards once the standard drafting team has determined what elements should be included in the continent-wide standard and what elements should be included in the regional standards.

    PRC-018 Disturbance Monitoring Equipment Installation and Data

    Violation Risk Factor Drafting Team Comments

    - R3.4, 3.5, 3.6, 3.7 – Requirements as written are ambiguous and need more clearly defined.

2. The SDT will bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.

3. The SDT should also consider any other issues that were not completely captured but were stated or referenced in the above materials.

4. The SDT should consider issues raised by the industry during the posting of the SAR for Project 2007-11 during the first comment period from March 22 through April 20, 2007, attached as Attachment 2.

Attachment 1

Excerpts from the *Reliability Standards Development Procedure Manual, Version 6* and the *ERO Rules of Procedure*:

(The drafting team will reference and follow, as appropriate, the following guidelines *(or later version as appropriate)* in determining what changes to make to the standards to bring them into conformance with these guidelines.)

Standard Review Guidelines

Applicability

Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose

Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements

Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability

Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations

Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness

Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance

In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language

Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality

Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements

In general, requirements for entities to have ‘capabilities’ (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to ‘maintain’ their capabilities.

Consistent Terminology

To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a ‘unique’ definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.

- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels may be applied for each requirement or combined to cover multiple requirements, as long as it is clear which requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

Compliance Monitor

Replace, 'Regional Reliability Organization' with 'Regional Entity'

Fill-in-the-blank Requirements

Do not include any 'fill-in-the-blank' requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization

Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates

Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply.

If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan.

Associated Documents

If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, 'Associated Documents'.

Functional Model Version 3

Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Attachment 2

Issues Raised by Industry During 1st Posting of SAR for Project 2007-11 Which are Outside the Responsibility of the SAR Drafting Team

Question 4 of the Comment Form: *Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.*

IRC Standards Review Committee commented:

The SDT should pose questions regarding:

(1a) whether or not NERC should require data recording performance requirements that can only be met by purchasing specific assets

(1b) If it is sufficient to mandate what information and performance is required rather than the hardware itself (it should accomplish the same results but would avoid the issue of asset purchasing)

(1c) Should assets per se be handled by the certification / recertification process - if the entity does not have the equipment, then it can not be certified; and if it doesn't continue to meet the requirements, it would not be able to meet compliance objectives

(2) If the PRC-002 requirements were not interconnection-wide, then DT should ask whether or not the obligation for the DME characteristic plans be assigned to the PC or TOP rather than the Regional Entity? PCs and TOPs have a better understanding of their own locality than would a region that may be tempted to homogenize the characteristic requirements

(3) Should ad hoc hardware details (sampling rates, file naming; format) be left to NAESB rather than NERC? Reliability only needs the information - efficiency and commonality would seem to be more related to Business Practices.

Standard Authorization Request Form

Title of Proposed Standard:	Disturbance Monitoring (Project 2007-11)
Request Date: Revised Date:	March 1, 2007 May 21, 2007

SAR Requester Information

Name:	Robert W. Millard on behalf of the Regional Reliability Standards Working Group	***SAR Type (Check one box.)***	
Company:	Reliability*First* Corporation	☐	New Standard
Telephone:	(708) 588-9886	☒	Revision to Existing Standard
Fax:	(330) 456-3648	☐	Withdrawal of Existing Standard
E-mail:	bob.millard@rfirst.org	☐	Urgent Action

Purpose *(Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)*

To establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models.

PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
PRC-018 — Disturbance Monitoring Equipment Installation and Data

PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV Planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV Planning Measures. As the Electric Reliability Organization begins enforcing compliance with Reliability Standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable Reliability Standards. The Version 0 standards and the translation of Phase III & IV Planning Measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. The Version 0 standards, Phase III & IV standards, and recent updates were put in place as a temporary starting point to start-up the Electric Reliability Organization and begin enforcement of mandatory standards. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 and Phase III & IV translations.

Industry Need *(Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation*.)

1. Provide an adequate level of reliability for the North American bulk power systems — ensure the standards are complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure they are enforceable as mandatory reliability standards with financial penalties — ensure

   (a) the applicability to bulk power system owners, operators, and users, and as appropriate particular classes of facilities, is clearly defined,

   (b) the purpose, requirements, and measures are results-focused and unambiguous and

   (c) the consequences of violating the requirements are clear.
3. Consider comments received during the initial development of this set of standards and other comments received from ERO regulatory authorities and stakeholders as described in the Detailed Description section below.
4. Bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.
5. Satisfy the standards procedure requirement for five-year review of the standards.

Brief Description *(Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)*

PRC-002 and PRC-018 were approved in 2006.

PRC-002 is one of four reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard. The standard drafting team (SDT) will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The SDT shall determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

When revising PRC-002 and PRC-018 the SDT will, ~~T~~ the SDT shall consider comments and issues as described in the Detailed Description section and Attachment 1 below for drafting and including other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders through the standards development procedure, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Note: Phasor measurement networks are to be addressed by Project 2008-06.

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☐	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability and Market Interface Principles

Applicable Reliability Principles (Check all boxes that apply.)	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☒	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an essential requirement of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage.Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

***Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)*

1. The SDT shall consider the following comments (excerpted from NERC's Reliability Standards Development Plan: 2007-2009) which attempt to capture comments from the:
    - FERC NOPR (Docket # RM06-16-00 dated October 20, 2006),
    - FERC staff report dated May 11, 2006 concerning NERC standards submitted with ERO application, and
    - Regional Fill-in-the-Blank Team (RRSWG – a NERC working group involved with regional standards development).
    - Phase III & IV Standard Drafting Team
    - Violation Risk Factors Drafting Team

PRC-002 Define and Document Disturbance Monitoring Equipment Requirements

FERC NOPR

- Commission will not propose to accept or remand this Reliability Standard until the ERO submits additional information related to the fill-in-the-blank aspects of this standard as further defined below under "Regional Fill-in-the-Blank Team Comments".

FERC Staff Report

- This standard designates RROs as the applicable entity. Staff is concerned about the appropriateness of RROs serving as the applicable entity in the new mandatory standards structure. These standards have been referred to as "fill-in-the-blank" standards (see comments under "Regional Fill-in-the-Blank Team Comments" below).

Phase III/IV comments

- There are no criteria that the RROs must use in specifying the process for identifying locations where DMEs are required (to be addressed when considering issues under "Regional Fill-in-the-Blank Team Comments" below).

Violation Risk Factor Drafting Team Comments

- R1 - This standard and all related sub requirements are after the fact data analysis.

Regional Fill-in-the-Blank Team Comments

- Determine what elements (if any) should be included in the North American standard and what elements should be included in the regional standards.
- Development of regional standards needs to be coordinated with regional entities.
- Regional entities should be notified to begin process for developing regional standards once the standard drafting team has determined what elements should be included in the continent-wide standard and what elements should be included in the regional standards.

PRC-018 Disturbance Monitoring Equipment Installation and Data

Violation Risk Factor Drafting Team Comments

- R3.4, 3.5, 3.6, 3.7 – Requirements as written are ambiguous and need more clearly defined.

2. The SDT will bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.

3. The SDT should also consider any other issues that were not completely captured but were stated or referenced in the above materials.

4. The SDT should consider issues raised by the industry during the posting of the SAR for Project 2007-~~0~~11 during the first comment period from March 22 through April 20, 2007, attached as Attachment 2.

Attachment 1

Excerpts from the *Reliability Standards Development Procedure Manual, Version 6* and the *ERO Rules of Procedure*:

(The drafting team will reference and follow, as appropriate, the following guidelines *(or later version as appropriate)* in determining what changes to make to the standards to bring them into conformance with these guidelines.)

Standard Review Guidelines

Applicability

Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?

Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.

Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.

Purpose

Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.

Performance Requirements

Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?

Does each requirement identify who shall do what under what conditions and to what outcome?

Measurability

Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?

Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?

If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?

Technical Basis in Engineering and Operations

Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?

Completeness

Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?

Consequences for Noncompliance

In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?

Clear Language

Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?

Practicality

Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?

Capability Requirements versus Performance Requirements

In general, requirements for entities to have ‘capabilities’ (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to ‘maintain’ their capabilities.

Consistent Terminology

To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?

If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a ‘unique’ definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.

Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?

Violation Risk Factors (Risk Factor)

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;

or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;

or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

~~Mitigation~~ Time Horizon

The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:

- **Long-term Planning** — a planning horizon of one year or longer.
- **Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.

- **Real-time Operations** — actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment** — follow-up evaluations and reporting of real time operations.

Violation Severity Levels

The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. (‘Violation severity levels’ replace existing ‘levels of non-compliance.’) The violation severity levels may be applied for each requirement or combined to cover multiple requirements, as long as it is clear which requirements are included.

The violation severity levels should be based on the following definitions:

- **Lower: mostly compliant with minor exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate: mostly compliant with significant exceptions** — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High: marginal performance or results** — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe: poor performance or results** — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

Compliance Monitor

Replace, ‘Regional Reliability Organization’ with ‘Regional Entity’

Fill-in-the-blank Requirements

Do not include any ‘fill-in-the-blank’ requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.

Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.

Requirements for Regional Reliability Organization

Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.

Effective Dates

Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply.

If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan.

Associated Documents

If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, 'Associated Documents'.

Functional Model Version 3

Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.

Attachment 2

Issues Raised by Industry During 1st Posting of SAR for Project 2007-11 Which are Outside the Responsibility of the SAR Drafting Team

Question 4 of the Comment Form: *Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.*

IRC Standards Review Committee commented:

The SDT should pose questions regarding:

(1a) whether or not NERC should require data recording performance requirements that can only be met by purchasing specific assets

(1b) I~~i~~f it is sufficient to mandate what information and performance is required rather than the hardware itself (it should accomplish the same results but would avoid the issue of asset purchasing)

(1c) Should assets per se be handled by the certification / recertification process - if the entity does not have the equipment, then it can not be certified; and if it doesn't continue to meet the requirements, it would not be able to meet compliance objectives

(2) If the PRC-002 requirements were not interconnection-wide, then DT should ask whether or not the obligation for the DME characteristic plans be assigned to the PC or TOP rather than the Regional Entity? PCs and TOPs have a better understanding of their own locality than would a region that may be tempted to homogenize the characteristic requirements

(3) Should ad hoc hardware details (sampling rates, file naming; format) be left to NAESB rather than NERC? Reliability only needs the information - efficiency and commonality would seem to be more related to Business Practices.

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Maureen E. Long
Standards Process Manager

June 12, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

Announcement: Nomination Period Opens for Standard Drafting Team

The Standards Committee announces the following standards action:

Nominations for Project 2007-11 — Disturbance Monitoring Standard Drafting Team (June 12–25, 2007)

The Standards Committee is seeking industry experts to serve on the Disturbance Monitoring Standard Drafting Team (Project 2007-11). If you are interested in serving on this team, please complete this nomination form and return it to sarcomm@nerc.net with "DME SDT Nomination" in the subject line by **June 25, 2007**. For questions, please contact David Taylor at 609-651-5089 or dave.taylor@nerc.net.

The drafting team will hold its first meeting August 7–9, 2007. This project involves upgrading the overall quality of the two standards below; eliminating some gaps in the requirements; and eliminating some "fill-in-the-blank" components:

- PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements
- PRC-018 — Disturbance Monitoring Equipment Installation and Data

Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

NERC Roster

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Nominations for the SAR drafting team members were solicited February 26–March 9, 2007.
2. The SAR was posted for a 30 day comment period March 22–April 20, 2007.
3. Nominations for the standard drafting team (SDT) for Project 2007-11 Disturbance Monitoring were solicited June 12–25, 2007.

Proposed Action Plan and Description of Current Draft:

The purpose of this standard is to establish requirements for recording and reporting sequence of events (SOE) data, fault recording (FR) data, and dynamic disturbance recording (DDR) data to facilitate analysis of Disturbances. This standard will replace PRC-002-1 and PRC-018-1.

The purpose of revising the above standards is to:

1. Ensure each of the standards is complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure they are enforceable as mandatory reliability standards with financial penalties; the applicability to bulk power system owners, operators, and users, and as appropriate particular classes of facilities is clearly defined; the purpose, requirements, and measures are results-focused and unambiguous; the consequences of violating the requirements are clear.
3. Incorporate other general improvements described in NERC's Reliability Standards Development Plan: 2007-2009 (summarized and outlined in the Reliability Standard Review Guidelines attached as Appendix A).
4. Consider the items mentioned in the Standard Review Forms (excerpted from NERC's Reliability Standards Development Plan: 2007-2009) attached as Appendix B, prepared by the NERC staff, which attempt to capture comments from the:
    - FERC NOPR (Docket # RM06-16-00 dated October 20, 2006) ,
    - FERC staff report dated May 11, 2006 concerning NERC standards submitted with ERO application,
    - Version 0 standards development, and
    - Regional Reliability Standards Working Group (RRSWG – a NERC working group involved with regional standards development).

The standard drafting team (SDT) also considered the following additional issues that were not completely captured but were stated or referenced in the above materials.

1. Modify PRC-002-1 to remove RRO in the applicability and eliminate the reference to RRO in PRC-018-1.
2. Create continent wide requirements applicable to Transmission Owners and Generation Owners.
3. The new standard (PRC-002-2) is being proposed based on the requirements of the existing PRC-002-1 and PRC-018-1 standards and a recommendation for replacing both of these existing standards is being proposed. The requirements in PRC-018-1 are being incorporated into PRC-002-2 with the exception of the maintenance and testing requirements in PRC-018-1.
4. Satisfy the standards procedure requirement for five-year review of the standards.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop and post reply comments to initial posting of standard	March 30–April 20, 2009
2. Post for second 30-day comment period	June, 2009
3. Post for 30-day pre-ballot period.	September, 2009
4. Conduct initial ballot	December, 2009
5. Post response to comments on first ballot	January, 2010
6. Conduct recirculation ballot	February, 2010
7. Board adoption date.	To be determined.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Substation[1] — An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modifying its characteristics.

[1] This definition is from IEEE C2-2002

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements

2. **Number:** PRC-002-2

3. **Purpose:** To ensure that Facility owners collect the data needed to facilitate analyses of Disturbances on the Bulk Electric System (BES).

4. **Applicability:**

    4.1. Transmission Owners with Substations having Facilities rated at 200 kV or above

    4.2. Generator Owners with any one of the following connected to the transmission system at 200 kV or above:

    - Generating units having a single generating unit of 500 MVA or higher nameplate rating
    - Generating plants with an aggregate plant total nameplate capacity of 1500 MVA or higher

5. **Effective Date:**

    Requirements R1 through R11:

    - The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:
        - Each Responsible Entity shall be at least 50% compliant on monitored equipment
    - The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter four years after Board of Trustees adoption:
        - Each Responsible Entity shall be 100% compliant on monitored equipment.

    Requirements R12 and R13

    - First day of first calendar quarter eighteen months after applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter after Board of Trustees adoption.

B. Requirements

R1. Each Transmission Owner shall record (or have a process in place to derive) the Sequence of Events data for changes in circuit breaker position (open/close) for each of its circuit breakers operated at 200 kV and above at each Substation that meets the following criteria:

R1.1. Contains any combination of three or more transmission lines operated at 200 kV or above and transformers having primary and secondary voltage ratings of 200 kV or above.

R1.2. Connected at 200 kV or above through generating unit step up transformer(s) (GSU(s)) to a generating plant having either a single generating unit of 500 MVA or higher nameplate rating, or through a GSU(s) to a generating plant with an aggregate plant total nameplate capacity of 1500 MVA or higher.

R2. Each Generator Owner shall record (or have a process in place to derive) the Sequence of Events data for changes in circuit breaker position (open/close) for its equipment identified in Table 2-1:

Table 2-1: Generator Owner's Requirement R2 for Sequence of Events Data

Location	Equipment
Each generating plant having either a single generating unit with a nameplate rating of 500 MVA or higher, and connected to the transmission system at 200 kV and above	Each generator output circuit breaker, including low side breakers
Each generating plant with an aggregate plant total nameplate capacity of 1500 MVA or higher, and connected to the transmission system at 200 kV and above	Each generator output circuit breaker, including low side breakers
Each Substation connected at 200 kV or above through GSU(s) to a generating plant having a single generating unit with a nameplate rating of 500 MVA or higher	Each circuit breaker 200 kV and above
Each Substation at 200 kV or above connected through GSU(s) to a generating plant with an aggregate plant total nameplate capacity of 1500 MVA or higher	Each circuit breaker 200 kV and above

R3. Each Transmission Owner and Generator Owner shall record the time stamp (or have a process in place to derive the time stamp) to within four milliseconds of input received for the change in circuit breaker position (open/close) for each of its circuit breakers specified in Requirements R1 and R2.

R4. Each Transmission Owner shall record (or have a process in place to derive) the following Fault Recording data for its equipment identified in Table 4-1:

R4.1. The three phase to neutral voltages on each monitored line or bus as follows:

- On ring buses, the voltages of bus sections connected to transmission lines.
- On breaker-and-a-half arrangements, the outer bus voltages, or the individual line voltages.
- On straight buses, common bus voltages or the individual line voltages.

R4.2. The three phase currents and the residual or neutral currents of each monitored line and transformer.

Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data

Location	Equipment
Each Substation containing any combination of three (3) or more elements consisting of transmission lines operated at 200 kV or above and transformers having primary and secondary voltage ratings of 200 kV or above Each Substation connected at 200 kV or above through generating unit step up transformer(s) to a generating plant having a single generating unit of 500 MVA or higher nameplate rating Each Substation connected at 200 kV or above through generating unit step up transformer(s) to an aggregate plant with a total nameplate capacity of 1500 MVA or higher	• Each transmission line operated at 200 kV or above that does not have fault data recorded at its remote terminal • Each transmission bus operated at 200 kV or above • Each transformer having low-side operating voltage of 200 kV or above

R5. Each Generator Owner shall record (or have a process in place to derive) the following Fault Recording data for its equipment identified in Table 5-1:

R5.1. The three phase to neutral voltages or phase to phase voltages on Generator Step-up Transformers (GSU(s)) from the high voltage side or low voltage side of the GSU, or from the generator bus.

R5.2. The three phase currents of GSU(s) from the high voltage side or low voltage side of the GSU, or from the generator bus.

R5.3. The neutral current of wye connected GSU(s) high voltage windings.

R5.4. The three phase to neutral voltages on each monitored line or bus as follows:

- On ring buses, the voltages of bus sections connected to transmission lines.
- On breaker-and-a-half arrangements, the outer bus voltages, or the individual line voltages.
- On straight buses, common bus voltages or the individual line voltages.

R5.5. The three phase currents and the residual or neutral currents of each monitored line and transformer.

Table 5-1: Generator Owner's Requirement R5 for Fault Recording Data

Location	Equipment
Each generating plant having either a single generating unit with a nameplate rating of 500 MVA or higher, and connected to the transmission system at 200 kV and above Each generating plant with an aggregate plant total nameplate capacity of 1500 MVA or higher, and connected to the transmission system at 200 kV and above	Each GSU with a high side of 200 kV and above
Each Substation connected at 200 kV or above through GSU(s) to a generating plant having a single generating unit with a nameplate rating of 500 MVA or higher Each Substation at 200 kV or above connected through GSU(s) to a generating plant with an aggregate plant total nameplate capacity of 1500 MVA or higher	• Each transmission line operated at 200 kV or above that does not have fault data recorded d at its remote terminal • Each bus operated at 200 kV or above • Each transformer having low-side operating voltage of 200 kV or above

R6. Each Transmission Owner and Generator Owner shall have Fault Recording data for its equipment identified in Requirements R4 and R5 that conforms to the following:

R6.1. A single record or multiple records that include the following:

- A pre trigger record length of at least two cycles and a post trigger record length of at least 50 cycles

  OR

- At least two cycles of the pre trigger event; the first three cycles of an event; and the final cycle of an event.

R6.2. A minimum recording rate of 16 samples per cycle.

R7. Unless a Transmission Owner has Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4 recorded no further than two Substations away, then for each Substation having a total of seven or more transmission lines connected at 200 kV or above, the Transmission Owner shall record (or have a process in place to derive) the following DDR data:

R7.1. At least one phase-to-neutral voltage at each voltage level of 200 kV and above.

R7.2. Frequency (at least one at the required Substation).

R7.3. At least one phase current (on the same phase and at the same voltage as the voltage monitored in R7.1) (for each line operated at 200 kV and above).

R7.4. Power and Reactive Power (MW and MVAR) flows expressed on a three-phase basis (for each line operated at 200 kV and above)

R8. Each Generator Owner shall record (or have a process in place to derive) the following DDR data at each of its generating plants with an aggregate nameplate rating of 1500 MVA or higher for each GSU that has a transformer high side connected at 200 kV or above:

R8.1. At least one phase-to-neutral voltage or one phase-to-phase voltage at either the GSU's high side or low side voltage level, or the generator bus voltage.

R8.2. Frequency (at least one at the required Substation)

R8.3. At least one phase current (on the same phase and at the same voltage as the voltage monitored in Requirement R8.1) or two phase currents for phase-to-phase voltages for each GSU.

R8.4. Power and Reactive Power (MW and MVAR) flows expressed on a three-phase basis (per each monitored element) for each GSU.

R9. Each Transmission Owner and Generator Owner that has DDR devices (to meet Requirement R7 or R8) shall manage its DDR data in accordance with the following technical specifications:

R9.1. Use the same phase for voltage and current recordings.

R9.2. Collect at least 960 samples per second to calculate RMS electrical quantities.

R9.3. Store calculated RMS values of electrical quantities at a rate of at least 6 times per second.

R10. Each Transmission Owner and Generator Owner that installs a DDR device after January 1, 2011 to meet Requirements R7, R8 and R9 shall install a device that is capable of continuous recording.

R11. Each Transmission Owner and Generator Owner that has a DDR device (to meet Requirements R7, R8 and R9) that does not have continuous recording capability shall set its device to trigger and record according to the following:

R11.1. For rate-of-change of frequency.

R11.2. For oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range.

R11.3. Set data record lengths at a minimum of three minutes.

R12. Each Transmission Owner and Generator Owner shall synchronize all of its Sequence of Event, Fault Recording, and DDR functions to within +/- 2 milliseconds of Universal Coordinated Time (UTC) with the associated hour offset.

R13. Each Transmission Owner and Generator Owner shall have all recorded Sequence of Event, Fault Recording, and DDR data available (locally or remotely) for 10 calendar days after a Disturbance.

C. Measures

M1. (To be added later)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

(To be added later.)

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Data Retention

1.3.1 Each Transmission Owner and Generator Owner shall retain all data provided to the Regional Entity, Reliability Coordinator or NERC for at least three years following the event.

1.3.2 Each Transmission Owner and Generator Owner shall each maintain, and report to the Regional Entity, Reliability Coordinator or NERC within 30 calendar days of a request, the following information for Sequence of Event, Fault Recording, and Dynamic Disturbance Recording data:

- Location
- Make and model of equipment
- Type of data source (Sequence of Events, Fault Recording, or Dynamic Disturbance Recording).
- Monitored elements, such as transmission circuit, bus section, circuit breakers, etc.

1.4. Compliance Monitoring and Assessment Processes

(To be added later)

1.5. Additional Compliance Information

1.5.1 Each Transmission Owner and Generator Owner shall meet all of the following criteria when reporting Sequence of Event, Fault Recording , and Dynamic Disturbance Recording data to its Regional Entity, Reliability Coordinator, or NERC:

- All Sequence of Event, Fault Recording, and Dynamic Disturbance Recording data shall be provided to the Regional Entity, Reliability Coordinator, or NERC within 30 calendar days of a request,
- All Fault Recording and Dynamic Disturbance Recording data shall be in a format such that any software system capable of viewing and analyzing COMTRADE (IEEE Std. C37.111-1999 or successor) files may be used to process and evaluate the data,
- All known delays in interposing relays shall be reported along with the SOE data,
- All data files shall be named in conformance with IEEE C37.232-2007, or its successor, Recommended Practice for Naming Time Sequence Data Files.

2. Violation Severity Levels (To be added later)

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL

E. Regional Variances

Unofficial Comment Form for First Draft of PRC-002-2 — Disturbance Monitoring and Reporting Requirements (Project 2007-11)

Please **DO NOT** use this form to submit comments. Please use the electronic comment form located at the link below to submit comments on the proposed first draft of reliability standard PRC-002-2. Comments must be submitted by **8:00 p.m. EDT on March 18, 2009**. If you have questions please contact Stephanie Monzon at stephanie.monzon@nerc.net or by telephone at 610-608-8084.

http://www.nerc.com/filez/standards/Disturbance_Monitoring_Project_2007-11.html

Background Information

The purpose of this standard is to establish requirements for recording and reporting sequence of events (SOE) data, fault recording (FR) data, and dynamic disturbance recording (DDR) data to facilitate analysis of Disturbances. This standard will replace PRC-002-1 and PRC-018-1.

The purpose of revising the above standards is to:

1. Ensure each of the standards is complete and the requirements are set at an appropriate level to ensure reliability.

2. Ensure the revised standard is enforceable as a mandatory reliability standard with financial penalties; the applicability to bulk power system owners, operators, and users, and as appropriate particular classes of facilities is clearly defined; the purpose, requirements, and measures are results-focused and unambiguous; the consequences of violating the requirements are clear.

3. Incorporate other general improvements described in NERC's Reliability Standards Development Plan: 2007-2009 (summarized and outlined in the Reliability Standard Review Guidelines attached as Appendix A).

4. Consider the items mentioned in the Standard Review Forms (excerpted from NERC's Reliability Standards Development Plan: 2007-2009) attached as Appendix B, prepared by the NERC staff, which attempt to capture comments from the:
    - FERC NOPR (Docket # RM06-16-00 dated October 20, 2006) ,
    - FERC staff report dated May 11, 2006 concerning NERC standards submitted with ERO application,
    - Version 0 standards development (see note 1), and
    - Regional Reliability Standards Working Group (RRSWG — a NERC working group involved with regional standards development).

The standard drafting team (SDT) also considered the following additional issues that were not completely captured but were stated or referenced in the above materials.

1. Modify PRC-002-1 to remove the Regional Reliability Organization (RRO) in the applicability and eliminate the reference to the RRO in PRC-018-1.
2. Create continent wide requirements applicable to Transmission Owners and Generation Owners.
3. The new standard (PRC-002-2) is being proposed based on the requirements of the existing PRC-002-1 and PRC-018-1 standards and a recommendation for replacing both of these existing standards is being proposed. The requirements in PRC-018-1 are being incorporated into PRC-002-2 with the exception of the maintenance and testing requirements in PRC-018-1.
4. Satisfy the standards procedure requirement for five-year review of the standards.

Key Issues Deliberated by the SDT:

In drafting the first version of this standard, the SDT considered the following issues:

1. The SDT decided to develop requirements for functionality for Disturbance data recording, rather than develop equipment requirements. The team focused on the "what" instead of the "how" i.e. not prescriptive.
2. The Disturbance data requirements are focused upon
   a. Sequence of events
   b. Faults
   c. Dynamic disturbances

   The requirements can be met by a variety of equipment.
3. In developing the Disturbance data requirements the SDT decided to focus on transmission voltage levels of 200 kV and above, generators 500 MVA and above, and generating stations 1500 MVA and above based on expected impact to the interconnected system. It is the team's strong belief that application of requirements below these values will require significant additional resources, while adding little value. The team recommends that requirements, if any, below these thresholds should be based on local needs to be identified by Regional Entities or Regional Reliability Organizations, while working with respective Transmission Owners and Generator Owners.
4. For each type of data (sequence of events, faults, dynamic disturbances) the requirements are arranged as follows:
   a. Locations for recording or having a process to derive: 1) sequence of events; 2) faults; and 3) dynamic disturbance recording data;
   b. Equipment to be monitored at required locations;
   c. Specific quantities to be monitored for required equipment; and
   d. Technical parameters to ensure adequate data to analyze a Disturbance
5. The SDT recommends that the maintenance and testing requirements for disturbance monitoring equipment be excluded from this (PRC-002-2) standard, because PRC-002-2 focuses on recording of Disturbance data and does not focus on the equipment that is used to record the data. The parties responsible for recording the data, namely Transmission Owners (TOs) and Generator Owners (GOs), can use any equipment as long as the equipment can record the specific Disturbance data at the required locations. This provides flexibility to the TOs and GOs to use various types of equipment such as relays, digital fault recorders, phasor monitoring units, swing recorders, etc. Since a multitude of equipment can be used to meet the requirements contained in this standard, the DM SDT does not have the expertise to develop an all encompassing set of maintenance/testing requirements.

   It is DM SDT's belief that the type of equipment that will be used by TOs and GOs to record Disturbance data will be similar to the protection and control system equipment. Therefore, NERC should consider finding another project that is more suitable to capture these requirements or create a SAR for these requirements.
6. The SDT decided to post the first version of this standard without compliance elements (VRFs, VSLs, etc.) to focus attention on the alone.
7. The criterion used by the SDT in selecting locations for monitoring/recording Disturbance data is based on minimum number of elements (lines, transformers,

etc.) or minimum amount of generation at a specific location. This approach facilitates the measurement of compliance to the requirements.

8. The SDT used the following IEEE definition in this standard: Substation - As defined by the IEEE C2-2002, (National Electric Safety Code) “An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and transformers, under control of qualified persons , through which electric energy is passed for the purpose of switching or modifying its characteristics.” As an example, if at a given location, there are three (3) 500 kV lines and four (4) 230 kV lines along with a 500-230 kV transformer, this is one substation with 7 lines above 200 kV.

The comment form includes questions to help in finalizing the development of the standard prior to balloting. For questions where you agree with the SDT, please state that you agree and if available, please provide supporting documentation. If you disagree with the SDT, please explain why you disagree and provide data to support your position. To improve the standard, the SDT would encourage responses to as many of these questions as you can answer.

The Disturbance Monitoring Standard Drafting Team would like to receive industry comments on this group of standards. Accordingly, we request that you return this form by **March 18, 2009**

Requirements to be Included in the Revised Standard

1. The SDT has considered the “fill in the blank” items that are specified in the NERC Board approved standard PRC-002-1 that the Regional Reliability Organizations were required to develop “procedures and requirements” for the entities to meet. The SDT also considered all the directives specified in FERC approved PRC-018-1. The SDT is proposing to change the “fill in the blank” characteristics into entity specific requirements and merge them with the PRC-018-1 requirements. The new proposed standard PRC-002-2 contains all requirements related to disturbance monitoring with the exception of maintenance and testing (see Question #3 below). Do you agree with the SDT’s proposal to develop and merge all disturbance monitoring requirements into a new PRC-002-2?

☐ Yes

☐ No

Comments:

2. The SDT has developed a mapping document showing the requirements in PRC-002-1 and PRC-018-1 and where, in proposed PRC-002-2, those requirements are reflected (except maintenance and testing – see Question #3 below). Do you agree that the SDT has reflected all the appropriate requirements of PRC-002-1 and PRC-018-1 in the proposed PRC-002-2?

☐ Yes

☐ No

Comments:

3. The SDT recommends that the maintenance and testing requirements for disturbance monitoring equipment belong in another standard. Do you agree with the SDT's proposal to exclude these requirements from PRC-002-2 and include them in another standard, either through the creation of a SAR or by assigning these requirements to an existing project?

☐ Yes

☐ No

Comments:

4. The criteria used by the SDT in selecting locations for monitoring/recording Disturbance data is based on minimum number of elements (lines, transformers, etc.) or minimum amount of generation at a specific location. This approach facilitates the measurement of compliance to the requirements. Do you agree with the SDT's approach? Please provide specific comments, examples or recommendations.

☐ Yes

☐ No

Comments:

5. In developing the Disturbance data requirements the SDT decided to focus on transmission voltage levels of 200 kV and above, generators 500 MVA and above, and generating stations 1500 MVA and above based on expected impact to the interconnected system. It is the team's strong belief that application of requirements below these values to include the entire BES will require significant additional resources, while adding little value.

The proposed standard requires the following:

> The status of GSU circuit breakers for generating plants connected at 200 kV and above shall be monitored on each generator with a nameplate capacity of 500 MVA or higher or an aggregate plant total of 1500 MVA or higher.

5.1. Do you agree with these nameplate values? Please provide supporting documentation for these values. If not, please propose alternate values and their technical basis.

☐ Yes

☐ No

Comments:

5.2. In part, Requirement R5 states that Fault Recording data shall be recorded at generating plants connected at 200 kV and above when a generator has a nameplate capacity of 500 MVA or higher or when there is an aggregate plant total of 1500 MVA or higher. Do you agree with these values? Please provide supporting documentation for these values. If not, please propose alternate values and their technical basis.

☐ Yes

☐ No

Comments:

5.3. Requirement R7 states that DDR data shall be recorded or derivable for all substations having a total of seven or more transmission lines connected at 200 kV or above. Do you agree with these values? Please provide supporting documentation for these values. If not, please propose alternate values and their technical basis.

☐ Yes

☐ No

Comments:

Requirements related to Sequence of Events

6. Requirement R3 states that Transmission Owners and Generator Owners shall record the time stamp or have a process in place to derive the time stamp to within four milliseconds of input received for the change in circuit breaker position (open/close) Do you agree with this value? If no, propose an alternate value and please provide technical basis.

☐ Yes

☐ No

Comments:

7. Do you agree with the other Sequence of Events requirements under R1 through R3 of the proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

☐ Yes

☐ No

Comments:

Requirements related to Fault Recording

8. Requirement R6 states that Fault Recording data shall include a pre trigger record length of at least two cycles and: a post trigger length of at least 50 cycles, or the first three cycles and the final cycle of an event. Do you agree with the requirement? If not, please propose alternate values or requirements and provide rationale.

☐ Yes

☐ No

Comments:

9. Do you agree with the other Fault Recording requirements in R4 through R6 of this proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

☐ Yes

☐ No

Comments:

Requirements related to Dynamic Disturbance Recording

10. Requirement R7 states that a DDR which is required at a substation meeting the location requirement shall be considered optional if a DDR meeting all of the requirements of R7.1, R7.2, R7.3 and R7.4 is found to be located one or two substations away. Do you agree with this option found in Requirement R7? If no, provide rationale.

☐ Yes

☐ No

Comments:

11. Requirement R8 states that Generator Owners shall record or have a process in place to derive DDR data for generating plants with an aggregate of 1500 MVA nameplate rating or higher. Do you agree with these values? Please provide supporting documentation for these values or (if you disagree with the values) alternate values and their technical basis.

☐ Yes

☐ No

Comments:

12. Do you agree with the other Dynamic Disturbance Recorder requirements in R7 through R11 of this proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

☐ Yes

☐ No

Comments:

General Questions

13. Do you agree with the Other Disturbance Monitoring Requirements R12 and R13 of this proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

☐ Yes

☐ No

Comments:

14. Are you aware of any regional variances that would be required as a result of the proposed standard?

☐ Yes

☐ No

Comments:

15. Are you aware of any conflicts between the proposed standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement?

☐ Yes

☐ No

Comments:

16. Do you have any other questions or concerns with the proposed standard that have not been addressed? If yes, please explain.

☐ Yes

☐ No

Comments:

17. Do you agree with the implementation plan as proposed by the SDT? If no, provide a plan that would be acceptable to you and provide rationale.

☐ Yes

☐ No

Comments:

18. The standard is proposing a definition for "Substation" based on the IEEE definition. Do you agree that there is sufficient misunderstanding of this term to warrant a definition? If so, do you agree that the IEEE definition is the most appropriate definition?

☐ Yes

☐ No

rate of 16 samples per cycle. **R2.2.3.** Event triggering requirements	 **Current R2.2.3,** trigger requirements, are not proposed due to the absence of industry-wide practices and the variations of established practices in different regions and locations. Therefore, it is not appropriate to define continental requirements and force those requirements on various regions or companies.	**R6.1.** A single record or multiple records that include the following: • A pre trigger record length of at least two cycles and a post trigger record length of at least 50 cycles OR • At least two cycles of the pre trigger event; the first three cycles of an event; and the final cycle of an event **R.6.2** A minimum recording rate of 16 samples per cycle.

Mapping of Requirements Specific to Dynamic Disturbance Recording from BOT Approved PRC-002-1 to Proposed PRC-002-2		
Standard PRC-002-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R3. The Regional Reliability Organization shall establish the following installation requirements for dynamic Disturbance recording: **R3.1**. Location, monitoring and recording requirements including the following: **R3.1.1**. Criteria for equipment location giving consideration to the following: - Site(s) in or near major load centers - Site(s) in or near major generation clusters	Regional applicability for dynamic Disturbance recording inferred in **current R3** is eliminated and functional entity responsibility is defined in **proposed R7, R8, R9, R10, & R11.**. In addition proposed requirements now emphasize “function’ as stated in **proposed R7, R8, R9, R10, & R11** not the equipment as stated in **current R3**. **Current R3.1** details contained in sub-requirements R3.1.1, R3.1.2 & R3.1.3 are covered by **proposed R7, R8, R9**, **R10, & R11** and associated sub-requirements. Location criteria stated in **current R3.1.1** is covered as part of **proposed R7 & R8** text. Specific measureable	**R7.** Unless a Transmission Owner has Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4 recorded no further than two Substations away, then for each Substation having a total of seven or more transmission lines connected at 200 kV or above, the Transmission Owner shall record (or have a process in place to derive) the following DDR data: **R7.1.** At least one phase-to-neutral voltage at each voltage level of 200 kV and above **R7.2.** Frequency (at least one at the required Substation) **R7.3.** At least one phase current (on the same phase and at the same voltage as the voltage monitored in R7.1 above) (for each line operated at 200 kV and above) **R7.4.** Power and Reactive Power (MW and MVAR) flows expressed on a three-phase basis (for each line operated at 200 kV and above) **R8.** Each Generator Owner shall record (or have a process in place to derive) the following DDR data at each of its generating plants with an aggregate nameplate rating of 1500 MVA or higher for each GSU that has a transformer high side connected at 200 kV or above: **R8.1.** At least one phase-to-neutral voltage or one phase-to-phase voltage at either the GSU’s high side or low side voltage level, or the generator bus voltage. **R8.2.** Frequency (at least one at the required Substation) **R8.3.** At least one phase current (on the same phase and at the same voltage as the voltage monitored in R8.1 above) or two phase currents for phase-to-phase voltages for each GSU. **R8.4.** Power and Reactive Power (MW and MVAR) flows expressed on a three-phase basis (per each monitored element) for each GSU.

Mapping of Requirements Specific to Dynamic Disturbance Recording from BOT Approved PRC-002-1 to Proposed PRC-002-2		
Standard PRC-002-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
- Site(s) in or near major voltage sensitive areas - Site(s) on both sides of major transmission interfaces - A major transmission junction - Elements associated with Interconnection Reliability Operating Limits - Major EHV interconnections between control areas - Coordination with neighboring regions within the interconnection	locations are stated.	
R3.1.2. Elements and number of phases to be monitored at each location.	Monitored devices stated in **current R3.1.2** are covered as part of **proposed R7 & R8** text. Number of phases to be monitored is not proposed however monitoring must be sufficient to derive required data.	
R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:	**Current R3.1.3 & sub-requirements R3.1.3.1 & R2.1.3.3** are specified as sub-requirements in **proposed R7**	

Mapping of Requirements Specific to Dynamic Disturbance Recording from BOT Approved PRC-002-1 to Proposed PRC-002-2		
Standard PRC-002-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. **R3.2**. Technical requirements, including the following: **R3.2.1**. Capability for continuous recording for devices installed after January 1, 2009. **R3.2.2**. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	**& R8**. **Current R3.2, R3.2.1 & R3.2.2** are defined along with additional requirements in the sub-requirements as part of **proposed R9**.	**R9.** Each Transmission Owner and Generator Owner that has DDR devices (to meet Requirement R7 or R8) shall manage its DDR data in accordance with the following technical specifications: **R9.1.** Use the same phase for voltage and current recordings. **R9.2.** Collect at least 960 samples per second to calculate RMS electrical quantities. **R9.3.** Store calculated RMS values of electrical quantities at a rate of at least 6 times per second. **R10.** Each Transmission Owner and Generator Owner that installs a DDR device after January 1, 2011 to meet Requirements R7, R8 and R9 shall install a device that is capable of continuous recording. **R11.** Each Transmission Owner and Generator Owner that has DDR devices (to meet Requirements R7, R8 and R9) that do not have continuous recording capability shall set its devices to trigger and record according to the following: **R11.1.** For rate-of-change of frequency. **R11.2.** For oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. **R11.3.** Set data record lengths at a minimum of three minutes.

Mapping of Other Disturbance Monitoring Requirements from BOT Approved PRC-002-1 to Proposed PRC-002-2		
Standard PRC-002-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: **R4.1**. Criteria for events that require the collection of data from DMEs. **R4.2**. List of entities that must be provided with recorded Disturbance data. **R4.3**. Timetable for response to data request. **R4.4**. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE1 analysis tool. **R4.5**. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming	Regional applicability for Disturbance data reporting inferred in **current R4** is eliminated and functional entity responsibility is defined in **proposed R12 &, R13 & compliance section D paragraphs 1.3.1, 1.3.2 & 1.5.1** **Current R4.1** is proposed to be replaced by **proposed compliance section D paragraphs 1.5.1 and 1st bullet under 1.5.1.** **Current R4.2 & R4.3** are covered by the **proposed compliance section D paragraphs 1.5.1 and 1st bullet under 1.5.1.** **Current R4.4** is covered by the **proposed compliance section D, 2nd bullet under 1.5.1.** **Current R4.5** is covered by the **proposed compliance section D, 4th bullet under 1.5.1.**	**R12.** *MAPPED TO PRC-018-1 Requirement R1 – See below.* **R13.** *MAPPED TO PRC-018-1 Requirement R1.2 – See below.* **Compliance Section D** **1.5. Additional Compliance Information** **1.5.1** Each Transmission Owner and Generator Owner shall meet all of the following criteria when reporting Sequence of Event, Fault Recording , and Dynamic Disturbance Recording data to the Regional Entity or the Reliability Coordinator or NERC: • All Sequence of Event, Fault Recording, and Dynamic Disturbance Recording data shall be provided to the Regional Entity, Reliability Coordinator, or NERC within 30 calendar days of a request, • All Fault Recording and Dynamic Disturbance Recording data shall be in a format such that any software system capable of viewing and analyzing COMTRADE (IEEE Std. C37.111-1999 or successor) files may be used to process and evaluate the data, • All known delays in interposing relays shall be reported along with the SOE data, • All data files shall be named in conformance with IEEE C37.232-2007, or its successor, Recommended Practice for Naming Time Sequence Data Files.

1. Title: Disturbance Monitoring Equipment Installation and Data Reporting	Proposed requirements now emphasize "function' and data capture or derivation and not equipment.	**1. Title:** Disturbance Monitoring and Reporting Requirements
3. Purpose: Ensure that Disturbance Monitoring Equipment (DME) is installed and that Disturbance data is reported in accordance with regional requirements to facilitate analyses of events.	The proposed requirements now emphasize "function' and not the equipment. In addition, regional applicability is eliminated.	**3. Purpose:** To ensure that Facility owners collect the data needed to facilitate analyses of Disturbances on the Bulk Electric System (BES).
4. Applicability: **4.1.** Transmission Owners **4.2.** Generator Owners	Further defined the applicability.	**4. Applicability:** **4.1** Transmission Owners with Substations having Facilities rated at 200 kV or above **4.2** Generator Owners with any one of the following and connected to the transmission system at 200 kV or above: • Generating plants having a single generating unit of 500 MVA or higher nameplate rating • Generating plants with an aggregate plant total nameplate capacity of 1500 MVA or higher

PRC-002-1 and PRC-018-1 Mapping to Proposed NERC Reliability Standard PRC-002-02

Mapping of Standard's Requirements from BOT Approved PRC-018-1 to Proposed PRC-002-2		
Standard PRC-018-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard PRC-002 Requirements 1-3) shall have DMEs installed that meet the following requirements:	Regional applicability is eliminated and functional entity responsibility is defined within proposed requirements.	**R1 through R11**. MAPPED TO PRC-002-1 ABOVE **R12.** Each Transmission Owner and Generator Owner shall synchronize all of its Sequence of Event, Fault Recording, and DDR functions to within +/- 2 milliseconds of Universal Coordinated Time (UTC) with the associated hour offset. **R13.** Each Transmission Owner and Generator Owner shall have all recorded Sequence of Event, Fault Recording, and DDR data available (locally or remotely) for 10 calendar days after a Disturbance.
R1.1. Internal Clocks in DME devices shall be synchronized to within 2 milliseconds or less of Universal Coordinated Time scale (UTC)	**Current R1.1** is covered by **proposed R10**.	
R1.2. Recorded data from each Disturbance shall be retrievable for ten calendar days.	**Current R1.2** is covered by **proposed R11**. SEE MAPPING TO **CURRENT R5** BELOW	COMPLIANCE SECTION D PARAGRAPH **1.5** MAPPED TO PRC-002-1 ABOVE

PRC-002-1 and PRC-018-1 Mapping to Proposed NERC Reliability Standard PRC-002-02

Mapping of Standard's Requirements from BOT Approved PRC-018-1 to Proposed PRC-002-2		
Standard PRC-018-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization's installation requirements (reliability standard PRC-002 Requirements 1 through 3).	Regional applicability is eliminated and functional entity responsibility is defined within proposed requirements.	GENERALLY MAPPED TO ALL PROPOSED REQUIREMENTS
R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region's installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1): **R3.1**. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder). **R3.2**. Make and model of equipment. **R3.3**. Installation location. **R3.4.** Operational status. **R3.5**. Date last tested. **R3.6**. Monitored elements, such as transmission circuit, bus section, etc.	Regional applicability is eliminated and functional entity responsibility is defined within **proposed compliance section D paragraph 1.3.2**. **Current R3.1, R3.2 & R3.3** are covered by **compliance section D, 1st, 2nd, and 3rd bullets under 1.3.2.** **Current R3.4 & R3.5** were not proposed due to changing status and lack of value added for analysis. **Current R3.6** is covered by **compliance section D, 4th bullet under 1.3.2.**	**Compliance Section D** **1.3. Data Retention** **1.3.2** Each Transmission Owner and Generator Owner shall each maintain, and report to the Regional Entity, Reliability Coordinator or NERC within 30 calendar days of a request, the following information for Sequence of Event, Fault Recording, and Dynamic Disturbance Recording data: • Location • Make and model of equipment • Type of data source (Sequence of Events, Fault Recording, or Dynamic Disturbance Recording). • Monitored elements, such as transmission circuit, bus section, circuit breakers, etc.

PRC-002-1 and PRC-018-1 Mapping to Proposed NERC Reliability Standard PRC-002-02

Mapping of Standard's Requirements from BOT Approved PRC-018-1 to Proposed PRC-002-2		
Standard PRC-018-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc. **R3.8**. Monitored electrical quantities, such as voltage, current, etc.	**Current R3.7 & R3.8** are already proposed as requirements making such a database unnecessary.	
R4. The Transmission Owner and Generator Owner shall each provide Disturbance data (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard PRC-002 Requirement 4).	Regional applicability is eliminated and functional entity responsibility is defined within proposed requirements.	GENERALLY MAPPED TO ALL PROPOSED REQUIREMENTS
R5. The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	**Current R5** is covered by **proposed compliance section D paragraph 1.3.1.**	**Compliance Section D** **1.3. Data Retention** **1.3.1** Each Transmission Owner and Generator Owner shall retain all data provided to the Regional Entity, Reliability Coordinator or NERC for at least three years following the event.

PRC-002-1 and PRC-018-1 Mapping to Proposed NERC Reliability Standard PRC-002-02

Mapping of Standard's Requirements from BOT Approved PRC-018-1 to Proposed PRC-002-2		
Standard PRC-018-1 NERC Board Approved	**Comment**	**Proposed Standard PRC-002-2**
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes: **R6.1**. Maintenance and testing intervals and their basis. **R6.2**. Summary of maintenance and testing procedures.	**Current R6 & sub-requirements** are proposed to be transferred to Project 2007-17 Protection System Maintenance and Testing	

Implementation Plan for PRC-002-02

Background

In developing the implementation plan, the Standard Drafting Team considered the following:

1. The requirements set forth in the proposed standard are more stringent than the existing requirements in the FERC approved standard PRC-018-1 and any regional requirements resulting in the implementation of PRC- 002-1.
2. The timeframe required by nuclear plants to be compliant will be dependent upon the period between refueling outages, which typically is around 24 months.
3. Any implementation plan will be impacted by the resource availability and approval processes that the Transmission Owners and Generator Owners have to go through every year.
4. PRC-018-1 as approved by FERC in June 2007 contained requirements that were to be included in Regional Reliability Organizations' (RRO) procedures, e.g. Requirement 1.1 regarding time synchronization. PRC-002-1, a fill-in-the-blank standard, contained a list of subject matter that was to be addressed in the RRO procedures in addition to the RRO procedure related requirements from PRC-018. Although not approved by FERC for monetary enforcement, PRC-002-1 was characterized as a good utility practice standard that warrants continued monitoring. In addition, some items such as time synchronization were the subject of blackout recommendations.

   The intended effective date of the PRC-002-1 requirements for the development of RRO procedures assumed that nine months from the NERC Board approval on August 2, 2006, the RRO procedures would have been issued, namely May 2007. Full compliance implementation of requirements such as time synchronization would be achieved by June 2011. The SDT proposes an effective date for requirements previously contained in PRC-018, which do not have fill-in-the-blank characteristics, such as R1.1, of 18 months following regulatory approval. In this manner, such requirements will continue to be on the same time table for full compliance implementation as intended by PRC-018-1. This includes approximate times to complete the proposed standard and obtain NERC and regulatory approval.

   All other requirements in this proposed continent wide draft standard effectively become the previous RRO fill-in-the-blank requirements. Since these requirements are not necessarily identical to any current or proposed regional procedures, the SDT believes that it is appropriate to provide the same preparatory time margin, namely four years for full compliance implementation from the time of regulatory approval, as was intended in PRC-002-1 & PRC-018-1 when issuance of an approved RRO procedure was referenced.

Effective Dates for PRC-002-2 Requirements R1 through R11

1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:

    a. Each Responsible Entity shall be at least 50% compliant on monitored equipment

2. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter four years after Board of Trustees adoption:

    a. Each Responsible Entity shall be 100% compliant on monitored equipment.

Effective Dates for PRC-002-2 Requirements R12 and R13 (PRC-018-1 R1.1 and R1.2):

1. The first day of the first calendar quarter eighteen months after applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter eighteen months after Board of Trustees adoption.

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Three Comment Periods Open

Now available at:

http://www.nerc.com/filez/standards/Reliability_Standards_Under_Development.html

Errata for Four Reliability Standards

Errata for four Reliability Standards are posted for a 30-day comment period. The comment period is now **open until 8 p.m. EST on March 2, 2009**.

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at 609-524-7047. An off-line, unofficial copy of the comment form is posted on the project page: http://www.nerc.com/filez/standards/Standards_Errata.html

Background

Clean and redline versions of the following standards are posted on the project page:

1. IRO-006-4 — Reliability Coordination — Transmission Loading Relief
2. MOD-021-0 — Documentation of the Accounting Methodology for the Effects of Controllable Demand-Side Management in Demand and Energy Forecasts
3. PER-001-0 — Operating Personnel Responsibility and Authority
4. TPL-006-0 — Data From the Regional Reliability Organization Needed to Assess Reliability

Errata Process

In accordance with the Standards Committee's procedure for Approving Errata in an Approved Reliability Standard, if the proposed revisions are supported by stakeholders and approved by the NERC Board of Trustees, the associated standards will be corrected and posted with a new version number and submitted to governmental authorities for their approval. To reflect that there is a minor change to correct errata, the version numbers will be updated by adding a decimal point and the numeral "1" after the decimal point. For example, IRO-006-4 will be changed to IRO-006-4.1.

Proposed Standard PRC-002-2 — Disturbance Monitoring and Reporting Requirements (Project 2007-11)

The Disturbance Monitoring Standard Drafting Team (Project 2007-11) has posted its first draft of standard PRC-002-2 — Disturbance Monitoring and Reporting Requirements, a mapping document, and an implementation plan for a 45-day comment period. The comment period is now **open until 8 p.m. EDT on March 18, 2009**.

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at 609-524-7047. An off-line, unofficial copy of the comment form is posted on the project page:
http://www.nerc.com/filez/standards/Disturbance_Monitoring_Project_2007-11.html

Background

The purpose of this standard is to establish requirements for recording and reporting sequence of events data, fault recording data, and dynamic disturbance recording data to facilitate analysis of Disturbances. The project involves replacing "fill-in-the-blank" requirements currently assigned to the Regional Reliability Organization with continent-wide requirements that are applicable to other functional entities. This standard will replace PRC-002-1 — Define and Document Disturbance Monitoring and Equipment Requirements and PRC-018-1 — Disturbance Monitoring Equipment Installation and Data. The project also involves bringing the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure.

Revisions to Standard NUC-001-1 — Nuclear Plant Interface Coordination for Order 716 (Project 2009-08)

The Nuclear Plant Interface Coordination Standard Drafting Team (Project 2009-08) has posted its first draft of standard NUC-001-2 — Nuclear Plant Interface Coordination, an implementation plan, and a Standards Authorization Request (SAR) for a 45-day comment period. The comment period is now **open until 8 p.m. EDT on March 18, 2009**.

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at 609-524-7047. An off-line, unofficial copy of the questions listed in the comment form is posted on the project page:
http://www.nerc.com/filez/standards/Project2009-08_Nuclear_Plant_Interface_Coordination.html

Background

The Nuclear Plant Interface Coordination standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring safe nuclear plant operation and shutdown. The proposed revisions address two directives in Federal Energy Regulatory Commission (FERC) Order 716 aimed at addressing stakeholder concerns for improved clarity. Additional revisions were made to change the term “Planning Authority” to “Planning Coordinator” (to match the terminology in the latest version of the Functional Model) and to bring the compliance elements of the standard into conformance with the latest version of the ERO Rules of Procedure.

Standards Development Process

The Reliability Standards Development Procedure contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

It is good idea to make a single document to cover all DME requirements
Yes
No
As I mentioned in item-1 above, all DME requirements should be in one document. The maintenance and testing requirements for DME should be in one document.

No
"or minimum amount of generation at a specific location." Whatever is this, I do not agree to have one recorder for many generator units. Every generator should have an own DME (such as capabilities of SER and Wave-Capture by a micor-processor relay).
No
These capacites (500MVA/unit and 1500MVA/plant) are too large. This will not help over-all post-disturbacne analysis. These values should be 20MVA/unit and 75MVA/plant.
No
These capacites (500MVA/unit and 1500MVA/plant) are too large. This will not help over-all post-disturbacne analysis. These values should be 20MVA/unit and 75MVA/plant.

They should be included in PRC-005 -- Transmission Protection System Maintenance and Testing
Yes
As written, R1.1 would require SOERs only at stations that have 3 transmission lines AND transformers. I’m sure that was not the intent. For clarity, R1.1 should be reworded to read (consistent with Table 4.1): “Contains any combination of five or more transmission lines elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above.”
No
Disagree with 200 kv and above...should be 100 kv and above.
No
Disagree with 200 kv and above...should be 100 kv and above. It is important for forensic analysis to have both bus and line quantities for DFR quantities. Bullets 2 and 3 should read: ♣ On breaker-and-a-half arrangements, the outer bus voltages, and the individual line voltages. ♣ On straight buses, common bus voltages and the individual line voltages.
No
For consistency in description, the DDR requirement in R7 should mirror the station description in R1.1: “…then for each Substation having any combination of seven or more transmission elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above a, the Transmission Owner shall record..."
Yes
No
R1.1 As written, R1.1 would require SOERs only at stations that have 3 transmission lines AND transformers. I’m sure that was not the intent. For clarity, R1.1 should be reworded to read (consistent with Table 4.1): “Contains any combination of five or more transmission lines elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above.” Note the change from 3 elements to 5 elements...3 elements woudl require a significant number of new installations.
No
The term "final cycle of the event" is confusing. The recording should remain for at least 2 seconds or until the triggered value has been eliminated.
No
R4.1 It is important for forensic analysis to have both bus and line quantities for DFR quantities. Bullets 2 and 3 should read: ♣ On breaker-and-a-half arrangements, the outer bus voltages, and the individual line voltages. ♣ On straight buses, common bus voltages and the individual line voltages.
Yes
R7 For consistency in description, the DDR requirement in R7 should mirror the station description in R1.1: “…then for each Substation having any combination of seven or more transmission elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above, the Transmission Owner shall record..." Also, the parenthetical qualifiers in both R7.3 and R7.3 should read: “(for each transmission element operated at 200 kV and above)”
Yes
No
R7 For consistency in description, the DDR requirement in R7 should mirror the station description in R1.1: “…then for each Substation having any combination of seven or more transmission elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above, the Transmission Owner shall record..." The parenthetical qualifiers in both R7.3 and R7.3 should read: “(for each transmission element operated at 200 kV and above)” R9.2 The term collect in the sample rate requirement of R9.2 can be confused with what is required for values required to be stored. R 9.3 speaks to

storage reuquirements. For clarity, R9.2 should read: “Sample at least 960 times per second to calculate RMS electrical quantities.”
Yes
No
For reasons of consistency in the ability to cross-regional or interconnection-wide disturbance analysis, there should be no regional variances.
No
Yes
Effective Date R12-R13 For consistency, the first bullet under Effective Dates should read: “The first day of the first calendar quarter two years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:"
No
Effective Date R12-R13 For consistency, the first bullet under Effective Dates should read: “The first day of the first calendar quarter two years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:

Yes
We assumed that the question refers to the merging of Standards PRC-002-1 and PRC-018-1.
No
Requirement R3.2.1 in PRC-002-1 lists a technical requirement for recording devices installed after Jan. 1, 2009. Requirement R10 in PRC-002-2 applies to the installation of DDR devices after Jan. 1, 2011. Why was the date changed? In PRC-002-1 R4.5 refers to naming data files. In PRC-002-2 the naming of data files was moved to Section D, Compliance, Subsection 1.5 Additional Compliance Information. It does not appear in the Requirement Section. Data file naming, and data file formatting should be a requirement.
Yes
We agree that the maintenance and testing should be in another standard. However, we are concerned that the time to develop a separate standard would introduce a "time gap" when there would be an in force Disturbance Monitoring Standard, with no document in place addressing maintenance and testing.
Yes
No
Performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. Monitoring should not be limited to breaker positions--this will improve event analysis. We do not feel that the 200kV threshold is an appropriate criteria for assessing criticality.
Yes
Yes
Yes

No
Sequence of Events requirements should include monitoring of transmission and generator circuit breaker positions, protective relay tripping for all protection groups, and teleprotection keying and receiving.
Yes
This requirement allows for the inclusion of legacy equipment. This requirement does not stipulate the recording of adequate information for analysis.
No
Referring to Requirement 4.1, the number of phases to be monitored is excessive. It will not provide any analytical benefit. Monitoring every transmission line in a ring bus is excessive. The second bullet referring to a breaker-and-a-half arrangement needs clarification. What is the "outer bus" in that arrangement? Definitions should be provided when references are made to substation designs or equipment that could have different names or designations in the industry. As we commented in Question 5, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. This needs to be reflected in Table 4-1. Referring to Requirement R4.2, the intent of measuring neutral current needs to be clarified, specifically with regard to transformers (see R5.3 in PRC-002-2). Referring to Requirement R5, the comments to R4.1 and R4.2 are applicable. In Table 5-1 the requirements that refer to the high side of critical GSU's should be directed at Transmission Owners, not Generation Owners. Referring to Requirement R6.1, the second bullet does not provide for the recording of adequate information (see response to Question 8).
Yes
No
Referring to Requirement R7, is a Generator Owner required to install a DDR if there is a DDR installed on the plant's outlet transmission system no further than two substations away? What is the basis for the "two Substations away" criteria?
No
Referring to Requirement R7, because of the limitations of legacy equipment, this requirement will not be met. Referring to Requirement R8, as noted in the response to Question 5 and elsewhere, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. Referring to Requirement R8.4, the statement in parenthesis "(per each monitored element)" is redundant. We have no comment to Requirement R9. Our response to Question 2 deals with Requirement R10. Requirement R11 should be reworded to: …that does not have continuous recording capability shall set its device to trigger and record according to the following where available: Requirement R11.1 should be worded to: R11.1 For rate-of-change of frequency, or delta frequency. Legacy equipment might not be able to satisfy Requirement R11.3.
Yes
No
No
Yes
Regarding Table 2-1: Generator Owner's Requirement R2 for Sequence of Events Data, as we commented in Question 5 and elsewhere performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. We do not feel that the 200kV threshold, nor the plant/plants' capacities are appropriate criteria for assessing criticality. This should be reflected in the table. The Applicability Section refers to Transmission Owners with facilities greater than 200kV, and Generator Owners with plants connected at greater than 200kV, capacities greater than 500MVA, aggregate plants

with capacities greater than 1500MVA. As we commented in Question 5 and elsewhere we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications.
No
Under the section Effective Dates for PRC-002-2 Requirements R1 through R11, the first section reads: "1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:…" For consistency the latter should be changed to four years after Board of Trustees adoption. As written, the timelines are not only inconsistent, but two years is too aggressive a time frame for what is required, in particular considering that Board of Trustees adoption precedes regulatory approval.
Yes
We agree that "substation" needs a definition. However, "switching station" is being used in the industry to describe those "substations" that do not necessarily have transformers, do not directly supply load or serve as generation outlets, but are strictly transmission junction points. Suggested rewording of the IEEE definition as applied to this Standard: Substation - An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and/or transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modfiying its characteristics. With the preceding change in mind, then Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data would have to be modified accordingly.

1. Selecting location for monitoring/recording disturbance data should be based on the disturbance analysis requirement as stated in the purpose section of this standard. But the SDT said,"… based on expected impact to the interconnected system. It is the team’s strong belief that application of requirements below these values will require significant additional resources…". This statement does not fully match the purpose. 2. Using the minimum number of elements or minimum amount of generation at a specific location has two deficiencies. Firstly, it may exclude some locations where it is critical for BES reliable operation but not under this minimum number criterion. Secondly, it may waster the resource in the case which the disturbance data are collected in two adjacent locations defined in the draft standard where there are elements between each other. So it is recommended that SDT review the approach and satisfy the purpose of this standard. It is better to provide some guideline to select the location, instead of use the number. Another suggestion is that SDT look at FERC approved standard EOP-004-1 disturbance reporting to determine how to select the locations for monition/recording disturbance data to facilitate the analysis of the events specified in EOP-004-1. 3. Disturbance data are mostly used by the entities that have a wide area view such as RC. Normally, these entities decide where to collect disturbance data for analysis. The draft standard does not have such wordings which allow these entities to have inputs to choose the locations and elements.
No
To use a specific number may not be appropriate way. Please see the comments in Q4 for justification

To use a specific number may not be appropriate way. Please see the comments in Q4 for justification
No
To use a specific number may not be appropriate way. Please see the comments in Q4 for justification

No
To use a specifie number may not be approperiate way. Please see the comments in Q4 for justification.
Yes
SDT took consideration of the resources needed when choosing the criterion for selecting locations for monitoring/recording disturbance data. This can be shown in Table 1 of R4, “Each transmission line operated at 200 kV or above that does not have fault data recorded at its remote terminal”. So if a line has fault data recorded at its remote terminal, it is not required to record at the nearest terminal. But what about the remote terminal is connected to a generator owned by a GO ? Does that mean the location owned by the TO is excluded? If using this same approach, why cannot the terminal owned by a GO be excluded if the remote terminal has the fault data recorded? There are no such wordings in the requirements for GO’s in the draft. So it is recommended that SDT review the disturbance monitoring/recording requirements at the location of interface between TO and GO.

Yes
B.R1.1. I am unclear on this. The current language un-necessarily complicates things. I am concerned that the current wording could be interpreted to mean all locations with 3 T-Lines and any Xfmrs with any voltage greater than 200kv. I would suggest that the wording from the left hand column of Table 4-1 be used here. Table 4-1: Wording in first paragraph in left column of table is inconsistent with B.R1.1 when describing elements to count. Also, third bullet in right column is inconsistent with Xfmr description in left column.
Yes
No
R7 is very difficult to read. A reword similar to is suggested: When a Transmission owner DOES NOT have Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4, recorded no further than 2 Substations away, then.....

We agree with these threshholds for some application of DME's, however for SOE requirements, we believe it should be reduced to 50MVA unit and 300MVA plant. Loss of generation affects the entire interconnection regardless of voltage level, and these levels are based on NPCC's current criteria. During a system wide event, many small generators may trip, and this generation adds up and is the reasoning behind monitoring smaller levels.
Yes
Yes
Yes
No
For SOE requirements, we believe it should be reduced to 50MVA unit and 300MVA plant. Loss of generation affects the entire interconnection regardless of voltage level, and these levels are based on NPCC's current criteria. During a system wide event, many small generators may trip, and this generation adds up and is the reasoning behind monitoring smaller levels. Just monitoring breaker position isn't enough. The SOE should monitor CB position, protective relaying tripping of all protection groups, and teleprotection keying and receive. The 3rd and 4th row in the table puts the responsibility to monitor the transmission substation on the generation owner. This

should be changed such that the station owner is required to monitor SOE at the substation. For monitoring the transmission substation SOE, we believe the 500MVA unit / 1500MVA plant, 200kV+ interconnection threshold is adequate.
Yes
Yes, this sounds good, but we don't understand how one could record the first 3 cycles and final cycle of an event.
No
R4.1 requires monitoring of 3 phase voltages on all bus sections of ring buses. We believe this is excessive. Reduce requirements to enough to be able derive all the quantities during normal maintenance conditions (outages). R5.5, second row in table: This puts the responsibility to monitor a transmission substation on the genertator owner. Change the requirement such that the substation owner needs to monitor this.
Yes
Yes
No
We agree with the minimum requirements set in R9 for all DDRs. R11.1 What is supposed to be captured with this trigger? A ROC trigger won't consistantly capture the events causing step changes in frequency. A delta frequency trigger is more effective for capturing drops/rises in frequency. We propose requiring a trigger for delta frequency/step change in frequency for all new equipment, and for existing equipment that meets R9 and has the capability. R11.2 Not all existing recorders have this capability. Require this trigger for existing recorders that meets R9 and has the cabability. R11.3 Not all existing recorders have this capability. Require 3 minute recordings for existing equipment with this capability, and 60 second post trigger recordings for existing recorders that meet R9, but cannot store 3 minute records.
Yes
No
No
Yes
Section A5 first sentence: "The First Day of the first calendar quarter four years after..." I think "four" was meant to be "two" such that it's consistant with the end of the sentence. R1.1 I found the sentence difficult to understand, change to the wording in the table under R4.2 R5.5 there is an extra "d" in "...fault data recorded d at it's remote terminal"

While we agree that using a minimum number of elements connected at some minimum voltage level is an appropriate method, we think that three elements may cause more substations to require the monitoring than is required to assure reliability.
Yes
Yes
Yes
No
This wording seems very confusing. Does it intend to require that the time stamp will be recorded to indicate the time of the change in state of the breaker with an accuracy of +/- 4 milliseconds? 2 millisecond resolution is required in R12. Is this inconsistent with that Requirement?
Yes
We would like to ensure that no separate Sequence of Events Recorder is required if the data can retrieved from archived SCADA logs.
Yes
How is the final cycle of an event determined?
No
The R4.1 and R5.4 ring bus requirements to monitor three-phase voltages on each transmission line seems unnecessary for reliability or for post-event analysis. Voltages from opposite locations on a ring bus should ensure that sufficient quantities are available to perform any required calculations.
Yes
Yes
Yes
No
Data should be retained longer than 10 calendar days. We would suggest 60 days as a minimum.
No
No
No
No
Effective dates for 50% and 100% compliance are given. The dates are the same unless no regulatory approval is required. Should the date for 50% compliance be two years after the "applicable Regulatory Approval" instead of also four years?
Yes
Some definitions of substation require a transformer so the IEEE definition includes what might be considered a switchyard as well as of a substation.

Yes
Yes
The SRC agrees with the proposal to exclude maintenance and testing from this standard.
Yes
The SRC would suggest that consideration be given to Market Entities that aggregate resources. It may be useful to specifically recognize "physical aggregation" so as to exclude "electronic aggregation."
Yes
As in the response to #4, the SRC would suggest that consideration be given to Market Entities that aggregate resources. It may be useful to specifically recognize "physical aggregation" so as to exclude "electronic aggregation."
Yes
As in the response to #4, the SRC would suggest that consideration be given to Market Entities that aggregate resources. It may be useful to specifically recognize "physical aggregation" so as to exclude "electronic aggregation."
Yes
The SRC agrees with the SDT decision to specify a common limit and recognize that special cases not covered by the common limit will be addressed by regional standards.
Yes
The SRC would suggest that Requirement 3 be separated into two independent requirements - one for TOs and one for GOs. Although the intent is to combine the two parallel requirements, it is possible for a compliance person to interpret the "AND" as an "inclusive AND" and require the TO (or GO) to have data for both R1 and R2 criteria.
No
The SRC agrees with the main requirement R1. However, the SRC does not agree with making R1.1 and R1.2 independent requirements. These two inclusions are explanatory text not specific ad hoc requirements. Note that in R2 the explanatory text is included in a Table not as independent requirements.
No
The SRC questions the need for two seemingly divergent Methods to achieve the reliability data objective. If the objective is to ensure that 2 cycles of pre-event data is available (to establish a base line) then both methods do that. But then Method 1 stores 50 cycles of data and ends (in essence losing all information after that 50 cycles). The second Method saves 3 cycles of post-event data and 2 cycles of data at the end. That means for events lasting longer than 50 cycles Method 1 is missing the end of event information, and Method 2 may not have any data at all after the first two cycles (except for the 3 cycles at the very end of the event). – The SRC would ask what is the information that is needed for analysis. Seemingly these two methods are saving different pieces of data and yet both are acceptable. What is the technical basis for the 16 samples per cycle requirement? The SRC would also suggest that Requirement 6 be separated into two independent requirements - one for TOs and one for GOs. Although the intent to combine the two parallel requirements, it is possible for a compliance person to interpret the "AND" as an "inclusive AND" and require the TO (or GO) to have data for both R4 and R5 criteria.
No
The SRC agrees with the data itself. – – The SRC does not agree that each data item listed in R4 must be an independent requirement. The SRC supports compliance with R4, but that the suggested sub-requirements be bullet items and that those items be handled through VSLs. – – Similarly with R5, the data items should be bulleted rather than being shown as independent. - Similarly with R6, the data items should be bulleted rather than being shown as independent.
Yes
The concept of the requirement is good but the wording can be improved. The issue is how to impose penalties for this requirement. If a TO "can" (i.e. the capability is there) get the required data, but the other TO's DDR fails, then who is responsible for compliance? In short, if each TO is responsible for the data then the two substation caveat has no meaning in cases of different

TSOs. In the case of the same TSO it may be useful if the two substation limit is justifiable. The SRC suggests rewriting the requirement in a positive fashion. One example would be: "The Transmission Owner of substations 200KV and above shall have access to Dynamic Disturbance Recording data at or within 2 substations of the subject asset or other processes capable of providing: - R7.1 - R7.2 - R7.3 - R7.4 " This proposal changes the requirement into reporting the required data for events that happen within radius of interest (i.e. two substations).
No
The SRC agrees with the concept of the requirement . The SRC does not agree that the specified data items should be treated as independent requirements. Further, the SRC suggests that the phrase "physical aggregate" be used.
No
The SRC agrees with the other DDR requirements in R7 through R10, but do not agree with and specifically have a question on R11.1. R11 requires TO and GO to set their DDRs (that do not have continuous recording capability) to trigger under specific conditions. R11.1 simply states for rate-of-change of frequency only, but does not specify what rate is it that the DDR should be triggered to start recording. Do we need a default frequency rate-of-change to be specified in R11.1? No, the identified items need not be assigned as independent subrequirements. For R10, the implementation caveat should not be part of the requirement. Rather it should be included as part of the Implementation Plan. The SRC would also suggest that Requirement 9 be separated into two independent requirements - one for TOs and one for GOs. Although the intent to combine the two parallel requirements, it is possible for a compliance person to interpret the "AND" as an "inclusive AND" and require the TO (or GO) to have data for both R7 and R8 criteria.
No
The SRC questions the use as Universal Coordinated Time in R12 as a reliability issue. Having UCT for every device may make it "easier" for an after-the-fact collection of DDR data, it does not address the fact that other data would not be on UCT, and that a team should be able to adjust for time differences rather than to subject someone to financial penalties even though it had the data it did not have the proper time zone defined.
No
No
Yes
Compliance item 1.3.2 and 1.5 seem to be adding undocumented requirements. The standard focuses on data collection but does not require the data to be provided to anyone. Is it implied (from the Rules of procedure) that the data be provided to the ERO, and therefore no requirement is needed? Data Retention also adds undocumented requirements. Mandatory formats should not be part of a standard.
No
The Implementation schedule for R1 - R11 is not clear. It seems as if a logical schedule would be that all entities be 50% compliant within 2 years and 100% compliant within 4 years. Yet as written it seems to obligate non-regulated entities to be compliant within 2 years while regulated entities have 4 years. Similarly for R12 & R13, the schedule gives regulated entities 18 months to comply but only 3 months for non-regulated entities.

A single standard addressing disturbance monitoring is GREATLY appreciated. This will simplify compliance efforts.
Yes

Yes
Maintenance and testing (M&T) separation is good as long as there is no text in either standard referring back to another standard. So, PRC-002-2 has recording parameters defined as it should; the M&T standard should only require the equipment to be maintained (keep it working) and tested (it works as programmed). If the installed equipment does not meet the requirements of PRC-002-2 either by wrong choice of equipment or poor programming, then there is only a PRC-002-2 violation, not a PRC-M&T standard violation as long as the equipment was maintained and tested. In other words, a single violation should only incur one standard being violated; standard verbiage should avoid the possibility of double jeopardy. I would suggest that the same SDT for PRC-002-2 work on the M&T standard.
Yes
I believe the applicability thresholds as described in the proposed standard goes a long way in bringing a reasonable dividing line between responsible reliability monitoring versus over extension of applicability just to make sure all the bases are covered. Smaller entities who can not possibly impact the BES in any way (cascading failure) will be spared unnecessary compliance expense.
Yes
For the WECC area, if we can't withstand a 1500 MVA loss without a cascading failure, then the system is operating too close to the line. I think the burden of proof should be on those who would argue for more stringent nameplate values.
Yes
Again, I feel the burden of proof should be on those who would argue for more stringent criteria.
Yes
Again, I feel the burden of proof should be on those who would argue for more stringent criteria.
Yes
Yes
Yes
If the former requirement is preferred, would it be best to require all new equipment abide by the 2 - 50 cycle requirement and only allow the first three cycles and the final cycle method for existing legacy equipment? I would not take issue with this when the standard is up for a vote.
Yes
Yes
I find the original verbiage of R7 confusing without the clarifying statement above. I would consider rewording R7.

The following are the comments of the DMWG which we are filing in support: We agree with the nameplate values. However, we have two questions. 1) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? 2) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
The following are the comments of the DMWG which we are filing in support: What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
Yes
No
The following are the comments filed by the DMWG which we are filing in support: The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirment be for substations with five or more lines operated at 200 kV or above.
Yes
The following comments are those filed by the DMWG which we are filing in support: The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
No
The following comments are those filed by the DMWG which we are filing in support: Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Yes
Yes
The following comments are those filed by the DMWG which we are filing in support: The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
No
The following comments are those filed by the DMWG which we are filing in support: The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects

30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirment eliminates the use of this adequate equipment.
Yes
The following comments are those filed by the DMWG which we are filing in support: The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Yes
The following comments are those filed by the DMWG which we are filing in support: Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
The following comments are those filed by the DMWG which we are filing in support: The Effective date information is unclear for the 50% and 100% compliance requirements.

No
Requirements related to DME equipment maintenance should not be included in the PRC-005 standard because the importance of DME equipment does not warrant the same high level attention as Protection Systems. PRC-002-2 seems to be a more logical place.
Yes
Yes
Yes
Yes
Yes
No
Table 2-1 indicates "Including low side breakers" for plant SER data inputs. If an aggregate generation site of 1500MVA is monitored at the >200kV level where the generation enters the transmission network, the system impact of any occurrence will be seen at the monitoring point. PEF dissagrees with the low side breakers position being included to be monitored by the DFR/SER. Monitoring of these breakers are included within the functional boundaries of the smaller generating units and the breaker voltages are less than 50KV and not part of the transmission grid. Extending this requirement will be costly since the DFR will be located at the

transmission network location remote to the multiple generators and low side breakers. The requirement should only include the >200kV circuit breaker SER data.
No
Wording is not very clear as to the fault length. An example on how it could be worded would be: "Recording duration shall be at least 50 cycles in total length with a minimum of 2 cycles of pre-fault data (or pre trigger)".
No
Monitoring of GSU transformer currents on units >500MVA is the correct approach. However, peaking generation locations will have many generating units of less than 500MVA. The aggregate combination of 1500MVA will encompass many GSU transformers. Monitoring of each of the GSUs' currents (even though they are >200kV) will require extensive DME equipment additions at locations remote to the transmission network where the DME equipment is (and should be) located. We believe these total aggregate generation currents should be monitored at the location where they are introduced to the transmission network. This location may be at an exit point from a generating unit bus or a transmission line the feeds the generation power into another remote transmission substation bus.

R1.1 and Table 4-1 specifies substations that "contain any combination of 3 or more transmission lines operated >200kV AND TRANSFORMERS having primary and secondary voltage ratings of >200kV". Above, the words “AND TRANSFORMERS” is interpreted as the location must contain a transformer with primary and secondary voltages >200kV to be a required location. For example, as it's written this would mean the location needs to contain a 500/230kV transformer in addition to at least qty 2 - >200kV lines. A location with 5 >200kV lines and a non-qualifying 230/115kV transformer would not be a required location. If the word was OR – a location with 3 >200kV lines would be a required location and would increase the 230kV substation requirement greatly. It is my opinion that these substations and associated >200kV lines do warrant monitoring because of their significance to the BES. R6.2 requires "16 samples per cycle", where R9.2 requires "960 samples per second". SDT should pick a common way to state sample rate. Table 4-1 the Location column specifies "transformers having primary AND secondary voltage ratings >= 200kV" where the Equipment column specifies "transformer having low-side operating voltage >= 200kV. Again, SDT should find a common way to state this requirement.
Yes
No
Clarification is needed whether to include switching stations as part of the criteria (ie, will a 230kV facility with 5 - 230kV transmission lines without a transformer require a DFR?) Many interpret that a substation includes transformation otherwise the station is a switching station.

We agree with the nameplate values. However, we have two questions. 1) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? 2) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?

The need to record and store continuously captured waveforms seems to be in excess. Triggered waveforms would suffice. Why the need to continuously record?
Yes
No
No
Yes
The driver for this standard is to ensure that the data required for proper analysis is captured. In order to analyze events, data from multiple recorders and multiple locations will be required. Has the committee considered the differences in recording methods used between vendors and the resulting differences in data captured for the same event? Most countries specify IEC 61000-4-30 Class A devices to ensure that all devices (no matter the manufacturer or device type) will provide the same data for the same event. Has the committee considered this standard?

In some areas of the interconnected network, there are substations that have fewer than 7 lines (typically 4 to 6 lines) connected to them. These areas might be sparsely populated but through them, transmission facilities are installed to facilitate transfer of remote resource to the load centres while supplying local area loads. Not having fault/disturbance recorders installed at these substations may create a void in the necessary data for event analysis. We suggest the SDT consider lowering the number to 4.
No
The disturbance monitoring function to which this time stamp refers is not obvious. From the flow of the requirements it appears to relate to sequence of events recording. If the requirement is indeed for the sequence of event recorder to mark a change in the status within 4 milliseconds of receiving an input of a change in the circuit breaker position, then the requirement should clearly state it is for the SOE recorder as otherwise, it will serve no purpose if the requirement is interpreted as applicable for a fault recording device. Further, please elaborate on the basis for the 4 ms.
Yes
No
We do not see the two sets of condition to cover the same period or achieve the same objective. The first condition requires recording that covers a (continuous) period from -2 cycles to +50 cycles of a trigger. In the second condition, the periods covered appear to be (a) -2 cycles to +3 cycles of a trigger, and (b) the last 3 cycles of the "event". Our questions and comments are: i. Are "trigger" and "event" interchangeable? If so, what does R6 mean by "the last cycle of the event" given that there is already a requirement for the +3 cycles of the trigger? ii. If they are not interchangeable, what does it mean by an "event"? iii. The two conditions appear to require recording different time periods since in the second condition, the recording is not continuous from -2 cycles to +50 cycles of the trigger; as written, it only covers a period of -2 cycles to +3 cycles, then a void until the last cycle of the "event", which is not defined. If however the intent is to record the event 2 cycles before it occurs through to the end of the event, which is hard to define, then we suggest the second bullet be revised as follows: “A pre-trigger record length of at least two cycles and a post-trigger record length that extends up until the trigger condition no longer exists.” Still we are unable to rationalize how the "first 3 cycles of the event" fit in.
No
Please see our comments on R6, above.

Yes
Yes
No
We agree with the other DDR requirements in R7 through R10, but do not agree with/have a question on R11.1. R11 requires TO and GO to set their DDRs (that do not have continuous recording capability) to trigger under specific conditions. R11.1 simple states for rate-of-change of frequency only, but does not specify what rate is it that the DDR should be triggered to start recording.
Yes
No
No
Yes
R1 and R2 indicate the conditions under which SOE logging should be made, i.e. "…for changes in circuit breaker position…". However, R4 and R5 as well as R7 and R8 do not say what the triggers for these recordings should be, e.g. a fault, a voltage sag or swell. We believe for consistency, reference should be made to some triggering conditions or events.

AEP is agreeable that the maintenance and testing belongs in another standard. Currently, there is a maintenance and testing team at work on standard PRC-005-1 (Project 2001-17) wherein these requirements would fit well.
No
AEP believes that there is some misunderstandings of the term "Substation" as applied in the standard. The portion 'enclosed assemblage' is not clear enough to distinguish assets applicable to the standard. For example, distinct and separate busses, of differing voltage, that may be enclosed by a common fence.When Considered separately, one or the other separate busses may not meet requirement criteria, but considered combined, may meet criteria. When considered combined, AEP believes that the inclusion of additional facilities, simply because they are within the same fence, does not significantly enhance reliability as to be warranted.
Yes
To provide better clarity of the requirement, it should be worded: The status of GSU circuit breakers for generating plants connected at 200 kV and above shall be monitored on each generator with a nameplate capacity of 500 MVA or higher, OR an aggregate plant total of 1500 MVA or higher AND CONNECTED AT 200kV AND ABOVE. – AEP agrees with these nameplate values. If criteria goes to 100 kv, then a much longer implementation period will be needed for the enormous amount of work that may be required. For AEP, 100 kv equipment is not for transport of bulk power and is generally considered a distribution system. Since the goal of NERC

is to have a more reliable system, the outages will invariably weaken the system for a period of time while companies are installing required equipment does not support this goal. For stressed systems, outages may be difficult to even get, especially those areas west of the Mississippi that have weak systems to begin with. – Enhanced analysis data does nothing to directly improve the reliability of the system, but provides data for analyzing events after they have already happened. Granted, it may uncover misoperations that can be mitigated so that they do not happen again, but there is already a standard for that.
Yes

Yes
Yes
Yes
Yes
Repeating DDR across multiple adjacent substations does not add reliability value. Again, clarity is needed to address this requirement in the context of multiple voltage yards within a substation fence.
Yes
Yes
Yes
No
Yes
The additional costs imposed by implementing this standard represent a financial risk to the utility. In the regulatory process, increased costs in tariffs and rate schedules are evaluated for recovery on a cost-benefit basis by the applicable regulatory authority. Additionally, such costs are subject to regulatory lags in the period before such cases are heard by this authority.

Yes
AEP would suggest the addition of the following wording where appropriate: Per the requirements of this standard, the equipment owner is responsible for disturbance monitoring and reporting unless the Transmission and Generation Owners have an alternative agreement to monitor interconnecting equipment. Section 1.5 of the Section D should be moved into the technical requirement portion of the standard. These involve technical considerations. Please remove bullet three (related to interposing relays). The omission of "Measures" is of concern. A clear sight on measurement should be a part of requirement development, otherwise the objective will not be clear. Additionally, for Effective Date, Requirements R1 through R11, first bullet, first line, should state "two," not "four" years to be consistent. Under Requirements R12 and R13, first bullet, third line, "eighteen months" should be inserted after the word "quarter" and "NERC" should be inserted before "Board." To be clear, R4.2 (p. 6) should have "one winding of each monitored" added before the word "transformer" in line 2. Page 7 contains a typographical error in the fourth row of table 5-1, in the first bullet of column two has a "d" following "recorded" in the fourth line. The page 2 Future Development Plan, on item 7, should have "NERC" added before "Board." "NERC" should also be added before "Board of Trustees" in three locations in Section A-5.
Yes
Yes
Yes, AEP agrees that there is sufficient misunderstanding. No, AEP does not agree that the IEEE definition is the most appropriate. The portion 'enclosed assemblage' is not clear enough to distinguish assets applicable to the standard. For example, distinct and separate busses, of differing voltage, that may be enclosed by a common fence.

The phased-in approach presented in the Implementation Plan for compliance seem to be unnecessarily restrictive. Issues such as obtaining outages, acquisition of equipment, &/or obtaining personnel necessary to install/replace recording equipment can be difficult and time consuming. It is recommended that rather than the phased-in approach, set a timeframe for completion at a more reasonable five (5) year level regardless of whether there is existing equipment or not.

Comments on PRC-002-2---Disturbance Monitoring and Reporting Requirements Draft 1, January 30, 2009 1. Requirement R5.4: Requirements identified in this section for monitoring bus and line voltages belong to TO and not to GO unless GO owns the Substation. The revision should clearly state that. 2. Requirement R5.4: We heard during the Q&A session of the webinar on 3/12/09 that GSU neutral current can be recorded by the residual current (sum of three phase currents). The

revision should clearly state that. 3. Requirement R5.4: Please clarify that recording of Generator Step Up transformer (GSU) phase currents can be done by deriving these currents from the GSU output breaker(s) currents. The revision should be modified to state this and that the GSU neutral current can be recorded by deriving this current from the GSU output breaker(s) phase currents. (Most of our GSUs are connected to the switchyard thru two output breakers in a ring bus. It makes lot more sense from a schedule and cost view point to use the quantities from the CTs of these output breakers rather than from the GSU CTs. It also makes sense from reliability viewpoint as less cabling means more reliability for the equipment, especially when with less additional cabling/wiring; we are recording the required quantities.) 4. Requirement R5.5: Requirements identified in this section for monitoring line three phase currents and the residual and monitored current belong to TO and not GO unless GO owns the Substation. The revision should clearly state that.

One standard should cover all issues relating to disturbance monitoring. Also, since DMEs are monitoring and not protective devices, is it necessary to specify maintenance/testing requirements? Requirements already in the Standard for data submittals would necessitate maintaining the availability of the DMEs.
No
"Aggregate plant total of 1500 MVA or higher" implies that several small generators, or peaking units, would have to be individually monitored if the total is 1500 MVA or higher. Suggest that 500 MVA be used as minimum generator size to be monitored.
No
Please see comment for 5.1.
No
Recommend that generator low side breaker monitoring should be excluded or optional if the high side breaker connected to the system is monitored.
No
Consider change to allow high side GSU voltage to be monitored at the high side bus of the same voltage. Present wording can be taken to imply that voltage must be monitored directly at GSU high side terminals. Also, can parallel GSUs be allowed to be monitored at a common point rather than individually? Likewise, can two GSUs connected at a common point at 200 kV or above be allowed to be monitored together at the common connection point?
Yes
No
Please see comments for 5.1. Also, consideration should be given to applying the "one or two substations away" option to R8 if the entire plant output connects to stations with DDRs.
No
Please see comments for 9.
No
Will regional variances be included in this standard?
Yes
When will violation severity levels be added?
No
DME installation at generating stations are dependent on outage schedules. Suggest increasing compliance requirements to 50% at three years and 100% at five years.
Yes
A definition is warranted, but the IEEE definition doesn't cover all the configurations that exist.

We agree with these nameplate values for Sequence of Event data and Fault Recording data. However, the requirement for Dynamic Disturbance Recording data should have a higher threshold since it is a higher level monitoring equipment, looking at power swings instead of just fault data. We suggest that an aggregate nameplate rating of 2000 MVA is more reasonable. See #11 below.
Yes
Yes
No
In R2, the Generator Owner is required to record Sequence of Events (SER) data for circuit breaker status for the equipment in the substation connected to a generating station of a specified capacity, in addition to that for the GSU. This appears to be an unnecessary duplication of equipment already being monitored by the Transmission Owner in R1. If this is a correct interpretation, we believe this requirement is redundant, and technically and financially unjustified. We strongly oppose requiring duplication of monitoring equipment for the same facility by both Transmission Owners and Generator Owners.
Yes
No
In R5.4 and R5.5, the Generator Owner is required to record Fault Recording data for equipment in the substation connected to a generating station of a specified capacity, in addition to that for the GSU. This appears to be an unnecessary duplication of equipment already being monitored by the Transmission Owner in R4. If this is a correct interpretation, we believe this requirement is redundant, and technically and financially unjustified. We strongly oppose requiring duplication of monitoring equipment for the same facility by both Transmission Owners and Generator Owners. Also, In R5.2, the statement is given that the three-phase current data from the "generator bus" is sufficient for monitoring. Does this mean that the three-phase currents from generator current transformers will meet this requirement?
Yes
No
In R8, the Generator Owner is required to record Dynamic Disturbance Recording (DDR) data for generating stations with a capacity of 1500 MVA or higher. This size requirement is already utilized to require monitoring of Fault Recording data in R5. DDR monitoring is more specialized and should be required at fewer facilities than Fault Recording data. For this reason we believe that the DDR requirement in R8 should only apply at aggregate facilities having a capacity of 2000 MVA or higher.
No
The intent of R13 is not clear to us. This seems to be a data retention requirement.

We agree with the nameplate values. However, we have two questions. 1) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? 2) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
Yes
No
The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirement be for substations with five or more lines operated at 200 kV or above.
Yes
The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
No
Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Yes
Yes
The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
No
The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides

the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirment eliminates the use of this adequate equipment.
Yes
The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Yes
Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
The Effective date information is unclear for the 50% and 100% compliance requirements.

Yes
Any time we can combine similar requirements into the same standard we are better off.
No
urrent "Requirements" R4 should NOT be moved to the Compliance section. This will result in missing requirement. This is hiding a requirement in Compliance or Monitoring and is a practice we need to get out of! Compliance sections 1.3.1, 1.3.2, and 1.5.1 need to be moved back into the Requirements section!
Yes
It would be ideal if ALL Maintenance and Testing requirements were in one standard!
Yes
I agree with the approach. This approach makes it clear where it is needed, except as noted below.
Yes
However, some confusion may be encountered when determining if it is a "plant" or "site" aggregate. Some utilities may not use the same nomenclature for each item. Two 900MW plants (or units) at one site should be captured, even though they are not a plant aggregate of 1500MVA.
Yes
This looks like the same as question 5.1. Are you asking if I agree with the 200kV threshold? If so, I agree, but I do not see the need to record the low side breakers per Table 2-1.
Yes
Yes
No
R1.1 is unclear. Is it the intent of the SDT to exclude substations with 3 or more lines at 200kV or above if there is no transformation at that substation? That appears to be what is required based on the "and" statement. R1.2: Some confusion may be encountered when determining if it is a "plant" or "site" aggregate. Some utilities may not use the same nomenclature for each item. Two 900MW plants (or units) at one site should be captured, even though they are not a plant aggregate of 1500MVA.

No
I do not have the expertise to respond to the trigger lengths. However, R6.1 bullet 2, What is an "event"? Is this different from the Disturbance used in R13?
No
R4.1, Bullet #1 appears too restrictive for a ring bus. It will require a fault recorder on each bus section with a line going to it. This is also a potential conflict with R7, which allows a recorder up to 2 busses away. Table 4-1. Am I correct in assuming that if there is no transformation with both sides >200kV, I do not need recording no matter how many lines are there? Same concern with "plant" vs. "site".
Yes
See concern in Q9 for R4.1, Bullet 1.
Yes
Same concern with "plant" vs. "site".
No expertise to provide input.
No
R13; The NERC definition of Disturbance is too vague for this standard. Any minor hiccup on the grid or even local area could be interpretted as a Disturbance.
No
No
Yes
R10; Delete the reference to R9 to read "Each TO and GO that installs a DDR device after January 1, 2011 to meet R7 and/or R8 shall install a device that is capable of continuous recording." R9 is a data management requirement only. It is not used to require the installation of a device. OR combine R10 into R9. R10 is an additional technical specification that would put the specs in one requirement, even though it would be a sub-requirement. Reiterate the need to move Section D Compliance items D.1.3.1, 1.3.2, 1.5.1 back into the requirements section.

Southern Company - Transmission
Jim Busbin
Southern Company Services, Inc.
Yes
Southern Company agrees with the comments made by the SERC Protection and Control Subcommittee (PCS). Generally, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid. These stability evaluations should be made according to an overall NERC defined methodology. In the absense of a NERC defined methodology, a SAR should be introduced to produce one.
Yes
No further comment.
No
Southern Company does not agree with separating from this standard maintenance and testing requirements for disturbance monitoring equipment for inclusion in another standard. We feel that separating those requirements needlessly complicates an entity's ability to monitor and maintain compliance with the standard(s). We realize the drafting team is handling a set of very technical and complex issues in this disturbance monitoring and reporting standard and we urge them to keep the standard simple where possible.
No

Southern Company supports the comments made by the SERC PCS. We urge the Drafting Team to utilize clarifying language in those areas identified in the comments of the SERC PCS. We are particularly keen on the idea of using diagrams to further clarify and illustrate the intent of the standard where needed. Southern Company disagrees with the use of arbitrary "checklist" values to determine location of disturbance monitoring equipment. As we commented in our response to Question #1, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid in accordance with a NERC defined methodology.
Yes
No further comment.
Yes

The maintenance and testing requirements do not belong in this Standard. However, since the devices' performance is not a system protection function, I believe that there should not be any NERC Standards/Requirements for maintenance and testing requirements. If deemed necessary, it would suffice to have a performance standard that requires that the appropriate data be available and collected from the disturbance monitoring equipment following system events, rather than imposing another set of maintenance requirements on the industry. To the extent that some of the disturbance monitoring functions are carried out by actual protective relays; example, SEL relays, then the maintenance of the protective functions of those relays will already be covered in PRC-005.

The new standard should at least allude to the context within which the data will be employed, and to the data quality (resolution, accuracy, band shape) that is requisite to this usage. (Data rates derive from the needed quality.) To do this for DDR devices the new standard must

somehow encapsulate core issues that are addressed in documents [21,125,221]. [21] Integrated Dynamic Information for the Western Power System: WAMS Analysis in 2005, J. F. Hauer, W. A. Mittelstadt, K. E. Martin, J. W. Burns, and Harry Lee in association with the Disturbance Monitoring Work Group of the Western Electricity Coordinating Council. Chapter 14 in the Power System Stability and Control volume of The Electric Power Engineering Handbook, edition 2, L. L. Grigsby ed., CRC Press, Boca Raton, FL, 2007. [125] WECC Disturbance/Performance Monitor Equipment: Proposed Standards for WECC Certification and Reimbursement, Principal Investigator K. E. Martin. Draft report of the WECC Disturbance Monitoring Work Group, March 17, 2004. [221] PMU System Testing and Calibration Guide. NASPI report of the Performance & Standards Task Team (PSTT), December 30, 2007.
Yes
Testing requirements must, among other things, verify that the hetterogenous sets of DDR data can be integrated and processed in a timely manner--e.g., the DDR types must in some sense be "interoperable." This will lead to desirable performance targets that should be incorporated into standards for future DDR installations. (See various documents on the WECC WAMS.)
No
While it may be convenient to enforce, the location criteria seem overly simplistic. Some locations are more important than others; the RRO is usually aware of them, and should be given discretion to set their monitoring requirements. Please note that the WECC places special emphasis upon the monitoring of major control systems, especially those for HVDC terminals and FACTS-like devices [123]. I strongly doubt that substation measurements on the ac side of these devices is sufficient to determine their behavior. [123] WSCC Plan for Dynamic Performance and Disturbance Monitoring, prepared by the WECC Disturbance Monitoring Work Group, October 4, 2000.
Yes
Yes, but ONLY if the subject substation does not interface to a major control system which cannot be fully monitored from the ac side.
No
12A. The term "collect" in R9.2 seems unclear--does it mean "measure and store (for subsequent off-line analysis)," or does it mean "measure as an input for on-line RMS caluculations?" 12B. For either interpretation of R9.2, the 960 sps requirement is an arbitrary value that seems unnecessarily high. The WECC WAMS contains DDR units that usually record point-on-wave and controller data at 960 sps, but these units also produce quite usable records when operated at 240 sps--what are the information targets, and what are the cost constraints? Phasor measurement units and other digital transducers can produce quite acceptable data with input rates below 960 sps, ESPECIALLY if their output rate is a mere (and unacceptably low) 6 sps. 12C. In R9.3, 6 sps recording is almost too slow to be useful in a DDR. R6.2 requires at least 16 samples per 60 Hz cycle in fault recording--it is not unreasonable to seek a similar number of samples for each cycle of the highest swing frequency that a DDR should record. This rounds off nicely at 30 sps. 12D. Extend R10 to read ". . . continuous recording at 30 sps. Future versions of this Standard may require 60 sps at some locations." 12E. Consider specifying additional triggers in R11.1 (continued frequency offsets, steps in voltage or line flow, manual triggers, . . .) 12F. Change R11.3 to read "Set data record lengths at a minimum of three minutes, plus at least one minute of pre-trigger data." A further requirement for trigger continuation should be considered for persistent oscillations or continued frequency offsets.
Yes

In R12, bear in mind that DDR units which are closely synchronized at their INPUTS are not necessarily synchronized at their OUTPUTS. E.g., the processing lag through a PMU can vary by 30 msec or more between different PMU types even when they are all operating at 30 sps. If properly filtered, the relative processing delay for 6 sps data would probably be something like 50 msec. These timing inconsistencies can be very important when developing an integrated profile of system dynamic behavior.
Yes
16A. My primary concern is that the proposed Standard does not address data quality issues, or establish a lexicon for such a discussion. Tedious as they may seem, filtering and spectral content are essential performance factors to examine in any DDR [21]. 16B. I have a LOT of concerns about Compliance item 1.5.1. The .dst files presently used in PMU networks are efficient to the point of being elegant--how large would an equivalent COMTRADE file be? 16C. Item 1.5.1 should have an additional bullet on configuration files: • All reported DDR data shall be accompanied by a configuration file (CF) providing the following primary information: [143] - the data source to which the CF applies (name of the archiving device) - structure of the data source records (number of sensors, sensor names, number of signals for each sensor) - parameters for each signal: ~ sensor producing the signal (includes sensor model & firmware version) ~ signal type (voltage, current, other) ~ scale factors for conversion to engineering units ~ timing shift or phasor rotation needed to correct known offset ~ associated voltage signal (for current signals only) ~ text data for generating signal name (might include sensor model & firmware version) It is acceptable to embed the configuratin file within the data header, if any. 16D. Item 1.5.1 should have an additional bullet specifying a processing log to accompany data which have been changed from those initially recorded. Such changes might include filtering, resampling, calculation of derived quanitites, renaming or selective deletion of signals. [143] Integrated Monitor Facilities for the Eastern Interconnection: Management & Analysis of WAMS Data Following a Major System Event, J. F. Hauer. Working Note of the Eastern Interconnection Phasor Project (EIPP), December 16, 2004.

Requirements related to DME equipment maintenance should not be included in the PRC-005 standard because the importance of DME equipment does not warrant the same high level attention as Protection Systems. PRC-002-2 seems to be a more logical place.
Yes
These requirements will create consistancy in the required locations where the regions "opinions" are not different.
Yes
Yes
No
Seven lines seems to be an arbitrary number (would not cover potentially needed locations and would require installations at locations not critical to the system). We suggest wording similar to that used in the SERC DME supplement. The required siting of DDR should be coordinated through the efforts of the appropriate reliability assessment groups that may be involved in accordance

with the guidance provided in PRC-002- 2. These locations are selected to provide extended time power system monitoring capability in order to assist analyses wide area disturbances. These locations are chosen to provide coverage across the BES EHV network. The locations selected should include the following considerations: • Major load centers • Major generation clusters • Major voltage sensitive areas • Major transmission interfaces • Major transmission junctions • Elements associated with Interconnection Reliability Operating Limits • Major EHV interconnections between control areas
Yes
No
Table 2-1 indicates "Including low side breakers" for plant SER data inputs. If an aggregate generation site of 1500MVA is monitored at the >200kV level where the generation enters the transmission network, the system impact of any occurrence will be seen at the monitoring point. PEC dissagrees with the low side breakers position being included to be monitored by the DFR/SER. Monitoring of these breakers are included within the functional boundaries of the smaller generating units and the breaker voltages are less than 50KV and not part of the transmission grid. Extending this requirement will be costly since the DFR will be located at the transmission network location remote to the multiple generators and low side breakers. The requirement should only include the >200kV circuit breaker SER data.
No
Ok with first bullet under R6.1, however, the second bullet refers to "event" without a definition of what constitutes an "event".
No
Monitoring of GSU transformer currents on units >500MVA is the correct approach. However peaking generation locations will have many generating units of less than 500MVA. The aggregate combination of 1500MVA will encompass many GSU transformers. Monitoring of each of the GSUs' currents (even though they are >200kV) will require extensive DME equipment additions at locations remote to the transmission network where the DME equipment is (and should be) located. We believe these total aggregate generation currents should be monitored at the location where they are introduced to the transmission network. This location may be at an exit point from a generating unit bus or a transmission line the feeds the generation power into another remote transmission substation bus.
Yes
Yes
Yes
Yes

No
Yes
R6.2 requires "16 samples per cycle" R9.2 requires "960 samples per second" SDT should pick a common way to state sample rate.
No
Some region requirements developed under current PRC-002-1 are closer to where NERC is moving than with other regions. Current PRC-018-1 is underway with TO & GO implementation to meet those region requirements today. For PEC, May 2009 is the first 50% effective date per PRC-018-1. PEC believes that under these circumstances that NERC should address this unique situation now and not wait until PRC-002-2 approval. Compliance related to PRC-018-1 should be deferred until approval of PRC-002-2.

Yes
Individual
Roger Champagne
Hydro-Québec TransÉnergie (HQT)
Yes
We assumed that the question refers to the merging of Standards PRC-002-1 and PRC-018-1.
No
Requirement R3.2.1 in PRC-002-1 lists a technical requirement for recording devices installed after Jan. 1, 2009. Requirement R10 in PRC-002-2 applies to the installation of DDR devices after Jan. 1, 2011. Why was the date changed? In PRC-002-1 R4.5 refers to naming data files. In PRC-002-2 the naming of data files was moved to Section D, Compliance, Subsection 1.5 Additional Compliance Information. It does not appear in the Requirement Section. Data file naming, and data file formatting should be a requirement.
Yes
We agree that the maintenance and testing should be in another standard. However, we are concerned that the time to develop a separate standard would introduce a "time gap" when there would be an in force Disturbance Monitoring Standard, with no document in place addressing maintenance and testing.
Yes
No
Performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. Monitoring should not be limited to breaker positions--this will improve event analysis. We do not feel that the 200kV threshold is an appropriate criteria for assessing criticality whether as a lower limit or a higher one; in some system, not all 200 kV facilities and above are critical. A performance based stability studies can be used to determine the appropriate system that should be monitored.
No
See Q5.1 answer above.
No
See Q5.1 answer above.
Yes
No
Sequence of Events requirements should include monitoring of transmission and generator circuit breaker positions, protective relay tripping for all protection groups, and teleprotection keying and receiving.
Yes
This requirement allows for the inclusion of legacy equipment. This requirement does not stipulate the recording of adequate information for analysis.
No
Referring to Requirement 4.1, the number of phases to be monitored is excessive. It will not provide any analytical benefit. Monitoring every transmission line in a ring bus is excessive. The second bullet referring to a breaker-and-a-half arrangement needs clarification. What is the "outer bus" in that arrangement? Definitions should be provided when references are made to substation designs or equipment that could have different names or designations in the industry. As we commented in Question 5, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. This needs to be reflected in Table 4-1. Referring to Requirement R4.2, the intent of measuring neutral current needs to be clarified, specifically with regard to transformers (see R5.3 in PRC-002-2). Referring to Requirement R5, the comments to R4.1 and R4.2 are applicable. In Table 5-1 the requirements

that refer to the high side of critical GSU's should be directed at Transmission Owners, not Generation Owners. Referring to Requirement R6.1, the second bullet does not provide for the recording of adequate information (see response to Question 8).
Yes
No
Referring to Requirement R7, is a Generator Owner required to install a DDR if there is a DDR installed on the plant's outlet transmission system no further than two substations away? What is the basis for the "two Substations away" criteria?
No
Referring to Requirement R7, because of the limitations of legacy equipment, this requirement will not be met. Referring to Requirement R8, as noted in the response to Question 5 and elsewhere, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. Referring to Requirement R8.4, the statement in parenthesis "(per each monitored element)" is redundant. We have no comment to Requirement R9. Our response to Question 2 deals with Requirement R10. Requirement R11 should be reworded to: ...that does not have continuous recording capability shall set its device to trigger and record according to the following where available: Requirement R11.1 should be worded to: R11.1 For rate-of-change of frequency, or delta frequency. Legacy equipment might not be able to satisfy Requirement R11.3.
Yes
No
No
Yes
Regarding Table 2-1: Generator Owner's Requirement R2 for Sequence of Events Data, as we commented in Question 5 and elsewhere performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. We do not feel that the 200kV threshold, nor the plant/plants' capacities are appropriate criteria for assessing criticality. This should be reflected in the table. The Applicability Section refers to Transmission Owners with facilities greater than 200kV, and Generator Owners with plants connected at greater than 200kV, capacities greater than 500MVA, aggregate plants with capacities greater than 1500MVA. As we commented in Question 5 and elsewhere we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications.
No
Under the section Effective Dates for PRC-002-2 Requirements R1 through R11, the first section reads: "1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:..." For consistency the latter should be changed to four years after Board of Trustees adoption. As written, the timelines are not only inconsistent, but two years is too aggressive a time frame for what is required, in particular considering that Board of Trustees adoption precedes regulatory approval.
Yes
We agree that "substation" needs a definition. However, "switching station" is being used in the industry to describe those "substations" that do not necessarily have transformers, do not directly supply load or serve as generation outlets, but are strictly transmission junction points. Suggested rewording of the IEEE definition as applied to this Standard: Substation - An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and/or transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modfiying its characteristics. With the preceding change in mind, then Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data would have to be modified accordingly.

Individual
Steve Rueckert
WECC
Yes
I also agree with changing the fill in the blank characteristics into entity specific requirements
No
I agree with the notion that the maintenance and testing requirements for disturbance monitoring equipment belong in another standard. However, I am concerned that if they are not initially included PRC-002-2, that for a while we run the risk of not having a standard that requires maintenance and testing of disturbance monitoring equipment. I am concerned that an effort through creation of a SAR or assigning these to an existing project may take longer than completion of the proposed PRC-002-2. Would it be possible to retain the existing requirment for the applicable entity to have a maintenance and testing program that includes maintenance and testing intervals and their basis, and a summary of maintenance and testing procedures (PRC-018, R6) in PRC-002-2 until such time that a replacement standard was approved, and then drop the requirement from PRC-002-2?

SERC Protection and Controls Sub-committee
Steve Waldrep (Co-Chair), Joe Spencer (SERC staff)
SERC Reliability Corporation
Yes
But we believe that the regional "Stability" group needs to decide on the locations of the DDR's based on a NERC defined methodology.
Yes
Except possible impact based on protection scheme used when three phase line or bus potential are not available.
No
Prefer that M&T continue to be contained within this standard.
No
Agree with the approach given our understanding of the standard's intent. The documents wording and Tables need to be clearer and more consistent. Suggest exempting 230 kV radial lines without transmission connected generation. Do not include these radial 230 KV lines in the count of 3 or more lines for SER & DFRs and do not include in the count of 7 or more lines for DDRs. It should be made clear that the equipment that must be monitored by a GO in Tables 2-1 and 5-1 should be limited to equipment owned by the GO. Under Table 4.1, change the "and" below to "or." "Each Substation containing any combination of three (3) or more elements consisting of transmission lines operated at 200 kV or above and (change this "and" to "or") transformers having primary and secondary voltage ratings of 200 kV or above." Wording in Table 4.1 is more clear (assuming we understand the intent) than the wording in R1.1 and R1.2. We suggest that you use this clearer wording for these two requirements. We suggest that you make use of diagrams to make the intent clearer.
Yes
Yes
No
Seven lines seems to be an arbitrary number (would not cover potentially needed locations and would require installations at locations not critical to the system). We suggest wording similar to that used in the SERC DME supplement. The required siting of DDR should be coordinated through the efforts of the appropriate reliability assessment groups that may be involved in accordance with the guidance provided in PRC-002- 2. These locations are selected to provide extended time power system monitoring capability in order to assist analyses wide area disturbances. These locations are chosen to provide coverage across the BES EHV network. The locations selected

should include the following considerations: • Major load centers • Major generation clusters • Major voltage sensitive areas • Major transmission interfaces • Major transmission junctions • Elements associated with Interconnection Reliability Operating Limits • Major EHV interconnections between control areas
Yes
Suggest in R3, for consistency, use similar terminology to R12 (where reference is +/- 2 ms).
No
Reference comments on #4 above. Suggest in R3, for consistency, use similar terminology to R12 (where reference is +/- 2 ms).
Yes
Add to the end of the first bullet "...for the same trigger point"
Yes
Re-label heading of Table 4-1 to indicate: "...for substation equipment owned by Transmission Owner"
Yes
Refer to response in 5.3
Yes
Yes
To make this clearer, reword R.7 to start with location requirements rather than exceptions. Also, under R11.3, the pre-trigger record length and post-trigger record length should be specified (what part of the 3 minutes should be pre and post trigger?).
Yes
Yes
See comment on response #1.
No
No
Yes
There appears to be a typo on the first bullet under Requirements R5.1 "Effective Date" "...four years" should be "... two years". Also a typo under Requirements R12 and R13 where "eighteen months" was left out in the second part of the sentence. This needs to be clarified.
Yes
We agree with the IEEE definition.

Simply specifying the number of elements may not be consistent with many existing Transmission Owner's historical DFR applicability criteria such as fault current availability and/or adjacent station coverage. A criteria consisting of a combination of the number of elements and a threshold short circuit MVA would be more appropriate for system coverage and yet still be measureable. Criteria should also include consideration for exceptions when there are adjacent station FRs in

order to provide good system coverage and avoid unecessary redundant installations and expeditures. Also, the wording of R1.1 may does not seem be clear to everyone. Suggest the use of diagrams for clarity.
Yes
Yes
No
The number of lines criteria is too arbitrary and will require an excessive number of installations at some entities and perhaps none at others. A better criteria is one that aligns with Regional needs and distributes these type of installations more evenly throughout the Region. Have the Regional Planning groups review and address where DDRs would be most effective and actually needed.
Yes
Yes
Yes
No
R4.1 should include provisions to exclude 3 phase potential monitoring for line/bus elements employing line protection schemes, such as current differential relaying, where 3 phase potentials are not presently available and would not needed but for the requirements. Adjacent or remote end element monitoring should be allowable for these cases.
Yes
Agree with the criterion of adjacent station coverage consistent with comments on 5.3.
Yes
No
R10 states DDR devices installed after 1-1-11 shall be capable of continuous recording. It is not clear when continuous recording would be required to begin.
Yes
No
Not as proposed, but there should be for DDR applications.
No

No
While this approach does facilitate the measurement of compliance, it does not necessarily effectively target those elements that have the greatest impact to the reliability of the Bulk Electric System. The critieria used should also include consideration of factors reflecting the importance or significance of the location to the power grid. For example: Radial taps should not be included as part of the three element requirement (minimum number of elements).
Yes
Yes
Yes
Yes
No
Three or more lines connected to a substation does not clearly indicate impact or significance to the bulk electric system. Also see comment 4. above.
Yes
Yes
Yes
We agree regarding the facility rating. However, Generator owners and Tranmission owners should be permitted to jointly (by contract) apply a "not more than two bus removed" criteria for siting purposes. In that way duplication can be avoided where there is adequate overlap between generation and tranmission locations. We also support WECC's comments responsive to this question.
No
The installed equipment of the neighboring (interconnected) entity should be included in the parameters of R7 "..no further than two substations away..". to provide an overlay between Tranmission owners. Similar to comment 11. above. We also support WECC's comments responsive to this question.
Yes
No
No
Yes
Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files? This appears to be adding requirements to the standard in the Additional Compliance Information section.
Yes
The time allowed in the draft standard appears acceptable.

Requirement R3.2.1 in PRC-002-1 lists a technical requirement for continuous recording for DDRs installed after Jan. 1, 2009. Requirement R10 in PRC-002-2 delays this requirement until Jan. 1, 2011. Why was the date changed? In PRC-002-1, R4.5 refers to naming data files. In PRC-002-2 the naming of data files was moved to Section D, Compliance, Subsection 1.5 Additional Compliance Information. It does not appear in the Requirement Section. Will this be enforced as a "Requirement"?
Yes
We agree that compliance must be measurable, and recognize also that it's possible for remote locations in a system to have a high concentration of generation spread across several busses. It would seem appropriate to require recorders in such areas. Also, in systems tightly networked at less than 200kV, it's possible for events to have significant impact on the EHV system, particularly under contingent conditions where EHV elements may be out of service.
No
See comments for question #4. Also, monitoring should not be limited to breaker positions; knowledge regarding what caused a generator to trip will improve event analysis.
Yes
We agree that compliance must be measurable, and recognize also that it's possible for remote locations in a system to have a high concentration of generation spread across several busses. It would seem appropriate to require recorders in such areas.
Yes
No
Sequence of Events requirements should include monitoring of transmission and generator circuit breaker positions and protective relay tripping for all protection groups.
Yes
This requirement allows for the inclusion of legacy equipment. However, this requirement does not stipulate the recording of adequate information for analysis of events that are more complex than a simple fault-trip.
No
Referring to Requirement 4.1 and 5.4, monitoring the voltage every transmission line in a ring bus is excessive. Referring to Requirement R4.2, the intent of measuring neutral current needs to be clarified, specifically with regard to transformers (see R5.3 in PRC-002-2).
Yes
No
It's possible for remote locations in a system to have a high concentration of generation spread across several busses. It would seem appropriate to require recorders in such areas.
No
Referring to Requirement R7, because of the limitations of legacy equipment, this requirement will not be met. Referring to Requirement R8, it's possible for remote locations in a system to have a high concentration of generation spread across several busses. It would seem appropriate to require recorders in such areas. Referring to Requirement R8.4, the statement in parenthesis

"(per each monitored element)" is redundant. Referring to Requirement R9.3, does this need to be stored if the values can be derived from the record? Response to Question 2 deals with Requirement R10. Requirement R11 should be reworded to: ...that "does" not have continuous recording capability shall set its device to trigger and record according to the following "where available": Requirement R11.1 should be worded to: R11.1 For rate-of-change of frequency, or delta frequency. Legacy equipment might not be able to satisfy Requirement R11.3.
Yes
Referring to Requirement R13, it could be read to mean that one only needs to keep data for 10 days. We believe it was intended to say the device shall have the storage to retain records for 10 days.
No
No
Yes
The Applicability Section refers to Transmission Owners with facilities greater than 200kV, and Generator Owners with plants connected at greater than 200kV, capacities greater than 500MVA, aggregate plants with capacities greater than 1500MVA. As commented in Question 4, the 200kV threshold is an not an appropriate criteria for assessing criticality.
No
Under the section Effective Dates for PRC-002-2 Requirements R1 through R11, the first section reads: "1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:..." Two years versus four years is inconsistent.
Yes
We agree that "substation" needs a definition. However, "switching station" is being used in the industry to describe those "substations" that do not necessarily have transformers, do not directly supply load or serve as generation outlets, but are strictly transmission junction points. Suggested rewording of the IEEE definition as applied to this Standard: Substation - An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and/or transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modfiying its characteristics. With the preceding change in mind, then Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data would have to be modified accordingly.

Loss of generation affects the system regardless of the voltage level the generator is connected. For Sequence of Events requirements, change units size to 50MVA, plant size to 300MVA, remove reference to connected at 200kV+ Change references to these levels for all Generator SOE requirements. See NERC 2003 Blackout Technical Report Recommendation TR-9
Yes
Yes

Yes
No
The Loss of generation affects the entire system regardless of interconnection voltage, and just knowing when breakers trip doesn't add enough information. In addition to circuit breaker position change, SOE data should be available for generator protective functions to enable the GO to report the root cause of generator trips which occur due to system disturbances. This is to support possible future blackout investigations and eventually lead to betters standards for generator – transmission system coordination. It is very important to capture root cause for units/plants of significant size, and this need is not dependent on interconnection voltage. Change SOE requirement for single unit to 50MVA+, and Plant to 300MVA+. Require SOE to monitor CB positions, protective relay tripping for all protection groups and teleprotection keying and receiving.
No
There is confusion over the meaning to the second option. Does it mean for faults with a duration of greater than 50 cycles this is the minimum record? Or does this allow for use of relays with limited fault recording to be used? Regardless, this record is not equal to the first option. The second record option would be inadequate.
No
(R4.1) Requiring monitoring 3 phase voltages of all ring bus bus sections is excessive. Reduce requirements to enough to be able derive all the quantities during normal maintenance conditions. (R5.5, second row of table) This puts the responsibility to monitor a transmission substation on the genertator owner. The gen owner likely does not own the transmission substation. Make monitoring this equipment the responsibility or the transmission owner. (following R6.) We note that there is no mention of FR triggering. While this is specific to the various manufacturers trigger algorithms and specific also to the location, there does need to be a statement that the FR is to trigger for near-by faults, system disturbances, and relay operations. While this type of consideration is difficult to address in a standard, it would be misleading to leave out entirely a statement that reliable FR triggering is necessary. We request that the team add a new provision stating that all required FR channels at a location should be recorded whenever a trigger asserts on any one of them.
Yes
Yes
No
(R9) We request that the team add a new provision stating that all required DDR channels at a location should be recorded whenever a trigger asserts on any one of them, even where the channels are distributed across multiple DDR units. (R10) what exactly do the words "to meet requirements R7, R8, and R9" have to do with all this? We propose removing the reference to R7, R8, R9 and simply require continous recording ability for newly installed DDRs The requirement of recorders installed after Jan 1, 2011 being able to continously record would be redundant for the NPCC which requires recorders installed after Jan 1, 2009 to be continous recorders. This will lead to confusion for some people and we propose adding some words describing such a situation and clarifying the requirements in such a case. (R11.1) It is our experience that rate-of-change in frequency is actually not a good DDR trigger. It produces many records for highly local events and may not catch significant disturbances. “Delta Frequency” is a proven DDR trigger, and performed admirably during the 2003 blackout. A good guideline for a delta frequency trigger would be to set to detect a sudden frequency change of 20 mHz. We suggest R11.1. should be written for delta frequency triggering with the aforementioned guideline for setting. Rate-of-change in frequency should not be mentioned in this standard. Rate-of-change in frequency is not a general name which includes delta frequency. (Refer to FDAC www.truc.org 2006 Conference paper: “Frequency Triggers.”) (R11.2) Not all existing recorders have this capability. Require this for existing recorders that have the cabability and future installations. (R11.3) Not all existing recorders have this capability. Require minimium of 3 minutes for recorders with the capability, and 60 seconds for the minimum post trigger record length for all others.

No
(R12) This requirement mainly concerns synchronizing with UTC Time Scale. The words “with the associated hour offset” have to do with Time Zone and should be removed from this sentence and placed in a separate sentence or a separate requirement. We suggest keeping these two concepts separate, both in the interest of clarity, and to facilitate future adjustments in wording. This area is covered in the report of IEEE PSRC I11 which is among the drafting team references. Two acceptable separate sentences or requirements would be as follows: “Each TO and GO shall synchronize all of its SOE, FR, and DDR functions to within +/- 2 milliseconds of Universal Coordinated Time (UTC) Time Scale.” “Within time sequence data files produced by SOE, FR, and DDR functions, and within filenames, time shall be expressed in 24 hour format, and with no local offset, or with some number of positive or negative local hour(s) of local offset. Each filename, in conforming to C37.232-2007 COMNAMES (See D. 1.5.1) must contain this offset information. Since C37.111-1999 COMTRADE does not include the offset within the .cfg file, and until this issue is addressed in a revision to COMTRADE, the offset in the filename shall be interpreted, for purposes of compliance with this standard, to apply to the time sequence data in the file.” On the last point, the drafting team is perhaps aware that an IEEE PSRC working group H4 is making revisions to C37.111-1999 COMTRADE, and is considering addition of local offset to the COMTRADE .cfg file.
No
No
Yes
(D1.5) The bullet items covering COMTRADE and COMNAMES seem to us to be “Requirements,” and it seems odd to find these items under “Compliance Information.” We suggest that, if these items remain in this position, there should be a corresponding Requirement. D.1.5 Common DDR files can be converted into COMTRADE and the purpose stated in COMTRADE for this conversion to a common format is that conversion “is necessary to facilitate the exchange of such data between applications.” D.1.5 The drafting team should be aware of several IEEE PSRC activities which are in process now, and will affect items covered in this Standard. These activities include the following: C37.111 COMTRADE revision – Working Group H4 C37.118 Synchrophasor Standard revision – Working Group H11 Channel Names and Instrument Names – Working Group H10 SOE Data – Working Groups H5b (completed) and H16

The SDT appears to have exceeded what is necessary by requiring all GOs and TOs to provide this information. Compliance with these draft requirements promises to be extremely costly. It is a major undertaking for all Generation Operator’s across the nation to install synchronized disturbance monitoring devices capable of recording down to +/- 2 milliseconds. Also, there should be allotted more time for the engineering and installation of new hardware, etc. than that provided in the proposed timetable
No
All requirements relating to DME (disturbance monitoring equipment) should be set forth within one standard. The SDT should add the maintenance and testing requirements as well. For utilities that may well have to invest considerable sums of money in the procurement and installation of new equipment, an awareness of any maintenance and testing requirements will allow for better informed, more cost effective procurement decisions

No
The SDT approach would in some instances require installation of redundant data monitoring equipment. One DDR per substation should be adequate; not one per generating unit.
No
E ON US recommends use of an aggregate nameplate value for generating plants of 2000 MVA or higher, as recommended in Standard EOP-004 Disturbance Reporting.
No
E ON US recommends use of an aggregate nameplate value for generating plants of 2000 MVA or higher, as recommended in Standard EOP-004 Disturbance Reporting.
In answering this question, E ON US would benefit from knowing the SDT's technical basis for the 4 milliseconds
No
The requirements seem to go beyond what is needed for bulk power system reliability. The requirements appear to prescribe equipment and processes so as to establish conventions that would enable the utility's response to broad operating data requests.
No
Generally, pre-trip data has more analytical value than post-trip data.
Yes
The SDT should explain the applicability of this requirement to the GO.
No
E ON US recommends use of an aggregate nameplate value for generating plants of 2000 MVA or higher, as recommended in Standard EOP-004 Disturbance Reporting.
No
The GO should be required to collect current and voltage data relative to the triggering event (i.e. change of breaker position). The format should be given in either CSV or plain text, which can be analyzed by any system. Rather than having all time-stamped current and voltage data recording equipment accommodate a certain IEEE format, the available data could be submitted in CSV/plain text and later analyzed in the IEEE format. Also, in Section A part 5 of the standard, the effective date for both 50% and 100% compliance is stated as "[t]he first day of the first calendar quarter four years after applicable Regulatory Approval…" It would be more reasonable to require 100% compliance in, for example, 8 years and lrequire 50% compliance in 4 years. This would allow sufficient time to do the necessary engineering, acquiring of equipment, etc. to meet the requirements of this standard.
No
E ON US objects to the compliance timetable of immediate to 18 months after NERC Board of Trustees or FERC approvals. More time is required to properly design, procure and install the disturbance monitoring equipment necessary to meet the proposed requirements, particularly in light of the uniqueness of the existing facilities and equipment to which the requirements apply.

Yes

No
Prefer M&T to be contained within this standard. Do not move DME M&T to a totally new standard.
Yes
We agree with the approach given our understanding of the standard’s intent. The wording in the requirements and the tables need to be clearer and more consistent. It should be made clear that the equipment that must be monitored by the GO in tables 2-1 and 5-1 should be limited to equipment owned by the GO. –We suggest replacing the word “its” with “Generator Owner” , and that the Heading of Table 2-1 be re-labeled to indicate: “...for generating plant and substation equipment owned by Generator Owner” As an example: We ask for clarification of the intent of the term ‘generator output breaker’ Please refer to the following example: A GO owns a breaker on the low-side of the GSU which is used to synchronize the unit. The TO owns breakers on the high-side of the GSU. For the purpose of this standard which of these breakers is deemed to be the generator output breaker(s)? We suggest clarifying that any references to a ‘low-side breaker’ to only include low-side breaker used as generator output breaker. We suggest exempting radial lines without transmission connected generation. Do not include these radial lines in the count of 3 or more lines for SOE & FRs and do not include in the count of 7 or more lines for DDRs. Radial lines do not need to be monitored.
Yes
Yes
No
Radial lines without transmission connected generation should not be included in the element count. Radial line feeding only load doesn't provide significant contribution to grid disturbances. Also we suggest rewarding R7 to: Each Substation having a total of seven or more transmission lines (not including radial Lines) connected at 200 kV or above, the Transmission Owner shall record (or have a process in place to derive) the following DDR data unless a Transmission Owner has Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4 recorded no further than two Substations away.
Yes
Yes
The location requirements for SOEs and FRs for TO should be the same. If we use a table under R4 then use a similar table under R1 – R2 – remove “its” and replace with “Generator Owner” , and re-label Heading of Table 2-1 to indicate: “...for generating plant and substation equipment owned by Generator Owner” Table 2-1 - remove the third and fourth row of info. Move the "each circuit breaker 200 KV and above" in the right hand column of rows 3 and 4 to right hand column of rows 1 and 2.
Yes
Add to end of first bullet under R6.1 "...for the same trigger point"
Yes
Re-label heading of table 4-1 to indicate:"... for substation equipment owned by Transmission Owner"
Yes
Yes
Reword R8 to indicate clarifythat the 1500 MVA aggregate nameplate rating includes only generation connected at 200 kV (high side of GSU) and above and that any generators at the same facility connected at less than 200 kV are not to be included.
Yes
To make this clearer, reword R.7 to start with location requirements rather than exceptions. – If we use a table under R1 and R4 then use a similar table under R7. Also, under R11.3, the pre-trigger record length and post-trigger record length should be specified (what part of the 3

minutes should be pre and post trigger?).We suggest that the pre-trigger and post-trigger be a minimum of 1 minute each with total record at least 3 minutes
Yes
Yes
We support the 200 kV cutoff. However, some regions have indicated the 200kV threshold is not appropriate and indicate a preference for a lower criteria. We believe that if the regions desire to require more granularity, that criteria should be applied in a regional standard which can be more restrictive and should be supported by a technical basis
Yes
Concern that FERC standards and code of conducts, as well as some RTO/ISO rules may prohibit the GO from access to system monitoring data necessary to participate in disturbance analysis studies.
The applicabilty section of this draft standard is not consistent with NERC's Statement of Compliance Registry Criteria for a TO and GO (i.e., individual generation resources larger than 20 MVA or a generation plant with aggregate capacity greater than 75 MVA that is connected via a step-up transformer(s) to facilities operated at voltages of 100 kV or higher). NERC's Statement of Compliance Registry Criteria states:"If an entity is part of a class of entities excluded based on the criteria above as individually being unlikely to have a material impact on the reliability of the bulk power system, but that in aggregate have been demonstrated [emphasis added] to have such an impact it may be registered for applicable standards and requirements irrespective of other considerations." We therefore recommend that the language referring to voltage and size be removed from the applicability portion of the standard and instead be applied to the requirements within the standard.
Yes
We suggest revising the langauge in section 5 first bullet for R1 through R11 to read: The first day of the first calendar quarter two years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required each Responsible Entity shall be at least 50% compliant within two years and 100% compliant within four years. Correct a typo error on the first bullet under requirment R5.1 "Effective Date" – "... four years" should be "... two years". Correct an omission error under Requirements R12 and R13 where "eighteen months" was left out in the second part of the sentence.
No
We do not belive that a defintion is warranted. However, if one is deemed necessary we agree with the use of the IEEE definition.

Is there a purpose to the analyses proposed. How much detail is really needed?
Yes
Yes
Yes
The element number criteria for SOE/FR/DDR needs to be adjusted (in general higher number criteria to not be burdensome to implement.). Also some stations that meet the proposed criteria are not as important, some that don't meet the criteria are. How many stations are impacted by SOE?
Yes
For generating stations with split interconnection voltages (some units connected below 200 kV), define how to interpret.

Yes
For generating stations with split interconnection voltages (some units connected below 200 kV), define how to interpret.
Yes
With coverage by FR and SOE, BPA does not think that DDR's are necessarily required at the same location. Their purpose is for overview devices and not as many may be required.
No
BPA believes 2-4 second SCADA/EMS records are good enough for most events.
No
With relay based SOE/FR capability plus standalone, BPA believes 2-4 second SCADA/EMS records are good enough for most events. The number of element criteria may be too stringent, change to 5 elements.
Yes
The number of element criteria may be too stringent, change to 5 elements.
No
BPA does not believe the individual phase voltage of each line is required if Bus voltage at the station is recorded. We think the R4.1 may say that, but maybe change the wording order to "The three phase to neutral voltages on each main bus or monitored line as follows:…", It shouldn't be required to monitor the voltages on a transfer bus in a main and auxilliary (transfer) bus scheme. The number of element criteria may be too stringent, change to 5 elements.
Yes
The DDR's purpose is for wide area monitoring not as a FR device (although it can help with that). Unless it doesn't interface to a control system (HVDC).
Yes
Yes, but BPA does not necessarilly think each GSU needs it. Some GSU's are parralleled onto a single circuit to integrate into the substation. If it's monitored at the substation that should be good.
No
R9.2 Change to clarify "Sampling" (vs "collecting") at 960 samples/second, in the slide presentation. R11.2 BPA does not think the oscillation trigger is viable - remove this requirement, or indicate better that if an optional oscillation detector is installed then set it per R11.2 requirements. Change R12 to say "…shall time synchronize all of its… Allow for additional/future triggers, frequency setpoint level vs rate of change. Change R11.3 to have record length include pre-trigger event of 30 seconds to 1 minute.
Yes
No
No
Yes
No
It's too fast for a 3 year budget cycle entity.
Yes

Otherwise, the SDT should provide a technical justification as to why these requirements are no longer needed for this type of equipment.
Yes
Yes
Our "yes" response is based on the fact that we have no strong technical reason to deviate from the values proposed by the SDT. In review of our own FirstEnergy footprint, the proposed values seem to capture the generation facilities that would most likely have a BES reliability impact. However, we would like to better understand the technical rationale used by the SDT in choosing these values.
Yes
Our "yes" response is based on the fact that we have no strong technical reason to deviate from the values proposed by the SDT. However, we would like to better understand the technical rationale used by the SDT in choosing these values.
Yes
No
To allow for some flexibility and consistent with other requirements, we recommend replacing 4 ms with 1/4 cycle.
Yes
Yes
Yes
Yes
Yes
Our "yes" response is based on the fact that we have no strong technical reason to deviate from the values proposed by the SDT. In review of our own FirstEnergy footprint, the proposed value of 1500 MVA would exempt our single unit nuclear generation facilities. We would like to better understand the technical rationale used by the SDT in choosing this value, and the SDT may want to consider lowering this value to 1000 MVA (single) and adding "over 2000 MVA (multiple units)" to assure that the some single-unit nuclear plants will be required to record dynamic disturbances.
Yes
Yes

No
No
Yes
1. The requirements as written may not take into account the actual entity that owns the equipment. If Transmission Owners installed the equipment relevant to their facilities, and Generation Owners did the same, duplicate monitoring may result. This isn’t a problem as it pertains to the actual equipment monitored, but it potentially results in additional costs to the entities. Also, regardless of the NERC Functional Model definitions, there are many different actual equipment ownership arrangements between generation-only entities and the transmission entities to which they are connected. For example, a generation entity may or may not actually own the connection breakers in the transmission substation. We suggest throughout the standard that in all instances where a TO and/or GO "shall" do something, that the word "shall" be replaced with "shall ensure". This is the same wording used in the recently approved RFC DME standard PRC-002-RFC-01 which alleviated many stakeholder concerns regarding ownership and responsibilities for disturbance monitoring. 2. The Compliance Section 1.5 of the standard includes information that is presently contained in requirement R4 of the existing PRC-002-1 standard. We have reviewed the NERC Reliability Standards Development Procedure and it appears that the SDT may have appropriately placed much of the section 1.5 information in section D. Compliance of the reliability standard. The only item in question is the second bullet of section 1.5.1 which may be more appropriately placed in the requirements section. However, it is FirstEnergy's opinion that "after the fact" data submittal type of requirements such as the need to "submit within 30 days upon request" are administrative, have no reliability impact and in general should not be subject to penalties and fines. While the inclusion of this item within the Compliance section avoids the item being subject to the Sanctions Guideline, we ask the team to reconsider its placement in the standard. It is FirstEnergy's opinion that the reliability standards need to evolve in such a way that clearly delineate reliability requirements from administrative requirements. We suggest subsections of section B "Requirements" labeled "1: Reliability Requirements" and "2: Administrative Requirements" and that the administrative requirements would generally receive "traffic ticket" warnings and only escalate to sanctions for repeat or willful violations. 3. The Purpose statement of the standard is missing the "reporting" aspect of this standard. We suggest the SDT change the Purpose statement to match the Purpose of the current PRC-002-1 standard and also detailed in the SAR: "To establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models." 4. The proposed Applicability section details the facilities for which the standard is applicable. However, since the proposed requirements already properly point out the locations that require disturbance monitoring equipment, the applicability section could simply state the TO and GO with no additional qualifying language.
Yes
Although we agree with the implementation plan, there seems to be a typographical error in the 1st bullet under the "Effective Date" section 5 of the standard: "four years" should be changed to "two years".

Yes
Yes
Yes

Yes
There needs to be some consideration for generator owners who don't own/operate the switchyard that the generator circuit breaker is in as they may not have ready access to the breaker status for high speed recording and they may be beholden to the switchyard owner to get access. Also, a power plant with an aggregate of 1500 MVA or higher might only have a small portion of the generation connected at 200 kV and above. Those portions not connected to the 200 kV and above system should not be required to meet the standard.
No
This should only be required for new plants that meet the criteria defined. Existing plants should be grandfathered. The other issues mentioned in Question 5.1 comments should also be considered and they are copied here: There needs to be some consideration for generator owners who don't own/operate the switchyard that the generator circuit breaker is in as they may not have ready access to the breaker status for high speed recording and they may be beholden to the switchyard owner to get access. Also, a power plant with an aggregate of 1500 MVA or higher might only have a small portion of the generation connected at 200 kV and above. Those portions not connected to the 200 kV and above system should not be required to meet the standard.
No
While the general premise might be acceptable, the Requirement R7 requires the DDR to monitor one phase current from every line operated 200 kV and above. This might not be possible or may be extremely difficult for some cases especially where the substation is jointly own/operated, is extremely large, or is quite old. The requirement should state a percentage of lines that must be monitored (say 50%).
Yes
This is not consistent with requirement R12 which states +/- 2 ms since within 4 ms means +/- 4.
No
Requiring sequence of events data for all substations 200 kV and above with 3 or more lines is too stringent. It will provide more data but drowning in data isn't the goal. This should be relaxed to substations with 5 or more lines as these will eliminate the smaller less important substations.
Yes
If you tell me what the definition of the end of an event is and then I'll be sure to capture the "final cycle" of the event.
Yes
There should be a provision for the case if the quantities aren't able to be measured (CT not available for example). In requirement R5.3 it makes the generator owner responsible to record the neutral current of the GSU high voltage winding. Sometimes, generators that have DFRs applied do not have this quantity available as they mostly have access to the low voltage quantities. In addition, if a generator owner has a fault recorder but doesn't have available channels for this additional quantity, he shouldn't be required to drop a channel he feels is important to make room for these mandated channels. For instance, one only needs two voltages and two currents to measure MW so a generator may have fault recording that measures 2 line voltages and 2 line currents and there may not be room to add the additional channels specified. Generally with two of the values you can derive the third so why force them to record all indicated quantities. These requiremens might be acceptable for new generator installations but there are existing installations that would find this ornerous.
Yes
No
If the majority of the 1500 MVA of the plant is recorded, smaller units that are not significant (300 MVA or less) shouldn't be required to be monitored regardless of what voltage level they connect at. Perhaps the requirement could be changed such that if more than 50% of the plant (by MVA) is recorded, units smaller than 300 MVA could be excluded. A generator owner may have a plant that exceeds 1500 MVA when aggregated but this could be due to a few large units, with other smaller units included that are not of consequence.
No

R9.2 requires sampling at 960 samples per second. There are many DDR devices in service presently that have lower sample rates that provide perfectly adequate data. For example, there are many Macrodyne PMUs in service that have a 720 Hz sample rate and a data storage rate of 30 Hz. These PMUs should either be grandfathered or requirement should be reduced to allow them to meet the criteria. Don't require people to replace adequate equipment that gives acceptable results.
No
Earlier in R3 you specify +/- 4 ms
WECC has had a disturbance monitoring plan for many years. As part of this plan they have required PMUs at certain locations. The PMUs that were "approved" include some that would not meet the R9.2 requirement as discussed earlier. This would create a conflict between what WECC agreed was acceptable and what this standard proposes.

Yes
A single standard to define the installation application of DMEs makes good sense.
Yes
Yes
Maintenance can be defined in another standard, however, PRC-002 should specifically allow for missing data for a given event since triggering may be inadequate and equipment can be down for maintenance/repair.
Yes
Application of DMEs at the 200 kVand above is the correct voltage level to begin applying DMEs. However, substations with only three lines are approaching distribution size stations which would typically be served from larger stations that should be monitored. This would cause undue burdens on transmission owners. Although disturbances can begin at lower voltages they spread through the system at 200 kV and above. Moreover, any disturbance will always go back and be seen at the larger stations. Adequate data can be obtained at 200kV and above to determine system stability issues and frequency response.
Yes
Yes
Yes
We generally agree with this, however, it needs some defining.
Yes
However, please view our comments for question 17.
Yes
Yes
We agree, however, the term "event" needs to be defined. Please provide a working definition for event.
Yes

Yes
This needs to be stated more clearly. Could you provide specific examples as part of FAQs.
Yes
Yes
The term continuous recording should be technically defined. Obviously a true continuous record can not be retrieved or stored locally for long periods. Continuous records must be retrievable in sections. The expectations of continuous recording need to be well defined to determine compliance if for no other reason to provide audit ability.
Yes
Please see comments for question 17.
No
No
No
No
From an audit standpoint the statement “Each Responsible Entity shall be at least 50% compliant on monitored equipment” would seem to be very difficult standard to meet or defend during on audit. Perhaps a better yardstick could be developed for improved audit ability. The overall four year requirement for 100% compliance and 50% compliance in 2 years will place an extremely high burden on many companies especially with nuclear assets. Two years is not enough time to budget design and install a DME into a nuclear facility. How can 50% compliance be met in two years? As seen in the last two years, most manufacturers are unable to keep up with industry demand. Therefore, the ability of the DME manufactures to meet the manufacture volume requirements is also unknown. Six years overall time frame is much more realistic for an implementation plan. GPS equipment synchronization is possible for all existing DMEs that I am aware of; however, some testing indicates that not all equipment can internally use this signal and actually time stamp to the required accuracy. Perhaps for older equipment, the requirement for accurate GPS time synchronization would be sufficient for the purpose of this standard. Older equipment should be allowed to be used during the transitional period without risk of an audit finding for not meeting a +2 millisecond time accuracy requirement. If you have equipment that cannot meet the +_ 2 millisecond requirement, this may result in an unintended consequence that will force companies to remove equipment from their DME list. Older DME equipment do not provide for long term storage. Requiring retrieval or local storage is only possible if the need for data is known soon enough to download and store locally. This would put almost everyone at risk for an audit finding for missing data. One of the primary reasons for replacing DMEs may be due to the 10 day retrieve ability requirement. It seems that timing of this requirement puts the cart before the horse and would seem entirely unrealistic to implement this requirement before the equipment is in place to provide the storage function. Again, if you have equipment that cannot meet the +_ 2 millisecond requirement, this may result in an unintended consequence that will force companies to remove equipment from their DME list.
No
The terms substation and "Aggregate plant total nameplate" for the purpose of this standard should be well defined due to the compliance/audit issues that a misunderstanding of these terms could bring for a TO and/or GO.

Good job on mappring all the requirements!!
Yes
Protective relays based on microprocessor technology support SOE and DFR functionality, along with the ability to directly interface with local GPS satellite clocks for very accurate recording of events and faults. These SOE and DFR capabilites are programmed with the same software progams that "protection engineers" use to program settings and logic. The Protection System Maintenance and Test Project may be a better location to contain the maintenance requirements for SOE and DFR functionality provided by microprocessor protective relays. If Test and Maintenance requirements for the "same box" are developed independently of the PSMT Project, there is a distinct possibility of conflicting maintenance and test requirements for the "same box" and also the possbility of "double jeopardy" when it comes to VSLs and other auditable compliance criteria. DDR, PMU and legacy SOE, DFR and DDR maintenance and test requirements could be developed in alignment with other test and maintenance requirements through joint coordination between the DMSDT and PSTMSDT, or another SAR and new SAR team may need to be formed with team members from both a DM backgound and Protection Systems background to develop comprehensive maintenance and test requirement for DM equipment.
Yes
The choice of DFR data being derived from 200kV and above is a good selection from a continental standard perspective. The choice of 3 lines or greater provides for more coverage than is needed for DFRs. In some cases, 200kV 3 line substations will have very little impact on the overall bulk energy deleivery systems. In the cases where DDRs are located in close proximity to these 3 line 200 Kv stations, there should be allowances for the fact that DDRs are covering the area and that DFRs may not be required from an additional data coverage standpoint.
Yes
Yes
Yes
There is good correlation from mulitple regions in support of the 200kV level and above for the busses that are considered the "most impactful" when considering major disturbances within a region. Busses that have a 10,000 MVA and above three phase short circuit capacity are significantly represented by 200kV and above criteria. When reviewing regional data for the 10,000 MVA and above three phase short circuit capacity, over 90% of those busses that are connected to generation, meet the 500/1500 MVA selected levels for generation, in support of the team's choice of these levels.
Yes
ocal GPS satellite clocks are needed to properly time tag events and provide for correct data for analysis purposes. It should be noted that breaker mechanical contacts, "a" "b" "aa" and "bb", can be significantly outside of the range of 4 milliseconds in tolerance for certain types of breakers. A method to accommodate values outside the 4 millisecond range may need to be accomodated.
Yes
No
Various manufacturer's equipment does not presently support this requirement. Special designs and modifications to certain types of relays and fault recording equipment will need to be developed to fully support this requirement, as presently written.
Yes
Yes
Yes
Yes

No
Certain DFR equipment, especially microprocessor relays used for DFR functionality, have limited storage. The relay equipment storage buffers for oscillographic information may be overwritten by new data in a roll over buffer and will not be available for the 10 day period. For SOE and DDR data the ten day storage requriement should be easily met, but not for relay DFR equipment.

Comment - For an interconnection point that is a transformer with the high and low side voltages exceeding 200kV and two different utilities owning the high and low side of the transformer, do both parties need to install monitoring equipment as described or does one utility take the responsibility for installing the monitoring equipment on either the high or low side winding?
Yes
We agree with the nameplate values. However, we have two questions. 1) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? 2) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
Yes
No
The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirment be for substations with five or more lines operated at 200 kV or above.
Yes
The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
No

Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Yes
Yes
The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
No
The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirment eliminates the use of this adequate equipment.
Yes
The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Yes
Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
The Effective date information is unclear for the 50% and 100% compliance requirements.

This section needs to be rewritten. It is confusing the way it is written with two different options. There is no definition of triggering. As an example: if the triggering is achieved using an input contact (generator/GSU breaker 'a' or 'b' contact) then having 2 cycle pre-tiggering will not capture the required important information and will have 50 cycles of post trigger data which is useless as the breaker has already opened. The other problem is that unlike transmission line relay operations (typically happens much shorter than 50 cycles) the generator relay operations can take several seconds from the inception of fault/abnormal condition (example: loss of field, under frequency, V/Hz, out of step, reverse power etc). Recommend changing the total record length to at least 5 sec with pre and post trigger length selectable based on the triggering mechanism.

We generally agree with the approach but refinements are needed. We suggest exempting 230 kV radial lines without transmission connected generation. Also do not include these radial 230 KV lines in the count of 3 or more lines for SER & DFRs and do not include in the count of 7 or more lines for DDRs.
Yes

Yes
No
Seven lines seems to be an arbitrary number (would not cover potentially needed locations and would require installations at locations not critical to the system). We suggest wording similar to that used in the SERC DME supplement. The required siting of DDR should be coordinated through the efforts of the appropriate reliability assessment groups that may be involved in accordance with the guidance provided in PRC-002-2. These locations are selected to provide extended time power system monitoring capability in order to assist analyses of wide area disturbances. These locations are chosen to provide coverage across the BES EHV network. The locations selected should include the following considerations: • Major load centers • Major generation clusters • Major voltage sensitive areas • Major transmission interfaces • Major transmission junctions • Elements associated with Interconnection Reliability Operating Limits • Major EHV interconnections between control areas

Key Issue #6 listed on page 3 of the Comment Form states that compliance elements (VRFs, VSL, etc.) will be included in a later version of the standard. We strongly encourage the drafting team to include these in the next version issued for comments, because the inclusion of these elements is needed to refine the Requirements.
Yes
Regarding the effective dates for Requirements R1 through R11, we question the effective date for 50% compliance - shouldn't it be something less than four years? Four years is the timeframe for 100% compliance.
No
We agree with the IEEE definition. We don't think that there is sufficient misunderstanding to warrant a NERC definition.
Individual
Armin Klusman
CenterPoint Energy

Yes
No
In Table 4.1 for Fault Recording Data, the SDT has attempted, to a degree, to allow monitoring of a substation at the remote terminals to preclude the requirement of installing Fault Recording equipment at the substation. For example, the first bullet indicates Fault Recording is required for each transmission line "that does not have fault data recorded at its remote terminals". In the second bullet, however, if the substation has a transmission bus, such as in breaker-and-a-half configurations, fault recording equipment is required. CenterPoint Energy's believes fault data recorded at remote terminals is sufficient for analyzing bus faults and autotransformer faults. Similar to the first bullet in Table 4.1, CenterPoint Energy recommends adding "that does not have fault data recorded at its remote line terminals" to the end of the second and third bullets that refer to buses and transformers.
No
CenterPoint Energy disagrees that criteria for Dynamic Disturbance Recording (DDR) should be solely based upon the number of connected lines at a substation. In addition to the number of lines, CenterPoint Energy recommends that DDR equipment be required only in substations that have direct interconnections to generating units.
No
CenterPoint Energy disagrees including the proposed sequence of events (SOE) requirements. SOE data is proposed for every change in circuit breaker position (open/close) for EACH circuit breaker in a substation operated at 200kV and above. Such SOE requirements are actually related to SCADA (supervisory control and data acquisition) equipment, not fault and disturbance recording equipment. Such requirements would essentially dictate the specification and the installation, or replacement, of SCADA sets and logic cages. CenterPoint Energy recommends removing SOE requirements from PRC-002. Should the industry determine SOE requirements belong in this standard, CenterPoint Energy recommends SOE recording only be required wherever Fault Recording Data is required. It is present industry practice that Fault Recording Data devices incorporate SOE capability and that SOE data include such information as protective relay pick-up time, as well as breaker interrupting / operating time.
No
The requirements to record all three phase to neutral voltages and all four currents on each transmission line are prescriptive and excessive. The monitoring of two sets of line voltages, in all substation configurations, is a common industry practice which has met the industry's needs. It is unnecessary and excessive to require monitoring of more than two sets of "three phase to neutral voltages" in any substation arrangement.
No
CenterPoint Energy disagrees criteria for Dynamic Disturbance Recording (DDR) should be solely based upon the number of connected lines at a substation. In addition to the number of lines, CenterPoint Energy recommends that DDR equipment be required only in substations that have direct interconnections to generating units. By locating DDR capability at generating plants, sufficient DDR data will be available to analyze system disturbances.
No
The FERC-approved NERC reliability standard FAC-003 for Vegetation Management includes allowances for certain situations resulting from natural disasters, such as tornados and hurricanes. This proposed standard does not address the enormous quantities of data, as well as the

complications, that arise in such natural disasters. CenterPoint Energy recommends reviewing the various requirements and including appropriate allowances to address natural disaster situations.
Yes
This draft standard includes ambiguities, such as the time stamp for the SOE data for the “change in circuit breaker position (open/close) for each circuit breaker in a substation”. Requirement 3 indicates the time stamp shall be recorded “to within four milliseconds of input received for the change in circuit breaker position (open/close) for each of its circuit breakers specified in Requirements R1 and R2”. It is questionable of what is meant by “within four milliseconds of input received for the change in circuit breaker position”. For example, is this referring to monitoring of a circuit breaker “52a” or “52b” auxiliary contact or is something else intended such as circuit breaker main contact parting or closing (when load or fault current begins and ends). The compliance section includes several items that appear to be requirements, but are shown in the compliance section instead of in the requirements section. For example, all the data must be in a format in which COMTRADE software can be used to evaluate the data. As another example, item D.1.5.1 states “All known delays in interposing relays shall be reported along with the SOE data”. It is unnecessary and excessive to require such reporting of time delays that are insignificant and should already be taken into account within the accuracy specification. CenterPoint Energy recommends removing items for the Compliance section that are truly requirements. Each item removed should be evaluated before including it as a requirement in this proposed standard. While previously referenced in response to Question 13, CenterPoint Energy is concerned this proposed standard does not sufficiently take into consideration common natural disaster situations. The FERC-approved NERC reliability standard FAC-003 for Vegetation Management does include allowances for situations resulting from natural disasters, such as tornados and hurricanes. This proposed standard does not address the enormous quantities of data and associated complications that arise in such situations. CenterPoint Energy recommends reviewing the various requirements and including appropriate allowances to address the expected operational issues that are encountered during and after natural disasters.

Even though there may be some overlap in hardware between DME and protection systems, we believe the maintenance requirement should be driven by the equipment function and impact on grid reliability. (Disturbance Monitoring Equipment should not be treated the same as protection system relays.) The PRC-002-2 SDT is in the best position to make that determination and specify maintenance requirements for DME.
Yes
Yes

All of the items in section 1.5 "Additional Compliance Information" of the Compliance section appear to be requirements. These are adding to the requirements in the standard and are not appropriate in this section. If the SDT feels these should be required (by virtue of using "shall"), then a new draft should be developed to include these as actual requirements of the standard. Additionally, the new draft should be posted for another comment period.
No
Paragraph 1 of the Implementation Plan appears to be written incorrectly. It says that 50% of R1 - R11 have to be completed in 4 years for following regulatory approval but within 2 years after BOT approval where regulatory approval is not required. Paragraph 2 then says that 100% of R1 - R11 has to be completed in 4 years. We assume the intent is for 50% of R1-R11 to be completed in 2 years, following regulatory approval, not 4 years.
We agree the IEEE definition is appropriate.

Yes
I agree with this proposal. However, I would suggest that current maintenance and testing requirements at either the NERC or RRO level be maintained until the new maintenance and testing standards are approved and in effect. In other words, don't eliminate any current requirements between now and the time new maintenance and testing requirements are put in place. In addition, testing requirements must, among other things, verify that the heterogenous sets of DDR data can be integrated and processed in a timely manner--e.g., the DDR types must in some sense be "interoperable." This will lead to desirable performance targets that should be

incorporated into standards for future DDR installations. (See various documents on the WECC WAMS.)
Yes
While it may be convenient to enforce, the location criteria proposed can be overly simplistic. Some locations are more important than others; the RRO is usually aware of them, and should be given discretion to set their monitoring requirements. Please note that the WECC places special emphasis upon the monitoring of major control systems, especially those for HVDC terminals and FACTS-like devices. Substation measurements on the ac side of these devices may not be sufficient to adequately determine their behavior.
Yes
I agree with the nameplate values. However, I have two questions. 1) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? 2) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Yes
Yes
No
The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems overly burdensome. This requirement would potentially include a significant number of remote substations. I suggest that this requirement be for substations with five or more lines operated at voltages between 200 kV and 300 kV and for substations with three or more lines operated at voltages over 300 kV.
Yes
The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
No
Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements operated between 200 kV and 300 kV and for substations with three or more elements operated at voltages over 300 kV. See my response to question 7 above.
Yes
Yes, but ONLY if the subject substation does not interface to a major control system which cannot be fully monitored from the ac side.
Yes
If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, this requirement is not clear whether this situation would meet this requirement. Also, what if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
No
The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes a DDR frequency response of 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second (point on wave) provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and this change to require 960 samples per second eliminates the use of this adequate equipment. 12A. The term "collect" in R9.2 seems unclear--does it mean "measure and store (for subsequent off-line analysis)," or does it mean "measure as an input for on-line RMS caluculations?" 12C. In R9.3, 6 sps recording is almost too slow to be useful in a DDR. R6.2 requires at least 16 samples per 60

Hz cycle in fault recording--it is not unreasonable to seek a similar number of samples for each cycle of the highest swing frequency that a DDR should record. This rounds off nicely at 30 sps. 12D. Extend R10 to read ". . . continuous recording at 30 sps. Future versions of this Standard may require 60 sps at some locations." 12E. Consider specifying additional triggers in R11.1 (continued frequency offsets, steps in voltage or line flow, manual triggers, . . .) 12F. Change R11.3 to read "Set data record lengths at a minimum of three minutes, plus at least one minute of pre-trigger data." A further requirement for trigger continuation should be considered for persistent oscillations or continued frequency offsets.
Yes
The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3. Also, in R12, bear in mind that DDR units which are closely synchronized at their INPUTS are not necessarily synchronized at their OUTPUTS. E.g., the processing lag through a PMU can vary by 30 msec or more between different PMU types even when they are all operating at 30 sps. If properly filtered, the relative processing delay for 6 sps data would probably be something like 50 msec. These timing inconsistencies can be very important when developing an integrated profile of system dynamic behavior and should be addressed by this Standard.
Yes
Would this standard apply to a combined cycle plant where the total capability was above 500 MW (and less than 1500 MW) but each of the individual units were not greater than 500 MW. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. I suggest allowing DST files as are used by entities within WECC. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section. 16C. Item 1.5.1 should have an additional bullet on configuration files: • All reported DDR data shall be accompanied by a configuration file (CF) providing the following primary information: - the data source to which the CF applies (name of the archiving device) - structure of the data source records (number of sensors, sensor names, number of signals for each sensor) - parameters for each signal: ~ sensor producing the signal (includes sensor model & firmware version) ~ signal type (voltage, current, other) ~ scale factors for conversion to engineering units ~ timing shift or phasor rotation needed to correct known offset ~ associated voltage signal (for current signals only) ~ text data for generating signal name (might include sensor model & firmware version) It is acceptable to embed the configuration file within the data header, if any. 16D. Item 1.5.1 should have an additional bullet specifying a processing log to accompany data which have been changed from those initially recorded. Such changes might include filtering, resampling, calculation of derived quanitites, renaming or selective deletion of signals.
The Effective date information is unclear for the 50% and 100% compliance requirements.

Although we agree in principle with this criteria, establishing a substation voltage threshold at 200-kV creates specific problems for our utility. LADWP maintains a significant number of transmission lines and substations above 200-kV for supplying power around our large service area. Many of these stations are several buses away from interties with other utilities. We suggest that additional language be included in the proposed standards to exclude "internal-transmission lines" rated 200-kV and above from these regulations. Transmission lines and substations at or near intertie connections would still comply with proposed regulations. This proposed exclusion should have little to no impact on intertie data provided to NERC.
Yes
These values appear reasonable and affect several of our generating stations.
Yes
These values appear reasonable and affect several of our generating stations.
No
As stated earlier, LADWP distributes power around our service area at 230-kV. As a result, several of our transmission lines and substations fall within these proposed regulations yet have little influence on interties with other utilities. Additional language to exclude "internal transmission " resources from these regulations should be considered.
Yes
As stated earlier, similar language can be included to exclude transmission lines and substations that are part of a utilities internal distribution system, and not near intertie point.
No
No
Yes
Final issue for LADWP is the proposed effective dates, 100% compliance within 4 years. Like many other utilities, our company is limited in resources, including design and installation staff. A preliminary review of these proposed regulations and their affect to our system suggests the need to install several new Fault Recorders and Disturbance Monitoring systems. The amount of work required will likely exceed the 4 years proposed. LADWP may need to discuss scenarios of extending installation dates beyong the proposed 4 year window.

The Effective date information is unclear for the 50% and 100% compliance requirements. Also, how would this implementation plan affect the PRC-018 application?

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments on 1st Draft of PRC-002-2 — Disturbance Monitoring and Reporting Requirements — Project 2007-11

The Disturbance Monitoring Standard Drafting Team thanks all commenters who submitted comments on the proposed first draft of reliability standard PRC-002-2 — Disturbance Monitoring and Reporting Requirements. This standard was posted for a 45-day public comment period from February 2, 2009 through March 18, 2009. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 62 sets of comments, including comments from more than 130 different people from over 70 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Disturbance_Monitoring_Project_2007-11.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby at 609.446.9723 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

The responses and proposed changes below were developed by the previous Drafting Team prior to the Project being moved to informal development in the Fall of 2010. The suggested changes to the Standard may not reflect the vision of the current Drafting Team, but the Drafting Team has taken them into consideration while drafting in the latest version of the Standard. The Project moved to formal development in January of 2013. The Drafting Team will be holding a Webinar and Workshops to bring the industry up to speed on the Project and to obtain feedback.

In drafting the second version of this standard, the SDT considered the following issues:

The SDT decided to develop requirements for functionality for Disturbance data recording, rather than to require specific equipment. The team focused on the “what” is required rather than describing “how” it is to be done.

The Disturbance data requirements are focused on

- Sequence of events
- Faults
- Dynamic disturbances

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/pa/Stand/Resources/Documents/Appendix3AStandardsProcessesManual.pdf

Posted: May 17, 2013

The requirements can be met by a variety of equipment.

The SDT re-introduced the requirements for maintenance and testing of disturbance recording systems in the proposed standard. The SDT is proposing that the responsible entities establish and utilize a maintenance and testing program that contains specific items. Maintenance and testing requirements that are currently part of the FERC approved standard, PRC-018-1 – Disturbance Monitoring Equipment Installation and Data Reporting Requirement R6 will be replaced by the requirements in the proposed PRC-002-2.

During the first posting, the majority of commenters either suggested alternate equipment location criteria or requested technical justification for the proposal in draft 1 of the standard. In response to this feedback, the SDT conducted an analysis of short-circuit MVA data using data submitted voluntarily by several utilities. The criterion used by the SDT in selecting locations for monitoring/recording Disturbance data is based on an analysis conducted by the team in 2009-2010. Please review the technical paper posted with the standard that summarizes the analysis.

The SDT removed the proposed IEEE definition for sub-station due to comments received in the first posting. The SDT also included definitions for Disturbance Monitoring Equipment (DME), Sequence of Events (SOE) recorder, Fault Recorder (FR), and Dynamic Disturbance Recorder (DDR). The definition for DME exists in the NERC Glossary of terms but will be replaced by the proposed definitions when the proposed standard is approved.

1. The SDT has considered the "fill in the blank" items that are specified in the NERC Board approved standard PRC-002-1 that the Regional Reliability Organizations were required to develop "procedures and requirements" for the entities to meet. The SDT also considered all the directives specified in FERC approved PRC-018-1. The SDT is proposing to change the "fill in the blank" characteristics into entity specific requirements and merge them with the PRC-018-1 requirements. The new proposed standard PRC-002-2 contains all requirements related to disturbance monitoring with the exception of maintenance and testing (see Question #3 below). Do you agree with the SDT's proposal to develop and merge all disturbance monitoring requirements into a new PRC-002-2?

Summary Consideration: Commenters generally agreed with the SDT proposal to retire PRC-018-1 (except for Testing and Maintenance requirements) and merge those requirements with a revision of PRC-002-1, resulting in a new standard, PRC-002-2. Commenters also agreed with the proposal to replace the "fill in the blank" requirements with entity specific requirements.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	Yes	We assumed that the question refers to the merging of Standards PRC-002-1 and PRC-018-1.
Response: The SDT thanks you for your comment. Your assumption is correct. The SDT proposes and discusses in the Implementation Plan the retirement of PRC-018-1 (except for Maintenance and Testing requirements) and the merger of those requirements with a revision of PRC-002-1, resulting in a new standard, PRC-002-2.		
SPP System Protection and Control Working Group	Yes	Please clarify the term "entity specific requirements" in Question #1.
Response: The SDT thanks you for your comment. Entity specific requirements are requirements in a standard that apply to entities that are the relevant functional entities as described in the Functional Model. In the case of the proposed standard, the relevant functional entities to which the standard requirements apply are the Planning Coordinator, the Transmission Owners and the Generator Owners.		
Members of the WECC Disturbance Monitoring Work Group	Yes	

Organization	Yes or No	Question 1 Comment
Southern Company - Transmission	Yes	Southern Company agrees with the comments made by the SERC Protection and Control Subcommittee (PCS). Generally, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid. These stability evaluations should be made according to an overall NERC defined methodology. In the absence of a NERC defined methodology, a SAR should be introduced to produce one.
Response: The SDT thanks you for your comment. The drafting team has made revisions and has related location determination to the results of short circuit study for the area of the system relevant to the functional entity. New proposed criteria for Sequence of Events (SOE) and Fault Recorder (FR) data requires that monitoring be installed on 20% of the bus locations with the highest calculated three-phase short circuit MVA within the Planning Coordinator's fault study area at 1500 MVA or above, as calculated under normal configurations and connected at a 100 kV or higher voltage. In addition there is are new proposed criteria for Dynamic Data Recorder (DDR) data that requires monitoring be installed on 5% of bus locations within a Planning Coordinator's area that includes bus locations with the highest calculated three-phase short circuit MVA at 1500 MVA or above, connected at 100kV or higher and includes generators with a nameplate rating of 1000 MVA or above, or for an aggregate nameplate rating of 1000 MVA or above with a common point of interconnection as identified by the Planning Coordinator's study.		
SERC Engineering Committee Planning Standards Subcommittee	Yes	
SERC Protection and Controls Sub-committee	Yes	But we believe that the regional "Stability" group needs to decide on the locations of the DDR's based on a NERC defined methodology.
Response: The SDT thanks you for your comment. Based on industry comments, the SDT revised the DDR requirement in the latest revision of proposed R17 to reflect current practice for determining DDR location requirements by assigning responsibility to the Planning Coordinators. Planning Coordinators are required to establish a list of DDR monitored locations every five years that includes 5% or the bus locations within the Planning Coordinator's area. The new proposed criteria for DDR requires monitoring be installed on 5% of bus locations within a Planning Coordinator's area that includes bus locations with the highest calculated three-phase short circuit MVA at 1500 MVA or above, connected at 100kV or higher and includes generators with a nameplate rating of 1000 MVA or above, or for an aggregate nameplate rating of 1000 MVA or above with a common point of interconnection as identified by the Planning Coordinator's study. Requirement R23 requires that the Transmission Owners and Generator Owners record DDR data at the locations specified by the Planning Coordinators.		
PacifiCorp	Yes	
Bonneville Power	Yes	Is there a purpose to the analyses proposed. How much detail is really needed?

Organization	Yes or No	Question 1 Comment
Administration		
Response: The SDT thanks you for your comment. The purpose of the standard is "To ensure that Facility owners collect the data needed to facilitate analyses of Disturbances on the Bulk Electric System (BES)"; therefore, the standard only establishes requirements for data collection and does not define how the data will be used or the extent of the analysis.		
FirstEnergy	Yes	We agree that it will be beneficial to consolidate these standards into one document.
Response: The SDT thanks you for your comment.		
Florida Power & Light	Yes	A single standard to define the installation application of DMEs makes good sense.
Response: The SDT thanks you for your comment.		
US Bureau of Reclamation	Yes	It is good idea to make a single document to cover all DME requirements
Response: The SDT thanks you for your comment.		
Cowlitz County PUD	Yes	A single standard addressing disturbance monitoring is GREATLY appreciated. This will simplify compliance efforts.
Response: The SDT thanks you for your comment.		
City of Tallahassee (TAL)	Yes	Any time we can combine similar requirements into the same standard we are better off.
Response: The SDT thanks you for your comment.		
PHI (PEPCO Holdings Inc.)	Yes	No need for different standards to cover DM.

Organization	Yes or No	Question 1 Comment
Response: The SDT thanks you for your comment.		
Pacific Northwest National Laboratory	Yes	The new standard should at least allude to the context within which the data will be employed, and to the data quality (resolution, accuracy, band shape) that is requisite to this usage. (Data rates derive from the needed quality.) To do this for DDR devices the new standard must somehow encapsulate core issues that are addressed in documents [21,125,221]. [21] Integrated Dynamic Information for the Western Power System: WAMS Analysis in 2005, J. F. Hauer, W. A. Mittelstadt, K. E. Martin, J. W. Burns, and Harry Lee in association with the Disturbance Monitoring Work Group of the Western Electricity Coordinating Council. Chapter 14 in the Power System Stability and Control volume of The Electric Power Engineering Handbook, edition 2, L. L. Grigsby ed., CRC Press, Boca Raton, FL, 2007. [125] WECC Disturbance/Performance Monitor Equipment: Proposed Standards for WECC Certification and Reimbursement, Principal Investigator K. E. Martin. Draft report of the WECC Disturbance Monitoring Work Group, March 17, 2004.[221] PMU System Testing and Calibration Guide. NASPI report of the Performance & Standards Task Team (PSTT), December 30, 2007.
Response: The SDT thanks you for your comment. The purpose of the standard is "To ensure that Facility owners collect the data needed to facilitate analyses of Disturbances on the Bulk Electric System (BES)"; therefore, the standard states requirements only for data collection and does not define how the data will be used or the extent of the analysis. The SDT believes that the granularity of data specifications may vary greatly depending upon the analysis tools selected and by vendors of monitoring equipment. The SDT has addressed what must be done, and does not specify how it is to be done.		
Hydro-Québec TransEnergie	Yes	We assumed that the question refers to the merging of Standards PRC-002-1 and PRC-018-1.
Response: The SDT thanks you for your comment. Your assumption is correct. The SDT proposes and discusses in the Implementation Plan the retirement of PRC-018-1 (except for Maintenance and Testing requirements) and the merger of those requirements with a revision of PRC-002-1, resulting in a new standard, PRC-002-2.		
WECC	Yes	I also agree with changing the fill in the blank characteristics into entity specific requirements
Response: The SDT thanks you for your comment.

2. The SDT has developed a mapping document showing the requirements in PRC-002-1 and PRC-018-1 and where, in proposed PRC-002-2, those requirements are reflected (except maintenance and testing – see Question #3 below). Do you agree that the SDT has reflected all the appropriate requirements of PRC-002-1 and PRC-018-1 in the proposed PRC-002-2?

Summary Consideration: Commenters generally agreed that the mapping document demonstrated that all the appropriate requirements of PRC-002-1 and PRC-018-1 (except maintenance and testing) have been reflected in the proposed PRC-002-2.

Note that PRC-002-1 had an effective date of nine months after BOT adoption (BOT adoption was 8/2/06). This means that RRO requirements were to be in place by 5/2/07. At that time, however, the standards process was transitioning to the current FERC approval and enforcement rules and procedures. Because of the transition, the RROs may or may not have completed the development of the appropriate requirements since PRC-002-1, a fill-in-the-blank standard, was not considered enforceable. To ensure that the SDT does not create a standard that may appear to be retroactive and inadvertently create a non-compliant situation, the SDT has advanced the date to be reasonable with any installations needing revision.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	Requirement R3.2.1 in PRC-002-1 lists a technical requirement for recording devices installed after Jan. 1, 2009. Requirement R10 in PRC-002-2 applies to the installation of DDR devices after Jan. 1, 2011. Why was the date changed? In PRC-002-1 R4.5 refers to naming data files. In PRC-002-2 the naming of data files was moved to Section D, Compliance, Subsection 1.5 Additional Compliance Information. It does not appear in the Requirement Section. Data file naming, and data file formatting should be a requirement.
Response: The SDT thanks you for your comment. PRC-002-1 had an effective date of nine months after BOT adoption (BOT adoption was 8/2/06). This means that RRO requirements were to be in place by 5/2/07. At that time, however, the standards process was transitioning to the current FERC approval and enforcement rules and procedures. Because of the transition, the RROs may or may not have completed the development of the appropriate requirements since PRC-002-1, a fill-in-the-blank standard, was not considered enforceable. To ensure that the SDT does not create a standard that may appear to be retroactive and inadvertently create a non-compliant situation, the SDT will advance the dates to be reasonable with any installations needing revision. Data file naming is not the subject of “what” is required but a matter of “how” processes and procedures are developed and communicated. The standard requires that the data be available; the format and how it is communicated is at the discretion of the users.		
FirstEnergy	No	We agree that maintenance and testing requirements might eventually be more appropriately located in another standard at some future time. However, in order to retain the current approved standard requirements that include

Organization	Yes or No	Question 2 Comment
		maintenance and testing, these requirements need to be included in this standard until such time they can be transferred to another standard. Otherwise, the SDT should provide a technical justification as to why these requirements are no longer needed for this type of equipment.
Response: Please see the response provided for this same comment repeated in question #3.		
MRO NERC Standards Review Subcommittee	No	In the proposed PRC-002-2 R8 (DDR), why did the SDT drop the requirement for single generators to be 500 MVA or higher as noted in the Applicability section 4.2
Response: The applicability section 4.2 states that PRC-002-2 applies to generator owners. The SDT realized generator nameplate rating for a single unit 500 MVA or higher is a requirement and should be placed in the requirement section of the standard. Requirements specific to generator MVA are stated in the revised draft standard.		
City of Tallahassee (TAL)	No	Current "Requirements" R4 should NOT be moved to the Compliance section. This will result in missing requirement. This is hiding a requirement in Compliance or Monitoring and is a practice we need to get out of! Compliance sections 1.3.1, 1.3.2, and 1.5.1 need to be moved back into the Requirements section!
Response: The purpose of this standard is to ensure that disturbance data is available. The conditions under which the data is used, why it is used, and by which entity it is used are as diverse of the range of disturbances and system configurations. Since neither this standard, nor its predecessors, established "what" analyses are required and by which entity they were required, it was not possible to establish reporting "requirements" which are really a matter of "how" the available information can be communicated. Compliance can use information communicated to a requesting entity to verify that the required data was actually available. The SDT believes that the information being "moved" to the compliance section is not requirements, but is part of compliance elements that relate to the requirements.		
Hydro-Québec TransEnergie (HQT)	No	Requirement R3.2.1 in PRC-002-1 lists a technical requirement for recording devices installed after Jan. 1, 2009. Requirement R10 in PRC-002-2 applies to the installation of DDR devices after Jan. 1, 2011. Why was the date changed? In PRC-002-1 R4.5 refers to naming data files. In PRC-002-2 the naming of data files was moved to Section D, Compliance, Subsection 1.5 Additional Compliance Information. It does not appear in the Requirement Section. Data file naming, and data file formatting should be a requirement.
Response: PRC-002-1 had an effective date of nine months after BOT adoption (BOT adoption was 8/2/06). This means that RRO requirements were to be in place by 5/2/07. At that time, however, the standards process was transitioning to the current FERC approval and enforcement rules and procedures. Because of the transition, the RROs may or may not have completed the development of the appropriate requirements since PRC-002-1, a fill-in-the-blank standard, was not considered enforceable. To ensure that the SDT does not create a standard that may appear to be retroactive and inadvertently create a non-compliant		

Organization	Yes or No	Question 2 Comment
situation, the SDT will advance the dates to be reasonable with any installations needing revision. Data file naming is not the subject of "what" is required but a matter of "how" processes and procedures are developed and communicated. The standard requires that the data be available; the format and how it is communicated is at the discretion of the users.		
Northeast Utilities	No	Requirement R3.2.1 in PRC-002-1 lists a technical requirement for continuous recording for DDRs installed after Jan. 1, 2009. Requirement R10 in PRC-002-2 delays this requirement until Jan. 1, 2011. Why was the date changed? In PRC-002-1, R4.5 refers to naming data files. In PRC-002-2 the naming of data files was moved to Section D, Compliance, Subsection 1.5 Additional Compliance Information. It does not appear in the Requirement Section. Will this be enforced as a "Requirement"?
Response: PRC-002-1 had an effective date of nine months after BOT adoption (BOT adoption was 8/2/06). This means that RRO requirements were to be in place by 5/2/07. At that time, however, the standards process was transitioning to the current FERC approval and enforcement rules and procedures. Because of the transition, the RROs may or may not have completed the development of the appropriate requirements since PRC-002-1, a fill-in-the-blank standard, was not considered enforceable. To ensure that the SDT does not create a standard that may appear to be retroactive and inadvertently create a non-compliant situation, the SDT will advance the dates to be reasonable with any installations needing revision. Data file naming is not the subject of "what" is required but a matter of "how" processes and procedures are developed and communicated. The standard requires that the data be available; the format and how it is communicated is at the discretion of the users.		
E.ON U.S.	No	The SDT appears to have exceeded what is necessary by requiring all GOs and TOs to provide this information. Compliance with these draft requirements promises to be extremely costly. It is a major undertaking for all Generation Operator's across the nation to install synchronized disturbance monitoring devices capable of recording down to +/- 2 milliseconds. Also, there should be allotted more time for the engineering and installation of new hardware, etc. than that provided in the proposed timetable
Response: The SDT thanks you for your comments. Only those GOs and TOs that are identified on the list of locations for which SOE, FR, or DDR functionality must be provided will be required to provide the information. The SDT believes that will be approximately 20% of the locations for SOE and FR, and 5% for DDR. The +/- 2 millisecond requirement is not a new requirement (it was in FERC approved PRC-018-1, Requirement R1.1). The proposed implementation schedule is consistent with PRC-018-1 and with PRC-002-1.		
Southern Company - Transmission	Yes	No further comment.

Organization	Yes or No	Question 2 Comment
Response: The SDT thanks you for your comment.		
SERC Protection and Controls Sub-committee	Yes	Except possible impact based on protection scheme used when three phase line or bus potential are not available.
Response: The SDT thanks you for your comment. Protection schemes are not addressed in this standard. The standard is intended to outline the requirements for DME; it is up to the individual entity to ensure that DME will not interfere with the functionality of their protection schemes.		
JEA	Yes	Good job on mappring all the requirements!!
Response: The SDT thanks you for your comment.

3. The SDT recommends that the maintenance and testing requirements for disturbance monitoring equipment belong in another standard. Do you agree with the SDT's proposal to exclude these requirements from PRC-002-2 and include them in another standard, either through the creation of a SAR or by assigning these requirements to an existing project?

Summary Consideration: Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2, Requirement R27. Eventually, a new SAR will be proposed and the requirements related to disturbance monitoring equipment will be fully developed and assigned to another standard.

Organization	Yes or No	Question 3 Comment
Southern Company - Transmission	No	Southern Company does not agree with separating from this standard maintenance and testing requirements for disturbance monitoring equipment for inclusion in another standard. We feel that separating those requirements needlessly complicates an entity's ability to monitor and maintain compliance with the standard(s). We realize the drafting team is handling a set of very technical and complex issues in this disturbance monitoring and reporting standard and we urge them to keep the standard simple where possible.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
SERC Protection and Controls Sub-committee	No	Prefer that M&T continue to be contained within this standard.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2		
Dominion	No	Prefer M&T to be contained within this standard. Do not move DME M&T to a totally new standard.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		

Organization	Yes or No	Question 3 Comment
FirstEnergy	No	We agree that maintenance and testing requirements might eventually be more appropriately located in another standard at some future time. However, in order to retain the current approved standard requirements that include maintenance and testing, these requirements need to be included in this standard until such time they can be transferred to another standard. Otherwise, the SDT should provide a technical justification as to why these requirements are no longer needed for this type of equipment.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2		
US Bureau of Reclamation	No	As I mentioned in item-1 above, all DME requirements should be in one document. The maintenance and testing requirements for DME should be in one document.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2		
Progress Energy Florida	No	Requirements related to DME equipment maintenance should not be included in the PRC-005 standard because the importance of DME equipment does not warrant the same high level attention as Protection Systems. PRC-002-2 seems to be a more logical place.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
DTE Energy/Detroit Edison	No	One standard should cover all issues relating to disturbance monitoring. Also, since DMEs are monitoring and not protective devices, is it necessary to specify maintenance/testing requirements? Requirements already in the Standard for data submittals would necessitate maintaining the availability of the DMEs.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
ITC Transmission, METC	No	The FERC-approved PRC-018-1 requires a maintenance and testing program for DME and it should be

Organization	Yes or No	Question 3 Comment
		included in the new PRC-002-2.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2		
Progress Energy Carolina, Inc.	No	Requirements related to DME equipment maintenance should not be included in the PRC-005 standard because the importance of DME equipment does not warrant the same high level attention as Protection Systems. PRC-002-2 seems to be a more logical place.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
WECC	No	I agree with the notion that the maintenance and testing requirements for disturbance monitoring equipment belong in another standard. However, I am concerned that if they are not initially included PRC-002-2, that for a while we run the risk of not having a standard that requires maintenance and testing of disturbance monitoring equipment. I am concerned that an effort through creation of a SAR or assigning these to an existing project may take longer than completion of the proposed PRC-002-2. Would it be possible to retain the existing requirment for the applicable entity to have a maintenance and testing program that includes maintenance and testing intervals and their basis, and a summary of maintenance and testing procedures (PRC-018, R6) in PRC-002-2 until such time that a replacement standard was approved, and then drop the requirement from PRC-002-2?
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
E.ON U.S.	No	All requirements relating to DME (disturbance monitoring equipment) should be set forth within one standard. The SDT should add the maintenance and testing requirements as well. For utilities that may well have to invest considerable sums of money in the procurement and installation of new equipment, an awareness of any maintenance and testing requirements will allow for better informed, more cost effective procurement decisions
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT		

Organization	Yes or No	Question 3 Comment
proposes temporarily addressing these requirements in PRC-002-2.		
Xcel Energy	No	Even though there may be some overlap in hardware between DME and protection systems, we believe the maintenance requirement should be driven by the equipment function and impact on grid reliability. (Disturbance Monitoring Equipment should not be treated the same as protection system relays.) The PRC-002-2 SDT is in the best position to make that determination and specify maintenance requirements for DME.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
Northeast Power Coordinating Council	Yes	We agree that the maintenance and testing should be in another standard. However, we are concerned that the time to develop a separate standard would introduce a "time gap" when there would be an in force Disturbance Monitoring Standard, with no document in place addressing maintenance and testing.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
IRC Standards Review Committee	Yes	The SRC agrees with the proposal to exclude maintenance and testing from this standard.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
SPP System Protection and Control Working Group	Yes	Recommend to include these requirements in PRC-005 (with time line) or a specific action plan with time line (parallel to PRC-002-2) to include in another standard.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
Florida Power & Light	Yes	Maintenance can be defined in another standard, however, PRC-002 should specifically allow for missing data for a given event since triggering may be inadequate and equipment can be down for maintenance/repair.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
MRO NERC Standards Review Subcommittee	Yes	Having a separate maintenance and testing standard may be easier to administrate for most utilities.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
NERC	Yes	They should be included in PRC-005 -- Transmission Protection System Maintenance and Testing
Response: The SDT thanks you for your comment and for your suggestion. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
Cowlitz County PUD	Yes	Maintenance and testing (M&T) separation is good as long as there is no text in either standard referring back to another standard. So, PRC-002-2 has recording parameters defined as it should; the M&T standard should only require the equipment to be maintained (keep it working) and tested (it works as programmed). If the installed equipment does not meet the requirements of PRC-002-2 either by wrong choice of equipment or poor programming, then there is only a PRC-002-2 violation, not a PRC-M&T standard violation as long as the equipment was maintained and tested. In other words, a single violation should only incur one standard being violated; standard verbiage should avoid the possibility of double jeopardy. I would suggest that the same SDT for PRC-002-2 work on the M&T standard.
Response: The SDT thanks you for your comment. The SDT agrees with your description of the appropriate separation of concepts. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
American Electric Power	Yes	AEP is agreeable that the maintenance and testing belongs in another standard. Currently, there is a maintenance and testing team at work on standard PRC-005-1 (Project 2001-17) wherein these requirements would fit well.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment		

Organization	Yes or No	Question 3 Comment
belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
City of Tallahassee (TAL)	Yes	It would be ideal if ALL Maintenance and Testing requirements were in one standard!
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
NV Energy (fka Sierra Pacific Resources)	Yes	The maintenance and testing requirements do not belong in this Standard. However, since the devices' performance is not a system protection function, I believe that there should not be any NERC Standards/Requirements for maintenance and testing requirements. If deemed necessary, it would suffice to have a performance standard that requires that the appropriate data be available and collected from the disturbance monitoring equipment following system events, rather than imposing another set of maintenance requirements on the industry. To the extent that some of the disturbance monitoring functions are carried out by actual protective relays; example, SEL relays, then the maintenance of the protective functions of those relays will already be covered in PRC-005.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
Pacific Northwest National Laboratory	Yes	Testing requirements must, among other things, verify that the hetterogenous sets of DDR data can be integrated and processed in a timely manner--e.g., the DDR types must in some sense be "interoperable." This will lead to desirable performance targets that should be incorporated into standards for future DDR installations. (See various documents on the WECC WAMS.)
Response: Data file formatting is not the subject of “what” is required by the standard but a matter of “how” processes and procedures are developed and communicated. The standard requires that the data be available; the format and how it is communicated is at the discretion of the users.		
Hydro-Québec TransEnergie (HQT)	Yes	We agree that the maintenance and testing should be in another standard. However, we are concerned that the time to develop a separate standard would introduce a "time gap" when there would be an in force Disturbance Monitoring Standard, with no document in place addressing maintenance and testing.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment		

Organization	Yes or No	Question 3 Comment
belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
JEA	Yes	Protective relays based on microprocessor technology support SOE and DFR functionality, along with the ability to directly interface with local GPS satellite clocks for very accurate recording of events and faults. These SOE and DFR capabilities are programmed with the same software progams that "protection engineers" use to program settings and logic. The Protection System Maintenance and Test Project may be a better location to contain the maintenance requirements for SOE and DFR functionality provided by microprocessor protective relays. If Test and Maintenance requirements for the "same box" are developed independently of the PSMT Project, there is a distinct possibility of conflicting maintenance and test requirements for the "same box" and also the possbility of "double jeopardy" when it comes to VSLs and other auditable compliance criteria. DDR, PMU and legacy SOE, DFR and DDR maintenance and test requirements could be developed in alignment with other test and maintenance requirements through joint coordination between the DMSDT and PSTMSDT, or another SAR and new SAR team may need to be formed with team members from both a DM backgound and Protection Systems background to develop comprehensive maintenance and test requirement for DM equipment.
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.		
Utility System Efficiencies, Inc.	Yes	I agree with this proposal. However, I would suggest that current maintenance and testing requirements at either the NERC or RRO level be maintained until the new maintenance and testing standards are approved and in effect. In other words, don't eliminate any current requirements between now and the time new maintenance and testing requirements are put in place.In addition, testing requirements must, among other things, verify that the heterogenous sets of DDR data can be integrated and processed in a timely manner--e.g., the DDR types must in some sense be "interoperable." This will lead to desirable performance targets that should be incorporated into standards for future DDR installations. (See various documents on the WECC WAMS.)
Response: The SDT thanks you for your comment. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2		
Kansas City Power & Light	Yes	The current Reliability Standard PRC-005 for maintenance and testing of system protection systems may not be a good place for maintenance and testing of Disturbance Monitoring Equipment (DME). The maintenance and

Organization	Yes or No	Question 3 Comment
		testing requirements for DME are not the same as for system protection systems and for that reason it is not recommended to mix them with PRC-005 if that was being suggested by the SDT. Protective relaying may not operate between maintenance cycles, however, that is typically not the case for DME operation. Maintenance should not be required if a DME triggers and correctly captures a record on a regular basis. Do not disagree with the concept of of a separate standard for the maintenance and testing for DME.
Response: The SDT thanks you for your comment. The SDT does not, in its proposal, intend a "mix" of disturbance monitoring requirements with system protection requirements; rather, the SDT intends for the specific requirements for each type of function to be covered. Commenters generally agreed that maintenance and testing of disturbance monitoring equipment belongs in another standard. Since such requirements are currently in FERC approved PRC-018-1, which the SDT is proposing for retirement, the SDT proposes temporarily addressing these requirements in PRC-002-2.

4. The criteria used by the SDT in selecting locations for monitoring/recording Disturbance data is based on minimum number of elements (lines, transformers, etc.) or minimum amount of generation at a specific location. This approach facilitates the measurement of compliance to the requirements. Do you agree with the SDT's approach? Please provide specific comments, examples or recommendations.

Summary Consideration: Comments indicated that those who responded agreed with the intent of the standard. However, stakeholders pointed out that the wording of the requirements and tables required clarification. Additionally, commenters stated that the location criteria for DME seemed arbitrary, and asked what the drafting team's technical justification was for the location criteria. Some commenters stated that the use of the term "substation" presented in the requirements was misunderstood.

The drafting team undertook a significant rewriting of the draft standard. The requirements were made clearer and the tables were eliminated. To determine location criteria, a task team was formed to develop a technical basis for the requirements. Based on data received, the task team developed location criteria for SOE and FR data to be 20% of bus locations with the highest calculated short circuit MVA level. To address the misunderstanding of the use of the term "substation," the drafting team dropped the use of the term and focused on buses as a location criterion.

Organization	Yes or No	Question 4 Comment
PNM	No	The defining sum of lines and transformers should be 4 instead of 3. The sum of 3 will exclude few sites.
Response: The SDT thanks you for your comment. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established new criteria for the location of DME that includes a short circuit MVA criteria. This is included in the revised draft standard.		
Duke Energy	No	We generally agree with the approach but refinements are needed. We suggest exempting 230 kV radial lines without transmission connected generation. Also do not include these radial 230 KV lines in the count of 3 or more lines for SER & DFRs and do not include in the count of 7 or more lines for DDRs.
Response: The SDT thanks you for your comment. The drafting team agrees with your suggestion on excluding radial lines and has modified the requirements in the revised draft standard to address this.		

Organization	Yes or No	Question 4 Comment
CenterPoint Energy	No	In Table 4.1 for Fault Recording Data, the SDT has attempted, to a degree, to allow monitoring of a substation at the remote terminals to preclude the requirement of installing Fault Recording equipment at the substation. For example, the first bullet indicates Fault Recording is required for each transmission line that does not have fault data recorded at its remote terminals?. In the second bullet, however, if the substation has a transmission bus, such as in breaker-and-a-half configurations, fault recording equipment is required. CenterPoint Energy's believes fault data recorded at remote terminals is sufficient for analyzing bus faults and autotransformer faults. Similar to the first bullet in Table 4.1, CenterPoint Energy recommends adding that does not have fault data recorded at its remote line terminals to the end of the second and third bullets that refer to buses and transformers.
Response: The SDT thanks you for your comment. The drafting team recognizes that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification. The revised standard should ensure that sufficient elements are monitored. The team agrees that if no DME is installed at a terminal, but all remote terminals have DME that monitor the required elements, then no DME should be required at that particular terminal.		
E.ON U.S.	No	The SDT approach would in some instances require installation of redundant data monitoring equipment. One DDR per substation should be adequate; not one per generating unit.
Response: The SDT thanks you for your comment. The standard provides criteria for what elements to monitor. It does not specify the type or number of DME to be installed. How the elements are monitored is up to the TOs and GOs.		
Entergy Services, Inc	No	a) Simply specifying the number of elements may not be consistent with many existing Transmission Owner's historical DFR applicability criteria such as fault current availability and/or adjacent station coverage. A criteria consisting of a combination of the number of elements and a threshold short circuit MVA would be more appropriate for system coverage and yet still be measureable. Criteria should also include consideration for exceptions when there are adjacent station FRs in order to provide good system coverage and avoid unecessary redundant installations and expeditures. b) Also, the wording of R1.1 may does not seem be clear to everyone. Suggest the use of diagrams for clarity.
Response: The SDT thanks you for your comment. a) To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes a short circuit MVA criteria. This is included in the revised draft standard. b) The drafting team recognizes that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the		

Organization	Yes or No	Question 4 Comment
requirements have been rewritten to provide clarification. The drafting team understands your comment regarding the use of diagrams to further clarify the standard. However, the drafting team does not believe that these diagrams belong in the standard, but rather in an FAQ or other technical document. The drafting team will consider writing an FAQ in addition to the standard.		
Brazos Electric Power Cooperative, Inc.	No	The approach needs better engineering support of the criteria.
Response: The SDT thanks you for your comment. The drafting team agrees that a technical basis for the criteria is needed. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes short circuit MVA criteria. It is included in the revised draft standard.		
Pacific Northwest National Laboratory	No	While it may be convenient to enforce, the location criteria seem overly simplistic. Some locations are more important than others; the RRO is usually aware of them, and should be given discretion to set their monitoring requirements. Please note that the WECC places special emphasis upon the monitoring of major control systems, especially those for HVDC terminals and FACTS-like devices [123]. I strongly doubt that substation measurements on the ac side of these devices is sufficient to determine their behavior.[123] WSCC Plan for Dynamic Performance and Disturbance Monitoring, prepared by the WECC Disturbance Monitoring Work Group, October 4, 2000.
Response: The SDT thanks you for your comment. The drafting team understands your comment, however, in order to avoid a fill-in-the-blank standard, a set of criteria is required. The original PRC-002 requires that the regional reliability organizations develop criteria for the location of DME, which was rejected by FERC. This standard will establish a baseline set of criteria and does not restrict the regions from having input into the location of DME.		
National Grid	No	Page 2, R1.1. of the mapping document as stated: R1.1. Contains any combination of three or more transmission lines operated at 200 kV or above and transformers having primary and secondary voltage ratings of 200 kV or above, contradicts: Page 4 Table 4-1 Each Substation containing any combination of three (3) or more elements consisting of transmission lines operated at 200 kV or above and transformers having primary and secondary voltage ratings of 200 kV or above. Further clarification is needed to avoid issues of interpretation.
Response: The SDT thanks you for your comment. The drafting team recognizes that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.		
American Electric Power	No	AEP believes that there is some misunderstandings of the term "Substation" as applied in the standard. The

Organization	Yes or No	Question 4 Comment
		portion 'enclosed assemblage' is not clear enough to distinguish assets applicable to the standard. For example, distinct and separate busses, of differing voltage, that may be enclosed by a common fence. When Considered separately, one or the other separate busses may not meet requirement criteria, but considered combined, may meet criteria. When considered combined, AEP believes that the inclusion of additional facilities, simply because they are within the same fence, does not significantly enhance reliability as to be warranted.
Response: The SDT thanks you for your comment. Based on industry, feedback the SDT will not be using “substation” to define the locations. Instead, the standard uses the bus as a requirement in the location criteria.		
TransAlta	No	a)1. Selecting location for monitoring/recording disturbance data should be based on the disturbance analysis requirement as stated in the purpose section of this standard. But the SDT said," based on expected impact to the interconnected system. It is the team’s strong belief that application of requirements below these values will require significant additional resources". This statement does not fully match the purpose.b)2. Using the minimum number of elements or minimum amount of generation at a specific location has two deficiencies. Firstly, it may exclude some locations where it is critical for BES reliable operation but not under this minimum number criterion. Secondly, it may waster the resource in the case which the disturbance data are collected in two adjacent locations defined in the draft standard where there are elements between each other. So it is recommended that SDT review the approach and satisfy the purpose of this standard. It is better to provide some guideline to select the location, instead of use the number. Another suggestion is that SDT look at FERC approved standard EOP-004-1 disturbance reporting to determine how to select the locations for monition/recording disturbance data to facilitate the analysis of the events specified in EOP-004-1.3. c) Disturbance data are mostly used by the entities that have a wide area view such as RC. Normally, these entities decide where to collect disturbance data for analysis. The draft standard does not have such wordings which allow these entities to have inputs to choose the locations and elements.
Response: The SDT thanks you for your comment. a) The purpose of the standard is to establish the criteria for the monitoring of system elements for disturbance analysis. The requirements in the draft standard do offer guidance in selection of locations for DME. The drafting team understands that the requirements may represent a significant burden on resources; however, the purpose of the standard is to ensure that sufficient elements are monitored to facilitate the analysis of power system disturbances. b) Based on other comments received, the drafting team understands that certain elements may be excluded and there may be some adjacent locations that could have duplicate data. The drafting team also reviewed EOP-004-1 criteria and determined that it does not provide criteria for the selection of locations based on measureable criteria. c) Disturbance data includes sequence-of-events and fault data, along with dynamic disturbance data. Typically, an RC uses the dynamic disturbance data to analyze a disturbance, and a utility will use SOE and FR data. The original PRC-002 requires that the regional reliability organizations develop criteria for the		

Organization	Yes or No	Question 4 Comment
location of DME, which was rejected by FERC. However, in order to avoid a fill-in-the-blank standard, a defined set of criteria is required. The standard establishes this set of criteria, and it does not restrict the regions from having input into the location of DME.		
US Bureau of Reclamation	No	"or minimum amount of generation at a specific location." Whatever is this, I do not agree to have one recorder for many generator units. Every generator should have an own DME (such as capabilities of SER and Wave-Capture by a micor-processor relay).
Response: The SDT thanks you for your comment. The draft standard is focused on recording requirements and elements to be monitored, not the type of equipment or how each element is monitored. It is the responsibility of the TO and GO to decide what equipment to use and how they will meet the requirement.		
Los Angeles Department of Water & Power	No	Although we agree in principle with this criteria, establishing a substation voltage threshold at 200-kV creates specific problems for our utility. LADWP maintains a significant number of transmission lines and substations above 200-kV for supplying power around our large service area. Many of these stations are several buses away from interties with other utilities. We suggest that additional language be included in the proposed standards to exclude "internal-transmission lines" rated 200-kV and above from these regulations. Transmission lines and substations at or near intertie connections would still comply with proposed regulations. This proposed exclusion should have little to no impact on intertie data provided to NERC.
Response: The SDT thanks you for your comment. The drafting team agrees with your suggestion on excluding radial lines and has modified the requirements in the revised draft standard to address this.		
SERC Protection and Controls Sub-committee	No	Agree with the approach given our understanding of thestandard's intent. a) The documents wording and Tables need to be clearerand more consistent. b) Suggest exempting 230 kV radial lines withouttransmission connected generation. Do not include these radial 230 KVlines in the count of 3 or more lines for SER & DFRs and do not includein the count of 7 or more lines for DDRs. c) It should be made clear thatthe equipment that must be monitored by a GO in Tables 2-1 and 5-1should be limited to equipment owned by the GO.Under Table 4.1, change the "and" below to "or." "Each Substation containing any combination of three (3) or more elements consisting of transmission lines operated at 200 kV or above and (change this "and" to "or") transformers having primary and secondary voltage ratings of 200 kV or above." Wording in Table 4.1 is more clear (assuming we understand the intent) than the wording in R1.1 and R1.2. We suggest that you use this clearer wording for these two requirements. d) We suggest that you make use of diagrams to make the intent clearer.
Response: The SDT thanks you for your comment. a) The drafting team agrees that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the		

Organization	Yes or No	Question 4 Comment
requirements have been rewritten to provide clarification. b) The drafting team agrees with your suggestion on excluding radial lines and has changed the wording of the requirements in the revised draft standard toaccount for this. c) The purpose of the standard is "To ensure that Facility owners, whether they are a TO or GO, monitor BES elements to ensure the data needed to facilitate analyses of Disturbances on the Bulk Electric System (BES)." Based on comments received, the drafting team recognized that the tables contained in the draft standard were confusing and unclear. The tables have been eliminated from the revised draft standard. d) The drafting team understands your comment regarding the use of diagrams to further clarify the standard. However, the drafting team does not believe that these diagrams belong in the standard, but rather in an FAQ or other technical document. The drafting team will consider writing an FAQ in addition to the standard.		
PacifiCorp	No	a) While this approach does facilitate the measurement of compliance, it does not necessarily effectively target those elements that have the greatest impact to the reliability of the Bulk Electric System. The critieria used should also include consideration of factors reflecting the importance or significance of the location to the power grid. For example: Radial taps should not be included as part of the three element requirement (minimum number of elements).
Response: The SDT thanks you for your comment. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard. The drafting team agrees with your suggestion on excluding radial lines and has modified the requirements in the revised draft standard to address this		
Southern Company - Transmission	No	a) Southern Company supports the comments made by the SERC PCS. We urge the Drafting Team to utilize clarifying language in those areas identified in the comments of the SERC PCS. b) We are particularly keen on the idea of using diagrams to further clarify and illustrate the intent of the standard where needed. c) Southern Company disagrees with the use of arbitrary "checklist" values to determine location of disturbance monitoring equipment. As we commented in our response to Question #1, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid in accordance with a NERC defined methodology.
Response: The SDT thanks you for your comment. a) The drafting team agrees that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification. b) The drafting team understands your comment regarding the use of diagrams to further clarify the standard. However, the drafting team does not believe that		

Organization	Yes or No	Question 4 Comment
these diagrams belong in the standard, but rather in an FAQ or other technical document. The drafting team will consider writing an FAQ in addition to the standard. c) The drafting team understands your concern related to the location of disturbance monitoring equipment installed for the purpose of recording disturbance data,, and others share this concern. In order to develop a continent-wide standard, it is necessary to develop a set of measurable criteria.. The team's opinion is that if location of DME is done by stability study alone, it will not be measurable. The team elected to use a three-phase short circuit MVA criteria based on data voluntarily provided by utilities in different regions to determine monitoring requirements. The revised draft of the standard is based on this set of criteria.		
IRC Standards Review Committee	Yes	The SRC would suggest that consideration be given to Market Entities that aggregate resources. It may be useful to specifically recognize "physical aggregation" so as to exclude "electronic aggregation."
Response: The SDT thanks you for your comment. The SDT agrees that this standard is based on physical aggregation, not electronic aggregation. The criteria specify the number of elements at a location and are not market-based.		
Dominion	Yes	We agree with the approach given our understanding of the standard's intent. a) The wording in the requirements and the tables need to be clearer and more consistent. It should be made clear that the equipment that must be monitored by the GO in tables 2-1 and 5-1 should be limited to equipment owned by the GO. We suggest replacing the word its with Generator Owner , and that the Heading of Table 2-1 be re-labeled to indicate: for generating plant and substation equipment owned by Generator OwnerAs an example: We ask for clarification of the intent of the term generator output breaker b) Please refer to the following example: A GO owns a breaker on the low-side of the GSU which is used to synchronize the unit. The TO owns breakers on the high-side of the GSU. For the purpose of this standard which of these breakers is deemed to be the generator output breaker(s)We suggest clarifying that any references to a low-side breaker to only include low-side breaker used as generator output breaker. c) We suggest exempting radial lines without transmission connected generation. Do not include these radial lines in the count of 3 or more lines for SOE & FRs and do not include in the count of 7 or more lines for DDRs. Radial lines do not need to be monitored.
Response: The SDT thanks you for your comment. a) The drafting team agrees that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification. b) The drafting team agrees with your comment regarding clarification of the generator output breaker. In the revised standard, it has added wording to clarify what the generator output breaker is, along with a statement confirming that it can be a low or high side breaker. c) The drafting team agrees with your suggestion on excluding radial lines and has modified the requirements in the revised draft standard to address this.		

Organization	Yes or No	Question 4 Comment
Bonneville Power Administration	Yes	The element number criteria for SOE/FR/DDR needs to be adjusted (in general higher number criteria to not be burdensome to implement.). Also some stations that meet the proposed criteria are not as important, some that don't meet the criteria are. How many stations are impacted by SOE?
Response: The SDT thanks you for your comment. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Florida Power & Light	Yes	Application of DMEs at the 200 kVand above is the correct voltage level to begin applying DMEs. However, substations with only three lines are approaching distribution size stations which would typically be served from larger stations that should be monitored. This would cause undue burdens on transmission owners. Although disturbances can begin at lower voltages they spread through the system at 200 kV and above. Moreover, any disturbance will always go back and be seen at the larger stations. Adequate data can be obtained at 200kV and above to determine system stability issues and frequency response.
Response: The SDT thanks you for your comment. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established a revised set of criteria for the location of DME that includes a short circuit MVA criteria. This is included in the revised draft standard.		
PG&E System Protection	Yes	The Threshold for the number of elements is too low.
Response: The SDT thanks you for your comment. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
NERC	Yes	As written, R1.1 would require SOERs only at stations that have 3 transmission lines AND transformers. I'm sure that was not the intent. For clarity, R1.1 should be reworded to read (consistent with Table 4.1): Contains any combination of five or more transmission lines elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above.?
Response: The SDT thanks you for your comment. The drafting team recognized that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.		
Grant County PUD	Yes	B.R1.1. I am unclear on this. The current language un-necessarily complicates things. I am concerned that the current wording could be interpreted to mean all locations with 3 T-Lines and any Xfmrs with any voltage greater

Organization	Yes or No	Question 4 Comment
		than 200kv.I would suggest that the wording from the left hand column of Table 4-1 be used here. Table 4-1: Wording in first paragraph in left column of table is inconsistent with B.R1.1 when describing elements to count. Also, third bullet in right column is inconsistent with Xfmr description in left column.
Response: The SDT thanks you for your comment. The drafting team recognizes that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.		
Tri-State Generation and Transmission Association	Yes	While we agree that using a minimum number of elements connected at some minimum voltage level is an appropriate method, we think that three elements may cause more substations to require the monitoring than is required to assure reliability.
Response: The SDT thanks you for your comment. To address concerns regarding location criteria and the number of elements, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Cowlitz County PUD	Yes	I believe the applicability thresholds as described in the proposed standard goes a long way in bringing a reasonable dividing line between responsible reliability monitoring versus over extension of applicability just to make sure all the bases are covered. Smaller entities who can not possibly impact the BES in any way (cascading failure) will be spared unnecessary compliance expense.
Response: Thank you for your positive comments.		
City of Tallahassee (TAL)	Yes	I agree with the approach. This approach makes it clear where it is needed, except as noted below.
Response: Thank you for your positive comments.		
Progress Energy Carolina, Inc.	Yes	These requirements will create consistancy in the required locations where the regions "opinions" are not different.
Response: Thank you for your positive comments.		
JEA	Yes	The choice of DFR data being derived from 200kV and above is a good selection from a continental standard perspective. The choice of 3 lines or greater provides for more coverage than is needed for DFRs. In some cases, 200kV 3 line substations will have very little impact on the overall bulk energy deleivery systems. In the cases where DDRs are located in close proximity to these 3 line 200 Kv stations, there should be allowances for

Organization	Yes or No	Question 4 Comment
		the fact that DDRs are covering the area and that DFRs may not be required from an additional data coverage standpoint.
Response: Thank you for your comments.		
Tucson Electric Power	Yes	Comment - For an interconnection point that is a transformer with the high and low side voltages exceeding 200kV and two different utilities owning the high and low side of the transformer, do both parties need to install monitoring equipment as described or does one utility take the responsibility for installing the monitoring equipment on either the high or low side winding?
Response: The SDT thanks you for your comment. The purpose of the standard is “To ensure that Facility owners collect the data needed to facilitate analyses of Disturbances on the Bulk Electric System (BES).” Therefore, the standard only establishes requirements for data collection and does not define how the data will be used or the extent of the analysis. The opinion of the drafting team is that if dual ownership exists, the two companies may work out an agreement to address the requirements.		
Utility System Efficiencies, Inc.	Yes	While it may be convenient to enforce, the location criteria proposed can be overly simplistic. Some locations are more important than others; the RRO is usually aware of them, and should be given discretion to set their monitoring requirements. Please note that the WECC places special emphasis upon the monitoring of major control systems, especially those for HVDC terminals and FACTS-like devices. Substation measurements on the ac side of these devices may not be sufficient to adequately determine their behavior.
Response: The SDT thanks you for your comment. The drafting team understands your comment; however, in order to avoid a fill-in-the-blank standard, a set of criteria is required. The original PRC-002 requires that the regional reliability organizations develop criteria for the location of DME, which was rejected by FERC. The standard will establish a baseline set of criteria and does not restrict the regions from having input into the location of DME.

Northeast Utilities		a) We agree that compliance must be measurable, and recognize also that it's possible for remote locations in a system to have a high concentration of generation spread across several busses. It would seem appropriate to require recorders in such areas. b) Also, in systems tightly networked at less than 200kV, it's possible for events to have significant impact on the EHV system, particularly under contingent conditions where EHV elements may

Organization	Yes or No	Question 4 Comment
		be out of service.
Response: The SDT thanks you for your comment. a) To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established a revised set of criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard. b) The team agrees with your comment; however, the team believes the revised standard will provide coverage for some buses at 100kV and above that could have a significant impact during events.		
Puget Sound Energy		
DTE Energy/Detroit Edison		
WECC		

5. In developing the Disturbance data requirements the SDT decided to focus on transmission voltage levels of 200 kV and above, generators 500 MVA and above, and generating stations 1500 MVA and above based on expected impact to the interconnected system. It is the team's strong belief that application of requirements below these values to include the entire BES will require significant additional resources, while adding little value.

The proposed standard requires the following:

The status of GSU circuit breakers for generating plants connected at 200 kV and above shall be monitored on each generator with a nameplate capacity of 500 MVA or higher or an aggregate plant total of 1500 MVA or higher.

5.1 Do you agree with these nameplate values? Please provide supporting documentation for these values. If not, please propose alternate values and their technical basis.

Summary Consideration: Many stakeholders questioned the generator nameplate criteria. Some thought 500MVA and 1500MVA were too high, and some thought them too low. Commenters stated that the GO and TO responsibilities were not clear. In addition, as in question 4, commenters questioned the technical basis for the number of elements for SOE and FR.

The drafting team formed a task-team to develop a technical justification for location criteria for SOE, FR, and DDR functionality. This task team developed a set of criteria based on short circuit MVA and generator nameplate rating based on data supplied by several utilities. The draft standard was rewritten to incorporate the criteria as part of the requirements. In rewriting the standard, the drafting team eliminated the tables and modified the wording of the requirements. The new draft requirements clarify TO and GO responsibility.

Organization	Yes or No	Question 5.1 Comment
Northeast Power Coordinating Council	No	a) Performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. b) Monitoring should not be limited to breaker positions--this will improve event analysis. c) We do not feel that the 200kV threshold is an appropriate criteria for assessing criticality.
Response: Thank you for your comments. a) The drafting team agrees that smaller generators could have a significant impact on the power system; however, the standard establishes baseline criteria to ensure data is available. The standard does not prevent a region from having or developing more stringent criteria. b) The drafting team discussed not limiting SOE to the breaker position and decided that the breaker position is sufficient SOE data for determining what		

Organization	Yes or No	Question 5.1 Comment
occurred during a wide area event. c) To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
US Bureau of Reclamation	No	These capacites (500MVA/unit and 1500MVA/plant) are too large. This will not help over-all post-disturbacne analysis. These values should be 20MVA/unit and 75MVA/plant.
Response: Thank you for your comments. The drafting team agrees that smaller generators could have a significant impact on the power system; however, the standard establishes baseline criteria to ensure data is available. The standard does not prevent a region from having or developing more stringent criteria.		
NERC	No	Disagree with 200 kv and above...should be 100 kv and above.
Response: Thank you for your comments. The drafting team has changed the threshold to 100kV.		
TransAlta	No	To use a specific number may not be appropriate way. Please see the comments in Q4 for justification
Response: Thank you for your comments. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
NYISO	No	We agree with these threshholds for some application of DME's, however for SOE requirements, we believe it should be reduced to 50MVA unit and 300MVA plant. Loss of generation affects the entire interconnection regardless of voltage level, and these levels are based on NPCC's current criteria. During a system wide event, many small generators may trip, and this generation adds up and is the reasoning behind monitoring smaller levels.
Response: Thank you for your comments. The drafting team agrees that smaller generators could have a significant impact on the power system; however, the standard establishes baseline criteria to ensure data is available. The standard does not prevent a region from having or developing more stringent criteria.		
NextEra Energy Resources (formerly FPL Energy)	No	In light of the same argument made above, it is recommended that the single generating unit level be changed to "750MVA or higher".
Response: Thank you for your comments. The drafting team does not agree with the recommendation. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft		

Organization	Yes or No	Question 5.1 Comment
standard.		
Exelon Generation LLC	No	Comments on PRC-002-2---Disturbance Monitoring and Reporting Requirements Draft 1, January 30, 2009 1. Requirements R2 and R3: Please clarify in this section that Generator Owner (GO) shall record the Sequence of Events data for changes in circuit breaker position only if GO owns the circuit breakers. If Transmission Owner (TO) owns the output circuit breaker, then recording the Sequence of Events data for the Generator output circuit breaker position, is the responsibility of the TO and not of GO.
Response: Thank you for your comments. The standard defines the elements that need to be monitored and identifies that the SOE shall be recorded. The GO is responsible for ensuring that the breaker SOE is captured but can accomplish this through agreement with the TO that is monitoring the breaker.		
DTE Energy/Detroit Edison	No	"Aggregate plant total of 1500 MVA or higher" implies that several small generators, or peaking units, would have to be individually monitored if the total is 1500 MVA or higher. Suggest that 500 MVA be used as minimum generator size to be monitored.
Response: Thank you for your comments. The drafting team does not agree with the recommendation. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Wisconsin Electric	No	We agree with these nameplate values for Sequence of Event data and Fault Recording data. However, the requirement for Dynamic Disturbance Recording data should have a higher threshold since it is a higher level monitoring equipment, looking at power swings instead of just fault data. We suggest that an aggregate nameplate rating of 2000 MVA is more reasonable. See #11 below.
Response: Thank you for your comments. The drafting team does not agree with the recommendation. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Hydro-Québec TransEnergie (HQT)	No	a) Performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. Monitoring should not be limited to breaker positions--this will improve event analysis. b) We do not feel that the 200kV threshold is an appropriate criteria for assessing criticality whether as a lower limit or a higher one; in some system, not all 200 kV facilities and above are critical. A performance based stability studies can be used to determine the appropriate system that should be monitored.

Organization	Yes or No	Question 5.1 Comment
Response: Thank you for your comments. a) The drafting team understands your comment; however, in order to avoid a fill-in-the-blank standard a set of criteria is required. The original PRC-002 requires that the regional reliability organizations develop criteria for the location of DME, which was rejected by FERC. The standard will establish baseline criteria and does not restrict the regions from having input into the location of DME. b) The drafting team understands that there are facilities at 200kV that are not critical and there are critical facilities at 100kV. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Northeast Utilities	No	See comments for question #4. Also, monitoring should not be limited to breaker positions; knowledge regarding what caused a generator to trip will improve event analysis.
Response: Thank you for your comments. The drafting team discussed not limiting SOE to the breaker position and decided that the breaker position is sufficient SOE data for determining what occurred during a wide area event.		
New York Independent System Operator	No	Loss of generation affects the system regardless of the voltage level the generator is connected. For Sequence of Events requirements, change units size to 50MVA, plant size to 300MVA, remove reference to connected at 200kV+ Change references to these levels for all Generator SOE requirements. See NERC 2003 Blackout Technical Report Recommendation TR-9
Response: Thank you for your comments. The drafting agrees that smaller generators could have a significant impact on the power system; however, the standard establishes baseline criteria to ensure data is available. The standard does not prevent a region from having or developing more stringent criteria.		
E.ON U.S.	No	E ON US recommends use of an aggregate nameplate value for generating plants of 2000 MVA or higher, as recommended in Standard EOP-004 Disturbance Reporting.
Response: Thank you for your comments. The drafting team does not agree with the recommendation. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Beckwith Electric Co	No	a) Recommend changing it to: "The status of GSU circuit breakers and sequence of events data of protective relay operations at the generating plants with a name plate capacity of 50 MVA or higher or an aggregate plant total of 300 MVA or higher. "This will help possible future blackout investigations and improve generator - transmission system protection coordination for plants of significant size. b) This requirement should be based on

Organization	Yes or No	Question 5.1 Comment
		the plant size and not the connected transmission voltage.
Response: Thank you for your comments. a) The drafting team discussed not limiting SOE to the breaker position and decided that the breaker position is sufficient SOE data for determining what occurred during a wide area event. b) The drafting team believes that the standard criteria for generation is based on plant size where connected to transmission systems at 200kV and above. The standard does not prevent a region from developing more stringent criteria.		
IRC Standards Review Committee	Yes	As in the response to #4, the SRC would suggest that consideration be given to Market Entities that aggregate resources. It may be useful to specifically recognize "physical aggregation" so as to exclude "electronic aggregation."
Response: Thank you for your comments. The SDT agrees that this standard is based on physical aggregation, not electronic aggregation. The criteria specify the number of elements at a location and are not market-based.		
SPP System Protection and Control Working Group	Yes	Recommend to include GSU circuit breakers for generating plants connected at critical substations below 200kV. Recent disturbances in the SPP area have shown the need to include GSU circuit breakers for generating plants connected at less than 200kV.
Response: Thank you for your comments. The focus of the standard is monitoring of the bulk electric system. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Members of the WECC Disturbance Monitoring Work Group	Yes	We agree with the nameplate values. However, we have two questions. a) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV Is this standard applicable to this plant?
Response: Thank you for your comments. a) The GO would be responsible for working with the TO or other GO owner to ensure that the required elements are monitored. b) The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		

Organization	Yes or No	Question 5.1 Comment
SERC Engineering Committee Planning Standards Subcommittee	Yes	These values seem to be in the appropriate range.
Response: Thank you for your positive comment.		
Bonneville Power Administration	Yes	For generating stations with split interconnection voltages (some units connected below 200 kV), define how to interpret.
Response: Thank you for your comments. The standard applies to generation connected to the Bulk Electric System.		
FirstEnergy	Yes	Our "yes" response is based on the fact that we have no strong technical reason to deviate from the values proposed by the SDT. In review of our own FirstEnergy footprint, the proposed values seem to capture the generation facilities that would most likely have a BES reliability impact. However, we would like to better understand the technical rationale used by the SDT in choosing these values.
Response: Thank you for your comments. The drafting team agrees that a technical basis for the criteria is needed. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Los Angeles Department of Water & Power	Yes	These values appear reasonable and affect several of our generating stations.
Response: Thank you for the positive comment.		
MRO NERC Standards Review Subcommittee	Yes	While the MRO NSRS does not disagree with the levels mentioned above, what is the technical basis for selecting those levels?
Response: Thank you for your comments. The drafting team agrees that a technical basis for the criteria is needed. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
PG&E System Protection	Yes	We agree with the nameplate values. However, we have two questions. a) R2 and table 2.1. requires the GO to

Organization	Yes or No	Question 5.1 Comment
		record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV Is this standard applicable to this plant?
Response: Thank you for your comments. a) The GO would be responsible for working with the TO or other GO owner to ensure that the required elements are monitored. b) The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
Cowlitz County PUD	Yes	For the WECC area, if we can't withstand a 1500 MVA loss without a cascading failure, then the system is operating too close to the line. I think the burden of proof should be on those who would argue for more stringent nameplate values.
Response: Thank you for your comments.		
Portland General Electric	Yes	The following are the comments of the DMWG which we are filing in support: We agree with the nameplate values. However, we have two questions. a) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. a) The GO would be responsible for working with the TO or other GO owner to ensure that the required elements are monitored. b) The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
Puget Sound Energy	Yes	We agree with the nameplate values. However, we have two questions. a) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments.		

Organization	Yes or No	Question 5.1 Comment
a) The GO would be responsible for working with the TO or other GO owner to ensure that the required elements are monitored. b) The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
American Electric Power	Yes	To provide better clarity of the requirement, it should be worded: The status of GSU circuit breakers for generating plants connected at 200 kV and above shall be monitored on each generator with a nameplate capacity of 500 MVA or higher, OR an aggregate plant total of 1500 MVA or higher AND CONNECTED AT 200kV AND ABOVE. AEP agrees with these nameplate values. If criteria goes to 100 kv, then a much longer implementation period will be needed for the enormous amount of work that may be required. For AEP, 100 kv equipment is not for transport of bulk power and is generally considered a distribution system. Since the goal of NERC is to have a more reliable system, the outages will invariably weaken the system for a period of time while companies are installing required equipment does not support this goal. For stressed systems, outages may be difficult to even get, especially those areas west of the Mississippi that have weak systems to begin with. Enhanced analysis data does nothing to directly improve the reliability of the system, but provides data for analyzing events after they have already happened. Granted, it may uncover misoperations that can be mitigated so that they do not happen again, but there is already a standard for that.
Response: Thank you for your comments. The standard has been reworded significantly since the prior posting.		
City of Tallahassee (TAL)	Yes	However, some confusion may be encountered when determining if it is a "plant" or "site" aggregate. Some utilities may not use the same nomenclature for each item. Two 900MW plants (or units) at one site should be captured, even though they are not a plant aggregate of 1500MVA.
Response: Thank you for your comments. If each plant has a single generator at 500 MVA or above, then each is required to be monitored. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
NV Energy (fka Sierra Pacific Resources)	Yes	These MVA and voltage levels appear to be appropriate for the intent of this Standard.
Response: Thank you for the positive comment.		
Arizona Public Service Co.	Yes	a) There needs to be some consideration for generator owners who don't own/operate the switchyard that the generator circuit breaker is in as they may not have ready access to the breaker status for high speed recording and they may be beholden to the switchyard owner to get access. b) Also, a power plant with an aggregate of 1500 MVA or higher might only have a small portion of the generation connected at 200 kV and above. Those

Organization	Yes or No	Question 5.1 Comment
		portions not connected to the 200 kV and above system should not be required to meet the standard.
Response: Thank you for your comments. a) The standard defines the elements that need to be monitored and identifies that the SOE shall be recorded. The GO is responsible for ensuring that the breaker SOE is captured, but can accomplish this through agreement with the TO that is monitoring the breaker. b) The standard applies to generation connected to the BES.		
Tucson Electric Power	Yes	We agree with the nameplate values. However, we have two questions. a) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. a) The GO would be responsible for working with the TO or other GO to ensure that the required elements are monitored. b) The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
Utility System Efficiencies, Inc.	Yes	I agree with the nameplate values. However, I have two questions. a) R2 and table 2.1. requires the GO to record or have a process in place to derive the Sequence of Events data for changes in circuit breaker position for its equipment. What if the GO does not own the circuit breakers for their Generators? b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. a) The GO would be responsible for working with the TOor other GO to ensure that the required elements are monitored. b) The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.

5.2 In part, Requirement R5 states that Fault Recording data shall be recorded at generating plants connected at 200 kV and above when a generator has a nameplate capacity of 500 MVA or higher or when there is an aggregate plant total of 1500 MVA or higher. Do you agree with these values? Please provide supporting documentation for these values. If not, please propose alternate values and their technical basis.

Summary Consideration: Commenters questioned the applicability of the standard to generators and the generator nameplate ratings in the criteria. They also questioned the technical justification for the criteria and recommended that bus voltage be monitored.

The standard does apply to generators connected to the BES system. The drafting team believes that monitoring the contributions from generators during a fault or wide area event will aid in the analysis of these events. The drafting team formed a task-team to develop a technical justification for location criteria for SOE, FR, and DDR functionality. This task team developed criteria based on short circuit MVA and generator nameplate rating based on data that was supplied by several utilities. The draft standard has been rewritten to incorporate the criteria as part of the requirements. The drafting team agrees that bus voltage should be monitored where applicable.

Organization	Yes or No	Question 5.2 Comment
US Bureau of Reclamation	No	These capacites (500MVA/unit and 1500MVA/plant) are too large. This will not help over-all post-disturbacne analysis. These values should be 20MVA/unit and 75MVA/plant.
Response: Thank you for your comments. Due to a lack of consensus from industry on generator size requirements for monitoring, the drafting team performed a study using data collected for the MVA study to determine what we think are appropriate generator nameplate ratings for monitoring. The data showed that appropriate criteria: 1- for SOE is the individual generators with a nameplate rating of 20 MVA or above or for an aggregate nameplate rating of 75 MVA or above connected to the facilities for FR is generators with a nameplate rating of 500 MVA or above, or for an aggregate nameplate rating of 500 MVA or above with a common point of electrical interconnection connected to the facilities contains DDR criteria for Generator Owners but does not include an MVA threshold.		
NERC	No	Disagree with 200 kv and above...should be 100 kv and above. It is important for forensic analysis to have both bus and line quantities for DFR quantities. Bullets 2 and 3 should read: On breaker-and-a-half arrangements, the outer bus voltages, and the individual line voltages.On straight buses, common bus voltages and the individual line voltages.
Response: Thank you for your comments. The drafting team does not agree that bus voltage is always required to perform a forensic analysis. For a breaker-and-a- half where each line has individual CCVTs for protection, bus CCVTs are typically not installed. For events, voltages from the lines can be used for any forensic analysis.		

Organization	Yes or No	Question 5.2 Comment
TransAlta	No	To use a specific number may not be appropriate way. Please see the comments in Q4 for justification
Response: Thank you for your comments. The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
NextEra Energy Resources (formerly FPL Energy)	No	In light of the same argument made above, it is recommended that the single generating unit level be changed to "750MVA or higher".
Response: Thank you for your comments. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This included in the revised draft standard.		
DTE Energy/Detroit Edison	No	Please see comment for 5.1.
Response: Thank you for your comments. Please refer to our response for 5.1.		
Hydro-Québec TransEnergie (HQT)	No	See Q5.1 answer above.
Response: Thank you for your comments. Please refer to our response for 5.1.		
E.ON U.S.	No	E ON US recommends use of an aggregate nameplate value for generating plants of 2000 MVA or higher, as recommended in Standard EOP-004 Disturbance Reporting.
Response: Thank you for your comments. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Arizona Public Service Co.	No	This should only be required for new plants that meet the criteria defined. Existing plants should be grandfathered. The other issues mentioned in Question 5.1 comments should also be considered and they are copied here: There needs to be some consideration for generator owners who don't own/operate the switchyard that the generator circuit breaker is in as they may not have ready access to the breaker status for high speed recording and they may be beholden to the switchyard owner to get access. Also, a power plant with an aggregate of 1500 MVA or higher might only have a small portion of the generation connected at 200 kV and above. Those portions not connected to the

Organization	Yes or No	Question 5.2 Comment
		200 kV and above system should not be required to meet the standard.
Response: Thank you for your comments. A requirement that applies to only new plants and grandfathers existing plants is not practical. Such a requirement could result in insufficient data for analysis during a wide-area event. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard The standard defines the elements that need to be monitored and identifies that the SOE shall be recorded. The GO is responsible for ensuring that the breaker SOE is captured, but can accomplish this through agreement with the TO that monitors the breaker. The standard applies to generation connected to the BES.		
Beckwith Electric Co	No	Recommend changing to: "Fault Recording data shall be recorded at generating plants when a generator has a nameplate capacity of 50 MVA or higher or when there is an aggregate plant total of 300 MVA or higher. "This will help possible future blackout investigations and improve generator - transmission system protection coordination for plants of significant size. This requirement should be based on the plant size and not the connected transmission voltage.
Response: Thank you for your comments. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard The drafting team believes that the standard criteria for generation is based on plant size where connected to transmission systems at 200kV and above		
Tucson Electric Power	Yes	What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
Utility System Efficiencies, Inc.	Yes	What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. . The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
IRC Standards Review Committee	Yes	As in the response to #4, the SRC would suggest that consideration be given to Market Entities that aggregate resources. It may be useful to specifically recognize "physical aggregation" so as to exclude "electronic aggregation."

Organization	Yes or No	Question 5.2 Comment
Response: Thank you for your comments. The SDT agrees that this standard is based on physical aggregation, not electronic aggregation. The criteria specify the number of elements at a location and are not market-based.		
Members of the WECC Disturbance Monitoring Work Group	Yes	What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES..		
Southern Company - Transmission	Yes	No further comment.
Response: Thank you for your comments.		
SERC Engineering Committee Planning Standards Subcommittee	Yes	These values seem to be in the appropriate range.
Response: Thank you for your positive comments.		
Bonneville Power Administration	Yes	For generating stations with split interconnection voltages (some units connected below 200 kV), define how to interpret.
Response: Thank you for your comments. . The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES. The standard applies to generation connected to the Bulk Electric System.		
FirstEnergy	Yes	Our "yes" response is based on the fact that we have no strong technical reason to deviate from the values proposed by the SDT. In review of our own FirstEnergy footprint, the proposed values seem to capture the generation facilities that would most likely have a BES reliability impact. However, we would like to better understand the technical rationale used by the SDT in choosing these values.
Response: Thank you for your comments. To address concerns regarding location criteria and the number of elements specified, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the		

Organization	Yes or No	Question 5.2 Comment
location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Los Angeles Department of Water & Power	Yes	These values appear reasonable and affect several of our generating stations.
Response: Thank you for your positive comments.		
MRO NERC Standards Review Subcommittee	Yes	Why do the TOP with Frequency Recorders need to record Voltage line to neutral (R4 or R5.4) but the GO can read Voltage line neutral or Voltage line to line. (R5)?
Response: Thank you for your comments. The requirement is based on the typical connections found at TO facilities and GO facilities.		
PG&E System Protection	Yes	What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. . The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES..		
Cowlitz County PUD	Yes	Again, I feel the burden of proof should be on those who would argue for more stringent criteria.
Response: Thank you for your comments.		
Portland General Electric	Yes	The following are the comments of the DMWG which we are filing in support: What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. . The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES.		
Puget Sound Energy	Yes	What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. . The first test would be to determine if a single generator meets the criteria; if not, the standard applies to generation connected to the BES..		

Organization	Yes or No	Question 5.2 Comment
American Electric Power	Yes	AEP agrees with these values. If criteria goes to 100 kv, then a much longer implementation period will be needed for the enormous amount of work that may be required. For AEP, 100 kv equipment is not for transport of bulk power and is generally considered a distribution system. Since the goal of NERC is to have a more reliable system, the outages that will invariably weaken the system for a period of time while companies are installing required equipment does not support this goal. For stressed systems, outages may be difficult to even get, especially those areas west of the Mississippi that have weak systems to begin with. Enhanced analysis data does nothing to directly improve the reliability of the system, but provides data for analyzing events after they have already happened. Granted, it may uncover misoperations that can be mitigated so that they do not happen again, but there is already a standard for that.
Response: Thank you for your comments.		
City of Tallahassee (TAL)	Yes	This looks like the same as question 5.1. Are you asking if I agree with the 200kV threshold? If so, I agree, but I do not see the need to record the low side breakers per Table 2-1.
Response: Thank you for your comments. The format of the standard has been changed significantly since the prior posting.		
NV Energy (fka Sierra Pacific Resources)	Yes	These MVA and voltage levels appear to be appropriate for the intent of this Standard.
Response: Thank you for your positive comments.

CenterPoint Energy		

5.3 Requirement R7 states that DDR data shall be recorded or derivable for all substations having a total of seven or more transmission lines connected at 200 kV or above. Do you agree with these values? Please provide supporting documentation for these values. If not, please propose alternate values and their technical basis.

Summary Consideration: Comments stated that the substations with seven lines as a location criterion for DDR functionality was arbitrary and commenters asked about the technical justification for the criteria. Some suggested that DDRs be located by study rather than by the number of lines. Commenters stated that in general, fewer DDRs are required than FRs. In addition, commenters stated that radial lines should be excluded from the criteria.

The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations. The number of circuits and the word substation was removed from the requirement.

Organization	Yes or No	Question 5.3 Comment
Southern Company - Transmission	No	Southern Company disagrees with the use of arbitrary "checklist" values for placement of DDR equipment. As we commented in our response to Questions #1 and #4, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid in accordance with a NERC defined methodology.
Response: Thank you for your comments. The drafting team acknowledges your concern, but in order to avoid a fill-in-the-blank standard, a set of criteria is required. The original PRC-002 requires that the regional reliability organizations develop criteria for the location of DME, and that was rejected by FERC. The standard will establish baseline criteria and does not restrict the regions from having input into the location of DME. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
SERC Protection and Controls Sub-committee	No	Seven lines seems to be an arbitrary number (would not cover potentially needed locations and would require installations at locations not critical to the system). We suggest wording similar to that used in the SERC DME supplement. The required siting of DDR should be coordinated through the efforts of the appropriate reliability assessment groups that may be involved in accordance with the guidance provided in PRC-002- 2. These locations are selected to provide extended time power system monitoring capability in order to assist analyses wide area disturbances. These locations are chosen to provide coverage across the BES EHV network. The locations selected should include the following considerations: Major load centers Major generation clusters Major voltage sensitive area Major transmission interfaces Major transmission junctions Elements associated with Interconnection Reliability Operating Limits Major EHV interconnections between control areas

Organization	Yes or No	Question 5.3 Comment
Response: Thank you for your comments. The drafting team acknowledges your concern, but in order to avoid a fill-in-the-blank standard, a set of criteria is required. The original PRC-002 requires that the regional reliability organizations develop criteria for the location of DME, and that was rejected by FERC. The standard will establish baseline criteria and does not restrict the regions from having input into the location of DME. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Dominion	No	Radial lines without transmission connected generation should not be included in the element count. Radial line feeding only load doesn't provide significant contribution to grid disturbances. Also we suggest rewarding R7 to: Each Substation having a total of seven or more transmission lines (not including radial Lines) connected at 200 kV or above, the Transmission Owner shall record (or have a process in place to derive) the following DDR data unless a Transmission Owner has Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4 recorded no further than two Substations away.
Response: Thank you for your comments. The drafting team agrees with your suggestion on excluding radial lines and has modified the requirements in the revised draft standard to address this. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Los Angeles Department of Water & Power	No	As stated earlier, LADWP distributes power around our service area at 230-kV. As a result, several of our transmission lines and substations fall within these proposed regulations yet have little influence on interties with other utilities. Additional language to exclude "internal transmission" resources from these regulations should be considered.
Response: Thank you for your comments. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
NERC	No	For consistency in description, the DDR requirement in R7 should mirror the station description in R1.1: “then for each Substation having any combination of seven or more transmission elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above a, the Transmission Owner shall record..."
Response: Thank you for your recommendation. The drafting team realizes the wording in the standard is not clear and has changed it for clarity.		
TransAlta	No	To use a specific number may not be appropriate way. Please see the comments in Q4 for justification
Response: Thank you for your comments. Please see our response to your Q4 comment.		

Organization	Yes or No	Question 5.3 Comment
Grant County PUD	No	R7 is very difficult to read. A reword similar to is suggested: When a Transmission owner DOES NOT have Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4, recorded no further than 2 Substations away, then.....
Response: Thank you for your comments. The drafting team realizes the wording in the standard is not clear and has changed it for clarity.		
Independent Electricity System Operator	No	In some areas of the interconnected network, there are substations that have fewer than 7 lines (typically 4 to 6 lines) connected to them. These areas might be sparsely populated but through them, transmission facilities are installed to facilitate transfer of remote resource to the load centres while supplying local area loads. Not having fault/disturbance recorders installed at these substations may create a void in the necessary data for event analysis. We suggest the SDT consider lowering the number to 4.
Response: Thank you for the recommendation. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Progress Energy Carolina, Inc.	No	Seven lines seems to be an arbitrary number (would not cover potentially needed locations and would require installations at locations not critical to the system). We suggest wording similar to that used in the SERC DME supplement. The required siting of DDR should be coordinated through the efforts of the appropriate reliability assessment groups that may be involved in accordance with the guidance provided in PRC-002- 2. These locations are selected to provide extended time power system monitoring capability in order to assist analyses wide area disturbances. These locations are chosen to provide coverage across the BES EHV network. The locations selected should include the following considerations: Major load centers Major generation clusters Major voltage sensitive areas Major transmission interfaces Major transmission junctions Elements associated with Interconnection Reliability Operating Limits Major EHV interconnections between control areas
Response: Thank you for your comments. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Hydro-Québec TransEnergie (HQT)	No	See Q5.1 answer above.
Response: Thank you for your comments. Please refer to the response in Q5.1 above.		
Entergy Services, Inc	No	The number of lines criteria is too arbitrary and will require an excessive number of installations at some entities and

Organization	Yes or No	Question 5.3 Comment
		perhaps none at others. A better criteria is one that aligns with Regional needs and distributes these type of installations more evenly throughout the Region. Have the Regional Planning groups review and address where DDRs would be most effective and actually needed.
Response: Thank you for your comments. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Arizona Public Service Co.	No	While the general premise might be acceptable, the Requirement R7 requires the DDR to monitor one phase current from every line operated 200 kV and above. This might not be possible or may be extremely difficult for some cases especially where the substation is jointly own/operated, is extremely large, or is quite old. The requirement should state a percentage of lines that must be monitored (say 50%).
Response: Thank you for your comments. The standard drafting team recognizes that it may be difficult to implement the criteria for the reasons stated. However, the drafting team believes the original criteria established are a good baseline to ensure that data is available for disturbance analysis.		
Duke Energy	No	Seven lines seems to be an arbitrary number (would not cover potentially needed locations and would require installations at locations not critical to the system). We suggest wording similar to that used in the SERC DME supplement. The required siting of DDR should be coordinated through the efforts of the appropriate reliability assessment groups that may be involved in accordance with the guidance provided in PRC-002-2. These locations are selected to provide extended time power system monitoring capability in order to assist analyses of wide area disturbances. These locations are chosen to provide coverage across the BES EHV network. The locations selected should include the following considerations: Major load centers Major generation clusters? Major voltage sensitive areas Major transmission interfaces Major transmission junctions Elements associated with Interconnection Reliability Operating Limits Major EHV interconnections between control areas
Response: Thank you for your comments. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
CenterPoint Energy	No	CenterPoint Energy disagrees that criteria for Dynamic Disturbance Recording (DDR) should be solely based upon the number of connected lines at a substation. In addition to the number of lines, CenterPoint Energy recommends that DDR equipment be required only in substations that have direct interconnections to generating units.
Response: Thank you for your comments. The drafting team disagrees with your recommendation to install DDR only at substations that have direct interconnections to generating units. DDR is typically installed at the points of a transmission system where a disconnect of load or generation would have a significant impact on system stability. This location may be far removed from where generation is directly connected to the transmission system. . The SDT		

Organization	Yes or No	Question 5.3 Comment
revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
IRC Standards Review Committee	Yes	The SRC agrees with the SDT decision to specify a common limit and recognize that special cases not covered by the common limit will be addressed by regional standards.
Response: Thank you for your positive comment.		
JEA	Yes	There is good correlation from multiple regions in support of the 200kV level and above for the busses that are considered the "most impactful" when considering major disturbances within a region. Busses that have a 10,000 MVA and above three phase short circuit capacity are significantly represented by 200kV and above criteria. When reviewing regional data for the 10,000 MVA and above three phase short circuit capacity, over 90% of those busses that are connected to generation, meet the 500/1500 MVA selected levels for generation, in support of the team's choice of these levels.
Response: Thank you for your comments.		
SERC Engineering Committee Planning Standards Subcommittee	Yes	These values seem to be in the appropriate range.
Response: Thank you for your comments.		
Bonneville Power Administration	Yes	With coverage by FR and SOE, BPA does not think that DDR's are necessarily required at the same location. Their purpose is for overview devices and not as many may be required.
Response: Thank you for your comments. The drafting team agrees that fewer DDRs are required than SOE and FR.		
Florida Power & Light	Yes	We generally agree with this, however, it needs some defining.
Response: Thank you for your comments.		
Cowlitz County PUD	Yes	Again, I feel the burden of proof should be on those who would argue for more stringent criteria.

Organization	Yes or No	Question 5.3 Comment
Response: Thank you for your comments.		
American Electric Power	Yes	AEP agrees with these values. If criteria goes to 100 kv, then a much longer implementation period will be needed for the enormous amount of work that may be required. For AEP, 100 kv equipment is not for transport of bulk power and is generally considered a distribution system. Since the goal of NERC is to have a more reliable system, the outages that will invariably weaken the system for a period of time while companies are installing required equipment does not support this goal. For stressed systems, outages may be difficult to even get, especially those areas west of the Mississippi that have weak systems to begin with. Enhanced analysis data does nothing to directly improve the reliability of the system, but provides data for analyzing events after they have already happened. Granted, it may uncover misoperations that can be mitigated so that they do not happen again, but there is already a standard for that.

Requirements related to Sequence of Events

6. **Requirement R3 states that Transmission Owners and Generator Owners shall record the time stamp or have a process in place to derive the time stamp to within four milliseconds of input received for the change in circuit breaker position (open/close) Do you agree with this value? If no, propose an alternate value and please provide technical basis.**

Summary Consideration: Commenters suggested that R3 be separated into two requirements, one for TOs and one for GOs. They questioned the technical justification for the 4millesecond requirement, and found 4milleseconds in requirement R3 confusing when compared to the +/- 2milleseconds requirement in R12. Commenters also asked for clarification regarding TO and GO responsibility in relation to statements with the clause “process to derive.”

The drafting team discussed requirements R3 and R12 and determined that only one time stamping requirement was needed. Therefore, R3 was removed from the standard. R12 is now R1 and applies to both TOs and GOs. The drafting team does not believe that a separate time stamping requirement for TOs and GOs is needed. The drafting team also discussed the clause “a process to derive” at length, agreed that it was not clear, and changed the requirements appropriately. Rather than having a process in place to derive, the drafting team chose to require monitoring of electrical quantities in order to determine three-phase voltage and current of monitored elements. The drafting team believes that this clarifies the intent of the standard.

Organization	Yes or No	Question 6 Comment
SPP System Protection and Control Working Group	No	Please clarify and give examples of the "four milliseconds of input received" and "have a process in place to derive". What is the basis for choosing "four milliseconds" over "quarter cycle"? Please ensure that using relays for this requirement is sufficient.
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard.		
Bonneville Power Administration	No	BPA believes 2-4 second SCADA/EMS records are good enough for most events.
Response: Thank you for your comments. The drafting team agrees that the 2-4 second SCADA/EMS records are generally good for most events, but as identified in the 2003 blackout report, it has been difficult to align the many events due to inconsistent time stamping. In the “August 14, 2003 Blackout: NERC Actions to Prevent and Mitigate the Impacts of Future Cascading Blackouts” report of February 10, 2004, Recommendation 12 states, “All digital fault recorders, digital event recorders, and power system disturbance recorders should be time stamped at the point of observation with a precise Global Positioning Satellite (GPS).” The point of observation is typically at the substation; therefore, it is recommended that the time synchronization be applied at the substation. The +/- 2		

Organization	Yes or No	Question 6 Comment
millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.		
FirstEnergy	No	To allow for some flexibility and consistent with other requirements, we recommend replacing 4 ms with 1/4 cycle.
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard.		
Tri-State Generation and Transmission Association	No	This wording seems very confusing. Does it intend to require that the time stamp will be recorded to indicate the time of the change in state of the breaker with an accuracy of +/- 4 milliseconds 2 millisecond resolution is required in R12. Is this inconsistent with that Requirement?
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing It has been removed from the revised standard. The +/- 2 millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.		
Independent Electricity System Operator	No	The disturbance monitoring function to which this time stamp refers is not obvious. From the flow of the requirements it appears to relate to sequence of events recording. If the requirement is indeed for the sequence of event recorder to mark a change in the status within 4 milliseconds of receiving an input of a change in the circuit breaker position, then the requirement should clearly state it is for the SOE recorder as otherwise, it will serve no purpose if the requirement is interpreted as applicable for a fault recording device. Further, please elaborate on the basis for the 4 ms.
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard.		
Exelon Generation LLC	No	Comments on PRC-002-2---Disturbance Monitoring and Reporting Requirements Draft 1, January 30, 2009 1. Requirements R2 and R3: Please clarify in this section that Generator Owner (GO) shall record the Sequence of Events data for changes in circuit breaker position only if GO owns the circuit breakers. If Transmission Owner (TO) owns the output circuit breaker, then recording the Sequence of Events data for the Generator output circuit breaker position, is the responsibility of the TO and not of GO.
Response: Thank you for your comments. The requirements identify the responsible entities required to have the data. It is up to that responsible entity to determine how the data is generated.		
PHI (PEPCO Holdings Inc.)	No	The time should be listed as 1/4 cycle, since many relays specs indiacte 1/4 cycle for this requirement.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard.		
Kansas City Power & Light	No	Many protective relays sample inputs every quarter cycle, equivalent to 4.2 msec. Is the 4 msec requirement above intended to disqualify relays from being used as recording devices for breaker position? What is meant by a process in place to derive time stamp? Can examples be provided?
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard.		
IRC Standards Review Committee	Yes	The SRC would suggest that Requirement 3 be separated into two independent requirements - one for TOs and one for GOs. Although the intent is to combine the two parallel requirements, it is possible for a compliance person to interpret the "AND" as an "inclusive AND" and require the TO (or GO) to have data for both R1 and R2 criteria.
Response: Thank you for your comments. The SDT agrees, and the revised standard has separate requirements for TOs and GOs where applicable.		
Southern Company - Transmission	Yes	Southern Company suggests the Drafting Team use their "reponses to comments" period to enlighten industry as to how a 4msec value was chosen for Requirement #4 and how a +/- 2msec value was chosen for Requirement #12.
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard. The +/- 2 millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.		
SERC Protection and Controls Sub-committee	Yes	Suggest in R3, for consistency, use similar terminology to R12 (where reference is +/- 2 ms).
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard. The +/- 2 millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.		
Florida Power & Light	Yes	However, please view our comments for question 17.
Response: Thank you. Please see response to question 17.		
Arizona Public Service Co.	Yes	This is not consistent with requirement R12 which states +/- 2 ms since within 4 ms means +/- 4.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard. The +/- 2 millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.		
JEA	Yes	Local GPS satellite clocks are needed to properly time tag events and provide for correct data for analysis purposes. It should be noted that breaker mechanical contacts, "a" "b" "aa" and "bb", can be significantly outside of the range of 4 milliseconds in tolerance for certain types of breakers. A method to accommodate values outside the 4 millisecond range may need to be accomodated.
Response: Thank you for the comments. The standards requires timestamp of the mechanical contact locally but what type of contact is not defined.		
Alberta Electric System Operator	Yes	The AESO supports the IRC SRC comments to this question.
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard.		
Duke Energy	Yes	Suggest in R3, for consistency, use similar terminology to R 12 (where reference is +/- 2 ms).
Response: Thank you for your comments. Based on industry comments, the drafting team recognized that this requirement was confusing. It has been removed from the revised standard. The +/- 2 millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.

Requirements related to Sequence of Events

7. Do you agree with the other Sequence of Events requirements under R1 through R3 of the proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

Summary Consideration: The majority of commenters did not agree with SOE requirements under R1 through R3. Comments suggested increasing the number of lines criterion to a quantity of five or greater. Also, commenters suggested that the generator nameplate size requirements be lowered to 50 MVA unit or 300 MVA plant. Additionally, commenters stated that the location criteria seemed arbitrary and suggested that it be derived from stability studies of the electric grid with a NERC-defined methodology.

In response to these and other comments, the drafting team undertook a significant rewriting of the draft standard. The requirement language was changed for clarity and the tables were eliminated. To determine location criteria, a task team was formed to develop a technical basis for the requirements. Based on data received,the task team developed location criteria for SOE and FR data to be 25% of bus locations with the highest calculated short circuit MVA level.

Organization	Yes or No	Question 7 Comment
Northeast Power Coordinating Council	No	Sequence of Events requirements should include monitoring of transmission and generator circuit breaker positions, protective relay tripping for all protection groups, and teleprotection keying and receiving.
Response: Thank you for your comments. The SDT believes that to establish SOE circuit breaker position is adequate; however, any additional information, such as protective relay tripping, could provide further insight in the event analysis.		
IRC Standards Review Committee	No	The SRC agrees with the main requirement R1.However, the SRC does not agree with making R1.1 and R1.2 independent requirements. These two inclusions are explanatory text not specific ad hoc requirements. Note that in R2 the explanatory text is included in a Table not as independent requirements.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Members of the WECC Disturbance Monitoring Work Group	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirement be for substations with five or more lines operated at

Organization	Yes or No	Question 7 Comment
		200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Southern Company - Transmission	No	Southern Company disagrees with the use of arbitrary "checklist" values. As we commented in our response to Questions #1, #4 and #5.3, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid in accordance with a NERC defined methodology.
Response: Thank you for your comments. Please see our response for questions 1, 4, and 5.3. The SDT understands your concern related to the location of disturbance monitoring equipment and it is shared by others. In order to develop a continent-wide standard, it is necessary to develop criteria that are measurable. The team's opinion is that if location of DME is done by stability study alone, it will not be measurable. The team evaluated developing a location criteria using three-phase chort circuit MVA criteria based on data collected from select utilities in different regions to determine monitoring requirements. The revised draft of the standard is based on these criteria.		
SERC Protection and Controls Sub-committee	No	Reference comments on #4 above. Suggest in R3, for consistency, use similar terminology to R12 (where reference is +/- 2 ms).
Response: Thank you for your comments. Please see the response in #4. The +/- 2 millisecond is in reference to time stamping. The 4 millisecond requirement relates to ability of the recording equipment to recognize a change to an input status.		
PacifiCorp	No	Three or more lines connected to a substation does not clearly indicate impact or significance to the bulk electric system. Also see comment 4. above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard. Also see the response to 4 above.		
Bonneville Power Administration	No	With relay based SOE/FR capability plus standalone, BPA believes 2-4 second SCADA/EMS records are good enough for most events. The number of element criteria may be too stringent, change to 5 elements.
Response: Thank you for your comments. The drafting team agrees that the 2-4 second SCADA/EMS records are generally good for most events, however, as identified in the 2003 blackout report, it was difficult to align the many events due to inconsistent time stamping. In the "August 14, 2003 Blackout: NERC Actions to		

Organization	Yes or No	Question 7 Comment
Prevent and Mitigate the Impacts of Future Cascading Blackouts" report of February 10, 2004, Recommendation 12 states; "All digital fault recorders, digital event recorders, and power system disturbance recorders should be time stamped at the point of observation with a precise Global Positioning Satellite (GPS)." The point of observation is typically at the substation; therefore, it is recommended that the time synchronization be applied at the substation. The +/- 2 millisecond requirement is a time source requirement and is already FERC-approved in PRC-018-1 Requirement R1.1.		
PG&E System Protection	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirement be for substations with five or more lines operated at 200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
NERC	No	R1.1As written, R1.1 would require SOERs only at stations that have 3 transmission lines AND transformers. I'm sure that was not the intent. For clarity, R1.1 should be reworded to read (consistent with Table 4.1):Contains any combination of five or more transmission lines elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above. Note the change from 3 elements to 5 elements...3 elements would require a significant number of new installations.
Response: Thank you for your comments. The drafting team agrees that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
NYISO	No	For SOE requirements, we believe it should be reduced to 50MVA unit and 300MVA plant. Loss of generation affects the entire interconnection regardless of voltage level, and these levels are based on NPCC's current criteria. During a system wide event, many small generators may trip, and this generation adds up and is the reasoning behind monitoring smaller levels. Just monitoring breaker position isn't enough. The SOE should monitor CB position, protective relaying tripping of all protection groups, and teleprotection keying and receive. The 3rd and 4th row in the table puts the responsibility to monitor the transmission substation on the generation owner. This should be changed such that the station owner is required to monitor SOE at the substation. For monitoring the transmission substation SOE, we believe the 500MVA unit / 1500MVA plant, 200kV+ interconnection threshold is adequate.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comments. The team believes that establishing SOE circuit breaker position is adequate; however, any additional information, such as protective relay tripping, could provide further insight in the event analysis. The generation size requirements have been changed.		
Portland General Electric	No	The following are the comments filed by the DMWG which we are filing in support: The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirement be for substations with five or more lines operated at 200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Progress Energy Florida	No	Table 2-1 indicates "Including low side breakers" for plant SER data inputs. If an aggregate generation site of 1500MVA is monitored at the >200kV level where the generation enters the transmission network, the system impact of any occurrence will be seen at the monitoring point. PEF disagrees with the low side breakers position being included to be monitored by the DFR/SER. Monitoring of these breakers are included within the functional boundaries of the smaller generating units and the breaker voltages are less than 50KV and not part of the transmission grid. Extending this requirement will be costly since the DFR will be located at the transmission network location remote to the multiple generators and low side breakers. The requirement should only include the >200kV circuit breaker SER data.
Response: Thank you for your comments. Since the tripping of a low voltage generator circuit breaker will have the same effect as tripping the circuit breaker that connects the GSU to the grid, the SDT believes it is reasonable to require monitoring on the low voltage circuit breaker.		
Puget Sound Energy	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirement be for substations with five or more lines operated at 200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		

Organization	Yes or No	Question 7 Comment
Exelon Generation LLC	No	Comments on PRC-002-2---Disturbance Monitoring and Reporting Requirements Draft 1, January 30, 2009 1. Requirements R2 and R3: Please clarify in this section that Generator Owner (GO) shall record the Sequence of Events data for changes in circuit breaker position only if GO owns the circuit breakers. If Transmission Owner (TO) owns the output circuit breaker, then recording the Sequence of Events data for the Generator output circuit breaker position, is the responsibility of the TO and not of GO.
Response: Thank you for your comments. The SDT agrees and has revised the standard to clarify that recording is the responsibility of the entity that owns the equipment.		
DTE Energy/Detroit Edison	No	Recommend that generator low side breaker monitoring should be excluded or optional if the high side breaker connected to the system is monitored.
Response: Thank you for your comments. The intent of monitoring generator circuit breakers is to determine when a generator is connected to the grid. Since the tripping of a low voltage generator circuit breaker will have the same effect as tripping the high side circuit breaker that connects the GSU to the grid, the SDT believes it is reasonable to require monitoring of both circuit breakers.		
Wisconsin Electric	No	In R2, the Generator Owner is required to record Sequence of Events (SER) data for circuit breaker status for the equipment in the substation connected to a generating station of a specified capacity, in addition to that for the GSU. This appears to be an unnecessary duplication of equipment already being monitored by the Transmission Owner in R1. If this is a correct interpretation, we believe this requirement is redundant, and technically and financially unjustified. We strongly oppose requiring duplication of monitoring equipment for the same facility by both Transmission Owners and Generator Owners.
Response: Thank you for your comments. The standard has been reworded to require the owner of the circuit breaker to do the monitoring of the circuit breaker status.		
City of Tallahassee (TAL)	No	R1.1 is unclear. Is it the intent of the SDT to exclude substations with 3 or more lines at 200kV or above if there is no transformation at that substation? That appears to be what is required based on the "and" statement. R1.2: Some confusion may be encountered when determining if it is a "plant" or "site" aggregate. Some utilities may not use the same nomenclature for each item. Two 900MW plants (or units) at one site should be captured, even though they are not a plant aggregate of 1500MVA.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard. The proposed standard refers to individual generators of 500 MVA with a combined generation at site of 1500 MVA. The generation size requirements have been changed.		
NV Energy (fka Sierra Pacific Resources)	No	The requirement to provide Sequence of Events recording data for stations with three or more transmission lines operated at 200kV or above seems to be overly burdensome. This requirement if left as written would potentially include a significant number of remote substations. As an alternative, we suggest that this requirement be changed to "stations with five or more lines operated at 200kV or above".
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Salt River Project	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. Suggest that this requirment be for substations with five or more lines operated at 200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Progress Energy Carolina, Inc.	No	Table 2-1 indicates "Including low side breakers" for plant SER data inputs. If an aggregate generation site of 1500MVA is monitored at the >200kV level where the generation enters the transmission network, the system impact of any occurrence will be seen at the monitoring point. PEC dissagrees with the low side breakers position being included to be monitored by the DFR/SER. Monitoring of these breakers are included within the functional boundaries of the smaller generating units and the breaker voltages are less than 50KV and not part of the transmission grid. Extending this requirement will be costly since the DFR will be located at the transmission network location remote to the multiple generators and low side breakers. The requirement should only include the >200kV circuit breaker SER data.
Response: Thank you for your comments. The intent of monitoring generator circuit breakers is to determine when a generator is connected to the grid. Since the tripping of a low voltage generator circuit breaker will have the same effect as tripping the high side circuit breaker that connects the GSU to the grid, the SDT believes		

Organization	Yes or No	Question 7 Comment
it is reasonable to require monitoring of both circuit breakers.		
Hydro-Québec TransEnergie (HQT)	No	Sequence of Events requirements should include monitoring of transmission and generator circuit breaker positions, protective relay tripping for all protection groups, and teleprotection keying and receiving.
Response: Thank you for your comments. The team believes that establishing SOE circuit breaker position is adequate; however, any additional information, such as protective relay tripping, could provide further insight in the event analysis.		
Brazos Electric Power Cooperative, Inc.	No	Need to add clarity to the criteria and do not reference Tables for requirements.
Response: Thank you for your comments. The drafting team agrees that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.		
Northeast Utilities	No	Sequence of Events requirements should include monitoring of transmission and generator circuit breaker positions and protective relay tripping for all protection groups.
Response: Thank you for your comments. The team believes that establishing SOE circuit breaker position is adequate; however, any additional information such as protective relay tripping could provide further insight in the event analysis.		
San Diego Gas and Electric Co.	No	The requirement for collecting SOE data at subs with three or more transmission lines operated at 200kV or above seems a bit stringent for the value received. We would suggest this requirement be put in place for substations with five or more lines operated at 200kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
New York Independent System Operator	No	The Loss of generation affects the entire system regardless of interconnection voltage, and just knowing when breakers trip doesn't add enough information. In addition to circuit breaker position change, SOE data should be available for generator protective functions to enable the GO to report the root cause of generator trips which occur due to system disturbances. This is to support possible future blackout investigations and eventually lead to betters standards for generator transmission system coordination. It is very important to capture root cause for units/plants of significant size, and this need is not dependent on interconnection voltage. Change SOE requirement for single unit to 50MVA+, and Plant to 300MVA+. Require SOE to monitor CB positions, protective relay tripping for all protection groups and teleprotection keying and receiving.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comments. The team believes that establishing SOE circuit breaker position is adequate; however, any additional information, such as protective relay tripping, could provide further insight in the event analysis. The generation size requirements have been changed.		
E.ON U.S.	No	The requirements seem to go beyond what is needed for bulk power system reliability. The requirements appear to prescribe equipment and processes so as to establish conventions that would enable the utility's response to broad operating data requests.
Response: Thank you for your comments. The intent of the standard is to provide information to analyze system disturbances.		
Arizona Public Service Co.	No	Requiring sequence of events data for all substations 200 kV and above with 3 or more lines is too stringent. It will provide more data but drowning in data isn't the goal. This should be relaxed to substations with 5 or more lines as these will eliminate the smaller less important substations.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Tucson Electric Power	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. This requirement would potentially include a significant number of remote substations. We suggest that this requirement be for substations with five or more lines operated at 200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
CenterPoint Energy	No	CenterPoint Energy disagrees including the proposed sequence of events (SOE) requirements. SOE data is proposed for every change in circuit breaker position (open/close) for EACH circuit breaker in a substation operated at 200kV and above. Such SOE requirements are actually related to SCADA (supervisory control and data acquisition) equipment, not fault and disturbance recording equipment. Such requirements would essentially dictate the specification and the installation, or replacement, of SCADA sets and logic cages. CenterPoint Energy recommends removing SOE requirements from PRC-002. Should the industry determine SOE requirements belong in this standard, CenterPoint Energy recommends SOE recording only be required wherever Fault Recording Data is required. It is present industry practice that Fault Recording Data devices incorporate SOE capability and that SOE data include such information as protective relay pick-up time, as well

Organization	Yes or No	Question 7 Comment
		as breaker interrupting / operating time.
Response: Thank you for your comments. While fault recorder data only may be sufficient for the analysis of most events, during major disturbances more detailed sequence of events information is required. The standard has been written to describe what quantities are needed, not what type of equipment is required to do the monitoring. Using a DFR to record SOE data is acceptable if it meets the timing and time synchronization requirements.		
Xcel Energy	No	R2 is written such that it appears that the Generator Owner will have to duplicate the SOE recording assigned to the Transmission Owner in R1.2. We assume that was not the SDT's intent, so we recommend that the third and fourth lines of Table 2-1 be modified to read "Each circuit breaker 200 kV and above if not already monitored by the Transmission Owner."
Response: Thank you for your comments. The standard has been revised to require the owner of the circuit breaker to monitor the status.		
Utility System Efficiencies, Inc.	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems overly burdensome. This requirement would potentially include a significant number of remote substations. I suggest that this requirement be for substations with five or more lines operated at voltages between 200 kV and 300 kV and for substations with three or more lines operated at voltages over 300 kV.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
British Columbia Transmission Corporation	No	The requirement for Sequence of Events data for substations with three or more transmission lines operated at 200 kV or above seems over burdensome. I suggest that this requirement be for substations with five or more lines operated at 200 kV or above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
PNM	No	The defining sum of lines and transformers should be 4 instead of 3. The sum of 3 will exclude few sites.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on data received and established revised criteria for the location of DME that includes short circuit MVA		

Organization	Yes or No	Question 7 Comment
criteria. This is included in the revised draft standard.		
Alberta Electric System Operator	Yes	The AESO supports the IRC SRC comments to this question.
Response: Thank you for your comments. Please see the response to the comments of the IRC Standards Review Committee.		
Tri-State Generation and Transmission Association	Yes	We would like to ensure that no separate Sequence of Events Recorder is required if the data can retrieved from archived SCADA logs.
Response: Thank you for your comments. If SCADA logs meet the timing requirements as stated in the standard – and many do – SCADA can be used for sequence of events.		
Dominion	Yes	The location requirements for SOEs and FRs for TO should be the same. If we use a table under R4 then use a similar table under R1- R2 remove its and replace with Generator Owner, and re-label Heading of Table 2-1 to indicate: for generating plant and substation equipment owned by Generator Owner? Table 2-1 - remove the third and fourth row of info. Move the "each circuit breaker 200 KV and above" in the right hand column of rows 3 and 4 to right hand column of rows 1 and 2.
Response: Thank you for your comments. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.

Requirements related to Fault Recording

8. Requirement R6 states that Fault Recording data shall include a pre trigger record length of at least two cycles and: a post trigger length of at least 50 cycles, or the first three cycles and the final cycle of an event. Do you agree with the requirement? If not, please propose alternate values or requirements and provide rationale.

Summary Consideration: While a majority of commenters supported these pre trigger and post trigger lengths, there were some requests for clarification, which the standard drafting team has addressed. Other commenters requested a definition for an event and asked what determines the final cycle of the event.

The drafting team undertook a significant rewriting of the draft standard. The requirement language was modified for clarity and the term "event" was removed. To determine location criteria, a task team was formed to develop a technical basis for the requirements; that basis is included in the revised draft standard.

Organization	Yes or No	Question 8 Comment
IRC Standards Review Committee	No	The SRC questions the need for two seemingly divergent Methods to achieve the reliability data objective. If the objective is to ensure that 2 cycles of pre-event data is available (to establish a base line) then both methods do that. But then Method 1 stores 50 cycles of data and ends (in essence losing all information after that 50

Organization	Yes or No	Question 8 Comment
		cycles). The second Method saves 3 cycles of post-event data and 2 cycles of data at the end. That means for events lasting longer than 50 cycles Method 1 is missing the end of event information, and Method 2 may not have any data at all after the first two cycles (except for the 3 cycles at the very end of the event). The SRC would ask what is the information that is needed for analysis. Seemingly these two methods are saving different pieces of data and yet both are acceptable. What is the technical basis for the 16 samples per cycle requirement? The SRC would also suggest that Requirement 6 be separated into two independent requirements - one for TOs and one for GOs. Although the intent to combine the two parallel requirements, it is possible for a compliance person to interpret the "AND" as an "inclusive AND" and require the TO (or GO) to have data for both R4 and R5 criteria.
Response: Thank you for your comments. The standard was written to allow for the use of legacy equipment. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven to be adequate. The value of 16 samples was chosen because all but the oldest microprocessor based relays sample at this rate or higher. The standard has been revised to clarify TO and GO requirements.		
SPP System Protection and Control Working Group	No	Recommend to change "first three cycles" to "first six cycles". Six cycles will give you the relay time plus the breaker time.
Response: Thank you for your comments. The SDT received strong support in the first posting for the requirement as written. No change made in that respect.		
SERC Engineering Committee Planning Standards Subcommittee	No	It is not clear why there are two different requirements for sampling data.
Response: Thank you for your comments. If you are referring to the differences in the sampling rates for fault records and DDRs, the differences are related to the data requirement differences between those two types of events.		
MRO NERC Standards Review Subcommittee	No	The first three cycles of an event and the final cycle of an event doesn't seem adequate.
Response: Thank you for your comments. On a large interconnected system, most faults will be recorded by multiple devices, including devices capable of recording longer records. The SDT believes that adequate information will be recorded and these fault record lengths have been selected to allow for legacy equipment.		

Organization	Yes or No	Question 8 Comment
NERC	No	The term "final cycle of the event" is confusing. The recording should remain for at least 2 seconds or until the triggered value has been eliminated.
Response: Thank you for your comments. The "final cycle of an event" requirement was intended to determine when a fault cleared, and "an event" has been changed to "the fault.". The final cycle of an event is the last electrical cycle that fault current was flowing. Requiring a two-second record length, or requiring the installation of a device that will continuously record until a fault clears, will eliminate the use of all but the latest generation of microprocessor based relays, and most legacy DFRs. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven to be adequate. In addition, the newer equipment installed at locations that previous had no equipment will have that capability, and are likely to record events one or more substations away, and that data will help in event analysis.		
Progress Energy Florida	No	Wording is not very clear as to the fault length. An example on how it could be worded would be: "Recording duration shall be at least 50 cycles in total length with a minimum of 2 cycles of pre-fault data (or pre trigger)".
Response: Thank you for your comments. The standard drafting team thinks that the requirement as worded makes clear that the minimum number of cycles is 52: 50 cycles post-trigger and a pre-trigger record length of two cycles.		
Independent Electricity System Operator	No	We do not see the two sets of condition to cover the same period or achieve the same objective. The first condition requires recording that covers a (continuous) period from -2 cycles to +50 cycles of a trigger.In the second condition, the periods covered appear to be (a) -2 cycles to +3 cycles of a trigger, and (b) the last 3 cycles of the "event". Our questions and comments are: i. Are "trigger" and "event" interchangeable? If so, what does R6 mean by "the last cycle of the event" given that there is already a requirement for the +3 cycles of the trigger ii. If they are not interchangeable, what does it mean by an "event" iii. The two conditions appear to require recording different time periods since in the second condition, the recording is not continuous from -2 cycles to +50 cycles of the trigger; as written, it only covers a period of -2 cycles to +3 cycles, then a void until the last cycle of the "event", which is not defined. If however the intent is to record the event 2 cycles before it occurs through to the end of the event, which is hard to define, then we suggest the second bullet be revised as follows: A pre-trigger record length of at least two cycles and a post-trigger record length that extends up until the trigger condition no longer exists. Still we are unable to rationalize how the "first 3 cycles of the event" fit in.

Organization	Yes or No	Question 8 Comment
Response: Thank you for your comments. The standard drafting teams does not think that "trigger" and "event" are interchangeable. Since this requirement is related to fault recording, the event is a fault that occurred. The trigger is a setting in the recording device that causes the device to record the event. The intent of this wording was to be able to determine when a fault started, and when it ended, while allowing legacy microprocessor based relays and legacy DFRs to be used to meet the standard. On a large interconnected system, most faults will be recorded by multiple devices, including devices capable of recording longer records. If the fault lasts for more than 50 cycles, there will likely be multiple records initiated by a DFR, and very likely a microprocessor based relay that clears the fault.		
City of Tallahassee (TAL)	No	I do not have the expertise to respond to the trigger lengths. However, R6.1 bullet 2, What is an "event"? Is this different from the Disturbance used in R13?
Response: Thank you for your comments. Since this requirement is related to fault recording, the event is a short circuit that occurred. The trigger is a setting in the recording device that causes the device to record the event. The term "Disturbance" used in Requirement R13 of draft 2 of the standard is the NERC Glossary term.		
Progress Energy Carolina, Inc.	No	Ok with first bullet under R6.1, however, the second bullet refers to "event" without a definition of what constitutes an "event".
Response: Thank you for your comments. The term "event" has been removed from the draft standard.		
New York Independent System Operator	No	There is confusion over the meaning to the second option. Does it mean for faults with a duration of greater than 50 cycles this is the minimum record? Or does this allow for use of relays with limited fault recording to be used? Regardless, this record is not equal to the first option. The second record option would be inadequate.
Response: Thank you for your comments. You are correct in the assumption that the second option was added to allow the use of legacy microprocessor based relays and legacy DFRs. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven to be adequate.		
E.ON U.S.	No	Generally, pre-trip data has more analytical value than post-trip data.
Response: Thank you for your comments. The standard does not address trip data, rather data gathered for a triggered event. The value of pre-trigger data versus post-trigger data depends on what you are trying to analyze. The standard does not preclude anyone from recording additional pre or post trigger data.		
JEA	No	Various manufacturer's equipment does not presently support this requirement. Special designs and modifications to certain types of relays and fault recording equipment will need to be developed to fully support

Organization	Yes or No	Question 8 Comment
		this requirement, as presently written.
Response: Thank you for your comments. The requirements were drafted to allow for the use of as many legacy recording devices as possible while still providing adequate information to analyze faults.		
Alberta Electric System Operator	No	The AESO supports the IRC SRC comments to this question. The AESO would also suggest that the R6 could be revised to require post trigger recording to be "at least 50 cycles post trigger AND the last cycle for extended faults".
Response: Thank you for your comments. See our response to the IRC SRC. Requiring at least 50 cycles would prevent the use of most protective relays which have proven adequate for most events. In the rare event that a fault lasts more than 50 cycles, it is likely that other protective relays and other DFRs will also record the fault.		
Beckwith Electric Co	No	This section needs to be rewritten. It is confusing the way it is written with two different options. There is no definition of triggering. As an example: if the triggering is achieved using an input contact (generator/GSU breaker 'a' or 'b' contact) then having 2 cycle pre-tiggering will not capture the required important information and will have 50 cycles of post trigger data which is useless as the breaker has already opened. The other problem is that unlike transmission line relay operations (typically happens much shorter than 50 cycles) the generator relay operations can take several seconds from the inception of fault/abnormal condition (example: loss of field, under frequency, V/Hz, out of step, reverse power etc). Recommend changing the total record length to at least 5 sec with pre and post trigger length selectable based on the triggering mechanism.
Response: Thank you for your comments. After a review of triggering practices among many utilities, the SDT decided to allow companies to continue to use whatever method they have found to work well for them. What works for one TO or GO may or may not work for another TO or GO. The drafting team did; however, add a requirement that requires TOs and GOs to have a triggering methodology. The drafting team feels that this requirement does not prescribe what to trigger for, but rather makes sure that the responsible entities have an established methodology to trigger for events. Once the generator is islanded from the transmission system within the time frame specified, the intent of the standard is to capture wide area events. The generator scenario provided does not have a wide area impact. The standard states that: "A pre trigger record length of at least two cycles and a post trigger record length of at least 50 cycles for the same trigger point OR at least two cycles of the pre trigger data; the first three cycles of the fault; and the final cycle of the fault." An entity is able to record a longer data length as long as it meets the requirement above.		
Kansas City Power & Light	No	Do not agree with the notion of data recording of the first 3 cycles and the final cycle. The first three cycles and the last cycle is not sufficient data to be useful for fault recording analysis. At least 6 cycles is needed at the beginning of the record. Although 6 cycles is better, that still does not guarantee sufficient data will be collected

Organization	Yes or No	Question 8 Comment
		in every instance. Recommend the SDT consider changing to capturing 6 cycles.
Response: Thank you for your comments. The SDT feels that this is a sufficient for recording most events.		
Northeast Power Coordinating Council	Yes	This requirement allows for the inclusion of legacy equipment. This requirement does not stipulate the recording of adequate information for analysis.
Response: Thank you for your comments. The standard was written to allow for the use of legacy equipment. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven to be adequate.		
Members of the WECC Disturbance Monitoring Work Group	Yes	The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Southern Company - Transmission	Yes	No further comment.
Response: Thank you.		
SERC Protection and Controls Sub-committee	Yes	Add to the end of the first bullet for the same trigger point?
Response: Thank you for your comments. The standard has been revised to include your suggestion.		
Dominion	Yes	Add to end of first bullet under R6.1 "for the same trigger point"
Response: Thank you for your comments. The standard has been revised to include your suggestion.		
Bonneville Power Administration	Yes	The number of element criteria may be too stringent, change to 5 elements.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit		

Organization	Yes or No	Question 8 Comment
MVA criteria. This is included in the revised draft standard.		
Florida Power & Light	Yes	We agree, however, the term "event" needs to be defined. Please provide a working definition for event.
Response: Thank you for your comments. The term “event” has been removed from the draft standard.		
PG&E System Protection	Yes	The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"? We recommend that we use "end of the event" instead.
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. “An event” has been changed to “the fault” in the revised standard.		
NYISO	Yes	Yes, this sounds good, but we don't understand how one could record the first 3 cycles and final cycle of an event.
Response: Thank you for your comments. This can be done in microprocessor based relays by recording two or more records and by using appropriate triggers.		
Tri-State Generation and Transmission Association	Yes	How is the final cycle of an event determined?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing.		
Cowlitz County PUD	Yes	If the former requirement is preferred, would it be best to require all new equipment abide by the 2 - 50 cycle requirement and only allow the first three cycles and the final cycle method for existing legacy equipment? I would not take issue with this when the standard is up for a vote.
Response: Thank you for your comments. It is likely that new protective relays will be able to record the longer records, but the SDT did not want to prescribe in the standard that all new protective relay schemes use the latest available protective relays.		
Portland General Electric	Yes	The following comments are those filed by the DMWG which we are filing in support: The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle		

Organization	Yes or No	Question 8 Comment
that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Puget Sound Energy	Yes	The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
NV Energy (fka Sierra Pacific Resources)	Yes	The Standard is unclear in the use of the terminology "final cycle of an event". Can this be further defined for clarity of the Standard?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Salt River Project	Yes	What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Hydro-Québec TransEnergie (HQT)	Yes	This requirement allows for the inclusion of legacy equipment. This requirement does not stipulate the recording of adequate information for analysis.
Response: Thank you for your comments. The standard was written to allow for the use of legacy equipment. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven to be adequate.		
Northeast Utilities	Yes	This requirement allows for the inclusion of legacy equipment. However, this requirement does not stipulate the recording of adequate information for analysis of events that are more complex than a simple fault-trip.
Response: Thank you for your comments. The standard was written to allow for the use of legacy equipment. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven to be adequate.		
San Diego Gas and Electric Co.	Yes	Is there a definition of "the final cycle of an event"? We'd want to make sure that we understand that fully.

Organization	Yes or No	Question 8 Comment
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Arizona Public Service Co.	Yes	If you tell me what the definition of the end of an event is and then I'll be sure to capture the "final cycle" of the event.
Response: Thank you for your comments. The term "event" refers to a fault (e.g. short circuit) recorded by a fault recorder. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Tucson Electric Power	Yes	The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
Utility System Efficiencies, Inc.	Yes	The term final cycle of an event is unclear. What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.		
British Columbia Transmission Corporation	Yes	What is the definition of the "final cycle of an event"?
Response: Thank you for your comments. This requirement was intended to determine when a fault cleared. The final cycle of an event is the last electrical cycle that fault current was flowing. "An event" has been changed to "the fault" in the revised standard.

Requirements related to Fault Recording

9. Do you agree with the other Fault Recording requirements in R4 through R6 of this proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

Summary Consideration: Comments indicated that the majority of respondents disagreed with Fault Recording requirements under R4 through R6. Commenters suggested increasing the number of lines criteria to a quantity of five or greater. Additionally, commenters pointed out that FR triggering requirements are not addressed.

To address these concerns, the drafting team undertook a significant rewriting of the draft standard. The requirement language was made clearer and the tables were eliminated. To determine location criteria, a task team was formed to develop a technical basis for the requirements. Based on data received, the task team developed location criteria for SOE and FR data to be 25-percent of bus locations with the highest calculated short circuit MVA level.

After a review of triggering practices among many utilities, the SDT decided to allow companies to continue to use whatever method they have found to work well for them. The drafting team did, however, add a requirement that requires applicable owners to have a triggering methodology. The drafting team feels that this requirement does not prescribe for what to trigger, but rather makes sure that the responsible entities have an established methodology to trigger for events.

Organization	Yes or No	Question 9 Comment
Northeast Power Coordinating Council	No	Referring to Requirement 4.1, the number of phases to be monitored is excessive. It will not provide any analytical benefit. Monitoring every transmission line in a ring bus is excessive. The second bullet referring to a breaker-and-a-half arrangement needs clarification. What is the "outer bus" in that arrangement? Definitions should be provided when references are made to substation designs or equipment that could have different names or designations in the industry. As we commented in Question 5, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. This needs to be reflected in Table 4-1.Referring to Requirement R4.2, the intent of measuring neutral current needs to be clarified, specifically with regard to transformers (see R5.3 in PRC-002-2). Referring to Requirement R5, the comments to R4.1 and R4.2 are applicable. In Table 5-1 the requirements that refer to the high side of critical GSU's should be directed at Transmission Owners, not Generation Owners. Referring to Requirement R6.1, the second bullet does not provide for the recording of adequate information (see response to Question 8).
Response: Thank you for your comments. Monitoring of all three phases is necessary for the analysis of all fault types. Monitoring all three phases, or two phases and the residual, will provide enough data to determine all three phases and the residual. The drafting team will consider developing an FAQ document to clarify		

Organization	Yes or No	Question 9 Comment
voltage monitoring requirements on ring buses and breaker-and-a-half arrangements. The standard is also being revised to more clearly indicate what equipment each GO and TO must monitor. The standard was written to allow for the use of legacy equipment. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven adequate.		
IRC Standards Review Committee	No	The SRC agrees with the data itself. The SRC does not agree that each data item listed in R4 must be an independent requirement. The SRC supports compliance with R4, but that the suggested sub-requirements be bullet items and that those items be handled through VSLs. Similarly with R5, the data items should be bulleted rather than being shown as independent. Similarly with R6, the data items should be bulleted rather than being shown as independent.
Response: Thank you for your comments. They were not intended to be interpreted as independent requirements; the SDT undertook a significant rewriting of the draft standard to provide clarification.		
Members of the WECC Disturbance Monitoring Work Group	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Bonneville Power Administration	No	BPA does not believe the individual phase voltage of each line is required if Bus voltage at the station is recorded. We think the R4.1 may say that, but maybe change the wording order to "The three phase to neutral voltages on each main bus or monitored line as follows:", It shouldn't be required to monitor the voltages on a transfer bus in a main and auxiliary (transfer) bus scheme. The number of element criteria may be too stringent, change to 5 elements.
Response: Thank you for your comments. The recording of every line and bus voltage is not explicitly stated. What is stated is that the voltages must be able to be determined. As long as an adequate number of voltages are recorded, such as every other bus or line on a ring bus, and circuit breaker position is known, all voltages can be determined. How an individual company chooses to comply with the requirements may vary from one GO or TO to the next. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		

Organization	Yes or No	Question 9 Comment
PG&E System Protection	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
NERC	No	R4.1 It is important for forensic analysis to have both bus and line quantities for DFR quantities. Bullets 2 and 3 should read: On breaker-and-a-half arrangements, the outer bus voltages, and the individual line voltages. On straight buses, common bus voltages and the individual line voltages.
Response: Thank you for your comments. There are multiple ways to determine every line and every bus voltage. If the two sets of bus voltages in a breaker-and-a-half scheme are recorded, and the status of every circuit breaker is known, all bus and line voltages can be determined.		
NYISO	No	R4.1 requires monitoring of 3 phase voltages on all bus sections of ring buses. We believe this is excessive. Reduce requirements to enough to be able derive all the quantities during normal maintenance conditions (outages).R5.5, second row in table: This puts the responsibility to monitor a transmission substation on the generator owner. Change the requirement such that the substation owner needs to monitor this.
Response: Thank you for your comments. The standard states that those voltages must be able to be determined, not that every line or bus voltage absolutely needs to be recorded. As long as an adequate number of voltages are recorded, and circuit breaker status is known, it is possible to determine all voltages without recording every line or bus individually. The SDT has revised the standard to more clearly differentiate GO and TO monitoring requirements.		
Tri-State Generation and Transmission Association	No	The R4.1 and R5.4 ring bus requirements to monitor three-phase voltages on each transmission line seems unnecessary for reliability or for post-event analysis. Voltages from opposite locations on a ring bus should ensure that sufficient quantities are available to perform any required calculations.
Response: Thank you for your comments. The standard states that those voltages must be able to be determined, not that every line or bus voltage absolutely needs to be recorded. As long as an adequate number of voltages are recorded, and circuit breaker status is known, it is possible to determine all voltages without recording every line or bus individually.		
Portland General Electric	No	The following comments are those filed by the DMWG which we are filing in support: Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Progress Energy Florida	No	Monitoring of GSU transformer currents on units >500MVA is the correct approach. However, peaking generation locations will have many generating units of less than 500MVA. The aggregate combination of 1500MVA will encompass many GSU transformers. Monitoring of each of the GSUs' currents (even though they are >200kV) will require extensive DME equipment additions at locations remote to the transmission network where the DME equipment is (and should be) located. We believe these total aggregate generation currents should be monitored at the location where they are introduced to the transmission network. This location may be at an exit point from a generating unit bus or a transmission line the feeds the generation power into another remote transmission substation bus.
Response: Thank you for your comments. If all of the generation is connected to a single transmission line, the currents and voltages may be monitored at the point of interconnection since this will be the same as the total plant output.		
Puget Sound Energy	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Independent Electricity System Operator	No	Please see our comments on R6, above.
Response: Thank you. See our response to R6 above.		
NextEra Energy Resources (formerly FPL Energy)	No	Section R4.1Recommend changing the first bullet to read On ring buses, the voltages of bus sections connected to transmission lines, or the individual line voltages. Section R4.2Recommend removing the word transformer from the qualifying sentence and changing the wording to The three phase currents and the residual or neutral currents of each monitored element as noted in Table 4-1. Table 4-1Recommend changing the single generating unit level to 750MVA or higher to avoid unnecessary

Organization	Yes or No	Question 9 Comment
		Fault Recording Equipment installations Section R5.1Recommend removal of language restricting the location of where to monitor for three phase to neutral voltages or phase to phase voltages associated with the GSU. Statement should allow for monitoring at T-line level as well. Section R5.2Recommend removal of language restricting the location of where to monitor for three phase to neutral voltages or phase to phase voltages associated with the GSU. Statement should allow for monitoring at T-line level as well. Section R5.4Recommend changing the first bullet to read On ring buses, the voltages of bus sections connected to transmission lines, or the individual line voltages. Section R5.5Recommend removing the word transformer from the qualifying sentence and changing the wording to The three phase currents and the residual or neutral currents of each monitored element as noted in Table 4-1. Table 5-1Recommend changing the single generating unit level to 750MVA or higher to avoid unnecessary Fault Recording Equipment installations.
Response: Thank you for your comments. Your recommendation for voltage locations to be monitored has been incorporated into the latest revision of the standard. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard. The standard is specifically worded to allow recording of voltages and currents on either side of a GSU. The SDT doesn't agree with your recommendation about changing the single generating unit level to 750MVA, thus the single generator nameplate rating remains at 500 MVA or above.		
Exelon Generation LLC	No	Comments on PRC-002-2---Disturbance Monitoring and Reporting Requirements Draft 1, January 30, 2009 1. Requirement R5.4: Requirements identified in this section for monitoring bus and line voltages belong to TO and not to GO unless GO owns the Substation. The revision should clearly state that.2. Requirement R5.4: We heard during the Q&A session of the webinar on 3/12/09 that GSU neutral current can be recorded by the residual current (sum of three phase currents). The revision should clearly state that. 3. Requirement R5.4: Please clarify that recording of Generator Step Up transformer (GSU) phase currents can be done by deriving these currents from the GSU output breaker(s) currents. The revision should be modified to state this and that the GSU neutral current can be recorded by deriving this current from the GSU output breaker(s) phase

Organization	Yes or No	Question 9 Comment
		currents. (Most of our GSUs are connected to the switchyard thru two output breakers in a ring bus. It makes lot more sense from a schedule and cost view point to use the quantities from the CTs of these output breakers rather than from the GSU CTs. It also makes sense from reliability viewpoint as less cabling means more reliability for the equipment, especially when with less additional cabling/wiring; we are recording the required quantities.) 4. Requirement R5.5: Requirements identified in this section for monitoring line three phase currents and the residual and monitored current belong to TO and not GO unless GO owns the Substation. The revision should clearly state that.
Response: Thank you for your comments. 1) The standard is being revised to clearly indicate what equipment each GO and TO should monitor. 2 and 3) If your GSU is delta on the low side and wye on the high side, the GSU neutral current cannot be determined by summing the three phase currents on the low side. The neutral current can be determined by summing the three phase currents on the high side. The intention of the standard is to tell each GO and TO what quantities are needed, not how to record them, since each entity may use a different approach that suits their needs. 4) The standard has been modified to explicitly state what equipment a GO and TO is to monitor.		
DTE Energy/Detroit Edison	No	Consider change to allow high side GSU voltage to be monitored at the high side bus of the same voltage. Present wording can be taken to imply that voltage must be monitored directly at GSU high side terminals. Also, can parallel GSUs be allowed to be monitored at a common point rather than individually? Likewise, can two GSUs connected at a common point at 200 kV or above be allowed to be monitored together at the common connection point?
Response: Thank you for your comments. The standard has been modified to indicate that either high or low side voltages and current can be recorded. The standard has been revised so that parallel GSUs can be monitored at a common point or individually. If all of the generation is connected to a single transmission line, the currents and voltages may be monitored at the point of interconnection, since this will be the same as the total plant output.		
Wisconsin Electric	No	In R5.4 and R5.5, the Generator Owner is required to record Fault Recording data for equipment in the substation connected to a generating station of a specified capacity, in addition to that for the GSU. This appears to be an unnecessary duplication of equipment already being monitored by the Transmission Owner in R4. If this is a correct interpretation, we believe this requirement is redundant, and technically and financially unjustified. We strongly oppose requiring duplication of monitoring equipment for the same facility by both Transmission Owners and Generator Owners. Also, In R5.2, the statement is given that the three-phase current data from the "generator bus" is sufficient for monitoring. Does this mean that the three-phase currents from generator current transformers will meet this

Organization	Yes or No	Question 9 Comment
		requirement?
Response: Thank you for your comments. The standard is being revised to clearly state that a GO is to monitor equipment that the GO owns, and the TO is to monitor the equipment the TO owns. Yes, this is the intent of Requirement 5.2.		
City of Tallahassee (TAL)	No	R4.1, Bullet #1 appears too restrictive for a ring bus. It will require a fault recorder on each bus section with a line going to it. This is also a potential conflict with R7, which allows a recorder up to 2 busses away.Table 4-1. Am I correct in assuming that if there is no transformation with both sides >200kV, I do not need recording no matter how many lines are there. Same concern with "plant" vs. "site".
Response: Thank you for your comments. The standard states that those voltages must be able to be determined, not that every line or bus voltage absolutely needs to be recorded. As long as an adequate number of voltages are recorded, and circuit breaker status is known, it is possible to determine all voltages without recording every line or bus individually. R7 is only for dynamic disturbance recording, not for fault recording, so there is no conflict. Your assumption is incorrect regarding transformation and number of lines. The standard does not address sites but rather Transmission switching stations, transmission substations, generating stations, HVAC converter stations, HVDC converter stations.		
NV Energy (fka Sierra Pacific Resources)	No	Table 4-1 should also be modified to identify Substations containing any combination of five or more elements. See response to Q7 previous.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Salt River Project	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Progress Energy Carolina, Inc.	No	Monitoring of GSU transformer currents on units >500MVA is the correct approach. However peaking

Organization	Yes or No	Question 9 Comment
		generation locations will have many generating units of less than 500MVA. The aggregate combination of 1500MVA will encompass many GSU transformers. Monitoring of each of the GSUs' currents (even though they are >200kV) will require extensive DME equipment additions at locations remote to the transmission network where the DME equipment is (and should be) located. We believe these total aggregate generation currents should be monitored at the location where they are introduced to the transmission network. This location may be at an exit point from a generating unit bus or a transmission line the feeds the generation power into another remote transmission substation bus.
Response: Thank you for your comments. If all of the generation is connected to a single transmission line, the currents and voltages may be monitored at the point of interconnection, since this will be the same as the total plant output.		
Hydro-Québec TransEnergie (HQT)	No	Referring to Requirement 4.1, the number of phases to be monitored is excessive. It will not provide any analytical benefit. Monitoring every transmission line in a ring bus is excessive. The second bullet referring to a breaker-and-a-half arrangement needs clarification. What is the "outer bus" in that arrangement? Definitions should be provided when references are made to substation designs or equipment that could have different names or designations in the industry. As we commented in Question 5, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. This needs to be reflected in Table 4-1.Referring to Requirement R4.2, the intent of measuring neutral current needs to be clarified, specifically with regard to transformers (see R5.3 in PRC-002-2). Referring to Requirement R5, the comments to R4.1 and R4.2 are applicable. In Table 5-1 the requirements that refer to the high side of critical GSU's should be directed at Transmission Owners, not Generation Owners. Referring to Requirement R6.1, the second bullet does not provide for the recording of adequate information (see response to Question 8).
Response: Thank you for your comments. Monitoring of all three phases is necessary for the analysis of all fault types. Monitoring all three phases, or two phases and the residual, will provide enough data to determine all three phases and the residual. The drafting team will consider developing an FAQ document to clarify voltage monitoring requirements on ring buses and breaker-and-a-half arrangements. The standard is also being revised to more clearly indicate what equipment each GO and TO must monitor. The standard was written to allow for the use of legacy equipment. With time stamping added, legacy equipment that meets the draft standard's (PRC-002-2) requirements should be adequate for the analysis of most system disturbances. The SDT believes that installing new equipment at locations that do not have any monitoring is more beneficial than replacing legacy equipment that is currently in use and has proven adequate.		
Brazos Electric Power Cooperative, Inc.	No	Clarify criteria and remove Tables.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comments. The drafting team agrees that the wording and tables in the standard require clarification. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.		
Entergy Services, Inc	No	R4.1 should include provisions to exclude 3 phase potential monitoring for line/bus elements employing line protection schemes, such as current differential relaying, where 3 phase potentials are not presently available and would not needed but for the requirements. Adjacent or remote end element monitoring should be allowable for these cases.
Response: Thank you for your comments. Adequate fault recording requires monitoring of both voltage and current. As long as those voltages can be determined in some manner, the requirements can be met without installing monitoring on every CCVT or VT. Table 4-1 within the draft standard allows for monitoring at remote terminals.		
Northeast Utilities	No	Referring to Requirement 4.1 and 5.4, monitoring the voltage every transmission line in a ring bus is excessive. Referring to Requirement R4.2, the intent of measuring neutral current needs to be clarified, specifically with regard to transformers (see R5.3 in PRC-002-2).
Response: Thank you for your comments. The standard states that those voltages must be able to be determined, not that every line or bus voltage absolutely needs to be recorded. As long as an adequate number of voltages are recorded, and circuit breaker status is known, it is possible to determine all voltages without recording every line or bus individually. Transformer neutral currents do not necessarily need to be monitored if they can be derived from the three phase currents. Neutral currents are frequently desirable for the analysis of ground faults.		
New York Independent System Operator	No	(R4.1) Requiring monitoring 3 phase voltages of all ring bus bus sections is excessive. Reduce requirements to enough to be able derive all the quantities during normal maintenance conditions. (R5.5, second row of table) This puts the responsibility to monitor a transmission substation on the genertator owner. The gen owner likely does not own the transmission substation. Make monitoring this equipment the responsibility or the transmission owner.(following R6.) We note that there is no mention of FR triggering. While this is specific to the various manufacturers trigger algorithms and specific also to the location, there does need to be a statement that the FR is to trigger for near-by faults, system disturbances, and relay operations. While this type of consideration is difficult to address in a standard, it would be misleading to leave out entirely a statement that reliable FR triggering is necessary. We request that the team add a new provision stating that all required FR channels at a location should be recorded whenever a trigger asserts on any one of them.

Organization	Yes or No	Question 9 Comment
Response: Thank you for your comments. The standard states that those voltages must be able to be determined, not that every line or bus voltage absolutely needs to be recorded. As long as an adequate number of voltages are recorded, and circuit breaker status is known, it is possible to derive all voltages without recording every line or bus individually. The SDT is revising the standard to clearly state that the owner of the equipment is to do the monitoring. After a review of triggering practices among many utilities, the SDT decided to allow companies to continue to use whatever method they have found to work well for them. What works for one TO or GO may or may not work for another TO or GO. The drafting team did, however, add a requirement that the applicable owner have a triggering methodology. The drafting team believes that this requirement does not prescribe what to trigger, for but rather makes sure that the responsible entities have an established methodology to trigger for events.		
Tucson Electric Power	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Alberta Electric System Operator	No	The AESO supports the IRC SRC comments.
Response: Thank you for your comments. As stated above to the IRC SRC, they were not intended to be interpreted as independent requirements. The SDT undertook a significant rewriting of the draft standard to provide clarification.		
CenterPoint Energy	No	The requirements to record all three phase to neutral voltages and all four currents on each transmission line are prescriptive and excessive. The monitoring of two sets of line voltages, in all substation configurations, is a common industry practice which has met the industry's needs. It is unnecessary and excessive to require monitoring of more than two sets of three phase to neutral voltages in any substation arrangement.
Response: Thank you for your comments. The standard states that those voltages must be able to be determined, not that every line or bus voltage absolutely needs to be recorded. As long as an adequate number of voltages are recorded, and circuit breaker status is known, it is possible to determine all voltages without recording every line or bus individually.		
Xcel Energy	No	As with Question 7, R5 is written such that it appears that the Generator Owner will have to duplicate the fault recording assigned to the Transmission Owner in R4. We assume that was not the SDT's intent, so we recommend that the second line of Table 5-1 include a clarifying statement such as "if not already monitored by

Organization	Yes or No	Question 9 Comment
		the Transmission Owner."
Response: Thank you for your comments. See answer to question 7 above. Additionally, the standard has been revised to clearly what equipment each GO and TO should monitor.		
Utility System Efficiencies, Inc.	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements operated between 200 kV and 300 kV and for substations with three or more elements operated at voltages over 300 kV. See my response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
British Columbia Transmission Corporation	No	Table 4-1 should also be modified to identify Substations containing any combination of five (5) or more elements. See response to question 7 above.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
Kansas City Power & Light	No	It is not necessary to require voltages on every line and bus for a ring bus configuration. Suggest requiring at least 33% with a of lines or busses for a ring bus configuration and no less than 2 will be a reasonable assurance there is a voltage collection for fault recording for events. It is unlikely under normal conditions 33% of the lines or busses in a ring would be out of service concurrently. So, for ring configuration stations with up to 6 lines, 2 voltage measures would be required. Ring configuration stations between 7 and 9 lines would require 3 voltage measures. Ring configuration stations with 10 to 12 lines, 4 voltage measures would be required. And so on.
Response: Thank you for your comments. The recording of every line and bus voltage is not explicitly stated in the standard. What is stated is that the voltages must be able to be determined. As long as an adequate number of voltages are recorded, such as every other bus or line on a ring bus, and circuit breaker position is known, all voltages can be determined.		
PNM	No	R5.3 requires recording current at the neutral bushing of wye-connected GSU transformer high-side windings. That does not have enough value to be a requirement. With the defined time synch. requirements and abundance of recorded voltages correlation of values is accomplished. It may have some value where only

Organization	Yes or No	Question 9 Comment
		low-side generator currents are monitored but not where high-side GSU currents are monitored.
Response: Thank you for your comments. The standard states that these values may be determined, not necessarily monitored. As written, the high side neutral current is only required if low side phase currents are recorded instead of the high side phase currents.		
Dominion	Yes	Re-label heading of table 4-1 to indicate:" for substation equipment owned by Transmission Owner"
Response: Thank you for your comments. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.		
MRO NERC Standards Review Subcommittee	Yes	Table 5-1 has a type-o - Row 2, Column 2, bullet 1 extra 'd'.
Response: Thank you. This has been corrected.		
PHI (PEPCO Holdings Inc.)	Yes	FR trigering requirements are not addressed.
Response: Thank you for your comments. After a review of triggering practices among many utilities, the SDT decided to allow companies to continue to use whatever method they have found to work well for them. What works for one TO or GO may or may not work for another TO or GO. The drafting team did, however, add a requirement that requires the applicable owner to have a triggering methodology. The drafting team feels that this requirement does not prescribe what to trigger for, but rather makes sure that the responsible entities have an established methodology to trigger for events.		
San Diego Gas and Electric Co.	Yes	Agree, except for the comment made in question 7 above about changing the SOE criteria from three lines to five lines.
Response: Thank you for your comments. To address concerns regarding location criteria, the SDT formed a task team dedicated to requesting and analyzing transmission system data. The task team analysis was based on the data received and established revised criteria for the location of DME that includes short circuit MVA criteria. This is included in the revised draft standard.		
E.ON U.S.	Yes	The SDT should explain the applicability of this requirement to the GO.
Response: Thank you for your comments. The standard has been revised to clearly state what equipment each GO and TO should monitor.		
Arizona Public Service Co.	Yes	There should be a provision for the case if the quantities aren't able to be measured (CT not available for example). In requirement R5.3 it makes the generator owner responsible to record the neutral current of the GSU high voltage winding. Sometimes, generators that have DFRs applied do not have this quantity available

Organization	Yes or No	Question 9 Comment
		as they mostly have access to the low voltage quantities. In addition, if a generator owner has a fault recorder but doesn't have available channels for this additional quantity, he shouldn't be required to drop a channel he feels is important to make room for these mandated channels. For instance, one only needs two voltages and two currents to measure MW so a generator may have fault recording that measures 2 line voltages and 2 line currents and there may not be room to add the additional channels specified. Generally with two of the values you can derive the third so why force them to record all indicated quantities. These requiremens might be acceptable for new generator installations but there are existing installations that would find this ornerous.
Response: Thank you for your comments. The SDT wrote the current recording requirements such that the currents may be determined, not necessarily monitored. It is not possible to derive all three phase quantities and neutral current by recording only two of the four, and the standard was written accordingly.		
SERC Protection and Controls Sub-committee	Yes	Re-label heading of Table 4-1 to indicate: for substation equipment owned by Transmission Owner?
Response: Thank you for your comments. The tables have been eliminated in the revised draft and the requirements have been rewritten to provide clarification.

Requirements related to Dynamic Disturbance Recording

10. Requirement R7 states that a DDR which is required at a substation meeting the location requirement shall be considered optional if a DDR meeting all of the requirements of R7.1, R7.2, R7.3 and R7.4 is found to be located one or two substations away. Do you agree with this option found in Requirement R7? If no, provide rationale.

Summary Consideration: In general, commenters agreed that if a DDR is found to be required at a substation and there is one located one or two substations away, the entity is in compliance without needing to install an additional DDR. However, based on industry comments, the SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations, revised every five years.

Organization	Yes or No	Question 10 Comment
Kansas City Power & Light	No	Does R7 require DDR at all substations one station away from the substation meeting the location requirement?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Grant County PUD	No	R7 is very difficult to read. A reword similar to is suggested: When a Transmission owner DOES NOT have Dynamic Disturbance Recording (DDR) data meeting all of the requirements of R7.1, R7.2, R7.3, and R7.4, recorded no further than 2 Substations away, then.....
Response: Thank you for your comments. The requirement to establish DDR locations have been revised and reworded.		
CenterPoint Energy	No	CenterPoint Energy disagrees criteria for Dynamic Disturbance Recording (DDR) should be solely based upon the number of connected lines at a substation. In addition to the number of lines, CenterPoint Energy recommends that DDR equipment be required only in substations that have direct interconnections to generating units. By locating DDR capability at generating plants, sufficient DDR data will be available to analyze system disturbances.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		

Organization	Yes or No	Question 10 Comment
IRC Standards Review Committee	Yes	The concept of the requirement is good but the wording can be improved. The issue is how to impose penalties for this requirement. If a TO "can" (i.e. the capability is there) get the required data, but the other TO's DDR fails, then who is responsible for compliance? In short, if each TO is responsible for the data then the two substation caveat has no meaning in cases of different TSOs. In the case of the same TSO it may be useful if the two substation limit is justifiable. The SRC suggests rewriting the requirement in a positive fashion. One example would be: "The Transmission Owner of substations 200KV and above shall have access to Dynamic Disturbance Recording data at or within 2 substations of the subject asset or other processes capable of providing:- R7.1- R7.2- R7.3- R7.4 "This proposal changes the requirement into reporting the required data for events that happen within radius of interest (i.e. two substations).
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Southern Company - Transmission	Yes	Southern Company restates its objection to the use of arbitrary location requirements.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
SERC Protection and Controls Sub-committee	Yes	Refer to response in 5.3
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Bonneville Power Administration	Yes	The DDR's purpose is for wide area monitoring not as a FR device (although it can help with that). Unless it doesn't interface to a control system (HVDC).
Response: Thank you for your comments. The SDT agrees that DDRs are for wide area monitoring. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		

Organization	Yes or No	Question 10 Comment
Florida Power & Light	Yes	This needs to be stated more clearly. Could you provide specific examples as part of FAQs.
Response: Thank you for your comments. The SDT will consider developing an FAQ document.		
Los Angeles Department of Water & Power	Yes	As stated earlier, similar language can be included to exclude transmission lines and substations that are part of a utilities internal distribution system, and not near intertie point.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
NERC	Yes	R7For consistency in description, the DDR requirement in R7 should mirror the station description in R1.1:then for each Substation having any combination of seven or more transmission elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above, the Transmission Owner shall record..."Also, the parenthetical qualifiers in both R7.3 and R7.3 should read:?(for each transmission element operated at 200 kV and above)?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Cowlitz County PUD	Yes	I find the original verbiage of R7 confusing without the clarifying statement above. I would consider rewording R7.
Response: Thank you for your comments. The requirements to establish DDR locations have been revised and reworded.		
American Electric Power	Yes	Repeating DDR across multiple adjacent substations does not add reliability value. Again, clarity is needed to address this requirement in the context of multiple voltage yards within a substation fence.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
City of Tallahassee (TAL)	Yes	See concern in Q9 for R4.1, Bullet 1.
Response: Thank you. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or		

Organization	Yes or No	Question 10 Comment
Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Pacific Northwest National Laboratory	Yes	Yes, but ONLY if the subject substation does not interface to a major control system which cannot be fully monitored from the ac side.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Entergy Services, Inc	Yes	Agree with the criterion of adjacent station coverage consistent with comments on 5.3.
Response: Thank you for your comment. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Alberta Electric System Operator	Yes	The AESO supports the IRC SRC comments.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Utility System Efficiencies, Inc.	Yes	Yes, but ONLY if the subject substation does not interface to a major control system which cannot be fully monitored from the ac side.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.

Requirements related to Dynamic Disturbance Recording

11. Requirement R8 states that Generator Owners shall record or have a process in place to derive DDR data for generating plants with an aggregate of 1500 MVA nameplate rating or higher. Do you agree with these values? Please provide supporting documentation for these values or (if you disagree with the values) alternate values and their technical basis.

Summary Consideration: In general, commenters disagreed with the aggregate of 1500 MVA. They supplied a wide range of recommended generator MVA nameplate ratings; The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.

Organization	Yes or No	Question 11 Comment
Hydro-Québec TransEnergie (HQT)	No	a) Referring to Requirement R7, is a Generator Owner required to install a DDR if there is a DDR installed on the plant's outlet transmission system no further than two substations away? b) What is the basis for the "two Substations away" criteria?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Southern Company - Transmission	No	Southern Company disagrees with utilization of arbitrary values to determine placement of disturbance monoritoring equipment. As we have previously stated in our comments, the determination of "where" to locate disturbance monitoring equipment should be derived from stability studies (angular, voltage. etc) of the electric grid in accordance with a NERC defined methodology.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.		
Northeast Utilities	No	It's possible for remote locations in a system to have a high concentration of generation spread across several busses. It would seem appropriate to require recorders in such areas.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is		

Organization	Yes or No	Question 11 Comment
installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
E.ON U.S.	No	E ON US recommends use of an aggregate nameplate value for generating plants of 2000 MVA or higher, as recommended in Standard EOP-004 Disturbance Reporting.
Response: The SDT does not agree. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Arizona Public Service Co.	No	If the majority of the 1500 MVA of the plant is recorded, smaller units that are not significant (300 MVA or less) shouldn't be required to be monitored regardless of what voltage level they connect at. Perhaps the requirement could be changed such that if more than 50% of the plant (by MVA) is recorded, units smaller than 300 MVA could be excluded. A generator owner may have a plant that exceeds 1500 MVA when aggregated but this could be due to a few large units, with other smaller units included that are not of consequence.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Northeast Power Coordinating Council	No	a) Referring to Requirement R7, is a Generator Owner required to install a DDR if there is a DDR installed on the plant's outlet transmission system no further than two substations away? b) What is the basis for the "two Substations away" criteria?
Response: The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
IRC Standards Review Committee	No	The SRC agrees with the concept of the requirement .The SRC does not agree that the specified data items should be treated as independent requirements. Further, the SRC suggests that the phrase "physical aggregate" be used.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
TransAlta	No	To use a specific number may not be appropriate way. Please see the comments in Q4 for justification.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is		

Organization	Yes or No	Question 11 Comment
installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
DTE Energy/Detroit Edison	No	a) Please see comments for 5.1. b) Also, consideration should be given to applying the "one or two substations away" option to R8 if the entire plant output connects to stations with DDRs.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Wisconsin Electric	No	In R8, the Generator Owner is required to record Dynamic Disturbance Recording (DDR) data for generating stations with a capacity of 1500 MVA or higher. This size requirement is already utilized to require monitoring of Fault Recording data in R5. DDR monitoring is more specialized and should be required at fewer facilities than Fault Recording data. For this reason we believe that the DDR requirement in R8 should only apply at aggregate facilities having a capacity of 2000 MVA or higher.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Members of the WECC Disturbance Monitoring Work Group	Yes	a) The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
PacifiCorp	Yes	We agree regarding the facility rating. However, Generator owners and Transmission owners should be permitted to jointly (by contract) apply a "not more than two bus removed" criteria for siting purposes. In that way duplication can be avoided where there is adequate overlap between generation and tranmission locations. We also support WECC's comments responsive to this question.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is		

Organization	Yes or No	Question 11 Comment
installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Dominion	Yes	Reword R8 to indicate clarify that the 1500 MVA aggregate nameplate rating includes only generation connected at 200 kV (high side of GSU) and above and that any generators at the same facility connected at less than 200 kV are not to be included.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Bonneville Power Administration	Yes	Yes, but BPA does not necessarilly think each GSU needs it. Some GSU's are parralleled onto a single circuit to integrate into the substation. If it's monitored at the substation that should be good.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
FirstEnergy	Yes	Our "yes" response is based on the fact that we have no strong technical reason to deviate from the values proposed by the SDT. In review of our own FirstEnergy footprint, the proposed value of 1500 MVA would exempt our single unit nuclear generation facilities. We would like to better understand the technical rationale used by the SDT in choosing this value, and the SDT may want to consider lowering this value to 1000 MVA (single) and adding "over 2000 MVA (multiple units)" to assure that the some single-unit nuclear plants will be required to record dynamic disturbances.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
PG&E System Protection	Yes	a) The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		

Organization	Yes or No	Question 11 Comment
Portland General Electric	Yes	a) The following comments are those filed by the DMWG which we are filing in support: The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Puget Sound Energy	Yes	a) The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
City of Tallahassee (TAL)	Yes	Same concern with "plant" vs. "site".
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
NV Energy (fka Sierra Pacific Resources)	Yes	Some clarity is needed with regard to whether the requirement is met if the GO does not own the switchyard, but the data is being recorded by the TO owning the switchyard.
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater. Data requirements for TOs and GOs are defined explicitly in the revised standard.		
San Diego Gas and Electric Co.	Yes	You might want to address the potential issue of different ownership between the generator and the attached substation, and what that does to the requirements.

Organization	Yes or No	Question 11 Comment
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater. Data requirements for TOs and GOs are defined explicitly in the revised standard.		
Tucson Electric Power	Yes	a) The requirement is not clear that If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, whether this meets the requirement. b) What if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.		
Utility System Efficiencies, Inc.	Yes	a) If the generator owner does not own the switchyard, but the data is being recorded by the switchyard owner, this requirement is not clear whether this situation would meet this requirement. b) Also, what if a plant is greater than 1500 MVA but less than 1500 MVA of the plant connects to a transmission system at greater than 200 kV? Is this standard applicable to this plant?
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater.

Requirements related to Dynamic Disturbance Recording

12. Do you agree with the other Dynamic Disturbance Recorder requirements in R7 through R11 of this proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

Summary Consideration: In general, commenters disagreed with the 960 sample per second sampling rate (which currently exists as a requirement in PRC-002-1). A technical analysis was performed on DDR sampling and storage rates, and based on this analysis, the drafting team specified a rate of 960 samples per second as the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The drafting team also realized that there was some confusion about sampling rate and storage rate for calculated values. The wording of the standard has been changed to eliminate this confusion.

Organization	Yes or No	Question 12 Comment
Northeast Power Coordinating Council	No	a) Referring to Requirement R7, because of the limitations of legacy equipment, this requirement will not be met. b) Referring to Requirement R8, as noted in the response to Question 5 and elsewhere, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications.

Organization	Yes or No	Question 12 Comment
		c) Referring to Requirement R8.4, the statement in parenthesis "(per each monitored element)" is redundant. We have no comment to Requirement R9. d) Our response to Question 2 deals with Requirement R10. e) Requirement R11 should be reworded to: that does not have continuous recording capability shall set its device to trigger and record according to the following where available: Requirement R11.1 should be worded to: R11.1 For rate-of-change of frequency, or delta frequency. Legacy equipment might not be able to satisfy Requirement R11.3.

Response: Thank you for your comments.

a) The SDT is accounting for legacy equipment through triggered records, reflected in the updated standard.

b,c) The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.

d) Please see our response to Question 2

e) The SDT revised the triggering requirements (old Requirement R11). The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT recognizes that there are regional variations in the application of triggers and has determined this is a practical approach. The latest revision of the standard allows legacy equipment to be used providing it meets all other requirements. The standard states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes.

Organization	Yes or No	Question 12 Comment
IRC Standards Review Committee	No	a) The SRC agrees with the other DDR requirements in R7 through R10, but do not agree with and specifically have a question on R11.1. R11 requires TO and GO to set their DDRs (that do not have continuous recording capability) to trigger under specific conditions. R11.1 simply states for rate-of-change of frequency only, but does not specify what rate is it that the DDR should be triggered to start recording. Do we need a default frequency rate-of-change to be specified in R11.1?No, the identified items need not be assigned as independent subrequirements. b) For R10, the implementation caveat should not be part of the requirement. Rather it should be included as part of the Implementation Plan. c) The SRC would also suggest that Requirement 9 be separated into two independent requirements - one for TOs and one for GOs. Although the intent to combine the two parallel requirements, it is possible for a compliance person to interpret the "AND" as an "inclusive AND" and require the TO (or GO) to have data for both R7 and R8 criteria.
Response: Thank you for your comments. a) The SDT revised the triggering requirements. The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes. b) The SDT agrees with the recommendation and pulled the date from the requirement and will place it in the revised implementation schedule. c) The revised requirements have the Planning Coordinators or Reliability Coordinators select the DDR locations. The Transmission Owners and Generator Owners are requiredto provide DDR functionality at the locations specified by the Planning Coordinators and record data on the specified Elements.		
SPP System Protection and Control Working Group	No	a) 1) Please clarify R 10 and R 11 with respect to date (January 1, 2011). One suggestion is to have R11 listed before R10.2) b) Specify the actual trigger value in R 11.1
Response: Thank you for your comments. a) The SDT pulled the date from the requirement and will place it in the revised implementation schedule The standard applies to legacy equipment that meets the requirements. b) The SDT revised the triggering requirements. The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range.		

Organization	Yes or No	Question 12 Comment
Members of the WECC Disturbance Monitoring Work Group	No	**a)** The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirement eliminates the use of this adequate equipment.
Response: Thank you for your comments. a) The draft standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1.		
PacifiCorp	No	a) The installed equipment of the neighboring (interconnected) entity should be included in the parameters of R7 ".no further than two substations away..". to provide an overlay between Transmission owners. b) Similar to comment 11. above. We also support WECC's comments responsive to this question.
Response: Thank you for your comments. a) The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations. b) See response to comments of referenced sections.		
Bonneville Power Administration	No	a) R9.2 Change to clarify "Sampling" (vs. "collecting") at 960 samples/second, in the slide presentation.R11.2 b) BPA does not think the oscillation trigger is viable - remove this requirement, or indicate better that if an optional oscillation detector is installed then set it per R11.2 requirements. c) Change R12 to say "shall time synchronize all of its Allow for additional/future triggers, frequency set point level vs. rate of change. d) Change R11.3 to have record length include pre-trigger event of 30 seconds to 1 minute.
Response: Thank you for your comments. a) The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power		

Organization	Yes or No	Question 12 Comment
flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1. b) & d) The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes. c) The SDT added the word "time" synchronize to now Requirement R1.		
PG&E System Protection	No	The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirement eliminates the use of this adequate equipment.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1.		
NERC	No	a) R7 For consistency in description, the DDR requirement in R7 should mirror the station description in R1.1: then for each Substation having any combination of seven or more transmission elements consisting of transmission lines operated at 200 kV or above or transformers having primary and secondary voltage ratings of 200 kV or above, the Transmission Owner shall record..."The parenthetical qualifiers in both R7.3 and R7.3 should read: (for each transmission element operated at 200 kV and above) b) R9.2 The term collect in the sample rate requirement of R9.2 can be confused with what is required for values required to be stored. R 9.3 speaks to storage reuquirements. For clarity, R9.2 should read: Sample at least 960 times per second to calculate RMS electrical quantities.

Organization	Yes or No	Question 12 Comment
Response: Thank you for your comments. The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1.		
NYISO	No	We agree with the minimum requirements set in R9 for all DDRs. a) R11.1 What is supposed to be captured with this trigger? A ROC trigger won't consistantly capture the events causing step changes in frequency. A delta frequency trigger is more effective for capturing drops/rises in frequency. We propose requiring a trigger for delta frequency/step change in frequency for all new equipment, and for existing equipment that meets R9 and has the capability. b) R11.2 Not all existing recorders have this capability. Require this trigger for existing recorders that meets R9 and has the cabability. R11.3 Not all existing recorders have this capability. c) Require 3 minute recordings for existing equipment with this capability, and 60 second post trigger recordings for existing recorders that meet R9, but cannot store 3 minute records.
Response: Thank you for your comments. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes.		
Portland General Electric	No	a) The following comments are those filed by the DMWG which we are filing in support: The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirement eliminates the use of this adequate equipment.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. Organization	Yes or No	Question 12 Comment
second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.		
Puget Sound Energy	No	a) The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirment eliminates the use of this adequate equipment.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: “Input sampling rate of at least 960 samples per second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.		
Schneider Electric	No	a) The need to record and store continuously captured waveforms seems to be in excess. Triggered waveforms would suffice. Why the need to continuously record?
Response: Thank you for your comments. Captured waveforms are not required or specified for DDR. Sampled input waveforms for DDR are not required to be stored continuously but rather the standard does require the continuous recording of the output according to the date in the implementation schedule. Continuous recording capability is not requirement for FR functionality.		
Independent Electricity System Operator	No	a) We agree with the other DDR requirements in R7 through R10, but do not agree with/have a question on R11.1. R11 requires TO and GO to set their DDRs (that do not have continuous recording capability) to trigger under specific conditions. b) R11.1 simple states for rate-of-change of frequency only, but does not specify what rate is it that the DDR should be triggered to start recording.
Response: Thank you for your comments. The SDT revised the triggering requirements. The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range If the recorder does not have continuous recording capability, it shall set to record data for a minimum of three minutes.		
NV Energy	No	a) I agree with the terms. However, nothing is mentioned in the standard about the acceptable format that the DDR continuous data must be. The WECC uses the BPA stream reader format, while others use the IEEE C37.118-2006 format. I think this is the place to state and consolidate formats, similar to the COMTRADE requirement for the fault

Organization	Yes or No	Question 12 Comment
		recorder data.
Response: Thank you for your comments. Yes, the format of the submitted data is important. The requirement for the submittal data in a COMTRADE format provides consistency to facilitate the analysis of system disturbances. This information is listed in Section D, 1.5.1 of the draft standard. The team agreed that an entity may use PMUs as DME if it meets the DDR requirements. The team will not address or establish PMU requirements in the standard because the standard is function specific instead of equipment specific. In addition, PMUs are excluded in the approved SAR.		
DTE Energy/Detroit Edison	No	Please see comments for 9.
Response: Thank you for your comments. Please see our response to your comment to Question 9.		
ITC Transmission, METC	No	R9.1 is redundant to R7.3, R8.3 which indicate that the current monitored is required to be from the same phase as the voltage monitored. This redundant requirement may lead to double jeopardy.
Response: Thank you for your comments. The SDT agrees that the requirement is redundant and deleted old Requirement R9 part 9.1.		
NV Energy (fka Sierra Pacific Resources)	No	Sample rate of 960 samples per second in R9.2 is higher than is needed for reliability and would antiquate the investment already made at numerous substations. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the Glossary and the 960 samples per second requirement precludes the use of this existing equipment.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: “Input sampling rate of at least 960 samples per second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.The team agreed that an entity may use PMUs as DME if it meets the DDR requirements. The team will not address or establish PMU requirements in the standard because the standard is function specific instead of equipment specific. The SDT is using the NERC Glossary definition for DME.		
Salt River Project	No	The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirement eliminates the use of this adequate equipment.

Organization	Yes or No	Question 12 Comment
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: “Input sampling rate of at least 960 samples per second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.The team agreed that an entity may use PMUs as DME if it meets the DDR requirements. The team will not address or establish PMU requirements in the standard because the standard is function specific instead of equipment specific. The SDT is using the NERC Glossary definition for DME.		
Pacific Northwest National Laboratory	No	a) 12A. The term "collect" in R9.2 seems unclear--does it mean "measure and store (for subsequent off-line analysis)," or does it mean "measure as an input for on-line RMS calculations" 12B. For either interpretation of R9.2, the 960 sps requirement is an arbitrary value that seems unnecessarily high. The WECC WAMS contains DDR units that usually record point-on-wave and controller data at 960 sps, but these units also produce quite usable records when operated at 240 sps--what are the information targets, and what are the cost constraints? Phasor measurement units and other digital transducers can produce quite acceptable data with input rates below 960 sps, ESPECIALLY if their output rate is a mere (and unacceptably low) 6 sps.12C. In R9.3, 6 sps recording is almost too slow to be useful in a DDR. R6.2 requires at least 16 samples per 60 Hz cycle in fault recording--it is not unreasonable to seek a similar number of samples for each cycle of the highest swing frequency that a DDR should record. This rounds off nicely at 30 sps.12D. Extend R10 to read ". . . continuous recording at 30 sps. Future versions of this Standard may require 60 sps at some locations."12E. b) Consider specifying additional triggers in R11.1 (continued frequency offsets, steps in voltage or line flow, manual triggers, . . .)12F. c) Change R11.3 to read "Set data record lengths at a minimum of three minutes, plus at least one minute of pre-trigger data." A further requirement for trigger continuation should be considered for persistent oscillations or continued frequency offsets.
Response: Thank you for your comments. a) The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: “Input sampling rate of at least 960 samples per second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.b) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. c) Requirements state that each Transmission Owner and Generator Owner that has a DDR device functionality that meets the Planning Coordinator or Reliability		

Organization	Yes or No	Question 12 Comment
Coordinator DDR monitoring requirements and does not have continuous recording capability shall set data record lengths at a minimum of three minutes. The standard does not specify pre-trigger or post-trigger lengths for DDR.		
Hydro-Québec TransEnergie (HQT)	No	a) Referring to Requirement R7, because of the limitations of legacy equipment, this requirement will not be met. b) Referring to Requirement R8, as noted in the response to Question 5 and elsewhere, we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications. c) Referring to Requirement R8.4, the statement in parenthesis "(per each monitored element)" is redundant. We have no comment to Requirement R9. d) Our response to Question 2 deals with Requirement R10. e) Requirement R11 should be reworded to: that does not have continuous recording capability shall set its device to trigger and record according to the following where available: Requirement R11.1 should be worded to:R11.1 For rate-of-change of frequency, or delta frequency. Legacy equipment might not be able to satisfy Requirement R11.3.
Response: Thank you for your comments. a) SDT is accounting for legacy equipment through triggered records, reflected in the updated standard. b,c) The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater. d) See our response to your comment in Question 2. e) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range		
Entergy Services, Inc	No	R10 states DDR devices installed after 1-1-11 shall be capable of continuous recording. It is not clear when continuous recording would be required to begin.
Response: Thank you for your comments. The latest revision of the standard states the effective dates for continuous recording. These requirements take effect the first day of the first calendar quarter one year after applicable regulatory approval, or in those jurisdictions where no regulatory approval is required.		
Northeast Utilities	No	a) Referring to Requirement R7, because of the limitations of legacy equipment, this requirement will not be met. b) Referring to Requirement R8, it's possible for remote locations in a system to have a high concentration of

Organization	Yes or No	Question 12 Comment
		generation spread across several busses. It would seem appropriate to require recorders in such areas. c) Referring to Requirement R8.4, the statement in parenthesis "(per each monitored element)" is redundant. d) Referring to Requirement R9.3, does this need to be stored if the values can be derived from the record e) Response to Question 2 deals with Requirement R10. f) Requirement R11 should be reworded to: that "does" not have continuous recording capability shall set its device to trigger and record according to the following "where available": g) Requirement R11.1 should be worded to: R11.1 For rate-of-change of frequency, or delta frequency. Legacy equipment might not be able to satisfy Requirement R11.3.
Response: Thank you for your comments. a) SDT is accounting for legacy equipment through triggered records, reflected in the updated standard. B,c) The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that DDR is installed to monitor generating plants adequately with a gross plant/facility nameplate rating of 1,000 MVA or greater. d) To clarify, the standard states the requirement to record electrical quantities specified for DDR data. e) Updated dates are described in the Implementation Plan. f) & g) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes.		
San Diego Gas and Electric Co.	No	The requirement in R9.2 to collect 960 samples per second seems high for the purpose of reliability.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: “Input sampling rate of at least 960 samples per second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.		

Organization	Yes or No	Question 12 Comment
New York Independent System Operator	No	a) (R9) We request that the team add a new provision stating that all required DDR channels at a location should be recorded whenever a trigger asserts on any one of them, even where the channels are distributed across multiple DDR units.(R10) what exactly do the words "to meet requirements R7, R8, and R9" have to do with all this? b) We propose removing the reference to R7, R8, R9 and simply require continuous recording ability for newly installed DDRs The requirement of recorders installed after Jan 1, 2011 being able to continuously record would be redundant for the NPCC which requires recorders installed after Jan 1, 2009 to be continuous recorders. This will lead to confusion for some people and we propose adding some words describing such a situation and clarifying the requirements in such a case.(R11.1) c) It is our experience that rate-of-change in frequency is actually not a good DDR trigger. It produces many records for highly local events and may not catch significant disturbances. Delta Frequency is a proven DDR trigger, and performed admirably during the 2003 blackout. A good guideline for a delta frequency trigger would be to set to detect a sudden frequency change of 20 mHz. We suggest R11.1. should be written for delta frequency triggering with the aforementioned guideline for setting. Rate-of-change in frequency should not be mentioned in this standard. Rate-of-change in frequency is not a general name which includes delta frequency. (Refer to FDAC www.truc.org 2006 Conference paper: Frequency Triggers.) (R11.2) Not all existing recorders have this capability. Require this for existing recorders that have the capability and future installations.(R11.3) Not all existing recorders have this capability. Require minimum of 3 minutes for recorders with the capability, and 60 seconds for the minimum post trigger record length for all others.
Response: Thank you for your comments. a) Cross Triggering of multiple devices will not be included as a requirement. The future implementation of continuous recording capabilities required in Requirement R24 (old Requirement R10) will eliminate the need for it. b) PRC-002-1 requirements are not mandatory and enforceable. The SDT does not expect that the use of a different date in this proposed standard, PRC-002-2, will deter the present installation of continuous recording equipment for new or retrofit installations as may be required by regional criteria or regional standards. c) SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range.		
E.ON U.S.	No	a) The GO should be required to collect current and voltage data relative to the triggering event (i.e. change of breaker position). b) The format should be given in either CSV or plain text, which can be analyzed by any system. Rather than having all time-stamped current and voltage data recording equipment accommodate a certain IEEE format, the available data could be submitted in CSV/plain text and later analyzed in the IEEE format.

Organization	Yes or No	Question 12 Comment
		c) Also, in Section A part 5 of the standard, the effective date for both 50% and 100% compliance is stated as [t]he first day of the first calendar quarter four years after applicable Regulatory Approval It would be more reasonable to require 100% compliance in, for example, 8 years and Irequire 50% compliance in 4 years. This would allow sufficient time to do the necessary engineering, acquiring of equipment, etc. to meet the requirements of this standard.
Response: Thank you for your comments. a) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes. b) The requirement for the submittal data in a COMTRADE format provides consistency to facilitate the analysis of system disturbances. Conversion of CSV or plain test to a COMTRADE format should not be an obstacle to data transfer. c) The effective dates have been modified and are determined by the need for Implementation within the five year cycle of locations determined by the Planning Coordinators or Reliability Coordinators.		
Arizona Public Service Co.	No	R9.2 requires sampling at 960 samples per second. There are many DDR devices in service presently that have lower sample rates that provide perfectly adequate data. For example, there are many Macrodyne PMUs in service that have a 720 Hz sample rate and a data storage rate of 30 Hz. These PMUs should either be grandfathered or requirement should be reduced to allow them to meet the criteria. Don't require people to replace adequate equipment that gives acceptable results.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1.		
Tucson Electric Power	No	The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirement eliminates the use of this adequate equipment.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities.		

Organization	Yes or No	Question 12 Comment
The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1.		
Alberta Electric System Operator	No	The AESO supports the IRC SRC comments.
Response: Thank you. See response to the IRC SRC comments.		
Utility System Efficiencies, Inc.	No	a) The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes a DDR frequency response of 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second (point on wave) provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and this change to require 960 samples per second eliminates the use of this adequate equipment.12A. The term "collect" in R9.2 seems unclear--does it mean "measure and store (for subsequent off-line analysis)," or does it mean "measure as an input for on-line RMS calculations?" 12C. In R9.3, 6 sps recording is almost too slow to be useful in a DDR. R6.2 requires at least 16 samples per 60 Hz cycle in fault recording--it is not unreasonable to seek a similar number of samples for each cycle of the highest swing frequency that a DDR should record. This rounds off nicely at 30 sps.12D. Extend R10 to read ". . . continuous recording at 30 sps. Future versions of this Standard may require 60 sps at some locations."12E. b) Consider specifying additional triggers in R11.1 (continued frequency offsets, steps in voltage or line flow, manual triggers, . . .)12F. Change R11.3 to read "Set data record lengths at a minimum of three minutes, plus at least one minute of pre-trigger data." A further requirement for trigger continuation should be considered for persistent oscillations or continued frequency offsets.
Response: Thank you for your comments. a) The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second" and "Output reporting rate of electrical quantities of at least 30 times per second".. The 960 samples per second requirement presently exists in PRC-002-1.b) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The SDT revised the related requirement by eliminating the need to trigger for rate-of-change of frequency and for oscillation triggers, set to trigger for low frequency oscillations in 0.1 to 4 Hz range. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes.		

Organization	Yes or No	Question 12 Comment
British Columbia Transmission Corporation	No	The 960 samples per second (R9.2) is higher than is needed for reliability. Typical DDR equipment collects 30 samples per second. For reliability purposes 0.1 to 3 Hz is sufficient (see NERC Glossary definition for Disturbance Monitoring Equipment) and 30 samples per second provides the required resolution for this frequency range. PMU equipment is adequate to meet the DDR definition in the NERC Glossary and the 960 samples per second requirement eliminates the use of this adequate equipment.
Response: Thank you for your comments. The standard was modified to clarify that it is the storage or reporting of 30 samples per second of the specified quantities. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: “Input sampling rate of at least 960 samples per second” and “Output reporting rate of electrical quantities of at least 30 times per second”.. The 960 samples per second requirement presently exists in PRC-002-1.		
Kansas City Power & Light	No	R10 is part implentation plan or effective date and part requirement. The requirement is a DDR device capable of continuous recording to meet requirements R7 through R9. The effective date is January 1, 2011. Request the SDT remove the effective date part from R10 and put that in section A. In addition, the Effective Date part of Section A is either incorrect or may be conflicting with the January 1, 2011 expectation by including R11 with a 50% compliance in two years and 100% compliant in four years after regulatory approval. Please consider the intentions and revise the Effective Date part of Section A to accurately reflect the SDT intentions regarding implementation of the requirement part of R10.
Response: Thank you for your comments. The effective dates have been modified and are determined by the need for Implementation within the five year cycle of locations determined by the Planning Coordinators or Reliability Coordinators.		
PNM	No	
PHI (PEPCO Holdings Inc.)	Yes	It should be clarified that if all 3 phase bus voltages are monitored, the monitored phase current for each of the lines do not all have to be on the same phase.
Response: Thank you for your comments. The standard has been revised to include single phase-neutral or positive sequence voltage.		
Florida Power & Light	Yes	a) The term continuous recording should be technically defined. Obviously a true continuous record can not be retrieved or stored locally for long periods. Continuous records must be retrievable in sections. The expectations of continuous recording need to be well defined to determine compliance if for no other reason to provide audit ability.

Organization	Yes or No	Question 12 Comment
Response: Thank you for your comments. The SDT clarified that continuous recording is assigned to DDR functionality only and the DDR sampling and storage rate apply.		
Dominion	Yes	a) To make this clearer, reword R.7 to start with location requirements rather than exceptions. If we use a table under R1 and R4 then use a similar table under R7. b) Also, under R11.3, the pre-trigger record length and post-trigger record length should be specified (what part of the 3 minutes should be pre and post trigger).We suggest that the pre-trigger and post-trigger be a minimum of 1 minute each with total record at least 3 minutes
Response: Thank you for your comments. a) The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.b) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes.		
SERC Protection and Controls Sub-committee	Yes	a) To make this clearer, reword R.7 to start with location requirements rather than exceptions. b) Also, under R11.3, the pre-trigger record length and post-trigger record length should be specified (what part of the 3 minutes should be pre and post trigger?).
Response: Thank you for your comments. a) The old Requirement R7 has been revised. The SDT revised the DDR requirement to require that Planning Coordinators or Reliability Coordinators determine the minimum number of DDR locations based on historical peak load in addition to required locations.b) The latest revision of the standard requires that the Planning Coordinator, Reliability Coordinator, Generator Owners,or the Transmission Owners document and apply a triggering methodology. The standard now states that each required DDR devices without continuous recording capability shall set data record lengths at a minimum of three minutes.		
Southern Company - Transmission	Yes	Southern Company supports the comments submitted by the SERC PCS for this question.
Response: Thank you for your comments. See reply to the SERC PCS.

General Questions

13. Do you agree with the Other Disturbance Monitoring Requirements R12 and R13 of this proposed standard? If no, provide specific suggestions that would make the requirements acceptable to you.

Summary Consideration: While a majority of the responses were in favor of these time synchronization and data retention requirements, there were some requests for clarification. The standard drafting team has addressed those with the following:

- The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.
- The last phrase of Requirement R12 (now Requirement R1), "with the associated hour offset," allows the entities to use whatever time zone (or hour offset) they feel is appropriate as long as the devices are synchronized to a UTC source.
- Disturbance data shall be stored for a minimum of 10 calendar days following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).

Several comments unrelated to the issues above were also received and the standard drafting team provided responses to those comments below.

Organization	Yes or No	Question 13 Comment
IRC Standards Review Committee	No	The SRC questions the use as Universal Coordinated Time in R12 as a reliability issue. Having UCT for every device may make it "easier" for an after-the-fact collection of DDR data, it does not address the fact that other data would not be on UCT, and that a team should be able to adjust for time differences rather than to subject someone to financial penalties even though it had the data it did not have the proper time zone defined.
Response: Thank you for your comments. The last phrase of Requirement R12 (now Requirement R1), "with the associated hour offset," allows the entities to use whatever time zone (or hour offset) they feel is appropriate as long as the devices are synchronized to a UTC source.		
Tri-State Generation and Transmission Association	No	Data should be retained longer than 10 calendar days. We would suggest 60 days as a minimum.

Organization	Yes or No	Question 13 Comment
Response: Thank you for your comments. The 10 days required by the standard is a minimum. Entities are free to retain data for longer periods or indefinitely if they choose.		
Wisconsin Electric	No	The intent of R13 is not clear to us. This seems to be a data retention requirement.
Response: Thank you for your comments. R13 is indeed a data retention requirement and is necessary to recreate an event after a Disturbance in a timely fashion. Disturbance data shall be stored for a minimum of 10 calendar days, following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).		
City of Tallahassee (TAL)	No	R13; The NERC definition of Disturbance is too vague for this standard. Any minor hiccup on the grid or even local area could be interpretted as a Disturbance.
Response: Thank you for your comments. The SDT thinks that the definition, while broad, is appropriate for use in the standard.		
San Diego Gas and Electric Co.	No	In R12, the criteria is to synchronize SOE, FR, and DDR functions to within +/- 2ms of UTC, but earlier in R3, the criteria for time-stamping changes in breaker position is to be within 4ms of UTC. We would suggest making both of the criteria to be within 4ms of UTC.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.		
New York Independent System Operator	No	(R12) This requirement mainly concerns synchronizing with UTC Time Scale. The words with the associated hour offset have to do with Time Zone and should be removed from this sentence and placed in a separate sentence or a separate requirement. We suggest keeping these two concepts separate, both in the interest of clarity, and to facilitate future adjustments in wording. This area is covered in the report of IEEE PSRC I11 which is among the drafting team references. Two acceptable separate sentences or requirements would be as follows: Each TO and GO shall synchronize all of its SOE, FR, and DDR functions to within +/- 2 milliseconds of Universal Coordinated Time (UTC) Time Scale. Within time sequence data files produced by SOE, FR, and DDR functions, and within filenames, time shall be expressed in 24 hour format, and with no local offset, or with some number of positive or negative local hour(s) of local offset. Each filename, in conforming to C37.232-2007 COMNAMES (See D. 1.5.1) must contain this offset information. Since C37.111-1999 COMTRADE does not include the offset within the .cfg file, and until this issue is addressed in a revision to COMTRADE, the offset in the filename shall be interpreted, for purposes of compliance with this standard, to apply to the time sequence data in the file. On the last point, the drafting team is perhaps aware that an IEEE PSRC working group H4 is making revisions to C37.111-1999

Organization	Yes or No	Question 13 Comment
		COMTRADE, and is considering addition of local offset to the COMTRADE .cfg file.
Response: Thank you for your comments. The SDT does not agree with the recommended rewording because UTC with local offset is used by many operating centers.		
E.ON U.S.	No	E ON US objects to the compliance timetable of immediate to 18 months after NERC Board of Trustees or FERC approvals. More time is required to properly design, procure and install the disturbance monitoring equipment necessary to meet the proposed requirements, particularly in light of the uniqueness of the existing facilities and equipment to which the requirements apply.
Response: Thank you for your comments. The SDT has revised the implementation schedule to allow transition time to become compliant with the requirements.		
Arizona Public Service Co.	No	Earlier in R3 you specify +/- 4 ms
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.		
JEA	No	Certain DFR equipment, especially microprocessor relays used for DFR functionality, have limited storage. The relay equipment storage buffers for oscillographic information may be overwritten by new data in a roll over buffer and will not be available for the 10 day period. For SOE and DDR data the ten day storage requrienment should be easily met, but not for relay DFR equipment.
Response: Thank you for your comments. Disturbance data shall be stored for a minimum of 10 calendar days, following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).		
Alberta Electric System Operator	No	The AESO supports the IRC SRC comments.
Response: Thank you for your comments. The last phrase of Requirement R12 (now Requirement R1), “with the associated hour offset,” allows the entities to use whatever time zone (or hour offset) they feel is appropriate as long as the devices are synchronized to a UTC source.		
CenterPoint Energy	No	The FERC-approved NERC reliability standard FAC-003 for Vegetation Management includes allowances for certain situations resulting from natural disasters, such as tornados and hurricanes. This proposed standard does not address the enormous quantities of data, as well as the complications, that arise in such natural disasters. CenterPoint Energy recommends reviewing the various requirements and including appropriate allowances to

Organization	Yes or No	Question 13 Comment
		address natural disaster situations.
Response: Thank you for your comments. Disturbance data shall be stored for a minimum of 10 calendar days, following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).		
Kansas City Power & Light	No	It is not possible to guarantee DME data will be available 10 calendar days after an event in R13. Considering the number of triggers involved setting off the collection of relevant date and the collection of relevant data and the limits of the storage of DME equipment, it is possible in storm situations where there can be so many triggered instances, the data for an event of interest may not be present. Request the SDT consider revising this requirement to require entities to retreive the DME data that is stored (either remotely or locally) within 10 calendar days of an event. What this does is remove the requirement to ensure the data of interest is there and emphasizes the need to retrieve data before it is lost. In addition, please clarify the definition of a "Disturbance" referred to in R13. Is it according to Table 1 in EOP-004-1?
Response: Thank you for your comments. Disturbance data shall be stored for a minimum of 10 calendar days, following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device). The SDT is using the definition of Disturbance found in the NERC Glossary of Terms.		
Florida Power & Light	Yes	Please see comments for question 17.
Response: Thank you for your comments. Please see response for question 17.		
PG&E System Protection	Yes	The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.		
Portland General Electric	Yes	The following comments are those filed by the DMWG which we are filing in support: The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.		

Organization	Yes or No	Question 13 Comment
Puget Sound Energy	Yes	The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard is silent on equipment.		
Salt River Project	Yes	The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.		
Pacific Northwest National Laboratory	Yes	In R12, bear in mind that DDR units which are closely synchronized at their INPUTS are not necessarily synchronized at their OUTPUTS. E.g., the processing lag through a PMU can vary by 30 msec or more between different PMU types even when they are all operating at 30 sps. If properly filtered, the relative processing delay for 6 sps data would probably be something like 50 msec. These timing inconsistencies can be very important when developing an integrated profile of system dynamic behavior.
Response: Thank you for your comments. The SDT thinks that the commenter's processing delay concern is related to equipment configuration, and since the standard does not address specific equipment, it falls outside the scope of the SDT. In addition, PMU application is excluded in the SAR.		
Northeast Utilities	Yes	Referring to Requirement R13, it could be read to mean that one only needs to keep data for 10 days. We believe it was intended to say the device shall have the storage to retain records for 10 days.
Response: Thank you for your comments. Disturbance data shall be stored for a minimum of 10 calendar days, following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).		
Tucson Electric Power	Yes	The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.		
Duke Energy	Yes	DDR data will overwrite after 10 days, in some instances.
Response: Thank you for your comments. Disturbance data shall be stored for a minimum of 10 calendar days, following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).		

Organization	Yes or No	Question 13 Comment
Utility System Efficiencies, Inc.	Yes	The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.Also, in R12, bear in mind that DDR units which are closely synchronized at their INPUTS are not necessarily synchronized at their OUTPUTS. E.g., the processing lag through a PMU can vary by 30 msec or more between different PMU types even when they are all operating at 30 sps. If properly filtered, the relative processing delay for 6 sps data would probably be something like 50 msec. These timing inconsistencies can be very important when developing an integrated profile of system dynamic behavior and should be addressed by this Standard.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment. The SDT thinks that the commenter's processing delay concern is related to equipment configuration, and since the standard does not address specific equipment, it falls outside the scope of the SDT. In addition, PMU application is excluded in the SAR.		
SPP System Protection and Control Working Group	Yes	1. Please clarify the definition of Disturbance. Is it according to Table 1 in EOP-004-1?
Response: Thank you for your comments. The SDT is using the definition of Disturbance found in the NERC Glossary of Terms.		
Members of the WECC Disturbance Monitoring Work Group	Yes	The +/- 2 milliseconds requirement is not consistent with the 4 millisecond requirement in R3.
Response: Thank you for your comments. The +/-2 millisecond requirement refers to how closely the recording devices must be synchronized to a UTC Source. The 4 millisecond requirement in Requirement R3 was eliminated from the standard since this standard does not address specific equipment.

General Questions

14. Are you aware of any regional variances that would be required as a result of the proposed standard?

Summary Consideration: Commenters were not aware of a variance for this standard at this point of its development. The SDT reminds commenters that entities are not precluded from developing more stringent criteria. Establishing a lower cutoff for a proposed NERC standard requirement is simply a variance of that requirement and not appropriate for inclusion in a regional standard. Any region that believes it is appropriate to establish such levels needs to decide whether developing a regional criteria or submitting it as a variance to the SDT best suits their situation.

Organization	Yes or No	Question 14 Comment
NERC	No	For reasons of consistency in the ability to cross-regional or interconnection-wide disturbance analysis, there should be no regional variances.
Response: The SDT thanks you for your comment.		
DTE Energy/Detroit Edison	No	Will regional variances be included in this standard?
Response: Thank you for your comment. As of this last posting, the SDT had not received any variance requests for this standard.		
Entergy Services, Inc	No	Not as proposed, but there should be for DDR applications.
Response: Thank you for your comment. As of this last posting, the SDT had not received any variance requests for this standard.

Response: Thank you for your comments. For Question 1, you commented: "But we believe that the regional "Stability" group needs to decide on the locations of the DDR's based on a NERC defined methodology." Allowing a regional stability group to define the locations is considered a fill-in-the-blank requirement. The SDT formed a task team dedicated to requesting and analyzing transmission system data. The SDT used the task team analysis results to establish revised criteria for locations.		
Dominion	Yes	We support the 200 kV cutoff. However, some regions have indicated the 200kV threshold is not appropriate and indicate a preference for a lower criteria. We believe that if the regions desire to require more granularity, that criteria should be applied in a regional standard which can be more restrictive and should be supported by a technical basis
Response: Thank you for your comments. Entities are not precluded from developing more stringent criteria. The SDT formed a task team dedicated to requesting and analyzing transmission system data and used the task team analysis results to establish revised criteria for locations.		
PHI (PEPCO Holdings Inc.)	Yes	PRC-002-RFC-01, draft 11, requires DM for single generating units 250MVA and above, and/or aggregate plant capacity of 750MVA and above.
Response: Thank you for your comment. Since this NERC DM standard has not been fully developed, Reliability*First* can develop and seek approval of its standard in accordance with approved Standard Development Procedures. Reliability*First* is encouraged to track the development of this standard and to consider if it wishes to continue to support and justify a more stringent MVA level of the developing NERC proposal and request a variance accordingly. The SDT formed a task team dedicated to requesting and analyzing transmission system data and used the task team analysis results to establish revised criteria for locations.		

Organization	Yes or No	Question 14 Comment
US Bureau of Reclamation	Yes	
Alberta Electric System Operator	Yes	
NV Energy		As stated previously, the DDR data format differs from region to region and should be standardized.
Response: Thank you for your comment. Data file formatting is not the subject of "what" is required by the standard, but a matter of "how" processes and procedures are developed and communicated. The standard requires that the data be available; the format and how it is communicated are at the discretion of the users.

General Questions

15. Are you aware of any conflicts between the proposed standard and any regulatory function, rule, order, tariff, rate schedule, legislative requirement, or agreement?

Summary Consideration: Commenters were generally unaware of any specific regulatory concerns; however, it was pointed out that the potential incremental financial impact may need to be considered before approval.

Dominion	Yes	Concern that FERC standards and code of conducts, as well as some RTO/ISO rules may prohibit the GO from access to system monitoring data necessary to participate in disturbance analysis studies.
Response: Thank you for your comment. The purpose of this standard is to ensure that disturbance data is available and does not establish requirements for disturbance analysis studies. The conditions under which the data is used, why it is used, and by which entity it is used are as diverse as the range of disturbances and system configurations. Since neither this standard, nor its predecessors, established "what" analyses are required and by which entity, it was not possible to		

Organization	Yes or No	Question 15 Comment
establish reporting "requirements" which are really a matter of "how" the available information can be communicated and utilized.		
American Electric Power	Yes	The additional costs imposed by implementing this standard represent a financial risk to the utility. In the regulatory process, increased costs in tariffs and rate schedules are evaluated for recovery on a cost-benefit basis by the applicable regulatory authority. Additionally, such costs are subject to regulatory lags in the period before such cases are heard by this authority.
Response: Thank you for your comment. The SDT understands your concern in the context of FERC-approved PRC-018-1, which required adding time synchronization. The extent of incremental installations resulting from approval of this standard over that resulting from current standards and criteria is unknown at this time, as the SDT is still developing the technical requirements. This standard is being developed to address reliability issues and serves to improve reliability; therefore, associated implementation costs should be justifiable.		
US Bureau of Reclamation	Yes	
Arizona Public Service Co.		WECC has had a disturbance monitoring plan for many years. As part of this plan they have required PMUs at certain locations. The PMUs that were "approved" include some that would not meet the R9.2 requirement as discussed earlier. This would create a conflict between what WECC agreed was acceptable and what this standard proposes.
Response: Thank you for your comment. The SDT is unable to determine from your comments whether the WECC requirements are more stringent. If those requirements are more stringent, the proposed standard requirements would not preclude those regional requirements from continuing. The entities would have only to demonstrate that they meet the standard requirements.

General Questions

16. Do you have any other questions or concerns with the proposed standard that have not been addressed? If yes, please explain.

Summary Consideration: Commenters provided a wide range of additional questions and comments. A majority of those comments are addressed as follows:

- Compliance Section 1.3.2 and 1.5 are in the Compliance section because they are supporting documentation to demonstrate compliance with the requirements.
- TOs and GOs are required to document and apply a triggering methodology for FR and DDR in the latest revision of the standard.
- The SDT revised the requirements to split the TO and GO requirements into separate requirements to more distinctly address ownership. The standard cannot address all issues with joint ownership. It is up to the owners to address these issues.
- The purpose of the standard is to ensure that data is available to analyze wide area events. Natural disasters may generate large amounts of data and the TO or GO is expected to have that data available. The standard does not state that all of the monitoring equipment must produce data for every event. In the event that a natural disaster, which is considered an act of god, destroys the monitoring equipment and data is not available, as long as data is available from other monitoring location, the intent of the standard's requirements is still met.

Organization	Yes or No	Question 16 Comment
Cowlitz County PUD	No	Typo above, it is 16.
Response: The SDT does not understand this comment.

Southern Company - Transmission	No	No further comment.
Northeast Power Coordinating Council	Yes	Regarding Table 2-1: Generator Owner's Requirement R2 for Sequence of Events Data, as we commented in Question 5 and elsewhere performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. We do not feel that the 200kV threshold, nor the plant/plants' capacities are appropriate criteria for assessing criticality. This should be reflected in the table.The Applicability Section refers to Transmission Owners with facilities greater than 200kV, and Generator Owners with plants connected at greater than 200kV, capacities greater than 500MVA, aggregate plants with capacities

Organization	Yes or No	Question 16 Comment
		greater than 1500MVA. As we commented in Question 5 and elsewhere we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications.
Response: Thank you for your comment. The standard has been revised to eliminate voltage level and generation size from the applicability section. Table 2-1 has been removed. The SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. Also see question 5 responses.		
IRC Standards Review Committee	Yes	Compliance item 1.3.2 and 1.5 seem to be adding undocumented requirements. The standard focuses on data collection but does not require the data to be provided to anyone. Is it implied (from the Rules of procedure) that the data be provided to the ERO, and therefore no requirement is needed? Data Retention also adds undocumented requirements. Mandatory formats should not be part of a standard.
Response: Thank you for your comment. The SDT considered this comment but decided to leave these items in the compliance section. The standard requirements should focus on the "what" and not the "how". In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard.		
SPP System Protection and Control Working Group	Yes	1)The proposed standard needs to include a statement to trigger a DFR on a fault. 2)Sections 1.3.2 and 1.5 from Section D (Compliance) are requirements so they need to be added in Section B (Requirement) 3) How does the requirements in this proposed standard apply to a substation jointly owned by two or more parties?
Response: Thank you for your comment. 1. The proposed standard has been revised to add triggering requirements related to a fault on the transmission system. 2. The SDT has retained these items in the compliance section. 3. The Transmission Owner or Generator Owner can ensure that disturbance monitoring is furnished by contract with the other party.		
Members of the WECC Disturbance Monitoring Work Group	Yes	1. Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. 2. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 3. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.

Organization	Yes or No	Question 16 Comment
Response: Thank you for your comment. 1. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors, such as available short circuit at the facility transmission system bus. 2 and 3. The SDT considered this comment and determined that DDR data can be provided in the stated format. The proposed standard will retain this requirement.		
PacifiCorp	Yes	1. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 2. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files? This appears to be adding requirements to the standard in the Additional Compliance Information section.
Response: Thank you for your comment. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement.		
FirstEnergy	Yes	1. The requirements as written may not take into account the actual entity that owns the equipment. If Transmission Owners installed the equipment relevant to their facilities, and Generation Owners did the same, duplicate monitoring may result. This isn't a problem as it pertains to the actual equipment monitored, but it potentially results in additional costs to the entities. Also, regardless of the NERC Functional Model definitions, there are many different actual equipment ownership arrangements between generation-only entities and the transmission entities to which they are connected. For example, a generation entity may or may not actually own the connection breakers in the transmission substation. We suggest throughout the standard that in all instances where a TO and/or GO "shall" do something, that the word "shall" be replaced with "shall ensure". This is the same wording used in the recently approved RFC DME standard PRC-002-RFC-01 which alleviated many stakeholder concerns regarding ownership and responsibilities for disturbance monitoring. 2. The Compliance Section 1.5 of the standard includes information that is presently contained in requirement R4 of the existing PRC-002-1 standard. We have reviewed the NERC Reliability Standards Development Procedure and it appears that the SDT may have appropriately placed much of the section 1.5 information in section D. Compliance of the reliability standard. The only item in question is the second bullet of section 1.5.1 which may be more appropriately placed in the requirements section. However, it is FirstEnergy's opinion that "after the fact" data submittal type of requirements such as the need to "submit within 30 days upon request" are administrative, have no reliability impact and in general should not be subject to penalties and fines. While the inclusion of this item within the Compliance section avoids the item being subject to the Sanctions Guideline, we ask the team to reconsider its placement in the standard.It is FirstEnergy's opinion that the reliability

Organization	Yes or No	Question 16 Comment
		standards need to evolve in such a way that clearly delineate reliability requirements from administrative requirements. We suggest subsections of section B "Requirements" labeled "1: Reliability Requirements" and "2: Administrative Requirements" and that the administrative requirements would generally receive "traffic ticket" warnings and only escalate to sanctions for repeat or willful violations. 3. The Purpose statement of the standard is missing the "reporting" aspect of this standard. We suggest the SDT change the Purpose statement to match the Purpose of the current PRC-002-1 standard and also detailed in the SAR: "To establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models." 4. The proposed Applicability section details the facilities for which the standard is applicable. However, since the proposed requirements already properly point out the locations that require disturbance monitoring equipment, the applicability section could simply state the TO and GO with no additional qualifying language.
Response: Thank you for your comment. 1. The proposed standard has been revised to include ownership of the equipment to be monitored in the disturbance monitoring requirements. 2. The SDT considered this comment but decided to leave these items in the compliance section. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard 3. The SDT considered this comment but decided not to change the purpose statement. The title of the standard reflects the reporting objective, but more importantly, the requirements contain the necessary reporting requirements between the entities responsible for DME. 4. The proposed standard has been revised in accordance with your comment.		
Los Angeles Department of Water & Power	Yes	Final issue for LADWP is the proposed effective dates, 100% compliance within 4 years. Like many other utilities, our company is limited in resources, including design and installation staff. A preliminary review of these proposed regulations and their affect to our system suggests the need to install several new Fault Recorders and Disturbance Monitoring systems. The amount of work required will likely exceed the 4 years proposed. LADWP may need to discuss scenarios of extending installation dates beyong the proposed 4 year window.
Response: Thank you for your comment. The proposed standard has been revised to require a less aggressive implementation schedule.		
PG&E System Protection	Yes	1. Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units was not. 2. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 3. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file

Organization	Yes or No	Question 16 Comment
		names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
Response: Thank you for your comment. 1. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors such as available short circuit at the facility transmission system bus. 2 and 3. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement.		
NERC	Yes	Effective Date R12-R13For consistency, the first bullet under Effective Dates should read: The first day of the first calendar quarter two years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:"
Response: Thank you for your comment. The standard will be revised to provide consistency in compliance requirements and a less aggressive implementation schedule.		
TransAlta	Yes	SDT took consideration of the resources needed when choosing the criterion for selecting locations for monitoring/recording disturbance data. This can be shown in Table 1 of R4, Each transmission line operated at 200 kV or above that does not have fault data recorded at its remote terminal. So if a line has fault data recorded at its remote terminal, it is not required to record at the nearest terminal. But what about the remote terminal is connected to a generator owned by a GO Does that mean the location owned by the TO is excluded? If using this same approach, why cannot the terminal owned by a GO be excluded if the remote terminal has the fault data recorded? There are no such wordings in the requirements for GO's in the draft. So it is recommended that SDT review the disturbance monitoring/recording requirements at the location of interface between TO and GO.
Response: Thank you for your comment. The Tables have been removed. The SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. Also see question 5 responses.		
NYISO	Yes	Section A5 first sentence: "The First Day of the first calendar quarter four years after?" I think "four" was meant to be "two" such that it's consistant with the end of the sentence.R1.1 I found the sentence difficult to understand, change to the wording in the table under R4.2R5.5 there is an extra "d" in "?fault data recorded d at it's remote terminal"

Organization	Yes or No	Question 16 Comment
Response: Thank you for your comment. The standard will be revised to provide consistency in compliance requirements and a less aggressive implementation schedule. The tables have been removed.		
Portland General Electric	Yes	The following comments are those filed by the DMWG which we are filing in support: 1. Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. 2. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 3. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
Response: Thank you for your comment. 1. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors, such as available short circuit at the facility transmission system bus. 2. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement.		
Progress Energy Florida	Yes	R1.1 and Table 4-1 specifies substations that "contain any combination of 3 or more transmission lines operated >200kV AND TRANSFORMERS having primary and secondary voltage ratings of >200kV".Above, the words AND TRANSFORMERS is interpreted as the location must contain a transformer with primary and secondary voltages >200kV to be a required location. For example, as it's written this would mean the location needs to contain a 500/230kV transformer in addition to at least qty 2 - >200kV lines. A location with 5 >200kV lines and a non-qualifying 230/115kV transformer would not be a required location. If the word was OR a location with 3 >200kV lines would be a required location and would increase the 230kV substation requirement greatly. It is my opinion that these substations and associated >200kV lines do warrant monitoring because of their significance to the BES.R6.2 requires "16 samples per cycle", where R9.2 requires "960 samples per second". SDT should pick a common way to state sample rate. Table 4-1 the Location column specifies "transformers having primary AND secondary voltage ratings >= 200kV" where the Equipment column specifies "transformer having low-side operating voltage >= 200kV. Again, SDT should find a common way to state this requirement.
Response: Thank you for your comment. The standard has been revised to eliminate voltage level and generation size from the applicability section. Table 4-1 has been removed. The SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. Also see question 5 responses.		

Organization	Yes or No	Question 16 Comment
Puget Sound Energy	Yes	1. Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. 2. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 3. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
Response: Thank you for your comment. 1. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors, such as available short circuit at the facility transmission system bus. 2 and 3. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement.		
Schneider Electric	Yes	The driver for this standard is to ensure that the data required for proper analysis is captured. In order to analyze events, data from multiple recorders and multiple locations will be required. Has the committee considered the differences in recording methods used between vendors and the resulting differences in data captured for the same event? Most countries specify IEC 61000-4-30 Class A devices to ensure that all devices (no matter the manufacturer or device type) will provide the same data for the same event. Has the committee considered this standard?
Response: Thank you for your comment. The SDT has considered the differences in recording methods used between vendors and resolved to allow for these vendor differences as long as the data is time stamped and sampled at the required rates or better. The SDT did not consider the IEC standard.		
Independent Electricity System Operator	Yes	R1 and R2 indicate the conditions under which SOE logging should be made, i.e. for changes in circuit breaker position. However, R4 and R5 as well as R7 and R8 do not say what the triggers for these recordings should be, e.g. a fault, a voltage sag or swell. We believe for consistency, reference should be made to some triggering conditions or events.
Response: Thank you for your comment. The proposed standard has been revised to add triggering requirements.		
American Electric Power	Yes	1.AEP would suggest the addition of the following wording where appropriate: Per the requirements of this standard, the equipment owner is responsible for disturbance monitoring and reporting unless the Transmission and Generation Owners have an alternative agreement to monitor interconnecting equipment. 2. Section 1.5

Organization	Yes or No	Question 16 Comment
		of the Section D should be moved into the technical requirement portion of the standard. These involve technical considerations. 3. Please remove bullet three (related to interposing relays). 4. The omission of "Measures" is of concern. A clear sight on measurement should be a part of requirement development, otherwise the objective will not be clear. 5 Additionally, for Effective Date, Requirements R1 through R11, first bullet, first line, should state "two," not "four" years to be consistent. Under Requirements R12 and R13, first bullet, third line, "eighteen months" should be inserted after the word "quarter" and "NERC" should be inserted before "Board." 6. To be clear, R4.2 (p. 6) should have "one winding of each monitored" added before the word "transformer" in line 2. 7. Page 7 contains a typographical error in the fourth row of table 5-1, in the first bullet of column two has a "d" following "recorded" in the fourth line. 8. The page 2 Future Development Plan, on item 7, should have "NERC" added before "Board." "NERC" should also be added before "Board of Trustees" in three locations in Section A-5.
Response: The SDT thanks you for your comments. 1. The SDT considered this comment but did not revise the proposed standard because the requirements should focus on what is required for reliability and not necessarily consider how they will be met (i.e. via agreement between responsible entities). 2. The SDT chose to retain these in the compliance section. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard. 3. The proposed standard has been revised in accordance with your comment. 4. The SDT plans to add measures with the second formal posting. 5. The standard will be revised to provide consistency in compliance requirements and a less aggressive implementation schedule. 6. The SDT considered this comment but did not revise the proposed standard accordingly because the drafting team thinks it is clearly stated in the revised standard. 7. Table 5-1 has been eliminated in the revised standard. 8. The proposed standard has been revised in section A-5 but was not revised on page 2.		
Exelon Generation LLC	Yes	1. Effective date: What does 50% compliant means for a registered Generation Owner (GO) like Exelon that has multiple sites with each site consisting of a single or multiple units? In our case, some units may require DDRs while others may not. Does 50% compliance within two years means 50% of the units in the fleet have to be compliant within two years or does 50% compliant within two years means 50% of the required parameters/quantities to be monitored should be available within two years? We are trying to understand for Generation Owners, does 50% compliance apply to a unit or to a site or to registered GO as a whole? Please clarify. 2. Effective date: PRC-018-1 had a Requirement of 75% compliant within 3 years. Has that Requirement been dropped by PRC-002-2? 3. Effective date: Requirement R12 and R13 This needs to be

Organization	Yes or No	Question 16 Comment
		clarified that these effective dates are applicable to the already installed DME equipment for which GO/TO is taking or intends to take credit for meeting the requirements of this standard. These dates are not applicable to the new equipment. New equipment is allowed to be installed within 2 to 4 years of Regulatory approval. So installing synchronizing capability within 18 months of Regulatory approval, when equipment is not even installed yet, does not make sense.
Response: Thank you for your comment. 1. Data for required parameters/quantities for 50% of the designated locations to be monitored should be available within two years. 2. PRC-018 will be replaced by the proposed standard. The 75% requirement has been dropped by PRC-002-2. 3. The standard will be revised to provide consistency in compliance requirements and a less aggressive implementation schedule.		
DTE Energy/Detroit Edison	Yes	When will violation severity levels be added?
Response: Thank you for your comment. Violation Severity Levels will be added for the second formal posting.		
City of Tallahassee (TAL)	Yes	1. R10; Delete the reference to R9 to read "Each TO and GO that installs a DDR device after January 1, 2011 to meet R7 and/or R8 shall install a device that is capable of continuous recording." R9 is a data management requirement only. It is not used to require the installation of a device. OR combine R10 into R9. R10 is an additional technical specification that would put the specs in one requirement, even though it would be a sub-requirement. 2. Reiterate the need to move Section D Compliance items D.1.3.1, 1.3.2, 1.5.1 back into the requirements section.
Response: Thank you for your comment. 1. The SDT has revised the standard to clarify this wording in accordance with your comments. 2. The SDT has considered this comment. The SDT chose to retain these in the compliance section. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard		
Pacific Northwest National Laboratory	Yes	16A. My primary concern is that the proposed Standard does not address data quality issues, or establish a lexicon for such a discussion. Tedious as they may seem, filtering and spectral content are essential performance factors to examine in any DDR [21].16B. I have a LOT of concerns about Compliance item 1.5.1. The .dst files presently used in PMU networks are efficient to the point of being elegant--how large would an equivalent COMTRADE file be?16C. Item 1.5.1 should have an additional bullet on configuration files:? All reported DDR data shall be accompanied by a configuration file (CF) providing the following primary

Organization	Yes or No	Question 16 Comment
		information: [143] - the data source to which the CF applies (name of the archiving device) - structure of the data source records (number of sensors, sensor names, number of signals for each sensor) - parameters for each signal: ~ sensor producing the signal (includes sensor model & firmware version) ~ signal type (voltage, current, other) ~ scale factors for conversion to engineering units ~ timing shift or phasor rotation needed to correct known offset ~ associated voltage signal (for current signals only) ~ text data for generating signal name (might include sensor model & firmware version)It is acceptable to embed the configuratin file within the data header, if any.16D. Item 1.5.1 should have an additional bullet specifying a processing log to accompany data which have been changed from those initially recorded. Such changes might include filtering, resampling, calculation of derived quantities, renaming or selective deletion of signals.[143] Integrated Monitor Facilities for the Eastern Interconnection: Management & Analysis of WAMS Data Following a Major System Event, J. F. Hauer. Working Note of the Eastern Interconnection Phasor Project (EIPP), December 16, 2004.
Response: The SDT thanks you for your comments and appreciates the level of detail in your concerns. The SDT chose to retain the existing proposed standard text in these areas. The standard requirements should focus on the "what" and not the "how". In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard		
Progress Energy Carolina, Inc.	Yes	R6.2 requires "16 samples per cycle"R9.2 requires "960 samples per second "SDT should pick a common way to state sample rate.
Response: Thank you for your comment. The SDT considered the comment but left the proposed standard wording unchanged in this regard. The draft standard was modified to revise the requirement to store calculated electrical quantities at a rate of at least 30 times per second. The specified rate of 960 samples per second is the internal sampling rate of the electrical signal used to achieve the desired metering accuracy for the derived RMS values of voltage, current, and power flow. The SDT clarified the requirement in the standard by adding the words: "Input sampling rate of at least 960 samples per second". The 960 samples per second requirement presently exist in PRC-002-1.		
Hydro-Québec TransEnergie (HQT)	Yes	1. Regarding Table 2-1: Generator Owner's Requirement R2 for Sequence of Events Data, as we commented in Question 5 and elsewhere performance based stability studies have identified facilities operated at voltages below 200kV, generators with less than 500MVA capacity, aggregate plants with less than 1500MVA that when lost would have a significant impact on the power system. We do not feel that the 200kV threshold, nor the plant/plants' capacities are appropriate criteria for assessing criticality. This should be reflected in the table. 2. The Applicability Section refers to Transmission Owners with facilities greater than 200kV, and Generator Owners with plants connected at greater than 200kV, capacities greater than 500MVA, aggregate plants with capacities greater than 1500MVA. As we commented in Question 5 and elsewhere we do not feel that the 200kV threshold is an appropriate criteria for assessing criticality, nor the single or generating plant capacity specifications.

Organization	Yes or No	Question 16 Comment
Response: Thank you for your comment. 1. Table 2-1 has been removed. The SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. Also see question 5 responses. 2. The standard has been revised to eliminate voltage level and generation size from the applicability section.		
Entergy Services, Inc	Yes	Seems like Section D.1.5 Additional Compliance Information should be listed as part of the requirements.
Response: Thank you for your comment. The SDT considered this it but decided to leave these items in the compliance sections. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard		
Northeast Utilities	Yes	The Applicability Section refers to Transmission Owners with facilities greater than 200kV, and Generator Owners with plants connected at greater than 200kV, capacities greater than 500MVA, aggregate plants with capacities greater than 1500MVA. As commented in Question 4, the 200kV threshold is an not an appropriate criteria for assessing criticality.
Response: Thank you for your comment. The standard has been revised to eliminate voltage level and generation size from the applicability section. The SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. Also see question 5 responses.		
San Diego Gas and Electric Co.	Yes	How would this standard apply to a typical combined cycle plant where the total capability of the plant is above 500MVA, but each of the individual generators is not?
Response: Thank you for your comment. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors, such as available short circuit at the facility transmission system bus.		
New York Independent System Operator	Yes	(D1.5) The bullet items covering COMTRADE and COMNAMES seem to us to be ?Requirements, and it seems odd to find these items under ?Compliance Information. We suggest that, if these items remain in this position, there should be a corresponding Requirement.D.1.5 Common DDR files can be converted into COMTRADE and the purpose stated in COMTRADE for this conversion to a common format is that conversion ?is necessary to facilitate the exchange of such data between applications.? D.1.5 The drafting team should be aware of several IEEE PSRC activities which are in process now, and will affect items covered in this Standard. These activities include the following:C37.111 COMTRADE revision Working Group H4C37.118

Organization	Yes or No	Question 16 Comment
		Synchrophasor Standard revision Working Group H11Channel Names and Instrument Names Working Group H10SOE Data Working Groups H5b (completed) and H16
Response: The SDT thanks you for these comments. The SDT chose to retain these in the compliance section. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard		
Tucson Electric Power	Yes	Would this standard apply to a combined cycle plant that the total capability was above 500 but each of the individual units were not. 2. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 3. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
Response: Thank you for your comment. 1. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors, such as available short circuit at the facility transmission system bus. 2 and 3. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement. The standard drafting team did not move the data format requirements into the Requirements section of the standard because the standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard.		
Duke Energy	Yes	Key Issue #6 listed on page 3 of the Comment Form states that compliance elements (VRFs, VSL, etc.) will be included in a later version of the standard. We strongly encourage the drafting team to include these in the next version issued for comments, because the inclusion of these elements is needed to refine the Requirements.
Response: Thank you for your comment. The SDT plans to include these compliance elements in the second formal posting of the proposed standard.		
CenterPoint Energy	Yes	1. This draft standard includes ambiguities, such as the time stamp for the SOE data for the change in circuit breaker position (open/close) for each circuit breaker in a substation?. Requirement 3 indicates the time stamp shall be recorded ?to within four milliseconds of input received for the change in circuit breaker position (open/close) for each of its circuit breakers specified in Requirements R1 and R2?. It is questionable of what is

Organization	Yes or No	Question 16 Comment
		meant by within four milliseconds of input received for the change in circuit breaker position. For example, is this referring to monitoring of a circuit breaker 52a or 52b auxiliary contact or is something else intended such as circuit breaker main contact parting or closing (when load or fault current begins and ends). 2. The compliance section includes several items that appear to be requirements, but are shown in the compliance section instead of in the requirements section. For example, all the data must be in a format in which COMTRADE software can be used to evaluate the data. As another example, item D.1.5.1 states All known delays in interposing relays shall be reported along with the SOE data?. It is unnecessary and excessive to require such reporting of time delays that are insignificant and should already be taken into account within the accuracy specification. CenterPoint Energy recommends removing items for the Compliance section that are truly requirements. Each item removed should be evaluated before including it as a requirement in this proposed standard. 3. While previously referenced in response to Question 13, CenterPoint Energy is concerned this proposed standard does not sufficiently take into consideration common natural disaster situations. The FERC-approved NERC reliability standard FAC-003 for Vegetation Management does include allowances for situations resulting from natural disasters, such as tornados and hurricanes. This proposed standard does not address the enormous quantities of data and associated complications that arise in such situations. CenterPoint Energy recommends reviewing the various requirements and including appropriate allowances to address the expected operational issues that are encountered during and after natural disasters.
Response: Thank you for your comment. 1. This requirement is intended to monitor a circuit breaker 52a or 52b contact. The intent is for the SOE device to record the change of state within 4 milliseconds of this change of state. 2. The SDT considered this comment but decided to retain the items in the compliance section in the revised standard, except that the interposing relay delay reporting has been eliminated. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard 3. Please see the response in question 13.		
Xcel Energy	Yes	All of the items in section 1.5 "Additional Compliance Information" of the Compliance section appear to be requirements. These are adding to the requirements in the standard and are not appropriate in this section. If the SDT feels these should be required (by virtue of using "shall"), then a new draft should be developed to include these as actual requirements of the standard. Additionally, the new draft should be posted for another comment period.
Response: Thank you for your comment. The SDT considered this comment and determined that the proposed standard will retain these compliance elements. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard		

Organization	Yes or No	Question 16 Comment
Utility System Efficiencies, Inc.	Yes	1. Would this standard apply to a combined cycle plant where the total capability was above 500 MW (and less than 1500 MW) but each of the individual units were not greater than 500 MW. 2. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. I suggest allowing DST files as are used by entities within WECC. 3. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.16C. Item 1.5.1 should have an additional bullet on configuration files:? All reported DDR data shall be accompanied by a configuration file (CF) providing the following primary information: - the data source to which the CF applies (name of the archiving device) - structure of the data source records (number of sensors, sensor names, number of signals for each sensor) - parameters for each signal: ~ sensor producing the signal (includes sensor model & firmware version) ~ signal type (voltage, current, other) ~ scale factors for conversion to engineering units ~ timing shift or phasor rotation needed to correct known offset ~ associated voltage signal (for current signals only) ~ text data for generating signal name (might include sensor model & firmware version)It is acceptable to embed the configuration file within the data header, if any.16D. Item 1.5.1 should have an additional bullet specifying a processing log to accompany data which have been changed from those initially recorded. Such changes might include filtering, resampling, calculation of derived quantities, renaming or selective deletion of signals.
Response: Thank you for your comment. 1. The draft standard posted for this comment period would not apply in this case. However, the SDT performed a technical analysis to determine the location requirements for SOE, FR and DDR data and produced a technical paper summarizing the analysis. The proposed standard has been revised in this area and the case cited may be subject to the standard depending on other factors, such as available short circuit at the facility transmission system bus. 2 and 3. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement.		
British Columbia Transmission Corporation	Yes	1. Under the compliance section, 1.5.1, DDR data shall be in a format able to be viewed by COMTRADE. COMTRADE cannot display common DDR data file formats. Suggest allowing DST files as are used by entities within WECC. 2. The last bullet under 1.5.1 in the Compliance section requires all data file names to be in conformance with IEEE C37.232-2007. Standard DDR equipment does not save file names in this manner. Does this requirement for naming conventions pertain only to shared files. This appears to be adding requirements to the standard in the Additional Compliance Information section.
Response: Thank you for your comment. The SDT considered this comment and determined that DDR data can be provided in the required format. The proposed standard will retain this requirement. The standard requirements should focus on the “what” and not the “how”. In addition, the formatting requirements do not have a		

Organization	Yes or No	Question 16 Comment
direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard		
Kansas City Power & Light	Yes	1. Section 1.3.2 and section 1.5 are in the format of requirements of response times and data format expectations. This is unusual for the Data Retention section. Normally the Data Retention section is targeted to the time required to retain information to demonstrate compliance. It is possible the data format expectations could be in the compliance section. Request the SDT consider whether these are more in line as requirements rather than data retention. 2. Believe there is a potential error in the Effective Date in Section A, item 5, Effective Date. The first sentence states for requirements R1 - R11 must be 50% compliant four years after approval of NERC or FERC, whichever applies. Should this be two years?
Response: Thank you for your comment. 1. The SDT considered this comment and decided to retain these compliance requirements. The standard requirements should focus on the "what" and not the "how". In addition, the formatting requirements do not have a direct impact on reliability. As a result, the drafting team elected to keep these lower-level facilitating data format requirements in the compliance section of the standard 2. The standard will be revised to provide consistency in compliance requirements and a less aggressive implementation schedule.		
MRO NERC Standards Review Subcommittee	Yes	
Bonneville Power Administration	Yes	
Alberta Electric System Operator	Yes	
Dominion		The applicability section of this draft standard is not consistent with NERC's Statement of Compliance Registry Criteria for a TO and GO (i.e., individual generation resources larger than 20 MVA or a generation plant with aggregate capacity greater than 75 MVA that is connected via a step-up transformer(s) to facilities operated at voltages of 100 kV or higher).NERC's Statement of Compliance Registry Criteria states: If an entity is part of a class of entities excluded based on the criteria above as individually being unlikely to have a material impact on the reliability of the bulk power system, but that in aggregate have been demonstrated [emphasis added] to have such an impact it may be registered for applicable standards and requirements irrespective of other considerations.? We therefore recommend that the language referring to voltage and size be removed from the applicability portion of the standard and instead be applied to the requirements within the standard.
Response: Thank you for your comment. The proposed standard has been revised in accordance with your comments.

General Questions

17. Do you agree with the implementation plan as proposed by the SDT? If no, provide a plan that would be acceptable to you and provide rationale.

Summary Consideration: The implementation plan in the revised standard has been modified, and the wording of the percentage of compliance milestones has been clarified.

If older GPS equipment has accuracy problems, it will need to be replaced to meet compliance.

Disturbance data shall be stored for a minimum of 10 calendar days following a Disturbance. This storage can be either local (in the recording device) or remote (in a substation data collection device, company network, or other storage device).

Organization	Yes or No	Question 17 Comment
Northeast Power Coordinating Council	No	Under the section Effective Dates for PRC-002-2 Requirements R1 through R11, the first section reads: "1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:?" For consistency the latter should be changed to four years after Board of Trustees adoption. As written, the timelines are not only inconsistent, but two years is too aggressive a time frame for what is required, in particular considering that Board of Trustees adoption precedes regulatory approval.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one in the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
IRC Standards Review Committee	No	The Implementation schedule for R1 - R11 is not clear. It seems as if a logical schedule would be that all entities be 50% compliant within 2 years and 100% compliant within 4 years. Yet as written it seems to obligate non-regulated entities to be compliant within 2 years while regulated entities have 4 years. Similarly for R12 & R13, the schedule gives regulated entities 18 months to comply but only 3 months for non-regulated entities.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one in the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		

Organization	Yes or No	Question 17 Comment
Bonneville Power Administration	No	It's too fast for a 3 year budget cycle entity.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Florida Power & Light	No	1. From an audit standpoint the statement Each Responsible Entity shall be at least 50% compliant on monitored equipment would seem to be very difficult standard to meet or defend during on audit. Perhaps a better yardstick could be developed for improved audit ability. The overall four year requirement for 100% compliance and 50% compliance in 2 years will place an extremely high burden on many companies especially with nuclear assets. Two years is not enough time to budget design and install a DME into a nuclear facility. How can 50% compliance be met in two years? As seen in the last two years, most manufacturers are unable to keep up with industry demand. Therefore, the ability of the DME manufactures to meet the manufacture volume requirements is also unknown. Six years overall time frame is much more realistic for an implementation plan. 2. GPS equipment synchronization is possible for all existing DMEs that I am aware of; however, some testing indicates that not all equipment can internally use this signal and actually time stamp to the required accuracy. Perhaps for older equipment, the requirement for accurate GPS time synchronization would be sufficient for the purpose of this standard. Older equipment should be allowed to be used during the transitional period without risk of an audit finding for not meeting a +2 millisecond time accuracy requirement. If you have equipment that cannot meet the +_ 2 millisecond requirement, this may result in an unintended consequence that will force companies to remove equipment from their DME list. 3. Older DME equipment do not provide for long term storage. Requiring retrieval or local storage is only possible if the need for data is known soon enough to download and store locally. This would put almost everyone at risk for an audit finding for missing data. One of the primary reasons for replacing DMEs may be due to the 10 day retrieve ability requirement. It seems that timing of this requirement puts the cart before the horse and would seem entirely unrealistic to implement this requirement before the equipment is in place to provide the storage function. Again, if you have equipment that cannot meet the +_ 2 millisecond requirement, this may result in an unintended consequence that will force companies to remove equipment from their DME list.
Response: Thank you for your comment. 1. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.2. The time accuracy requirement is deemed necessary as a technical requirement to provide data that is adequate for wide area disturbance event		

Organization	Yes or No	Question 17 Comment
analysis. 3. The less aggressive implementation plan should aid in meeting the storage function.		
US Bureau of Reclamation	No	As I have mentioned in tems 2 & 5 above, generator capacities (500MVA/unit and 1500MVA/plant) are too large. This will not help over-all post-disturbance analysis. These values should be 20MVA/unit and 75MVA/plant.
Response: Thank you for your comment. Please see the responses for question 5 above.		
NERC	No	Effective Date R12-R13For consistency, the first bullet under Effective Dates should read:The first day of the first calendar quarter two years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Tri-State Generation and Transmission Association	No	Effective dates for 50% and 100% compliance are given. The dates are the same unless no regulatory approval is required. Should the date for 50% compliance be two years after the "applicable Regulatory Approval" instead of also four years?
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
NextEra Energy Resources (formerly FPL Energy)	No	The phased-in approach presented in the Implementation Plan for compliance seem to be unnecessarily restrictive. Issues such as obtaining outages, acquisition of equipment, &/or obtaining personnel necessary to install/replace recording equipment can be difficult and time consuming. It is recommended that rather than the phased-in approach, set a timeframe for completion at a more reasonable five (5) year level regardless of whether there is existing equipment or not.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to		

Organization	Yes or No	Question 17 Comment
ensure a realistic transition to the new requirements.		
Exelon Generation LLC	No	1. Effective date: What does 50% compliant means for a registered Generation Owner (GO) like Exelon that has multiple sites with each site consisting of a single or multiple units? In our case, some units may require DDRs while others may not. Does 50% compliance within two years means 50% of the units in the fleet have to be compliant within two years or does 50% compliant within two years means 50% of the required parameters/quantities to be monitored should be available within two years? We are trying to understand for Generation Owners, does 50% compliance apply to a unit or to a site or to registered GO as a whole? Please clarify. 2. Effective date: PRC-018-1 had a Requirement of 75% compliant within 3 years. Has that Requirement been dropped by PRC-002-2? 3. Effective date: Requirement R12 and R13 This needs to be clarified that these effective dates are applicable to the already installed DME equipment for which GO/TO is taking or intends to take credit for meeting the requirements of this standard. These dates are not applicable to the new equipment. New equipment is allowed to be installed within 2 to 4 years of Regulatory approval. So installing synchronizing capability within 18 months of Regulatory approval, when equipment is not even installed yet, does not make sense.
Response: Thank you for your comment. 1. . Data for required parameters/quantities for 50% of the designated locations to be monitored should be available within two years. 2. PRC-018 will be replaced by the proposed standard. The 75% requirement has been dropped by PRC-002-2. 3. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
DTE Energy/Detroit Edison	No	DME installation at generating stations are dependent on outage schedules. Suggest increasing compliance requirements to 50% at three years and 100% at five years.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
ITC Transmission, METC	No	In the effective dates for Requirements R1 through R11, the Item 1. time frame of "four years" contradicts the Item 2. time frame "two years".
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation		

Organization	Yes or No	Question 17 Comment
plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Progress Energy Carolina, Inc.	No	Some region requirements developed under current PRC-002-1 are closer to where NERC is moving than with other regions. Current PRC-018-1 is underway with TO & GO implementation to meet those region requirements today. For PEC, May 2009 is the first 50% effective date per PRC-018-1. PEC believes that under these circumstances that NERC should address this unique situation now and not wait until PRC-002-2 approval. Compliance related to PRC-018-1 should be deferred until approval of PRC-002-2.
Response: Thank you for your comment. PRC-018 will remain in effect until the adoption of this standard. The SDT is not aware of plans to defer PRC-018 compliance.		
Hydro-Québec TransEnergie (HQT)	No	Under the section Effective Dates for PRC-002-2 Requirements R1 through R11, the first section reads: "1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:?" For consistency the latter should be changed to four years after Board of Trustees adoption. As written, the timelines are not only inconsistent, but two years is too aggressive a time frame for what is required, in particular considering that Board of Trustees adoption precedes regulatory approval.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Northeast Utilities	No	Under the section Effective Dates for PRC-002-2 Requirements R1 through R11, the first section reads: "1. The first day of the first calendar quarter four years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years after Board of Trustees adoption:?" Two years versus four years is inconsistent.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Alberta Electric System Operator	No	The AESO supports the IRC SRC comments.

Organization	Yes or No	Question 17 Comment
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Xcel Energy	No	Paragraph 1 of the Implementation Plan appears to be written incorrectly. It says that 50% of R1 - R11 have to be completed in 4 years for following regulatory approval but within 2 years after BOT approval where regulatory approval is not required. Paragraph 2 then says that 100% of R1 - R11 has to be completed in 4 years. We assume the intent is for 50% of R1-R11 to be completed in 2 years, following regulatory approval, not 4 years.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Southern Company - Transmission	Yes	Southern Company supports the comments submitted by the SERC PCS for this question.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
SERC Protection and Controls Sub-committee	Yes	There appears to be a typo on the first bullet under Requirements R5.1 "Effective Date" four years should be two years. Also a typo under Requirements R12 and R13 where "eighteen months" was left out in the second part of the sentence. This needs to be clarified.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
PacifiCorp	Yes	The time allowed in the draft standard appears acceptable.
Response: The SDT thanks you for your comment.		
Dominion	Yes	We suggest revising the language in section 5 first bullet for R1 through R11 to read: The first day of the first calendar quarter two years after applicable Regulatory Approval, or in those jurisdictions where no regulatory approval is required each Responsible Entity shall be at least 50% compliant within two years

Organization	Yes or No	Question 17 Comment
		and 100% compliant within four years. Correct a typo error on the first bullet under requirement R5.1 Effective Date four years should be two years. Correct an omission error under Requirements R12 and R13 where eighteen months was left out in the second part of the sentence.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
FirstEnergy	Yes	Although we agree with the implementation plan, there seems to be a typographical error in the 1st bullet under the "Effective Date" section 5 of the standard: "four years" should be changed to "two years".
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Cowlitz County PUD	Yes	Question 17 Comments: This standard as written will not apply to Cowlitz and therefore will not present a burden.
Response: The SDT thanks you for your comment.		
SPP System Protection and Control Working Group	Yes	1) Please clarify the effective dates section stating when each entity needs to be 50% and 100% compliant respectively.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.		
Duke Energy	Yes	Regarding the effective dates for Requirements R1 through R11, we question the effective date for 50% compliance - shouldn't it be something less than four years? Four years is the timeframe for 100% compliance.
Response: Thank you for your comment. The standard has been revised to ensure consistency with the effective dates in the standard and the implementation plan (now one and the same in the revised version of the standard). The standard drafting team considered required transition time in the revised effective dates to ensure a realistic transition to the new requirements.

General Questions

18. The standard is proposing a definition for "Substation" based on the IEEE definition. Do you agree that there is sufficient misunderstanding of this term to warrant a definition? If so, do you agree that the IEEE definition is the most appropriate definition?

Summary Consideration: Comments indicate that there is sufficient misunderstanding of the term "Substation" to warrant a definition; however, as several comments pointed out, the IEEE definition of Substation includes a transformer and therefore eliminates what the industry commonly refers to as "switching stations." Because of this, the drafting team agrees that the IEEE definition of Substation is not acceptable for use in this standard.

The drafting team has made significant changes to the standard based on comments received. The new location criteria are based on short circuit levels and eliminate the word "Substation" from the standard.

Organization	Yes or No	Question 18 Comment
Alberta Electric System Operator	No	
Response:		
Duke Energy	No	We agree with the IEEE definition. We don't think that there is sufficient misunderstanding to warrant a NERC definition.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term "Substation."		
IRC Standards Review Committee	No	
Response:		
SERC Engineering Committee Planning Standards Subcommittee	No	There is not sufficient misunderstanding to warrant a definition.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term "Substation."		

Organization	Yes or No	Question 18 Comment
Dominion	No	We do not believe that a definition is warranted. However, if one is deemed necessary we agree with the use of the IEEE definition.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term “Substation.”		
Florida Power & Light	No	The terms substation and "Aggregate plant total nameplate" for the purpose of this standard should be well defined due to the compliance/audit issues that a misunderstanding of these terms could bring for a TO and/or GO.
Response: Thank you for your comment. The Standard has been modified to hopefully clarify the location requirement with out using the term “Substation.”		
US Bureau of Reclamation	No	This document should be clarified the meaning of "Interconnected System." Is it connection of TO and GO system? Is it junction point of Main-transmission system and sub-transmission system? Etc.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term “Substation.” “Interconnected systems” of the TO and GO or multiple TOs will need to have appropriate agreements of responsibility for compliance to the standard requirements, but this is beyond the scope of this standard.		
Progress Energy Florida	No	Clarification is needed whether to include switching stations as part of the criteria (i.e., will a 230kV facility with 5 - 230kV transmission lines without a transformer require a DFR?) Many interpret that a substation includes transformation otherwise the station is a switching station. .
Response: Thank you for your comment. The SDT agrees that the IEEE definition may not apply to these “Switching Substations.” The standard has been modified to clarify the location requirement without using the term “Substation.”		
Bonneville Power Administration	Yes	Also supply the IEEC C37.111-1999 and C37.232-2007 referred to.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term “Substation.”		
SERC Protection and Controls Sub-committee	Yes	We agree with the IEEE definition.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term “Substation.”		

Organization	Yes or No	Question 18 Comment
American Electric Power	Yes	Yes, AEP agrees that there is sufficient misunderstanding. No, AEP does not agree that the IEEE definition is the most appropriate. The portion 'enclosed assemblage' is not clear enough to distinguish assets applicable to the standard. For example, distinct and separate busses, of differing voltage, that may be enclosed by a common fence.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term "Substation."		
Manitoba Hydro	Yes	We agree with the IEEE definition.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term "Substation."		
DTE Energy/Detroit Edison	Yes	A definition is warranted, but the IEEE definition doesn't cover all the configurations that exist.
Response: Thank you for your comment. The Standard has been modified to hopefully clarify the location requirement without using the term "Substation."		
ITC Transmission, METC	Yes	The definition does not work with the standard. There are station facilities with multiple switchyards that are not connected locally. This may cause inaccuracies when counting number of lines for a substation.
Response: Thank you for your comment. The SDT agrees that the IEEE definition may not apply to these "Switching Substations." The standard has been modified to clarify the location requirement without using the term "Substation."		
Hydro-Québec TransEnergie (HQT)	Yes	We agree that "substation" needs a definition. However, "switching station" is being used in the industry to describe those "substations" that do not necessarily have transformers, do not directly supply load or serve as generation outlets, but are strictly transmission junction points. Suggested rewording of the IEEE definition as applied to this Standard: Substation - An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and/or transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modfiying its characteristics. With the preceding change in mind, then Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data would have to be modified accordingly.
Response: Thank you for your comment. The SDT agrees that the IEEE definition may not apply to these "Switching Substations." The standard has been modified to clarify the location requirement without using the term "Substation."		
Northeast Utilities	Yes	We agree that "substation" needs a definition. However, "switching station" is being used in the industry to describe those "substations" that do not necessarily have transformers, do not directly supply load or serve as

Organization	Yes or No	Question 18 Comment
		generation outlets, but are strictly transmission junction points. Suggested rewording of the IEEE definition as applied to this Standard: Substation - An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and/or transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modfiying its characteristics. With the preceding change in mind, then Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data would have to be modified accordingly.
Response: Thank you for your comment. The SDT agrees that the IEEE definition may not apply to these “Switching Substations.” The standard has been modified to clarify the location requirement without using the term “Substation.”		
Tri-State Generation and Transmission Association	Yes	Some definitions of substation require a transformer so the IEEE definition includes what might be considered a switchyard as well as of a substation.
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term “Substation.”		
Southern Company - Transmission	Yes	Southern Company supports the proposed definition of "Substation."
Response: Thank you for your comment. The standard has been modified to clarify the location requirement without using the term “Substation.”		
Northeast Power Coordinating Council	Yes	We agree that "substation" needs a definition. However, "switching station" is being used in the industry to describe those "substations" that do not necessarily have transformers, do not directly supply load or serve as generation outlets, but are strictly transmission junction points. Suggested rewording of the IEEE definition as applied to this Standard: Substation - An enclosed assemblage of equipment, e.g. switches, circuit breakers, buses and/or transformers, under control of qualified persons, through which electric energy is passed for the purpose of switching or modifying its characteristics. With the preceding change in mind, then Table 4-1: Transmission Owner's Requirement R4 for Fault Recording Data would have to be modified accordingly.
Response: Thank you for your comment. The SDT agrees that the IEEE definition may not apply to these “Switching Substations.” The standard has been modified to clarify the location requirement without using the term “Substation.”

Nomination Form

Project 2007-11 Disturance Monitoring
Standard Drafting Team

Please return this form as soon as possible. If you have any questions, please contact Howard Gugel at howard.gugel@nerc.net.

By submitting the following information, you are indicating your willingness and agreement to actively participate in the Standard Drafting Team (SDT) meetings if appointed to the SDT by the Standards Committee. This means that if you are appointed to the SDT, you are expected to attend all (or at least the vast majority) of the face-to-face SDT meetings as well as participate in all the SDT meetings held via conference calls, and failure to do so shall result in your removal from the SDT.

Project 2007-11 Disturbance Monitoring

The purpose of this project is to establish requirements for recording and reporting sequence of events (SOE) data, fault recording (FR) data, and dynamic disturbance recording (DDR) data to facilitate analysis of Disturbances.

We are seeking two individuals who have experience and expertise with disturbance monitoring or power system operations. If possible, we would like to add a member from the RFC Region and Canada.

We are also seeking a lawyer to participate on the team.

Experience with developing standards inside or outside (e.g., IEEE, NAESB, ANSI, etc.) of the NERC process is beneficial, but is not required, and should be highlighted in the information submitted if applicable.

Name:	
Organization:	
Address:	
Telephone:	
E-mail:	

Please briefly describe your experience and qualifications to serve on the requested Standard Drafting Team:
If you are currently a member of any NERC drafting team, please list each team here: ☐ Not currently on any active SAR or standard drafting team. ☐ Currently a member of the following SAR or standard drafting team(s):
If you previously worked on any NERC drafting team please identify the team(s): ☐ No prior NERC SAR or standard drafting team. ☐ Prior experience on the following team(s):

Select each NERC Region in which you have experience relevant to the Project for which you are volunteering:

☐ ERCOT	☐ NPCC	☐ SPP
☐ FRCC	☐ RFC	☐ WECC
☐ MRO	☐ SERC	☐ NA – Not Applicable

Select each Industry Segment that you represent:

☐	1 — Transmission Owners
☐	2 — RTOs, ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable

Select each Function[1] in which you have current or prior expertise:	
☐ Balancing Authority ☐ Compliance Enforcement Authority ☐ Distribution Provider ☐ Generator Operator ☐ Generator Owner ☐ Interchange Authority ☐ Load-serving Entity ☐ Market Operator ☐ Planning Coordinator	☐ Transmission Operator ☐ Transmission Owner ☐ Transmission Planner ☐ Transmission Service Provider ☐ Purchasing-selling Entity ☐ Reliability Coordinator ☐ Reliability Assurer ☐ Resource Planner

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:			
Name:		Telephone:	
Organization:		E-mail:	
Name:		Telephone:	
Organization:		E-mail:	

[1] These functions are defined in the NERC Functional Model, which is available on the NERC web site.

Standards Announcement

Project 2007-11 Disturbance Monitoring Standard Drafting Team

Nomination Period Open through April 25, 2013

Link to Official Nomination Form
Link to Word Version of Nomination Form

Background
The purpose of this project is to establish requirements for recording and reporting sequence of events (SOE) data, fault recording (FR) data, and dynamic disturbance recording (DDR) data to facilitate analysis of Disturbances.

We are seeking two individuals who have experience and expertise with disturbance monitoring or power system operations. If possible, we would like to add a member from the RFC Region and Canada.

We are also seeking a lawyer to participate on the team.

Experience with developing standards inside or outside (e.g., IEEE, NAESB, ANSI, etc.) of the NERC process is beneficial, but is not required, and should be highlighted in the information submitted if applicable.

Instructions for Submitting a Nomination
If you are interested in serving on the Standard Drafting Team, please complete this nomination form by **April 25, 2013**. The nomination form should be submitted describing the individual's experience or qualifications related to the project.

An unofficial Word version of the nomination form is also posted on the Standard Drafting Team Vacancies page.

Standards Process

The Reliability Standards Development Plan explains NERC's work plan for standards development in 2013 and beyond, and the Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our gratitude to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Standard Authorization Request Form – Revised SAR

Request Date	April 15, 2013

SAR Requester Information	**SAR Type** (*Check a box for each one that applies.*)	
Individual, Group, or Committee Name Project 2007-11 Disturbance Monitoring Standard Drafting Team	☐	New Standard
Primary Contact (if Group or Committee) Lee Pedowicz	☒	Revision to existing Standard
Company or Group Name Northeast Power Coordinating Council	☐	Withdrawal of existing Standard
E-mail lpedowicz@npcc.org	☐	Project Identified in Reliability Standards Development Plan (Project Number and Name:)
Telephone (212) 840-1070	☒	Modification to NERC Glossary term or addition of new term

Brief Description of Proposed Standard Modifications/Actions (In three sentences or less, summarize the proposed actions a drafting team will be responsible for implementing.) By this Standard the Drafting Team will establish the requirements for capturing power system disturbance data to enable the effective analysis of power system disturbances.
Need (Explain why the Standard is being developed or modified. Clearly indicate why the actions being proposed are needed for maintaining or improving bulk power system reliability, including an assessment of the reliability and market interface impacts. This is similar to the Purpose statement in a Reliability Standard.) PRC-002 is being revised to ensure the capturing of power system data following a system disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. This will improve system reliability by providing personnel with described data to enable more effective post events analyses. This information will also be used to verify system models.
Goals (Describe what must be accomplished in order to meet the above need. This section would become the Requirements in a Reliability Standard.) Sufficient Sequence of Events, Fault, and Dynamic Disturbance recordings to analyze power system disturbances must be captured and accessible.
Objectives and/or Potential Future Metrics (Describe what the potential measure or criteria for success may be for determining the successful implementation of this request. Provide ideas for potential metrics to be developed and monitored in the future relative to this request, if any.) To obtain adequate power system data to perform an analysis of an event on the BES.
Detailed Description (In three paragraphs or more, provide a detailed description of the proposed actions a drafting team will be responsible for executing so that the team can efficiently implement this request. While you will check applicability boxes on the following page, this description must include proportional identification of to whom the standard should apply among industry participants.) Using the version of PRC-002-2 that had been developed when the Project was categorized as informal in 2011, the Drafting Team will make the revisions necessary to reflect the goal of collecting sufficient Bulk Electric System disturbance data. The revised version will be posted for industry comment, and the Standard revised and reposted as necessary. The Drafting Team will also review technical justifications for requirements in the Standard. The Drafting Team will also be responsible for taking the steps necessary to expose industry to the content of the Standard. This will give industry the opportunity to make more informed comments, and improve the overall process.

In the Applicability Section, responsible entity was used to include the Planning Coordinator and Reliability Coordinator functional entities as described in the NERC Functional Model. The Drafting Team recognized that among the different regions there are different entities that address Dynamic Disturbance recording. The appropriate use of responsible entity will ensure that the responsibility for collecting needed disturbance data will be recognized. For requirements for which neither the Planning Coordinator or the Reliability Coordinator is the appropriate applicable entity, the specific functional entity will be named. The Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard. The Planning Coordinators and Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data. The drafting team is creating the following new terms: Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording.
OPTIONAL: Technical Analysis Performed to Support Justification (Provide the results of any technical study or analysis performed to justify this request. Alternatively, if deemed necessary, propose a technical study or analysis that should be performed prior to a related standard development project being initiated in response to this request.) A study of multiple systems across the continent was done to determine the locations needed to record sufficient power system data for Sequence of Events, Faults, and Dynamic Disturbances based on three phase bolted short circuit MVA thresholds.

Reliability Functions

The Standard(s) May Apply to the Following Functions *(Check box for each one that applies.)*		
☐	Regional Entity	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource	Develops a >one year plan for the resource adequacy of its

	Planner	specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check box for all that apply.)*	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard(s) comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Standard Authorization Request Form

Title of Proposed Standard:	Disturbance Monitoring (Project 2007-11)
Request Date: Revised Date:	March 1, 2007 May 21, 2007

SAR Requester Information

Name: Robert W. Millard on behalf of the Regional Reliability Standards Working Group		SAR Type (Check one box.)	
Company:	Reliability*First* Corporation	☐	New Standard
Telephone:	(708) 588-9886	☒	Revision to Existing Standard
Fax:	(330) 456-3648	☐	Withdrawal of Existing Standard
E-mail:	bob.millard@rfirst.org	☐	Urgent Action

Purpose (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)

~~To establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models.~~

~~PRC-002 — Define and Document Disturbance Monitoring Equipment Requirements~~

~~PRC-018 — Disturbance Monitoring Equipment Installation and Data~~

~~PRC-002 was a Version 0 standard that was modified solely to add Phase III & IV Planning Measures; PRC-018 is a new standard developed as a translation of Phase III & IV Planning Measures. As the Electric Reliability Organization begins enforcing compliance with Reliability Standards under Section 215 of the Federal Power Act in the United States and applicable statutes and regulations in Canada and Mexico, the industry needs a set of clear, measurable, and enforceable Reliability Standards. The Version 0 standards and the translation of Phase III & IV Planning Measures, while a good foundation, were translated from historical operating and planning policies and guides that were appropriate in an era of voluntary compliance. The Version 0 standards, Phase III & IV standards, and recent updates were put in place as a temporary starting point to start-up the Electric Reliability Organization and begin enforcement of mandatory standards. However, it is important to update the standards in a timely manner, incorporating improvements to make the standards more suitable for enforcement and to capture prior recommendations that were deferred during the Version 0 and Phase III & IV translations.~~

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

PRC-002 is being revised to ensure the capturing of power system data following a system disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. This will improve system reliability by providing personnel with described data to enable more effective post events analyses. This information will also be used to verify system models.

~~1. Provide an adequate level of reliability for the North American bulk power systems — ensure the standards are complete and the requirements are set at an appropriate level to ensure reliability.~~

~~2. Ensure they are enforceable as mandatory reliability standards with financial penalties — ensure~~

~~(a) the applicability to bulk power system owners, operators, and users, and as appropriate particular classes of facilities, is clearly defined,~~

~~(b) the purpose, requirements, and measures are results-focused and unambiguous and~~

~~(c) the consequences of violating the requirements are clear.~~

~~3. Consider comments received during the initial development of this set of standards and other comments received from ERO regulatory authorities and stakeholders as described in the Detailed Description section below.~~

~~4. Bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.~~

~~5. Satisfy the standards procedure requirement for five-year review of the standards.~~

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

By this Standard the Drafting Team will establish the requirements for capturing power system disturbance data to enable the effective analysis of power system disturbances.

~~PRC-002 and PRC-018 were approved in 2006.~~

~~PRC-002 is one of four reliability standards identified by the Regional Reliability Standards Working Group as a standard that has some requirements that need to be defined by each regional entity in a regional standard. The standard drafting team (SDT) will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained with the disturbance monitoring program documentation. The SDT shall determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.~~

~~When revising PRC-002 and PRC-018 the SDT will, the SDT shall consider comments and issues as described in the Detailed Description section and Attachment 1 below for drafting and including other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders through the standards development procedure, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.~~

~~Note: Phasor measurement networks are to be addressed by Project 2008-06.~~

Reliability Functions

The Standard will Apply to the Following Functions (Check all applicable boxes.)		
☒ ☐	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☐	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.

Reliability and Market Interface Principles

Applicable Reliability Principles (Check all boxes that apply.)	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
☒	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box.)*
Recognizing that reliability is an essential requirement of a robust North American economy:
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

Using the version of PRC-002-2 that had been developed when the Project was categorized as informal in 2011, the Drafting Team will make the revisions necessary to reflect the goal of collecting sufficient Bulk Electric System disturbance data. The revised version will be posted for industry comment, and the Standard revised and reposted as necessary. The Drafting Team will also review technical justifications for requirements in the Standard.

The Drafting Team will also be responsible for taking the steps necessary to expose industry to the content of the Standard. This will give industry the opportunity to make more informed comments, and improve the overall process.

In the Applicability Section, responsible entity was used to include the Planning Coordinator and Reliability Coordinator functional entities as described in the NERC Functional Model. The Drafting Team recognized that among the different regions there are different entities that address Dynamic Disturbance recording. The appropriate use of responsible entity will ensure that the responsibility for collecting needed disturbance data will be recognized. For requirements for which neither the Planning Coordinator or the Reliability Coordinator is the appropriate applicable entity, the specific functional entity will be named.

The Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard. The Planning Coordinators and Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data.

The drafting team is creating the following new terms: Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording.

~~The SDT shall consider the following comments (excerpted from NERC's Reliability Standards Development Plan: 2007-2009) which attempt to capture comments from the:~~

~~FERC NOPR (Docket # RM06-16-00 dated October 20, 2006),~~

~~FERC staff report dated May 11, 2006 concerning NERC standards submitted with ERO application, and~~

~~Regional Fill-in-the-Blank Team (RRSWG – a NERC working group involved with regional standards development).~~

- ~~Phase III & IV Standard Drafting Team~~
- ~~Violation Risk Factors Drafting Team~~

~~PRC-002 Define and Document Disturbance Monitoring Equipment Requirements~~

~~FERC NOPR~~

- ~~Commission will not propose to accept or remand this Reliability Standard until the ERO submits additional information related to the fill-in-the-blank aspects of this standard as further defined below under "Regional Fill-in-the-Blank Team Comments".~~

~~FERC Staff Report~~

~~• This standard designates RROs as the applicable entity. Staff is concerned about the appropriateness of RROs serving as the applicable entity in the new mandatory standards structure. These standards have been referred to as "fill-in-the-blank" standards (see comments under "Regional Fill-in-the-Blank Team Comments" below).~~

~~Phase III/IV comments~~

~~• There are no criteria that the RROs must use in specifying the process for identifying locations where DMEs are required (to be addressed when considering issues under "Regional Fill-in-the-Blank Team Comments" below).~~

~~Violation Risk Factor Drafting Team Comments~~

~~• R1 - This standard and all related sub requirements are after the fact data analysis.~~

~~Regional Fill-in-the-Blank Team Comments~~

~~• Determine what elements (if any) should be included in the North American standard and what elements should be included in the regional standards.~~

~~• Development of regional standards needs to be coordinated with regional entities.~~

~~• Regional entities should be notified to begin process for developing regional standards once the standard drafting team has determined what elements should be included in the continent-wide standard and what elements should be included in the regional standards.~~

~~PRC-018 Disturbance Monitoring Equipment Installation and Data~~

~~Violation Risk Factor Drafting Team Comments~~

~~• R3.4, 3.5, 3.6, 3.7 Requirements as written are ambiguous and need more clearly defined.~~

~~1. The SDT will bring the standards into conformance with the latest version of the Reliability Standards Development Procedure and the ERO Rules of Procedure as described in Attachment 1 below.~~

~~2. The SDT should also consider any other issues that were not completely captured but were stated or referenced in the above materials.~~

~~3.~~1. ~~The SDT should consider issues raised by the industry during the posting of the SAR for Project 2007-11 during the first comment period from March 22 through April 20, 2007, attached as Attachment 2.~~

~~Attachment 1~~

~~Excerpts from the *Reliability Standards Development Procedure Manual, Version 6* and the *ERO Rules of Procedure*:~~

~~(The drafting team will reference and follow, as appropriate, the following guidelines *(or later version as appropriate)* in determining what changes to make to the standards to bring them into conformance with these guidelines.)~~

~~Standard Review Guidelines~~

~~Applicability~~

~~Does this reliability standard clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted? Where multiple functional classes are identified is there a clear line of responsibility for each requirement identifying the functional class and entity to be held accountable for compliance? Does the requirement allow overlapping responsibilities between Registered Entities possibly creating confusion for who is ultimately accountable for compliance?~~

~~Does this reliability standard identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area? If no geographic limitations are identified, the default is that the standard applies throughout North America.~~

~~Does this reliability standard identify any limitations on the applicability of the standard based on electric facility characteristics, such as generators with a nameplate rating of 20 MW or greater, or transmission facilities energized at 200 kV or greater or some other criteria? If no functional entity limitations are identified, the default is that the standard applies to all identified functional entities.~~

~~Purpose~~

~~Does this reliability standard have a clear statement of purpose that describes how the standard contributes to the reliability of the bulk power system? Each purpose statement should include a value statement.~~

~~Performance Requirements~~

~~Does this reliability standard state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest?~~

~~Does each requirement identify who shall do what under what conditions and to what outcome?~~

~~Measurability~~

~~Is each performance requirement stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement?~~

~~Does each performance requirement have one or more associated measures used to objectively evaluate compliance with the requirement?~~

~~If performance results can be practically measured quantitatively, are metrics provided within the requirement to indicate satisfactory performance?~~

~~Technical Basis in Engineering and Operations~~

~~Is this reliability standard based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field?~~

~~Completeness~~

~~Is this reliability standard complete and self-contained? Does the standard depend on external information to determine the required level of performance?~~

~~Consequences for Noncompliance~~

~~In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, are the consequences of violating a standard clearly known to the responsible entities?~~

~~Clear Language~~

~~Is the reliability standard stated using clear and unambiguous language? Can responsible entities, using reasonable judgment and in keeping with good utility practices, arrive at a consistent interpretation of the required performance?~~

~~Practicality~~

~~Does this reliability standard establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter?~~

~~Capability Requirements versus Performance Requirements~~

~~In general, requirements for entities to have 'capabilities' (this would include facilities for communication, agreements with other entities, etc.) should be located in the standards for certification. The certification requirements should indicate that entities have a responsibility to 'maintain' their capabilities.~~

~~Consistent Terminology~~

~~To the extent possible, does this reliability standard use a set of standard terms and definitions that are approved through the NERC reliability standards development process?~~

~~If the standard uses terms that are included in the NERC Glossary of Terms Used in Reliability Standards, then the term must be capitalized when it is used in the standard. New terms should not be added unless they have a 'unique' definition when used in a NERC reliability standard. Common terms that could be found in a college dictionary should not be defined and added to the NERC Glossary.~~

~~Are the verbs on the 'verb list' from the DT Guidelines? If not – do new verbs need to be added to the guidelines or could you use one of the verbs from the verb list?~~

~~**Violation Risk Factors (Risk Factor)**~~

~~**High Risk Requirement**~~

~~A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures;~~

~~or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.~~

~~**Medium Risk Requirement**~~

~~A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures;~~

~~or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.~~

~~**Lower Risk Requirement**~~

~~A requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. A requirement that is administrative in nature;~~

~~or a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.~~

~~**Time Horizon**~~

~~The drafting team should also indicate the time horizon available for mitigating a violation to the requirement using the following definitions:~~

- ~~**Long-term Planning** — a planning horizon of one year or longer.~~
- ~~**Operations Planning** — operating and resource plans from day-ahead up to and including seasonal.~~
- ~~**Same-day Operations** — routine actions required within the timeframe of a day, but not real-time.~~

- ~~**Real-time Operations** – actions required within one hour or less to preserve the reliability of the bulk electric system.~~
- ~~**Operations Assessment** – follow-up evaluations and reporting of real time operations.~~

~~**Violation Severity Levels**~~

~~The drafting team should indicate a set of violation severity levels that can be applied for the requirements within a standard. ('Violation severity levels' replace existing 'levels of non-compliance.') The violation severity levels may be applied for each requirement or combined to cover multiple requirements, as long as it is clear which requirements are included.~~

~~**The violation severity levels should be based on the following definitions:**~~

- ~~**Lower: mostly compliant with minor exceptions** – The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.~~
- ~~**Moderate: mostly compliant with significant exceptions** – The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.~~
- ~~**High: marginal performance or results** – The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.~~
- ~~**Severe: poor performance or results** – The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.~~

~~**Compliance Monitor**~~

~~Replace, 'Regional Reliability Organization' with 'Regional Entity'~~

~~**Fill-in-the-blank Requirements**~~

~~Do not include any 'fill-in-the-blank' requirements. These are requirements that assign one entity responsibility for developing some performance measures without requiring that the performance measures be included in the body of a standard – then require another entity to comply with those requirements.~~

~~Every reliability objective can be met, at least at a threshold level, by a North American standard. If we need regions to develop regional standards, such as in under-frequency load shedding, we can always write a uniform North American standard for the applicable functional entities as a means of encouraging development of the regional standards.~~

~~**Requirements for Regional Reliability Organization**~~

~~Do not write any requirements for the Regional Reliability Organization. Any requirements currently assigned to the RRO should be re-assigned to the applicable functional entity.~~

~~**Effective Dates**~~

~~Must be 1st day of 1st quarter after entities are expected to be compliant – must include time to file with regulatory authorities and provide notice to responsible entities of the obligation to comply.~~

~~If the standard is to be actively monitored, time for the Compliance Monitoring and Enforcement Program to develop reporting instructions and modify the Compliance Data Management System(s) both at NERC and Regional Entities must be provided in the implementation plan.~~

~~Associated Documents~~

~~If there are standards that are referenced within a standard, list the full name and number of the standard under the section called, 'Associated Documents'.~~

~~Functional Model Version 3~~

~~Review the requirements against the latest descriptions of the responsibilities and tasks assigned to functional entities as provided in pages 13 through 53 of the draft Functional Model Version 3.~~

~~Attachment 2~~

~~Issues Raised by Industry During 1st Posting of SAR for Project 2007-11 Which are Outside the Responsibility of the SAR Drafting Team~~

~~Question 4 of the Comment Form:~~ *~~Please provide any other comments (that you have not already provided in response to the first three questions on this form) that you have on the revised SAR.~~*

~~IRC Standards Review Committee commented:~~
~~The SDT should pose questions regarding:~~
~~(1a) whether or not NERC should require data recording performance requirements that can only be met by purchasing specific assets~~

~~(1b) If it is sufficient to mandate what information and performance is required rather than the hardware itself (it should accomplish the same results but would avoid the issue of asset purchasing)~~

~~(1c) Should assets per se be handled by the certification / recertification process – if the entity does not have the equipment, then it can not be certified; and if it doesn't continue to meet the requirements, it would not be able to meet compliance objectives~~

~~(2) If the PRC-002 requirements were not interconnection-wide, then DT should ask whether or not the obligation for the DME characteristic plans be assigned to the PC or TOP rather than the Regional Entity? PCs and TOPs have a better understanding of their own locality than would a region that may be tempted to homogenize the characteristic requirements~~

~~(3) Should ad hoc hardware details (sampling rates, file naming; format) be left to NAESB rather than NERC? Reliability only needs the information – efficiency and commonality would seem to be more related to Business Practices.~~

Unofficial Comment Form

Project 2007-11 Disturbance Monitoring

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the Standard Authorization Request (SAR). The electronic comment form must be completed by **Monday, June 3, 2013**.

If you have questions please contact Barb Nutter at barbara.nutter@nerc.net or by telephone at 404.446.9692.

2007-11 Disturbance Monitoring Project Page

Background Information
This posting is soliciting informal comment.

Project 2007-11 Disturbance Monitoring was initiated to address an existing "fill in the blank" standard. FERC did not approve or remand PRC-002-1 in Order 693 because the standard contained requirements that applied to the Regional Reliability Organization and did not specifically identify performance requirements for registered entities. FERC did approve PRC-018-1 in Order 693. Similar to PRC-002-1, PRC-018-1 contained Regional Reliability Organization requirements, but FERC stated that the requirements are clear enough to be enforced.

The purpose of this revised SAR is to establish requirements for recording and reporting sequence of events (SOE) data, fault recording (FR) data, and dynamic disturbance recording (DDR) data to facilitate analyses of Disturbances.

This Project will replace PRC-002-1 and PRC-018-1 with PRC-002-2.

PRC-002-1 is being revised to ensure the capturing of power system data following a system disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The proposed standard will not specify what equipment must be used to capture this data, but on ensuring that the requisite data is captured. This will improve system reliability by providing personnel with necessary data to enable more effective analysis of events that affect the Bulk Electric System. This information will also be used to verify system models. PRC-002-2 will also incorporate the pertinent requirements of PRC-018-1 so that PRC-018-1 may be retired.

Using the version of PRC-002-2 that was developed when the Project was in informal development, the Drafting Team will make the revisions necessary to reflect the goal of collecting sufficient Bulk Electric System disturbance data. The Drafting Team will also review technical justifications for requirements in the Standard.

The Drafting Team will also take the steps necessary to present to industry to the content of the Standard. This will give industry the opportunity to make more informed comments, and improve the overall process.

In the Applicability Section, Responsible Entity was used to include the Planning Coordinator and Reliability Coordinator functional entities as described in the NERC Functional Model. The Drafting Team recognized that among the different regions there are different entities that address Dynamic Disturbance recording. The appropriate use of Responsible Entity will ensure that the responsibility for collecting needed disturbance data will be recognized. For requirements for which neither the Planning Coordinator or the Reliability Coordinator is the appropriate applicable entity, the specific functional entity will be named.

The Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard. Planning Coordinators and Reliability Coordinators as applicable will be responsible for determining a list of locations for which the owner must capture Dynamic Disturbance data.

A study of multiple systems across the continent was done to determine the locations needed to record sufficient power system data for Sequence of Events, Faults, and Dynamic Disturbances based on three phase bolted short circuit MVA thresholds.

The drafting team is creating the following new terms: Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording. The drafting team is also using the NPCC Regional definition of Generating Plant in PRC-002-2, and is proposing to move the Regional definition to the NERC Glossary.

You do not have to answer all questions. Enter All Comments in Simple Text Format.
Bullets, numbers, and special formatting will not be retained. Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you agree the scope of the revised SAR describes the work to be performed in this project? If not, please explain.

☐ Yes
☐ No
Comments:

2. The revised SAR identifies a list of functional entities that may be assigned responsibility for requirements in the set of standards addressed by this SAR. Do you agree with the list of proposed applicable functional entities? If no, please explain.

☐ Yes
☐ No

Standards Announcement Updated Links

Project 2007-11 Disturbance Monitoring

Revised SAR Informal Comment Period Open: May 3, 2013 – June 3, 2013

Now Available

A revised Standard Authorization Request (SAR) for Project 2007-11 Disturbance Monitoring is posted for a 30-day informal comment period through **8 p.m. Eastern on Monday, June 3, 2013**.

Background information for this project can be found on the project page.

Instructions for Commenting

The comment period for the revised SAR is open through **8 p.m. Eastern on Monday, June 3, 2013**. Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team will consider all comments received during the informal comment period and determine if revisions to the current standards are necessary. The drafting team will then make a recommendation to the Standards Committee on whether or not to proceed with the project.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

There is no specific mention of the removal of the PRC-018 R6 Maintenance requirement in the SAR. The original SDT was moving it to PRC-005. R6 is ambiguous, and if included needs to be revised or else should be removed. It should be stipulated that DFR/DDR should be verified semi-annually to ensure that the device is receiving analog signals. The Need Section should be revised to limit the applicability to the BES, and to exclude the verification of system models as a specific need for this standard. Suggest the following wording for the Need Section: PRC-002 is being revised to ensure adequate BES data is captured to enable effective post event analysis following a BES disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. Utilization of this data will allow the entity to improve system reliability through BES system improvement. The wording under Brief Description of Proposed Standard Modifications/Actions should also be revised to the following for consistency: By this Standard the Drafting Team will establish the requirements for capturing BES disturbance data to enable effective post event analysis following a BES disturbance. The Standard Drafting Team (SDT)

will review PRC-002 and any NERC approved Regional Disturbance Monitoring Standard.
Yes
No
Once the Standard becomes effective, it will provide continent-wide consistency and clarity for capturing the data needed to analyze various power system disturbances, and validate some of the models used in planning or operational studies. It will decrease the number of standards for this topic.We don’t agree with the need for a standard as proposed. There could be a general requirement for providing DME data for events analysis and modeling purposes that could be put in the Rules of Procedure as opposed to a standard.
Yes
We are in favor of having disturbance monitoring equipment (DM) data capture with common capabilities in the field, but we have concerns with the SAR’s approach. There could be a general requirement for providing DME data for events analysis and modeling purposes that could be put in the Rules of Procedure as opposed to a standard. We would recommend that the NERC Planning Committee develop a common specification and approach to be used for all North America. If the goal of PRC-002 is to enable a data stream for modeling and disturbance analysis, there should be a single standard for provision of such data or a provision included in the Rules of Procedure.
A thoughtful approach must be considered to the possibility of fill-in-the-blank requirements in the standards that apply to the Regional Reliability Organization. Many of these things are no longer done and should be removed from the standards. Some are procedural processes that need not be in the standards, but rather enforced through regional agreements. A few of the items should be codified in the Rules of Procedure. Three phase bolted short circuit MVA thresholds don't appear as appropriate criteria to determine the locations needed to record sufficient power system data for Dynamic Disturbances as stated in SAR (Technical Analysis Performed to Support Justification). Instead of three phase short circuit thresholds, the Planning Coordinator (PC) / Reliability Coordinator (RC) should consider other criteria such as large generation stations with a combined capability above a certain MW level, major load centers, regional and interregional transmission interfaces (flow gates), substations with large tap-changing and phase-shifting transformers, key substations in major load centers. Only Principle number 7 applies. The proposed standard purpose is to collect information to facilitate analysis of a BES disturbance. DDR/DFR do not control, operate, or monitor the BES system. Compliance to this Standard may require Owners to install new equipment. The Implementation Plan when developed should consider the need to budget, engineer, procure and install new DME. Referring to the fourth paragraph of the Detailed Description, it is not appropriate to assign the responsibility of the functional entities. Recommend the fourth paragraph be changed as follows: It is envisioned that the Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard and that the Planning Coordinators or Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data. A sentence should be added in the "Need" section to indicate that the Standard Drafting Team will review the need for having a regional Disturbance

Monitoring standard (PRC-002-NPCC-01). The location where disturbance monitoring devices will be required must be clearly identified by the SDT using clear equipment description (generating station, unit, bus, lines, transformers…) and clear MVA and/or kV thresholds. In reference to the fourth paragraph of the "Detailed Description" section, consideration should be taken in scenarios where the physical location of the disturbance monitoring equipment is shared between the Generator Operator and the Transmission Operator. Addressing this scenario would prevent duplication of equipment at nearby locations or at the same location.

The post 2003 blackout recommendations included the need for synchronized recording devices in power plants and substations to aid in the analysis of wide area events. The industry is faced with a conflict where PRC-002-1 is a fill in the blank standard, thus not FERC approved, but PRC-018-1 is FERC approved. Combining PRC-018-1 into the new PRC-002-2 which will be a continent wide standard is the only way to correct this issue.

Yes
Once the standard becomes effective, it will provide similar continent wide conditions for capturing data needed in analyzing various power system disturbances and validating some of the models used in planning or operational studies.
Yes
We advise the SDT to be mindful of the varied system characteristics among different regions and areas. Hence, the standards should not stipulate a one-size fit all type of installation requirements – may that be locational, geographical or voltage based. The locations for installing DMEs, especially the dynamic disturbance recorders, need to consider the relevance, value and type of the recorded data that can contribute to accomplishing the purpose of having useful information for event analysis.

We are of the opinion that Transmission Owners are the primary applicable entities, with Generator Owner applicability being limited to specific cases (see #5 below). The Transmission Operator and Generator Operator should be removed from applicability to this standard.

Yes
The requirement for generator Dynamic Disturbance Recording (DDR) should be reserved for areas having critical density of generation or load, or for generation near critical flowgates, or for other areas which are recognized as having potential generator stability issues. It should not simply be applied to all generators above a given size. Also for generators, the requirement for DDR should be able to be sufficiently satisfied by using data from plant Distributed Control Systems (DCS).
Individual
Anthony Jablonski
ReliabilityFirst
Yes
ReliabilityFirst agrees that the scope of the revised SAR adequately describes the necessary work to be performed in this project. ReliabilityFirst agrees that the shift in focus of the SAR to ensure that the requisite disturbance data is captured (rather than prescribing the equipment which must be used to capture disturbance data) is an appropriate course of action.
Yes
ReliabilityFirst believes there is definitely a need for this standard. ReliabilityFirst offers the following reasons in support of this standard’s development. This proposed standard will improve system reliability by providing personnel with necessary data to enable the industry to more effectively analyze system events that affect the Bulk Electric System and Bulk Power System. The new version of the standard will remove the "fill-in-the-blank" requirements currently assigned to the Regional Reliability Organization within the current PRC-018-1 and PRC-002-1 standards. And finally, with the events data system models can be reviewed and verified for better accuracy. Each of which will enhance overall system reliability.

(1) General - de-capitalize the word “standard” throughout the SAR. Alternatively, replace the word “standard” with the words “Reliability Standard”. (2) Need - add a “-“ between the words bulk power for consistency with other instances of these words. (3) Objectives and/or Potential Future Metrics - rewrite “BES” as Bulk Electric System (BES) because it is the first instance of these words in the SAR. Also, for clarity, consider adding the words “North American” before Bulk Electric System. (4) Detailed Description - replace Bulk Electric System with its acronym “BES”. (5) General - de-capitalize all instances of “Requirements” because it is not defined in the NERC Glossary of Terms. (6) Detailed Description - capitalize the words “drafting team” in the last paragraph in this section for consistency with the rest of the document. (7) OPTIONAL: Technical Analysis Performed to Support Justification - for clarity, “continent” should be referred to as “North American continent”.

We propose that the “Need Statement” be revised for the following two reasons: a. to limit the applicability to the BES, b. to exclude the verification of system models as a specific need for this standard We propose the following wording be considered: “PRC-002 is being revised to ensure adequate BES data is captured to enable effective post event analysis following a BES disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this

data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. Utilization of this data will allow the entity to improve system reliability through BES system improvement." And the wording under Brief Description should also be changed to the following for consistency: "By this Standard the Drafting Team will establish the requirements for capturing BES disturbance data to enable effective post event analysis following a BES disturbance. The standard drafting team (SDT) will review PRC-002 and any NERC approved Regional Standard PRC-002." Under Goals we recommend the following wording: "Sufficient Adequate (limited redundancy) Sequence of Events, Fault, and Dynamic Disturbance recordings to analyze power system disturbances must be captured and accessible." Where means Adequate means: (lawfully and reasonably sufficient) Sufficient means: (enough to meet the needs of a situation or condition)
Yes
Yes
Yes
We think it is not appropriate to assign under the Detailed Description the responsibility of the functional entities. We recommend the fourth paragraph be changed as follows: "It is envisioned that the Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard and that the Planning Coordinators or Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data."

Bill Middaugh
Yes
No
We believe that the drafting team should develop requirements for specifying which locations require Dynamic Disturbance data. That would eliminate the need for including the Planning Coordinator and the Reliability Coordinator. If a coordinating entity is retained in the Applicability, it should only be the Planning Coordinator because the Functional Model does not provide for assigning this type responsibility to the Reliability Coordinator.

Focusing on data rather than equipment to provide the required recorded information has benefits however this creates some concerns. For example, assume we have a GPS clock and relay that can meet the 2ms criteria however prior to an event the clock loses time due to an internal error (these devices are not perfect) so the relay no longer has the correct time of the event. If this data is then requested by the RE would this be a compliance violation because the data is wrong even though the equipment is capable of meeting the criteria? Will this data be audited? Even though the focus is on data and equipment capabilities and not specifying stand alone or relaying equipment to record data it seems there should be some discussion on the maintenance differences. I recommend that protective relays used for DME type functions should not be in two maintenance plans.
No
In the past there was desire to have a continent wide standards that did not vary based on regions so the requirements were uniform across the continent. Is it now the goal to accept differences in the requirements by regions? Perhaps clarify if this uniformity is not desired.
Yes
I have concerns that at stations that have recording equipment already in place that they may not meet the data capabilities required. This may be a significant # of locations for some TOs. Will there be a way to grandfather in existing locations that will be specified in the standard? Some of the statements from the webinar were to use the fault study and then select 20% of buses using the MVA criteria. This kind of analysis seems straight forward but can create complexity with how it is audited by enforcement in order to prove that 20% was achieved. In general does the drafting team consider how the standard may be audited? Some aspects of the standard may be difficult to audit so one recommendation is to try and consider if there will be difficulties with auditing as requirements are written. I think that if protective relays are acceptable for performing certain DME functions at certain locations they should not have a maintenance requirement under PRC-002 if they are maintained under PRC-005. The SDT may already agree with this but if not please take this under consideration. PRC-005 is a stringent standard that already aims to make sure relaying is operable for protection which is more critical to the BES then data recording in comparison and it has much longer intervals than quarterly. Many relays could meet the 50 cycles recording length but they are not perfect devices. If a relay does not capture at least 2 cycles of pre trigger and 50 cycles of a fault lasting longer than 50 cycles is this a compliance violation? This requirement is logical but I have concern about compliance and overwriting relay data with extending record length. The need for monitoring tie lines needs to be clear. From the webinar it may not have been.
Individual

Exeln and its affiliates
Yes
ComEd believes that fault recording equipment and dynamic disturbance recording equipment that is time synchronized by a GPS Satellite clock are sufficient to analyze disturbances. Although separate sequence of event recording may be useful for Generator Owners/Operators, it should not be required for Transmission Owners. Modern microprocessor relays already include a great deal of built-in sequence of event recording capability. A requirement for SOE capability is thus not needed in a standard and would only be burdensome. Additionally, experience at Exelon has shown that investigation of power system events very rarely requires the use of this built-in sequence of event records capability to determine the root cause of an event.
No
ComEd does not believe that it is necessary that a disturbance monitoring standard apply to the planning coordinator or reliability coordinator. ComEd is rapidly installing modern protection equipment such that eventually all HV & EHV transmission lines and transformers will be protected by equipment with built-in oscillographic and sequence of events capabilities. By the end of 2015, with or without a standard, all of ComEd's EHV lines will have built-in oscillographic and sequence of events capabilities. Currently, the majority of both HV and EHV line relaying are microprocessor based. Thus, there is no need for any involvement of the planning coordinator or reliability coordinator to determine requirements or locations for oscillographic or sequence of events capabilities. For long term disturbance monitors, ComEd believes the standard would be better served by providing a short list of important circuits that would require stored synchrophasor data or long term disturbance monitoring, i.e. all generators greater than X MW or at the tie point of generating stations greater than Y MW aggregate capacity, stability limited lines or IROLS, etc. This would eliminate the need for involving the planning coordinator or reliability coordinator and target required recording data to the most important circuits only. Also, the minimum amount of useful data should be required to be stored for long term disturbance monitors (positive sequence voltage and current (or one phase of voltage and current) and frequency). MW and MVAR can always be calculated. Including the Reliability Coordinator and/or Planning Coordinator is like creating a fill in the blank standard just with a different entity filling in the blank.
Yes
Yes, however, this standard should be very low burden as a good argument could also be made that a standard is not needed at all. Since the 2003 Blackout, the proliferation of microprocessor relays with ever increasing oscillographic recording and sequence of event recording capabilities has increased the amount of data available to a high level and this increase will continue over time with or without a standard. Many entities, including ComEd, include GPS Satellite clocks in the standard design of their transmission relay schemes, etc. Many entities are voluntarily installing equipment that records and stores synchrophasor data on important generator connections and circuits. This is evidenced by comments by NERC

related to investigations of more recent disturbances versus disturbances in the past. We recommend that the only things that need to be in a standard for disturbance monitoring equipment is that a simple list of fault recording equipment needs to be kept, whatever type is used (i.e. relay type (e.g. SEL321), DFR type). Also, a list of long term disturbance monitoring equipment needs to be kept, whatever type is used (long term disturbance monitors or stored phasor data) including that the equipment is connected to a GPS Satellite clocks. Additionally, the standard could require continuous recording for any long term disturbance monitoring, although this is already industry standard, with data retention at least a certain time (e.g. 10 days) and connection of all new monitoring equipment to a GPS Satellite clock. Anything else is just a significant record keeping burden that ComEd does not believe adds anything to reliability and therefore is not justifiable. With modern equipment it is not necessary for NERC to specify things like sample rates, tolerance/accuracy of GPS clocks, etc.
The Exelon business units have been using the RFC criteria PRC-002 and have spent time and money to implement the methodology for capturing and reporting data to align with the RFC criteria. The concern is that there are intentions to move away from the Regional Criteria which would cause a reevaluation and possible rework to the methodology currently used.

Although the NSRF agrees with capturing BES event data, there are entities who currently have devices installed which gather DME data. The issue is how can a Standard (such as PRC-002) mandate the purchasing of such equipment? The cost could be substantial for both large and small applicable entities.
Yes

No
Yes
The cost associated with a 20% bus implementation could be great for both large and small entities (even though the NSRF believes this is being discussed within the SDT). Perhaps NERC should capture what is currently installed within each interconnection as a starting point prior to new installs or relocation of current devices. The Standard should have a foot note (as in PRC-024-1, foot note 1) that states applicable entities are not required to have DME installed or activated on their assets, or words to that effect. This will allow applicable entities to follow the direction of their RC or PC in where they should place DMEs. It will also allow applicable entities understand the importance of installing DMEs and allow the future budgeting of DME's.

Previously proposed Disturbance Monitoring standards were often vague on who was responsible for requirements and it was difficult for entities to determine exactly the scope of

the standard. We see the benefit of this project and encourage the standard drafting team to avoid repeating the mistakes of the past.
1. The PRC-002/018 SDT should keep cost justification in mind, especially as regards TO-vs-GO duplication of DME. This project should be included in the CEAP Pilot Program. 2. We have been installing this equipment in accordance with our RRO's requirements, but it seems unlikely that anyone will ever ask for data, since the TO has DME on their side of the fence at each plant. The role of GO-collected data in Disturbance analysis may be minimal to nonexistent, in which case it would make sense to require GO's to have DME only under very limited circumstances. 3.The revised PRC-002/018 standard should also define the target settings required. The NERC Glossary definition of a Disturbance is of no use, and the criteria in Att. 2 of EOP-004 are written solely for the use of TOs.

Under the Detailed Description section, it is noted that "the Planning Coordinators and Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data." However, under the Technical Analysis Performed to Support Justification section, it is noted that "a study of multiple systems across the continent was done to determine the locations needed to record sufficient power system data for Sequence of Events, Faults, and Dynamic Disturbances based on three phase bolted short circuit MVA thresholds." These two statements appear to be contradictory. In one case, Planning Coordinators and Reliability Coordinators are to specify locations. In the other case, it can be inferred that sufficient research has been conducted already to propose criteria for specifying locations that would be applicable to the standard. If Planning Coordinators and Reliability Coordinators will

be responsible to specify locations, there should be clear division of authority between these two functional entities. Furthermore, there should be some responsibility for Planning Coordinators and Reliability Coordinators to justify on a technical and financial basis the locations that they specify since Generator Owners and Transmission Owners will bear the direct cost of any new infrastructure to comply with the standard.
No
It is not clear what direct role Generator Operators and Transmission Operators would have in the implementation of PRC-002-2. Furthermore, the other functional entities (Reliability Coordinator, Planning Coordinator, Transmission Owner, and Generator Owner) are mentioned elsewhere in the SAR form while Transmission Operator and Generator Operator are not.
Tacoma Power appreciates this opportunity to provide comments.

(1)The slides from the May 22nd NERC webinar indicate considerable PRC-002-2 draft 1 development has already occurred. Based on our experience this draft appears to require a density of disturbance monitoring well in excess of what we believe is needed for disturbance analysis. The SDT has explained the difficulties of developing the August 2003 Blackout sequence of events. (a) Have NERC and its various entities experienced the same level of difficulty in determining a sequence of events since PRC-018-1 and regional criteria have been implemented? (b) For our understanding how many disturbances have NERC and Regional Entities analyzed since June 18th, 2007? (2) Based on our experience we believe that there is now sufficient information to determine the sequence of events, and that regional and NERC disturbance analyses are infrequent. Thankfully widespread disturbances are rare. We understand the importance of disturbance analysis and support an appropriate amount of the correct monitoring equipment, in the right locations, to capture what is necessary to determine sequence of events and system response to determine root cause. (3) We believe that the 1500MVA threshold is very low, too close to current load levels. If 1500MVA is retained, then 20% is too high. (4) We agree that short circuit MVA is a valid factor to consider, however, we also believe that topology is just as important to yield proper placement of disturbance monitors. (5) We request that if <200kV locations are to be included then a bifurcated criteria is warranted and should be used. Major generating sources should be captured, and a much lower percentage of buses are required below 200kV.
Yes
Yes
(1) The SERC Regional Criteria has worked well for SERC and its members. Please consider it as

input to your PRC-002-2 development. Each region’s present criteria are valid input to the standard. As you are aware the BES topology varies considerably depending on load density, so regional variance and even intra-region differences should be considered.
(1) At present, our Planning Coordinator (MISO) is nearing completion on a 3-year project to install Phasor Measurement Units (PMUs) across the MISO controlled transmission system. These PMUs fall into the category of Dynamic Disturbance Recording (DDR) equipment. It is expected across the industry that this type of equipment will be useful in determining the details of system disturbances. (2) According to the Detailed Description of the SAR, on page 3, “The Planning Coordinators and Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data.” We request clarification on how the Planning Coordinator and Reliability Coordinator will be able to fulfill their obligations of locating this monitoring equipment. (3) In addition, we have concerns that revisions to PRC-002, depending on the specifics of the requirements, could be burdensome to Transmission and Generator Owners who may find they have a vastly increased deployment of this type monitoring equipment in order to be compliant.
Individual
Michelle R. D'Antuono
Ingleside Cogeneration LP
Yes
Ingleside Cogeneration (“ICLP”) agrees that the DME standard should focus on the data desired, not the equipment type. The technology is changing rapidly and PRC-002-2 should not inhibit the use of the latest recorder capabilities.
No
ICLP is not sure what role Planning Coordinators and Reliability Coordinators will play in the updated standard. We believe some caution is in order if the intent is to identify additional locations where DME should be deployed beyond those established through the application of PRC-002-2’s criteria. Since the RC and PC decisions will have a cost impact on a Generator Owner, it is important that limits to their authority are established up front – with an allowance for an appeal to NERC if a dispute arises.
Yes
ICLP sees this project as an opportunity to correct Issues with PRC-018-1 which we believe serves no reliability purpose. In particular, the existing requirements to perform regular DME maintenance are unnecessarily burdensome – as data recorders are not directly tied to BES real time reliability. We have no problem performing the maintenance, but the record keeping – and the zero compliance approach in the intervals is excessive for a data gathering function.

Yes
Group
FirstEnergy
Larry Raczkowski
Yes
FirstEnergy (FE) prefers this scope for this SAR as opposed to a more prescriptive method of previous standard, ie, this standard will not specify what equipment must be used to capture this data.
No
On page 4 of the SAR, Transmission Operator and Generation Operator are included. FE believes that the respective Owner (Transmission and Generation) should be applicable, not the Operator. FE agrees that the applicable entities are the Transmission Owner, Generation Owner, Planning Coordinator and Reliability Coordinator.
Yes
FE supports NERC's project to develop a continent-wide standard for disturbance monitoring equipment (DME). Installations of DME devices provide valuable insight for post-event analysis and diagnostics. The DME standard must allow for efficient use of equipment sharing for a TO/GO interface location and not force each owner to separately maintain its own equipment. Additionally, an appropriate balance of required locations must be considered in the reliability cost-benefit.
FE is wondering why the reference to a Regional standard is being implied as a related standard in the development of a NERC standard? It is our understanding that the team will begin its work from the draft PRC-002-2 that was started during an informal project development stage. While products from Regional Entity organizations (NPCC, RFC, etc) may be useful for the team's reference, this NERC drafting team should not be editing/revising a Regional Entity standard. We suggest the SAR reference to "PRC-002-NPCC-01... Redundant requirements to be removed from this Standard" as found on the top of page 6 be deleted from the SAR. Additionally the "Related Standards" table should be further edited to insert a row for PRC-

002-1 with an explanation of "Revise to create PRC-002-2" and edit the explanation statement on PRC-018-1 to say "..after PRC-002-2 approved" for version clarity.

The standard produced needs to clarify what events qualify as those for which registered entities are responsible to acquire, save and report SOE, FR and DDR data per the standard. The standard should clarify these events with reference to criteria already established and followed by NERC and/or others such as Regions or ISOs etc in their analysis programs/practices. For example, regarding data for NERC the standard could set out which of the Categories defined in NERC Events Analysis program the data would be required for. At the end of the day no entity wants or should be surprised with a request for data from any entity after any event. And requests for data via this standard need to be reasonable and justifiable by, for instance, the size and/or impact of the event.
Yes
Yes
The need for this standard is driven by recommendations 12A and 12B in the NERC and US-Canada reports on the August 2003 Blackout. The recommendations were made with and in the context of the SOE record produced for and included in the reports. The standard produced via this SAR must improve but be limited to the ability to produce SOE records like those provided in the NERC and US-Canada reports. The standard must be careful not to overshoot with, for instance, requirements designed to acquire data beyond that needed to do SOE records to the extent and granularity included in the NERC and US-Canada blackout reports, which will happen if the standard requires too much data from too many sources (e.g. extensive and unnecessary SOE or FR from small generators or switching stations.

Hydro-Québec TransÉnergie supports this initiative as it will bring clarity and consistency in the

industry regarding disturbance monitoring while decreasing the number of standards on this topic.
A sentence should be added in the "Need" section to indicate that the Standard Drafting Team will review the need for having a regional Disturbance Monitoring standard (PRC-002-NPCC-01). The location where disturbance monitoring devices will be required must be clearly identified by the SDT using clear equipment description (generating station, unit, bus, lines, transformers…) and clear MVA and/or kV thresholds. In reference to the fourth paragraph of the "Detailed Description" section, consideration should be taken in scenarios where the physical location of the disturbance monitoring equipment is shared between the Generator Operator and the Transmission Operator. Addressing this scenario would prevent duplication of equipment at nearby locations or at the same location.

Disturbance Monitoring Equipment (DME) should be required of GOs/GOPs only if the TO determines that this equipment is necessary. Generally, GO/GOPs generally have little or no role in analyzing Disturbances. It may be necessary to add Distribution Providers to the list of Responsible Entities depending on what requirements are eventually developed
Yes
Previously proposed Disturbance Monitoring standards were often vague on who was responsible for requirements, and it was difficult for entities to determine exactly the scope of the standard. We see the benefit of this project and encourage the standard drafting team to

avoid repeating the mistakes of the past.
1. The PRC-002-1/PRC-018 SDT should keep cost justification in mind, especially as regards TO-vs-GO duplication of DME. We have been installing this equipment in accordance with our RRO's requirements. However, based on our experience, because TOs have DME on their side of the fence at each plant, the role of GO-collected data in Disturbance analysis may be minimal to nonexistent. Therefore, GOs should be required to have DME only if the applicable TO determines GO DME is necessary. 2. This standard may prove difficult for GOs to comply with in terms of disturbance data retrieval because it is dependent upon being aware that a disturbance is occurring somewhere on the transmission system. The GO is not the primary responsible entity for detecting and reporting a disturbance on the BES. On occasion, there may be information about a disturbance that is available to a TO and may not be available to the GO/GOP, therefore, the GO/GOP should not held accountable for the analysis of the disturbance. It should be clear in the standard that the GO/GOP is accountable only for information that is available to them at the time of the disturbance. The revised PRC-002-1/PRC-018-1 standard should also define the target settings for DME.

Michael Lowman
Yes
However, we don't believe that this work necessarily must be accomplished in a reliability standard, but could instead be accomplished under the authority of NERC's Rules of Procedure for data collection and Events Analysis Program. See our responses to questions 3 and 4 below.
Yes
However, the Transmission Planner and the Transmission Operator should also be included to work in conjunction with the Reliability Coordinator and the Planning Coordinator to identify locations for collecting Dynamic Disturbance Data.
No
The Standard Drafting Team should consider that, as an alternative to a reliability standard, these provisions for collecting and providing data could be made in NERC's Rules of Procedure. As the Commission recognized in Order No. 693 paragraph 1550 approving PRC-018-1, "the procedures specified in PRC-002-1 will be provided pursuant to the data gathering provisions of the ERO's Rules of Procedure and the Commission's ability to obtain information pursuant to section 215 of the FPA and Part 39 of the Commission's regulations". There is precedent for handling this type of data collection activity in the Rules of Procedure. Reliability standards TPL-005-0 and TPL-006-0 likewise dealt with Regional Entity reliability assessments and data to be provided to NERC. In NERC's Oct. 19, 2011 Petition in Docket No. RM12-1 to approve TPL-001-2, NERC requested to withdraw the two pending Reliability Standards: TPL-005-0 "Regional and Interregional Self-Assessment Reliability Reports", and TPL-006-0.1 "Data From the Regional Reliability Organization Needed to Assess Reliability". NERC stated that the requirements from

these two Reliability Standards not approved in FERC Order No. 693 have been moved to Sections 803 and 804 of the NERC Rules of Procedure.
Yes
We do not believe a standard is necessary to accomplish the stated goal. This data collection activity could be handled with appropriate revisions to NERC's Rules of Procedure.

We propose that the "Need Statement" be revised for the following two reasons: a. to limit the applicability to the BES, b. to exclude the verification of system models as a specific need for this standard. We propose the following wording be considered: "PRC-002 is being revised to ensure adequate BES data is captured to enable effective post event analysis following a BES disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. Utilization of this data will allow the entity to improve system reliability through BES system improvement." And the wording under Brief Description should also be changed to the following for consistency: "By this Standard the Drafting Team will establish the requirements for capturing BES disturbance data to enable effective post event analysis following a BES disturbance. The standard drafting team (SDT) will review PRC-002 and any NERC approved Regional Standard PRC-002."
Yes
Yes
We think it is not appropriate to assign under the Detailed Description the responsibility of the functional entities. We recommend the fourth paragraph be changed as follows: "It is envisioned that the Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard and that the Planning Coordinators or Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data."
Group
ACES Standards Collaborators
Jason Marshall
Yes

We agree that SAR clearly identifies the scope of work to be performed.
Yes
We agree that the Transmission Owner and Generator Owner are the correct applicable entities that will be required to provide sequence of event, dynamic disturbance and fault event data as they will be the owners of the event recording assets. If the standard is developed, we also agree that the planning coordinator and/or reliability coordinator should be considered in the standards development process as the entity that could replace the regional reliability organization and that identifies locations for the installation of event recorders.
No
(1) No, we do not agree that there is a need for this standard. This standard is better suited to be a guideline and, in effect, will indirectly require transmission owners and generator owners to install new equipment. It is our understanding that the Energy Policy Act of 2005 specifically excluded the authority to order the installation of additional equipment. Can a regulator indirectly require a registered entity to perform an action such as installing new equipment that it cannot compel directly? (2) The requirements in the last version of PRC-002-2 are administrative in nature and SAR appears to focus on developing administrative requirements. While the data itself will be valuable to perform post event analysis, the collection of data itself is actually administrative. The real value obtained is in performing the event analysis and model verification. Thus, it would make more sense to require entities to perform post-event analysis and model verification rather than to collect data. The entity would then be responsible for determining what type of data it would need and how to obtain that data. Furthermore, NERC already has an event analysis process and is developing or has recently developed a number of model verification standards such as MOD-026-1 and MOD-027-1. (3) The NERC event analysis process has been very successful. We are unaware of any recent event since this standard was first proposed in 2009 that NERC has not been able to evaluate for lack of data. Before this standard is developed, we suggest that the drafting team review the need for the standard with NERC's Reliability Risk Management department. (4) Many companies are already installing a tremendous number of phasor measurement units (PMU). These units are capable of recording all the necessary data for events analysis. The joint FERC-NERC event report from the Arizona-Southern California outage of September 2011 highlighted the proliferation of the PMUs which facilitate the event analysis. The PMU has become so ubiquitous because DOE has employed a carrot approach of providing funding for their installation. This approach is much more effective than a penalty approach established in an enforcement regime. (5) In the end, we think the directives issued by FERC in the spring of 2007 have been overcome by six plus years of events. The world has changed tremendously. Furthermore, we believe PRC-018 should be retired rather than developing any standard.
No
We believe a guideline that supports the existing events analysis process along with a significant industry educational outreach explaining the benefits of collecting the data would yield better results. Registered entities will pursue projects with reliability benefits if the benefits clearly exist and are well understood. Unfortunately, this standard has the potential to

become a zero defect standard that provides little reliability benefit. For example, we can see the proposed synchronization requirement PRC-002 R12 becoming a zero defect requirement that provides little value with paper compliance violations similar to those experienced with PRC-005. Registered entities will be forced to prove they have synchronized equipment because these kinds of maintenance records are easy to misplace and will likely lead to violations of the requirement. Even if they can show the equipment is currently within tolerances, they will have no paperwork showing they synchronized it and will still be in violation even though the end result, synchronized equipment, is the desired result.

Entergy Services, Inc.
No
There is no clear scope of the project presented in the SAR Brief Description. The scope should define what disturbance data needs to be collected and why it is important (objectives of what the standard is to accomplish). As presented, the SAR does not clearly define what the new standard is trying to accomplish and how the new standard will addresses industry needs is for improving the reliability of the BES. (See Q5 comments.)
Yes
Yes
However, the SAR is not clear in that it is not clearly define what “power system” data needs to be collected and why it is important for post event analyses and verification of system models. The specific “Power system” data that would be beneficial needs to be listed along with a justification why the collection of this data is important for improving the reliability of the Bulk Electrical System (BES).
The purpose section is totally deleted, so the SAR does not contain a proper purpose. The Detailed Description is not clear as to what are the objectives of the standard. Information provided are items that need to be considered when drafting the standard, however there are no clear details as to what objectives are (and their basis) nor the equipment that should be within the scope of the standard (e.g., generating unit size, line voltage, etc.). The SAR is not clear the use of the vague term “power system” in the brief description is unclear. Does “power system” imply the Bulk Power System, Bulk Electric System, or generating equipment?
Individual
Andrew Gallo
City of Austin dba Austin Energy
Yes

Austin Energy (AE) suggests the SDT consider type of equipment as well as required data. Doing so will ensure checks and balances. That is, the requirements should not specify data without considering the technological capability of the equipment commonly used in the industry.
No
The SAR indicates there may be a role for the Transmission Operator and Generator Operator. The NERC Functional Model Version 5 demonstrates that designing, installing and maintaining facilities is more appropriate to the Transmission Owner and Generator Owner functions.
Yes
Austin Energy (AE) supports a standard that increases clarity, especially regarding responsibilities.
Austin Energy (AE) supports revision of the Disturbance Monitoring standards to close out some "fill-in-the-blank" issues.

Pamela R. Hunter
Yes
No
The GO should not be included – see comments under Question 3.
No
From the GO perspective, post events analysis typically is able to be performed using relay operation records stored within the protective relaying coupled with unit control system historical data. The need for additional high speed data capture equipment, to date, has not been justified from a GO/GOP perspective. The benefit/cost value has not been sufficient to drive the widespread installation of such equipment. The cost for GO/GOP to add DME to each generating facility can be significant due to the design, equipment, and installation costs.
Yes
If the information is needed to verify system models, those entities that create and use the models should make the investment to install equipment needed for those studies.
Individual
Scott Langston
City of Tallahassee
Yes

No
TAL believes the same goal could be accomplished by voluntary efforts.
No
TAL believes voluntary efforts on the part of each entity could be used to provide disturbance monitoring, or an alternative is to leave it up to each region to decide what is needed.

Group
IRC-SRC
Terry Bilke
No
While we agree that the SAR describes the work the team plans to undertake, we don’t agree with the proposed approach.
No
The project background page outlines that the need for the change is to address the “fill in the blank” issue where there are differences among regions. The proposed SAR makes matters significant worse in that rather than 7 regions, there will be over 100 RCs and PCs involved. In fact, NERC has acknowledged that there are areas where there are no PCs. What is planned for the gaps and overlaps?
No
We don’t agree with the need as proposed. There could be a general requirement for providing DME data for events analysis and modeling purposes. We would suggest the drafting team investigate the ability to put this in the Rules of Procedure or as a standing Section 1600 data request as opposed to a standard.
We are in favor of having disturbance monitoring equipment (DME) with common capabilities in the field, but we have concerns with the SAR’s approach. The SAR proposes to fix a “fill in the blank” problem (where each Region has a specification for DME and a process to collect information) by handing off the responsibility to the Planning Coordinator and Reliability Coordinator. This will exacerbate the problem in that there are more Planning Coordinators (80 according to the NERC Registry) than there are Regions and there is no direct alignment or mapping of transmission owners, transmission planners, generator owners and their respective Planning Coordinator (if they even have one). This will increase the balkanization and add gaps. We would recommend that the NERC Planning Committee develop a common specification and approach to be used for all North America. If the goal of PRC-002 is to enable a data stream for modeling and disturbance analysis, there should be a single standard for provision of such data or a provision included in the Rules of Procedure or a standing Section 1600 data request.
We recommend a thoughtful approach to the disposition of requirements in the standards that

apply to the Regional Reliability Organization. Many of these things are no longer done and should be removed from the standards. Some are procedural processes that need not be in the standards, but rather enforced through regional agreements. A few of the items should be codified in the Rules of Procedure. If some of requirements have been taken over by Reliability Coordinators, the applicable function in the standard should change. Finally, NERC needs to address who is the Planning Coordinator in an area where none is defined. We also need to realize that if the goal is to eliminate a "fill in the blank" issue, the solution is not to just move the blanks.

No
We are concerned with the comment regarding the use of this data to verify system models. The primary intent of the data is to analyze system events including assisting in determining proper relay operation. We feel that any additional evaluation of the data would not be very helpful. To use the data as discussed, the configuration of the system would be needed including what generation was operating.
No
While we see a need for consistency at least across an interconnection for the specification and collection of disturbance data, that consistency is probably best provided by a minimum of oversight. Pulling the Reliability Coordinator and Planning Coordinator into this may compartmentalize the requirements even more than was originally thought in the regional standard set-up. Additionally, there are concerns as to just what the role the Reliability Coordinator and Planning Coordinator will be in determining locations for the recording equipment. If the locations are to be specified within an Reliability Coordinator footprint that's one item but if the Reliability Coordinator is to be actively involved in making the determinations then it may be outside the normal operating horizon associated with the Reliability Coordinator function.
Yes
Utilizing a standard ensures consistency in establishing the requirements for DME across North America. Perhaps some consideration could be given to letting the standard provide overview or generic requirements associated with DME but then the details be provided in a guideline or best practices document. However, given this there may then be a tendency for the regions to add additional details in regional standards which are more in-depth than the NERC standard.
We would suggest that the drafting team give consideration to grandfathering existing Disturbance Monitoring Equipment installations in the new standard. Several entities have invested significant funds in this equipment and some sort of consideration for this equipment is definitely well deserved. The standard needs to clearly specify that any maintenance plans for relays associated with Disturbance Monitoring Equipment would be covered in PRC-005

rather than in PRC-002. Stand-alone Disturbance Monitoring Equipment would be covered in PRC-002. There was additional information that was made available during the webinar held on May 22, 2013 which was beneficial to understanding just where the standard is going. It would have been helpful for all if that information could have been made available earlier in the comment period.

CenterPoint Energy believes a new standard is not needed at this time; therefore, the revised SAR is not needed. Please see response to Questions 3 and 4 below.
No
CenterPoint Energy believes a new standard is not needed at this time; therefore, the revised SAR is not needed. Please see response to Questions 3 and 4 below.
No
CenterPoint Energy does not believe there is a need for a new standard at this time. Please see response to Question 4.
CenterPoint Energy believes there are already regional requirements in place in ERCOT that address many of the items identified in the draft SAR, namely fault and sequence of events data. For example, ERCOT Nodal Operating Guide requirements presently specify the following disturbance monitoring equipment requirements: • Equipment types • Triggering requirements • Location requirements • Data recording requirements • Data retention/reporting requirements (format, elements reported, three-year retention period) • Maintenance requirements • Annual equipment reporting • Review process for DME equipment location Additionally, PRC-018-1 already requires entities to follow RRO requirements, and it includes requirements for: • Time sync and data availability • Maintenance program • Data retention FERC and NERC prepared a report dated April 2012 for the Arizona-Southern California outages of September 2011 indicating that disturbance monitoring data was available in this region for facilitating a quick turnaround of a complex event analysis. Similarly, FERC and NERC prepared a report dated August 2011 for the Southwest cold weather event of February 2011. Furthermore, PRC-004 requires analysis and mitigation of transmission protection system misoperations. Event data assists Entities in recreating the sequence of events needed for cause analysis and mitigation development; therefore, Entities already have un-written requirements to install sufficient recorders to meet PRC-004.
CenterPoint Energy believes existing requirements in PRC-018-1 should be reviewed by the team for inclusion in Phase 2 of the Paragraph 81 project, for example, requirements R3 and R5. The VRF for each requirement is “Lower” and the requirements have not been identified as Tier 1, 2, or 3 in the 2013 Actively Monitored List. Furthermore, PRC-018-1 is not a performance-based standard but rather a standard for analytical purposes. This information

can be gathered through other existing means, such as NERC Section 400 of the NERC Rules of Procedure.

Robert Rhodes
No
We are concerned with the comment regarding the use of this data to verify system models. The primary intent of the data is to analyze system events. The SAR, and subsequent standard, should restrict itself to just that. Model validation is another issue for another drafting team and should be covered in a separate project.
No
While we see a need for consistency at least across an interconnection for the specification and collection of disturbance data, that consistency is probably best provided by a minimum of oversight. Pulling the RCs and PCs into this may compartmentalize the requirements even more than was originally thought in the regional standard set-up. Additionally, there are concerns as to just what the role of the RC and PC will be in determining locations for the recording equipment. If the locations are to be specified within an RC footprint that's one item but if the RC is to be actively involved in making the determinations then it may be outside the normal operating horizon associated with the RC function.
Yes
Utilizing a standard ensures consistency in establishing the requirements for DME across North America. Perhaps some consideration could be given to letting the standard provide overview or generic requirements associated with DME but then the details be provided in a guideline or best practices document. However, given this there may then be a tendency for the regions to add additional details in regional standards which are more in-depth than the NERC standard.
One way to minimize the oversight of the specification would be for the PC to take an active role is developing the requirements in either the guideline or best practices document which would serve as the source for this type of information.
We would suggest that the drafting team give consideration to grandfathering existing DME installations in the new standard. Several entities have invested significant funds in this equipment and some sort of consideration for this equipment is definitely well deserved. The standard needs to clearly specify that any maintenance plans for relays associated with DME would be covered in PRC-005 rather than in PRC-002. Stand-alone DME would be covered in PRC-002. There was additional information that was made available during the webinar held on May 22, 2013 which was beneficial to understanding just where the standard is going. It would have been helpful for all if that information could have been made available earlier in the comment period, especially for those who could not participate in the webinar.

Consideration of Comments

Project 2007-11 Disturbance Monitoring

The Project 2007-11 SDT thanks all commenters who submitted comments on the Standard Authorization Request (SAR). There were 44 sets of comments, including comments from approximately 145 different people from approximately 85 companies representing 7 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration of all Comments Received

The main change in the Revised SAR was that the PRC-002-2 is to capture the appropriate data to analyze power system disturbances and not the type of equipment that should be used.

Several commenters made suggested wording changes for the Revised SAR. The Standard Drafting Team (SDT) did not intend to repost the Revised SAR so no changes will be made to the wording of the Revised SAR.

The Drafting Team understands there are misunderstandings and interest in how the MVA short circuit study was performed and how it is applied in the standard. In order to facilitate industry understanding, gather different industry viewpoints, and answer questions - the SDT is holding two technical conferences. The first conference is in Tempe, AZ July 30 and 31, 2013 and the second conference is in Atlanta, GA August 6 and 7, 2013. The conferences will allow attendees to have other questions concerning the standard answered, provide feedback, and it will provide the SDT with additional information to make needed revisions to the standards prior to the comment period and ballot posting.

Please see the summary responses for each question for detailed responses.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/pa/Stand/Resources/Documents/Appendix_3A_StandardsProcessesManual.pdf

1. Do you agree the scope of the revised SAR describes the work to be performed in this project? If not, please explain.

Summary Consideration: There were 42 responses to this question. Of these, 14 did not agree with the scope, and 28 did agree.

The common threads of the comments were:

1. Suggestions to clarify applicability to the BES rather than the BPS, power system, or some other designation.
2. Apparent misconception that the standard will be requiring specific equipment.
3. Some suggestions regarding maintenance of the recording capability.
4. Concerns with statements that the information may be used to verify system models.
5. Requests for clarification as to what events qualify as those for which recordings are to be available.
6. Concerns that it is not clear what the disposition of PRC-018 will be.
7. Some misunderstandings of the MVA short circuit study criteria and how it is to be used.
8. Suggestions for revisions to the “Need” statement and to the “Brief Description” section.
9. One entity is of the opinion that SOER is not needed for Transmission Owners.
10. One entity is of the opinion that the information can be gathered under the NERC Rules of Procedure rather than through a Reliability Standard.

The Standard SDT (SDT) appreciates the comments and believes that some clarifications are needed. The SDT believes several very important aspects of the SAR and intended standard have been misunderstood. The SDT is taking the approach to describe the technical parameters needed for the data recording capability to provide for the adequate gathering of sufficient data with accurate time stamping to provide for the analysis of wide-spread system disturbances. The SDT will clarify which categories of events, as described in the NERC Events Analysis Process documents, were considered in the drafting of the standard.

The SDT will clarify that the standard applies only to locations that are part of the BES. The SDT acknowledges that information other than this data, such as system topology and what generation is online, will be required to be used in combination with this disturbance monitoring data and allow for disturbance analyses.

The SDT is not planning to include a maintenance requirement. The SDT has deliberately not specified what equipment must be used, but described the type of information that is needed and the time-stamping and sampling parameters that will make the information usable in disturbance analyses. The SDT is of the opinion that it should not matter what equipment is used to provide for the recordings, only that the information is provided and meets the standard requirements. This will also provide for the use of any existing or future technology that can meet or exceed the requirements.

One entity questioned whether the loss of a GPS clock, which is normally functional at a given location, would automatically result in a violation of the standard. The SDT recognizes that all such systems have occasional failures or maintenance requirements. The SDT will address the availability and maintenance aspects in the standard, with the intent being that it is recognized that such failures do occur. There will be response requirements for such occurrences, but the SDT is of the opinion that it will be rare for such occurrences, and there will be other locations which will continue to function. The loss of a few locations should not make the information unusable.

The SDT agrees with commenters that state that requiring the use of disturbance monitoring information to verify system models goes beyond the scope of the project. The SDT intends to pursue the development of a guideline document to go along with the standard and may include statements that such practices as verification of system models is not required by the standard, but that it may be considered a good utility practice to do so insofar as the information is relevant and usable for the purpose.

The PRC-002-2 requirements will allow PRC-018-1 to be retired.

The SDT has discussed what events will require data recordings. The SDT has not included this issue in the SAR nor does the SDT plan to include requirements for it in the standard. Instead the SDT has focused on the entities - NERC, the Regions or RCs – that the standard authorizes to make requests for the data, after noting the typical situations in which these entities are most likely to request the data; for instance, Event Categories 3, 4, and 5 in NERC's Event Analysis Program. The SDT has made a significant change in approach since the posting of the first draft in 2009. The approach now will not be equipment centric and will instead address the identification of locations for which Sequence of Events Recording (SOER), Fault Recording (FR), and Dynamic Disturbance Recording (DDR) capability is to be required. Further, the standard will describe the technical methodology using the MVA short circuit level to determine the locations of Sequence of Events Recording (SOER) and Fault Recording (FR), and specify the functional entities that are responsible to either identify the locations or to provide the capability at those locations. The NERC Standards Committee has approved the use of a trial application in this project of the Cost Effectiveness Analysis Process (CEAP).

The Standard Drafting Team reviewed both the "Need" and the "Brief Description" Sections in response to comments. The STD does not feel that those Sections need revision.

NERC Legal Staff was consulted regarding the collection of disturbance monitoring data under the NERC Rules of Procedure, and with reference to the FERC rule for FAC-003-2 it was determined that the collection of data was enforceable.

As stipulated in the standard, the collecting of not only FR and DDR data, but SOER data is needed for event analysis. The Transmission Owner is in a position to capture this data.

Organization	Yes or No	Question 1 Comment
Ameren	No	(1)The slides from the May 22nd NERC webinar indicate considerable PRC-002-2 draft 1 development has already occurred. Based on our experience this draft appears to require a density of disturbance monitoring well in excess of what we believe is needed for disturbance analysis. The SDT has explained the difficulties of developing the August 2003 Blackout sequence of events. (a) Have NERC and its various entities experienced the same level of difficulty in determining a sequence of events since PRC-018-1 and regional criteria have been implemented? (b) For our understanding how many disturbances have NERC and Regional Entities analyzed since June 18th, 2007? (2) Based on our experience we believe that there is now sufficient information to determine the sequence of events, and that regional and NERC disturbance analyses are infrequent. Thankfully widespread disturbances are rare. We understand the importance of disturbance analysis and support an appropriate amount of the correct monitoring equipment, in the right locations, to capture what is necessary to determine sequence of events and system response to determine root cause. (3) We believe that the 1500MVA threshold is very low, too close to current load levels. If 1500MVA is retained, then 20% is too high.(4) We agree that short circuit MVA is a valid factor to consider, however, we also believe that topology is just as important to yield proper placement of disturbance monitors.(5) We request that if <200kV locations are to be included then a bifurcated criteria is warranted and should be used. Major generating sources should be captured, and a much lower percentage of buses are required below 200kV.
Response: The SDT thanks you for your comment.		
CenterPoint Energy Houston Electric, LLC	No	CenterPoint Energy believes a new standard is not needed at this time; therefore, the revised SAR is not needed. Please see response to

Organization	Yes or No	Question 1 Comment
		Questions 3 and 4 below.
Response: The SDT thanks you for your comment.		
Dominion Resources Services, Inc.	No	Dominion believes the scope needs to be more clearly defined to ensure the capturing and analysis of disturbances on the "Bulk Electric System" as opposed to the nebulous "power system."
Response: The SDT thanks you for your comment.		
Nebraska Public Power District	No	Focusing on data rather than equipment to provide the required recorded information has benefits however this creates some concerns. For example, assume we have a GPS clock and relay that can meet the 2ms criteria however prior to an event the clock loses time due to an internal error (these devices are not perfect) so the relay no longer has the correct time of the event. If this data is then requested by the RE would this be a compliance violation because the data is wrong even though the equipment is capable of meeting the criteria? Will this data be audited?Even though the focus is on data and equipment capabilities and not specifying stand alone or relaying equipment to record data it seems there should be some discussion on the maintenance differences. I recommend that protective relays used for DME type functions should not be in two maintenance plans.
Response: The SDT thanks you for your comment.		
Western Area Power Administraton - Upper Great Plains Region	No	Including the statement that "This information will also be used to verify system models" goes beyond the purpose of ensuring that the requisite data is captured. Adding requirements for verifying system models will likely over-complicate the standard and delay its ultimate industry approval.

Organization	Yes or No	Question 1 Comment
Response: The SDT thanks you for your comment.		
Public Service Enterprise Group	No	The standard produced needs to clarify what events qualify as those for which registered entities are responsible to acquire, save and report SOE, FR and DDR data per the standard. The standard should clarify these events with reference to criteria already established and followed by NERC and/or others such as Regions or ISOs etc in their analysis programs/practices. For example, regarding data for NERC the standard could set out which of the Categories defined in NERC Events Analysis program the data would be required for. At the end of the day no entity wants or should be surprised with a request for data from any entity after any event. And requests for data via this standard need to be reasonable and justifiable by, for instance, the size and/or impact of the event.
Response: The SDT thanks you for your comment.		
Entergy Services, Inc.	No	There is no clear scope of the project presented in the SAR Brief Description. The scope should define what disturbance data needs to be collected and why it is important (objectives of what the standard is to accomplish). As presented, the SAR does not clearly define what the new standard is trying to accomplish and how the new standard will addresses industry needs is for improving the reliability of the BES. (See Q5 comments.)
Response: The SDT thanks you for your comment.		
Northeast Power Coordinating Council	No	There is no specific mention of the removal of the PRC-018 R6 Maintenance requirement in the SAR. The original SDT was moving it to PRC-005. R6 is ambiguous, and if included needs to be revised or else should be removed. It should be stipulated that DFR/DDR should be verified semi-annually to ensure that the device is receiving analog signals.

Organization	Yes or No	Question 1 Comment
		The Need Section should be revised to limit the applicability to the BES, and to exclude the verification of system models as a specific need for this standard. Suggest the following wording for the Need Section:PRC-002 is being revised to ensure adequate BES data is captured to enable effective post event analysis following a BES disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. Utilization of this data will allow the entity to improve system reliability through BES system improvement. The wording under Brief Description of Proposed Standard Modifications/Actions should also be revised to the following for consistency:By this Standard the SDT will establish the requirements for capturing BES disturbance data to enable effective post event analysis following a BES disturbance. The Standard SDT (SDT) will review PRC-002 and any NERC approved Regional Disturbance Monitoring Standard.
Response: The SDT thanks you for your comment.		
Tacoma Power	No	Under the Detailed Description section, it is noted that “the Planning Coordinators and Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data.” However, under the Technical Analysis Performed to Support Justification section, it is noted that “a study of multiple systems across the continent was done to determine the locations needed to record sufficient power system data for Sequence of Events, Faults, and Dynamic Disturbances based on three phase bolted short circuit MVA thresholds.” These two statements appear to be contradictory. In one case, Planning Coordinators and Reliability Coordinators are to specify locations. In the other case, it can be inferred that sufficient research has been conducted already to propose criteria for

Organization	Yes or No	Question 1 Comment
		specifying locations that would be applicable to the standard. If Planning Coordinators and Reliability Coordinators will be responsible to specify locations, there should be clear division of authority between these two functional entities. Furthermore, there should be some responsibility for Planning Coordinators and Reliability Coordinators to justify on a technical and financial basis the locations that they specify since Generator Owners and Transmission Owners will bear the direct cost of any new infrastructure to comply with the standard.
Response: The SDT thanks you for your comment.		
Kansas City Power & Light	No	We are concerned with the comment regarding the use of this data to verify system models. The primary intent of the data is to analyze system events including assisting in determining proper relay operation. We feel that any additional evaluation of the data would not be very helpful. To use the data as discussed, the configuration of the system would be needed including what generation was operating.
Response: The SDT thanks you for your comment.		
Southwest Power Pool	No	We are concerned with the comment regarding the use of this data to verify system models. The primary intent of the data is to analyze system events. The SAR, and subsequent standard, should restrict itself to just that. Model validation is another issue for another SDT and should be covered in a separate project.
Response: The SDT thanks you for your comment.		
Northeast Utilities	No	We propose that the “Need Statement” be revised for the following two reasons:a. to limit the applicability to the BES,b. to exclude the verification of system models as a specific need for this standardWe

Organization	Yes or No	Question 1 Comment
		propose the following wording be considered:”PRC-002 is being revised to ensure adequate BES data is captured to enable effective post event analysis following a BES disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. Utilization of this data will allow the entity to improve system reliability through BES system improvement.” And the wording under Brief Description should also be changed to the following for consistency:”By this Standard the SDT will establish the requirements for capturing BES disturbance data to enable effective post event analysis following a BES disturbance. The standard SDT (SDT) will review PRC-002 and any NERC approved Regional Standard PRC-002.” Under Goals we recommend the following wording: "Sufficient Adequate (limited redundancy) Sequence of Events, Fault, and Dynamic Disturbance recordings to analyze power system disturbances must be captured and accessible." Where meansAdequate means: (lawfully and reasonably sufficient)Sufficient means: (enough to meet the needs of a situation or condition)
Response: The SDT thanks you for your comment.		
Consolidated Edison Co. of NY, Inc.	No	We propose that the “Need Statement” be revised for the following two reasons:a. to limit the applicability to the BES,b. to exclude the verification of system models as a specific need for this standard.We propose the following wording be considered:”PRC-002 is being revised to ensure adequate BES data is captured to enable effective post event analysis following a BES disturbance. (Note that the development of PRC-002-2 under Project 2007-11 was made informal in 2011.) The emphasis will not be on what equipment may be used to capture this data, but on ensuring

Organization	Yes or No	Question 1 Comment
		that the requisite data is captured. PRC-002-2 will also include the pertinent requirements of PRC-018-1 that will allow that Standard to be retired. Utilization of this data will allow the entity to improve system reliability through BES system improvement." And the wording under Brief Description should also be changed to the following for consistency:"By this Standard the SDT will establish the requirements for capturing BES disturbance data to enable effective post event analysis following a BES disturbance. The standard SDT (SDT) will review PRC-002 and any NERC approved Regional Standard PRC-002."
Response: The SDT thanks you for your comment.		
MISO	No	While we agree that the SAR describes the work the team plans to undertake, we don't agree with the proposed approach.
Response: The SDT thanks you for your comment.		
Madison Gas and Electric Company	Yes	Although the NSRF agrees with capturing BES event data, there are entities who currently have devices installed which gather DME data. The issue is how can a Standard (such as PRC-002) mandate the purchasing of such equipment? The cost could be substantial for both large and small applicable entities.
Response: The SDT thanks you for your comment.		
City of Austin dba Austin Energy	Yes	Austin Energy (AE) suggests the SDT consider type of equipment as well as required data. Doing so will ensure checks and balances. That is, the requirements should not specify data without considering the technological capability of the equipment commonly used in the industry.
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 1 Comment
Exeln and its affiliates	Yes	ComEd believes that fault recording equipment and dynamic disturbance recording equipment that is time synchronized by a GPS Satellite clock are sufficient to analyze disturbances. Although separate sequence of event recording may be useful for Generator Owners/Operators, it should not be required for Transmission Owners. Modern microprocessor relays already include a great deal of built-in sequence of event recording capability. A requirement for SOE capability is thus not needed in a standard and would only be burdensome. Additionally, experience at Exelon has shown that investigation of power system events very rarely requires the use of this built-in sequence of event records capability to determine the root cause of an event.
Response: The SDT thanks you for your comment.		
FirstEnergy Corp	Yes	FirstEnergy (FE) prefers this scope for this SAR as opposed to a more prescriptive methodof previous standard, ie, this standard will not specify what equipment must be used to capture this data.
Response: The SDT thanks you for your comment.		
Duke Energy	Yes	However, we don't believe that this work necessarily must be accomplished in a reliability standard, but could instead be accomplished under the authority of NERC's Rules of Procedure for data collection and Events Analysis Program. See our responses to questions 3 and 4 below.
Response: The SDT thanks you for your comment.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration ("ICLP") agrees that the DME standard should focus on the data desired, not the equipment type. The technology is changing rapidly and PRC-002-2 should not inhibit the use of the latest

Organization	Yes or No	Question 1 Comment
		recorder capabilities.
Response: The SDT thanks you for your comment.		
ReliabilityFirst	Yes	ReliabilityFirst agrees that the scope of the revised SAR adequately describes the necessary work to be performed in this project. ReliabilityFirst agrees that the shift in focus of the SAR to ensure that the requisite disturbance data is captured (rather than prescribing the equipment which must be used to capture disturbance data) is an appropriate course of action.
ACES	Yes	We agree that SAR clearly identifies the scope of work to be performed.

2. **The revised SAR identifies a list of functional entities that may be assigned responsibility for requirements in the set of standards addressed by this SAR. Do you agree with the list of proposed applicable functional entities? If no, please explain.**

Summary Consideration:

The Standard SDT (SDT) appreciates industry comments pertaining to the list and responsibilities of proposed functional entities addressed in this SAR. Overall, 23 commenters replied 'Yes' to this question while 15 replied 'No'. Of the respondents who provided additional comments, many were in consensus regarding specific areas. These areas, and the SDT's response to these concerns, are provided below:

•*The Transmission Owner (TO) and Generator Owner (GO) are the primary applicable entities for this Standard.* The SDT agrees that the TO and GO play a critical role in ensuring the capability of Disturbance Monitoring recording since they are the ultimate owners of the equipment. Specifically, TOs generally perform system fault studies and have the most direct involvement with Fault Recording (FR) and Sequence of Events Recording (SOE) and its placement. As the SAR addresses, the TOs and GOs will be responsible for the bulk of Requirements in this Standard. However, the Planning Coordinator and Reliability Coordinator have a wide-area view pertaining to location placement of Dynamic Disturbance Recording (DDR).

•*The Generator Owner (GO) should not be included as an applicable functional entity.* Generator Owners (GOs) play a critical role in providing FR, SOE, and DDR capability. Generator Owners (GOs) are responsible to provide Fault Recording (FR) and Sequence of Events Recording (SOE) at generation interconnection facilities at sites selected by the TO using the MVA criteria, and Dynamic Disturbance Recording (DDR) at generating plants above a given MVA level.

•*Further explanation and clarity should be provided for the role of the Planning Coordinator (PC) or Reliability Coordinator (RC) in the applicable functional entities.* The requirements for Dynamic Disturbance Recording locations incorporate wide-area (Regional or Interconnection-wide) perspective of the Bulk Electric System (BES). The PC or RC has the responsibility of determining the locations for DDR, maintaining a list of those locations, and coordinating that information with the TOs and GOs in its footprint. Their authority on placement set forth in this Standard. Many PCs and RCs, or their staffs, have already worked in conjunction with their TOs and GOs to perform analyses of DDR placement. Furthermore, in some Regions the RC, or its staff is better suited, to be the applicable functional entity rather than the PC.

•*The Transmission Operator (TOP) and Generator Operator (GOP) should be removed from applicability of this Standard.* The SDT agrees with this statement and has removed the TOP and GOP from any applicability pertaining to this Standard.

•*Distribution Provider should also be included depending on the specific requirements developed.* The SDT has considered this comment. The Requirements being developed pertain to Disturbance Monitoring for the Bulk Electric System (BES). For this purpose, the Transmission Owner (TO) and Generator Owner (GO) are best suited to accomplish adequate coverage for capturing BES Disturbances.

•*Continent-wide standard and addressing the "fill in the blank" issue for Planning Coordinator (PC) and Reliability Coordinator (RC).* The intent of this Standard is to provide a continent-wide standard that provides adequate coverage for Disturbance Monitoring. Regional differences have minimally been addressed in certain Requirements in this Standard based on system dynamic performance; however, regional variances have been minimized. The SDT would like to again clarify that the PC and RC are included as applicable functional entities in this Standard for the location Requirements pertaining to Dynamic Disturbance Recording (DDR). However, the location Requirements are no longer "fill in the blank" requirements and it is the responsibility of the PC and RC to determine where these locations and Elements are to be monitored based on the Standards' Requirements. The PC and RC have a wide-area view, and including both allows for regional variances, filling in potential gaps or variances between Regions.

Organization	Yes or No	Question 2 Comment
American Electric Power	No	AEP agrees overall with the functional entities as specified, however it might be necessary to also include Distribution Provider, depending on what specific requirements are eventually developed.
Response: The SDT thanks you for your comment.		
CenterPoint Energy Houston Electric, LLC	No	CenterPoint Energy believes a new standard is not needed at this time; therefore, the revised SAR is not needed. Please see response to Questions 3 and 4 below.
Response: The SDT thanks you for your comment.		
Exeln and its affiliates	No	ComEd does not believe that it is necessary that a disturbance monitoring standard apply to the planning coordinator or reliability coordinator. ComEd is rapidly installing modern protection equipment such that eventually all HV & EHV transmission lines and transformers will be protected by equipment with built-in oscillographic and sequence of events capabilities. By the end of 2015, with or without

Organization	Yes or No	Question 2 Comment
		a standard, all of ComEd's EHV lines will have built-in oscillographic and sequence of events capabilities. Currently, the majority of both HV and EHV line relaying are microprocessor based. Thus, there is no need for any involvement of the planning coordinator or reliability coordinator to determine requirements or locations for oscillographic or sequence of events capabilities. For long term disturbance monitors, ComEd believes the standard would be better served by providing a short list of important circuits that would require stored synchrophasor data or long term disturbance monitoring, i.e. all generators greater than X MW or at the tie point of generating stations greater than Y MW aggregate capacity, stability limited lines or IROLS, etc. This would eliminate the need for involving the planning coordinator or reliability coordinator and target required recording data to the most important circuits only. Also, the minimum amount of useful data should be required to be stored for long term disturbance monitors (positive sequence voltage and current (or one phase of voltage and current) and frequency). MW and MVAR can always be calculated. Including the Reliability Coordinator and/or Planning Coordinator is like creating a fill in the blank standard just with a different entity filling in the blank.
Response: The SDT thanks you for your comment.		
LG&E and KU Services	No	Disturbance Monitoring Equipment (DME) should be required of GOs/GOPs only if the TO determines that this equipment is necessary. Generally, GO/GOPs generally have little or no role in analyzing Disturbances.It may be necessary to add Distribution Providers to the list of Responsible Entities depending on what requirements are eventually developed
Response: The SDT thanks you for your comment.		
Ingleside Cogeneration LP	No	ICLP is not sure what role Planning Coordinators and Reliability Coordinators will play in the updated standard. We believe some caution is in order if the intent is to identify additional locations where DME should be deployed beyond those established through the application of PRC-002-2's criteria. Since the RC and PC decisions will have a cost

Organization	Yes or No	Question 2 Comment
		impact on a Generator Owner, it is important that limits to their authority are established up front - with an allowance for an appeal to NERC if a dispute arises.
Response: The SDT thanks you for your comment.		
Nebraska Public Power District	No	In the past there was desire to have a continent wide standards that did not vary based on regions so the requirements were uniform across the continent. Is it now the goal to accept differences in the requirements by regions? Perhaps clarify if this uniformity is not desired.
Response: The SDT thanks you for your comment.		
Tacoma Power	No	It is not clear what direct role Generator Operators and Transmission Operators would have in the implementation of PRC-002-2. Furthermore, the other functional entities (Reliability Coordinator, Planning Coordinator, Transmission Owner, and Generator Owner) are mentioned elsewhere in the SAR form while Transmission Operator and Generator Operator are not.
Response: The SDT thanks you for your comment.		
FirstEnergy Corp	No	On page 4 of the SAR, Transmission Operator and Generation Operator are included. FE believes that the respective Owner (Transmission and Generation) should be applicable, not the Operator. FE agrees that the applicable entities are the Transmission Owner, Generation Owner, Planning Coordinator and Reliability Coordinator.
Response: The SDT thanks you for your comment.		
Southern Company Operations Compliance	No	The GO should not be included - see comments under Question 3.

Organization	Yes or No	Question 2 Comment
Response: The SDT thanks you for your comment.		
MISO	No	The project background page outlines that the need for the change is to address the "fill in the blank" issue where there are differences among regions. The proposed SAR makes matters significant worse in that rather than 7 regions, there will be over 100 RCs and PCs involved. In fact, NERC has acknowledged that there are areas where there are no PCs. What is planned for the gaps and overlaps?
Response: The SDT thanks you for your comment.		
City of Austin dba Austin Energy	No	The SAR indicates there may be a role for the Transmission Operator and Generator Operator. The NERC Functional Model Version 5 demonstrates that designing, installing and maintaining facilities is more appropriate to the Transmission Owner and Generator Owner functions.
Response: The SDT thanks you for your comment.		
Wisconsin Electric Power Company	No	We are of the opinion that Transmission Owners are the primary applicable entities, with Generator Owner applicability being limited to specific cases (see #5 below). The Transmission Operator and Generator Operator should be removed from applicability to this standard.
Response: The SDT thanks you for your comment.		
Bill Middaugh	No	We believe that the SDT should develop requirements for specifying which locations require Dynamic Disturbance data. That would eliminate the need for including the Planning Coordinator and the Reliability Coordinator. If a coordinating entity is retained in the Applicability, it should only be the Planning Coordinator because the Functional Model does not provide for assigning this type responsibility to the Reliability Coordinator.

Organization	Yes or No	Question 2 Comment
Response: The SDT thanks you for your comment.		
Southwest Power Pool	No	While we see a need for consistency at least across an interconnection for the specification and collection of disturbance data, that consistency is probably best provided by a minimum of oversight. Pulling the RCs and PCs into this may compartmentalize the requirements even more than was originally thought in the regional standard set-up. Additionally, there are concerns as to just what the role of the RC and PC will be in determining locations for the recording equipment. If the locations are to be specified within an RC footprint that's one item but if the RC is to be actively involved in making the determinations then it may be outside the normal operating horizon associated with the RC function.
Response: The SDT thanks you for your comment.		
Kansas City Power & Light	No	While we see a need for consistency at least across an interconnection for the specification and collection of disturbance data, that consistency is probably best provided by a minimum of oversight. Pulling the Reliability Coordinator and Planning Coordinator into this may compartmentalize the requirements even more than was originally thought in the regional standard set-up. Additionally, there are concerns as to just what the role the Reliability Coordinator and Planning Coordinator will be in determining locations for the recording equipment. If the locations are to be specified within an Reliability Coordinator footprint that's one item but if the Reliability Coordinator is to be actively involved in making the determinations then it may be outside the normal operating horizon associated with the Reliability Coordinator function.
Response: The SDT thanks you for your comment.		
Duke Energy	Yes	However, the Transmission Planner and the Transmission Operator should also be included to work in conjunction with the Reliability Coordinator and the Planning

Organization	Yes or No	Question 2 Comment
		Coordinator to identify locations for collecting Dynamic Disturbance Data.
Response: The SDT thanks you for your comment.		
Essential Power, LLC	Yes	The SRT believes it may be necessary to add the Distribution Provider depending on what requirements are eventually developed.
Response: The SDT thanks you for your comment.		
ACES	Yes	We agree that the Transmission Owner and Generator Owner are the correct applicable entities that will be required to provide sequence of event, dynamic disturbance and fault event data as they will be the owners of the event recording assets. If the standard is developed, we also agree that the planning coordinator and/or reliability coordinator should be considered in the standards development process as the entity that could replace the regional reliability organization and that identifies locations for the installation of event recorders.
Response: The SDT thanks you for your comment.

3. Do you agree there is a need for a standard? Please explain your response.

Summary Consideration:

The Standard SDT (SDT) appreciates industry comments regarding the need for a standard. Overall, 30 commenters replied 'Yes' to this question while 9 replied 'No', thus the consensus of responses was an agreement that there is a need for a standard.

Of the commenters that provided a 'No' response with an explanation, many were in consensus regarding specific areas. These areas, and the SDT's response to these concerns, are provided below:

• '*The standard is better suited to be a guideline and, in effect, will indirectly require transmission owners and generator owners to install new equipment. …the same goal can be accomplished by voluntary efforts.'* The SDT has worked to draft a standard which requires applicable functional entities to record sufficient information to capture the data needed at identified locations to enable post-disturbance analyses. The SDT has deliberately avoided specifying equipment to be installed. The SDT has taken this approach because it recognized the unintended consequences of precluding the use of new technology or other adaptations of other available or, possibly, already existing equipment. The standard is a performance based standard. Further, the capture of the information or data is very important for post-disturbance analysis. A guideline which will indirectly require TO and GO to install new DME equipment or which relies on voluntary efforts may not result in the actual provision of the information that is needed.

•*General requirement for providing DME data for events analysis and modeling purposes that could be put in the Rules of Procedure as opposed to a standard.* The industry approved SAR indicates that this data should be provided as specified in a Reliability Standard. For further discussion on the Rules of Procedure and Section 1600 please refer to the response to Question 4.

Organization	Yes or No	Question 3 Comment
ACES	No	(1) No, we do not agree that there is a need for this standard. This standard is better suited to be a guideline and, in effect, will indirectly require transmission owners and generator owners to install new equipment. It is our understanding that the Energy Policy Act of 2005 specifically excluded the authority to order the installation of additional equipment. Can a regulator indirectly require a registered entity to perform an action such as installing new equipment that it cannot compel directly? (2) The requirements in the last version of PRC-002-2 are administrative in nature and SAR

Organization	Yes or No	Question 3 Comment
		appears to focus on developing administrative requirements. While the data itself will be valuable to perform post event analysis, the collection of data itself is actually administrative. The real value obtained is in performing the event analysis and model verification. Thus, it would make more sense to require entities to perform post-event analysis and model verification rather than to collect data. The entity would then be responsible for determining what type of data it would need and how to obtain that data. Furthermore, NERC already has an event analysis process and is developing or has recently developed a number of model verification standards such as MOD-026-1 and MOD-027-1. (3) The NERC event analysis process has been very successful. We are unaware of any recent event since this standard was first proposed in 2009 that NERC has not been able to evaluate for lack of data. Before this standard is developed, we suggest that the SDT review the need for the standard with NERC's Reliability Risk Management department. (4) Many companies are already installing a tremendous number of phasor measurement units (PMU). These units are capable of recording all the necessary data for events analysis. The joint FERC-NERC event report from the Arizona-Southern California outage of September 2011 highlighted the proliferation of the PMUs which facilitate the event analysis. The PMU has become so ubiquitous because DOE has employed a carrot approach of providing funding for their installation. This approach is much more effective than a penalty approach established in an enforcement regime. (5) In the end, we think the directives issued by FERC in the spring of 2007 have been overcome by six plus years of events. The world has changed tremendously. Furthermore, we believe PRC-018 should be retired rather than developing any standard.
Response: The SDT thanks you for your comment.		
CenterPoint Energy Houston Electric, LLC	No	CenterPoint Energy does not believe there is a need for a new standard at this time. Please see response to Question 4.
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 3 Comment
Southern Company Operations Compliance	No	From the GO perspective, post events analysis typically is able to be performed using relay operation records stored within the protective relaying coupled with unit control system historical data. The need for additional high speed data capture equipment, to date, has not been justified from a GO/GOP perspective. The benefit/cost value has not been sufficient to drive the widespread installation of such equipment. The cost for GO/GOP to add DME to each generating facility can be significant due to the design, equipment, and installation costs.
Response: The SDT thanks you for your comment.		
Northeast Power Coordinating Council	No	Once the Standard becomes effective, it will provide continent-wide consistency and clarity for capturing the data needed to analyze various power system disturbances, and validate some of the models used in planning or operational studies. It will decrease the number of standards for this topic. We don't agree with the need for a standard as proposed. There could be a general requirement for providing DME data for events analysis and modeling purposes that could be put in the Rules of Procedure as opposed to a standard.
Response: The SDT thanks you for your comment.		
City of Tallahassee	No	TAL believes the same goal could be accomplished by voluntary efforts.

City of Tallahassee	No	TAL believes the same goal could be accomplished by voluntary efforts.
Response: The SDT thanks you for your comment.		
City of Tallahassee	No	TAL believes the same goal could be accomplished by voluntary efforts.
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 3 Comment
Duke Energy	No	The Standard SDT should consider that, as an alternative to a reliability standard, these provisions for collecting and providing data could be made in NERC's Rules of Procedure. As the Commission recognized in Order No. 693 paragraph 1550 approving PRC-018-1, "the procedures specified in PRC-002-1 will be provided pursuant to the data gathering provisions of the ERO's Rules of Procedure and the Commission's ability to obtain information pursuant to section 215 of the FPA and Part 39 of the Commission's regulations".There is precedent for handling this type of data collection activity in the Rules of Procedure. Reliability standards TPL-005-0 and TPL-006-0 likewise dealt with Regional Entity reliability assessments and data to be provided to NERC. In NERC's Oct. 19, 2011 Petition in Docket No. RM12-1 to approve TPL-001-2, NERC requested to withdraw the two pending Reliability Standards: TPL-005-0 "Regional and Interregional Self-Assessment Reliability Reports", and TPL-006-0.1 "Data From the Regional Reliability Organization Needed to Assess Reliability". NERC stated that the requirements from these two Reliability Standards not approved in FERC Order No. 693 have been moved to Sections 803 and 804 of the NERC Rules of Procedure.
Response: The SDT thanks you for your comment.		
MISO	No	We don't agree with the need as proposed. There could be a general requirement for providing DME data for events analysis and modeling purposes. We would suggest the SDT investigate the ability to put this in the Rules of Procedure or as a standing Section 1600 data request as opposed to a standard.
Response: The SDT thanks you for your comment.		
Madison Gas and Electric Company	No	
Dominion Resources Services,	No	

Organization	Yes or No	Question 3 Comment
Inc.		
Ameren	Yes	(1) The SERC Regional Criteria has worked well for SERC and its members. Please consider it as input to your PRC-002-2 development. Each region's present criteria are valid input to the standard. As you are aware the BES topology varies considerably depending on load density, so regional variance and even intra-region differences should be considered.
Response: The SDT thanks you for your comment.		
american Transmission Company, LLC	Yes	ATC believes the standard is necessary to insure consistency of data across the North American Grid.
Response: The SDT thanks you for your comment.		
City of Austin dba Austin Energy	Yes	Austin Energy (AE) supports a standard that increases clarity, especially regarding responsibilities.
Response: The SDT thanks you for your comment.		
Idaho Power Company	Yes	Consistent requirements should assist and facilitate entities with post fault analysis for wide area disturbances and monitoring practices.
Response: The SDT thanks you for your comment.		
FirstEnergy Corp	Yes	FE supports NERC's project to develop a continent-wide standard for disturbance monitoring equipment (DME). Installations of DME devices provide valuable insight for post-event analysis and diagnostics. The DME standard must allow for efficient use of equipment sharing for a TO/GO interface location and not force each owner to separately maintain its own equipment. Additionally, an appropriate balance of required locations must be considered in the reliability cost-benefit.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment.		
Entergy Services, Inc.	Yes	However, the SAR is not clear in that it is not clearly define what “power system” data needs to be collected and why it is important for post event analyses and verification of system models. The specific “Power system” data that would be beneficial needs to be listed along with a justification why the collection of this data is important for improving the reliability of the Bulk Electrical System (BES).
Response: The SDT thanks you for your comment.		
Hydro QuÃ©bec TransÃ‰nergie	Yes	Hydro-QuÃ©bec TransÃ‰nergie supports this initiative as it will bring clarity and consistency in the industry regarding disturbance monitoring while decreasing the number of standards on this topic.
Response: The SDT thanks you for your comment.		
Ingleside Cogeneration LP	Yes	ICLP sees this project as an opportunity to correct Issues with PRC-018-1 which we believe serves no reliability purpose. In particular, the existing requirements to perform regular DME maintenance are unnecessarily burdensome - as data recorders are not directly tied to BES real time reliability. We have no problem performing the maintenance, but the record keeping - and the zero compliance approach in the intervals is excessive for a data gathering function.
Response: The SDT thanks you for your comment.		
Independent Electricity System Operator	Yes	Once the standard becomes effective, it will provide similar continent wide conditions for capturing data needed in analyzing various power system disturbances and validating some of the models used in planning or operational studies.
Response: The SDT thanks you for your comment.		

Organization	Yes or No	Question 3 Comment
Essential Power, LLC	Yes	Previously proposed Disturbance Monitoring standards were often vague on who was responsible for requirements and it was difficult for entities to determine exactly the scope of the standard. We see the benefit of this project and encourage the standard SDT to avoid repeating the mistakes of the past.
Response: The SDT thanks you for your comment.		
LG&E and KU Services	Yes	Previously proposed Disturbance Monitoring standards were often vague on who was responsible for requirements, and it was difficult for entities to determine exactly the scope of the standard. We see the benefit of this project and encourage the standard SDT to avoid repeating the mistakes of the past.
Response: The SDT thanks you for your comment.		
ReliabilityFirst	Yes	ReliabilityFirst believes there is definitely a need for this standard. ReliabilityFirst offers the following reasons in support of this standard's development. This proposed standard will improve system reliability by providing personnel with necessary data to enable the industry to more effectively analyze system events that affect the Bulk Electric System and Bulk Power System. The new version of the standard will remove the "fill-in-the-blank" requirements currently assigned to the Regional Reliability Organization within the current PRC-018-1 and PRC-002-1 standards. And finally, with the events data system models can be reviewed and verified for better accuracy. Each of which will enhance overall system reliability.
Response: The SDT thanks you for your comment.		
ITC	Yes	The post 2003 blackout recommendations included the need for synchronized recording devices in power plants and substations to aid in the analysis of wide area events. The industry is faced with a conflict where PRC-002-1 is a fill in the blank standard, thus not FERC approved, but PRC-018-1 is FERC approved. Combining PRC-018-1 into the new PRC-002-2 which will be a continent wide standard is the only

Organization	Yes or No	Question 3 Comment
		way to correct this issue.
Response: The SDT thanks you for your comment.		
South Carolina Electric and Gas	Yes	The standard is needed in order to ensure that sufficient information is collected during a system disturbance to properly evaluate and simulate the disturbance.
Response: The SDT thanks you for your comment.		
Southwest Power Pool	Yes	Utilizing a standard ensures consistency in establishing the requirements for DME across North America. Perhaps some consideration could be given to letting the standard provide overview or generic requirements associated with DME but then the details be provided in a guideline or best practices document. However, given this there may then be a tendency for the regions to add additional details in regional standards which are more in-depth than the NERC standard.
Response: The SDT thanks you for your comment.		
Kansas City Power & Light	Yes	Utilizing a standard ensures consistency in establishing the requirements for DME across North America. However, given this there may then be a tendency for the regions to add additional details in regional standards which are more in-depth than the NERC standard.
Response: The SDT thanks you for your comment.		
Pepco Holdings Inc.	Yes	When determining the selection criteria for where this equipment is to be located, the SDT should be mindful of the significant dollars and resources already expended over the last several years to add DME equipment to specific sites specified by the Regional Reliability Organizations in accordance with PRC-002.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment.		
Exeln and its affiliates	Yes	Yes, however, this standard should be very low burden as a good argument could also be made that a standard is not needed at all. Since the 2003 Blackout, the proliferation of microprocessor relays with ever increasing oscillographic recording and sequence of event recording capabilities has increased the amount of data available to a high level and this increase will continue over time with or without a standard. Many entities, including ComEd, include GPS Satellite clocks in the standard design of their transmission relay schemes, etc. Many entities are voluntarily installing equipment that records and stores synchrophasor data on important generator connections and circuits. This is evidenced by comments by NERC related to investigations of more recent disturbances versus disturbances in the past. We recommend that the only things that need to be in a standard for disturbance monitoring equipment is that a simple list of fault recording equipment needs to be kept, whatever type is used (i.e. relay type (e.g. SEL321), DFR type). Also, a list of long term disturbance monitoring equipment needs to be kept, whatever type is used (long term disturbance monitors or stored phasor data) including that the equipment is connected to a GPS Satellite clocks. Additionally, the standard could require continuous recording for any long term disturbance monitoring, although this is already industry standard, with data retention at least a certain time (e.g. 10 days) and connection of all new monitoring equipment to a GPS Satellite clock. Anything else is just a significant record keeping burden that ComEd does not believe adds anything to reliability and therefore is not justifiable. With modern equipment it is not necessary for NERC to specify things like sample rates, tolerance/accuracy of GPS clocks, etc.
Response: The SDT thanks you for your comment.		
Transmission Reliability Engineering and Controls	Yes	You cannot manage what you do not measure. Much of the data required by this SAR will give utilities better insight into their BES areas.

Organization	Yes or No	Question 3 Comment

4. **If you do not believe a standard is needed - what other method could be used to achieve the results stated in the revised SAR.**

Summary Consideration:

The SDT appreciates all comments provided and alternatives that have been suggested. The team responds to the common themes in the comments, as follows.

1. The end deliverable of the SAR will be the development of revised NERC standard PRC-002-2. Reasons for this include:

- Some commenters suggested that the standard's purpose could be achieved on a non-mandatory basis, potentially assisted by guidelines or education. The SDT notes that, at the time of the 2003 Northeast Blackout, NERC Planning Committee Standards/Guidelines were in place. Each of the then-10 RROs also had DME requirements for their then-voluntary members to follow. However, the blackout investigations found inadequate DME implemented or operational, with the result that their final reports included the recommendations that are driving the present NERC development effort of PRC-002-2 as a mandatory and enforceable reliability standard.
- Some commenters suggest achieving PRC-002-2's purpose through the NERC RoPs. The SDT notes that:

  If RoP changes are needed, they will be made using the ROP change process (RoP Section 1400), versus the Standard Development Process. The SDT believes the Standard Development Process provides registered entities more influence and control of the development of the reliability requirements that they may become subject to.

  If the RoPs are not changed, data requests will be under RoP Section 1600. A lot more time and process will be required to issue requests per Section 1600 compared to the 10 days request period proposed in PRC-002-2. This may lead to longer recorded data retention periods for registered entities.

  Nothing in current NERC reliability standards or the RoPs compels a registered entity to collect or retain the SOER, FR or DDR data sought by PRC-002-2. RoP Section 1600 can be used to compel an entity to provide data, but only if they already have it or have the means to get it. If an entity did not have SOE, FR or DDR at the time of a system incident or disturbance, the present NERC reliability standards and RoPs could not be used to hold the entity liable for not having the data because they lacked means to record it at the time. Nor could they compel the entity to acquire the means for a potential future incident/disturbance. Inadequate bodies of data to do event analyses could again result.

  RoP violations are enforceable, in the US, only by FERC, versus by Regions or NERC via the ERO CMEP.

If the purpose of PRC-002-2 was to be implemented through the RoPs the SDT anticipates that ROP changes would be required. Also, to effectively meet PRC-002-2's purpose the ROPs would have to somehow implement the same or similar requirements to those that would be in PRC-002-2 as a reliability standard. Compliance would be enforced by FERC. The SDT believes that the purpose of PRC-002-2 should be achieved via development as per the Standards Process Manual, followed by implementation, execution, and compliance monitoring and enforcement of PRC-002-2 as a NERC reliability standard.

2. The SDT anticipates limited ways in which PRC-002-2 could be enforced as a "zero-defect" standard.

- An entity that inadequately implements SOER, FR, or DDR to meet the locational requirements and the (approved) standard implementation plan.
- An entity's data submittal does not meet requirements; e.g.: data synchronization to UTC (+/- 2 ms); timeliness (30 days); data required (currents, voltages, etc).

An entity is not otherwise in violation of the standard in other circumstances. For example, finding DME recording facilities with time synch out more than +/- 2 ms of UTC is not a violation; a violation is only incurred if data is reported with time synch out more than +/- 2 ms of UTC. Also, the DMSDT is not planning to include maintenance requirements from PRC-002-2.

3. When completed, PRC-002-2 will lay out the requirements for SOER, FR and DDR data needed from registered entities. By following the Standard Development Process, this data will be the minimum that industry and other stakeholders accept as required in order to facilitate the event analyses indicated in the standard's Purpose. The SDT does not agree with "grandfathering" of existing facilities that would be inadequate for an entity to meet the reporting obligations it will have under PRC-002-2.

Organization	Yes or No	Question 4 Comment
City of Tallahassee	No	TAL believes voluntary efforts on the part of each entity could be used to provide disturbance monitoring, or an alternative is to leave it up to each region to decide what is needed.
Response: The SDT thanks you for your comment.

Organization	Yes or No	Question 4 Comment
		what is needed.
Response: The SDT thanks you for your comment.		
City of Tallahassee	No	TAL believes voluntary efforts on the part of each entity could be used to provide disturbance monitoring, or an alternative is to leave it up to each region to decide what is needed.
Response: The SDT thanks you for your comment.		
ACES	No	We believe a guideline that supports the existing events analysis process along with a significant industry educational outreach explaining the benefits of collecting the data would yield better results. Registered entities will pursue projects with reliability benefits if the benefits clearly exist and are well understood. Unfortunately, this standard has the potential to become a zero defect standard that provides little reliability benefit. For example, we can see the proposed synchronization requirement PRC-002 R12 becoming a zero defect requirement that provides little value with paper compliance violations similar to those experienced with PRC-005. Registered entities will be forced to prove they have synchronized equipment because these kinds of maintenance records are easy to misplace and will likely lead to violations of the requirement. Even if they can show the equipment is currently within tolerances, they will have no paperwork showing they synchronized it and will still be in violation even though the end result, synchronized equipment, is the desired result.
Response: The SDT thanks you for your comment.		
PacifiCorp	No	
Dominion Resources Services, Inc.	Yes	Dominion believes the NERC Rules of Procedure can be amended to facilitate analysis of disturbances.

Organization	Yes or No	Question 4 Comment
Response: The SDT thanks you for your comment.		
Southern Company Operations Compliance	Yes	If the information is needed to verify system models, those entities that create and use the models should make the investment to install equipment needed for those studies.
Response: The SDT thanks you for your comment.		
Madison Gas and Electric Company	Yes	The cost associated with a 20% bus implementation could be great for both large and small entities (even though the NSRF believes this is being discussed within the SDT). Perhaps NERC should capture what is currently installed within each interconnection as a starting point prior to new installs or relocation of current devices. The Standard should have a foot note (as in PRC-024-1, foot note 1) that states applicable entities are not required to have DME installed or activated on their assets, or words to that effect. This will allow applicable entities to follow the direction of their RC or PC in where they should place DMEs. It will also allow applicable entities understand the importance of installing DMEs and allow the future budgeting of DME's.
Response: The SDT thanks you for your comment.		
Northeast Power Coordinating Council	Yes	We are in favor of having disturbance monitoring equipment (DM) data capture with common capabilities in the field, but we have concerns with the SAR's approach. There could be a general requirement for providing DME data for events analysis and modeling purposes that could be put in the Rules of Procedure as opposed to a standard. We would recommend that the NERC Planning Committee develop a common specification and approach to be used for all North America. If the goal of PRC-002 is to enable a data stream for modeling and disturbance analysis, there should be a single standard for provision of such data or a provision included in the Rules of Procedure.

Organization	Yes or No	Question 4 Comment
Response: The SDT thanks you for your comment.		
Duke Energy	Yes	We do not believe a standard is necessary to accomplish the stated goal. This data collection activity could be handled with appropriate revisions to NERC's Rules of Procedure.
Response: The SDT thanks you for your comment.		
Independent Electricity System Operator	Yes	
Gustavo Brunello	Yes	
Northeast Utilities	Yes	
CenterPoint Energy Houston Electric, LLC		CenterPoint Energy believes there are already regional requirements in place in ERCOT that address many of the items identified in the draft SAR, namely fault and sequence of events data. For example, ERCOT Nodal Operating Guide requirements presently specify the following disturbance monitoring equipment requirements: o Equipment types o Triggering requirements o Location requirements o Data recording requirements o Data retention/reporting requirements (format, elements reported, three-year retention period) o Maintenance requirements o Annual equipment reporting o Review process for DME equipment locationAdditionally, PRC-018-1 already requires entities to follow RRO requirements, and it includes requirements for: o Time sync and data availability o Maintenance program o Data retentionFERC and NERC prepared a report dated April 2012 for the Arizona-Southern California outages of September 2011 indicating that disturbance monitoring data was available in this region for facilitating a quick turnaround of a complex event analysis. Similarly, FERC and NERC prepared a report dated August 2011 for the Southwest cold weather event of February 2011. Furthermore, PRC-004 requires analysis and mitigation of transmission protection system

Organization	Yes or No	Question 4 Comment
		misoperations. Event data assists Entities in recreating the sequence of events needed for cause analysis and mitigation development; therefore, Entities already have un-written requirements to install sufficient recorders to meet PRC-004.
Response: The SDT thanks you for your comment.		
Southwest Power Pool		One way to minimize the oversight of the specification would be for the PC to take an active role is developing the requirements in either the guideline or best practices document which would serve as the source for this type of information.
Response: The SDT thanks you for your comment.		
MISO		We are in favor of having disturbance monitoring equipment (DME) with common capabilities in the field, but we have concerns with the SAR's approach. The SAR proposes to fix a "fill in the blank" problem (where each Region has a specification for DME and a process to collect information) by handing off the responsibility to the Planning Coordinator and Reliability Coordinator. This will exacerbate the problem in that there are more Planning Coordinators (80 according to the NERC Registry) than there are Regions and there is no direct alignment or mapping of transmission owners, transmission planners, generator owners and their respective Planning Coordinator (if they even have one). This will increase the balkanization and add gaps.We would recommend that the NERC Planning Committee develop a common specification and approach to be used for all North America. If the goal of PRC-002 is to enable a data stream for modeling and disturbance analysis, there should be a single standard for provision of such data or a provision included in the Rules of Procedure or a standing Section 1600 data request.

5. **If you have any other comments on this SAR that you haven't already mentioned above, please provide them here:**

Summary Consideration:

The SDT appreciates the comments and has the provided summary responses below:

- *How will the Planning Coordinators and Reliability Coordinators fulfill their obligation?* The PC's and RC's have mandate, experience, and expertise related to assuring reliability of wide areas of the BES. The SDT believes the PC and RC have the wide area perspective necessary to determine BES locations where collection of DDR data would be of the most value for wide area disturbance analysis. *Concern was noted for using MVA short circuit levels for determining DDR locations.* The current draft of PRC-002-2 proposes a short circuit MVA criteria for determination of Sequence of Events and Fault Recording locations not DDR locations.

- *What are the details on the methodology for determining DM locations?* The details for determining the DM recording locations will be included in the standard itself. The details for describing the methodology go beyond the scope of the SAR.

- *How will duplication for DM data collection for GO and TO responsibilities be handled?* The methodology for determining the DM recording location will be designed to avoid the collection of duplicate data.

- *What will happen to Regional Disturbance Monitoring standards?* Regional standards are not in the scope of the SDT. Currently, NPCC is the only region with a FERC approved regional disturbance monitoring standard. The region will decide the status of its Regional Disturbance Monitoring standard.

- *The determination method might be more suitable if it used the FERC 754 data request bus determination method. The FERC 754 method identifies the more strategic elements in the BES.* The FERC Order 754 method refers to the specific steps for the collection of data for the identification of "the buses at which a protection system single point of failure could result in an adverse impact to reliability of the bulk power system." (Quote from NERC's Request for Data or Information Order No. 754 Single Point of Failure on Protection Systems, August 16, 2012, page 7). To ensure complete BES coverage for fault recording, the bus selection screening method to be used has to be more encompassing. The method used will ensure the capturing of BES system wide data.

- *A comment was made concerning grandfathering of the existing equipment.* The team has discussed the option of grandfathering the existing DM equipment that does not meet data quality requirements of the Standard and determined such option would not be justified. The Standard will be applicable to a limited number of locations critical to BES reliability where the specified data quality will be required. Nonetheless, in recognition of the fact that certain existing DME devices with limited capabilities would still provide acceptable data for Disturbance Analysis, the SDT added clauses with relaxed requirements for FR and DDR data quality.

- *Will there be a cost/benefit evaluation, economic impact of the standard?* The NERC Standards Committee has approved the use of a Cost Effectiveness Analysis Process (CEAP) trial application for this project of the Cost Effectiveness Analysis Process (CEAP).

- *Several questions were requirements on equipment maintenance*. The SDT is not planning to specify maintenance requirements.

Organization	Question 5 Comment
Nebraska Public Power District	I have concerns that at stations that have recording equipment already in place that they may not meet the data capabilities required. This may be a significant # of locations for some TOs. Will there be a way to grandfather in existing locations that will be specified in the standard? Some of the statements from the webinar were to use the fault study and then select 20% of buses using the MVA criteria. This kind of analysis seems straight forward but can create complexity with how it is audited by enforcement in order to prove that 20% was achieved. In general does the SDT consider how the standard may be audited? Some aspects of the standard may be difficult to audit so one recommendation is to try and consider if there will be difficulties with auditing as requirements are written.I think that if protective relays are acceptable for performing certain DME functions at certain locations they should not have a maintenance requirement under PRC-002 if they are maintained under PRC-005. The SDT may already agree with this but if not please take this under consideration. PRC-005 is a stringent standard that already aims to make sure relaying is operable for protection which is more critical to the BES then data recording in comparison and it has much longer intervals than quarterly.Many relays could meet the 50 cycles recording length but they are not perfect devices. If a relay does not capture at least 2 cycles of pre trigger and 50 cycles of a fault lasting longer than 50 cycles is this a compliance violation? This requirement is logical but I have concern about compliance and overwriting relay data with extending record length.The need for monitoring tie lines needs to be clear. From the webinar it may not have been.

Organization	Question 5 Comment
Response: The SDT thanks you for your comment.	
Manitoba Hydro	(1) General - de-capitalize the word “standard” throughout the SAR. Alternatively, replace the word “standard” with the words “Reliability Standard”. (2) Need - add a “-” between the words bulk power for consistency with other instances of these words. (3) Objectives and/or Potential Future Metrics - rewrite “BES” as Bulk Electric System (BES) because it is the first instance of these words in the SAR. Also, for clarity, consider adding the words “North American” before Bulk Electric System. (4) Detailed Description - replace Bulk Electric System with its acronym “BES”. (5) General - de-capitalize all instances of “Requirements” because it is not defined in the NERC Glossary of Terms. (6) Detailed Description - capitalize the words “SDT” in the last paragraph in this section for consistency with the rest of the document. (7) OPTIONAL: Technical Analysis Performed to Support Justification - for clarity, “continent” should be referred to as “North American continent”.
Response: The SDT thanks you for your comment.	
Ameren	(1) At present, our Planning Coordinator (MISO) is nearing completion on a 3-year project to install Phasor Measurement Units (PMUs) across the MISO controlled transmission system. These PMUs fall into the category of Dynamic Disturbance Recording (DDR) equipment. It is expected across the industry that this type of equipment will be useful in determining the details of system disturbances. (2) According to the Detailed Description of the SAR, on page 3, “The Planning Coordinators and Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data.” We request clarification on how the Planning Coordinator and Reliability Coordinator will be able to fulfill their obligations of locating this monitoring equipment.(3) In addition, we have concerns that revisions to PRC-002, depending on the specifics of the requirements, could be burdensome to Transmission and Generator Owners who may find they have a vastly increased deployment of this type monitoring equipment in order to be compliant.

Organization	Question 5 Comment
Response: The SDT thanks you for your comment.	
Essential Power, LLC	1. The PRC-002/018 SDT should keep cost justification in mind, especially as regards TO-vs-GO duplication of DME. This project should be included in the CEAP Pilot Program.2. We have been installing this equipment in accordance with our RRO's requirements, but it seems unlikely that anyone will ever ask for data, since the TO has DME on their side of the fence at each plant. The role of GO-collected data in Disturbance analysis may be minimal to nonexistent, in which case it would make sense to require GO's to have DME only under very limited circumstances.3.The revised PRC-002/018 standard should also define the target settings required. The NERC Glossary definition of a Disturbance is of no use, and the criteria in Att. 2 of EOP-004 are written solely for the use of TOs.
Response: The SDT thanks you for your comment.	
LG&E and KU Services	1. The PRC-002-1/PRC-018 SDT should keep cost justification in mind, especially as regards TO-vs-GO duplication of DME. We have been installing this equipment in accordance with our RRO's requirements. However, based on our experience, because TOs have DME on their side of the fence at each plant, the role of GO-collected data in Disturbance analysis may be minimal to nonexistent. Therefore, GOs should be required to have DME only if the applicable TO determines GO DME is necessary.2. This standard may prove difficult for GOs to comply with in terms of disturbance data retrieval because it is dependent upon being aware that a disturbance is occurring somewhere on the transmission system. The GO is not the primary responsible entity for detecting and reporting a disturbance on the BES. On occasion, there may be information about a disturbance that is available to a TO and may not be available to the GO/GOP, therefore, the GO/GOP should not held accountable for the analysis of the disturbance. It should be clear in the standard that the GO/GOP is accountable only for information that is available to them at the time of the disturbance.The revised PRC-002-1/PRC-018-1 standard should also define

Organization	Question 5 Comment
	the target settings for DME.
Response: The SDT thanks you for your comment.	
Hydro QuÃ©bec TransÃ‰nergie	A sentence should be added in the "Need" section to indicate that the Standard SDT will review the need for having a regional Disturbance Monitoring standard (PRC-002-NPCC-01).The location where disturbance monitoring devices will be required must be clearly identified by the SDT using clear equipment description (generating station, unit, bus, lines, transformers...) and clear MVA and/or kV thresholds.In reference to the fourth paragraph of the "Detailed Description" section, consideration should be taken in scenarios where the physical location of the disturbance monitoring equipment is shared between the Generator Operator and the Transmission Operator. Addressing this scenario would prevent duplication of equipment at nearby locations or at the same location.
Response: The SDT thanks you for your comment.	
Northeast Power Coordinating Council	A thoughtful approach must be considered to the possibility of fill-in-the-blank requirements in the standards that apply to the Regional Reliability Organization. Many of these things are no longer done and should be removed from the standards. Some are procedural processes that need not be in the standards, but rather enforced through regional agreements. A few of the items should be codified in the Rules of Procedure. Three phase bolted short circuit MVA thresholds don't appear as appropriate criteria to determine the locations needed to record sufficient power system data for Dynamic Disturbances as stated in SAR (Technical Analysis Performed to Support Justification). Instead of three phase short circuit thresholds, the Planning Coordinator (PC) / Reliability Coordinator (RC) should consider other criteria such as large generation stations with a combined capability above a certain MW level, major load centers, regional and interregional transmission interfaces (flow gates), substations with large tap-changing and phase-shifting transformers, key substations in major load centers. Only Principle number 7 applies. The proposed standard

Organization	Question 5 Comment
	purpose is to collect information to facilitate analysis of a BES disturbance. DDR/DFR do not control, operate, or monitor the BES system. Compliance to this Standard may require Owners to install new equipment. The Implementation Plan when developed should consider the need to budget, engineer, procure and install new DME. Referring to the fourth paragraph of the Detailed Description, it is not appropriate to assign the responsibility of the functional entities. Recommend the fourth paragraph be changed as follows: It is envisioned that the Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard and that the Planning Coordinators or Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data. A sentence should be added in the "Need" section to indicate that the Standard SDT will review the need for having a regional Disturbance Monitoring standard (PRC-002-NPCC-01). The location where disturbance monitoring devices will be required must be clearly identified by the SDT using clear equipment description (generating station, unit, bus, lines, transformers…) and clear MVA and/or kV thresholds. In reference to the fourth paragraph of the "Detailed Description" section, consideration should be taken in scenarios where the physical location of the disturbance monitoring equipment is shared between the Generator Operator and the Transmission Operator. Addressing this scenario would prevent duplication of equipment at nearby locations or at the same location.
Response: The SDT thanks you for your comment.	
american Transmission Company, LLC	ATC supports the objective to not specify the required technology.
Response: The SDT thanks you for your comment.	
City of Austin dba Austin Energy	Austin Energy (AE) supports revision of the Disturbance Monitoring standards to close out some “fill-in-the-blank” issues.
Response: The SDT thanks you for your comment.	

Organization	Question 5 Comment
CenterPoint Energy Houston Electric, LLC	CenterPoint Energy believes existing requirements in PRC-018-1 should be reviewed by the team for inclusion in Phase 2 of the Paragraph 81 project, for example, requirements R3 and R5. The VRF for each requirement is “Lower” and the requirements have not been identified as Tier 1, 2, or 3 in the 2013 Actively Monitored List. Furthermore, PRC-018-1 is not a performance-based standard but rather a standard for analytical purposes. This information can be gathered through other existing means, such as NERC Section 400 of the NERC Rules of Procedure.
Response: The SDT thanks you for your comment.	
FirstEnergy Corp	FE is wondering why the reference to a Regional standard is being implied as a relatedstandard in the development of a NERC standard? It is our understanding that the team will begin its work from the draft PRC-002-2 that was started during an informal project development stage. While products from Regional Entity organizations (NPCC, RFC, etc) may be useful for the team's reference, this NERC SDT should not be editing/revising a Regional Entity standard. We suggest the SAR reference to "PRC-002-NPCC-01... Redundant requirements to be removed from this Standard" as found on the top of page 6 be deleted from the SAR. Additionally the "Related Standards" table should be further edited to insert a row for PRC-002-1 with an explanation of "Revise to create PRC-002-2" and edit the explanation statement on PRC-018-1 to say "..after PRC-002-2 approved" for version clarity.
City of Tallahassee	no comment
City of Tallahassee	No comment

Tacoma Power	Tacoma Power appreciates this opportunity to provide comments.
Transmission Reliability Engineering and	The determination method might be more suitable if it used the FERC 754 data

Organization	Question 5 Comment
Controls	request bus determination method. The FERC 754 method identifies the more strategic elements in the BES.
Response: The SDT thanks you for your comment.	
Exeln and its affiliates	The Exelon business units have been using the RFC criteria PRC-002 and have spent time and money to implement the methodology for capturing and reporting data to align with the RFC criteria. The concern is that there are intentions to move away from the Regional Criteria which would cause a reevaluation and possible rework to the methodology currently used.
Response: The SDT thanks you for your comment.	
Public Service Enterprise Group	The need for this standard is driven by recommendations 12A and 12B in the NERC and US-Canada reports on the August 2003 Blackout. The recommendations were made with and in the context of the SOE record produced for and included in the reports. The standard produced via this SAR must improve but be limited to the ability to produce SOE records like those provided in the NERC and US-Canada reports. The standard must be careful not to overshoot with, for instance, requirements designed to acquire data beyond that needed to do SOE records to the extent and granularity included in the NERC and US-Canada blackout reports, which will happen if the standard requires too much data from too many sources (e.g. extensive and unnecessary SOE or FR from small generators or switching stations.
Response: The SDT thanks you for your comment.	
American Electric Power	The proposed standards developed in earlier phases of this project were often vague on stating specifically who was responsible for the requirements. In addition, it was often difficult for entities to determine which devices were in or out of scope. AEP supports the work of this project team, and would encourage them to avoid those earlier missteps as they develop and propose future revisions.

Organization	Question 5 Comment
Response: The SDT thanks you for your comment.	
Entergy Services, Inc.	The purpose section is totally deleted, so the SAR does not contain a proper purpose. The Detailed Description is not clear as to what are the objectives of the standard. Information provided are items that need to be considered when drafting the standard, however there are no clear details as to what objectives are (and their basis) nor the equipment that should be within the scope of the standard (e.g., generating unit size, line voltage, etc.). The SAR is not clear the use of the vague term “power system” in the brief description is unclear. Does “power system” imply the Bulk Power System, Bulk Electric System, or generating equipment?
Response: The SDT thanks you for your comment.	
Wisconsin Electric Power Company	The requirement for generator Dynamic Disturbance Recording (DDR) should be reserved for areas having critical density of generation or load, or for generation near critical flowgates, or for other areas which are recognized as having potential generator stability issues. It should not simply be applied to all generators above a given size. Also for generators, the requirement for DDR should be able to be sufficiently satisfied by using data from plant Distributed Control Systems (DCS).
Response: The SDT thanks you for your comment.	
Independent Electricity System Operator	We advise the SDT to be mindful of the varied system characteristics among different regions and areas. Hence, the standards should not stipulate a one-size fit all type of installation requirements - may that be locational, geographical or voltage based. The locations for installing DMEs, especially the dynamic disturbance recorders, need to consider the relevance, value and type of the recorded data that can contribute to accomplishing the purpose of having useful information for event analysis.
Response: The SDT thanks you for your comment.	

Organization	Question 5 Comment
MISO	We recommend a thoughtful approach to the disposition of requirements in the standards that apply to the Regional Reliability Organization. Many of these things are no longer done and should be removed from the standards. Some are procedural processes that need not be in the standards, but rather enforced through regional agreements. A few of the items should be codified in the Rules of Procedure. If some of requirements have been taken over by Reliability Coordinators, the applicable function in the standard should change. Finally, NERC needs to address who is the Planning Coordinator in an area where none is defined. We also need to realize that if the goal is to eliminate a "fill in the blank" issue, the solution is not to just move the blanks.
Response: The SDT thanks you for your comment.	
Northeast Utilities	We think it is not appropriate to assign under the Detailed Description the responsibility of the functional entities. We recommend the fourth paragraph be changed as follows: "It is envisioned that the Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard and that the Planning Coordinators or Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data."
Response: The SDT thanks you for your comment.	
Consolidated Edison Co. of NY, Inc.	We think it is not appropriate to assign under the Detailed Description the responsibility of the functional entities. We recommend the fourth paragraph be changed as follows: "It is envisioned that the Transmission Owners and Generator Owners will be responsible for the bulk of the Requirements in this Standard and that the Planning Coordinators or Reliability Coordinators will be responsible for specifying locations requiring Dynamic Disturbance data."
Response: The SDT thanks you for your comment.	

Organization	Question 5 Comment
Kansas City Power & Light	We would suggest that the SDT give consideration to grandfathering existing Disturbance Monitoring Equipment installations in the new standard. Several entities have invested significant funds in this equipment and some sort of consideration for this equipment is definitely well deserved.The standard needs to clearly specify that any maintenance plans for relays associated with Disturbance Monitoring Equipment would be covered in PRC-005 rather than in PRC-002. Stand-alone Disturbance Monitoring Equipment would be covered in PRC-002. There was additional information that was made available during the webinar held on May 22, 2013 which was beneficial to understanding just where the standard is going. It would have been helpful for all if that information could have been made available earlier in the comment period.
Response: The SDT thanks you for your comment.	
Southwest Power Pool	We would suggest that the SDT give consideration to grandfathering existing DME installations in the new standard. Several entities have invested significant funds in this equipment and some sort of consideration for this equipment is definitely well deserved.The standard needs to clearly specify that any maintenance plans for relays associated with DME would be covered in PRC-005 rather than in PRC-002. Stand-alone DME would be covered in PRC-002.There was additional information that was made available during the webinar held on May 22, 2013 which was beneficial to understanding just where the standard is going. It would have been helpful for all if that information could have been made available earlier in the comment period, especially for those who could not participate in the webinar.
Response: The SDT thanks you for your comment.	
Gustavo Brunello	what is the difference between "Disturbance" and "Event" in the following 2 clauses:R13. Each Transmission Owner and Generator Owner shall have all recorded Sequence of Event, Fault Recording, and DDR data available (locally or remotely) for 10 calendar days after a DisturbanceD_Compliance_ 1.3.1 Each Transmission Owner

Organization	Question 5 Comment
	and Generator Owner shall retain all data provided to the Regional Entity, Reliability Coordinator or NERC for at least three years following the event.

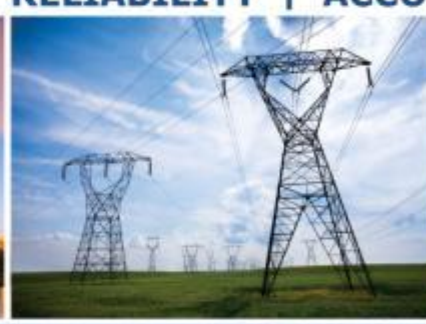
Informal Request for Information

Project 2007-11 Disturbance Monitoring

June 5, 2013

RELIABILITY | ACCOUNTABILITY



3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

Introduction and Scope

The NERC Project 2007-11 Disturbance Monitoring Standards Drafting Team (DMSDT) requests specific data as outlined below from Generator Owners and Transmission Owners (in cooperation with their Reliability Coordinators and Planning Coordinators as needed) to enable the Drafting Team to refine the PRC-002-2 Requirements to identify Disturbance Monitoring recording locations. After consideration of comments from the first posting of the Standard in 2009 and further review of the Standard's Requirements, the Drafting Team concluded that using a substation's configuration to determine the locations for Disturbance Monitoring recording would not ensure adequate coverage for Bulk Electric System disturbances. The Drafting Team formed the Monitoring Value Analysis (MVA) Task Team to develop a methodology for determining optimum Disturbance Monitoring recording locations. Using data submitted from several entities, the MVA Task Team realized a correlation existed between three phase fault MVA and optimum Disturbance Monitoring recording siting. PRC-002-2 will require the use of this methodology when locating Disturbance Monitoring recording.

The informal request for information period is open Wednesday, June 5, 2013 through 8 p.m. Eastern Friday, July 4, 2013.

Responses are to be submitted using the Excel spreadsheet. The spreadsheet contains three tabs:

1. DMSDT Information Library
2. Example from NE-USA
3. "Blank" NERC Information Template
    a. Enter your company's information here

Background and Data Requested

Background

Project 2007-11 Disturbance Monitoring is being conducted to establish minimum requirements for capturing power system disturbance data to enable the effective analysis of power system disturbances.

The project impacts two existing standards:

- PRC-002-1 Define Regional Disturbance Monitoring & Reporting Requirements

- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

The project involves replacing "fill-in-the-blank" requirements currently assigned to the Regional Reliability Organization with continent-wide requirements that are applicable and would become mandatory to other functional entities, after FERC and the appropriate Provincial Authorities approvals. If necessary, each region can supplement PRC-002-2 with a regional standard or regional criteria that include additional or more stringent requirements.

The DMSDT previously issued a draft standard, and received industry comments, in 2009. The team realized the challenge with establishing continent-wide requirements is the regional variability of the electric grid. The exercise of identifying location thresholds for implementation of Sequence of Events, Fault Recording, and Dynamic Disturbance recording data capture requires an analysis of data from the NERC Regions that identifies appropriate thresholds.

Requested Data

Subject to this request's Information Collection Restraints (see below) and for each Targeted Location (see list below) the following data is requested:

Bolted Three Phase Short Circuit Current and MVA

1. Submit the most up-to-date three phrase short circuit MVA data for a NERC Operating Region.
2. Conditions for the short circuit program should include maximum generation with normal operating connectivity.
3. Provide data for all listed buses at a targeted location (row).

Targeted Locations

The data request is applicable to sites on the electric grid commonly referred to as:

1. Transmission Switching Stations
2. Transmission Substations
3. Generating Stations
4. High Voltage Direct current (HVDC) Converter stations

Data Collection Constraints

1. All buses with three phase short circuit MVA of 1500 MVA or larger should be included.
2. All buses operated at a voltage greater than 100kV L-L.
3. Optional: If an interconnected location has a bus with three phase short circuit MVA less than 1500 MVA, it may be reported for more complete connectivity topology.
4. One bus to be listed per row.

Standards Announcement

Project 2007-11 Disturbance Monitoring

Informal Request for Information: June 5, 2013 – July 5, 2013

Now Available

To: Transmission Owners and Generator Owners
Cc: Reliability Coordinators and Planning Coordinators

Informal Request for Information
An informal request for information is open for a 30-day period from Wednesday, June 5, 2013 through 8 p.m. ET on **Friday, July 5, 2013**. **Pleaese note: Response to this informal request for information is not mandatory.**

The Disturbance Monitoring Standard Drafting Team is considering using three phase bolted fault magnitude information to determine the locations for Disturbance Monitoring recording on the Bulk Electric System The location criteria currently under consideration is based on limited information provided by members of the Standard Drafting Team. More information from industry will help to further refine the criteria.

The Disturbance Monitoring Standard Drafting Team is requesting that Transmission Owners and Generator Owners provide bus fault magnitude information for three phase bolted faults on buses operated at 100kV and higher in their areas. The information is to be provided in an electronic format (in an Excel spreadsheet) for the individual buses, and be given as current and the corresponding MVA values. The bus names on the submissions can be changed to preserve confidentiality, but the Standard Drafting Team requests the entity maintain a cross reference to facilitate recording location identification in the event additional information or clarification is needed.

Instructions for Submitting Information
This informal information request to Transmission Owners, Generator Owners, Reliability Coordinators, and Planning Coordinators is **open through 8 p.m. ET on Friday, July 5, 2013**. Please submit your information to Barb Nutter.

If you have any questions about the project or the informal information request, please contact Barb Nutter via email or by telephone at (404) 446.9692.

Next Steps

The timing of the informal request for information will allow for the information provided to be evaluated by the Drafting Team prior to the Workshops on July 30-31, and August 6-7, 2013.

Background information for this project can be found on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. Nominations for the SAR Drafting Team members were solicited February 26 – March 9, 2007.
2. The SAR was posted for a 30-day comment period March 22 – April 20, 2007.
3. Nominations for the Standard Drafting Team (SDT) for Project 2007-11 Disturbance Monitoring were solicited June 12 – 25, 2007.
4. The project was placed into informal development the fall of 2010.
5. The project was placed into formal development January 2013.
6. Nominations for two additional SDT members were solicited April 12 – 25, 2013.
7. Three additional SDT members were added May 22, 2013.
8. Industry webinar was held May 22, 2013.
9. Industry technical conferences were held July 30 - 31, 2013 and August 6 - 7, 2013.

Description of Current Draft

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with a 10-day Ballot	November 2013
Final Ballot	May 2014
BOT Adoption	August 2014

Effective Dates

See PRC-002-2 Implementation Plan.

Version History

Version	Date	Action	Change Tracking
1.0	TBD	Effective Date	New

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Glossary of Terms (Glossary) used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Dynamic Disturbance Recording (DDR) –The recording of time sequenced data for dynamic power system characteristics such as power swings, frequency variations, and abnormal voltage problems.

Fault Recording (FR) –The recording of time sequenced waveform data for short circuits or failure of Elements resulting in abnormal voltage(s) and/or current(s).

Sequence of Events Recording (SOER) –The recording of time sequenced data for change in status of Elements, which may include protection and control devices.

Rationale for Definitions:

The standard addresses the recording (data), not the equipment used to do the recording. The new definitions in the standard for Dynamic Disturbance Recording (DDR), Fault Recording (FR), and Sequence of Events Recording (SOER) specify the recording, not the devices. The devices were not specified because of the proliferation of multiple function devices, and the intent of the Standard is to address the result, not the how the result was achieved.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Disturbance Monitoring and Reporting Requirements
2. **Number:** PRC-002-2
3. **Purpose:** To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.
4. **Applicability:**

Functional Entities:

4.1 The Responsible Entity is:

4.1.1 Eastern Interconnection – Planning Coordinator

4.1.2 ERCOT – Planning Coordinator or Reliability Coordinator

4.1.3 Western Interconnection – Reliability Coordinator

4.2. Transmission Owner

4.3. Generator Owner

Rationale for Functional Entities:

The Responsible Entity – the Planning Coordinator or Reliability Coordinator, as applicable in each Interconnection – has the best wide-area view of the BES and is most suited to be responsible for determining the Elements for which Dynamic Disturbance Recording (DDR) is required. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available for those Elements selected.

Fault Recording (FR) and Sequence of Events Recording (SOER) locations are best selected by Transmission Owners because they have the required tools, information, and working knowledge of their systems to determine these locations. The Transmission Owners and Generator Owners will have the responsibility for ensuring that adequate data is available at the bus locations established by the Transmission Owner.

B. Requirements and Measures

R1. Each Transmission Owner shall identify BES bus locations for Sequence of Events Recording (SOER) and Fault Recording (FR). *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. Bus locations shall be identified using *PRC-002-2 Attachment 1 – Sequence of Events Recording (SOER) and Fault Recording (FR) Locations Selection Methodology*.

1.2. Bus locations shall be assessed at least every five calendar years.

M1. The Transmission Owner has a dated (electronic or hardcopy) list of BES bus locations for Sequence of Events Recording and Fault Recording, identified in accordance with Attachment 1, assessed within the required interval.

Rationale for R1:

SOER and FR data are not required from every location on the BES to conduct adequate analysis of a BES event; SOER and FR from key locations on the BES will suffice. Requirement R1 directs a uniform methodology to select these locations.

Review of actual BES short circuit data received from the industry in response to the DMSDT's June 5, 2013 through July 5, 2013 data request illuminated a strong correlation between the available short circuit MVA at a transmission bus and its relative size and importance to the BES based on (i) its voltage level, (ii) the number of transmission lines and other devices at the bus, and (iii) the number and size of generating units connected at or near the bus. Buses with a large short circuit MVA level are major contributors to fault currents; these locations have a significant effect on system reliability and performance. Conversely, locations with very low short circuit MVA level seldom cause large system events, so Fault Recording (FR) and Sequence of Events Recording (SOER) typically is not as significant at these locations.

For the purpose of PRC-002-2, a minimum number of locations for FR and SOER are required to facilitate sufficient coverage and data for analyzing large system events. Based on these concepts, the SDT developed a procedure included in Attachment 1 – SOER and FR Locations Selection Methodology, that utilizes the maximum available calculated three phase short circuit MVA. Using this methodology helps ensure sufficient coverage while accounting for variations in size and system strength of Transmission Owners across all the Interconnections. Additionally, this methodology provides flexibility in the selection process.

Each Transmission Owner must re-assess the list of bus locations every five calendar years to account for any system changes such as the addition or removal of large generating resources.

R2. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the owners of those Elements, within 90 calendar days of determination, that the Elements require Sequence of Events Recording (SOER) and Fault Recording (FR). *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M2. The Transmission Owner has dated evidence (electronic or hardcopy) of notification to owners of Elements established in Requirement R1. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R2:

To ensure effective and timely post-event analysis, it is important to have continuity of SOER and FR, with sufficient data from bus locations across the BES. Of the BES bus locations determined in Requirement R1, there may be locations where the Transmission Owner of the bus location does not own all the Elements. This requirement ensures that all necessary BES Elements at a selected bus location have SOER and FR data available by requiring the Transmission Owner of that bus location to notify the other owners of their respective BES Elements that they require SOER and FR per this standard. A 90 calendar day notification deadline provides adequate time for the Transmission Owner to make the appropriate determination and notification.

R3. Each Transmission Owner and Generator Owner shall have Sequence of Events Recording (SOER) for circuit breaker position (open/close) for each circuit breaker they own connected to the bus locations as per Requirement R2. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M3. The Transmission Owner or Generator Owner has evidence (electronic or hardcopy) of Sequence of Events Recording for circuit breaker position as specified in Requirement R2. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings.

Rationale for R3:

Change of state of circuit breaker position, time-stamped, as per Requirement R12 to a common clock, provides the basis for assembling the detailed sequence of events timeline of a power system disturbance.

R4. Each Transmission Owner and Generator Owner shall have Fault Recording (FR) to determine the following electrical quantities at the bus locations as per Requirement R2: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1. Phase-to-neutral voltages for each phase of either each line or bus.

4.2. Each phase current and the residual or neutral current for the following BES Elements:

4.2.1. Transformers that have a low-side operating voltage of 100kV or above.

4.2.2. Transmission lines.

M4. The Transmission Owner or Generator Owner has evidence (electronic or hardcopy) of Fault Recording to determine electrical quantities as specified in Requirement R4. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R4:

The required electrical quantities may either be directly measured or derived if sufficient data is measured (e.g. residual or neutral current if the phase currents are directly measured). In order to cover all possible fault types, all phase-to-neutral voltages are required at each location established for either 1) each connected line, or 2) the bus itself. Phase current and residual current are required to distinguish between phase faults and ground faults. It also facilitates determination of the fault location and cause of relay operation.

R5. Each Transmission Owner and Generator Owner shall have Fault Recording (FR) as specified in Requirement R4 that meets the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

5.1. A single record or multiple records that include:

- A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point.
- At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault.

5.2. A minimum recording rate of 16 samples per cycle.

5.3. Trigger settings for at least the following:

5.3.1. Neutral (residual) overcurrent.

5.3.2. Phase undervoltage.

M5. The Transmission Owner or Generator Owner has evidence (electronic or hardcopy) that Fault Recording meets Requirement R5. Evidence may include, but is not limited to: (1) device specification (R5, Part 5.2) and configuration (R5, Parts 5.1 and 5.3), or (2) actual data recordings or derivations.

Rationale for R5:

Time-stamped pre- and post-trigger fault data aid in the analysis of protection system operations and determination of operation as designed. System faults generally occur for a short time period, approximately 1 to 50 cycles; thus, a 50 cycle post-trigger minimum record length is adequate. Multiple records allow for legacy microprocessor relays which, when time synchronized, are capable of providing adequate fault data but not capable of providing fault data in a single record with 50 contiguous cycles post-trigger.

A minimum recording rate of 16 samples per cycle (960 Hz) is required to get sufficient point-on-wave data for recreating accurate fault conditions.

R6. Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall identify BES Elements for which Dynamic Disturbance Recording (DDR) is required. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

6.1. The Elements shall include the following:

6.1.1. A minimum of one DDR location per 3,000 MW of the Responsible Entity's historical peak system Demand, inclusive of Requirement R6, Part 6.1, Sub-parts 6.1.2 – 6.1.7.

6.1.2. At least one DDR location in each Responsible Entity's footprint.

6.1.3. Generating resource(s) with:

6.1.3.1. Gross individual nameplate rating greater than or equal to 500 MVA.

6.1.3.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA.

6.1.4. Locations necessary to monitor all Elements of:

- Eastern Interconnection - all permanent Flowgates.
- ERCOT Interconnection - major transmission interfaces.
- Hydro-Quebec Interconnection - major transmission interfaces.
- Western Interconnection - all major transfer paths as defined by the Regional Entity.

6.1.5. Both ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter.

6.1.6. Locations necessary to monitor all Elements associated with Interconnection Reliability Operating Limits.

6.1.7. Any one Element within a major voltage sensitive area as defined by an in-service undervoltage load shedding (UVLS) program.

6.**2**. The Elements shall be assessed at least every five calendar years.

M6. The Responsible Entity has a dated (electronic or hardcopy) list of BES Elements for Dynamic Disturbance Recording, identified in accordance with Requirement R6, assessed within the required interval.

Rationale for R6:

The Responsible Entity needs to ensure that there are sufficient BES Elements identified for DDR because of the crucial role DDR plays in wide-area disturbance analysis. Additionally, DDR is used for capturing the Bulk Electric System transient and post-transient response and for validating the system model's performance. The requirement for DDR for identified BES Elements, for the purpose of this standard, is based upon industry experience with wide-area disturbance analysis and the need for adequate data to facilitate event analysis.

From its experience with changes to the Bulk Electric System that would affect DDR, the SDT decided that the five calendar year re-assessment of the list is a reasonable interval for this review.

R7. Each Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall notify, within 90 calendar days of determination, each Transmission Owner and Generator Owner of the locations and Elements they own for which Dynamic Disturbance Recording (DDR) is required as established in Requirement R6. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M7. The Responsible Entity has dated evidence (electronic or hardcopy) of notification to owners of Elements established in Requirement R6. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

Rationale for R7:

Communication of selected Elements is required to ensure that the owners of the respective Elements are aware of their responsibilities under this standard. The Responsible Entity is only required to share the list of required Elements that each Transmission Owner and Generator Owner owns.

R8. Each Transmission Owner shall have Dynamic Disturbance Recording (DDR), for each Element they own as per Requirement R7, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

8.1. One phase-to-neutral or positive sequence voltage.

8.2. The phase current on the same phase at the same voltage corresponding to the voltage in Requirement R8, Part 8.1, or the positive sequence current.

8.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required.

8.4. Frequency of any one of the voltage(s) in Requirement R8, Part 8.1.

M8. The Transmission Owner has evidence (electronic or hardcopy) of Dynamic Disturbance Recording to determine electrical quantities as specified in Requirement R8. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R8:

Dynamic Disturbance Recording is used for measurement of transient response to system disturbances, during a relatively balanced post-fault condition. Therefore, it is sufficient to provide a phase-to-neutral voltage or positive sequence voltage.

Because all of the buses within a location are at the same frequencies one frequency measurement is adequate.

R9. Each Generator Owner shall have Dynamic Disturbance Recording (DDR), for each Element they own as per Requirement R7, to determine the following electrical quantities: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1. One phase-to-neutral, phase-to-phase, or positive sequence voltage at either the generator step-up (GSU) transformer high-side or low-side voltage level.

9.2. The phase current on the same phase at the same voltage in Requirement R9, Part 9.1, phase current(s) for any phase-to-phase voltages, or positive sequence current.

9.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required.

9.4. Frequency of at least one of the voltages in Requirement R9, Part 9.1.

M9. The Generator Owner has evidence (electronic or hardcopy) of Dynamic Disturbance Recording to determine electrical quantities as specified in Requirement R9. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.

Rationale for R9:

A crucial part of wide area disturbance analysis is understanding the dynamic response of generating resources. Therefore, it is necessary for Generator Owners to have DDR at either the high- or low-side of the generator step-up (GSU) transformer, measuring the specified electrical quantities, to adequately capture generator response.

R10. Each Transmission Owner and Generator Owner that is responsible for Dynamic Disturbance Recording (DDR) as per Requirement R7 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, triggered records must meet the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

10.1. Triggered record lengths of at least three minutes.

10.2. At least one of the following three triggers:

- Off nominal frequency trigger set at:

	Low	High
o Eastern Interconnection	<59.75 Hz	>61.0 Hz
o Western Interconnection	<59.55 Hz	>61.0 Hz
o ERCOT Interconnection	<59.35 Hz	>61.0 Hz
o Hydro-Quebec Interconnection	<58.55 Hz	>61.5 Hz

- Rate of change of frequency trigger set at:

o Eastern Interconnection	< -0.03125 Hz/sec	> 0.125 Hz/sec
o Western Interconnection	< -0.05625 Hz/sec	> 0.125 Hz/sec
o ERCOT Interconnection	< -0.08125 Hz/sec	> 0.125 Hz/sec
o Hydro-Quebec Interconnection	< -0.18125 Hz/sec	> 0.1875 Hz/sec

- Undervoltage trigger set at:
    - No lower than 85% of normal operating voltage for a duration of 5 seconds

M10. Each Transmission Owner and Generator Owner has dated evidence (electronic or hardcopy) of data recording and storage in accordance with Requirement R10. Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings.

Rationale for R10:

Large scale system outages generally are an evolving sequence of events that occur over an extended period of time, making DDR an essential component of data collection and event analysis. Data available pre- and post-contingency helps identify the causes and effects of each event leading to outages. Therefore, continuous recording and storage are necessary to ensure sufficient data are available for the entire Disturbance.

Existing DDR equipment across the BES may not record continuously. To accommodate its use for the purposes of this standard, triggered records are acceptable if the equipment was installed prior to the effective date of this standard. The frequency triggers are defined based on the dynamic response associated with each Interconnection. The undervoltage trigger is defined to capture possible delayed undervoltage conditions such as Fault Induced Delayed Voltage Recovery (FIDVR).

R11. Each Transmission Owner and Generator Owner shall have Dynamic Disturbance Recording (DDR), for the Elements as per Requirement R7, which conform to the following technical specifications: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

11.1. Input sampling rate of at least 960 samples per second.

11.2. Output recording rate of electrical quantities of at least 30 times per second.

M11. The Transmission Owner or Generator Owner has evidence (electronic or hardcopy) that Dynamic Disturbance Recording meets Requirement R11. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings (R11, Part 11.2).

Rationale for R11:

Input sampling rate of at least 960 samples per second, which corresponds to 16 samples per cycle, on the input side of the DDR equipment, ensures adequate accuracy for calculation of recorded measurements such as complex voltage and frequency.

Output recording rate of electrical quantities of at least 30 times per second refers to the recording and measurement calculation rate of the device. Recorded measurements of at least 30 times per second provide adequate recording speed to monitor low frequency oscillations typically of interest during power system disturbances.

R12. Each Transmission Owner and Generator Owner shall time synchronize all Sequence of Events Recording (SOER), Fault Recording (FR), and Dynamic Disturbance Recording (DDR) data for the bus locations as per Requirement R2 and Elements as per Requirement R7 to within ± 2 milliseconds of Coordinated Universal Time (UTC), time stamped with or without a local time offset. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M12. The Transmission Owner or Generator Owner has evidence (electronic or hardcopy) of time synchronization described in Requirement R12. Evidence may include, but is not limited to: (1) device specification and configuration, or (2) actual data recordings.

Rationale for R12:

Time synchronization of disturbance monitoring equipment allows for the time alignment of large volumes of geographically dispersed data records from diverse recording sources. A universally recognized time standard is necessary to provide the foundation for this alignment. Coordinated Universal Time (UTC) is the foundation used for the time alignment of records. It is an international time standard utilizing atomic clocks for generating precision time measurements at fractions of a second levels. The local time offset, expressed as a negative number, is the difference between UTC and the local time zone where the measurements are recorded.

Accuracy of ±2 milliseconds for time synchronization is specified in response to Recommendation 12b in the NERC August, 2003, Blackout Final NERC Report Section V Conclusions and Recommendations:

“Recommendation 12b: Facilities owners shall, in accordance with regional criteria, upgrade existing dynamic recorders to include GPS time synchronization…”

Also, from the U.S.-Canada Power System Outage Task Force Interim Report: Causes of the August 14th Blackout, November 2003, in the United States and Canada, page 103:

“Establishing a precise and accurate sequence of outage-related events was a critical building block for the other parts of the investigation. One of the key problems in developing this sequence was that although much of the data pertinent to an event was time-stamped, there was some variance from source to source in how the time-stamping was done, and not all of the time-stamps were synchronized…”

From NPCC’s SP6 Report Synchronized Event Data Reporting, revised March 31, 2005, the investigation by the authoring working group revealed that existing GPS receivers can be expected to provide a time code output which has an uncertainty on the order of 1 millisecond, uncertainty being a quantitative descriptor.

The ±2 milliseconds accuracy requirement specified in this standard is realistically achievable with equipment available and proper cabling installation.

R13. Each Transmission Owner and Generator Owner shall provide Sequence of Event Recording (SOER), Fault Recording (FR), and Dynamic Disturbance Recording (DDR) data for the bus locations as per Requirement R2 and Elements as per Requirement R7 to the Reliability Coordinator, Regional Entity, or NERC upon request: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

13.1. The recorded data will be provided within 30 calendar days of a request.

13.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request.

13.3. Sequence of Events Recording data will be provided in Comma Separated Value (.CSV) format following Attachment 2.

13.4. Fault Recording and Dynamic Disturbance Recording data will be provided in electronic C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files.

13.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

M13. The Transmission Owner or Generator Owner has evidence (electronic or hardcopy) data was submitted upon request in accordance with Requirement R13. Evidence may include, but is not limited to: (1) dated transmittals to the requesting entity with formatted records, (2) device specification and configuration, or (3) actual data recordings.

Rationale for R13:

Multiple entities and data recordings may be involved in wide area disturbance analysis therefore, standardized file format and naming conventions improves timely analysis.

The SDT determined that providing the data within 30 calendar days is reasonable based on normal business operations workload. A 10 calendar day time frame provides a practical limit on the duration of data required to be stored and informs the requesting entities how long the data will be available.

R14. Each Transmission Owner and Generator Owner, within 90 calendar days of the discovery of a failure of the Sequence of Events Recording (SOER), Fault Recording (FR), or Dynamic Disturbance Recording (DDR) at the bus locations as per Requirement R2 and Elements as per Requirement R7, shall: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

- Restore the recording ability.
- Report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability.

M14. The Transmission Owner or Generator Owner has dated evidence (electronic or hardcopy) that meets Requirement R14. Evidence may include, but is not limited to: (1) dated reports of discovery of a failure, (2) documentation noting the date the data recording was restored, or (3) dated CAP transmittals to the Regional Entity.

Rationale for R14:

Each Transmission Owner and Generator Owner who owns equipment used for collecting the data required for this standard must repair any failures in a reasonable time period to ensure that adequate data is available for event analysis. Therefore, it is required to return the data recording ability to service within 90 calendar days of a discovery of failure. If the Disturbance Monitoring Equipment (DME) equipment cannot be returned to service within 90 calendar days (e.g. budget cycle, service crews, vendors, etc.), the Entity must report it to the Regional Entity along with a Corrective Action Plan for returning the equipment to service.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Transmission Owner shall retain evidence of Requirements R1 and R2, Measures M1 and M2 for five calendar years.

The Transmission Owner shall retain evidence of Requirement R8, Measure M8 for three calendar years.

The Generator Owner shall retain evidence of Requirement R9, Measure M9 for three calendar years.

The Transmission Owner and Generator Owner shall retain evidence of Requirements R3, R4, R5, R10, R11, R12, R13, and R14, Measures M3, M4, M5, M10, M11, M12, M13, and M14 for three calendar years.

The Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable) shall retain evidence of Requirements R6 and R7, Measures M6 and M7 for five calendar years.

If a Transmission Owner, Generator Owner, or Responsible Entity (Planning Coordinator or Reliability Coordinator) is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Long-term Planning	Lower	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 80% but less than 100% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by 30 calendar days or less.	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 70% but less than or equal to 80% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 30 calendar days and less than or equal to 60 calendar days.	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 60% but less than or equal to 70% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 60 calendar days and less than or equal to 90 calendar days.	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for less than or equal to 60% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 90 calendar days.

R2	Long-term Planning	Lower	The Transmission Owner as directed by Requirement R2 was late in notifying the owners by 10 calendar days or less.	The Transmission Owner as directed by Requirement R2 was late in notifying the owners by greater than 10 calendar days but less than or equal to 20 calendar days.	The Transmission Owner as directed by Requirement R2 was late in notifying the owners by greater than 20 calendar days but less than or equal to 30 calendar days.	The Transmission Owner as directed by Requirement R2 was late in notifying one or more owners by greater than 30 calendar days.
R3	Long-term Planning	Lower	Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 75% but less than 100% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.	Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 50% but less than or equal to 75% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.	Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 10% but less than or equal to 50% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.	Each Transmission or Generator Owner as directed by Requirement R3 implemented from 0% but less than or equal to 10% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.

Sequence of Events Recording (SOER) and Fault Recording (FR)

Locations Selection Methodology

(Requirement R1)

To identify monitored BES bus locations for Sequence of Events Recording and Fault Recording required by Requirement 1 of PRC-002-2, each Transmission Owner shall follow sequentially, unless otherwise noted, the steps listed below:

Step 1. Determine a complete list of BES bus locations that it owns.

A single bus location includes any bus Elements at the same voltage level within the same physical location sharing a common ground grid. For example, ring bus or breaker-and-a-half bus configurations are single bus locations.

Step 2. Reduce the list to those locations that have a maximum available calculated three phase short circuit MVA of 1500 MVA or greater. If there are no buses on the resulting list, proceed to Step 7.

Step 3. Determine the 11 BES bus locations on the list with the highest maximum available calculated three phase short circuit MVA level. If the list has 11 or fewer bus locations, proceed to Step 7.

Step 4. Calculate the median MVA level of the 11 bus locations determined in Step 3.

Step 5. Multiply the median MVA level determined in Step 4 by 20%.

Step 6. Reduce the BES bus locations on the list to only those that have a maximum available calculated three phase short circuit MVA higher than the greater of:

a. 1500 MVA or

b. 20% of median MVA level determined in Step 5.

Step 7. <u>If there are no bus locations on the list:</u> the procedure is complete and no Fault Recording and Sequence of Events Recording will be required. Proceed to Step 9.

<u>If the list has 11 or fewer bus locations:</u> Fault Recording and Sequence of Events Recording is required at the BES bus location with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 9.

<u>If the list has more than 11 bus locations:</u> Fault Recording and Sequence of Events Recording is required on at least the 10% of the BES bus locations, determined in Step 6, with the highest maximum available calculated three phase short circuit MVA. Proceed to Step 8.

Step 8. Fault Recording and Sequence of Events Recording is required at additional BES bus locations on the list determined in Step 6. The aggregate of the number of bus locations determined in Step 7 and this Step will be at least 20% of the bus locations determined in Step 6.

The additional bus locations are selected, at the Transmission Owner's discretion, to provide maximum wide-area coverage for Fault Recording and Sequence of Events Recording, therefore the following types of BES locations are recommended:

a. Electrically distant bus locations or from other DME devices.
b. Voltage sensitive areas.
c. Cohesive load and generation zones.
d. Bus locations with a relatively high number of incident transmission circuits.
e. Bus locations with reactive power devices.
f. Major Facilities interconnecting outside the Transmission Owner's area.

Step 9. The list of monitored locations for Sequence of Events Recording and Fault Recording for PRC-002-2 Requirement R1 is the aggregate of the bus locations determined in Steps 7 and 8.

Introduction

The emphasis of PRC-002-2 is not on how Disturbance Monitoring data is captured, but what Bulk Electric System data is captured. There are a variety of ways to capture the data PRC-002-2 addresses, and existing and currently available equipment can meet the requirements of this standard. PRC-002-2 also addresses the importance of addressing the availability of Disturbance Monitoring capability to ensure the completeness of BES data capture.

From a compliance perspective, questions have been raised by industry regarding how conformance to this standard would be judged during a natural disaster which most likely would cause abnormal system conditions for the capturing of data that PRC-002-02 addresses, and also cause the loss of Disturbance Monitoring capability. This is addressed by NERC in its Appendix 4B Sanction Guidelines of the North American Electric Reliability Corporation, Section 2 Basic Principles, Section 2.8 Extenuating Circumstances effective Dec. 20, 2012:

"In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate penalties."

Guideline for Requirement R1:

Sequence of events and fault records for the analysis, reconstruction, and reporting of system disturbances is important. However, SOER and FR data are not required at every location on the BES to conduct adequate or thorough analysis of a disturbance. As major tools of event analysis, the time synchronized time stamp for a breaker change of state and the recorded waveforms of voltage and current for individual circuit sallow precise reconstruction of events of both localized and wide-area disturbances.

In addition, more quality information is always better than less when performing event analysis. However, 100% coverage of all elements is not practical or required for effective analysis of wide-area disturbance. Therefore, selectivity of required locations to monitor is important for the following reasons:

1. Identify key locations where crucial information is available when required
2. Excessive overlap of coverage is avoided
3. Avoid gaps in critical coverage
4. Provide coverage of system elements that could propagate a disturbance
5. Avoid mandates to cover system elements that are more likely to be a casualty of a disturbance rather than a cause
6. Establish selection criteria to provide effective coverage in different regions of the continent

Listed as follows, the major characteristics available to determine the selection process are:

1. System voltage level
2. The number of transmission lines into a switchyard
3. The number and size of connected generating units

4. The available short circuit levels

Although it is straightforward to establish a bright line criteria for the application of identified locations, analysis was required to establish a sound technical basis to fulfill the required objectives, rather than using opinions, feelings, or anecdotal judgment based upon experience in one area.

To answer these questions and establish criteria for location of SOER and FR, the DMSDT established a sub-team referred to as the Monitored Value Analysis Team (MVA Team). The team collected information from a wide variety of transmission systems throughout the continent to analyze transmission buses by the characteristics previously identified for the selection process.

The MVA Team learned that the development of criteria is not possible for adequate SOER and FR coverage, based solely upon simple, bright-line characteristics, as such the number of lines into a switchyard at a particular voltage level or at a set level of short circuit current. To provide the appropriate coverage, a relatively simple but effective Location Selection Procedure was developed. This Procedure, included as Attachment 1, assists entities in fulfilling Requirement R1 of the standard.

The Location Selection Procedure is weighted to buses with higher short circuit levels. This is chosen for the following reasons:

1. The method is voltage level independent
2. It is likely to select buses near large generation centers
3. It is likely to select buses where delayed clearing can cause electric system cascading outages
4. Selected buses directly correlate to the Universal Power Transfer equation: Lower Impedance – increased power flows – greater system impact

To perform the simple calculations of Attachment 1 of the standard, the following information below is required and the following steps (provided in summary form) are required for systems with more than 11 BES bus locations with three-phase short circuit levels above 1500 MVA.

1. Total number of BES buses in the transmission system under evaluation.
   a. Only tangible switchyard buses are included
   b. Pseudo buses created for analysis purposes in system models are excluded
2. Determine the three-phase short-circuit MVA for each bus.
3. Exclude buses from the list with short circuit levels below 1500 MVA
4. Determine the median short circuit for the top 11 buses on the list (position number 6).
5. Multiply median short circuit level by 20%.
6. Reduce the list of BES buses with short circuit levels higher than 20% of the median
7. Apply SOER and FR at buses with short circuit levels in the top 10% of the list (from 6).
8. Apply SOER and FR at buses at an additional 10% of the list using engineering judgment, and allowing flexibility to factor in the following considerations.
   a. Electrically distant bus locations from other DME devices

b. Voltage sensitive areas
c. Cohesive load and generation zones
d. Bus locations with a relatively high number of incident transmission circuits
e. Bus locations with reactive power devices
f. Major facilities interconnecting outside the Transmission Owners' area.

There is no requirement for SOER and FR for generating units in this standard. SOER recordings of the opening of the primary generator output interrupting devices (e.g. synchronizing breaker) may not reliably indicate the actual time that a generator tripped; for instance, when it trips on reverse power after loss of its prime mover (e.g. combustion or steam turbine). For event analysis purposes, more valuable information is attained about generators and their response to system events pre- and post-contingency through DDR data versus SOER or FR records.

The reassessment interval of five years was chosen based upon experience. Five years is long enough to avoid unnecessary, but long enough to adapt for changing system configurations.

Guideline for Requirement R2: See rationale.

Guideline for Requirement R3:

Analyses of wide-area disturbances often begin by evaluation of SOERs to help determine the initiating event(s) and follow the disturbance propagation. Recording of breaker operations help determine the interruption of line flows while generator loading is best determined by DDR recordings, since generator loading can be essentially zero regardless of breaker position. SOER of generator breaker operations provide little useful data of generator loading.

Generator Owners are included in this requirement because a Generator Owner may, in some situations, own breakers at the Transmission Owner's bus location. However, buses owned by the Generator Owner will not require SOER because they will not be studied to begin with. Therefore, only Generator Owners who own equipment at the Transmission Owner location may need to implement SOER per PRC-002-2.

Breaker status can be determined by analysis of suitably time synchronized FRs with the data provided in the manner detailed in R14.

Guideline for Requirement R4:

The bus locations for which FR data is required are determined based on the methodology described in Attachment 1 of the standard. The Elements connected to those bus locations for which FR data is required include:

- Transmission lines, including interconnection facilities with generating resources
- Transformers

Only those Elements that are included in BES as per the latest in effect NERC definition are to be monitored. For example, radial lines or transformers with low-side voltage less than 100 kV are not included.

Fault recordings are required from each terminal of an Element connected to applicable bus locations.

Generator step-up transformers (GSU) are excluded from the above based on the following:

- The methodology for determining bus locations for (FR) does not include generator buses
- The length of an interconnection between a transmission station and a generating resource is typically short. Current contribution from a generator in case of fault in the transmission system will be captured by fault recording on the transmission station end of the interconnection.
- Faults on the interconnection itself are unlikely. For such faults it is sufficient to have fault current recordings from the transmission station end of the interconnection. Current contribution from a generator is rather deterministic and can be readily calculated if needed.

The SDT, in consultations with NERC's Event Analysis group, determined that DDR from selected generator locations are far more important for event analysis than FRs.

<u>Recording of Electrical Quantities</u>
For effective fault analysis it is necessary to know values of all phase and neutral currents and all phase-to-neutral voltages. Based on such FRs it is possible to determine all fault types. Fault Recordings also augment SOERs in evaluating circuit breaker operation.

<u>Current Recordings</u>
The required electrical quantities are normally directly measured. Certain quantities can be derived if sufficient data is measured, for example residual or neutral currents.
Since a transmission system is well balanced, with phase currents having essentially similar magnitudes and phase angle differences of 120°, during normal conditions there is negligible neutral (residual) current. In case of a ground fault the resulting phase current imbalance produces residual current that can be either measured or calculated.

Neutral current, also known as ground or residual current $\mathbf{I}_{r,}$ is calculated as a sum of vectors of three phase currents:

$\mathbf{I}_r = 3 \bullet \mathbf{I}_0 = \mathbf{I}_A + \mathbf{I}_B + \mathbf{I}_C$ Equation 1

$\mathbf{I}_0$ - Zero-sequence current

$\mathbf{I}_A$, $\mathbf{I}_B$, $\mathbf{I}_C$ - Phase current (vectors)

Another example of how required electrical quantities can be derived is based on Kirchhoff's law. Fault currents for one of the Elements connected to a particular bus location can be derived as a vectorial sum of fault currents recorded at the other Elements connected to that bus location.

<u>Voltage Recordings</u>
There are two options for recording phase-to-neutral voltages at applicable bus locations:

1. At terminals of each line. This option would apply to lines that have full set of VTs/CVTs required for distance protections, which is quite common in practice.
2. At a particular bus, in which case all the Elements connected to that common bus are covered. This option may not be applied that often in practice as it requires full set of phase-neutral VTs/CVTs at the bus.

Guideline for Requirement R5:

This requirement directs the applicable entities to have FR at locations determined per Requirement R1 that meets the following:

Requirement R5, Part 5.1 specifies the minimum amount of Fault Recording data. Pre and post trigger fault data along with the SOE breaker data, all time stamped to a common clock at millisecond accuracy, aid in the analysis of protection system operations after a fault to determine if the protection system operated as designed. Generally speaking, BES faults and the system response to them occur within a very short time period, approximately 1 to 50 cycles, thus a 50 cycle post trigger record length provides adequate data. Multiple records allow for legacy microprocessor relays which when time synchronized to a common clock are capable of providing adequate fault data but not capable of providing fault data in a single record with 50 cycle post trigger data.

Requirement R5, Part 5.2 specifies the minimum recording rate of FR data. A minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SOER.

Requirement R5, Part 5.3 specifies the minimum triggers to ensure FR data is available. A trigger is a set point on an Oscilloscope or Fault Recording device. The trigger can be set so that when the monitored value on the recording device goes above or below the trigger value, data is recorded. Requirement R5, Part 5.3.1 specifies a neutral (residual) overcurrent trigger for ground faults. Requirement R5, Part 5.3.2 specifies a phase under-voltage trigger for phase-phase faults.

Guideline for Requirement R6:

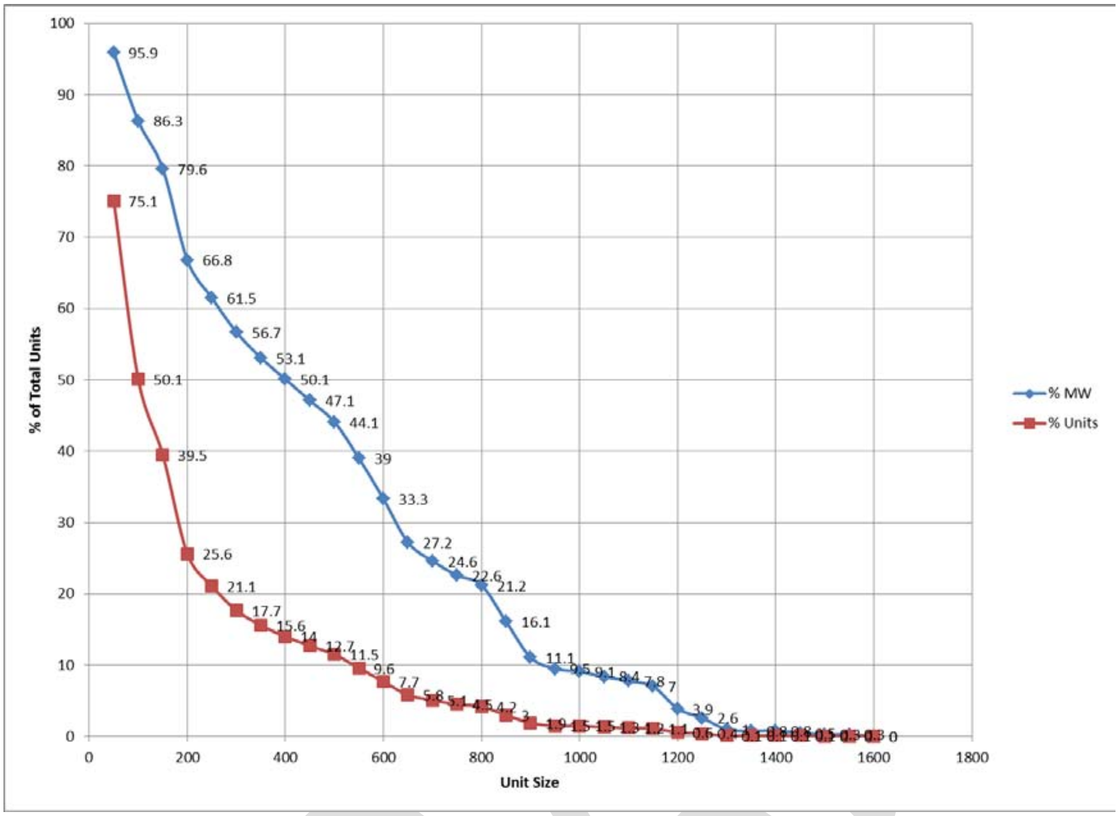
Dynamic Disturbance Recording is used for wide-area disturbance monitoring to determine the system's electromechanical transient and post-transient response and validate system model performance. DDR is typically located based on strategic studies which include angular, frequency, voltage, and oscillation stability. However, for adequately monitoring the system's dynamic response and ensuring sufficient coverage to determine system performance, DDR is required at key locations in addition to a minimum requirement of DDR coverage.

Each Responsible Entity (PC or RC) is required to identify sufficient locations for DDR coverage for, at a minimum, one location per 3,000 MW of historic peak demand. This number of locations is included to provide adequate system-wide coverage across an Interconnection. To clarify, if any of the key Elements requiring DDR monitoring are within the Responsible Entity's area, these locations are required. If a Responsible Entity (PC or RC) does not have a sufficient number of DDR to meet the one DDR per 3,000 MW of historic peak demand requirement, additional BES Elements must be defined.

Loss of large generating resources poses a frequency and angular stability risk for all Interconnections across North America. Data capturing the dynamic response of these machines during a disturbance helps the analysis of large Disturbances. To determine and provide basis for unit size criteria, the DMSDT acquired limited specific generating unit data from NERC's Generating Availability Data System (GADS) program. The data contained generating unit size information for each generating unit in North America which is reporting in 2013 to the NERC GADS program. The team analyzed the spreadsheet data to determine: (i) how many units were above or below selected size thresholds; and (ii) the aggregate sum of the ratings of the units within the boundaries of those thresholds. Statistical information about this data was then produced, i.e. averages, means and percentages. The team determined the following basic information about the generating units of interest (current NA fleet i.e. units reporting in 2013) included in the spreadsheet:

- The number of individual generating units in total included in the spreadsheet.
- The number of individual generating units rated at 20 MW or larger included in the spreadsheet. These units would generally require that their owners be registered as GOs in the NERC CMEP.
- The total number of units within selected size boundaries.
- The aggregate sum of ratings, in MWs, of the units within the boundaries of those thresholds.
- The information in the spreadsheet does not provide information by which the plant location of each unit can be determined i.e. the team could not use the information to determine which units were located together at a given generation site or facility.

The following figure captures these concepts:



From this information, the team was able to reasonably speculate the generating unit size thresholds proposed in Requirement R6, Part 6.1.3.1 of the standard. The 500MVA individual unit size threshold was selected because this number roughly accounts for 47% of the generating capacity in NERC footprint while only requiring DDR coverage on about 12.5% of the generating units. As mentioned, there was no data pertaining to unit location for aggregating plant/facility sizes. However, Requirement R6, Part 6.1.3.2 is included to capture larger units located at large generating plants which could pose a stability risk to the system if multiple large units were lost due to electrical or non-electrical contingencies. The incremental impact to the number of units requiring monitoring is expected to be relatively low.

Major transmission interfaces are explicitly defined based on the Interconnection since a common naming convention for these interfaces does not exist. In the Eastern Interconnection, all Flowgates defined in the NERC Book of Flowgates will require DDR *on the metered end of the Flowgate*. However, this data may be calculated, rather than directly measured, if the accurate quantity can be derived (e.g. either end of the Flowgate line could be monitored since the other end could be derived). In the Western Interconnection, these major transmission interfaces are defined by the Regional Entity. In ERCOT and Quebec Interconnections, the Responsible Entity will be required to identify those interfaces that are deemed significant enough to require monitoring (i.e. are utilized for real-time limits such as System Operating Limits or “contingencies”).

Locations where an undervoltage load shedding (UVLS) program is deployed are prone to voltage instability since they are areas of significant Load. The Responsible Entity (PC or RC) will identify these areas where a UVLS is in service and identify a useful and effective location to monitor DDR such that action of the UVLS or voltage instability could be captured on the BES. For example, a major 500kV or 230kV substation on the EHV system close to the load pocket where the UVLS is deployed would likely be a valuable location for DDR coverage and would aid in post-disturbance analysis of the load area's response to large system deviations (voltage, frequency, etc.).

Guideline for Requirement R7: See rationale.

Guideline for Requirement R8:

Dynamic Disturbance Recording measures transient response to system disturbances after fault is cleared (post-fault), under a relatively balanced operating condition. Therefore, it is sufficient to provide a single phase-to-neutral voltage or positive sequence voltage. Recording of all three phases of a circuit is not required, although this may be used to compute and record the positive sequence voltage.

The bus where a voltage measurement is required is based on the list of Elements defined by the Responsible Entity (PC or RC) in Requirement R6. Voltage recording is required for all expected bus configurations at a given location. For example, a breaker-and-a-half or double bus configuration has a North (or East) Bus and South (or West) Bus, which would require that both buses should have voltage recording, because either can be taken out of service indefinitely. This may be accomplished either by recording both bus voltages separately, or by providing a selector switch to connect either bus voltage transformers to a single recording input of the DDR device. This component of the requirement is therefore included to mitigate the potential of failed frequency, phase angle, real power, and reactive power calculations due to voltage measurements removed from service while sufficient voltage measurement is actually available during these operating conditions.

When current recording is required, it should be on the same phase as the voltage recording taken at the location if a single phase-to-neutral voltage is provided. Positive sequence current record is also acceptable. Duplication of current record is not required, because when a line (or a transformer) is out of service its current and power flow records are nil, and do not impact the event analysis process.

For all circuits where current recording is required, real and reactive power will be recorded on a three-phase basis. These recordings may be derived either from phase quantities or from positive sequence quantities.

Guideline for Requirement R9:

All Guidelines specified for Requirement R8, equally apply to Requirement R9, too. Since either of the high or low side windings of the generator step-up (GSU) transformer may be connected in delta, phase-to-phase voltage recording is an acceptable voltage recording. As it was explained in the Guideline R8, the system (BES) is operating under a relatively balanced operating condition and, if needed, phase-to-neutral quantities can be derived from phase-to-phase quantities.

Guideline for Requirement R10:

Large scale system outages are generally an evolving sequence of events that occur over an extended period of time, making DDR an essential component of data collection and event analysis. Pre- and post-contingency data helps identify the causes and effects of each event leading to the outages. This drives a need for continuous recording and storage to ensure sufficient data is available for the entire Disturbance.

Transmission Owners and Generator Owners are required to have continuous DDR for the Elements identified in Requirement R6. However, this requirement recognizes that legacy equipment may exist at some locations that do not have continuous data recording capabilities. For equipment that was installed prior to the effective date of the standard, triggered DDR records of three minutes are acceptable using at least one of the trigger types specified in Requirement R10, Part 10.2:

- Off nominal frequency triggers are used to capture high or low frequency excursions of significant size based on the Interconnection size and inertia.
- Rate-of-change of frequency triggers are used to capture major changes in system frequency which could be caused by large changes in generation or load, or possibly changes in system impedance.
- The undervoltage trigger specified in this standard is provided to capture possible sustained undervoltage conditions such as Fault Induced Delayed Voltage Recover (FIDVR) events. A sustained voltage of 85% is outside normal schedule operating voltages and is sufficiently low to capture abnormal voltage conditions on the BES.

Guideline for Requirement R11:

Dynamic Disturbance Recording contains the dynamic response of power system to a disturbance and is used for analyzing complex power system events. This recording is typically used to capture short term and long term disturbances, such as a power swing. Since the data of interest is changing over the time, Dynamic Disturbance Recording is normally stored in the form of RMS values or phasor values, as opposed to directly sampled data as found in a Fault Recording.

The issue of the sampling rate used in a recording instrument is quite important for at least two reasons: the anti-aliasing filter selection and accuracy of signal representation. The anti-aliasing filter selection is associated with the requirement of a sampling rate at least twice the highest frequency in sampled signal. At the same time, the accuracy of signal representation is also dependent on the selection of the sampling rate. In general, the higher the sampling rate, the better representation. In the abnormal conditions of interest (e.g. faults or other disturbances); the input signal may contain frequencies in the range of 0-400 Hz. Hence, the rate of 960 samples per second (16 samples/cycle) is considered an adequate sampling rate that satisfies the input signal requirements.

In general dynamic events of interest are: inter-area oscillations, local generator oscillations, wind turbine-generator torsional modes, HVDC control modes, exciter control modes, and steam turbine torsional modes. Their frequencies range from 0.1-20 Hz. In order to reconstruct these dynamic events, a minimum recording time of 30 times per second is required.

Guideline for Requirement R12: See rationale.

Guideline for Requirement R13:

This requirement directs the applicable entities that upon requests from the Reliability Coordinator, Regional Entity or NERC to provide SOER, FR data for locations determined in requirement R1 and DDR data for Elements determined per requirement R6. To facilitate the analysis of BES disturbances, it is important that the data is provided to the requestor within a reasonable period of time.

Requirement R13, Part 13.1 specifies the maximum timeframe of 30 calendar days to provide the data. Thirty calendar days is a reasonable time frame to allow for the collection of data, and submission to the requestor.

Requirement R13, Part 13.2 specifies that the minimum time period of 10 calendar days that the data will be retrievable preceding a request. With the equipment in use that has the capability of making a recording, having the data retrievable for the 10 calendar days preceding a request is realistic and doable. It is important to note that applicable entities should account for any expected delays in retrieving data and this may require devices to have data available for more than 10 days.

Requirement R13, Part 13.3 specifies a Comma Separated Value (.CSV) format per Attachment 2 for the SOER data. It is necessary to establish a standard format as it will be incorporated with other submitted data to provide a detailed sequence of events timeline of a power system disturbance.

Requirement R13, Part 13.4 specifies the IEEE C37.111 COMTRADE format for the FR and DDR data. The IEEE C37.111 is the Standard for Common Format for Transient Data Exchange it is well established in the industry. It is necessary to specify a standard format as it will be incorporated with other submitted data to provide a detailed analysis of a power system disturbance.

Requirement R13, Part 13.5 specifies the IEEE C37.232 COMNAME format for the naming the data files of the SOER, FR and DDR. The IEEE C37.232 is the Standard for Common Format for Naming Time Sequence Data Files first version was approved in 2007. From the August 14, 2003 blackout there was thousands of Fault Recording data files collected. The collected data files did not have a common naming convention and because of that it became difficult to discern which files came from which utilities and which ones were captured by which devices. The lack of a common naming practice seriously hindered the investigation process. Subsequently, and in their initial report on the blackout, NERC stressed the need for having a common naming practice and listed it as one of their top ten recommendations.

Guideline for Requirement R14:

This requirement directs the respective owners of Transmission and Generator equipment to be alert to the existence of equipment used for SOER, FR, and DDR, at the bus locations which had been established in Requirement R1, which are found to be out of service. The owners are to endeavor to return the equipment to service within 90 calendar days of discovery of a failure. This requirement is structured to recognize that the existence of a reasonable amount of equipment out of service does not result in lack of sufficient data for coverage of the system. Furthermore, 90 calendar days is typically sufficient time for repair or maintenance to be performed. However, in recognition of the fact that there may be occasions for which it is not possible to return the equipment to service within 90 calendar days, the requirement further provides that, for such cases, the entity must report such occasions to the Regional Entity and also provide a Corrective Action Plan. These actions are considered to be the appropriate level of due diligence needed to provide for a robust and adequate data availability.

This Excel Workbook is designed to assist Transmission Owners in using the Median Method for determining monitoring bus locations for Fault Recording and Sequence of Events Recording on their individual systems.

Instructions for use:

For Transmission Owners Only:

1	Organize your short circuit data in the format shown on the Data Input worksheet
2	Your short circuit data should use three phase short circuit with your selected pre-fault voltage
3	Your short circuit data should be ordered from highest three phase short circuit MVA value to lowest three phase short circuit MVA value for all buses greater than 100 kV
4	Your short circuit data should either eliminate or commonly identify non-real buses, zero buses, pseudo buses, or buses which are used for modeling purposes only, by using a common designation for all these type buses that can be eliminated from the Median calculation. It is most common to identify these non-real buses with the number "0" in the bus coded number field.
5	The Data Input Worksheet is designed to have you copy your properly formatted and sorted three phase MVA short circuit data into rows starting at column A row 6 of the worksheet.
6	Data Input, Col. F, is the most important column, it must have the three phase MVA short circuit data values, sorted from highest MVA to lowest MVA. The MVA values in column F, as sorted from highest to lowest MVA, should include all voltage levels greater than or equal to 100 kV.
7	Once you input all of your short circuit data into the Data Input worksheet starting at Column A Row 6, the values in cells B2, B3 and B4 should all be equal. These values should equal the number of rows of short circuit data that you have input. Copy Cell B2 using Cntrl C, then Paste Value, Special value only, back into Cell B2. This should be the total number of rows contained in the data set.
8	If you have zero numbered buses, or pseudo buses, commonly identified by say a number 0 in the bus coded number column, then you need to determine the number of zero numbered buses that are included in this data set.
9	For you to be able to determine this zero bus coded number, you need to select your entire data set, including the header row, from column / row A5 to G___(last row of data). As an example, if your data contains 100 rows, then your highlighted area for sorting and filtering should be A5 to G105. Then using the sort filter command, turn on Filter
10	Once the Filter is on, go to the bus coded number column, pull down the Filter and select only the zero bus coded number rows. The values in cells B3, and B4 should now be equal and indicate the number of zero numbered buses in your data set.
11	We want to store the zero numbered bus rows (number) into cell B4 as a value. To do this, select Cell B4, hit Cntrl C, then hit paste special, value only. This now replaces the formula in Cell B4 with the value of zero buses in the data set.
12	Now we wish to eliminate the zero bus rows from the rest of our data processing, so in the bus coded number column, we want to filter out the zero bus rows, so we reverse the pull down selection by selecting all rows, except the zero bus coded numbered rows. Leave this Filter in place for the rest of the Median method process.
13	If Cell B4 contains the number zero, then Cell F2 should now contain the 6th value down from the highest short circuit MVA value, and Cell G2 should contain 20% of the Cell F2 value. If Cell F2's value is greater than 1500 MVA this is the new lowest MVA value to be used to determine the number of Median selected buses. If the value in F2 is less than 1500 MVA, then we will use 1500 MVA as the lowest value to select the number of Median buses.
14	If Cell B4 contains a value greater than zero, then Cell F2 needs to be replaced with the MVA value contained in the 11th row, column F of the filtered data set. If the value in F2 is less than 1500 MVA then we will use 1500 MVA as the lowest value to select the number of Median buses.
15	With the Filter still applied to our data set, and zero buses deselected, we will need to use the F2 value to apply as the value used for the MVA column pull down.
16	Using Column F, MVA value pull down, use the Number Filter function, greater than or equal to the F2 value. With this Filter F2 number value applied, now Cntrl C Cell C2, and replace C2 with paste special, value only. This now is the number of buses selected by the Median method.
17	You are Finished!!! The number in Cell C2 indicates the number of Median method selected buses, D2 contains the number of total FR and SOER locations, E2 shows the number of FR / SOER for the Top 10% buses and F2 shows the number of FR / SOER for the Distributed 10% buses.
Notes:	Example 1 (Ex 1 without zero buses) is an additional worksheet shown for a system that does not contains any zero buses. All zero bus entries have been eliminated from the data set.
Notes:	Example 2 (Ex 2 with zero buses) is an additional worksheet shown for a system that contains zero buses. Note for a system that contains zero buses, you must observe the row 11, column F MVA value, and place it into Cell F2. In example 2, this MVA value is equal to 5685 MVA, based on the data set provided.

Implementation Plan

Project 2007-11 Disturbance Monitoring

Requested Approvals

- PRC-002-2 Disturbance Monitoring and Reporting Requirements

Requested Retirements

- PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements
- PRC-018-1 Disturbance Monitoring Equipment Installation and Data Reporting

Prerequisite Approvals

- None

Applicable Entities

- Planning Coordinator
- Reliability Coordinator
- Transmission Owner
- Generator Owner

Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definitions:	
Dynamic Disturbance Recording (DDR)	The recording of time sequenced data for dynamic power system characteristics such as power swings, frequency variations, and abnormal voltage problems.
Fault Recording (FR)	The recording of time sequenced waveform data for short circuits or failure of Elements resulting in abnormal voltage(s) and /or current(s).
Sequence of Events Recording (SOER)	The recording of time sequenced data for change in status of Elements, which may include protection and control devices.

Background

The Implementation Plan reflects consideration of the following:

1. This standard reflects the need for data, rather than equipment, with the understanding that the data is collected from Disturbance Monitoring Equipment distributed across the system.
2. A significant amount of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording equipment already exists on the BES. The location requirements in this standard align with industry practices for locating this equipment. Therefore, many existing recordings can satisfy the Requirements and Implementation Plan put forth.
3. Fault MVA data is readily available or calculable by the Transmission Owners for the bus locations they own. Therefore, six (6) months is adequate time for generating the list of BES bus locations following the methodology described in Attachment 1.
4. Responsible Entities have the relevant data and information pertaining to the Elements requiring Dynamic Disturbance Recording and six (6) months is adequate time for working with any affected Entities and generating the list of Elements.
5. The nine (9) month time period for R2, R7, and R14 includes the six (6) month implementation for R1, and R6 (refer to 3, and 4 preceding), and a three (3) month additional time period to make notifications. The nine (9) months for R14 implementation is reasonable for the contents of that requirement. All requirements pertaining to possible implementation of equipment are referenced to notification of the list of bus locations or Elements to account for any delays in the process of location and Element selection.
6. A total percentage (%) of BES bus locations and Elements established in Requirements R1 and R6 respectively, are used in the Implementation Plan since these lists are explicitly created and readily available. It is expected that many locations will become compliant with incremental changes to recording.
7. A graduated approach to implementation recognizes that progress will be made while attempting to minimize any potential significant impact to the Entities. The timelines put forth allow for inertial delays in implementing new equipment or technologies (e.g. developing new standards and processes, testing and energization, and project management).
8. Implementation of disturbance monitoring following changes to the system are addressed by referencing the Implementation Plan to the time of notification following reassessment. Changes to disturbance monitoring are only required for identified bus locations or Elements following reassessment of the lists as per Requirement R1, Part 1.2 and Requirement R6, Part 6.2.

9. Implementing SOER, FR, and DDR may require scheduled outages for both Transmission Owners and Generator Owners. Generator Owners may have outage cycles of 24 months or more depending on the type and characteristics of the generating units or plant. Meanwhile, Transmission Owners will have more Elements requiring SOER, FR, and DDR and may have to schedule outages across the system. The Implementation Plan takes this into account for scheduling outages.
10. An Entity owning only one (1) identified bus location, Element, or generating unit is allowed four (4) years for implementation to accommodate normal outage schedules.
11. The Implementation Plan accounts for any increase in requests to vendors for this technology or equipment that could impact implementation timelines for the respective Entities.

General Considerations

Each Transmission Owner and Generator Owner shall maintain the ability to provide Disturbance data using current methods until the entity meets the requirements of PRC-002-2 in accordance with this Implementation plan. As required in PRC-018-1 Disturbance Monitoring Equipment Installed and Data Reporting, Requirement R1, Parts 1.1 and 1.2, it is expected that the Transmission Owner and Generator Owner will have those functionalities in regards to their current Disturbance Data.

Standard(s) for Retirement

PRC-002-1	Midnight of the day immediately prior to the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.
PRC-018-1	Midnight of the day immediately prior to the Effective Date of PRC-002-2 in the particular jurisdiction in which the new standard is becoming effective.

Implementation Plan for Definitions

Entities shall use these definitions when implementing any requirement in this standard that references one of the definitions.

Implementation Plan for PRC-002-2 Requirements R1 and R6:

Entities shall be 100% compliant on the first day of the first calendar quarter six (6) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R2, R7, and R14:

Entities shall be 100% compliant on the first day of the first calendar quarter nine (9) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Implementation Plan for PRC-002-2 Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13:

Entities shall be compliant with the initial list of BES bus locations in Requirement R1 and list of Elements in Requirement R6 within the following:

- Following governmental authority or as otherwise provided for in jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect,
  - At least 25% compliant within two (2) years following notification of the list
  - At least 50% compliant within three (3) years following notification of the list
  - 100% compliant within four (4) years following notification of the list

  - **Note**: Entities that own only one (1) identified BES bus location, Element, or generating unit shall be 100% compliant within four (4) years following notification of the list.

- Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is forty-eight (48) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction,

Entities shall be 100% compliant with a reassessed list from Requirement R1, Part 1.2 or R6, Part 6.2 within three (3) years following notification of the list.

Implementation Plan Summary											
Requirement	Entity	Identify bus locations/ Elements	Notification	SOE	FR	DDR	Time Sync	5 Year Assessment	Other	Percent Compliant	Following compliance instructions noted for each requirement above:
R1	TO	X		X	X			X		100	Six (6) months
R2	TO		X							100	Nine (9) months
R3	TO/GO			X						25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R4	TO/GO				X					25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R5	TO/GO				X					25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R6	RE (PC or RC)	X				X		X		100	Six (6) months
R7	RE (PC or RC)		X							100	Nine (9) months
R8	RE (PC or RC)					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R9	TO					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R10	GO					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R11	TO/GO					X				25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R12	TO/GO						X			25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R13	TO/GO								X	25	Two (2) years
										50	Three (3) years
										100	Four (4) years
R14	TO/GO								X	100	Nine (9) months

Project 2007-11 Disturbance Monitoring

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the Standard Authorization Request (SAR). The electronic comment form must be completed by 8 p.m. Eastern on **December 16, 2013**.

If you have questions please contact Barb Nutter via email or by telephone at 404-446-9692.

Click here for the Project Page.

Background Information

Project 2007-11 Disturbance Monitoring was initiated to replace the existing fill-in-the-blank Standard PRC-002-1 Define Regional Disturbance Monitoring and Reporting Requirements with a more comprehensive standard. (Fill-in-the-blank standards are those standards that depend on regional criteria or procedures not currently contained within certain Reliability Standards, but which are needed to provide additional requirements for implementing the standards within the Regions.)

In its Order 693 (March 16, 2007) FERC did not approve or remand PRC-002-1 "…because the regional requirements for installing Disturbance Monitoring Equipment had not been submitted." FERC, in Order 693 did approve PRC-018-1. Similar to PRC-002-1, PRC-018-1 contained Regional Reliability Organization (the term Regional Reliability Organization used in PRC-018-1, now Regional Entity) requirements. FERC stated that PRC-018-1 ensured "that disturbance monitoring equipment is installed and disturbance data is reported in accordance with comprehensive requirements." Project 2007-11 was moved to informal development in the Fall of 2010. The Project was restored to formal development status in January, 2013.

The Purpose of PRC-002-2 is "To have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances." For Sequence of Events and Fault Recording, the Drafting Team decided that it was more practical to require recording, not require equipment, to capture adequate information to analyze BES disturbances. An entity must have data recorded that could determine abnormal disturbance values at a location. It is not the "how", but the "what" regarding data capture. The Drafting Team set up a Monitored Value Analysis Team that looked at three phase bolted bus short circuit MVA data received from members of the Drafting Teams. The Team determined that as long as data was captured for analysis from buses, the Bulk Electric System response to a disturbance could be determined. An Informal Request for Information was posted to industry from June 5, 2013 through July 5, 2013 for short circuit data from around the continent. The information received confirmed the team's analysis. The Drafting Team developed a Locations Selection Methodology which is Attachment 1 in PRC-002-2.

For Dynamic Disturbance Recording, Requirements define the locations Dynamic Disturbance Recording data must be captured for.

The Drafting Team developed three new definitions that are used and included in the posted PRC-002-2: Dynamic Disturbance Recording (DDR), Fault Recording (FR), Sequence of Events Recording (SOER) These definitions will be added to the NERC Glossary of Terms Used in Reliability Standards.

Transmission Owners and Generator Owners will be responsible for the majority of the Requirements in PRC-002-2. Responsible Entities include Planning Coordinators and Reliability Coordinators, as applicable. Each Responsible Entity will be responsible to identify BES Elements for Dynamic Disturbance Recording.

This Project will replace PRC-002-1 with PRC-002-2, and allow the retirement of PRC-018-1.

Transmission Owners – Please note the following:

Requirement R1 requires each Transmission Owner to identify BES bus locations for Sequence of Events Recording (SOER) and Fault Recording (FR). The bus locations are identified using *PRC-002-2 Attachment 1 – Sequence of Events Recording (SOER) and Fault Recording (FR) Locations Selection Methodology*.

An Excel Workbook has been designed to assist Transmission Owners in using the methodology (referred to as the Median Method) discussed in Attachment 1. This workbook has been posted along with the other PRC-002-2 materials during this comment period to give Transmission Owners the opportunity to try out Requirement R1's bus location method by either using their entire system data, or a selected portion of their systems to obtain a full or partial listing of the bus locations that would have to be included in for SOER and FR.

**Please use the electronic comment form to submit your final comments to NERC.*

You do not have to answer all questions. Enter All Comments in Simple Text Format.
Bullets, numbers, and special formatting will not be retained. Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

1. Do you support the new definitions for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording? If not, please explain why and provide suggested changes.

☐ Yes
☐ No

Comments:

2. Do you agree with the methodology in Requirement R1 that selects the BES bus location for Sequence of Events Recording and Fault Recording? If not, please provide technical justification.

☐ Yes
☐ No
Comments:

3. Are the appropriate functional entities identified in the Applicability section for PRC-002-2?
☐ Yes
☐ No
Comments:

4. Do you agree with the Elements requiring Dynamic Disturbance Recording listed in Requirement R6? If not, please provide technical justification.

☐ Yes
☐ No
Comments:

5. Do you agree with the VRFs/VSLs and the Drafting Team's justification? If not, please explain why.
☐ Yes
☐ No
Comments:

6. Do you agree with the Implementation Plan? If not, please explain why.
☐ Yes
☐ No
Comments:

7. If you have any other comments that you haven't already mentioned above, please provide them here:
Comments:

A. Introduction

1. **Title:** **Define Regional Disturbance Monitoring and Reporting Requirements**

2. **Number:** PRC-002-1

3. **Purpose:** Ensure that Regional Reliability Organizations establish requirements for installation of Disturbance Monitoring Equipment (DME) and reporting of Disturbance data to facilitate analyses of events and verify system models.

4. **Applicability**

   4.1. Regional Reliability Organization.

5. **Effective Date:** Nine months after BOT adoption.

B. Requirements

R1. The Regional Reliability Organization shall establish the following installation requirements for sequence of event recording:

R1.1. Location, monitoring and recording requirements, including the following:

R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R1.1.2. Devices to be monitored.

R2. The Regional Reliability Organization shall establish the following installation requirements for fault recording:

R2.1. Location, monitoring and recording requirements, including the following:

R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.).

R2.1.2. Elements to be monitored at each location.

R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R2.1.3.1. Three phase to neutral voltages.

R2.1.3.2. Three phase currents and neutral currents.

R2.1.3.3. Polarizing currents and voltages, if used.

R2.1.3.4. Frequency.

R2.1.3.5. Megawatts and megavars.

R2.2. Technical requirements, including the following:

R2.2.1. Recording duration requirements.

R2.2.2. Minimum sampling rate of 16 samples per cycle.

R2.2.3. Event triggering requirements.

R3. The Regional Reliability Organization shall establish the following installation requirements for dynamic Disturbance recording:

R3.1. Location, monitoring and recording requirements including the following:

R3.1.1. Criteria for equipment location giving consideration to the following:

- Site(s) in or near major load centers
- Site(s) in or near major generation clusters
- Site(s) in or near major voltage sensitive areas
- Site(s) on both sides of major transmission interfaces
- A major transmission junction
- Elements associated with Interconnection Reliability Operating Limits
- Major EHV interconnections between control areas
- Coordination with neighboring regions within the interconnection

R3.1.2. Elements and number of phases to be monitored at each location.

R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following:

R3.1.3.1. Voltage, current and frequency.

R3.1.3.2. Megawatts and megavars.

R3.2. Technical requirements, including the following:

R3.2.1. Capability for continuous recording for devices installed after January 1, 2009.

R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.

R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following:

R4.1. Criteria for events that require the collection of data from DMEs.

R4.2. List of entities that must be provided with recorded Disturbance data.

R4.3. Timetable for response to data request.

R4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE[1] analysis tool,

R4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files[2].

R4.6. Data content requirements and guidelines.

---

[1] IEEE C37.111-1999 IEEE Standard Common Format for Transient Data Exchange for Power Systems or its successor standard

[2] Compliance with this requirement is not effective until the IEEE Standard is approved.

R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.

R6. The Regional Reliability Organization shall periodically (at least every five years) review, update and approve its Regional requirements for Disturbance monitoring and reporting.

C. Measures

M1. The Regional Reliability Organization's requirements for the installation of Disturbance Monitoring Equipment shall address Requirements 1 through 3.

M2. The Regional Reliability Organization's Disturbance monitoring data reporting requirements shall include all elements identified in Requirements 4.

M3. The Regional Reliability Organization shall have evidence it provided its Regional Disturbance monitoring and reporting requirements as required in Requirement 5.

M4. The Regional Reliability Organization shall have evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain documentation of its DME requirements for three years.

The Compliance Monitor will retain its audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization shall demonstrate compliance through providing its documentation of Disturbance Monitoring and Reporting requirements or self-certification as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exist:

2.1.1 Disturbance data reporting requirements were not specified as required in R4.1 through R4.6.

2.1.2 No evidence it conducted a review at least once every five years of its regional requirements for Disturbance monitoring and reporting as required in R6.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions exist:

2.2.1 Technical requirements were not specified for one or more types of DMEs.

2.2.2 Requirements do not provide criteria for equipment location or criteria for monitored elements or monitored quantities as required R1, R2 and R3.

2.3. Level 3: Not applicable.

2.4. Level 4: Disturbance monitoring and reporting requirements were not available or were not provided to Transmission Owners and Generator Owners.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking

A. Introduction

1. **Title:** **Disturbance Monitoring Equipment Installation and Data Reporting**

2. **Number:** PRC-018-1

3. **Purpose:** Ensure that Disturbance Monitoring Equipment (DME) is installed and that Disturbance data is reported in accordance with regional requirements to facilitate analyses of events.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Generator Owner.

5. **Effective Dates:** Phased in over four years after BOT adoption:

   Requirements 1 and 2:

   – 50% compliant two years after initial issuance of regional requirements per RELIABILITY STANDARD PRC-002 Requirement 5.

   – 75% compliant three years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   – 100% compliant four years after initial issuance of regional requirements per reliability standard PRC-002 R5.

   Requirements 3 through 6:

   – 100% compliant six months after BOT adoption for already installed DME.

   – 100% compliant six months after installation for DMEs installed to meet Regional Reliability Organization requirements per reliability standard PRC-002 Requirements 1, 2 and 3.

B. Requirements

R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard PRC-002 Requirements 1-3) shall have DMEs installed that meet the following requirements:

R1.1. Internal Clocks in DME devices shall be synchronized to within 2 milliseconds or less of Universal Coordinated Time scale (UTC)

R1.2. Recorded data from each Disturbance shall be retrievable for ten calendar days..

R2. The Transmission Owner and Generator Owner shall each install DMEs in accordance with its Regional Reliability Organization’s installation requirements (reliability standard PRC-002 Requirements 1 through 3).

R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region’s installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1):

R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder).

R3.2. Make and model of equipment.

R3.3. Installation location.

R3.4. Operational status.

R3.5. Date last tested.

R3.6. Monitored elements, such as transmission circuit, bus section, etc.

R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc.

R3.8. Monitored electrical quantities, such as voltage, current, etc.

R4. The Transmission Owner and Generator Owner shall each provide Disturbance data (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard PRC-002 Requirement 4).

R5. The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years.

R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes:

R6.1. Maintenance and testing intervals and their basis.

R6.2. Summary of maintenance and testing procedures.

C. Measures

M1. The Transmission Owner and Generator Owner shall each have evidence that DMEs it is required to have meet the functional requirements specified in Requirement 1 and are installed in accordance with its associated Regional Reliability Organization's requirements (R2).

M2. The Transmission Owner and Generator Owner shall each maintain the data listed in Requirements 3.1 through 3.8 for the DMEs installed to meet its Regional Reliability Organization's DME installation requirements.

M2.1 The Transmission Owner and Generator Owner shall each have evidence it provided this DME data to its Regional Reliability Organization within 30 calendar days of a request.

M3. The Transmission Owner and Generator Owner shall each have evidence it retained and provided recorded Disturbance data to entities in accordance with its associated Regional Reliability Organization's Disturbance data reporting requirements. (R4 R5)

M4. Each Transmission Owner and Generator Owner that is required to install DMEs to meet its Regional Reliability Organization's DME installation requirements, shall have an associated DME maintenance and testing program as defined in Requirement 6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Transmission Owner and Generator Owner shall each retain any Disturbance data provided to the Regional Reliability Organization (Requirement 4) for three years.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Transmission Owner and Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if any of the following conditions is present:

2.1.1 DMEs that meet all the Regional Reliability Organization's installation requirements (in accordance with Requirement 2) were installed at 90% or more but not all of the required locations.

2.1.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with Requirement 4) was provided for 90% or more but not all of the required locations.

2.1.3 Data on required DMEs was incomplete (in accordance with R3)

2.1.4 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, but records indicate maintenance and testing did occur within the identified intervals for the portions of the program that were documented.

2.2. Level 2: There shall be a level two non-compliance if any of the following conditions is present:

2.2.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 80% or more but less than 90% of the required locations.

2.2.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 80% or more but less than 90% of the required locations.

2.2.3 Recorded Disturbance data was not provided to all required entities (in accordance with R4)

2.2.4 Archived data was not retained for three years (in accordance with Requirement 5).

2.2.5 Documentation of the DME maintenance and testing program provided was complete as required in R6, but records indicate that maintenance and testing did not occur within the defined intervals.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions is present:

2.3.1 DMEs that meet all Regional Reliability Organization's installation requirements (in accordance with R2) were installed at 70% or more but less than 80% of the required locations.

2.3.2 Recorded Disturbance data that meets all Regional Reliability Organization's Disturbance data requirements (in accordance with R4) was provided for 70% or more but less than 80% of the required locations.

2.3.3 Documentation of the DME maintenance and testing program provided was incomplete as required in R6, and records indicate implementation of the documented portions of the maintenance and testing program did not occur within the identified intervals.

2.4. **Level 4:** There shall be a level four non-compliance if any one of the following conditions is present:

2.4.1 DMEs that meet all Regional Reliability Organization’s installation requirements (in accordance with R2) were installed at less than 70% of the required locations.

2.4.2 Recorded Disturbance data that meets all Regional Reliability Organization’s Disturbance data requirements (in accordance with R4) was provided for less than 70% of the required locations.

2.4.3 DMEs that meet all functional requirements (in accordance with R1) were not installed at all required locations.

2.4.4 Documentation of the DME maintenance and testing program was not provided, or no evidence that the testing program did occur within the identified intervals

E. Regional Differences

None identified.

Consideration of Issues and Directives

Project 2007-11 Disturbance Monitoring
PRC-002-2 Disturbance Monitoring and Reporting Requirements

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"For the reasons stated in the NOPR, the Commission will not approve or remand PRC-002-1." "We agree with [American Public Power Association], Alcoa and Otter Tail that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA, Alcoa and Otter Tail's suggestions in the Reliability Standards development process as it modifies PRC-002-1 to provide missing information needed for the Commission to act on this Reliability Standard." (see below for American Public Power Association, Alcoa, and Otter Tail discussion)	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1455-56	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances. The use of recording and specifying recording data parameters, greater consistency is achieved in PRC-002-2.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
"APPA agrees with the Commission's proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in addressing the completion of this Reliability Standard."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1452	PRC-002-2 will apply on a continent-wide basis and will ensure that there is adequate data available to facilitate event analysis of Bulk Electric System (BES) Disturbances.
"Alcoa suggests that the ERO—instead of a Regional Entity—should define the requirements for DME and the type of report it generates. The requirements and equipment specifications should be consistent throughout North America. In addition, Alcoa suggests that the criteria for installation of such equipment should include the necessary monitoring and recording that contribute to analysis and enhance reliability."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 1453	Determines the key locations for which Disturbance data must be recorded which eliminates the need for equipment requirements. PRC-002-2 specifies the storage requirements and recording format for the collected data to ensure continent-wide uniformity to expedite event analysis.
"Otter Tail suggests that PRC-002-1 should be developed on an Interconnection wide basis to ensure consistency and promote reliability of the Bulk-Power System."	FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards	PRC-002-2 will apply on a continent-wide basis.

Project 2007-11- Disturbance Monitoring		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
	for the Bulk-Power System (Issued March 16, 2007); Paragraph 1454	
"The Commission requires supplemental information for any Reliability Standard that currently requires a regional reliability organization to fill in missing criteria or procedures. Where important information has not yet been provided to us to enable us to complete our review, we are not in a position to approve or remand those Reliability Standards. Accordingly, we will not approve or remand such Reliability Standards until the ERO submits further information. Until such information is provided, compliance with fill-in-the-blank standards should continue on a voluntary basis, and the Commission considers compliance with such Reliability Standards to be a matter of good utility practice."	Fill-in-the-blank Consideration FERC Docket No. RM06-16-000; Order No. 693; Mandatory Reliability Standards for the Bulk-Power System (Issued March 16, 2007); Paragraph 297.	By addressing recording instead of equipment, the Drafting Team has produced a continent-wide standard to have adequate data available to facilitate event analysis of Bulk Electric System (BES) disturbances.

Project 2007-11 – Disturbance Monitoring

PRC-002-2 – Disturbance Monitoring and Reporting Requirements

Mapping Document for PRC-018-1 to PRC-002-2 and PRC-002-1 to PRC-002-2

PRC-002-2 addresses the recording (data), not "how" the data is recorded, thus eliminating the complications that arise from the inherent differences between regional power systems. PRC-018-1 and PRC-002-1 deal with equipment, PRC-002-2 deals with recording. By specifying recording instead of equipment, PRC-002-2 governs the practical capturing of abnormal event data on the BES.

PRC-018-1 Requirements reference PRC-002-1 which requires PRC-018-1 Requirements to be either retired or covered in PRC-002-2.

As used herein, the acronym SOER is Sequence of Events Recording, the acronym FR is Fault Recording, and the acronym DDR is Dynamic Disturbance Recording.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1. Each Transmission Owner and Generator Owner required to install DMEs by its Regional Reliability Organization (reliability standard **PRC-002 Requirements 1-3**) shall have DMEs installed that meet the following requirements:	**R12.** Each Transmission Owner and Generator Owner shall time synchronize all **Sequence of Events Recording** (SOER), **Fault Recording** (FR), and **Dynamic Disturbance Recording** (DDR) data for the bus locations as per Requirement R2 and Elements as per Requirement R7to **within ± 2 milliseconds** of Coordinated Universal Time (UTC), time stamped with or without a local offset. **R13.** Each Transmission Owner and Generator Owner shall provide **Sequence of Event**

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R1.1. Internal Clocks in DME devices shall be synchronized to **within 2 milliseconds** or less of Universal Coordinated Time scale (UTC) R1.2. Recorded data from each Disturbance shall be **retrievable for ten calendar days**.	**Recording**, **Fault Recording**, and **Dynamic Disturbance Recording** data for the bus locations as per Requirement R2 and Elements as per Requirement R7 to the Reliability Coordinator, Regional Entity, or NERC upon request: 13.1. The recorded data will be provided within 30 calendar days of a request. 13.2. The recorded data will be **retrievable for the period of 10 calendar days** preceding a request. 13.3. Sequence of Events Recording data will be provided in Comma Separated Value (.CSV) format following Attachment 2. 13.4. Fault Recording and Dynamic Disturbance Recording data will be provided in electronic C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files. 13.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).
Notes: PRC-018-1, Requirement R1 is covered in PRC-002-2, Requirements R12 and R13. PRC-018-1 addresses the equipment used for Disturbance monitoring data recording, PRC-002-2 addresses the recorded data. Technological advances made in the types of equipment used to record power system data have made it more effective to direct PRC-002-2 at the recording, not the equipment. Time synchronization and having the data retrievable for 10 days are general parameters that facilitate data analysis. PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirement R13.	
R2. The Transmission Owner and Generator Owner shall each **install DMEs in accordance with** its Regional Reliability Organization's installation	**R1.** Each Transmission Owner shall identify BES bus locations for **Sequence of Events Recording** (SOER) and Fault Recording (FR). 1.1. Bus locations shall be identified using *PRC-002-2 Attachment 1 – Sequence of*

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
requirements (reliability standard **PRC-002 Requirements 1 through 3**). **PRC-002-1** R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following: R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1.Location, monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars.	*Events Recording (SOER) and Fault Recording (FR) Locations Selection Methodology.* 1.2. Bus locations shall be assessed at least every five calendar years. **R2**. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the owners of those Elements, within 90 calendar days of determination, that the Elements require **Sequence of Events Recording** (SOER) and Fault Recording (FR). **R3**. Each Transmission Owner and Generator Owner shall have **Sequence of Events Recording** (SOER) for circuit breaker position (open/close) for each of the circuit breakers they own connected to the bus locations as per Requirement R2. **R4.** Each Transmission Owner and Generator Owner shall have **Fault Recording** (FR) at the bus locations as per Requirement R2 to determine the following electrical quantities: 4.1. Phase-to-neutral voltages for each phase of either each line or bus they own. 4.2. Each phase current and the residual or neutral current for the following BES Elements they own: 4.2.1. Transformers that have a low-side operating voltage of 100kV or above. 4.2.2. Transmission Lines.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R2.2.Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements. R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location, monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009.	**R5.** Each Transmission Owner and Generator Owner shall have **Fault Recording** as specified in Requirement R4 that meets the following: 5.1. A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault. 5.2. A minimum recording rate of 16 samples per cycle. 5.3. Trigger settings for at least the following: 5.3.1. Neutral (residual) overcurrent. 5.3.2. Phase undervoltage. **R6.** Each Responsible Entity shall identify BES Elements for which **Dynamic Disturbance Recording** (DDR) is required. 6.1. The Elements shall include the following: 6.1.1. A minimum of one DDR location per 3,000 MW of the Responsible Entity's historical peak system Load, inclusive of Requirement R6, Part 1, Sub-parts 6.1.1 – 6.1.7. 6.1.2 At least one DDR location in each Responsible Entity's footprint. 6.1.3. Generating resource(s) with:

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	6.1.3.1. Gross individual nameplate rating greater than or equal to 500 MVA. 6.1.3.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. 6.1.4. Locations necessary to monitor all Elements of: • Eastern Interconnection - all permanent Flowgates. • ERCOT Interconnection - major transmission interfaces. • Hydro-Quebec Interconnection - major transmission interfaces. • Western Interconnection - all major transfer paths as defined by the Regional Entity. 6.1.5. Both ends of HVDC terminals (back-to-back or each terminal of a DC circuit) on the AC portion of the converter. 6.1.6. Locations necessary to monitor all Elements of Interconnection Reliability Operating Limits. 6.1.7. Any one Element within a major voltage sensitive area as defined by an in-service undervoltage load shedding (UVLS) program. 6.2. The Elements shall be assessed at least every five calendar years.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	R7. Each Responsible Entity shall notify, within 90 calendar days of determination, each Transmission Owner and Generator Owner of the locations and Elements they own for which **Dynamic Disturbance Recording** is required as established in Requirement R6. **R8.** Each Transmission Owner shall have **Dynamic Disturbance Recording**, for each Element they own as per Requirement R7, to determine the following electrical quantities: 8.1. One phase-to-neutral or positive sequence voltage. 8.2. The phase current on the same phase at the same voltage corresponding to the voltage in Requirement R8, Part 8.1, or the positive sequence current. 8.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 8.4. Frequency of any one of the voltage(s) in Requirement R8, Part 8.1. **R9.** Each Generator Owner shall have **Dynamic Disturbance Recording**, for each Element they own as per Requirement R7, to determine the following electrical quantities: 9.1. Any one phase-to-neutral, phase-to-phase, or positive sequence voltage at either the Generator Step Up Units (GSUs) high-side or low-side voltage level. 9.2. The phase current on the same phase at the same voltage in Requirement R9, Part 9.1, two phase currents for phase-to-phase voltages, or positive sequence current.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	9.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 9.4. Frequency of at least one of the voltages in Requirement R9, Part 9.1. **R10.** Each Transmission Owner and Generator Owner that is responsible for Dynamic Disturbance Recording as per Requirement R7 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, the following is required: 10.1. Triggered record lengths of at least three minutes. 10.2. At least one of the following triggers: • Off nominal frequency trigger set at: Low High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec

<tr><th>Standard PRC-018-1 (To be Retired)
FERC Approved</th><th>Proposed Standard PRC-002-2</th></tr>
<tr><td></td><td>• Undervoltage trigger set at:
o No lower than 85% of normal operating voltage for a duration of 5 seconds

R11. Each Transmission Owner and Generator Owner shall have Dynamic Disturbance Recording, for the Elements as per Requirement R7, which conform to the following technical specifications:
11.1. Input sampling rate of at least 960 samples per second.
11.2. Output recording rate of electrical quantities of at least 30 times per second.</td></tr>
<tr><td colspan="2">Notes: PRC-018-1, Requirement R2 and PRC-002-1 Requirements R1-R3 are covered in PRC-002-2, Requirements R1-R2, and R3-R11. PRC-018-1, Requirement R2 references PRC-002-1 Requirements R1-R3. PRC-002-1, Requirements R1-R3 reference equipment installation requirements for FR, SOER, and DDR. The technical parameters of PRC-002-2 pertain to the characteristics and content of the recordings that are needed to facilitate event analysis.</td></tr>
<tr><td>R3. The Transmission Owner and Generator Owner shall each maintain, and report to its Regional Reliability Organization on request, the following data on the DMEs installed to meet that region’s installation requirements (reliability standard PRC-002 Requirements1.1, 2.1 and 3.1):</td><td>None.</td></tr>
</table>

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R3.1. Type of DME (sequence of event recorder, fault recorder, or dynamic disturbance recorder). R3.2. Make and model of equipment. R3.3. Installation location. R3.4. Operational status. R3.5. Date last tested. R3.6. Monitored elements, such as transmission circuit, bus section, etc. R3.7. Monitored devices, such as circuit breaker, disconnect status, alarms, etc. R3.8.Monitored electrical quantities, such as voltage, current, etc.	
Notes: PRC-018-1, Requirement R3 is not covered in PRC-002-2. PRC-018-1 Requirement R3 refers to equipment and therefore is not mapped to PRC-002-2 which deals with recorded data and not equipment.	

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
R4. The Transmission Owner and Generator Owner shall each **provide Disturbance data** (recorded by DMEs) in accordance with its Regional Reliability Organization's requirements (reliability standard **PRC-002 Requirement 4**). **PRC-002-1** R4. The Regional Reliability Organization shall establish requirements for facility owners to report Disturbance data recorded by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request. 4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool. 4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	**R13.** Each Transmission Owner and Generator Owner **shall provide Sequence of Event Recording (SOER), Fault Recording (FR), and Dynamic Disturbance Recording (DDR) data** for the bus locations as per Requirement R2 and Elements as per Requirement R7 to the Reliability Coordinator, Regional Entity, or NERC upon request: 13.1. The recorded data will be provided within 30 calendar days of a request. 13.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request. 13.3. Sequence of Events Recording data will be provided in Comma Separated Value (.CSV) format following Attachment 2. 13.4. Fault Recording and Dynamic Disturbance Recording data will be provided in electronic C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files. 13.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
Notes: PRC-018-1, Requirement R4 references PRC-002-1 Requirement R4 which is covered is PRC-002-2, Requirement R13.	
R5. The Transmission Owner and Generator Owner shall each **archive all data** recorded by DMEs for Regional Reliability Organization-identified events for at least three years.	Covered in the Compliance section **1.2** Evidence Retention The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The Transmission Owner, Generator Owner, Planning Coordinator, and Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation: The Transmission Owner shall retain evidence of Requirements R1 and R2, Measures M1 and M2 for five calendar years. The Transmission Owner shall retain evidence of Requirements R3, R4, R5, and R8 Measures M3, M4, M5, and M8 for three calendar years.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
	The Planning Coordinator and Reliability Coordinator shall retain evidence of Requirements R6 and R7, Measures M6 and M7 for five calendar years. The Generator Owner shall retain evidence of Requirement R9, Measure M9 for three calendar years. The Transmission Owner and Generator Owner shall retain evidence of Requirements R10, R11, R13, and R14, Measures M10, M11, M13, and M14 for three calendar years. If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer. The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.
Notes: PRC-018-1, Requirement R5 is covered in the PRC-002-2 Compliance section under Evidence Retention.	
R6. Each Transmission Owner and Generator Owner that is required by its Regional Reliability Organization to have DMEs shall have a maintenance and testing program for those DMEs that includes: R6.1. Maintenance and testing intervals	**R14.** Each Transmission Owner and Generator Owner, within 90 calendar days of the discovery of a failure of the **Sequence of Events Recording** (SOER), **Fault Recording** (FR), or **Dynamic Disturbance Recording** (DDR) at the bus locations as per Requirement R2 and Elements as per Requirement R7, shall: • Restore the recording ability. • Report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability.

Standard PRC-018-1 (To be Retired) FERC Approved	Proposed Standard PRC-002-2
and their basis. R6.2. Summary of maintenance and testing procedures.	
Notes: PRC-018-1, Requirement R6 is covered in PRC-002-2, Requirement R14. PRC-018-1, Requirement R6 deals with routine maintenance and testing of equipment. PRC-002-2, Requirement R14 deals with the long term availability of recording capability. Both Requirements are meant to ensure the availability of the recording of data. By requiring the TOs and GOs to notify their Regional Entity reinforces the importance of the available recording capability.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R1. The Regional Reliability Organization shall establish the following installation requirements for **sequence of event recording**: R1.1. Location, monitoring and recording requirements, including the following: R1.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R1.1.2. Devices to be monitored	**R1.** Each Transmission Owner shall identify BES bus locations for **Sequence of Events Recording** (SOER) and Fault Recording (FR). 1.1. Bus locations shall be identified using *PRC-002-2 Attachment 1 – Sequence of Events Recording (SOER) and Fault Recording (FR) Locations Selection Methodology.* 1.2. Bus locations shall be assessed at least every five calendar years.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R2. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the owners of those Elements, within 90 calendar days of determination, that the Elements require **Sequence of Events Recording** (SOER) and Fault Recording (FR). **R3**. Each Transmission Owner and Generator Owner shall have **Sequence of Events Recording** for circuit breaker position (open/close) for each of the circuit breakers they own connected to the bus locations as per Requirement R2.
Notes: PRC-002-1, Requirement R1 is covered in PRC-002-2, Requirements R1-R3. (See PRC-018-1, Requirement R3 above for additional information.)	
R2. The Regional Reliability Organization shall establish the following installation requirements for **fault recording**: R2.1. Location , monitoring and recording requirements, including the following: R2.1.1. Criteria for equipment location (e.g., by voltage, geographic area, station size, etc.). R2.1.2. Elements to be monitored at each location. R2.1.3. Electrical quantities to be recorded for each monitored	**R1.** Each Transmission Owner shall identify BES bus locations for Sequence of Events Recording (SOER) and **Fault Recording** (FR). 1.1. Bus locations shall be identified using *PRC-002-2 Attachment 1 – Sequence of Events Recording (SOER) and Fault Recording (FR) Locations Selection Methodology*. 1.2. Bus locations shall be assessed at least every five calendar years. **R2.** Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the owners of those Elements, within 90 calendar days of determination, that the Elements require Sequence of Events Recording (SOER) and **Fault Recording** (FR).

Standard PRC-002-1	Proposed Standard PRC-002-2
element shall be sufficient to determine the following: R2.1.3.1. Three phase to neutral voltages. R2.1.3.2. Three phase currents and neutral currents. R2.1.3.3. Polarizing currents and voltages, if used. R2.1.3.4. Frequency. R2.1.3.5. Megawatts and megavars. R2.2. Technical requirements, including the following: R2.2.1.Recording duration requirements. R2.2.2. Minimum sampling rate of 16 samples per cycle. R2.2.3. Event triggering requirements.	**R4.** Each Transmission Owner and Generator Owner shall have **Fault Recording** (FR) to determine the following electrical quantities at the bus locations as per Requirement R2: 4.1. Phase-to-neutral voltages for each phase of either each line or bus. 4.2. Each phase current and the residual or neutral current for the following BES Elements: 4.2.1. Transformers that have a low-side operating voltage of 100kV or above. 4.2.2. Transmission Lines. **R5.** Each Transmission Owner and Generator Owner shall have **Fault Recording** as specified in Requirement R4 that meets the following: 5.1. A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault. 5.2. A minimum recording rate of 16 samples per cycle. 5.3. Trigger settings for at least the following: 5.3.1. Neutral (residual) overcurrent. 5.3.2. Phase undervoltage.
Notes: PRC-002-1, Requirement R2 is covered in PRC-002-2, Requirements R1, R2, R4, and R5.	

Standard PRC-002-1	Proposed Standard PRC-002-2
R3. The Regional Reliability Organization shall establish the following installation requirements for **dynamic Disturbance recording**: R3.1. Location , monitoring and recording requirements including the following: R3.1.1.Criteria for equipment location giving consideration to the following: -Site(s) in or near major load centers -Site(s) in or near major generation clusters -Site(s) in or near major voltage sensitive areas -Site(s) on both sides of major transmission interfaces -A major transmission junction -Elements associated with Interconnection Reliability Operating Limits -Major EHV interconnections between control areas -Coordination with neighboring regions within the interconnection R3.1.2. Elements and	**R6.** Each Responsible Entity shall identify BES Elements for which **Dynamic Disturbance Recording** (DDR) is required. 6.1. The Elements shall include the following: 6.1.1. A minimum of one DDR location per 3,000 MW of the Responsible Entity's historical peak system Load, inclusive of Requirement R6, Part 1, Sub-parts 6.1.1 – 6.1.7. 6.1.2 At least one DDR location in each Responsible Entity's footprint. 6.1.3. Generating resource(s) with: 6.1.3.1. Gross individual nameplate rating greater than or equal to 500 MVA. 6.1.3.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. 6.1.4. Locations necessary to monitor all Elements of: • Eastern Interconnection - all permanent Flowgates. • ERCOT Interconnection - major transmission interfaces. • Hydro-Quebec Interconnection - major transmission interfaces. • Western Interconnection - all major transfer paths as defined by the Regional Entity. 6.1.5. Both ends of HVDC terminals (back-to-back or each terminal of a DC circuit)

Standard PRC-002-1	Proposed Standard PRC-002-2
number of phases to be monitored at each location. R3.1.3. Electrical quantities to be recorded for each monitored element shall be sufficient to determine the following: R3.1.3.1. Voltage, current and frequency. R3.1.3.2. Megawatts and megavars. R3.2. Technical requirements, including the following: R3.2.1. Capability for continuous recording for devices installed after January 1, 2009. R3.2.2. Each device shall sample data at a rate of at least 960 samples per second and shall record the RMS value of electrical quantities at a rate of at least 6 records per second.	on the AC portion of the converter. 6.1.6. Locations necessary to monitor all Elements of Interconnection Reliability Operating Limits. 6.1.7. Any one Element within a major voltage sensitive area as defined by an in-service undervoltage load shedding UVLS program. 6.2. The Elements shall be assessed at least every five calendar years. **R7.** Each Responsible Entity shall notify, within 90 calendar days of determination, each Transmission Owner and Generator Owner of the locations and Elements they own for which **Dynamic Disturbance Recording** (DDR) is required as per Requirement R7. **R8**. Each Transmission Owner shall have Dynamic Disturbance Recording, for each Element they own as per Requirement R7, to determine the following electrical quantities: 8.1. One phase-to-neutral or positive sequence voltage. 8.2. The phase current on the same phase at the same voltage corresponding to the voltage in Requirement R8, Part 8.1, or the positive sequence current. 8.3. Real Power and Reactive Power flows expressed on a three-phase basis corresponding to all circuits where current measurements are required. 8.4. Frequency of any one of the voltage(s) in Requirement R8, Part 8.1.

Standard PRC-002-1	Proposed Standard PRC-002-2
	R10. Each Transmission Owner and Generator Owner that is responsible for **Dynamic Disturbance Recording** as per Requirement R7 shall have continuous data recording and storage. If the equipment was installed prior to the effective date of this standard and is not capable of continuous recording, the following is required: 10.1. Triggered record lengths of at least three minutes. 10.2. At least one of the following triggers: • Off nominal frequency trigger set at: Low High o Eastern Interconnection <59.75 Hz >61.0 Hz o Western Interconnection <59.55 Hz >61.0 Hz o ERCOT Interconnection <59.35 Hz >61.0 Hz o Hydro-Quebec Interconnection <58.55 Hz >61.5 Hz • Rate of change of frequency trigger set at: o Eastern Interconnection < -0.03125 Hz/sec > 0.125 Hz/sec o Western Interconnection < -0.05625 Hz/sec > 0.125 Hz/sec o ERCOT Interconnection < -0.08125 Hz/sec > 0.125 Hz/sec o Hydro-Quebec Interconnection < -0.18125 Hz/sec > 0.1875 Hz/sec • Undervoltage trigger set at: o No lower than 85% of normal operating voltage for a duration of 5 seconds

Standard PRC-002-1	Proposed Standard PRC-002-2
	R11. Each Transmission Owner and Generator Owner shall have **Dynamic Disturbance Recording**, for the Elements as per Requirement R7, which conform to the following technical specifications: 11.1. Input sampling rate of at least 960 samples per second. 11.2. Output recording rate of electrical quantities of at least 30 times per second.
Notes: PRC-002-1, Requirement R3 is covered in PRC-002-2, Requirements R6-R8 and R10-R11.	
R4. The Regional Reliability Organization shall establish requirements for facility owners to **report Disturbance data recorded** by their DME installations. The Disturbance data reporting requirements shall include the following: 4.1. Criteria for events that require the collection of data from DMEs. 4.2. List of entities that must be provided with recorded Disturbance data. 4.3. Timetable for response to data request.	**R13.** Each Transmission Owner and Generator Owner **shall provide Sequence of Event Recording, Fault Recording, and Dynamic Disturbance Recording data** for the bus locations as per Requirement R2 and Elements as per Requirement R7 to the Reliability Coordinator, Regional Entity, or NERC upon request: 13.1. The recorded data will be provided within 30 calendar days of a request. 13.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request. 13.3. Sequence of Events Recording data will be provided in Comma Separated Value (.CSV) format following Attachment 2. 13.4. Fault Recording and Dynamic Disturbance Recording data will be provided in electronic C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files. 13.5. Data files will be named in conformance with C37.232, IEEE Standard for Common Format for Naming Time Sequence Data Files (COMNAME).

Standard PRC-002-1	Proposed Standard PRC-002-2
4.4. Provision for reporting Disturbance data in a format which is capable of being viewed, read and analyzed with a generic COMTRADE analysis tool, 4.5. Naming of data files in conformance with the IEEE C37.232 Recommended Practice for Naming Time Sequence Data Files. 4.6. Data content requirements and guidelines.	
Notes: PRC-002-1, Requirement R4 is covered in PRC-002-2, Requirement R13.	
R5. The Regional Reliability Organization shall provide its requirements (and any revisions to those requirements) including those for DME installation and Disturbance data reporting to the affected Transmission Owners and Generator Owners within 30 calendar days of approval of those requirements.	**R2.** Each Transmission Owner that identifies BES Elements at the locations established Requirement R1 shall **notify the owners** of those Elements, within 90 calendar days of determination, that the Elements require Sequence of Events Recording and Fault Recording. **R6.** Each Responsible Entity shall identify BES Elements for which **Dynamic Disturbance Recording** (DDR) is required. 6.1. The Elements shall include the following: 6.1.1. A minimum of one DDR location per 3,000 MW of the Responsible

Standard PRC-002-1	Proposed Standard PRC-002-2
	Entity's historical peak system Load, inclusive of Requirement R6, Part 1, Sub-parts 6.1.1 – 6.1.7. 6.1.2 At least one DDR location in each Responsible Entity's footprint. 6.1.3. Generating resource(s) with: 6.1.3.1. Gross individual nameplate rating greater than or equal to 500 MVA. 6.1.3.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. 6.1.4. Locations necessary to monitor all Elements of: • Eastern Interconnection - all permanent Flowgates. • ERCOT Interconnection - major transmission interfaces. • Hydro-Quebec Interconnection - major transmission interfaces. • Western Interconnection - all major transfer paths as defined by the Regional Entity. 6.1.5. Both ends of HVDC terminals (back-to-back or each terminal of a DC circuit) on the AC portion of the converter. 6.1.6. Locations necessary to monitor all Elements of Interconnection Reliability Operating Limits. 6.1.7. Any one Element within a major voltage sensitive area as defined by an in-service undervoltage load shedding (UVLS) program.

Standard PRC-002-1	Proposed Standard PRC-002-2
	6.2. The Elements shall be assessed at least every five calendar years. **R7.** Each Responsible Entity **shall notify**, within 90 calendar days of determination, each Transmission Owner and Generator Owner of the locations and Elements they own for which **Dynamic Disturbance Recording** (DDR) is required as established in Requirement R6.
Notes: PRC-002-1, Requirement R5 is covered in PRC-002-2, Requirements R2, R6-R7.	
R6. The Regional Reliability Organization shall periodically (**at least every five years**) review, update and approve its Regional requirements for Disturbance monitoring and reporting.	**R1.** Each Transmission Owner shall identify BES bus locations for Sequence of Events Recording (SOER) and Fault Recording (FR). 1.1. Bus locations shall be identified using *PRC-002-2 Attachment 1 – Sequence of Events Recording (SOER) and Fault Recording (FR) Locations Selection Methodology.* 1.2. Bus locations shall be **assessed at least every five calendar** years. **R6.** Each Responsible Entity shall identify BES Elements for which Dynamic Disturbance Recording (DDR) is required. 6.1. The Elements shall include the following: 6.1.1. A minimum of one DDR location per 3,000 MW of the Responsible Entity's historical peak system Load, inclusive of Requirement R6, Part 1, Sub-parts 6.1.1 – 6.1.7. 6.1.2 At least one DDR location in each Responsible Entity’s footprint.

Standard PRC-002-1	Proposed Standard PRC-002-2
	6.1.3. Generating resource(s) with: 6.1.3.1. Gross individual nameplate rating greater than or equal to 500 MVA. 6.1.3.2 Gross individual nameplate rating greater than or equal to 300 MVA where the gross plant/facility aggregate nameplate rating is greater than or equal to 1000MVA. 6.1.4. Locations necessary to monitor all Elements of: • Eastern Interconnection - all permanent Flowgates. • ERCOT Interconnection - major transmission interfaces. • Hydro-Quebec Interconnection - major transmission interfaces. • Western Interconnection - all major transfer paths as defined by the Regional Entity. 6.1.5. Both ends of HVDC terminals (back-to-back or each terminal of a DC circuit) on the AC portion of the converter. 6.1.6. Locations necessary to monitor all Elements of Interconnection Reliability Operating Limits. 6.1.7. Any one Element within a major voltage sensitive area as defined by an in-service undervoltage load shedding (UVLS) program. 6.2. The Elements shall be **assessed at least every five** calendar years.

Standard PRC-002-1	Proposed Standard PRC-002-2
Notes: PRC-002-1, Requirement R6 is covered in PRC-002-2, Requirements R1 and R6.	

Project 2007-11 Disturbance Monitoring

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-002-2 – Disturbance Monitoring and Reporting Requirements.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined by the ERO Sanctions Guidelines.

The Disturbance Monitoring and Reporting Requirements Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria –VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) – Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) –Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed VRF	**Lower**
NERC VRF Discussion	R1 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R1 establishes the list of Sequence of Events Recordings and Fault Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for establishing a list of BES bus locations for Sequence of Events Recording and Fault Recording using the selection procedure in Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish the list of BES bus locations for Sequence of Events Recording and Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R1 contains only one objective which is to establish a list of BES bus locations for Sequence of Events Recording and Fault Recording and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.

VRF and VSL Justifications – PRC-002-2, R1	
Proposed Lower VSL	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 80% but less than 100% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by 30 calendar days or less.
Proposed Moderate VSL	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 70% but less than or equal to 80% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 30 calendar days and less than or equal to 60 calendar days.
Proposed High VSL	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for more than 60% but less than or equal to 70% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 60 calendar days and less than or equal to 90 calendar days.
Proposed Severe VSL	The Transmission Owner identified the bus locations as directed by Requirement R1, Part 1.1 for less than or equal to 60% of the required bus locations. OR The Transmission Owner assessed the bus locations as directed by Requirement R1, Part 1.2 but was late by greater than 90 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-

VRF and VSL Justifications – PRC-002-2, R1	
the Current Level of Compliance	002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R1 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the	Non CIP

VRF and VSL Justifications – PRC-002-2, R1	
'weakest link' characteristic, should apply binary VSLs	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R2	
Proposed VRF	**Lower**
NERC VRF Discussion	R2 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R2 requires the Transmission Owner to notify the other affected owners to provide Sequence of Events Recordings and Fault Recordings at bus locations selected in Requirement R1. This is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for notifying the other affected owners to provide Sequence of Events Recordings and Fault Recordings at bus locations selected in Requirement R1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to notify the owners of BES bus locations for Sequence of Events Recording and Fault Recording selected in R1 could not directly affect the electrical state or capability of the BES, or the ability to

VRF and VSL Justifications – PRC-002-2, R2	
	effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R2 contains only one objective which is to notify the owners of BES bus locations for Sequence of Events Recording and Fault Recording selected in R1.
Proposed Lower VSL	The Transmission Owner as directed by Requirement R2 was late in notifying the owners by 10 calendar days or less.
Proposed Moderate VSL	The Transmission Owner as directed by Requirement R2 was late in notifying the owners by greater than 10 calendar days but less than or equal to 20 calendar days.
Proposed High VSL	The Transmission Owner as directed by Requirement R2 was late in notifying the owners by greater than 20 calendar days but less than or equal to 30 calendar days.
Proposed Severe VSL	The Transmission Owner as directed by Requirement R2 was late in notifying one or more owners by greater than 30 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level	Guideline 2a: The VSL assignment is for R2 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R2	
Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R3	
Proposed VRF	**Lower**
NERC VRF Discussion	R3 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R3 provides criteria for Sequence of Events Recording which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Sequence of Events Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Sequence of Events Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R3 contains only one objective which is to establish criteria for Sequence of Events Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 75% but less than 100% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Moderate VSL	Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 50% but less than or equal to 75% of the

VRF and VSL Justifications – PRC-002-2, R3	
	total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed High VSL	Each Transmission or Generator Owner as directed by Requirement R3 implemented more than 10% but less than or equal to 50% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
Proposed Severe VSL	Each Transmission or Generator Owner as directed by Requirement R3 implemented from 0% but less than or equal to 10% of the total Sequence of Events Recording for circuit breaker position (open/close) for each of the circuit breakers at the bus locations as per Requirement R2.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments	Guideline 2a: The VSL assignment is for R3 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R3	
that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R4	
Proposed VRF	**Lower**
NERC VRF Discussion	R4 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely

VRF and VSL Justifications – PRC-002-2, R4	
	affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R4 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recording selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R4 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 75% but less than 100% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Moderate VSL	The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 50% but less than or equal to 75% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.

VRF and VSL Justifications – PRC-002-2, R4	
Proposed High VSL	The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 10% but less than or equal to 50% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
Proposed Severe VSL	The Transmission Owner or Generator Owner implemented Fault Recording as directed by Requirement R4, Parts 4.1 and 4.2 that covers more than 0% but less than or equal to 10% of the total set of required electrical quantities, which is the product of the total number of monitored BES Elements and the number of specified electrical quantities per each Element.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R4 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSL uses similar terminology to that used in the

VRF and VSL Justifications – PRC-002-2, R4	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R5	
Proposed VRF	**Lower**
NERC VRF Discussion	R5 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative

VRF and VSL Justifications – PRC-002-2, R5	
	conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R5 provides criteria for Fault Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Fault Recordings selected in R1, Attachment 1. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Fault Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R5 contains only one objective which is to establish criteria for Fault Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 75% but less than 100% of the total recording properties as specified in Requirement R5.
Proposed Moderate VSL	The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 50% but less than or equal to 75% of the total recording properties as specified in Requirement R5.
Proposed High VSL	The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 10% but less than or equal to 50% of the total recording properties as specified in Requirement R5.

VRF and VSL Justifications – PRC-002-2, R5	
Proposed Severe VSL	The Transmission Owner or Generator Owner implemented Fault Recording that meets more than 0% but less than or equal to 10% of the total recording properties as specified in Requirement R5.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R5 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R5	
on A Single Violation, Not on A Cumulative Number of Violations	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R6	
Proposed VRF	**Lower**
NERC VRF Discussion	R6 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R6 establishes the list of Dynamic Disturbance Recordings that is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.

VRF and VSL Justifications – PRC-002-2, R6	
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for identifying BES Elements for Dynamic Disturbance Recording. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to identify BES Elements for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R6 contains only one objective which identifies BES Elements within specified criteria and to review the list every 5 calendar years. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R6, Part 6.1 for more than 80% but less than 100% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R6, Part 6.2 but was late by 30 calendar days or less.
Proposed Moderate VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R6, Part 6.1 for more than 70% but less than or equal to 80% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R6, Part 6.2 but was late by greater than 30 calendar days and less than or equal to 60 calendar days.
Proposed High VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R6, Part 6.1 for more than 60% but less than

VRF and VSL Justifications – PRC-002-2, R6	
	or equal to 70% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R6, Part 6.2 but was late by greater than 60 calendar days and less than or equal to 90 calendar days.
Proposed Severe VSL	The Responsible Entity accurately identified the Elements for DDR as directed by Requirement R6, Part 6.1 for less than or equal to 60% of the required Elements. OR The Responsible Entity assessed the Elements for DDR as directed by Requirement R6, Part 6.2 but was late by greater than 90 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous	Guideline 2a: The VSL assignment is for R6 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – PRC-002-2, R6	
Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R7	
Proposed VRF	**Lower**
NERC VRF Discussion	R7 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R7 requires the Responsible Entity to notify the owners to provide Dynamic Disturbance Recordings for Elements selected in R6. This is consistent with FERC guideline G1, Recommendation 12 of the Blackout Report.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for the Responsible Entity to notify the owners of the Elements for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to notify the owners of the Elements selected for Dynamic Disturbance Recording in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R7 contains only one objective which is to notify the owners of BES Elements selected for Dynamic Disturbance Recording selected in R6.
Proposed Lower VSL	The Responsible Entity as directed by Requirement R7 was late in notifying the owners by 10 calendar days or less.
Proposed Moderate VSL	The Responsible Entity as directed by Requirement R7 was late in notifying the owners by greater than 10 calendar days but less than or equal to 20 calendar days.

VRF and VSL Justifications – PRC-002-2, R7	
Proposed High VSL	The Responsible Entity as directed by Requirement R7 was late in notifying the owners by greater than 20 calendar days but less than or equal to 30 calendar days.
Proposed Severe VSL	The Responsible Entity as directed by Requirement R7 was late in notifying one or more owners by greater than 30 calendar days.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R7 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.

VRF and VSL Justifications – PRC-002-2, R7	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R8	
Proposed VRF	**Lower**
NERC VRF Discussion	R8 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to

VRF and VSL Justifications – PRC-002-2, R8	
	effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R8 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner implemented DDR as directed by Requirement R8, Parts 8.1 and 8.4 that covers more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Transmission Owner implemented DDR as directed by Requirement R8, Parts 8.1 through 8.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Transmission Owner implemented DDR as directed by Requirement R8, Parts 8.1 through 8.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all

VRF and VSL Justifications – PRC-002-2, R8	
	applicable BES Elements.
Proposed Severe VSL	The Transmission Owner failed to implement DDR as directed by Parts 8.1 through 8.4.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R8 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R8	
on A Single Violation, Not on A Cumulative Number of Violations	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R9	
Proposed VRF	**Lower**
NERC VRF Discussion	R9 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R9 provides criteria for Dynamic Disturbance Recordings which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.

VRF and VSL Justifications – PRC-002-2, R9	
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement establishes criteria for Dynamic Disturbance Recording selected in R6. The team could not identify other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to establish criteria for Dynamic Disturbance Recording could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R9 contains only one objective which is to establish criteria for Dynamic Disturbance Recording. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Generator Owner implemented DDR as directed by Requirement R9, Parts 9.1 through 9.4 that covers more than 75% but less than 100% of the total required electrical quantities for all applicable BES Elements.
Proposed Moderate VSL	The Generator Owner implemented DDR as directed by Requirement R9, Parts 9.1 through 9.4 for more than 50% but less than or equal to 75% of the total required electrical quantities for all applicable BES Elements.
Proposed High VSL	The Generator Owner implemented DDR as directed by Requirement R9, Parts 9.1 through 9.4 for more than 0% but less than or equal to 50% of the total required electrical quantities for all applicable BES Elements.
Proposed Severe VSL	The Generator Owner failed to implement DDR as directed by Requirement R9, Parts 9.1 through 9.4.
FERC VSL G1	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1

VRF and VSL Justifications – PRC-002-2, R9	
Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	(enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R9 is not binary. VRF and VSL Justifications – PRC-002-2, R12	
Proposed VRF	**Lower**
NERC VRF Discussion	R12 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R12 requires time synchronization of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data which falls under Recommendation 12 of the Blackout Report and is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement calls for time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations established in R1 and R6. The team could not identify

VRF and VSL Justifications – PRC-002-2, R12	
	other continent-wide reliability standards of the same nature.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failures to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R12 contains only one objective which is to time synchronize Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner implemented time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording for more than 90% but less than 100% of the bus locations established in Requirements R1 and Elements established in Requirement R6 as directed by Requirement R12.
Proposed Moderate VSL	The Transmission Owner or Generator Owner implemented time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording for more than 80% but less than or equal to 90% of the bus locations established in Requirements R1 and Elements established in Requirement R6 as directed by Requirement R12.
Proposed High VSL	The Transmission Owner or Generator Owner implemented time synchronization for Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording for more than 70% but less than or equal to 80% of the bus locations established in Requirements R1 and Elements established in Requirement R6 as directed by Requirement R12.
Proposed Severe VSL	The Transmission Owner or Generator Owner failed to implement time synchronization for Sequence of Events Recording, Fault

VRF and VSL Justifications – PRC-002-2, R12	
	Recording, and Dynamic Disturbance Recording for less than 70% of the bus locations established in Requirements R1 and Elements established in Requirement R6 as directed by Requirement R12.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R12 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VRF and VSL Justifications – PRC-002-2, R12	
Violations	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R13	
Proposed VRF	**Lower**
NERC VRF Discussion	R13 is administrative in nature and a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R13 provides criteria around timelines for providing the data and the data format. This is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** The requirement has parts that are of equal importance; only one VRF

VRF and VSL Justifications – PRC-002-2, R13	
	was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria on providing Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R6.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data for locations selected in R1 and Elements established in R6 could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Lower" which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R13 contains only one objective which is to provide Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data within the specified criteria. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.1 provided the requested data more than 30 calendar days but less than 40 calendar days from the request. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.2 provided more than 90% but less than 100% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Parts 13.3 through 13.5 provided more than 90% but less than 100% in the proper data format.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.1 provided the requested data more than 40 calendar days but less than or equal to 50 calendar days from the request.

VRF and VSL Justifications – PRC-002-2, R13	
	OR The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.2 provided more than 80% but less than or equal to 90% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Parts 13.3 through 13.5 provided more than 80% but less than or equal to 90% in the proper data format.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.1 provided the requested data more than 50 calendar days but less than or equal to 60 calendar days from the request. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.2 provided more than 70% but less than or equal to 80% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Parts 13.3 through 13.5 provided more than 70% but less than or equal to 80% in the proper data format.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.1 failed to provide the requested data more than 60 calendar days from the request. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Part 13.2 failed to provide less than or equal to 70% of the requested data. OR The Transmission Owner or Generator Owner as directed by Requirement R13, Parts 13.3 through 13.5 provided less than or equal to 70% in the proper data format.

VRF and VSL Justifications – PRC-002-2, R13	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The proposed VSL's provide a broader compliance range than the associated VSL's in PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R13 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single	Non CIP

VRF and VSL Justifications – PRC-002-2, R13	
lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – PRC-002-2, R14	
Proposed VRF	**Lower**
NERC VRF Discussion	R14 is a requirement in a long-term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state of capability of the BES, or the ability to effectively monitor, control, or restore the BES.
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report** R14 provides criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard** This requirement does not have parts.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards** This requirement sets the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data.

VRF and VSL Justifications – PRC-002-2, R14	
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs** Failure to follow the criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data could not directly affect the electrical state or capability of the BES, or the ability to effectively monitor and control the BES. Violation of the requirement will not lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Lower” which is consistent with NERC guidelines for similar requirements.
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation** R14 contains only one objective which is to establish criteria around the availability of Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording data. Since the requirement has only one objective, only one VRF was assigned.
Proposed Lower VSL	The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 90 calendar days but less than 100 calendar days after discovery of the failure.
Proposed Moderate VSL	The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 100 calendar days but less than or equal to 110 calendar days after discovery of the failure.
Proposed High VSL	The Transmission Owner or Generator Owner as directed by Requirement R14 reported a failure and provided a Corrective Action Plan to the Regional Entity more than 110 calendar days but less than or equal to 120 calendar days after discovery of the failure.
Proposed Severe VSL	The Transmission Owner or Generator Owner as directed by Requirement R14 failed to report a failure and provide a Corrective Action Plan to the Regional Entity more than 120 calendar days after discovery of the failure.
FERC VSL G1 Violation Severity Level Assignments Should Not	PRC-002-2 differs from PRC-002-1 (not enforceable) and PRC-018-1 (enforceable and will be retired upon approval of PRC-002-2) in that PRC-002-2 deals with Sequence of Events Recording, Fault Recording, and Dynamic Disturbance Recording in order to adequately capture

VRF and VSL Justifications – PRC-002-2, R14	
Have the Unintended Consequence of Lowering the Current Level of Compliance	data for events analysis; and not equipment as referenced in the PRC-002-1 and PRC-018-1. Therefore, the VSL's cannot be compared between PRC-002-2 and PRC-018-1. The VSL's for this requirement meet or exceed the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment is for R14 is not binary. Guideline 2b: The propose VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Proposed VSLs are based on a single violation and not a cumulative violation methodology.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer	Non CIP

VRF and VSL Justifications – PRC-002-2, R14	
network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

Standards Announcement Reminder

Project 2007-11 Disturbance Monitoring
PRC-002-2

Ballot and Non-Binding Poll Now Open through December 16, 2013

Now Available

A ballot for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels is open through **8 p.m. Eastern on Monday, December 16, 2013**.

Instructions for Balloting
Members of the ballot pools associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

Standards Development Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller (via email), Standards Development Administrator, or at 404-446-2560.

Standards Announcement

Project 2007-11 Disturbance Monitoring

Ballot Pools Forming: November 1 – December 2, 2013
Formal Comment Period: November 1 – December 16, 2013

Additional Document Posted for Comment:
Cost Effectiveness Comment Period: November 1 – December 2, 2013

Upcoming:
Ballot and Non-Binding Poll: December 6-16, 2013

Now Available

A formal comment period for **PRC-002-2 - Disturbance Monitoring and Reporting Requirements** is open through **8 p.m. Eastern on Monday, December 16, 2013** and ballot pools are forming through **8 a.m. Monday, December 2, 2013** (*please note that ballot pools close at 8 a.m. Eastern and mark your calendar accordingly*).

NERC has developed a Cost Effective Analysis Process (CEAP) to introduce the concept of cost consideration and effectiveness into the development of new and revised standards. As part of the pilot of the CEAP, NERC is proposing to conduct a CEA to provide information about cost impacts of draft Reliability Standards and their relative effectiveness, which will allow the industry to evaluate and propose alternative approaches for achieving the reliability objectives of the standard.

A pilot of "Phase II" of the CEAP, the CEA, is posted for industry comment for the Disturbance Monitoring Project through **8 p.m. Eastern on Monday, December 2, 2013**. More information about the CEAP is available here.

Transmission Owners – Please note the following:
An Excel Workbook has been designed to assist Transmission Owners in using the methodology (referred to as the Median Method) discussed in Attachment 1. This workbook has been posted along with the other PRC-002-2 materials during this comment period to give Transmission Owners the opportunity to try out Requirement R1's bus location method by either using their entire system data, or a selected portion of their systems to obtain a full or partial listing of the bus locations that would have to be included in for SOER and FR.

Instructions for Joining Ballot Pool(s)

Ballots pools are being formed for the standard and non-binding poll for PRC-002-2. Registered Ballot Body members must join both ballot pools to be eligible to vote in the balloting of PRC-002-2 and to submit an opinion for the non-binding poll of the associated VRFs and VSLs. Registered Ballot Body members may join the ballot pools at the following page: Join Ballot Pool.

During the pre-ballot window, members of the ballot pool may communicate with one another by using the "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list server.) The ballot pool email list servers for the ballot pools are:

Ballot: bp-2007-11_DM_Ballot_in
Non-Binding Poll: bp-2007-11_DM_NBP_in

Instructions for Commenting

A formal comment period is open for PRC-002-2 through **8 p.m. Eastern on Monday, December 16, 2013**. A CEA has also been posted for industry comment and is open through **8 p.m. Eastern on Monday, December 2, 2013**. Please use the links below to the electronic comment forms to submit comments:

PRC-002-2
Cost Effective Analysis

If you experience any difficulties in using the electronic forms, please contact Wendy Muller. An off-line, unofficial copy of the comment forms are posted on the project page.

Next Steps

A ballot and non-binding poll of the associated VRFs and VSLs will be conducted **December 6, 2013** through **8 p.m. Eastern Monday, December 16, 2013**.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Protection Engineering: The 4 year implementation plan could be challenging to fit into our project process. We employ a 3 year cycle with definition in year 1, scope/design in year 2, and construction in year 3. Any delays in any given year could cause us to exceed the requirement.
As related to R5.1, we wonder if there is a need for both bulleted items. We are assuming that these two bulleted items represent an "OR" otherwise they would be listed as two separate Req. Further, if "At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault" is sufficient, why is there an option to capture 50 cycles of data? We also request clarification of R8 to either explicitly allow or not allow the power measurements to be calculated from the voltage and current used in 8.1 & 8.2. In the WECC footprint, we believe Sequence of Events is typically abbreviated SER.

While we believe that our Wind sites have a low risk of being one of the selected entities required to install & maintain disturbance monitoring equipment, the standard provides no compensation for the purchase, installation, and maintenance of this equipment. It may a significant burden on our projects.

R2 and R7 have 10 day time limits before elevating to the next Violation Security Level. This is too short and should be increased to 30 days.
Yes
The proposed standard still needs work before it is acceptable. The following items need to be addressed: 1. The standard requires all owners of identified BES elements to implement the various types of recording. However, for jointly owned facilities, this puts co-owners in a position whereby they can be held in violation of the standard if the operating/maintenance entity of a co-owned facility does not implement and maintain compliance with the standard. For jointly owned facilities, the standard should specifically address which of the co-owners (preferably the co-owner that operates or maintains the facility) is responsible for compliance with the standard. 2. Requirement 14 needs to be re-written. As it is now written, R14 requires that a TO or GO formally report to the Regional Entity an outage of any of the recording capabilities covered by the standard along with a Corrective Action Plan. However, in the “Rationale for R14” discussion that is included it is clear that the intent or this requirement is to require the TO/GO to report the problem only if they cannot restore the lost recording capability within 90 days. The requirement needs to be re-written to state the actual intent because as it is now written, one must contact the Regional entity every time the recording capability goes out, no matter how long it went out for. 3. Requirements R10 through R13 all seem to be required specifications and shouldn’t have their own requirements but could rather be combined into an Appendix to the standard. 4. The standard should allow for monitoring/recording up to the capability of the equipment presently installed (this is not referring to the capability of the presently installed recording capability but rather the presently installed BES equipment capability). A utility shouldn’t have to install major equipment (CCVTs, breakers, etc) just to meet the standard

if their presently installed equipment doesn't allow adequate monitoring. 5. In Requirement R3 it is not clear if a GO will be required to monitor a low side generator breaker. The standard refers to breaker connected to the identified bus location. If this refers to each breaker that is directly connected to the bus location, the requirement should use the term "directly". Without qualifying as such, the question remains as to whether the low side breaker qualified as being connected to the bus since it is connected to the bus through the GSU transformer.

1) Implementation for Requirement R14, as presently written, applies 9 months after the standard is approved. This requirement needs to be clarified. It should only apply to those SOE, FR, and DDR devices that have been installed in accordance with, and meet the requirements of, this standard. Legacy DME equipment that may exist at one of the busses identified in R1, which does not meet the requirements of this standard, should not be subject to Requirement R14, until the equipment is upgraded, or replaced, to meet the full requirements of this standard. This clarification needs to be made, or, the implementation for R14 should be moved to coincide with the timetable for Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13. 2) The timetable for implementation of Requirements R3, R4, R5, R8, R9, R10, R11, R12 and R13 allows an entity that owns only one bus location four years to achieve compliance. However, Entities must be compliant with a reassessed list from Requirement R1, Part 1.2 or R6, Part 6.2 within three years following notification of the list. Why this discrepancy? Four years seems appropriate in both cases, in order to schedule the numerous outages necessary to install the equipment, particularly if generation units are connected to the bus.
1) Requirement R2 should be re-written as follows: Each transmission Owner that identifies BES Elements, which are owned by other entities, at the locations established in Requirement R1 shall notify the owners of those Elements ….. By adding the phrase - which are owned by other entities - eliminates the need to unnecessarily provide documentation that it notified itself of the requirement. 2) Requirement R4 Part 4.1 should be re-written as follows: Phase-to-neutral voltages for each phase of either each BES line or bus. The term BES must be added to provide clarity and to be consistent with Part 4.2 and the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide voltage monitoring on non BES radial lines, or distribution transformers connected to the bus. 3) Requirement R8 should be re-written as follows: Each Transmission Owner shall have Dynamic Disturbance Recording (DDR), for each BES Element they own as per Requirement R7, to determine the following electrical quantities. The term BES must be added to provide clarity and be consistent with the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide monitoring on non BES radial lines, or distribution transformers connected to the bus. 4) Requirement R9 should be re-written as follows: Each Generator Owner shall have Dynamic Disturbance Recording (DDR), for each BES Element they own as per Requirement R7, to determine the following electrical quantities. The term BES must be added to provide clarity and be consistent with the intent of the standard as detailed in the Guidelines and Technical Basis section. There is no need to provide monitoring on non BES station service transformers connected to the bus. 5) Requirement R13 Part 13.2 poses an

indeterminate requirement on the size of the hard drive required to archive data. The present requirement states that the data will be retrievable for the period of 10 calendar days preceding a request. However, there is no requirement on how long after an event the request might be made. If the request was not made until six months after the event, would the data have to be retrievable for six months after the event? In order to place certainty on this data storage requirement Part 13.2 should be re-written as follows: The recorded data will be retrievable for a period of 10 calendar days following an event. This places a limit on data storage capacity and also makes it clear that a request for data must be made within 10 calendar days of the event. 6) Requirement R14 needs to be re-written to be consistent with the intent of the requirement as expressed in the shaded box describing the Rationale for R14. As presently written, R14 requires that the Owner must both restore recording ability AND report the inability to record data to the Regional Entity. To be consistent with the Rationale, Requirement R14 should be re-written as follows: Each Transmission Owner and Generation Owner, upon discovery of a failure of the Sequence of Events Recording (SOER), Fault Recording (FR), or Dynamic Disturbance Recording (DDR) at the bus locations as per Requirement R2 and elements as per Requirement R7, shall restore the recording ability within 90 calendar days, OR , if the recording capability cannot be restored within 90 days, report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability. 7) In the Guidelines and Technical Basis in the next to last paragraph of the section on Guideline for Requirement R1 it states that there is no requirement for SOER and FR for generating units. Later in the section on Guideline for Requirement R4 it states that generator step-up transformers are excluded from fault recording. If so, why is Generator Owner listed as an applicable entity in Requirement R4? It makes sense to list them in R3, since they may own breakers connected to Transmission Owners bus, but the GSU Transformer, station service transformer, and generator itself would not qualify for Fault Recording. 8) There is no specific requirement for the sampling rate for SOER within the standard itself. In the Guidelines and Technical Basis section on Guideline for Requirement R5 it states that a minimum recording rate of 16 samples per cycle is required to get accurate waveforms and to get 1 millisecond resolution for any digital input which may be used for SOER. There are a vast number of microprocessor relays currently installed on the system that have a sampling rate of 16 samples per cycle for analog inputs, however, the digital inputs, which would be used for SOE recording, are only sampled every quarter cycle. Existing regional DME standards and criteria recognize this and permit these types of microprocessor relays to be acceptable for both FR and SOER applications. As such, in order to allow these devices to continue to be an acceptable application, we would suggest two requirements be added for SOER devices, similar to that included in the RFC DME criteria, that states: SOER recording equipment should be capable of determining and recording the time that an input is received to within one quarter of an electrical cycle (or less) of input change of state. SOER recording equipment should have time stamp capability to record seconds to at least three decimal places (i.e. ss.000). 9) The bus selection methodology in Attachment 1 defines a single bus location as including any bus Elements at the same voltage level within the same physical location sharing a common ground grid. However, there are some substations that have multiple busses at the same voltage level within the same physical location that share a common ground grid, but are not physically connected together. They are either physically isolated from one another, or connected via a normally open tie switch or breaker. In these cases, the above definition does fit this scenario and each bus should be evaluated independently. To address this scenario perhaps the definition should be re-written as follows: A single bus location includes any bus Elements at the same voltage level that are connected together within the same physical location sharing a common ground grid.

1.) Regional Standard PRC-002-NPCC-01 which recently became effective conflicts with PRC-002-2. There is no bright line 500 MVA criteria for GOs to install DDR in the NPCC Regional Standard which instead allows the Reliability Coordinator to make the call. Also, it is not clear from R6 if the GO is supposed to wait for notification from the RC to install DDR or if the GO should go ahead and install DDR at units >500 MVA on their own. 2.) It's recognized that the SDT researched the 500 MVA cutoff point to cover what was felt to be an appropriate percentage of US generating assets. Based on comparisons with other Regional Criteria and Standards, this number seems low – some use a number of 1000 MVA. A compromise cutoff of 750 MVA is suggested. 3.) PRC-002-NPCC-01 requires installation of SOER and FR at generating units while PRC-002-2 specifically states SOER and FR are not required at generating units. Some GOs have spent considerable capital dollars to comply with a new NPCC Regional Standard, only to have a new conflicting continent wide Standard proposed.
No
The two/three/four year requirement for a GO to be 25%/50%/100% compliant should be increased to three/four/five years to give more time to budget these large capital expenditures.
Regional Standard PRC-002-NPCC-01 technical specifications for DDR conflict with PRC-002-2 technical specifications. The NPCC Regional Standard R9 specifies a DDR recording rate of 6 times per second while PRC-002-2 specifies 30 times per second. Conflicts with the Regional Standard should be removed so entities are not penalized for Regional Standard compliance.

Yes
MWG finds that requirements for data retention are essential to this standard but are missing in the current draft. MWG recommends including a requirement that all triggered data recordings be retained for a minimum of 2 years and that all continuous data recordings be retained for a minimum of 30 days. MWG also recommends including a requirement that all continuous data recordings be scanned against the set of triggers defined in R10 and those portions of the continuous recordings that fall within the time periods defined by those triggers be retained for a minimum of 2 years.

No
The definition for SOER optionally includes protection devices and only mandates the monitoring of the status of Elements. This is reinforced by R3 which only dictates the recording of circuit breaker position. The purpose of the standard is to "have adequate data available to facilitate analysis of BES disturbances". We don't see how any comprehensive analysis of disturbances can be done in the absence of protection device information. At least some basic protection information is integral in disturbance analysis. We could support the definitions as used within this standard but do not support using the abbreviations SOER (or SER or SOE), FR (or DFR) and DDR as defined NERC Glossary abbreviations. These acronyms have been used by the industry for many years to label recording equipment. When industry experts and engineers refer to a FR (or a DFR) they mean the equipment, a digital fault recorder, not a particular type of recorded measurement data. Same is true for SOER (or SOE or SER) and DDR. Since this is a data standard, strong consideration should

be given to using the word “data” in place of the word “recording”, such as Dynamic Disturbance Data, Fault Data and Sequence of Events Data with acronyms of DD, FD and SD. Also the definition of SOER presently uses the phrase “… status of Elements, which may include protection and control devices.” We recommend changing the word “Elements” to “circuit breakers” which is what is stated in R3. Also the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status.
Yes
We agree with the idea behind the methodology, however the term BES bus locations is not defined. The NERC BES definition applies to Elements, not buses. Continuing to Requirement R2, a TO might not have visibility to BES classification of elements it does not own. Planning/Reliability Coordinator would be a more applicable functional entity for this role. They should also be responsible for reaching out to the GO’s with notification for SOER and FR. A TO has no authority to perform this function; a GO might also question the bus selection and ask that another TO bus be included instead. The methodology in Attachment 1 is overly complicated (9 steps); and following eight of these required steps, it is then left up to the T.O. to add “discretionary” stations, if desired. Just using the highest 11 station fault MVA values may not be the most accurate. Contributions from a foreign, nearby utility can raise a station’s fault values, even though the station itself is not that critical to the listing entity. Using “Station” instead of “Bus” or “Location” would be more definitive. e.g. a 230 kV “Station”, a 345 kV “Station”,…). The term “bus” can be defined in different ways, so can “location.”
Yes
No
Requirement R6 is confusing. It asks for the identification of BES Elements for which Dynamic Disturbance Recording (DDR) is required but sub-Parts 6.1.1 and 6.1.2 are not criteria for “Elements”, but rather, they are criteria based on demand size and footprint. It would be helpful if the requirement is split into two: one for the threshold for having DDR (demand size and footprint, i.e., sub-Parts 6.1.1 and 6.1.2), and one for the location/element (sub-Parts 6.1.3 to 6.1.6). Suggest moving the minimum quantities in sub-Parts 6.1.1 (minimum 1 DDR per 3000 MW) and 6.1.2 (minimum 1 DDR per RE footprint) to the end of the list. In that way the requirements for sub-Parts 6.1.3 (Generation resources), 6.1.4 (Flowgates, etc…), 6.1.5 (HVDC), 6.1.6 (IROLs) and 6.1.7 (UVLS) will be stated up front as non-negotiable requirements, and state that additional DDR locations are only needed if fulfilling the first 5 do not meet the two extra minimum quantities requirements. Sub-Part 6.1.3--Needs to be clarified to make it understood how to add up the MW ratings of combined cycle unit generators and cross compound generators. Some examples would be helpful. Sub-Part 6.1.4, first bullet – Requiring monitoring of all “Flowgates” on the Eastern Interconnection seems arbitrary and diminishes the role of those with the best understanding of the nature of their system to determine the appropriate locations for DDRs. If “Flowgate” monitoring is required, this item should include a link to the official list of NERC Flowgates so that the “Responsible Entity” knows where they need to install DDRs. For example, the NY-NE interface is one of the official NERC Flowgates, which means that entities will need a DDR at each of eight stations that interconnect with New York; while entities on the other end of the interconnection in NE will need to do the same. Regarding “monitor all Elements of: all permanent Flowgates”. If a Flowgate is made up of a combination of several transmission lines and transformers, does every line need to be monitored? Do both ends of the lines need to be monitored? Does every transformer need to be monitored (low side or high side side)? Please show some typical examples. The guideline for R6 included in the draft fails to explain why all Flowgates should be monitored. The Book of Flowgates includes circuits that can become thermally overloaded under outage conditions at low flows, e.g. circuits with the maximum pre-contingency flow of 150 MW at unity power factor. This requirement seems to be very conservative and somehow conflicting with sub-Part 6.1.3.2 because there are many generation plants that do not exceed the specified thresholds by a small number and those generating plants are not monitored. Clarify that DDR is for “all permanent Flowgates” ONLY if the Flowgates are BES Elements. Sub-Part 6.1.5 – this will require the installation of DDRs at HVDC facilities that are smaller than the generator requirement listed in sub-Part 6.1.3 (500 MW). This requirement should be rephrased to deal with the cases when the ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter are owned by different entities. Sub-Part 6.1.6 – This requirement could

lead to installation of DDRs at many substations to just capture one flow that is part of an IROL. Also, DDR data is of little value for IROLs that are thermal in nature. Sub-Part 6.1.6/Guideline - The Guideline for R6 included in the draft has no explanation about why all Elements associated with Interconnection Reliability Operating Limits (IROLs) should be monitored. The NERC lists including all elements associated with IROLs are very extensive. This requirement will dramatically increase the number of the DDRs need to be installed. This could cause too excessive burden on some TOs. Also, there is nothing to limit the burden which can be placed on the TO by a Responsible Entity (Planning Coordinator or Reliability Coordinator, as applicable). Depending on the impact, a 3-year implementation plan might not be achievable.
No
The VSLs don't take into account the size of responsible entity. Larger entities should be given more time.
No
Recommend updating the "entity" for the following requirements on the Implementation Plan Summary: R8 - TO R9 - GO R10 - TO/GO The Implementation Plan doesn't take into account the size of responsible entity. Larger entities should be given more time (see response to Question 5).
Regarding Attachment 1: a) The term "BES bus location" is not clear. There could be two or more BES bus locations at the same physical location (substation). The definition of "BES bus" could not be found. b) Step 7 of Attachment 1 does not specify how to round the 10% of the BES bus locations, determined in Step 6, with the highest maximum available calculated three phase short circuit MVA. c) Step 8 of Attachment 1 does not specify how to round the additional 10% of the BES bus locations determined in Step 6. d) Attachment 1 does not specify how to distribute an odd number for 20% of the BES bus locations between b) and c) from above. In Part 1.2 and Part 6.2, what prevents a TO or RE from assessing the locations and elements too frequently? As written, it provides no clause to prevent excessively short re-assessment periods. There should be some minimum time (say several years) between assessments to provide stability where monitoring is really needed. Frequent assessments could move locations above and below the minimum criteria line and create confusion. We agree with R1, but do not see the need for R2 because through R1 and Attachment 1 each TO has already identified the bus locations that it owns for having Sequence of Events Recording (SOER) and Fault Recording (FR). There is not another owner(s) that a TO needs to communicate the list to, unless the "list of BES bus locations that it owns" stated in Step 1 of Attachment 1 means only the location ownership but not the Element ownership. But if that's the case, Step 1 in Attachment 1 needs to be clarified. In R2, it infers that the TO as part of R1 developed a list of Elements, however R1 requires the TO only to determine BES bus locations. If it was the intent that the TO determine the specific Elements, we suggest R2 be reworded to say "Each transmission owner shall identify BES Elements at the bus locations established in Requirement R1 and shall notify…". If it was the intent that the GOs (and other affected TOs) to determine which BES Elements they own at the bus locations, then do not require that the TO identify the BES Elements, instead let the owners of those Elements identify their Elements. The intent of Requirement R2 is for Transmission Owners to notify "other" owners of BES Elements, as explained in the Rationale statement. The requirement as written would also require the Transmission Owner to notify itself. Therefore, suggest revising R2 and M2 as follows: R2. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the "other" owners of those Elements… M2. The Transmission Owner has dated evidence (electronic or hardcopy) of notification to "other" owners of Elements… Requirement R3 specifically asks to have SOER, however the guideline for R3 allows for the breaker status to be determined by analysis of suitably time synchronized FRs with the data provided in the manner detailed in R4. This should be identified in the Requirement itself. The guideline is a non-binding portion of a standard. The guideline for R3 has a typo (it should reference R4 instead of R14). Requirement R4 is not clear if determine means that the required BES Elements of TO and GO shall have waveforms for each phase current and the residual or neutral current. Regarding Requirement R4, Part 4.2, it is not clear if only high-side voltage winding voltages and currents need to be recorded. Clarification is needed if low-side voltage windings and transformer neutral need to be monitored also. Part 4.1- More specificity is needed in the requirement. Are phase to neutral voltages needed for each line? If common bus side voltages are available is it sufficient to have one set of phase-neutral voltages for the bus location? If so the wording should more accurately reflect this. Presently it reads – "…. Voltages for each phase of either each line or bus." which could be confusing. Part 4.2 – Residual current and neutral current

are two different quantities. Residual current is current present in the neutral of the Element CT circuit while neutral current implies current directly measured by a CT in the neutral of an Element. This wording should probably be more specific by stating if the monitored transformer has a neutral CT it should be monitored (if this was the intention of the Drafting Team). Sub-Part 4.2.1 – Is monitoring required on both HV and LV sides of these transformers? The wording for this requirement should be more specific. M4 (1): add “plus evidence the device was commissioned at the specific bus in question”. In Part 5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the requirement. We suggest R5.1 be reworded to say “A single record or multiple records that include at least one of the following:”. Part 5.1 – the two bullet items in this requirement are confusing and should be reworded to clarify what is intended. Part 5.1 Bullet 2- The wording should be changed as follows: “At least two cycles of the pre-trigger data, the first three cycles of the fault as seen by the Fault Recorder, and the final cycle of the fault as seen by the Fault Recorder.” Because the deployment of Fault Recorders are not required on every BES bus, unless the fault is being cleared on an Element directly connected to the bus, the fault recorder may not always accurately capture the fault information if it is occurring more than one bus away from the Fault Recorder location. Without this additional wording the Fault Recorder would have to capture the actual final cycle of the fault which may be impossible if it is not directly monitoring it. Part 5.2 assumes that SOE recording is driven by DFR analog sampling since it infers the achievement of a 1ms digital event resolution for a 960Hz (16x60Hz) analog sample rate. Stating analog and event resolution requirements (i.e. 16 samples per cycle and 1ms event resolution respectively) separately and explicitly is clearer and accommodates instances where SOER is separate from analog sampling. Part 5.3.1. asks to have trigger settings for neutral (residual) overcurrent, which implies for R4 that it is necessary not only to determine but to monitor either each phase current or neutral current. Regarding requirement R6, the standard should not create a new term like “Responsible Entity” but should only refer to specific NERC entities like TO, GO, RC, etc. If the Drafting Team decides to retain sub-Part 6.1.6, then it is recommended the phrase "all Elements associated with Interconnection Reliability Operating Limits" be replaced with "elements critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies" similar to the language used in CIP-002-4. CIP-002-4 - Attachment 1 Critical Asset Criteria reads: 1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies. There is an error in the mapping document. R6 of PRC-018-1 speaks to the need for maintenance of DME. The Drafting Team has mapped this requirement to R14 of PRC-002-2. These two activities are not the same since R14 is a break-fix requirement for DME, while R6 of PRC-018 speaks to maintenance activities of DME. Maintenance of DME ensures devices that need calibration are calibrated as well as correcting any non-annunciated failures. R14 of PRC-002-2 requires entities to repair equipment that they know is in a failed state. The Part 8.3 wording is too restrictive. Real and reactive power may not be able to be determined operationally if say a bus is split at the time of an event (or the split is caused by an event). Suggest the Drafting Team correct this requirement by referencing “nominal” real and reactive power which refers to the original design of the DDR channel assignments which under normal operating conditions Real and Reactive Power could be determined. The design should be assuming all normally-closed circuit breakers on a bus are closed. This avoids being out of compliance during a specific event, if open bus breakers preclude recording the MVA flows on all elements. Requirement R10 should allow the legacy equipment to have multiple triggered records which make up the required length. It is stated that triggered records from existing equipment can be accepted in lieu of continuous recording if the triggered records meet the criteria in 10.1 and 10.2. If continuous recording is available and meet all criteria, are triggered DDR records required? R13 – this requirement places the RC, RE and/or NERC in the middle of data sharing. There is no requirement in the standard to facilitate entities to partake in data sharing. Is this really the intent? What if adjacent entities need to exchange post-disturbance information? Does that really need to occur via the RC, RE or NERC if an entity cannot directly request necessary data? Requirement R13, Part 13.3. asks for SOER data in Comma Separated Value (.CSV) format whereas the majority of Disturbance Monitoring Equipment (DME) do not save data in this format. In addition, if breaker open/close position determination from FR data is acceptable, no .CSV file can be created by the recording tool itself. There is no need to require this data to be written in CSV format. Tab delimited text would work as well and would not limit the use of commas in descriptors or other entries. The format described in Attachment 2 is limiting and incomplete (see comments on

Attachment 2 below). Similarly, R13 Part 13.4. asks for FR and DDR data in C37.111 , IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files whereas the majority of DME equipment does not save data in this format. Are manually converted records acceptable? This requires that Fault Recording and Disturbance Recording data will be provided in COMTRADE (C37.111) formatted files, but does not specify a revision level or year for the COMTRADE standard. The requirement should specify “C37.111-2013 or later” in order to require a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data. In R14, reword to indicate that the second bullet is only applicable if the first bullet is not completed within 90 days. We suggest this wording for the second bullet – “If recording ability is not restored within 90 days, report the inability...” The Rationale for requirement R14 recognizes that the DME equipment cannot be always returned to service within 90 calendar days of the discovery of a failure. Requirement R14 itself, however, is not clear and should be rewritten to reflect that. PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2013, NPCC applicable entities are two years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant with this Regional Reliability Standard. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Regarding Attachment 2, the format in Attachment 2 is limited and incomplete. While the information required is obviously necessary, the format limits or omits information available from some SOERs. R13.3 states that the files must be comma-delimited, but Attachment 2 makes no statement about the length of any string or value. There is no provision for SOERs which may have detailed descriptors of the contacts being monitored but may be a single string. “Local Time Offset from UTC” should be expressed in hours before or after UTC rather than letter designations. There is no provision for acceptable terms for “State” except for “OPEN “and “CLOSE”. Other terms may be more appropriate for some devices monitored by an SOER, such as “ENABLED” or “DISABLED”, “ON” or “OFF”, etc. In short, Attachment 2 appears to be an attempt at defining a standard but does not adequately define a format. Development of such a standard may be better left to an IEEE Working Group or other entity.

Yes
No
Modify the applicability section 4.3 by adding the following parenthetical after Generator Owner: (“Applies to GO only if GO owns a generator output breaker in the TO’s system”) We made the comment in the 11/19/13 webinar that DME in general should be a topic for TOs and not GOs. TOs interpret and use DME data, GOs do not. TOs generally have wide-ranging arrays of DME, continuous recording and storage infrastructure, and experts in monitoring and maintaining such equipment; GOs do not. The webinar presenters stated that this would make TOs responsible for monitoring GO equipment, and there is no technical reason for making them do so. We disagree in that disturbances do not originate exclusively in generation plants, and the majority of such events may in fact stem from transmission system problems (as was the case for the Northeast blackout of ’03). That is, one can just as easily say that R9 makes GOs responsible for monitoring reactions to the TO’s system, and there is no technical reason for making GOs do so. Given this inability to establish a universal cause-vs-effect rule for disturbances the least-total-cost approach should be followed, and centralizing DME makes more sense than splitting it between involved entities (TOs) and those who merely hand-over recordings (GOs). This point was made again in the 12/5/13 NAGF outreach WebEx meeting, and there did not appear to be a strong rationale for having GOs be designated Responsible Entities when they in fact would be mere appendages, i.e. installing what are to them black boxes and handing-over recordings that they don’t understand.

No
Disagree. Smaller generators who may be drawn into the standard are likely to have only one location to install equipment. This would require 100% compliance within 2 years of notification. If notification occurs soon after a major outage, the generator may be forced to take an unneeded outage just to comply with the standard. Suggest adding the following: For entities with fewer than four locations identified by the TO, entity shall be 100% compliant within four years with no compliance required prior to that date.
1. It appeared from the 11/19/13 webinar that the R9 obligation for GO's to "have" DDR does not mean that they must own such equipment, and this position was confirmed in the 12/5/13 NAGF outreach meeting. That is, it would do just as well to have an agreement with the TO to fulfill the PRC-002 requirements if and where the TO already has DDR on their side of the generation plant fence. This point does not come across clearly in the present text of PRC-002. R9 should have a footnote saying that "This standard defines the 'what' of DDR, not the 'how.' GOs may install this equipment or, where the TO already has suitable DDR, contract with the TO." It would be still better to just drop GOs from the picture, however, per our comment to question #3 above. Additionally, it is not clear in R9 whether the specification for signal measurements is on a per generating unit basis or if the signals of interest are a per line basis aggregate at generating stations. Please more clearly specify if the signals of interest are individual unit measurements or plant total measurement (grouped by output circuit, plant total, etc.). This determination weighs heavily on the cost and method of implementation where new equipment must be installed. 2. R6 sets DDR applicability criteria based on the "nameplate rating," but doesn't say of what. This could be the generator, or the most-limiting component. We believe that applicability should be based on the most-limiting component, since this sets the actual output achievable. The term, "Facility Rating," as defined in FAC-008 should then be used to avoid confusion. 3. The frequency and Hz/s settings of R10 should have a latch-time criterion, to prevent spurious triggering of the DME. We suggest three cycles. 4. R10 calls for DME to be triggered at no lower than 85% of normal voltage with a latch-time of 5 seconds, but the 5-second ride-through requirement of PRC-024 is only +/- 10%, which is also often where V/Hz relays are set. A trigger of 85% voltage x 5 sec may therefore cause DME to miss the action. Additionally, R10 allows the use of triggered records from equipment installed prior to the effective date of PRC-002-2, but does not specify how many records an entity must be able to produce in the retrievable period specified in R13 as 10 days prior to a request. This specification is crucial to the amount of memory requirements of existing equipment. At the maximum trigger frequency (triggering every 3 minutes), the existing equipment becomes effectively a continuous recorder. For existing equipment with triggered recording capability, how many records are required to be available in the 10 day retrievable record.

Yes
Yes
Requirement R4 as written could require both the Transmission Owner and the Generator Owner to monitor the requested electrical quantities for all lines and elements at the bus or switchyard where the generator is interconnected. R4 needs to be re-written to clarify that the GO is only responsible for monitoring for faults on the equipment it owns and the same for the TO. For Requirement R13, subsections 13.3, 13.4 and 13.5 should be deleted from the standard entirely. These items are completely administrative in nature and are not results based. An entity could make a typo mistake

in formatting or when naming a file and be non-compliant with the requirement. Also, the sub-requirements reference IEEE standards and software formats which are not subject to the NERC procedures for standards development and are not under the purview of the legally authorized regulatory authority. Thus these sub-requirements have no valid standing in a NERC Reliability Standard. These items are more appropriate for a reference document. Finally, the standard is written in a confusing format where twelve of the 14 requirements in the standard reference other requirements, which in many cases reference another requirement (or two). As a GO, I need to know, in a clear concise manner, what electrical quantities or status I need to monitor where, and what attributes are needed for the disturbance monitoring equipment

The definition for SOER optionally includes protection devices and only mandates the monitoring of the status of Elements. This is reinforced by R3 which only dictates the recording of circuit breaker position. The purpose of the standard is to “have adequate data available to facilitate analysis of BES disturbances”. We don’t see how any comprehensive analysis of disturbances can be done in the absence of protection device information. At least some basic protection information is integral in disturbance analysis.
No
This requirement (and associated Attachment 1) requires some clarity before we can determine if we agree with the methodology. This may be a bit problematic with the BES definition not confined to busses. What is a BES bus location? Does this mean the entity gathers information on all fault levels for busses which contain at least one BES Element?
Yes
No
1. R6.1.4, first bullet – Requiring monitoring of all “Flowgates” on the Eastern Interconnection seems arbitrary and diminishes the role of those with the best understanding of the nature of their system to determine the appropriate locations for DDRs. The guideline for R6 included in the draft fails to explain why all flowgates should be monitored. The Book of Flowgates includes circuits that can become thermally overloaded under outage conditions at low flows, e.g. circuits with the maximum precontingency flow of 150 MW at unity power factor. This requirement seems to be very conservative and somehow conflicting with the requirement R6.1.3.2 since there are many generation plants that do not exceed the specified thresholds by a small number and those generating plants are not monitored. 2. Requirement R6.1.5 - This requirement should be rephrased to deal with the cases when the ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter are owned by different entities 3. Requirement R6.1.6 - The guideline for R6 included in the draft has no explanation about why all Elements associated with Interconnection Reliability Operating Limits (IROLs) should be monitored. The NERC lists including all elements associated with IROLs are very extensive. This requirement will increase the number of the DDRs need to be installed exponentially.
Yes
Yes
1. R5.1 Bullet 2- The wording should be changed as follows: “At least two cycles of the pre-trigger data, the first three cycles of the fault as seen by the Fault Recorder, and the final cycle of the fault as seen by the Fault Recorder.” Because the deployment of Fault Recorders are not required on every BES bus location, unless the fault is being cleared on an Element directly connected to the bus, the fault recorder may not always accurately capture the fault information if it is occurring more than one bus away from the Fault Recorder location. Without this additional wording the Fault Recorder would have to capture the actual final cycle of the fault which may be impossible if it is not

directly monitoring it. 2. R4.1- More specificity is needed in the requirement. Are phase to neutral voltages needed for each line? If common bus side voltages are available is it sufficient to have one set of phase-neutral voltages for the bus location? If so the wording should more accurately reflect this. Presently it reads – “.... Voltages for each phase of either each line or bus.” which could be confusing. 3. R4.2 – Residual current and neutral current are two different things. Residual current is current present in the neutral of the Element CT circuit while neutral current implies current directly measured by a CT in the neutral of an Element. This wording should probably be more specific by stating if the monitored transformer has a neutral CT it should be monitored (if this was the intention of the DT). 4. R4.2.1 – Is monitoring required on both HV and LV sides of these transformers? The wording for this requirement should be more specific. 5. There is an error in the mapping document. R6 of PRC-018-1 speaks to the need for maintenance of DME. The DT has mapped this requirement to R14 of PRC-002-2. These two activities are not the same at all since R14 is a break-fix requirement for DME, while R6 of PRC-018 speaks to maintenance activities of DME. Maintenance of DME ensures devices that need calibration are calibrated as well as correcting any non-annunciated failures. In fact preventative maintenance should reduce the failures. R14 of PRC-002-2 requires entities to repair equipment that they know are in a failed state. 6. R13 – this requirement places the RC, RE and/or NERC in the middle of data sharing. There is no requirement in the standard to facilitate entities to partake in data sharing. Is this really the intent? What if adjacent entities need to exchange post-disturbance information? Does that really need to occur via the RC, RE or NERC if an entity cannot directly request necessary data? 7. R8.3 wording is too restrictive. Real and reactive power may not be able to be determined operationally if say a bus is split at the time of an event (or the split is caused by an event). Suggest the DT correct this requirement by perhaps referencing “nominal” real and reactive power which refers to the original design of the DDR channel assignments which under normal operating conditions, Real and Reactive Power could be determined. 8. R3, R4, R12, R13, R14 all reference “the bus locations as per Requirement R2” however this requirement is a notification requirement only for Elements not owned by the TO that need DME. These requirements need to reference both R1 and R2 pending changes to R1/R2. 9. The way R2 is worded presently, it sounds like a TO is required to notify itself if it owns BES Elements at the bus locations. The only action in R1 is to identify busses for DME. It should probably be expanded to indicate that after the busses are identified the TO needs to have DME on the Elements that are owned by the same TO. 10. R3, R4, R12, R13, R14: List of locations that need Sequence of Events Recorders and Fault Recorders is identified in R1 and communicated in R2. Suggest replacing reference to R2 with R1 11. R8,9,10,11 and R13, R14: Suggest changing reference to R7 with R6 (see the comment for R3 and R4 above) 12. Section 1.2 - Evidence Retention: Second sentence states:” For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.” . To avoid confusion we recommend that the SDT removes “may ask” and provide further clarification on what evidence needs to be retained and for how long. One approach would be to make a retention period to be “greater or longer of” the period since the last audit or the list below. 13. Section 1.2 - Evidence Retention: To avoid confusion we suggest that the retention period for R1/R2 and R6/R7 is specified as “current version of the list” or “current and previous version of the list”. This will avoid confusion associated with the five years retention when the list is produced at a 5 year cycle.

No
1. DDR definition: The phrase "abnormal voltage problems" is redundant. Suggest definition be changed to: The recording of time sequenced data for dynamic power system characteristics such as power swings, frequency variations, or abnormal voltage conditions. 2. SOER definition: Need to specifically identify circuit breakers, which are the primary Elements needed for SOER as indicated in Requirement 3. Suggest it be changed to: The recording of time sequenced data for change in status of Elements, particularly circuit breakers, and including other protection and control devices as needed.
Yes

Yes
Yes
No
Item 5 This item references a nine month timeframe associated with R14. There does not appear to be any such timeframe listed under R14. Since the required in-service dates for DME are from two to four years, that timeframe should determine the compliance date for R14.
In Requirement 14, there is a discrepancy between the text of R14 and the Rationale statement which follows. The bullet “Restore the recording capability” should be changed to “Restore the recording capability if possible”. This will allow the entity more time if necessary to correct the problem, which is allowable as described in the Rationale. As it stands, an entity will be in violation if the recording capability is not restored within 90 days of discovery of a failure.

Lincoln Electric System
LES recommends the drafting team further clarify the bus selection process included in Attachment 1. As drafted, the current Attachment 1 methodology does not appear to account for substation configurations such as a 115kV tap bus with a radial transformer fed from that bus. Although the radial transformer would not be considered a BES Element, the bus would be considered BES since it carries through-flow on the line. At this substation, there is no relaying and therefore no capability for SEOR or FR. In consideration of this, does the drafting team intend for this type of bus to be included on the list? By including these busses, the total number of busses, and therefore the total number of substations requiring SEOR and FR, would increase considerably for some entities.
R13.2 specifies that “The recorded data will be retrievable for the period of 10 calendar days preceding a request”. As drafted, this requirement seems to indicate that if an event happened on June 1st and the data was requested on June 30th, then the data would have to be retrievable from June 20th to the 30th. However, if a request is made on June 6th following a June 1st disturbance, it would not be possible to comply with the 10 calendar day requirement. Unless LES misunderstands the drafting team’s intent, it seems as though the requirement is meant to ensure that data is available and retrievable for a period of 10 calendar days following a disturbance in the event further analysis needs to be conducted. To ensure this intent is conveyed, LES recommends rewording R13.2 to indicate that the 10 day period starts at the time of the event. Additionally, R13.2 should also account for circumstances beyond the control of the TO or GO in which multiple events caused the relays recording the data to overwrite it with more recent events due to limited memory space. As an example, a TO could have information available for the 10 days required by the standard, but multiple disturbances due to severe weather on day 12 resulted in initial data being unavailable for a request initiated on day 12 or later. If this occurs, R13.2 would then place the Transmission Owner or Generator Owner in violation of the standard due to a limitation inherent to the relay. 13.2. The recorded data will be retrievable for the period of 10 calendar days following a disturbance.(1) Footnote (1): The 10 calendar day period may be waived for circumstances beyond the control of an applicable Transmission Owner or an applicable Generator Owner, such as, but not limited to, equipment manufacturer limitations resulting in the loss of data.

We agree with R1, but we do not see the need for R2 since through R1 and Attachment 1, each TO has already identified the bus locations that it owns for having Sequence of Events Recording (SOER) and Fault Recording (FR). There is not another owner(s) that a TO needs to communication the list to, unless the "list of BES bus locations that it owns" depicted in Step 1 of Attachment 1 means only the location ownership but not the Element ownership. But if that's the case, Step 1 in Attachment 1 needs to be clarified.
Yes
No
R6 is confusing. It asks for the identification of BES Elements for which Dynamic Disturbance Recording (DDR) is required but Part 6.1.1 and 6.1.2 are not criteria for "Elements", but rather, they are criteria based on demand size and footprint. It would be helpful if the requirement is split into two: one for the threshold for having DDR (demand size and footprint, i.e., Pats 6.1.1 and 6.1.2), and one for the location/element (Parts 6.1.3 to 6.1.6). Requirement R6.1.4 - The guideline for R6 included in the draft fails to explain why all flowgates should be monitored. The Book of Flowgates includes circuits that can become thermally overloaded under outage conditions at low flows, e.g. circuits with the maximum precontingency flow of 150 MW at unity power factor. This requirement seems to be very conservative and somehow conflicting with the requirement R6.1.3.2 since there are many generation plants that do not exceed the specified thresholds by a small number and those generating plants are not monitored. Requirement R6.1.5 - This requirement should be rephrased to deal with the cases when the ends of high-voltage direct current (HVDC) terminals (back-to-back or each terminal of a DC circuit) on the alternating current (AC) portion of the converter are owned by different entities. Requirement R6.1.6 - The guideline for R6 included in the draft has no explanation about why all Elements associated with Interconnection Reliability Operating Limits (IROLs) should be monitored. The NERC lists including all elements associated with IROLs are very extensive. This requirement will increase the number of the DDRs need to be installed exponentially.

Sequence of Events Recording (SOER) – This definition should only specify functionality and *not* attempt to define scope. Instead, we suggest “The recording of time sequenced data for change in status of a monitored, binary value”. Fault Recording (FR) – Again, this definition should only specify functionality and *not* attempt to define scope. Instead, we suggest “The recording of time-sequenced waveform data for a monitored analog value.”
No
Fault analysis programs such as ASPEN include tap busses to provide connection points for distribution transformers, series capacitors, three-terminal lines, etc. Since these connection points do not have circuit breakers associated with them they are not appropriate locations for disturbance monitoring. However, when applying the Attachment 1 process, these tap busses could show up and possibly distort the Attachment 1 data. The fault summary feature in ASPEN has a check box to ignore tap busses. AEP requests that this feature be utilized in the Attachment 1 process. AEP is concerned that the “top 10%” requirement could force the installation of fault recording devices to be installed at a station with only 2 BES sources. An example is a protected load bus with only 2 BES elements that is connected to stations which meet the requirement and have fault recording devices installed. In this case, both of the stations remote to the protected load bus are BES buses in the top 10% of a TO’s bus listing. The standard should not require DFR/SER at those locations. AEP’s position is that the standard should focus on fault information availability after an event that allows for accurate analysis and not on over-saturation of fault recording equipment that will require monitoring and maintenance to ensure that the equipment is in service when needed. R2 states that TOs must notify owners of Elements that those elements require SOER/FR. However, the process identified in R1 does not establish a requirement to identify BES Elements. This does not account for the fact that not all elements on the identified busses should require SOER/FR. AEP suggests that the SDT add a new R1.3 to state “For each bus identified per 1.1, the Transmission Owner shall identify the BES elements that require FR and the BES interrupting devices that require SOER”. The draft can be interpreted to require TOs to dictate to GOs and IPPs where they must install FR/SOER. AEP believes it would be inappropriate for TOs to specify FR/SOER locations for GOs and IPPs. While Attachment 1 provides a reasonable method for TOs to produce a list of buses that it owns, R2 will make TOs responsible to keep track of elements within those buses that it does not own. This responsibility should be revised so that TOs can focus on ensuring that they have adequate equipment in place to monitor its system, rather than managing the complex logistics needed to notify GOs and IPPs.
Yes
No
This listing appears far too prescriptive by going beyond the “what’s” and specifying the “how’s”. In the application of R6, the Responsible Entity should consider existing DDR installations when determining where to require DDR. There may be existing installations that can satisfy the R6 criteria. At a minimum, it might be beneficial to add such considerations to the “Guideline for Requirement R6” section. It is unclear whether DDR is required on all generating resources or only some generating resources that meet the requirements of R6.1.3.1 and R6.1.3.2. We suggest changing the title of Section 6.1.3 to “All generating resources with:” to be consistent with the other sections.
Yes

No
We believe the implementation plan will be sufficient, however we cannot state that with absolute certainty until the completion of the identification processes in R1 and R6. At this time, the actual scope is still unknown.
In general, we believe the standard is written to prescriptively when the standard emphasizes post-event analysis. More clarity is needed regarding time frame, etc. as to what is expected of a TO after they informed that data recording is required for an element owed by the TO. R13.1: Suggest "The recorded data will be provided within 30 calendar days, or other agreed-upon timeframe, of a request." It appears that R2 applies to shared stations only. If this is accurate, we suggest rewording to clarify the intended applicability. In addition, it is unclear which entity would be responsible for the installations. The wording in R13.2 is unclear. Possible interpretations include that the data must be retrievable for at least 10 days at any given time, or that the data must be retrievable on a continuous basis. Please revise to provide clarification. The sub-bullets listed in R13, especially R13.2, would be more appropriately included in the technical requirements of each DME type in R3, R5 and R11. The sub-bullets in R14 read do not clearly read as an OR statement and may be misinterpreted as an AND statement. We recommend removing the bullets and making the item read as a single sentence: "… shall restore the recording ability or report the inability to record data…" R3 requires GOs and TOs to install SOER for each circuit breaker they own that is connected to the bus locations identified in R1. This does not account for the fact that not all of the circuit breakers on the identified busses should require SOER because some breakers may be associated with non BES equipment. R4.1 should be modified to state "Phase-to-neutral voltages for each phase of either each specified line or bus." In R5.1, an "or" should be added to the end of the first bullet to improve clarity. Also, in R5.3 the word "settings" should be removed to improve technical accuracy. In R7, the word "determination" should be replaced with "identification" to be consistent with the rest of the standard. R8 should be revised as follows to improve clarity: R8.1: "At least one phase…" R8.2: "The current on the same phase as the voltage in…" R8.4: "Frequency of at least one of the…. R9 should be revised as follows to improve clarity: R9.1: "At least one phase…" R9.2: "The phase current on the same phase as the voltage in…" The drafting team may want consider combining requirements that are related to the same monitoring equipment types. R4 and R5 could be combined because they both relate to specifications of FR equipment. Similarly, R8, R10, and R11 could be combined, as they all relate to DDR equipment.

Comment on R6 – The standard should not use the term “Responsible Entity” but should only refer to specific NERC entities like TO, GO, RC, etc. Comment on R6.1.4 –Requiring monitoring of all Elements of “Flowgates” on the Eastern Interconnection seems arbitrary and may miss important locations for DDRs, especially for areas that do not use flowgates. If “Flowgate” monitoring is required, this item should include a link to the official list of NERC Flowgates so that the “Responsible Entity” knows where they need to install DDRs. This requirement will also lead to installation of equipment that provides practically no value to the Purpose of this standard. For example, the NY-NE interface is one of the official NERC Flowgates, which means that ISO-NE will need a DDR at each of eight stations that interconnect with New York; NYISO will need to do the same and lead to the installation of unnecessary, redundant equipment. DDR location requirements for ERCOT, Hydro-Quebec, and the Western Interconnection do not define major transmission interfaces or major transfer paths, allowing for arbitrary interpretation. Also, for the Western Interconnection, responsibility is placed on the “Regional Entity” and not a “Responsible Entity” like the Reliability Coordinator or Planning Coordinator. Comment on R6.1.5 – this will require Reliability or Planning Coordinators to call for the installation of DDRs at HVDC facilities that are smaller than the generator requirement listed in R6.1.3 (500 MW). If this requirement is retained, it should be specify “… HVDC facilities greater than 500 MW…” Comment on R6.1.6 – This requirement could lead to installation of DDRs at many, many substations in New England just to capture one flow or voltage that is part of an IROL. Also, DDR data is of little value for IROLs that are thermal in nature. General comment on 6.1.3 through 6.1.7: The level of detail specified in these items eliminates the role of the RC/PC who are best able to determine appropriate locations for DDRs. This requirement should recommend locations and not attempt to precisely specify where DDRs should be installed. These requirements could be rephrases as follows: “The RC/PC shall specify DDR locations that serve the Purpose of this standard (To have adequate data available to facilitate event analysis of BES disturbances). The RC/PC should consider specifying locations that include generators and HVDC facilities greater than 500 MW, major transmission interfaces, transfer paths, flowgates, voltage sensitive areas…”
No
The VSL for R6 calls for the Reliability Coordinator or Planning Coordinator to have “accurately identified the Elements for DDR as directed by Requirement R6”. The term “accurately” should be deleted.
No
Installation of potentially 200 additional DDRs will take far longer than the time specified in the Implementation Plan.
Requirement R5.1 currently reads: 5.1. A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault. Comment R5.1 – the two bullet items in this requirement are confusing/conflicting and should be reworded to clarify what is intended. I.E. is it 50 cycles per bullet 1 or three cycles per bullet 2? This is probably for single and multiple records but the language should identify the difference as shown below. • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. (Single Record Only) • At least two cycles of the pre-trigger data, the first three cycles of the fault, and the final cycle of the fault. (Multiple Records Only) Comment on R13, this requirement could place the Reliability Coordinator/Planning Coordinator in the middle of data sharing. This requirement should encourage direct sharing of data. Also, R13.3 and Attachment 2 attempts to define yet another format for SOE data; There are well established formats for this type of data, such as COMTRADE, that include many other aspects of data such as file and signal naming conventions.
Individual
David Kiguel
N/A
No

The proposed definition of SOER indicates that it may include protection and control devices. However, R3 only specifies the recording of circuit breaker position (open/close). The purpose of the standard is to “have adequate data available to facilitate analysis of BES disturbances.” In order to permit for a comprehensive analysis of disturbances some basic protection device information is necessary and should not be optional in the definition. I suggest replacing “may include” with “includes.”
Yes
No
1. Requirement R6.1.5 – Consideration should be given to address the case when the ends of HVDC terminals (back-to-back or each terminal of a DC circuit) on the AC portion of the converter are owned by different entities 2. Requirement R6.1.6 – Justification should be provided on the technical justification for all Elements associated with IROLs to be monitored. The NERC lists including all elements associated with IROLs are very extensive, thus significantly increasing the number of the DDRs that need to be installed.
Yes
Yes
The Drafting Team and NERC staff are to be commended for the work done, this being such a complex standard. They have taken the right approach by addressesing “what” (data) is to be captured, not “how” and by not considering Disturbance Monitoring equipment. However,additional work is needed to make this standard acceptable. 1. The way R2 is worded presently, it sounds like a TO is required to notify itself if it owns BES Elements at the bus locations. The only action in R1 should be to identify busses for DME, expanded to indicate that after the busses are identified the TO needs to have DME on the Elements that are owned by the same TO and notify such identification for the Elements owned by others, if any. 2. R4.1- As written, this requirement could be confusing. Are phase to neutral voltages needed for each line? If common bus side voltages are available is it sufficient to have one set of phase-neutral voltages for the bus location? If so the wording should more accurately reflect this. Presently it reads – “…. Voltages for each phase of either each line or bus.” which could be confusing. 3. R4.2 – Residual current and neutral current are two different things. Residual current is current present in the neutral of the Element CT circuit while neutral current implies current directly measured by a CT in the neutral of an Element. This requirement should specify that if the monitored transformer has a neutral CT it should be monitored (if this was the intention of the DT). 4. R4.2.1 – Is monitoring required on both HV and LV sides of these transformers? The wording for this requirement should be more specific. 5. R5.1 Bullet 2- The wording should be changed as follows: “At least two cycles of the pre-trigger data, the first three cycles of the fault as seen by the Fault Recorder, and the final cycle of the fault as seen by the Fault Recorder.” Since the deployment of Fault Recorders is not required on every BES bus location, unless the fault is being cleared on an Element directly connected to the bus, the fault recorder may not always accurately capture the fault information if it occurs more than one bus away from the Fault Recorder location. Without this additional wording the Fault Recorder would have to capture the actual final cycle of the fault which may be impossible if it is not directly monitoring it. 6. There seems to be an error in the mapping document. R6 of PRC-018-1 speaks to the need for maintenance of DME. The DT has mapped this requirement to R14 of PRC-002-2. These two activities are not the same at all since R14 is a break-fix requirement for DME, while R6 of PRC-018 speaks to maintenance activities of DME. Maintenance of DME ensures devices that need calibration are calibrated as well as correcting any non-annunciated failures. In fact preventative maintenance should reduce the failures. R14 of PRC-002-2 requires entities to repair equipment that they know are in a failed state. 7. Real and reactive power may not be able to be determined operationally if for example, a bus is split at the time of an event (or the split is caused by an event). Suggest the DT correct this requirement by perhaps referencing “nominal” real and reactive power which refers to the original design of the DDR channel assignments which under normal operating conditions, Real and Reactive Power could be determined. 8. R3, R4, R12, R13, R14 all reference “the bus locations as per Requirement R2” however this requirement is a notification

requirement only for Elements not owned by the TO that need DME. These requirements need to refer to both R1 and R2. 9. R3, R4, R12, R13, R14: List of locations that need Sequence of Events Recorders and Fault Recorders is identified in R1 and communicated in R2. Suggest replacing reference to R2 with R1 10. R8,9,10,11 and R13, R14: Suggest changing reference to R7 with R6 (see the comment for R3 and R4 above).

Texas Reliability Entity
Texas Reliability Entity
Yes
In the definition of Dynamic Disturbance Recording, we would suggest including phasors in the list of power system characteristics. This would be useful in applying DDRs at locations where there may be angular stability concerns or subsynchronous resonance concerns.
Yes
(1) The SDT may want to consider different short-circuit MVA levels based on the voltage or voltage class, i.e. 1500 MVA for 100-200kV, 2500 MVA for >300kV, etc. (2) To insure broader system coverage, the SDT may also want to consider including some flexibility in the location criteria in Step 8 of Attachment 1, such as substations > 200kV with 3 or more non-radial line terminals, substations < 200kV with 5 or more non-radial line terminals.
Yes
Yes
(1) The SDT should clarify the meaning of "major transmission interfaces" in 6.1.4, as this is an undefined term that will lead to considerable debate about what a "major" interface is. (2) The SDT may also want to consider applying DDRs to Elements with a known angular stability issue or subsynchronous resonance issue that does not rise to the level of an IROL.
(1) For Requirements R2-R5 at substations where there are multiple Transmission Owners, are entities allowed to use a shared FR/SOER, or is each entity individually responsible for the Elements that they own? (2) For Requirement R14, there appears to be an "or" missing following the 1st bullet, "Restore the recording ability, or". The SDT may want to consider having the entity reporting DDR failures report to the Responsible Entity as well as the Regional Entity, so that the Responsible Entity can look at possible alternative methods to monitor the Elements required per R7.

Seattle City Light
Paul Haase
Seattle City Light appreciates the effort of the drafting team in developing this proposed Standand, and understand the concept to focus requirement on data requirements rather than equipment requirements. That said, Seattle does not support this draft or approach. The draft is far too complex and technical to be an effective Federal regulation, in part because it requires a slow and cubmersome process to update each time a technical specification goes out of date. Seattle recommends that the Standard be revised to provide general requirements that are consistent over time, with details referenced in a separate document similar to the data collection and data preparation manuals associated with data-collection regulations in other areas (such as for regional

model development). Additionally, Seattle cannot support such a detailed and complex Standard until additional guidance is available about the compliance implications, such as an RSAW or guidance document.

Several problems in the correct operation of protective measures are related as reflexes of unmitigated harmonics influencing the actuation of protective relays. Industrial plants with high nonlinearities and intense electric power consumption have large influence in the interconnection to the transmission system. The harmonic distortions introduced by these industrial plants range from low to very high orders, up to the 20th harmonic. These distortions may lead to measurement errors and the incorrect operation of protective relays. To avoid aliasing the sampling rate needed to analyze such events, capturing up to the 24th harmonic, should be 48 samples per cycle. Fault recording should therefore be carried out at a minimum of 48 points per cycle, above the typically used 16 points per cycle of protection algorithms.
Yes
No
Power swings are one of the most common and dangerous long-term disturbance events. They occur due to inadequate power flow conditions in a variety of states of the BES. These dangerous states may be reached through unforeseeable manual maneuvers or inadvertent automatic maneuvers during operation, as those occurring during an fault. Power swings may evolve to a system-wide failure, due to voltage dips, under- over-frequency, etc. To correct evaluate this situation it is necessary to compute the system power. Therefore, it's also necessary to monitor currents as well as voltages.
Yes
Yes
Attachment 2 provides a template for standardization of Sequence of Event records. Following the successful implementation of COMTRADE and recognizing the leading role the US BES plays internationally, it would be more beneficial to all parties involved if the template was based on C37.239-2010 COMFEDE, avoiding multiple templates for SOE records in several countries.

ACES Standards Collaborators
Ben Engelby
No
We do not support the proposed definitions because these seem to be straightforward and understandable without proposing additional glossary terms. The Standards Drafting Team Guidelines, dated April 2009, states: “The SDT should avoid developing new definitions unless absolutely necessary. There is a glossary of terms that has been approved for use in reliability standards. Before a drafting team adds a new term, the team should check the latest version of the Glossary of Terms for Reliability Standards to determine if the same term, or a term with the same meaning, has already been defined. If a term is used in a standard and the term is defined in a collegiate dictionary, then there is no need to also include the term in the NERC Glossary of Reliability Terms. The addition of an adjective or a prefix to an already defined term should not result in a new defined term. It is very difficult to reach consensus on new terms. If a simple phrase can be used in a standard to replace a new term, then the drafting team should consider using the

phrase rather than trying to obtain stakeholder consensus on the new term." We do not see how these proposed terms are "absolutely necessary." Please provide a rationale why other approaches could not be taken.
No
We concur with the drafting team's observation and rationale that there is no need to monitor disturbances for small systems in the same manner as large systems. However, we believe this standard should require an entity to generate its own methodology that identifies how it will determine locations to install Fault Recording and Sequence of Events Recording devices and supporting equipment and how often it will conduct these assessments. We feel the method proposed for selecting bus locations is too restrictive and could be subject to interpretation from auditors when not properly followed.
No
(1) There is confusion over the Planning Coordinator and Reliability Coordinator functions and their respective relationships. As the standard is currently written, both the PC and the RC are subject to the standard in ERCOT? (2) We do not believe any function would benefit from the standard. Industry has already benefitted from the DOE grants to install PMUs and would continue to benefit from these types financial incentives to continue installing PMUs for situational awareness. The existing financial incentives have obviated the need for the standard as evidenced by report on the September 8, 2011 Arizona-California outages. There was sufficient data to analyze the event. NERC should develop a technical guideline on this topic instead of a standard.
No
We believe that Requirement R6 could be consolidated with other requirements and the detailed sub-requirements could be moved to an appendix. This would be more appropriate to model this standard like PRC-023-2, where the appendix provides important details but does not subject registered entities to violations for every sub-requirement.
No
We do not support the standard as written, as it should be consolidated into fewer requirements and should take a more streamlined approach. Since we do not support the standard, we cannot support the corresponding VRFs and VSLs.
No
The implementation plan is confusing. We do not see the need for a phased in plan, where some requirements are enforceable before others. Assuming standard continues to be developed which we do not support, we recommend consolidating the entire standard to two or three requirements and propose a straight forward implementation plan.
(1) This standard is unnecessary because there are already significant amounts of PMU data to construct sequence of events and other post-event analysis of disturbances. As referenced in the Southwest Blackout Report of 2011, there is a multitude of disturbance monitoring devices installed on the electric grid. The Southwest Blackout Report states, "PMUs are widely distributed throughout WECC as the result of a WECC-wide initiative known as the Western Interconnection Synchrophasor Program (WISP)." We do not see the cost benefit of requiring additional resources for an issue that is not a high priority for reliability. (2) As stated above, there are financial incentive programs through other federal agencies that provide funding for disturbance monitoring equipment. We recommend that NERC work with those programs to develop a technical guideline to ensure these devices are installed and monitoring critical areas of the electric system. (3) Why has the drafting team decided to include 14 requirements to this project? In light of recent standards projects like Paragraph 81, the industry is supporting reducing and consolidating the amount of requirements. We do not see the need to have 14 requirements for disturbance monitoring. While we do not believe the standard is needed, we strongly recommend that the drafting team revise this standard to two or three requirements if it persists. The amount of detail is unnecessary and poses a serious compliance burden on registered entities. (4) R2 requires implementation within ninety days of Fault Recording and Sequence of Events Recording devices following a notification provided by the Transmission Owner. We question if this will provide entities sufficient time to acquire such devices from their suppliers. Moreover, entities can be, from time-to-time, directed to suspend maintenance activities on their BES elements due to extreme weather conditions or more immediate system level emergencies. These entities plan their maintenance activities months in advance, only to have such activities delayed by days or weeks as necessary to maintain system reliability. We recommend

extending the period required within R2 to at least twelve months, as this should be sufficient time to acquire and install these recording devices during non-peak calendar dates. (5) We feel that R8 and R9 do not adequately accommodate joint substation facilities and shared resources. As stated, the burden to install Dynamic Disturbance Recording devices falls on each individual Transmission Owner and Generator Owner. Sharing such installations limits the number of connected measuring devices to facility structures, including current and potential transformers, further limiting the possibility that one of these measuring devices catastrophically fails and leads to a more significant impact on the facility's availability because they are jointly owned. (6) We previously commented that an appendix, modeled similarly like in Standard PRC-023-2, would be a better alternative to Requirement R6. Likewise, including details like those listed in R12 would further strengthen a case to incorporate this appendix in the Standard and not subject registered entities to possible violations for every requirement. We feel that technology has significantly improved since 2003, as manufacturers have supported the need to align such devices on a common frame of time. Still R12 places the burden on registered entity, when it seems more appropriate to be included in a manufacturer technical specification. (7) We feel Requirement R13 is arbitrary, could be subject to interpretation from auditors and meets paragraph 81 criteria. Transmission Owners and Generator Owners could be required to prove the negative, and demonstrate that they have not received a request to provide device data to their Reliability Coordinators, Regional Entities, and NERC. Furthermore, this standard meets several Paragraph 81 criteria including B1 Administrative, B2 Data Collection/Data Retention, and B4 Reporting. The requirement is administrative because it compels data formats that are immaterial to reliability with the sole purpose to simplify data collection and communication. It meets the data collection/data retention criterion because the requirement is about collecting data. It also meets the reporting criterion because it compels data reporting. Please strike the requirement in its entirety. It would be more appropriate to include in a guideline. (8) We believe numerous requirements of this Standards fall under Paragraph 81 Criteria B, and are thus unnecessary. For instance, we feel requirements R1.2 and R6.2 are "Periodic Updates" due to the need to reassess each list every five calendar years. Likewise, we feel requirements R2, R7, and R13 are "Administrative" due to the need to collect, organize, format, and then circulate data and communications sent to identified entities within a specific timeframe. We feel that several other requirements could be "Data Collection" in nature. Requirements R5.1, R5.2 require the collection of data according to specifications outlined for the minimum recording rate and data duration. Requirements R10.1 and R10.2 require the collection of data according to specifications outlined for the trigger record lengths and trigger settings. Likewise, Requirements R11.1 and R11.2 require the collection of data according to specifications outlined for input sampling rate and output recording rate. Requirement R12 require the collection of data according to specifications outlined for time synchronization. Finally, Requirement R14 is "Administrative" and "Documentation" in nature based on the need to circulate the discovery of device failure within a specific timeframe and provide a Corrective Action Plan to the Regional Entity if repair is outside this timeframe. (9) The costs of installing new equipment for disturbance monitoring could be significant for our members. We find this standard is unnecessary and NERC should work with the Department of Energy (DOE) to further expand the use of grant money to supply registered entities with funding for these types of monitoring equipment. The prior grants from the DOE have been very successful and we see no reason to require these monitoring devices to be subject to enforceable reliability standards. There is no convincing evidence that these standards are being developed to address a reliability need. We see no justification for industry to allocate resources to disturbance monitoring equipment when there are other priorities that should be addressed first, such as cyber security. Furthermore, the joint NERC and FERC report on the September 8, 2011 outage in Arizona and southern California further demonstrates that there is not a need for the standard. It stated that there was ample event data that was recorded and used to analyze the event. (10) We appreciate the opportunity to comment on the cost of developing this standard (CEAP process). However, the timeline of submitting comments should align with the ballot and comment deadlines. It is unreasonable to set the comment deadline for the CEAP two weeks before the project comment deadline, considering the due date is Monday following Thanksgiving. We are concerned that industry was not aware of this deadline and did not have adequate time to prepare comments. (11) Thank you for the opportunity to comment.

The intent of the methodology is good and will help TOs in determining the number of DMEs required. However, the application of the methodology using the provided "Median_Method_Template" is quite cumbersome and could be simplified.
Yes
Yes
Yes
No
The times for meeting requirements R1 and R6 are adequate. However, the time of 9 months required for complying with requirements R2, R7 and R14 is too short, especially considering that R14 may require troubleshooting, testing, shipping, repairs, possible replacement of the failed FR, SOER or DDR, possible discussions with suppliers, design and drawing considerations if the replacement is not identical, etc. Given the existing demands on maintenance and design staff, and the need to also develop a corrective action plan for the Regional Entity, the SDT should consider extending this time.
(1) An acronym is given for each of Sequence of Events Recording (SOER) and Fault Recording (FR) and Dynamic Disturbance Recording (DDR) but the acronyms are never used, and sometimes the full phrase is used without the acronym noted. This occurs throughout the standard and should be made consistent and cleaned up. If the acronyms are not going to be used, there is no need to state them. (2) R1, 1.2 - would be clearer to state 'identified bus locations should be reassessed at least once every five calendar years'. (3) M1 (same applies for all measures) - should be written to say that the entity 'shall have' not 'has'. (4) M1 - the last few words of the measure that deal with 1.2 are not complete - 'assessed within the required interval' should be 'and evidence that the identified bus locations have been reassessed within the required interval'. (5) R2 - would be more consistent with the rest of the standard to refer to 'BES bus locations' rather than 'locations' and 'identified' instead of 'established' and 'identification' instead of 'determination'. (6) M2 - would be more consistent to say 'BES Elements' rather than just 'Elements' and 'at the BES bus locations identified' as opposed to 'established' and 'notice' instead of 'information'. The measure is also missing the timeframe. (7) R3/M3/R4 - the reference to Requirement R2 does not seem correct in this context - should be those BES bus locations identified in R1? (8) M3 - the description of the circuit breaker position in M3 is lacking specificity that appears in requirement - '(open/close) for each.....' (9) R4 - for consistency, 'bus locations' should be 'BES bus location' and 'as per' should be 'identified in'. (10) R6, 6.2 - would be clearer to state 'the identified BES Elements shall be reassessed at least once every five calendar years'. (11) M6 - would be more complete to state 'The Responsible Entity shall have a dated (electronic or hard copy) list of BES Elements for which Dynamic Disturbance Recording (DDR) is required as identified in accordance with Requirement R6 and evidence that such identified BES Elements have been reassessed within the required interval.' (12) R7 - reference to 'the locations' needs to be more specific - is this the 'BES bus locations'? To be consistent, 'Elements' should be 'BES Elements' and 'established in' should be 'identified in'. (13) M7 - would be clearer if reference to 'owners' was to 'each Transmission Owner and Generator Owner'. 'established' should be 'identified' to be consistent. (14) R8 - 'Element' should be 'BES Element'. The words 'for which they received notification' could be added after 'own'. (15) R9 - same comments as R8 (16) R10 - the reference to R7 does not seem correct - is this meant to be R8 or R9 as it is these parts that put obligation on the TO and GO, whereas R7 puts an obligation on a responsible entity? Reference to 'equipment' seems vague - is this DDR equipment? (17) M10 - reference to 'data recording' should be to DDR? (18) R11 - as above, the reference to R7 does not seem correct - should be R8 or R9? 'Element' should be 'BES Element'. (19) R12 - as above, reference to R7 should be to R8 or 9? 'Element' should be 'BES Element', 'bus locations' should be 'BES bus locations' and

the word 'identified pursuant to' should replace 'as per' to be consistent. (20) R13 - same comments as R12. (21) M13 - the words 'data was submitted' should be replaced with 'that SOER, FR and DDR data was provided to the Reliability Coordinator, Regional Entity or NERC upon request'. (22) R14 - same comments as R12.

For R1 – Add wording that would only obligate each Transmission Owner to identify BES bus locations where it owns Elements with wording like, ". . . Each Transmission Owner shall identify BES bus locations where it owns Elements . . ."
Yes
Please see question 7.
No
Note that R6 clearly states where DDRs are required where the intent of this Standard was for "data" and not devices. The SDT has presented mixed signals to the industry, please clarify. In R6.1.2., it states that at least one DDR location in each Responsible Entity's footprint. It is not clear if this means the Responsible Entities listed in R6 or the Responsible Entities listed in the Applicability Section 4. Does the Planning Coordinator or Reliability Coordinator, (as applicable) identify BES Elements for which DDR is required in the footprint of each Transmission Owner and Generator Owner or in their own respective footprints? R6.1.2. should be clarified to read "Each Planning Coordinator or Reliability Coordinator, (as applicable) is required to have at least one DDR in their footprint."
No
According to the Implementation Plan, the STD makes it clear that this Standard reflects the need for data, not the equipment used to collect the data. In addition, the SDT has already identified that there is already a significant amount of SOER, FR, and DDR equipment currently employed on the BES. The NSRF wants to point out that Section 215 of the Federal Power Act states that the ERO cannot order the construction of additional generation or transmission assets. The NSRF views the purchasing of equipment to provide "data" as construction. The Implementation Plan states that Generator Owners and Transmission Owners may be required to schedule outages to install or implement SOER, FR, and DDR equipment. Installing or implementing of SOER, FR, and DDR equipment is construction because it changes the current equipment configuration to a different configuration. To build on this point, Requirement 12 has the requirement to synchronize the time element. We believe this can only happen with some sort of satellite clock/ gps device, requiring the purchase of said additional device.
The NSRF believes that this Standard should apply only to those devices already installed by the Generator Owners and Transmission Owners on BES Elements. The SDT has already made it clear that there is an abundance of these devices on the BES. Therefore, a footnote should be added that the Registered Entities are not required to spend the ratepayers' money to buy new equipment to satisfy the requirements of this Standard. The NSRF proposes it should read "Each Transmission Owner and Generator Owner is not required to have Dynamic Disturbance Recording, Fault Recording, or Sequence of Events Recording devices which capture the essential data of PRC-002-2, installed or activated on its BES Elements." This would be incredibly comparable to footnote 1 of the industry-approved NERC Standard PRC-024-1. That footnote states "Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit."

Yes
We could support the definitions as used within this standard but do not support using the abbreviations SOER (or SER or SOE), FR (or DFR) and DDR as defined NERC Glossary abbreviations. These acronyms have been used by the industry for many years to label recording equipment. When industry experts and engineers refer to a FR (or a DFR) they mean the equipment, a digital fault recorder, not a particular type of recorded measurement data. Same is true for SOER (or SOE or SER) and DDR. Since this is a data standard, strong consideration should be given to using the word “data” in place of the word “recording”, such as Dynamic Disturbance Data, Fault Data and Sequence of Events Data with acronyms of DD, FD and SD. Also the definition of SOER presently uses the phrase “… status of Elements, which may include protection and control devices.” We recommend changing the word “Elements” to “circuit breakers” which is what is stated in R3. Also the last part of the definition referring to protection and control devices should be deleted since there is no requirement to monitor protection and control device status.
Yes
Yes
Yes
However, clarity is needed under 6.1.3 to understand how to add up the MW ratings of combined cycle unit generators and cross compound generators. Some examples will be most helpful. Also clarity is needed in requirement 6.1.4 when you refer to “monitor all Elements of: all permanent flowgates”. If a flowgate is made up of a combination of several transmission lines and transformers, does every line need to be monitored? Do both ends of the lines need to be monitored? Does every transformer need to be monitored (lowside or highside side)? Please show some typical examples. Also, under requirement 6.1, it may be better to move the minimum quantities requirements 6.1.1 (minimum 1 DDR per 3000m MW) and 6.1.2 (minimum 1 DDR per RE footprint) to the end of the list. In that way the requirements for 6.1.3 (Generation resources), 6.1.4 (Flowgates, etc…), 6.1.5 (HVDC), 6.1.6 (IROLs) and 6.1.7 (UVLS) will be stated up front as non-negotiable requirements, and state that additional DDR locations are only needed if fulfilling the first 5 does not meet the two extra minimum quantities requirements.
No
Recommend updating the “entity” for the following requirements on the Implementation Plan Summary: R8 – TO R9 – GO R10 – TO/GO
PRC-002-2 and the associated Implementation Plan do not address coordination with existing mandatory Regional Reliability Standards, specifically, PRC-002-NPCC-01, Disturbance Monitoring. As of October 20, 2013, NPCC applicable entities are two years into a four year FERC approved Implementation Plan. NPCC applicable entities have no option but to continue to implement the Regional Reliability Standard or be found non-compliant with this Regional Reliability Standard. The development of a continent-wide NERC Reliability Standard creates uncertainty for NPCC applicable entities regarding the adequacy of the NPCC Disturbance Monitoring Equipment (DME) installed to date and the potential for additional DME locations and/or requirements. Dominion cannot support this continent-wide standard without inclusion of a variance for the NPCC Region (PRC-002-NPCC-01). Dominion believes the intent of Requirement R2 is for Transmission Owners to notify “other” owners of BES Elements, as explained in the Rationale statement. The requirement as written would also require the Transmission Owner to notify itself. Therefore, Dominion suggests revising R2 and M2 as follows: R2. Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the “other” owners of those Elements… M2. The Transmission Owner has dated evidence (electronic or hardcopy) of notification to “other” owners of Elements… In R1.2 and R 6.2, what prevents a TO or RE from assessing the locations and elements on too frequent of a time basis. As written, it provides no clause to prevent excessively short re-

assessment periods. There should be some minimum time (say several years) between assessments to provide stability in where monitoring is really needed. Frequent assessments could jockey locations above and below the minimum criteria line and create confusion. In R2, it infers that the TO as part of R1 developed a list of Elements, however R1 requires the TO only to determine BES bus locations. If it was the intent that the TO determine the specific Elements, we suggest R2 be reworded to say “Each transmission owner shall identify BES Elements at the bus locations established in Requirement R1 and shall notify…”. If it was the intent that the GOs (and other affected TOs) to determine which BES Elements they own at the bus locations, then do not require that the TO identify the BES Elements, instead let the owners of those Elements identify their Elements. In R5.1, change wording (similar to how R10.2 is stated) to indicate that meeting either one of the bullets satisfies the requirement. We suggest R5.1 be reworded to say “A single record or multiple records that include at least one of the following:”. In R14, reword to indicate that the second bullet is only applicable if the first bullet is not completed within 90 days. We suggest this wording for the second bullet – “If recording ability is not restored within 90 days, report the inability...”

We respectfully request that a methodology similar to the one that was used in R1 is deployed in this requirement in order to determine an adequate percentage of flowgates needed for visibility of faults.
No
We believe that the time frames in the violation severity levels are too stringent when compared to the other items in the same violation level. A relatively short term delay in communication (30 to 60 days) is much less severe than not performing a function. Suggest lengthening out timeframes.
Yes
(1) We feel that the first bullet of 5.1 is not needed due to the content of the second bullet. If the team determines that it does need to be kept, a post-trigger record length of 30 cycles for the same trigger point would be adequate. (2) For R14, please provide additional clarity around the fact that if the equipment is returned to service within the 90 day time limit then it does not have to be reported. Respectfully suggest the second bullet to change to, “If not returned to service within 90 days, report the inability to record data to the Regional Entity along with a Corrective Action Plan (CAP) to restore the recording ability.”

1. In R2, to avoid confusion as to what the phrase “BES Elements at the locations established in Requirement R1” means, we recommend that the Attachment 1, Step 1 have this sentence modified with a new parenthetical phrase an the end: “A single bus location includes any bus Elements at the same voltage level within the same physical location sharing a common ground grid (i.e., Elements directly connected to the bus).” In addition, since the only owners of those Elements may be other TOs or GOs, the reference to “shall notify the owners of those Elements” should be clarified. This requirement should be written as follows: “Each Transmission Owner that identifies BES Elements at the locations established in Requirement R1 shall notify the TRANSNISSION OWNERS AND GENERATION OWNERS of those Elements, within 90 calendar days of determination, that the Elements require Sequence of Events Recording (SOER) and Fault Recording (FR).” 2. In R10, the last two bullets should be combined into one: • Under voltage trigger set at no lower than 85% of normal operating voltage for a duration of 5 seconds. 3. The language in R14 should have “either” added to clarify the required actions. In addition, the language in the second bullet “Report the inability to record data” was changed to “Report the inability to restore the recording ability.” See below. “Each Transmission Owner and Generation Owner, within 90 calendar days of the discovery of a failure of the Sequence of Events Recording (SOER), Fault Recording (FR), or Dynamic Disturbance Recoding (DDR) at the bus locations per Requirement R2 and Elements as per Requirement R7, shall EITHER: • Restore the recording ability • Report the inability to restore the recording ability to the Regional Entity along with a Corrective Action plan (CAP) to restore the recording ability.

(1) In Requirement R5.1, are the two bulleted items both required, or is only one item required, i.e., are the bulleted items listed with a coordinating conjunction of “and” or “or”? From past balloting on other Standards, e.g., CIP Standards, a numbered list in the Measure/Requirement mean the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence.” Seminole requests clarification on this concern. (2) In Requirement R14, Seminole reasons that the requirement is intended to require the filing of a CAP if the inability to record data exists for longer than 90 consecutive calendar days. This reasoning is in line with the Rationale box for Requirement R14, however, the actual Requirement appears to require the filing of a CAP notwithstanding if the failure is remedied within 90 calendar days of discovery of the failure. Seminole requests that the requirement be revised to state that the filing of a CAP is only required if the inability to record exists for more than 90 calendar days from the date of discovery. (3) In Requirement R14, are the two bulleted items both required, or is only one item required, i.e., are the bulleted items listed with a coordinating conjunction of “and” or “or”? From past balloting on other Standards, e.g., CIP Standards, a numbered list in the Measure/Requirement mean the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence.” Seminole requests clarification on this concern. (4) In Requirement R14, it appears that the intent of the SDT was to require the submission of a CAP if the failure was not remedied within 90 calendar days. If the failure is not remedied within 90 calendar days, it appears from the Requirements and the VRF/VSL penalty matrix that a CAP is required to be submitted to the RE within the same 90-day window. Seminole requests that the time to submit a

CAP be extended an additional 30 calendar days to read that an entity has 120 calendar days from the date of discovery of a failure in which to submit a CAP to its RE. This would allow a true 90-day window for fixing the CAP. For example, under the current language if an entity believes it will have remedied a piece of equipment on day 83, it would probably be best practice for that entity to prepare a CAP for submission in order to meet the 90-day CAP submission window in case delays arose. Seminole believes that this is not in line with the intent of the SDT and Seminole request the additional 30-day window for submission of a CAP, i.e., 120 days from date of discovery of the failure, and for Requirement R14 and the penalty matrix to reflect this change.

Attachment 1 and the median method results in an excessive number of buses requiring disturbance monitoring for a system (a large amount of tightly interconnected buses within a metropolitan area).
Yes
No
The inclusion of all permanent flowgates is our objection. This requirement will result in the inclusion of monitoring points that are not necessarily critical to the BES. The approach of the Western Interconnection to include all major transfer paths as defined by the Regional Entity seems to be a more logical approach.
Yes
No
We do not agree based on our earlier comments in regards to Attachment 1.

Michelle D'Antuono
Ingleside Cogeneration LP
Yes
Ingleside Cogeneration L.P. agrees with the strategy the project team has taken to focus on the output of recorders – not the devices themselves. Recording technology is rapidly evolving and equipment-related requirements may be quickly be outdated otherwise.
Yes
Ingleside Cogeneration notes that the MVA thresholds applied are generally consistent with those established in EOP-004-2 “Event Reporting” and the criticality criteria used in CIP Version 5. This makes inherent sense, and would encourage the use of similar rules across all NERC standards in order to properly balance regulatory costs against benefits.
Yes
No
Unlike the MVA thresholds applied in R1, ICLP does not believe that the 1000 MVA threshold for generation facilities (R6.1.3.2) is consistent with other NERC criticality criteria. In addition, from the perspective of a Cogeneration facility, full nameplate capacity is normally not fully available to the Bulk Electric System. Therefore, either the threshold should be raised to 1500 MVA or should be revised to specify that the 1000 MVA threshold refers to “aggregate nameplate capacity available to the BES”.
Yes

Yes
Ingleside Cogeneration L.P. believes that the two to four year deployment schedule for recording capability is sufficient.

What is the purpose of the following clause in the definition of SOER: "…which may include protection and control devices"? Since the focus of this definition is on recording, and not equipment, consider removing this clause.
No
The 1500 MVA fault level includes many busses that are relatively unimportant to the BES. For example, in the 115 kV portion of our system, 83% of buses have fault levels above 1500 MVA. On our system, fault levels of 4000 MVA are a much better indication of buss important to the overall BES. However, rather than create a new MVA criteria in this standard, we suggest using criteria developed for other standards that determine important subsets of the BES. The requirements in CIP-002-5 R2.5 define substations that have a "medium" impact on the BES. Requiring a FR at a substations classified as "low" is overly burdensome. Alternatively, substations that do not have circuits subject to PRC-023-2 applicability section 4.2.1 should be except from FR requirements. Although we already have fault recorders on all 115 kV transmission substations with more than 3 lines, the purposed methodology would require additional Fault Recorders. These additional fault recorders would provide very little additional data, because the existing fault records include the remote ends of almost all transmission lines. The proposed standard does not take into adequate account the industry progress towards GPS synchronized microprocessor based relays. Much of the data required by FR is already recorded by relays. However, relay records only count as FR if they meet all the FR requirements for the entire substation. Rather than focus on obtaining 100% coverage of quantities at substations, this standard should facilitate taking advantage as much as possible of already installed hardware.
Yes
No
Considering the VSLs for Requirement R4, using "the product of the total number of monitored BES Elements and the number of specified electrical quanitities per each Element" would work well for current on the Element, but what about bus voltage shared by DDR on multiple Elements? Considering the VSLs for Requirements R4, R5, R8, R9, and R11, would it be more appropriate to base the percentages on how many required BES bus locations or BES Elements have the minimum recording properties, electrical quantities, or other specifications/parameters? (Consider the language in the VSLs for Requirement R10.) It seems like determining a percentage of the total recording properties, electrical quantities, or other specifications/parameters may be difficult in some cases. An example (scenario) of how these VSLs, as written, would be applied may be helpful. Should the Severe VSL for Requirement R11 be written something like the following? "The Transmission Owner or Generator Owner implemented Dynamic Disturbance Recording that meets less than or equal to 10% of the total recording properties as specified in Requirement R11." In other words, is '1%' intentional? Considering the VSLs for Requirement R13, are the percentages based upon (1) BES bus locations, or BES Elements; (2) recording properties, or electrical quantities; (3) length of data recorded; or (4) a combination? An example (scenario) of how these

VSLs, as written, would be applied may be helpful. In the VRF/VSL Justification, the FERC VSL G3 comment for Requirement R11 is missing (page 34).
No
The disagreement is not so much with the implementation plan itself but whether part of the implementation plan should reside within the standard itself. More specifically, should part of the implementation plan be included under Requirements R3, R4, R5, R8, R9, R10, R11, R12, and R13? Of primary concern are BES bus locations or BES Elements that are added as part of the review at least once every five calendar years. An implementation plan normally addresses phasing in of the standard, or new version of the standard, not ongoing implementation.
There is general concern about the cost of implementation, especially cost sharing for installation of Dynamic Disturbance Recording (DDR). For example, the Responsible Entity seems to have latitude on selecting BES Elements, beyond the DDR locations identified in Requirement R6, Parts 6.1.3 through 6.1.7, and therefore which Transmission Owners and Generator Owners must install DDR to meet Requirement R6, Part 6.1.1. If two Transmission Owners share equipment at a BES bus location, which Transmission Owner is responsible under R1 and R2 for identification and notification? Under Requirement R5, Part 5.1, do the bulleted items constitute an ‘and’ or ‘or’ condition? For example, if a post-trigger record length of 50 cycles is available, but a fault lasts 51 cycles such that the final cycle of the fault is not captured, would this be compliant with the intent of Requirement R5, Part 5.1? If not, then it seems that either (1) both bulleted items would be required or (2) just the second bulleted item would be required. Consider changing “a single record or multiple records that include:” to “a single record or multiple records that include at least one of the following:” Under Requirement R5, Part 5.3, what latitude are Transmission Owners and Generator Owners afforded in establishing thresholds for neutral (residual) overcurrent and phase undervoltage trigger settings? Under Requirement R6, Part 6.1.7 attempts to define every area that uses UVLS as a “Major Voltage Sensitive Area.” UVLS programs are also used to address localized voltage issues. As currently written, a DDR would be required for every entity that uses any undervoltage relays, no matter how localized. We suggest removing section 6.1.7 as the other criteria in requirement 6 will provide widespread installation of DDRs. Under Requirement R8, Part 8.2, consider changing “…same voltage corresponding to…” to “…same voltage level corresponding to…” Under Requirement R9, Part 9.4, consider changing “…of at least one of…” to “…of any of…” Under Measurement M12, consider explicitly adding “station drawings,” or similar verbiage, as evidence. Device specifications and configuration or actual data recordings may be insufficient to demonstrate time synchronization; it may be necessary to demonstrate that cabling is connected. If failure of DDR is discovered, recorded data may not be retrievable for the period of 10 calendar days preceding a request. If a disturbance occurs before recording ability is restored, but an entity is compliant with Requirement R14, is it the intent of the standard that an entity could be found non-compliant with Requirement R13 for the failed DDR? Under Measurement M13, change “…evidence (electronic or hardcopy) data…” to “…evidence (electronic or hardcopy) that data…” Under Requirement R14, does loss of time synchronization qualify as a “failure”? Generally, it seems that this type of issue would be corrected quickly (within 90 calendar days of discovery) and therefore not require reporting. Under Requirement R14, if a Transmission Owner or Generator Owner restores the recording ability within 90 calendar days of the discovery of a failure, does the failure need to be reported to the Regional Entity to be compliant with Requirement R14? In other words, do the bulleted items under Requirement R14 constitute an ‘and’ or ‘or’ condition? In Attachment 1, Step 1, would bus Elements on the high-side of transformation at the same physical location be considered a single bus location and be distinct from the bus Elements on the low-side of the transformation, even if both sets of bus Elements share a common ground grid? In other words, is it possible to have two bus locations at the same physical location, even if they share a common ground grid, provided that there is transformation connecting the two bus locations? Consider a 230kV to 115kV substation. In Attachment 1, Step 1, what is meant by the verbiage “…or from other DME devices”? Additionally, the acronym ‘DME’ does not appear to be defined in the standard itself (only in the Rationale for R14).

The methodology is acceptable, but a requirement should be added before R1 and the present R1 should be modified as noted below. a. Generator Owners should also be obligated to identify applicable bus locations where they own Elements using the Attachment 1 Steps, rather than delegating this obligation to the Transmission Owners. b. Generator Owners will be able to determine maximum available calculated three phase short circuit MVA after PRC-027-1 becomes a mandatory standard because this standard will require Transmission Owners to provide short circuit study information which makes this possible. In the implementation plan for this standard, Generator Owners could be exempt from compliance with R1 until after the applicable regulatory approvals of PRC-027-1. c. In addition, the scope of the bus locations that need to be considered for identification should be explicitly limited to locations where an entity owns Elements. d. Consider wording for the present R1, but new Requirement R2 like, “Each Generator Owner and Transmission Owner shall identify BES bus locations where it owns Elements for Sequence of Events . . .”
Yes
Yes
The criteria for selecting Elements requiring DDR in Requirement R6 are mostly acceptable. However, ATC recommends the consideration of the following wording changes: a. For R6 – Simplify the beginning with wording like, “Each Planning Coordinator or Reliability Coordinator (as applicable) shall . . .” b. For R6.1 – Specify more clearly that R6.1 is limited to BES Elements with wording like, “The BES Elements shall include the following:” c. For R6.1.1 – Make each sub requirement consistent with the parent R6.1 subject of “Elements” with wording like, “Elements at a minimum of one DDR location per . . .” d. For R6.1.2 – Make each sub requirement consistent with the parent R6.1 subject of “Elements” with wording like, “Elements at a minimum of one DDR location in . . .” e. For R6.1.3 – Add more clarity regarding the applicable Elements with wording like, “Elements at DDR locations, which interconnect the following generation resources to BES transmission buses:” f. For R6.1.4 – Make each sub item consistent with the parent R6.1 subject of “Elements” with wording like, “Elements necessary to monitor the following items:” g. For R6.1.4, bullet item 1 – Limit the scope of this item to only major permanent flowgates (similar to the other three bullets), rather than all permanent flowgates (which generally includes all BES circuits), and allow the Planning Coordinators to define what “major” means with wording like, “Eastern Interconnection – all major permanent Flowgates as defined by the applicable Planning Coordinator.”
Yes
ATC recommends the following: a. Regarding Requirement R2 – Similar to the recommendation for R1, Generator Owners, not just Transmission Owners, should be obligated to identify Elements at BES bus locations established in R1 that require SOER and FR. If any identified Elements are owned by other Generator Owners or Transmission Owners, then the Generator Owner or Transmission Owner should notify the respective owners. ATC recommends revising the R2 wording to, “Each Generator Owner and Transmission Owner shall identify which BES Elements require SOER and FR at the BES bus locations established in Requirement R1.” Revise the R2.1 wording to, “Each Generator Owner and Transmission Owner shall determine whether any required Elements are owned by other Generator Owners or Transmission Owners.” And finally, revise the R2.2 wording to, “If any required Elements are owned by other Generator Owners or Transmission Owners, then the Generator Owner or Transmission Owner should notify the respective owners of those Elements.” b. Regarding Requirement R3 – This requirement should follow through with the obligations that were prepared for in R2 by requiring SOER and FR for all of the Elements identified in R2, not just selected circuit

breakers. ATC recommends revising the R3 wording to, “Each Generator Owner and Transmission Owner shall have SOER and FR for each Element that they own and was identified per Requirement R2.”

For step 1 in Attachment 1 please confirm the following: For a 115kV and a 345kV bus in the same substation on the same ground grid is this considered two bus locations such that these would be used in step 3 as two of the 11 buses to calculate the median? For step 7 in Attachment 1 if I have a 230kV bus and a 345kV bus in the same substation in my top 10% is this acceptable to count them as two buses that require FR/SOER since it is a single location? Is this indicating that both buses need to meet the FR/SOER requirements? Please clarify for Attachment 1: Should a 115kV tap substation with no breakers but only a load serving transformer with a high side breaker be included in the fault bus list? It appears they should but would a tap sub with no breakers be required to have FR or SOER? Should generator GSU 13.8kV buses and tie transformer tertiary 13.8kV buses be in the bus fault list? Example list 1 appeared to have some 13.2kV buses but the instructions do say to use 100kV and above. Please confirm only 100kV or above buses should be used.
Yes
No
For clarification, “A minimum of one DDR location per 3,000 MW of the Responsible Entity's historical peak system Demand, inclusive of Requirement R6, Part 6.1, Sub-parts 6.1.2 – 6.1.7” means that for a peak demand of 3030MW a Responsible Entity must have at least two DDRs on its system and this requirement is satisfied if two DDRs are already on the system due to the other sub parts in R6? Has or should it be confirmed the RC or PCs have a clear understanding and listing of “permanent Flowgates” and locations necessary to monitor all Elements associated with IROLs? They may need to confirm they are using similar or same terminology.
No
“directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation…” I recommend these be moved to Moderate levels if not lower to match the criteria.
No
It is recommended to have 5 years to become compliant instead of 4 years to match this with the reassessment activities. Since there is no method to track the various percent compliant for the 2nd and 3rd years it is recommended to require 100% compliance by the final year.
For clarification on R2 after receiving notification from a TO that FR or SOER may be required how long does the receiving entity have to install the appropriate recording device? Please clarify if it is still 4 years to be 100% compliant? R3 can we clarify the circuit breakers that are not connected to lines and transformers designated in R4 are not required to be part of the SOER? For example, do not require SOER for a 115kV circuit breaker on a 115/34.5kV load serving transformer. R4 M4 states that “Evidence may include, but is not limited to: (1) documents describing the device specifications and configurations; or (2) actual data recordings or derivations.” For individual relays used as recorders this may encompass a significant amount of data. Consider allowing evidence to be a single design standard or common general design example to be allowed as evidence rather than requiring all the detail data from every location which could be hundreds of relays with settings/drawings/records for example. There is a similar concern for R3 M3 evidence. R5 5.1 states: A single record or multiple records that include: • A pre-trigger record length of at least two cycles and a post-trigger record length of at least 50 cycles for the same trigger point. Consider using 30 cycles instead of 50 cycles for post records since faults typically should be clearing faster (less than 10 cycles on most critical high voltage lines). This may reduce the risk of memory record overwrite

in relays that are of older vintage. DDR capabilities will also most likely be installed in the most critical areas for longer recording needs. R5 5.3.2 lists a required trigger setting for phase under voltage. Many relays used for FR will use the phase impedance zone reaches to trigger records. This can clearly define the reach for data to be triggered where defining an under voltage may be more difficult to control the reach. There is some concern with overwriting data in the relays with settings that are less intuitive for controlling how often a device may trigger. I strongly recommend allowing phase under voltage or phase distance reaches for 5.3.2 as trigger points. Generally the trigger requirements appear logical. There is some concern that these recording devices are not perfect and devices that appear to be functioning correctly will occasionally not trigger as set. These are not perfect devices. Is there a risk for non-compliance for devices that are set to meet compliance yet do not trigger correctly? This seems like an unnecessary risk. R8 8.1 seems to be a bit confusing. R8 8.1 allows a single phase to neutral voltage yet 8.3 appears to require all voltages. R8 8.2 is also similar in nature. Can this be changed to require one voltage and one current on the same phase? R11 states “11.2. Output recording rate of electrical quantities of at least 30 times per second.” Please clarify to make sure this can be clearly understood by an audit or enforcement team as well as owners. Is this processing speed or DSP of a device? For example some relays state “AC voltage and current inputs 8000 samples per second, 3 dB low-pass analog filter cut-off frequency of 3000 Hz” or “protection and control processing 8 times per power system cycle”. Are these examples what is asked for with 11.2? Most devices are likely to meet this rate. Does it really need to be in the standard? This seems excessive. Any options to reduce the requirements in this standard would help to limit the complexity and data to manage. R13 states: “13.2. The recorded data will be retrievable for the period of 10 calendar days preceding a request.” This is a good goal to shoot far however data can be overwritten in relaying devices with the best intentions when numerous operations and voltage levels are used to trigger events. I don’t feel that the ability to guarantee data is available for this time period is fully under the control of the person setting the pickup and triggering in the device 100% of the time. This should not be a finable enforceable requirement and should be removed. On occasion failing equipment can provide such great amounts of data as to overwrite memories in relaying equipment. R13.4 states “Fault Recording and Dynamic Disturbance Recording data will be provided in electronic C37.111, IEEE Standard for Common Format for Transient Data Exchange (COMTRADE), formatted files.” Can the statement be added that if the device is not capable of providing COMTRADE files directly then it is acceptable to provide the data in its native format? I am concerned with the need to reformat data could risk loss of data before it may ever get to an analysis team. Some formats may not be easily convertible in older devices. Consider adding: Data content requirements and guidelines shall be in accordance with R13.3, R13.4 and R13.5 or other formats deemed acceptable by the requesting regional entity. R14 requires the tracking of recording failures and restoration. I recommend this only be required for recording devices not under another maintenance plan. For protective relays performing recording functions they should not be under this requirement if they are covered under PRC-005 which is a stringent maintenance plan that will be in place. This will reduce additional tracking requirements and burden.

PPL NERC Registered Affiliates

Brent Ingebrigtson
Yes
No
These comments are submitted on behalf of the following PPL NERC Registered Affiliates (PPL): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; and PPL Generation, LLC, PPL; Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. The TOs have the system specific knowledge as to where on their networks, SOERs, FRs and DDRs should be installed to effectively capture disturbance data. Many TOs have existing DME equipment in place (previously specified per the Regional Entities) which provides the relevant system disturbance data required for disturbance analysis. The R1, R6 requirements may lead to installation of redundant equipment. Perhaps the R1, R6 requirements should specify that the TOs evaluate where SOERs and FRs are to be installed to effectively capture disturbance data? Re-specifying DME installation per PRC-002-2 may result in redundant evaluation and equipment installation of DMEs. Previous electric sector DME efforts driven by PRC-002-1 and Regional Criteria should be recognized in the specifications for DME installations.
No
PPL made the comment in the 11/19/13 webinar that DME in general should be a topic for TOs and not GOs. TOs interpret and use DME data, GOs do not. TOs generally have wide-ranging arrays of DME, continuous recording and storage infrastructure, and experts in monitoring and maintaining such equipment; stand alone GOs do not. The webinar presenters stated that making R9 pertain to TOs rather than GOs would make TOs responsible for monitoring GO equipment, and there is no technical reason for making them do so. PPL disagrees in that disturbances do not originate exclusively in generation plants, and the majority of such events may in fact stem from transmission system problems (as was the case for the Northeast blackout of ’03). That is, one can just as easily say that R9 makes GOs responsible for monitoring reactions to the TO’s system, and there is no technical reason for making GOs do so. Given this inability to establish a universal cause-vs.-effect rule for disturbances the least-total-cost approach should be followed, and centralizing DME makes more sense than splitting it between involved entities (TOs) and those who merely hand-over recordings (GOs). This point was made again in the 12/5/13 NAGF outreach webex meeting, and there did not appear to be a strong rationale for having GOs be designated Responsible Entities when they in fact would be mere appendages, i.e. installing what are to them black boxes and handing-over recordings that they don’t understand.
Yes
Yes
No
Since there has been previous DME installation guidance provided by Regional efforts (via a Regional Standards or Criteria), it should be assumed that TOs have previously installed DME (SOER, FR, DDRs) equipment in locations specified per the Regional or local requirements. Therefore, requiring TOs to have any new DMEs installed per R1, R6 within 6-9 months of when PRC-002-2 becomes enforceable is not justifiable. There should be a (12-24 month) grace period to install any newly required DMEs (SOERs, FRS, DDRs) per PRC-002-2 R1 and R6. Concur with implementation time frames of R2, R7 and R14 requirements.
1. It appeared from the 11/19/13 webinar that the R9 obligation for GOs to “have” DDR does not mean that they must own such equipment, and this position was confirmed in the 12/5/13 NAGF outreach meeting. That is, it would do just as well to have an agreement with the TO to fulfill the PRC-002 requirements if and where the TO already has DDR on their side of the generation plant fence. This point does not come across clearly in the present text of PRC-002. R9 should have a footnote saying that “This standard defines the ‘what’ of DDR, not the ‘how.’ GOs may install this equipment or, where the TO already has suitable DDR, contract with the TO.” It would be still better

to just eliminate GOs from the requirement, however, per our comment to question #3 above. 2. R6 sets DDR applicability criteria based on the “nameplate rating,” but doesn’t say of what. This could be the generator, or the most-limiting component. We believe that applicability should be based on the most-limiting component, since this sets the actual output achievable. The term, “Facility Rating,” as defined in FAC-008 should then be used to avoid confusion. 3. The frequency and Hz/s settings of R10 should have a latch-time criterion, to prevent inadvertent triggering of the DME. We suggest three cycles. 4. R10 calls for DME to be triggered at no lower than 85% of normal voltage with a latch-time of 5 seconds, but the 5-second ride-through requirement of PRC-024 is only +/-10%, which is also often where V/Hz relays are set. A trigger of 85% voltage x 5 sec may therefore cause DME to miss the action. 5. Triggered (as opposed to continuously-recording) DME needs to have sufficient storage capability to capture a major disturbance and a potentially large number of aftershocks, but we have no way of knowing how many such recordable events may occur, creating a compliance risk. The SDT should establish the expected maximum number of recordable events and state it in the standard.

No
The definition for SOER optionally includes protection devices and only mandates the monitoring of the status of Elements. This is reinforced by R3 which only dictates the recording of circuit breaker position. The purpose of the standard is to “have adequate data available to facilitate analysis of BES disturbances”. We don’t see how any comprehensive analysis of disturbances can be done in the absence of protection device information. At least some basic protection information is integral in disturbance analysis.
No
The methodology in Attachment 1 is overly complicated (9 steps); and following eight of these required steps, it is then left up to the T.O. to add “discretionary” stations, if desired. Just using the highest 11 station fault MVA values may not be the most accurate. Contributions from a foreign, nearby utility can raise a station’s fault values, even though the station itself is not that critical to the listing entity. Using “Station” instead of “Bus” or “Location” would be more definitive. e.g. a 230 kV “Station”, a 345 kV “Station”,…). The term “bus” can be defined in different ways, so can “location.”
Yes
No
R6.1.6 – This requirement could lead to unnecessary installation of DDRs in non-integral substations.
Yes
Yes
R10 It is stated that triggered records from existing equipment can be accepted in lieu of continuous recording if the triggered records meet the criteria in 10.1 and 10.2. If continuous recording is available and meet all criteria, are triggered DDR records required? R13.3 There is no need to require this data to be written in CSV format. Tab delimited text would work as well and would not limit the use of commas in descriptors or other entries. The format described in Attachment 2 is limiting and incomplete (see comments on Attachment 2).. R13.4 This requires that Fault Recording and Disturbance Recording data will be provided in COMTRADE (C37.111) formatted files, but does not specify a revision level or year for the COMTRADE standard. The requirement should specify “C37.111-2013 or later” in order to require a version of COMTRADE that includes formatting for phasor data for Disturbance Recording. Prior versions of C37.111 were not compatible with phasor data. Attachment 2 The format in Attachment 2 is limited and incomplete. While the information required is obviously necessary, the format limits or omits information available from some SOERs.

R13.3 states that the files must be comma-delimited, but Attachment 2 makes no statement about the length of any string or value. There is no provision for SOERs which may have detailed descriptors of the contacts being monitored but may be a single string. “Local Time Offset from UTC” should be expressed in hours before or after UTC rather than letter designations. There is no provision for acceptable terms for “State” except for “OPEN “and “CLOSE”. Other terms may be more appropriate for some devices monitored by an SOER, such as “ENABLED” or “DISABLED”, “ON” or “OFF”, etc. In short, Attachment 2 appears to be an attempt at defining a standard but does not adequately define a format. Development of such a standard may be better left to an IEEE Working Group or other entity.

No
We agree with R1, but we do not see the need for R2 since through R1 and Attachment 1, each TO has already identified the bus locations that it owns for having Sequence of Events Recording (SOER) and Fault Recording (FR). There is not another owner(s) that a TO needs to communicate the list to, unless the “list of BES bus locations that it owns” depicted in Step 1 of Attachment 1 means only the location ownership but not the Element ownership. But if that is the case, then Step 1 in Attachment 1 needs to be clarified to distinguish the need for R1 and R2.
No
This is a “fill in the blank” as identified in the FERC Order 693 and was written to be complied with by the RROs for years. We question why there is need for the RC and PC to comply with these. In fact, the Paragraph 81 activities have identified many requirements that are by the FERC’s perspective not consequential or primary for reliability. We do not believe that a mere reassignment from the old RRO entities to the RC or PC that these requirements suddenly become critical to reliability. NERC should consider other avenues to provide entities with methods to acquire fault data for event analysis. The solution to everything we do shouldn’t be a standard. In fact nearly all new relays and digital meters have disturbance recording capabilities, it is possible to acquire data for event analysis without DDR. Since the intent of this standard is primarily to have post-event data available, it can be argued this is not a critical reliability standard. We point out that the NERC Rules of Procedure have a detailed section on disturbance response procedures.
No
R6 is confusing. It asks for the identification of BES Elements for which Dynamic Disturbance Recording (DDR) is required but Part 6.1.1 and 6.1.2 are not criteria for “Elements”, but rather, they are criteria based on demand size and footprint. It would clarify for compliance if the requirement is split into two: one for the threshold for having DDR (demand size and footprint, i.e., Pats 6.1.1 and 6.1.2), and one for the location/element (Parts 6.1.3 to 6.1.6).Also, M6 for R6 states that the responsible entity must “accurately” identify elements requiring DDR per numerous sub-requirements under R.6.1. and measures degrees of compliance against an identified set of points as specified per 6.1.4. R.6.2. requires that entities, at a minimum, perform a new assessment for DDR locations every 5 years. When there are elements added to the Interconnections or long-term system reconfigurations that take a DDR(s) out of service or renders them incapable of recording the required data, should that be a trigger for a reassessment?

No
(1) Ameren also supports the SERC Protection & Control Subcommittee (PCS) comments and hereby includes them by reference rather than repeating them all.
Yes
No
(1) We ask the SDT to replace 'Planning Coordinator' with 'Regional Entity' in 4.1.1 because the Regional Entity has a wider view, and it promotes consistency.
No
(1) In conjunction with our Planning Coordinator we have voluntarily installed over 30 PMUs which was a significant effort and resource commitment over the last 3 years. Even though they have not yet been needed for disturbance analysis, some operating visualization tools are being used and we have reviewed some minor perturbations. However, if we would still need to have a PMU covering every generator with 500 MW or greater as in 6.1.3.1, as well as all permanent flowgates, as covered in 6.1.4, that would require us to add many more PMUs to the system. We believe this would be burdensome, given the effort already undertaken over the last 3 years to get to where we presently are. We respectfully disagree with the drafting team's brief justification in the Rationale for R6.
Yes
No
We request the SDT to make the following changes: (1) Add 1 month to item 3 for the TO to identify BES Elements in R1. (2) Delete 'bus locations and' in item 6 so that the total percentage (%) is based on BES Elements throughout the Implementation Plan. There are bus locations at which there are several different owners of the BES Elements. (3) Replace '24 months or more' with 'up to 60 months' in item 9. (4) The Implementation Plan Summary is very helpful but the Entity is incorrect for R8, R9, and R10.
We request the SDT to make the following changes: (1) In R1, add 'After identifying BES bus locations, each TO shall identify the BES Elements directly connected to that bus location at its voltage level.' We request allocating another month to do so. We believe that this will provide a consistent reference for R2 which refers to BES Elements as if they've been established in R1. (2) In R3, insert 'Transmission Owner' before 'bus locations' to make it consistent with the page 32 Guideline for R3 explanation that the GO does not need SOER at its GO bus locations. Also insert 'BES' between 'each' and 'circuit breaker' because not all breakers are BES Elements. It then states 'Each Transmission Owner and Generator Owner shall have Sequence of Events Recording (SOER) for circuit breaker position (open/close) for each BES circuit breaker they own connected to the Transmission Owner bus locations as per Requirement R2.' (3) Include the BES bus location along with the BES Element in R6 so that it is clear that DDR is only required at one terminal of a two-terminal Element. (4) Reword R8 and R9 to 'Each Transmission (Generation) Owner shall have Dynamic Disturbance Recording (DDR), for each location and Element as dictated by the Responsible Entity per Requirement R7, to determine…' (5) Reword R11 to be similar using 'that is responsible for' to R10 to 'Each Transmission Owner and Generator Owner that is responsible for Dynamic Disturbance Recording (DDR) as per Requirement R7 shall conform …' (6) Reword R12 to 'Each Transmission Owner and Generator Owner that is responsible for Sequence of Events Recording (SOER) and Fault Recording (FR) at the bus locations on BES Elements as per Requirement R2, and Dynamic Disturbance Recording (DDR) on BES Elements as per Requirement R7 shall time synchronize data to within …' (7) If at all possible we would like another opportunity to provide comments on CEAP for PRC-002-2 in the next draft. Several aspects of this draft made in unclear as to what is required, and therefore difficult to assess cost impact.
